**April 2011**

# **OmniSwitch CLI Reference Guide**

Alcatel-Lucent 

**[www.alcatel-lucent.com](http://www.alcatel-lucent.com)**

---

**This user guide documents release 6.4.4 of the OmniSwitch 6400 Series, OmniSwitch 6850 Series, OmniSwitch 6850E Series, OmniSwitch 6855 Series, and OmniSwitch 9000E Series  
The functionality described in this guide is subject to change without notice.**

Technical Support .....	li
<b>Chapter 1 Ethernet Port Commands</b> .....	1-1
trap port link .....	1-4
interfaces speed .....	1-6
interfaces mode .....	1-8
interfaces autoneg .....	1-10
interfaces crossover .....	1-12
interfaces pause .....	1-14
interfaces e2e-flow-vlan .....	1-17
interfaces duplex .....	1-19
interfaces admin .....	1-21
interfaces cli-prompt .....	1-23
interfaces alias .....	1-25
interfaces ifg .....	1-26
interfaces no l2 statistics .....	1-27
interfaces max frame .....	1-29
interfaces flood multicast .....	1-31
interfaces flood .....	1-33
interfaces flood rate .....	1-35
interfaces violation-recovery-time .....	1-37
interfaces violation-recovery-maximum .....	1-39
interfaces violation-recovery-trap .....	1-41
interfaces clear-violation-all .....	1-42
interfaces wait-to-restore .....	1-43
interfaces transceiver ddm .....	1-45
interfaces link-monitoring admin-status .....	1-47
interfaces link-monitoring time-window .....	1-49

---

interfaces link-monitoring link-flap-threshold .....	1-51
interfaces link-monitoring link-error-threshold .....	1-53
interfaces clear-link-monitoring-stats .....	1-55
interfaces hybrid preferred-fiber .....	1-56
interfaces hybrid autoneg .....	1-57
interfaces hybrid crossover .....	1-59
interfaces hybrid duplex .....	1-61
interfaces hybrid speed .....	1-63
interfaces hybrid pause .....	1-65
show interfaces .....	1-68
show interfaces capability .....	1-72
show interfaces flow control .....	1-74
show interfaces pause .....	1-76
show interfaces e2e-flow-vlan .....	1-78
show interfaces accounting .....	1-79
show interfaces counters .....	1-81
show interfaces counters errors .....	1-83
show interfaces collisions .....	1-85
show interfaces status .....	1-87
show interfaces port .....	1-89
show interfaces violation-recovery .....	1-92
show interfaces ifg .....	1-94
show interfaces flood rate .....	1-96
show interfaces traffic .....	1-98
show interfaces transceiver .....	1-100
show interfaces hybrid .....	1-103
show interfaces hybrid status .....	1-107
show interfaces hybrid pause .....	1-109
show interfaces hybrid capability .....	1-111
show interfaces hybrid accounting .....	1-113
show interfaces hybrid counters .....	1-115
show interfaces hybrid counters errors .....	1-117
show interfaces hybrid collisions .....	1-119
show interfaces hybrid traffic .....	1-121
show interfaces hybrid port .....	1-123
show interfaces hybrid flood rate .....	1-125
show interfaces hybrid ifg .....	1-127
show interfaces link-monitoring config .....	1-129
show interfaces link-monitoring statistics .....	1-132
debug interfaces set backpressure .....	1-134
debug interfaces backpressure .....	1-135
link-fault-propagation group .....	1-137
link-fault-propagation group source .....	1-139
link-fault-propagation group destination .....	1-141
link-fault-propagation group wait-to-shutdown .....	1-143
show link-fault-propagation group .....	1-144
interfaces tdr-test-start .....	1-146
interfaces no tdr-statistics .....	1-147
show interfaces tdr-statistics .....	1-148

<b>Chapter 2</b>	<b>UDLD Commands</b> .....	2-1
	udld .....	2-2
	udld port .....	2-3
	udld mode .....	2-5
	udld probe-timer .....	2-7
	udld echo-wait-timer .....	2-9
	clear udld statistics port .....	2-11
	interfaces clear-violation-all .....	2-12
	show udld configuration .....	2-13
	show udld configuration port .....	2-14
	show udld statistics port .....	2-16
	show udld neighbor port .....	2-18
	show udld status port .....	2-20
<b>Chapter 3</b>	<b>Power over Ethernet (PoE) Commands</b> .....	3-1
	lanpower start .....	3-3
	lanpower stop .....	3-5
	lanpower power .....	3-6
	lanpower maxpower .....	3-8
	lanpower priority .....	3-10
	lanpower priority-disconnect .....	3-12
	lanpower slot-priority .....	3-14
	lanpower redundant-power .....	3-16
	lanpower capacitor-detection .....	3-17
	show lanpower .....	3-18
	show lanpower capacitor-detection .....	3-21
	show lanpower priority-disconnect .....	3-22
	show lanpower slot-priority .....	3-23
<b>Chapter 4</b>	<b>Source Learning Commands</b> .....	4-1
	mac-address-table .....	4-2
	mac-address-table vpls permanent sap .....	4-4
	mac-address-table vpls permanent mesh-sdp .....	4-6
	mac-address-table static-multicast .....	4-8
	mac-address-table aging-time .....	4-10
	source-learning .....	4-12
	source-learning chassis-distributed .....	4-14
	show mac-address-table .....	4-15
	show mac-address-table all .....	4-18
	show mac-address-table vpls .....	4-20
	show mac-address-table vpls sap .....	4-22
	show mac-address-table vpls mesh-sdp .....	4-24
	show mac-address-table static-multicast .....	4-26
	show mac-address-table count .....	4-29
	show mac-address-table vpls count .....	4-31
	show mac-address-table all count .....	4-33
	show mac-address-table aging-time .....	4-35
	show source-learning .....	4-36
	show source-learning chassis-distributed .....	4-38

