This document provides information for selecting hardware. Note that this document is current with supported information for OV3600 7.7.

This section includes the following topics:

- "CPU, Memory, and Storage Matrix" on page 5
- "Choosing Your CPU" on page 7
- "Choosing Your Memory" on page 7
- "Choosing Your RAID Controller" on page 7
- "Choosing Your Hard Drives" on page 8

CPU, Memory, and Storage Matrix

The following table lists the recommended specifications for optimum OV3600 server performance.

Table 1: Recommended CPU, Memory, and Storage

Devices	CPU	RAM (GB)	Disk Config	IOs Needed by OV3600	Storage (GB)
Less than 500		8		50	75
500	Intel® Core™ i3-2220 @ 3.30GHz	16	6x 146GB 15k RAID 10	300	410
1000	Intel Core i5-3570 @ 3.40GHz	32	10x 146GB 15k RAID 10	600	685
1500	Intel® Xeon® E5-2660 @ 2.20GHz	48	12x 146GB 15k RAID 10	900	821
4000	Dual Intel Xeon E5-2660 @ 2.20GHz	80	16x 146GB 15k RAID 10	2400	1095
5000	Dual Intel Xeon E5-2690 @ 2.90GHz	96	18x 146GB 15k RAID 10	3000	1232
5000 SSD	Dual Intel Xeon E5-2690 @ 2.90GHz	96	6x 500GB SSD RAID 10	3000	1397

Ensure that the disk subsystem can sustain 4KB random write rates. Sustained sequential write rates will not help because OV3600 writes are primarily random.

The following table lists the minimum specifications required to run OV3600.

Table 2: Minimum CPU, Memory, and Storage

Devices	Appliance Name	CPU	RAM (GB)	Disk Config	IOPs	Storage (GB)
Less than 500			4		30	75
500		Intel Core i3 550 @ 3.20GHz	8	4x 146GB 15k RAID 10	300	273
1000		Intel Xeon E5-1603 @ 2.8 GHz	16	6x 146GB 15k RAID 10	600	410
1500	OV3600-HWPRO*	Intel Xeon E5-2640 @ 2.50GHz	32	6x 146GB 15k RAID 10	900	410
4000	OV3600-HWENT*	Dual Intel Xeon E5-2640 @ 2.50GHz	64	8x 146GB 15k RAID 10	2400	548

* These systems represent appliances that are available from Alcatel-Lucent.

Assumptions

The recommendations provided in this document are based on extensive testing scenarios run in house. The following assumptions are common across these tests. If your particular environment differs significantly in any of these dimensions, then this *Server Sizing Guide* might not be appropriate for your situation.

Table 3: Assumptions used during testing

Item	Assumption
% Switches	20%. Note that doubling the wired switch/total device ratio from 20% to 40% results in a 20% decrease in the number of devices for which the system can process data. (For example, the ENT system is rated for 3200 devices at 40% wired switches.)
Syslog messages per second (continuous)	PRO: 125 messages per second ENT: 250 messages per second
Client traps per second (continuous)	PRO: 50 ENT: 100
Roaming Rate per second	This value should equal approximately 1/3 the value of client traps that result in actionable items. <ul style="list-style-type: none"> PRO: 17 (approximately) ENT: 33 (approximately)
Client historical retention	In OV3600 Setup > General , the Client Association and VPN History option is set to 14 days.
Reporting rate	OV3600 default reports and reporting rate.

OV3600 includes the 64-bit CentOS operating system based on Red Hat Enterprise Linux (RHEL), and that is installed by default. If you choose to install RHEL instead of the supplied CentOS, you will need to purchase your own RHEL license and support separately.

Your hardware should incorporate margins for WLAN expansion as well as for future OV3600 features and modules. These recommended specifications are formulated to keep OV3600 running on the same hardware platform for up to three years.

To ensure hardware capability, purchase server hardware that is certified to be compatible with Red Hat Enterprise Linux 5 (RHEL5).

Additional factors that can influence the processing requirements for your OV3600 server:

- How many devices will the server manage?
- How often will OV3600 communicate with these devices?

Choosing Your CPU

For most OV3600 installations, Alcatel-Lucent recommends selecting high-performance Xeon E-series CPUs.

