MIBs Overview

This chapter provides an overview of the AOS-W Enterprise MIBs in the following sections:

- MIBs
- SNMP

MIBs

A Management Information Base (MIB) is a virtual database that contains information that is used for network management. Each managed device contains MIBs that define the properties of that device. A separate MIB is provided for each defined property, such as the group of physical ports that are assigned to a VLAN or the statistical data of packets that are transferred at a specific rate.

MIB objects, such as a MIB table or a specific element of data in a MIB table, are identified with Object Identifiers (OIDs). The OIDs are designated by text strings and integer sequences.

For example, *Alcatel-Lucent* and *1.3.6.1.4.1.14823* both represent the private enterprise node *Alcatel-Lucent*, as shown in [Figure 1 on page 16](#).

Alcatel-Lucent is the parent of the proprietary MIBs that are supported on AOS-W Wired AP Edition.

The numerical string lists the nodes of the enterprise MIB hierarchy, as shown in [Table 2](#).

Table 2 MIB Node Identification - Enterprise Nodes

Integer	String	Name
1	1	OSI
3	1.3	ORG
6	1.3.6	DOD
1	1.3.6.1	Internet
4	1.3.6.1.4	Private
1	1.3.6.1.4.1	Enterprise
14823	1.3.6.1.4.1.14823	Alcatel_Lucent

[Figure 1](#) illustrates the high-level hierarchy of the MIBs. This document only covers the enterprise MIBs, objects designed to specifically support Alcatel-Lucent devices. Standard MIBs are not covered.

Figure 1 High-Level MIB Hierarchy

MIB is one of the elements of Simple Network Management Protocol (SNMP), which is used to manage network devices. To deliver information between devices, every object referred to in an SNMP message must be listed in the MIB. If a component of a device is not described in a MIB, that component cannot be recognized by SNMP—there is no information for SNMP managers and SNMP agents to exchange.

The information provided by a MIB is a file that describes network elements with numerical strings. This information is compiled into readable text by the SNMP manager. For information about reading MIB text files, see “[Reading MIB Files](#)” on page 20.

SNMP

Three significant elements of SNMP are Managers, Agents, and MIBs.

- Managers (software application) are consoles that are used to communicate with and manage devices that support SNMP Agents. Managers collect information by polling Agents. Managers can also be used to send configuration updates or send controlling requests to actively manage a network device.
- Agents (software application) provide information from the network devices to the Managers. Network devices include workstations, routers, microwave radios, and other network components. Agents are embedded in the Mobility Access Switch firmware, unlike some devices such as servers that require the agent to be installed separately.

- MIBs are used for communication between the Managers and the Agents. The OIDs of the MIBs enable the Managers and Agents to communicate specific data requests and data returns.
- To ensure functionality with SNMP, MIB objects must be defined with the proper *keywords*, as shown in [Table 3](#).

AOS-W Enterprise MIBs support SNMPv1, SNMPv2, and SNMPv3.

Table 3 *MIB Keywords*

Keyword	Description
Sequence	The sequence of objects of the MIB. This keyword is used mostly with entry MIB objects to list the MIB objects that exchange information.
Syntax	Textual conventions, such as <i>Integer32</i> .
Max-Access	Defines the object accessibility: <i>read-only</i> : can be retrieved but not modified <i>read-write</i> : can be retrieved and modified <i>not-accessible</i> : cannot be retrieved; it is for internal (device) use only <i>accessible-for-notify</i> : can be retrieved when a trap message (notification) is sent
Status	Defines the status of the object: <i>current</i> : up to date and valid. <i>deprecated</i> : indicates an obsolete definition. It permits new or continued implementation to maintain interoperability with existing implementations. <i>obsolete</i> : obsolete. It should not be implemented and/or can be removed if previously implemented.
Description	A text string that describes the object.

This chapter provides information on and examples of using MIBs.

Downloading MIB Files

The most recent Alcatel-Lucent MIB files are available for registered customers at:
<https://service.esd.alcatel-lucent.com>.

For assistance to set up an account and access files, please contact customer service. See [Contacting Support](#) on page 14.

Monitoring WLAN Health

This section lists SNMP MIBs that are frequently used to run health checks on Alcatel-Lucent Instant devices, which can be performed through a MIB browser application. To retrieve information from a MIB, the following information is required:

- SNMP version
- SNMP community name—*public* or *private*
- The IP Address of the Alcatel-Lucent Instant
- The OID of the MIB value you want to monitor

In addition, MIB files can be placed in the appropriate disk location to assist the user in locating desired OID values for monitoring. If MIB files need to be acquired, see [Downloading MIB Files](#), above.

It is assumed that the workstation is connected to the Alcatel-Lucent Instant and that a MIB browser is available. For most applications, the *root* of the MIB must be included in the OID—the OID begins with a decimal point as shown below.

.1.3.6.1.4.1.674.2.2.1.1.2.1

MIB Browsers

If using an application that is run through CLI (a *cmd* window), the command would resemble the following:

```
snmpget -v 2c -c <community name> <Instant IP address><MIB OID>
```

[Figure 2](#) shows an example of submitting a command to obtain information.