<b>Chapter 5</b>	<b>VLAN Management Commands</b> .....	5-1
	vlan .....	5-2
	vlan stp .....	5-4
	vlan mobile-tag .....	5-6
	vlan authentication .....	5-8
	vlan mtu-ip .....	5-10
	vlan port default .....	5-11
	vlan source-learning .....	5-13
	show vlan .....	5-15
	show vlan port .....	5-18
	show vlan router mac status .....	5-21
	show vlan gvrp .....	5-23
	show vlan ipmvlan .....	5-26
<b>Chapter 6</b>	<b>802.1Q Commands</b> .....	6-1
	vlan 802.1q .....	6-2
	vlan 802.1q frame type .....	6-4
	show 802.1q .....	6-6
<b>Chapter 7</b>	<b>Distributed Spanning Tree Commands</b> .....	7-1
	bridge mode .....	7-4
	bridge protocol .....	7-6
	bridge cist protocol .....	7-8
	bridge port loop-guard .....	7-10
	Examples .....	7-11
	bridge 1x1 protocol .....	7-12
	bridge mst region name .....	7-14
	bridge mst region revision level .....	7-16
	bridge mst region max hops .....	7-17
	bridge msti .....	7-19
	bridge msti vlan .....	7-21
	bridge priority .....	7-23
	bridge cist priority .....	7-25
	bridge msti priority .....	7-27
	bridge 1x1 priority .....	7-29
	bridge hello time .....	7-31
	bridge cist hello time .....	7-33
	bridge 1x1 hello time .....	7-35
	bridge max age .....	7-37
	bridge cist max age .....	7-39
	bridge 1x1 max age .....	7-41
	bridge forward delay .....	7-43
	bridge cist forward delay .....	7-45
	bridge 1x1 forward delay .....	7-47
	bridge mode 1x1 pvst+ .....	7-49
	bridge bpdu-switching .....	7-50
	bridge path cost mode .....	7-52
	bridge auto-vlan-containment .....	7-54
	bridge port pvst+ .....	7-56
	bridge .....	7-58
	bridge cist .....	7-60
	bridge 1x1 .....	7-62

bridge priority .....	7-64
bridge cist priority .....	7-66
bridge msti priority .....	7-68
bridge 1x1 priority .....	7-70
bridge path cost .....	7-72
bridge cist path cost .....	7-76
bridge msti path cost .....	7-80
bridge 1x1 path cost .....	7-83
bridge mode .....	7-87
bridge cist mode .....	7-89
bridge 1x1 mode .....	7-91
bridge connection .....	7-93
bridge cist connection .....	7-95
bridge 1x1 connection .....	7-97
bridge cist admin-edge .....	7-99
bridge 1x1 admin-edge .....	7-101
bridge cist auto-edge .....	7-103
bridge 1x1 auto-edge .....	7-105
bridge cist restricted-role .....	7-107
bridge 1x1 restricted-role .....	7-109
bridge cist restricted-tcn .....	7-111
bridge 1x1 restricted-tcn .....	7-113
bridge cist txholdcount .....	7-115
bridge 1x1 txholdcount .....	7-116
bridge rrstp .....	7-117
bridge rrstp ring .....	7-118
bridge rrstp ring vlan-tag .....	7-120
bridge rrstp ring status .....	7-122
show spantree .....	7-123
show spantree cist .....	7-129
show spantree msti .....	7-133
show spantree 1x1 .....	7-138
show spantree ports .....	7-142
show spantree cist ports .....	7-153
show spantree msti ports .....	7-157
show spantree 1x1 ports .....	7-162
show spantree mst region .....	7-168
show spantree msti vlan-map .....	7-170
show spantree cist vlan-map .....	7-172
show spantree map-msti .....	7-174
show spantree mst port .....	7-175
show bridge rrstp configuration .....	7-178
show bridge rrstp ring .....	7-179

**Chapter 8**

<b>Link Aggregation Commands .....</b>	<b>8-1</b>
static linkagg size .....	8-3
static linkagg name .....	8-5
static linkagg admin state .....	8-6
static agg agg num .....	8-7
lacp linkagg size .....	8-9
lacp linkagg name .....	8-12
lacp linkagg admin state .....	8-13

lacp linkagg actor admin key .....	8-15
lacp linkagg actor system priority .....	8-16
lacp linkagg actor system id .....	8-17
lacp linkagg partner system id .....	8-18
lacp linkagg partner system priority .....	8-20
lacp linkagg partner admin key .....	8-21
lacp agg actor admin key .....	8-22
lacp agg actor admin state .....	8-25
lacp agg actor system id .....	8-27
lacp agg actor system priority .....	8-29
lacp agg partner admin state .....	8-31
lacp agg partner admin system id .....	8-33
lacp agg partner admin key .....	8-35
lacp agg partner admin system priority .....	8-37
lacp agg actor port priority .....	8-39
lacp agg partner admin port .....	8-41
lacp agg partner admin port priority .....	8-43
lacp agg standby .....	8-45
lacp linkagg pre-empt .....	8-47
lacp linkagg pre-empt timer .....	8-49
show linkagg .....	8-51
show linkagg port .....	8-56
dhl num .....	8-61
dhl num linka linkb .....	8-63
dhl num admin-state .....	8-65
dhl num vlan-map linkb .....	8-66
dhl num pre-emption-time .....	8-68
dhl num mac-flushing .....	8-70
show dhl .....	8-72
show dhl num .....	8-74
show dhl num link .....	8-77
<b>Chapter 9</b>	<b>Ethernet Ring Protection Commands</b> .....
	erp-ring .....
	erp-ring protected-vlan .....
	erp-ring rpl-node .....
	erp-ring wait-to-restore .....
	erp-ring enable .....
	erp-ring ethoam-event remote-endpoint .....
	erp-ring guard-timer .....
	clear erp statistics .....
	show erp .....
	show erp protected-vlan .....
	show erp statistics .....
<b>Chapter 10</b>	<b>GVRP Commands</b> .....
	gvrp .....
	gvrp port .....
	gvrp transparent switching .....
	gvrp maximum vlan .....
	gvrp registration .....
	gvrp applicant .....

gvrp timer .....	10-11
gvrp restrict-vlan-registration .....	10-13
gvrp restrict-vlan-advertisement .....	10-15
gvrp static-vlan restrict .....	10-17
clear gvrp statistics .....	10-19
show gvrp statistics .....	10-20
show gvrp last-pdu-origin .....	10-23
show gvrp configuration .....	10-24
show gvrp configuration port .....	10-26
show gvrp configuration linkagg/port .....	10-28
show gvrp timer .....	10-31

<b>Chapter 11</b>	<b>MVRP Commands</b> .....	11-1
	vlan registration-mode .....	11-2
	mvrp .....	11-4
	mvrp port .....	11-5
	mvrp linkagg .....	11-7
	mvrp transparent-switching .....	11-9
	mvrp maximum vlan .....	11-10
	mvrp registration .....	11-11
	mvrp applicant .....	11-13
	mvrp timer join .....	11-15
	mvrp timer leave .....	11-17
	mvrp timer leaveall .....	11-19
	mvrp timer periodic-timer .....	11-21
	mvrp periodic-transmission .....	11-23
	mvrp restrict-vlan-registration .....	11-24
	mvrp restrict-vlan-advertisement .....	11-26
	mvrp static-vlan-restrict .....	11-28
	show mvrp configuration .....	11-30
	show mvrp port .....	11-32
	show mvrp linkagg .....	11-35
	show mvrp timer .....	11-38
	show mvrp statistics .....	11-41
	show mvrp last-pdu-origin .....	11-44
	show vlan registration-mode .....	11-46
	show mvrp vlan-restrictions .....	11-47
	show vlan mvrp .....	11-49
	mvrp clear-statistics .....	11-51