Alcatel-Lucent performs scalability testing using Intel based hardware at this time. See [Table 1](#) in "CPU, Memory, and Storage Matrix" on [page 5](#) for recommendations on CPU selection based on clock speed and core type.

Choosing Your Memory

OV3600's memory recommendations scale linearly with the managed device count.

With OV3600 servers running at full load for those device counts with a large number of floorplans, the recommended memory usually results in best overall performance.

Best performance is defined by minimal disk reads due to sufficient caching, thus allowing for maximum disk write performance and minimal CPU I/O wait time.

Choosing Your RAID Controller

RAID 1+0 is the **ONLY** supported RAID configuration for OV3600.

Software RAID and SATA drives are **NOT SUPPORTED** for any configuration of OV3600.

RAID Configuration Information

For RAID 1+0:

- Dedicated Hardware RAID controller with caching and battery backup or non volatile (NV) cache.
- RAID controller should be configured for Write-Back caching with battery backup (unless NVcache is selected, then Force Write-Back without Battery backup is recommended).
- Individual Drive Caching should be enabled.
- Ensure that all disks are assigned and configured to a single volume.

Improper RAID configuration can result in drastically reduced server performance.

200 Devices and Below

OV3600 100 and 200 models perform well on a single, fast (spindle speed) disk.

500 Devices

RAID 1+0 configuration of four (4) or more 15K SAS drives in a single volume with dedicated Hardware RAID controller with minimum 256MB of cache and battery backup.

1,000 Devices

RAID 1+0 configuration of four (4) or more 15K SAS drives in a single volume with dedicated Hardware RAID controller with minimum 256MB of cache and battery backup.

1,750 Devices

RAID 1+0 configuration of six to eight (6-8) or more 15K SAS drives in a single volume with dedicated Hardware RAID controller with minimum 512MB of cache and battery backup.

2,500 Devices

RAID 1+0 configuration of six to eight (6-8) or more 15K SAS drives in a single volume with dedicated Hardware RAID controller with minimum 1GB of cache and battery backup.

5,000 Devices - Non-SSD Drives

RAID 1+0 configuration of sixteen (16) or more 15K SAS drives in a single volume with dedicated Hardware RAID controller with minimum 1GB of cache and battery backup.

5,000 Devices - SSD Drives

AWMS 2,500 - 5,000 device installations with SSDs require **Single Level Cell (SLC) Enterprise class SSD drives.**

Do not use Multi Level Cell (MLC) Consumer class drives. Use of MLC drives can result in drastically reduced SSD drive lifespan and data loss/volume failure due to write exhaustion.

A minimum of six (6) Enterprise SSDs in a RAID 1+0 configuration are required, (Refer to "[CPU, Memory, and Storage Matrix](#)" on page 5 for minimum needed storage capacity information.) Eight (8) or more SSDs in a RAID 1+0 configuration are recommended.

The target random write 4KB IOP Performance is at minimum 3,000 sustained IOPS for 5,000 device monitoring.

The actual disk IOP requirement can vary depending on the configuration of the OV3600 server.

If you have any questions regarding hardware compatibility or selection, contact Alcatel-Lucent support.

OV3600 servers servicing more than 2,500 devices require 64-bit OS and OV3600 7.1 or higher. Do not use software RAID systems or SATA disk drives.

Choosing Your Hard Drives

15K SAS drives are the highest performance spinning platter drives available today. Serial ATA and 10K SAS are vastly outperformed by 15K SAS and should not be used in an OV3600 server.

You will need to select the appropriately sized hard drive to meet your desired storage volume after taking into account RAID 1+0 reduction on overall storage capacity.

RAID 1+0 reduces your single volume available drive space by $\frac{1}{2}$ because of the redundancy introduced. An example would be 16x 146GB 15K SAS hard drives in a RAID 1+0 volume will result in approximately 1.1 TB of storage space $[(16*146GB)/ 2]$.

SSDs vs 15K SAS

Solid State Drives are becoming more affordable and are being offered as a high performance drive option by many vendors. SSDs offer performance that far outstrips 15K SAS, but at a significant cost premium.

OV3600 supports deployment on SSD based storage arrays and can take advantage of the high speed disk access and stellar random write performance.