Figure 2 CLI Interface

```
[root@localhost ~]# snmpget -v 2c -c public 10.65.77.8 .1.3.6.1.4.1.14823.2.3.3.1.1.2.0
SNMPv2-SMI::enterprises.14823.2.3.3.1.1.2.0 = STRING: "Instant-CB:A5:52"
```

Figure 3 shows how information may be obtained through a graphical user interface (GUI). The user interface and the available features vary by application.

Figure 3 Graphical User Interface

Reading MIB Files

This section describes how to interpret the basic components of a MIB file. To determine the OIDs, viewing the file `snmp.h` may be necessary, which is described in [SNMP File on page 23](#). For additional information about MIB files, see [MIBs on page 15](#). For a listing of SNMP MIB OIDs, see [Chapter 4, “SNMP MIBs Reference” on page 47](#).

MIB files describe a specific component of a network device. The files are numerical strings that are converted to ASCII text by the compiler of the SNMP manager. A word processor or text editor can be used to open the ASCII file. The contents of an example Instant enterprise MIB file, `aruba-cts.my`, are described below.

Opening Line

Following is the opening line, the beginning of the MIB file.

Inheritance

This section shows the vendor of the MIB and the inheritance, and provides an overall description.

A significant part of inheritance is the OID. The entire OID is not listed for each MIB object—instead, the parent of the object is shown. The OID can be determined from the parent object as follows.

aiEnterpriseMibModules is the parent object—its OID is 1.3.6.1.4.1.14823.2.3.3.

aiStateGroup **OBJECT IDENTIFIER ::= { aiMIB 2 }**, the OID is
1.3.6.1.4.1.14823.2.3.3.1.2.

aiVirtualControllerKey **OBJECT-TYPE**, the OID is 1.3.6.1.4.1.14823.2.3.3.1.1.0.

All MIBs and their related OIDs are listed in the snmp file of Instant. For more information, see [SNMP File on page 23](#).

MIB Modules

MIB objects can be placed in logical groups, [Group](#) and [Table](#). One MIB file can consist of multiple groups. A group typically contains at least one table. The table lists the MIB objects that contain the information that is exchanged.

The first object of a table is an [Entry](#). The keyword SEQUENCE lists the objects of the table that contain device information. Each subsequent object (Informative MIB Object) inherits the OID of the Entry, and contains information sorted by keywords: Syntax, Access, Status, Description. For details about keywords, see [MIBs on page 15](#).

The OID of the Entry is aiAccessPointEntry is aiAccessPointTable 1, which represents 1.3.6.1.4.1.14823.2.3.3.1.2.1.1. The OIDs of the subsequent objects of this table are appended increments of the Entry OID.

SNMP File

The snmp.h file lists the OIDs of all MIBs. Following are sections from snmp.h that show the complete OID of each of the Controller Transport Service (CTS) MIB elements. The list starts from the ancestral parent *iso*.

The SNMP file with all Alcatel-Lucent MIBs is listed in [Chapter 4, “SNMP MIBs Reference” on page 47](#).

All Instant MIBs inherit their OIDs from the Alcatel-Lucent MIB node. The following rows list the MIBs that precede CTS, starting from *iso*.

```

{ "iso",                                HASHNEXT("1") },

Instant MIB

The chapter provides information about the Alcatel-Lucent Instant MIB, as well as entities that are attempting to access the network.

[Figure 4](#) shows the architecture of the Alcatel-Lucent Instant MIB relative to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.aruba). The Instant MIB is listed in the file *alcatel-lucent-instant.my*. For information about downloading Alcatel-Lucent Instant MIB file, see “[Downloading MIB Files](#)” on page 19.

Figure 4 Instant MIB Hierarchy

The supported tables in the Instant MIB are listed and summarized in [Table 4](#). The objects of the supported tables are described in the following sections.

The following table lists the supported tables in the Instant MIB:

Table 4 *Supported Instant MIB Tables*

Group	Description
aiAccessPointTable	Contains all the access points connected to the virtual controller. This table is indexed by the MAC Address of the OAW-IAP.
aiRadioTable	Contains all the radios of the access points connected to the virtual controller. This table is indexed by the MAC Address and radio number.
aiWlanTable	Contains all the BSSIDs that are active on the virtual controller. This table is indexed by the MAC address and a WLAN Index of the OAW-IAP.
aiClientTable	Contains information about all the clients connected to the virtual controller. When a client roams from one access point to another, all the counters in this table are reset to 0.

Traps

This module defines the traps that can be generated by the OAW-IAP. Traps are MIB objects (variables) that transmit information to the SNMP Manager when an event occurs. Traps are included as varbinds (variable bindings) in the trap protocol data unit (PDU). Varbinds are defined in the *Description* section below.

Figure 5 shows the architecture of the Traps MIB relative to 1.3.6.1.4.1.14823 (iso.org.dod.internet.private.enterprise.aruba). The Traps are listed in the file *aruba-trap.my* MIB file. For information about downloading Alcatel-Lucent MIB files, see “[Downloading MIB Files](#)” on page 19.