<b>Chapter 12</b>	<b>802.1AB Commands</b> .....	12-1
	lldp destination mac-address .....	12-3
	lldp transmit fast-start-count .....	12-4
	lldp transmit interval .....	12-5
	lldp transmit hold-multiplier .....	12-6
	lldp transmit delay .....	12-7
	lldp reinit delay .....	12-8
	lldp notification interval .....	12-9
	lldp lldpdu .....	12-10
	lldp notification .....	12-12
	lldp network-policy .....	12-14
	lldp med network-policy .....	12-16

	lldp tlv management .....	12-18
	lldp tlv dot1 .....	12-20
	lldp tlv dot3 mac-phy .....	12-22
	lldp tlv med .....	12-24
	show lldp config .....	12-26
	show lldp network-policy .....	12-28
	show lldp med network-policy .....	12-30
	show lldp system-statistics .....	12-32
	show lldp statistics .....	12-34
	show lldp local-system .....	12-36
	show lldp local-port .....	12-39
	show lldp local-management-address .....	12-41
	show lldp remote-system .....	12-42
	show lldp remote-system med .....	12-44
	lldp trust-agent .....	12-47
	lldp trust-agent violation-action .....	12-49
	show lldp trusted remote-agent .....	12-51
	show lldp trust-agent .....	12-53
<b>Chapter 13</b>	<b>Interswitch Protocol Commands</b> .....	13-1
	amap .....	13-2
	amap discovery time .....	13-3
	amap common time .....	13-5
	show amap .....	13-7
<b>Chapter 14</b>	<b>IP Commands</b> .....	14-1
	ip interface .....	14-5
	ip managed-interface .....	14-8
	ip interface dhcp-client .....	14-11
	ip interface tunnel .....	14-13
	ip router primary-address .....	14-15
	ip router router-id .....	14-16
	ip static-route .....	14-17
	ip route-pref .....	14-19
	ip default-ttl .....	14-21
	ping .....	14-22
	traceroute .....	14-25
	ip directed-broadcast .....	14-27
	ip service .....	14-28
	ip redistrib .....	14-30
	ip access-list .....	14-32
	ip access-list address .....	14-33
	ip route-map action .....	14-35
	ip route-map match ip address .....	14-37
	ip route-map match ipv6 address .....	14-39
	ip route-map match ip-nexthop .....	14-41
	ip route-map match ipv6-nexthop .....	14-43
	ip route-map match tag .....	14-45
	ip route-map match ipv4-interface .....	14-47
	ip route-map match ipv6-interface .....	14-49
	ip route-map match metric .....	14-51
	ip route-map match route-type .....	14-53

---

	show ipsec sa .....	16-17
	show ipsec key .....	16-19
	show ipsec ipv6 statistics .....	16-21

<b>Chapter 17</b>	<b>RIP Commands</b> .....	17-1
	ip load rip .....	17-2
	ip rip status .....	17-3
	ip rip interface .....	17-4
	ip rip interface status .....	17-6
	ip rip interface metric .....	17-8
	ip rip interface send-version .....	17-9
	ip rip interface recv-version .....	17-11
	ip rip force-holddowntimer .....	17-13
	ip rip host-route .....	17-15
	ip rip route-tag .....	17-16
	ip rip interface auth-type .....	17-17
	ip rip interface auth-key .....	17-18
	ip rip update-interval .....	17-19
	ip rip invalid-timer .....	17-20
	ip rip garbage-timer .....	17-21
	ip rip holddown-timer .....	17-22
	show ip rip .....	17-23
	show ip rip routes .....	17-25

	show ip rip interface .....	17-28
	show ip rip peer .....	17-30
<b>Chapter 18</b>	<b>RDP Commands</b> .....	18-1
	ip router-discovery .....	18-2
	ip router-discovery interface .....	18-3
	ip router-discovery interface advertisement-address .....	18-5
	ip router-discovery interface max-advertisement-interval .....	18-7
	ip router-discovery interface min-advertisement-interval .....	18-9
	ip router-discovery interface advertisement-lifetime .....	18-11
	ip router-discovery interface preference-level .....	18-13
	show ip router-discovery .....	18-15
	show ip router-discovery interface .....	18-17
<b>Chapter 19</b>	<b>BFD Commands</b> .....	19-1
	ip bfd-std status .....	19-3
	ip bfd-std transmit .....	19-4
	ip bfd-std receive .....	19-5
	ip bfd-std mode .....	19-6
	ip bfd-std echo interval .....	19-8
	ip bfd-std l2-hold-timer .....	19-9
	ip bfd-std interface .....	19-10
	ip bfd-std interface status .....	19-11
	ip bfd-std interface transmit .....	19-12
	ip bfd-std interface receive .....	19-13
	ip bfd-std interface multiplier .....	19-14
	ip bfd-std interface echo-interval .....	19-15
	ip bfd-std interface mode .....	19-16
	ip bfd-std interface l2-hold-timer .....	19-18
	ip ospf bfd-std status .....	19-19
	ip ospf bfd-std all-interfaces .....	19-21
	ip ospf interface bfd-std .....	19-22
	ip ospf interface bfd-std drs-only .....	19-23
	ip ospf interface bfd-std all-nbrs .....	19-24
	ip bgp bfd-std status .....	19-25
	ip bgp bfd-std all-neighbors .....	19-26
	ip bgp neighbors bfd-std .....	19-27
	vrrp bfd-std .....	19-28
	vrrp track address bfd-std .....	19-29
	ip static-route all bfd-std .....	19-30

# About This Guide

This *OmniSwitch CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch 6400 Series, OmniSwitch 6850 Series, OmniSwitch 6855 Series, OmniSwitch 6850E Series, and OmniSwitch 9000E Series switches.

## Supported Platforms

This information in this guide applies to the following products:

- OmniSwitch 6850E Series (9600, 9700, and 9800 switches)
- OmniSwitch 9000E Series (9700E and 9800E switches)
- OmniSwitch 6400 Series
- OmniSwitch 6850 Series
- OmniSwitch 6855 Series

---

**Note.** This *OmniSwitch CLI Reference Guide* covers Release 6.4.4, which is supported on the OmniSwitch 6400 Series, OmniSwitch 6850 Series, OmniSwitch 6855 Series, OmniSwitch 6850E Series, and OmniSwitch 9000E Series switches.