To select an appropriate SSD you'll want to ensure that the SSD is classified as "Enterprise" class. This generally indicates a drive that uses Single Level Cell (SLC) technology versus Multi Level Cell (MLC) technology. SLC technology is required for an OV3600 server to avoid unexpected write exhaustion and/or poor performance due to write amplification.

Confirm with your vendor prior to purchasing SSDs that their offerings are appropriate for a 24/7 sustained high random write database server and are not a consumer-grade SSD.

In general, RAID 1+0 is still recommended for SSD deployments to allow for the best overall redundancy and performance. Any parity based RAID (5/6/etc) is not recommended.

For additional information, please contact Alcatel-Lucent support.

This section explains sizing information for the following topics:

- "CPU Configuration " on page 10
- "Disk Partitioning" on page 10
- "Filesystem Configuration" on page 10

CPU Configuration

Ensure that Power Management is configured for **Maximum Performance**. By default, most vendors configure BIOS to an eco-friendly setting.

Ensure that Memory Operating Mode is configured to **Optimizer Mode**, if available.

Disk Partitioning

OV3600 automatically partitions the disk subsystem upon installation. You can override these values. [Table 4](#) below lists the default partitioning and provides guidance for more advanced scenarios.

Table 4: *Default Partitions*

Default Partitions	Size
boot	100 MB
swap	4 GB
/	Remainder of disk space

Filesystem Configuration

For OV3600, the NOOP File I/O scheduler provides the best random write performance. If you are running OV3600 7.2 or later, OV3600 should automatically manage this setting for you.

To check the currently assigned scheduler (if sda is not your device name, please replace with the correct device name):

```
# cat /sys/block/sda/queue/scheduler
noop anticipatory deadline [cfq] (Sample Output)
```

To configure noop as your preferred scheduler:

```
# echo noop > /sys/block/sda/queue/scheduler
```

And confirm that your change has been applied:

```
# cat /sys/block/sda/queue/scheduler
[noop] anticipatory deadline cfq (Expected Output)
```

This section includes the following topics:

- "Virtualization" on page 11
- "Scalability Assumptions" on page 11

Virtualization

OV3600 can run in a VMware and Xen virtualized environment. To ensure scalability, dedicate the processing and memory. You must also ensure that the disk subsystem can maintain the IOPS throughput as detailed below.

Most virtualized environments use a shared disk subsystem assuming that each application will have bursts of I/O without a sustained high I/O throughput. OV3600 requires a continuous sustained high data I/O rate.

For virtualized environment, use dedicated hardware. If you are using the specifications outlined in the "CPU, Memory, and Storage Matrix" on page 5 section, the hardware for virtualization should exceed these specifications by 20%.

Alcatel-Lucent recommends a 20% increase buffer for virtualized environments. Ensure you allocate enough extra disk space for the OS and swap when partitioning the virtual disk.

Scalability Assumptions

Using the specifications outlined in the "CPU, Memory, and Storage Matrix" on page 5 section, Alcatel-Lucent continually tests scalability based on the following assumptions. Deviations from these assumptions can impact overall scalability of your OV3600 server.

Table 5: *Wireless Scalability Test Values*

Category	
AP Interface polling period	10
Device-to-device link period	5
CDP neighbor data polling	30
Ratio of switches/routers to access points	25%
Read ARP polling (hours)	4
Read CDP table for device discovery polling (hours)	4
Read bridge forwarding table polling (hours)	4
Interface Up/Down polling period	10

Auditing more than once a day can have a tremendous impact on scalability.

Table 6: Wired Scalability Test Values

Category	
Ratio of switches/routers to access points	25%
Average port density of switches/routers	36
Read ARP polling period (hours)	8
Read CDP table for device discovery polling period (hours)	8
Read bridge forwarding table polling period (hours)	8
Interface polling period (minutes)	20

Table 7: VisualRF Scalability Test Values

Category	
Average floor plan size (feet)	62,500
Number of access points per floor plan	20
Number of clients per floor plan	100
Number of attenuation grid cells per floor plan	2,500
Number Rogue devices per floor plan	20
OV3600 Synchronization timer (minutes)	15
Rogue location timer (minutes)	30
Location calculation timer (min/max/number of samples)	90/360/3

Failover Server

The Failover server should be as powerful as the most powerful OV3600 server that it monitors to ensure smooth operation in a failover situation.