---

## Unsupported Platforms

The information in this guide does not apply to the following products:

- OmniSwitch (original version with no numeric model name)
- OmniSwitch 6600 Family
- OmniSwitch 6800 Family
- OmniSwitch 7700/7800
- OmniSwitch 8800
- OmniSwitch 9000
- Omni Switch/Router
- OmniStack
- OmniAccess

## Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

## When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features may be found in the *OmniSwitch CLI Reference Guide*, *OmniSwitch AOS Release 6 Network Configuration Guide*, and the *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide*. Once you are familiar with the procedures and base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.

## What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

## What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

## How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.

## Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

<b>bold text</b>	Indicates basic command and keyword syntax. Example: <b>show snmp station</b>
<i>italicized text</i>	Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc. Example: <b>no snmp station</b> <i>ip_address</i>  Italicized text that is not enclosed with straight brackets ([ ]) indicates required information.
[ ] (Straight Brackets)	Indicates optional parameters for a given command. Example: <b>show aaa server</b> [ <i>server_name</i> ] Here, you can enter either of the following options: <b>show aaa server</b> <b>show aaa server</b> <i>server_name</i> (where <i>server_name</i> is the user-specified server name, e.g., <b>show aaa server myserver1</b> )  Note that this example includes <i>italicized text</i> . The optional parameter in this case is a user-specified server name.
{ } (Curly Braces)	Indicates that the user must choose between one or more parameters. Example: <b>port mirroring</b> { <b>enable</b>   <b>disable</b> } Here, you must choose one of the following: <b>port mirroring enable</b> or <b>port mirroring disable</b>

---

(Vertical Pipes)	Used to separate parameter choices within a command string. For example, the command string <b>show health threshold [rx   txrx   memory   cpu]</b> separates the choices <b>rx</b> , <b>txrx</b> , <b>memory</b> , and <b>cpu</b> . Examples: <b>show health threshold rx</b> <b>show health threshold txrx</b> <b>show health threshold memory</b> <b>show health threshold cpu</b>
“” (Quotation Marks)	Used to enclose text strings that contain spaces. The quotation marks are required input on the command line. Example: <b>vlan 2 “new test vlan”</b>

---

# Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process. The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

## Stage 1: Using the Switch for the First Time

**Pertinent Documentation:** *Getting Started Guide*  
*Release Notes*

A hard-copy *Getting Started Guide* is included with your switch; this guide provides all the information you need to get your switch up and running the first time. This guide provides information on unpacking the switch, rack mounting the switch, installing modules, unlocking access control, setting the switch's IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

## Stage 2: Gaining Familiarity with Basic Switch Functions

**Pertinent Documentation:** *Hardware Users Guide*  
*Switch Management Guide*

Once you have your switch up and running, you will want to begin investigating basic aspects of its hardware and software. Information about switch hardware is provided in the platform-specific *Hardware Users Guide*. This guide provides specifications, illustrations, and descriptions of all hardware components—chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, uplink modules, stacking modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

The *Switch Management Guide* for your switch platform is the primary user guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

## Stage 3: Integrating the Switch Into a Network

**Pertinent Documentation:** *Network Configuration Guide*  
*Advanced Routing Configuration Guide*

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. The *Network Configuration Guide* for your switch platform contains overview information, procedures and examples on how standard networking technologies are configured in the OmniSwitch.

The *Advanced Routing Configuration Guide* includes configuration information for networks using advanced routing technologies, such as OSPF and multicast routing protocols (DVMRP and PIM-SM).

**Anytime**

The *OmniSwitch CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.

## Related Documentation

The following are the titles and descriptions of all the related OmniSwitch AOS Release 6 user manuals:

- *OmniSwitch 6400 Series Getting Started Guide*

Describes the hardware and software procedures for getting an OmniSwitch 6400 Series switch up and running. Also provides information on fundamental aspects of OmniSwitch software and stacking architecture.

- *OmniSwitch 6850 Series Getting Started Guide*

Describes the hardware and software procedures for getting an OmniSwitch 6850 Series switch up and running. Also provides information on fundamental aspects of OmniSwitch software and stacking architecture.

- *OmniSwitch 6855 Series Getting Started Guide*

Describes the basic information you need to unpack and identify the components of your OmniSwitch 6855 shipment. Also provides information on the initial configuration of the switch.

- *OmniSwitch 6850E Series Getting Started Guide*

Describes the hardware and software procedures for getting an OmniSwitch 6850E Series up and running. Also provides information on fundamental aspects of OmniSwitch software architecture.

- *OmniSwitch 9000E Series Getting Started Guide*

Describes the hardware and software procedures for getting an OmniSwitch 9000E Series switch up and running. Also provides information on fundamental aspects of OmniSwitch software architecture.

- *OmniSwitch 6400 Series Hardware Users Guide*

Complete technical specifications and procedures for all OmniSwitch 6400 Series chassis, power supplies, and fans. Also includes comprehensive information on assembling and managing stacked configurations.

- *OmniSwitch 6850 Series Hardware User Guide*

Complete technical specifications and procedures for all OmniSwitch 6850 Series chassis, power supplies, and fans. Also includes comprehensive information on assembling and managing stacked configurations.

- *OmniSwitch 6855 Series Hardware User Guide*

Complete technical specifications and procedures for all OmniSwitch 6855 Series chassis, power supplies, and fans.

- *OmniSwitch 6850E Series Hardware Users Guide*

Complete technical specifications and procedures for all OmniSwitch 6850E Series chassis, power supplies, fans, and Network Interface (NI) modules.

- *OmniSwitch 9000E Series Hardware User Guide*

Complete technical specifications and procedures for all OmniSwitch 9000E Series chassis, power supplies, and fans.

- *OmniSwitch CLI Reference Guide*

Complete reference to all CLI commands supported on the OmniSwitch 6400, 6850, 6850E, 6855, and 9000E. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.

- *OmniSwitch AOS Release 6 Switch Management Guide*

Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).

- *OmniSwitch AOS Release 6 Network Configuration Guide*

Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP), security options (authenticated VLANs), Quality of Service (QoS), and link aggregation.

- *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide*

Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), and OSPF.

- *OmniSwitch Transceivers Guide*

Includes information on Small Form Factor Pluggable (SFPs) and 10 Gbps Small Form Factor Pluggables (XFPs) transceivers.

- Technical Tips, Field Notices

Includes information published by Alcatel-Lucent's Customer Support group.

- *Release Notes*

Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.

## User Manual CD

Some products are shipped with documentation included on a User Manual CD that accompanies the switch. This CD also includes documentation for other Alcatel-Lucent data enterprise products.

All products are shipped with a Product Documentation Card that provides details for downloading documentation for all OmniSwitch and other Alcatel-Lucent data enterprise products.

All documentation is in PDF format and requires the Adobe Acrobat Reader program for viewing. Acrobat Reader freeware is available at [www.adobe.com](http://www.adobe.com).

---

**Note.** In order to take advantage of the documentation CD's global search feature, it is recommended that you select the option for *searching PDF files* before downloading Acrobat Reader freeware.

---

To verify that you are using Acrobat Reader with the global search option, look for the following button in the toolbar:

---

**Note.** When printing pages from the documentation PDFs, de-select Fit to Page if it is selected in your print dialog. Otherwise pages may print with slightly smaller margins.

---

## Technical Support

An Alcatel-Lucent service agreement brings your company the assurance of 7x24 no-excuses technical support. You'll also receive regular software updates to maintain and maximize your Alcatel-Lucent product's features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners. Additionally, with 24-hour-a-day access to Alcatel-Lucent's Service and Support web page, you'll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent's technical support, open a new case or access helpful release notes, technical bulletins, and manuals. For more information on Alcatel-Lucent's Service Programs, see our web page at [service.esd.alcatel-lucent.com](http://service.esd.alcatel-lucent.com), call us at 1-800-995-2696, or email us at [esd.support@alcatel-lucent.com](mailto:esd.support@alcatel-lucent.com).

# 1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports (10 Mbps, 100 Mbps, 1 Gbps, and 10 Gbps). This includes:

- Performing hardware diagnostics, loading software, and initializing hardware.
- Notifying other software modules in the system when Ethernet links become active or inactive.
- Configuring basic line parameters for Ethernet ports.
- Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

*Filename:* AlcatelIND1Port.mib  
*Module:* alcatelIND1PortMIB

*Filename:* IETF\_ETHERLIKE.mib  
*Module:* EtherLike-MIB

A summary of the available commands is listed here.

Trap port commands	trap port link
<b>Interfaces commands</b>	<b>interfaces speed</b> <b>interfaces mode</b> <b>interfaces autoneg</b> <b>interfaces crossover</b> <b>interfaces pause</b> <b>interfaces e2e-flow-vlan</b> <b>interfaces duplex</b> <b>interfaces admin</b> <b>interfaces cli-prompt</b> <b>interfaces alias</b> <b>interfaces ifg</b> <b>interfaces no I2 statistics</b> <b>interfaces max frame</b> <b>interfaces flood</b> <b>interfaces flood rate</b> <b>interfaces wait-to-restore</b> <b>interfaces transceiver ddm</b> <b>show interfaces</b> <b>show interfaces capability</b> <b>show interfaces flow control</b> <b>show interfaces pause</b> <b>show interfaces e2e-flow-vlan</b> <b>show interfaces accounting</b> <b>show interfaces counters</b> <b>show interfaces counters errors</b> <b>show interfaces collisions</b> <b>show interfaces status</b> <b>show interfaces port</b> <b>show interfaces ifg</b> <b>show interfaces flood rate</b> <b>show interfaces traffic</b> <b>show interfaces transceiver</b>

---

## trap port link

Enables trap link messages. If enabled, a message is displayed on the Network Management Station (NMS) whenever the specified port changes state.

**trap** {*slot* | *slot/port[-port2]*} **port link** {**enable** | **disable** | **on** | **off**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>enable</b>	Port link up/down traps are displayed on the NMS.
<b>disable</b>	Port link up/down traps are not displayed on the NMS.
<b>on</b>	Same as <b>enable</b> .
<b>off</b>	Same as <b>disable</b> .

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>   <b>on</b>   <b>off</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to enable or disable trap link messages for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to enable or disable trap link messages on a specific interface or range of interfaces.

### Examples

```
-> trap 3/1 port link enable
-> trap 3 port link enable
-> trap 3/1-6 port link enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show interfaces status](#)

Displays interface line settings.

## MIB Objects

```
esmConfigTable  
  esmPortSlot  
  esmPortIF
```

---

## interfaces speed

Configures interface line speed.

```
interfaces {slot | slot/port[-port2]} speed {auto | 10 | 100 | 1000 | 10000 | max {100 | 1000}}
```

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>auto</b>	The switch automatically sets the line speed to match the attached device (auto-sensing).
<b>10</b>	Sets the interface to 10 Mbps.
<b>100</b>	Sets the interface to 100 Mbps.
<b>1000</b>	Sets the interface to 1 Gigabit.
<b>10000</b>	Sets the interface to 10 Gigabit.
<b>max 100</b>	Sets the maximum speed to 100 megabits.
<b>max 1000</b>	Sets the maximum speed to 1000 megabits (1 Gigabit).

### Defaults

parameter	default
<b>auto   10   100   1000   10000   max 100   max 1000</b>	Auto

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **auto** option sets the speed to auto-sensing.
- The 10 Gigabit fiber ports only support 10000 Mbps.
- Enter a slot number to configure the interface speed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the interface speed for a specific interface or range of interfaces.

## Examples

```
-> interfaces 3/1 speed auto
-> interfaces 3 speed 100
-> interfaces 3/1-8 speed auto
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">interfaces duplex</a>	Configures duplex mode.
<a href="#">interfaces autoneg</a>	Enables and disables auto negotiation.
<a href="#">show interfaces status</a>	Displays interface line settings.

## MIB Objects

```
esmConfTable
    esmPortCfgSpeed
```

---

## interfaces mode

Configures the mode of the ports to allow the switch to act in standalone or stacking mode.

**interfaces** {*slot* | *slot/port*} **mode** {**uplink** | **stacking**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i>	The slot and port number (3/1).
<b>uplink</b>	Configures the ports as uplinks allowing the switch to act in standalone mode for network connectivity.
<b>stacking</b>	Configures the ports as stacking to allow the switch to be stacked in a virtual chassis.

### Defaults

parameter	default
<b>mode</b>	uplink

### Platforms Supported

OmniSwitch 6850E, 6855-U24X

### Usage Guidelines

- Mode change does not take affect until the switch is rebooted.
- Only supported on the 10-Gigabit SFP+ ports
- Changing the mode of one port automatically changes the other port to the same mode. Mixing port modes is not supported.
- After changing the mode a message will display in approximately 5 seconds indicating success or failure. Re-enter the command if the change is not successful.
- Enter a slot number to configure the mode for all interfaces on a specific slot.
- Enter a slot and port number to configure the mode for a specific interface.

### Examples

```
-> interfaces 4/25 mode stacking
WED JUL 01 18:08:29 : HSM-CHASSIS (101) info message:
+++ Ni 4 Port 25,26 are set to stackable for next boot:OK

-> interfaces 4 mode uplink
WED JUL 01 18:08:29 : HSM-CHASSIS (101) info message:
+++ Ni 4 Port 25,26 are set to uplink for next boot:OK
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

### [show stack topology](#)

Displays the current operating topology of switches in a stacked configuration.

### [show stack status](#)

Displays the current redundant stacking status for a stacked configuration.

### [show ni](#)

Displays the current status for a switch in standalone mode.

## MIB Objects

esmPortModeTable

esmPortModeIndex

esmPortSavedMode

---

## interfaces autoneg

Enables or disables auto negotiation on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {*slot* | *slot/port[-port2]*} **autoneg** {**enable** | **disable** | **on** | **off**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>enable</b>	Enables auto negotiation.
<b>disable</b>	Disables auto negotiation.
<b>on</b>	Same as enable.
<b>off</b>	Same as disable.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>   <b>on</b>   <b>off</b>	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If auto negotiation is disabled, auto MDIX, auto speed, and auto duplex are not accepted. See the [interfaces crossover](#) command on [page 1-12](#) for more information.
- Copper Gigabit ports do not support disabling of auto negotiation.
- Enter a slot number to configure auto-negotiation for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure auto-negotiation for a specific interface or range of interfaces.

### Examples

```
-> interfaces 3 autoneg disable
-> interfaces 3/1 autoneg disable
-> interfaces 3/1-4 autoneg disable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">interfaces speed</a>	Configures interface speed.
<a href="#">interfaces crossover</a>	Configures crossover port settings.
<a href="#">show interfaces status</a>	Displays interface line settings.
<a href="#">show interfaces capability</a>	Displays auto negotiation, speed, duplex, and crossover settings.

## MIB Objects

esmConfTable  
esmPortCfgAutoNegotiation

---

## interfaces crossover

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {*slot* | *slot/port[-port2]*} **crossover** {**auto** | **mdix** | **mdi**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>auto</b>	The interface will automatically detect crossover settings.
<b>mdix</b>	Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
<b>mdi</b>	Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

### Defaults

parameter	default
<b>auto</b>   <b>mdix</b>   <b>mdi</b> (all copper ports)	auto

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If auto negotiation is disabled, then automatic crossover will also be disabled. See the [interfaces autoneg](#) command on [page 1-10](#) for more information.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.
- Enter a slot number to configure crossover settings for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure crossover settings for a specific interface or range of interfaces.

### Examples

```
-> interfaces 3 crossover mdi
-> interfaces 3/1 crossover mdix
-> interfaces 3/1-4 crossover auto
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">interfaces speed</a>	Configures interface speed.
<a href="#">interfaces autoneg</a>	Enables and disables auto negotiation.
<a href="#">show interfaces status</a>	Displays interface line settings.
<a href="#">show interfaces capability</a>	Displays auto negotiation, speed, duplex, and crossover settings.

## MIB Objects

esmConfTable  
esmPortCfgCrossover

---

## interfaces pause

Configures whether or not the switch will transmit, honor, or transmit and honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

**interfaces** {*slot* | *slot/port[-port2]*} **pause** {**tx** | **rx** | **tx-and-rx** | **disable**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>tx</b>	Transmits PAUSE frames to peer switches when traffic congestion occurs on the local interface. Does not honor PAUSE frames from peer switches.
<b>rx</b>	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer. Does not transmit PAUSE frames to peer switches.
<b>tx-and-rx</b>	Transmits and honors PAUSE frames when traffic congestion occurs between peer switches.
<b>disable</b>	Disables flow control on the interface.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Defaults

By default, flow control is disabled on all switch interfaces.

### Usage Guidelines

- Note that if the standalone switch is a 24-port unit, then only the **interfaces pause** command is required to enable end-to-end (E2E) flow control. However, if the switch is a 48-port unit, then a flow control VLAN, which is configured using the **interfaces e2e-flow-vlan** command, is required in addition to enabling RX/TX pause flow control.
- A stack of switches or a chassis-based switch will honor receive pause frames.
- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported.
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings, as shown in the following table, override the configured settings as long as autonegotiation and flow control are both enabled for the interface:

Configured Local Tx	Configured Local Rx	Configured Remote Tx	Configured Remote Rx	Operational Local Tx	Operational Local Rx
No	No	No	No	No	No
Yes	Yes	Yes	Yes	Yes	Yes
Yes	No	Yes	No	No	No
No	Yes	No	Yes	Yes	Yes
No	No	No	Yes	No	No
Yes	Yes	No	No	No	No
Yes	No	Yes	Yes	No	No
No	Yes	Yes	No	No	Yes
No	No	Yes	No	No	No
Yes	Yes	No	Yes	Yes	Yes
Yes	No	No	No	No	No
No	Yes	Yes	Yes	Yes	Yes
No	No	Yes	Yes	No	No
Yes	Yes	Yes	No	No	No
Yes	No	No	Yes	Yes	No
No	Yes	No	No	No	No

- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.
- Enter a slot number to configure how flow control PAUSE frames are processed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure how flow control PAUSE frames are processed on a specific interface or range of interfaces.

## Examples

```
-> interfaces 3/1 pause tx
-> interfaces 4/2 pause rx
-> interfaces 1 tx-and-rx
-> interfaces 3/1-6 pause tx
-> interfaces 3/1-6 disable
```

## Release History

Release 6.3.2; command was introduced.

## Related Commands

[interfaces hybrid pause](#)

Configures flow control settings for combo ports.

[interfaces e2e-flow-vlan](#)

Configures a dedicated VLAN for carrying end-to-end (E2E) flow control messages to remote systems.

[show interfaces pause](#)

Displays interface flow control settings.

## MIB Objects

esmConfigTable

    esmPortCfgFlow

dot3PauseTable

    dot3PauseAdminMode

---

## Related Commands

- show interfaces e2e-flow-vlan** Displays the E2E flow control VLAN configuration.
- interfaces pause** Configures whether or not the switch will transmit, honor, or transmit and honor flow control PAUSE frames.
- show interfaces pause** Displays interface flow control settings.

## MIB Objects

esmE2EFlowVlan

---

## interfaces duplex

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

**interfaces** {*slot* | *slot/port[-port2]*} **duplex** {**full** | **half** | **auto**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>full</b>	Sets interface to full duplex mode.
<b>half</b>	Sets interface to half duplex mode.
<b>auto</b>	Switch will automatically set both the duplex mode settings to auto-negotiation.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>full   half   auto</b>	<b>full</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- OS9-GNI-C24 modules can be configured for full and half duplex. All other Gigabit Ethernet modules on the OmniSwitch 9000 only support full duplex mode.
- On OS9-GNI-C24 modules, if a link is down and auto negotiation is enabled, then half duplex is not accepted since these modules are Gigabit modules by default.
- Gigabit and 10 Gigabit fiber ports only support full duplex.
- Enter a slot number to configure the duplex mode for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the duplex mode for a specific interface or range of interfaces.

## Examples

```
-> interfaces 3/1 duplex auto
-> interfaces 3 duplex half
-> interfaces 3/1-4 auto
```

## Release History

Release 6.1; command was introduced.

## Related Commands

### [interfaces speed](#)

Configures interface line speed. Set to **auto** to set speed and duplex mode to auto-sensing.

### [show interfaces status](#)

Displays interface line settings (for example, speed, and mode).

## MIB Objects

esmConfTable

    esmPortAutoDuplexMode

---

## interfaces admin

Administratively enables or disables interfaces.

```
interfaces {slot | slot/port[-port2]} admin {up | down}
```

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>up</b>	Enables the interface.
<b>down</b>	Disables the interface.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>up   down</b>	up

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to administratively enable or disable all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to administratively enable or disable a specific interface or range of interfaces.

### Examples

```
-> interfaces 3/1 admin up
-> interfaces 3 admin down
-> interfaces 3/1-4 admin up
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### [show interfaces](#)

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

### [show interfaces port](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

## MIB Objects

ifTable

ifAdminStatus

---

## interfaces cli-prompt

Enables or disables the display of a confirmation prompt when an interface is administratively disabled using the **interfaces admin {up | down}** command.

**interfaces cli-prompt {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the display of a confirmation prompt when an interface is administratively disabled.
<b>disable</b>	Disables the display of a confirmation prompt when an interface is administratively disabled.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is used in conjunction with the **interfaces admin** command to enable or disable the confirmation prompt.
- By default, the warning prompt will not be displayed.
- If the interface is already operationally down, the warning prompt will not be displayed.
- If a range of interfaces or slots is provided in the **interfaces admin down** command and the display of confirmation prompt is enabled, then the prompt will be displayed irrespective of the operational status of the interface.
- The configuration of this command can be captured in the snapshot when the display of the warning prompt is enabled.
- The configuration of this command cannot be captured in any interface show commands.

### Examples

```
-> interfaces cli-prompt enable
-> interfaces 1/1 admin down
-> Confirm Command (Y/N) :

-> interfaces cli-prompt disable
-> interfaces 1/1 admin down
```

## Release History

Release 6.3.4; the command was introduced.

## Related Commands

[interfaces admin](#)

Administratively enables or disables interfaces.

## MIB Objects

N/A

---

## interfaces alias

Configures a description (alias) for a single port.

**interfaces** *slot/port* **alias** *description*

---

### Syntax Definitions

*slot/port*

The slot and port number (3/1).

*description*

A description for the port, which can be up to 40 characters long. Spaces must be contained within quotes (for example, "IP Phone").

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To remove an alias use a description consisting of two quotes without any spaces (for example, "").
- On combo ports the configuration changes made with the **interfaces alias** command apply to both the fiber and to the copper port. You cannot configure separate aliases.

### Examples

```
-> interfaces 3/1 alias switch_port
-> interfaces 2/2 alias "IP Phone"
-> interfaces 3/1 alias ""
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show interfaces](#)

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

[show interfaces port](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

### MIB Objects

```
ifXTable
  ifAlias
```

---

## interfaces ifg

Configures the inter-frame gap on Gigabit Ethernet interfaces.

**interfaces** {*slot* | *slot/port[-port2]*} **ifg** *bytes*

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>bytes</i>	Inter-frame gap value, in bytes. Valid range is 9–12.

### Defaults

parameter	default
<i>bytes</i>	12

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to configure the inter-frame gap value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the inter-frame gap value for a specific interface or range of interfaces.

### Examples

```
-> interfaces 3/1 ifg 10
-> interfaces 3 ifg 10
-> interfaces 3/1-4 ifg 10
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show interfaces ifg](#) Displays the inter-frame gap value for one or more ports.

### MIB Objects

esmConfTable  
esmPortCfgIfg

---

## interfaces no l2 statistics

Resets all statistics counters.

**interfaces** {*slot* | *slot/port[-port2]*} **no l2 statistics** [**cli**]

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>cli</b>	Clears the counters from the CLI only; SNMP statistics continue to maintain cumulative totals.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command requires an upper or lower case “L” character in front of the “2” character. Entering the digit “1” (one) will result in an error message.
- When the **cli** parameter is not specified, both CLI and SNMP statistics are cleared.
- Enter a slot number to reset the statistics counters for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to reset the statistics counters for a specific interface or range of interfaces.

### Examples

```
-> interfaces 3/1 no l2 statistics
-> interfaces 3 no l2 statistics
-> interfaces 3/1-6 no l2 statistics
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1.R02; **cli** parameter was added.

## Related Commands

<b>show interfaces</b>	Displays general interface information, including when statistics were last cleared.
<b>show interfaces accounting</b>	Displays interface accounting information (for example, packets received/transmitted and deferred frames received).
<b>show interfaces counters</b>	Displays interface counters information (for example, unicast, broadcast, and multi-cast packets received/transmitted).
<b>show interfaces counters errors</b>	Displays interface error frame information (for example, CRC errors, transit errors, and receive errors).
<b>show interfaces collisions</b>	Displays interface collision information (for example, number of collisions and number of retries).

alCetherClearStats

---

## interfaces max frame

Configures the maximum frame size for Gigabit Ethernet interfaces.

**interfaces** {*slot* | *slot/port[-port2]*} **max frame** *bytes*

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>bytes</i>	Maximum frame size, in bytes. Valid range is 1518–9216.

### Defaults

---

parameter	default
<i>bytes</i> (Gigabit Ethernet Packets)	9216
<i>bytes</i> (Ethernet Packets)	1553

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to configure the maximum frame size for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the maximum frame size on a specific interface or range of interfaces.

### Examples

```
-> interfaces 3/1 max frame 1518
-> interfaces 3 max frame 1518
-> interfaces 3/1-3 max frame 1518
```

### Release History

Release 6.1; command was introduced.

**Related Commands****show interfaces**

---

## interfaces flood multicast

Enables flood rate limiting for multicast traffic on the specified interface.

**interfaces** *slot*[/*port*[-*port2*]] **flood multicast** {**enable** | **disable**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>enable</b>	Enables multicast rate limiting.
<b>disable</b>	Disables multicast rate limiting.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When the **interfaces flood multicast** command is used to enable rate limiting, the peak flood rate value configured for an interface is also applied to multicast traffic.
- Applying the peak flood rate value to multicast traffic also limits IP Multicast Switching (IPMS) and non-IPMS multicast traffic.
- When multicast rate limiting is disabled, the peak flood rate value for the interface is no longer applied to multicast traffic. This does not prevent the normal flow of multicast traffic on the specified interface.
- Enter a slot number to enable or disable multicast flood rate limiting for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to enable or disable multicast flood rate limiting on a specific interface or range of interfaces.

### Examples

```
-> interfaces 3 flood multicast
-> interfaces 1/47 flood multicast
-> interfaces 1/45-48 flood multicast
```

### Release History

Release 6.1; command was introduced.

Release 6.4.3; command was deprecated.

## interfaces flood

Enables broadcast, multicast or unknown unicast traffic storm control on the specified interface.

**interfaces** {*slot* | *slot/port[-port2]*} **flood** [**broadcast** | **multicast** | **unknown-unicast** | **all**] [**enable** | **disable**]

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>broadcast</b>	Packets with a destination MAC address of FF:FF:FF:FF:FF:FF.
<b>multicast</b>	Packets with a multicast MAC address.
<b>unknown-unicast</b>	Unicast packets with an unknown destination MAC address.
<b>all</b>	Applies to broadcast, multicast, and unknown unicast packets.
<b>enable</b>	Enables broadcast, multicast, or unknown unicast rate limiting.
<b>disable</b>	Disables broadcast, multicast, or unknown unicast rate limiting.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to enable or disable traffic storm control for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to enable or disable traffic storm control on a specific interface or range of interfaces.
- The keyword **all** applies to all traffic types; broadcast, multicast and unknown-unicast.

### Examples

```
-> interfaces 3 flood broadcast enable
-> interfaces 1/47 flood broadcast enable
-> interfaces 3 flood multicast enable
-> interfaces 1/45-48 flood multicast enable
-> interfaces 3 flood unknown-unicast enable
-> interfaces 1/47 flood unknown-unicast enable
```

```
-> interfaces 3 flood all enable  
-> interfaces 1/47 flood all enable  
-> interfaces 1/45-48 flood all enable
```

## Release History

Release 6.4.3; command was introduced.

---

## interfaces flood rate

Configures flood rate limiting for broadcast, multicast, or unknown unicast traffic on the specified interface.

**interfaces** {*slot* | *slot/port[-port2]*} **flood** [**broadcast** | **multicast** | **unknown-unicast** | **all**] **rate** [**mbps** | **pps** | **percentage** *percent*]

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>mbps</i>	The number of megabits per second.
<i>pps</i>	The number of packets per second.
<i>percent</i>	The percentage of the port speed.

### Defaults

The default flood limit settings:

port speed	flood limit
10 mbps	4 mbps
100 mbps	49 mbps
1 Gig	496 mbps
10 Gig	997 mbps

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- By default, unknown unicast and multicast traffic is flooded to all Layer 2 ports in a VLAN.
- Enter a slot number to configure flood rate limiting for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure flood rate limiting on a specific interface or range of interfaces.
- The keyword **all** applies to all traffic types, broadcast, multicast and unknown-unicast.
- The CLI command, '**interfaces** *slot[/port[-port2]]* **flood rate** *num*', is supported only during boot up process for backward compatibility.

## Examples

```
-> interfaces 1/1-5 flood all rate mbps 10
-> interfaces 1/1 flood broadcast rate pps 500
-> interfaces 1/2 flood multicast rate percentage 35
-> interfaces 1/3 flood unknown-unicast rate mbps 5
```

## Release History

Release 6.1; command was introduced.

Release 6.4.3; **broadcast**, **multicast**, **unknown-unicast**, and **all** parameters were added.

```

---

## interfaces violation-recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

**interfaces** [*slot* | *slot/port[-port2]*] **violation-recovery-time** {*seconds* | **default**}

**interfaces** {*slot* | *slot/port[-port2]*} **violation-recovery-time default**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>seconds</i>	The number of seconds after which a port is reactivated. The valid range is 30-600 seconds or specify 0 to disable the recovery timer.
<b>default</b>	Sets the recovery time to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

### Defaults

- By default, this command configures the global recovery time. The global value applies to all ports on all modules in the switch.
- By default, the violation recovery time is set to 300 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When the recovery timer expires, the interface is operationally re-enabled and the violation on the interface is cleared.
- The violation recovery time value does not apply to interfaces that are in a permanent shutdown state. A port in this state is only recoverable using the **interfaces clear-violation-all** command.
- The interface violation recovery mechanism is not supported on link aggregates, but is supported on the link aggregate member ports.
- Set the recovery time to 0 to disable this violation recovery mechanism.
- Enter a slot number to configure the recovery time for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the recovery time for a specific interface or a range of interfaces.
- When this command is used to configure the recovery time for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum recovery time configured for the switch.

- When configuring the time for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.

## Examples

```
-> interfaces violation-recovery-time 600
-> interfaces 2 violation-recovery-time 100
-> interfaces 2/3 violation-recovery-time 200
-> interfaces 2/4-9 violation-recovery-time 500
-> interfaces 2/4-9 violation-recovery-maximum default
-> interfaces 2/3 violation-recovery-time 0
-> interfaces violation-recovery-time 0
```

## Release History

Release 6.4.4; command introduced.

## Related Commands

[interfaces violation-recovery-maximum](#)

Configures the maximum number of recovery attempts before a port is permanently shut down.

[show interfaces port](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

[show interfaces violation-recovery](#)

Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

## MIB Objects

```
alaPortViolationRecoveryTable
  alaPortViolationRecoveryTime
```

---

## interfaces violation-recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

**interfaces** [*slot* | *slot/port[-port2]*] **violation-recovery-maximum** *max\_attempts*

**interfaces** {*slot* | *slot/port[-port2]*} **violation-recovery-maximum default**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>max_attempts</i>	The maximum number of recovery attempts. Valid range is 0-50.
<b>default</b>	Sets the number of recovery attempts to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

### Defaults

By default, this command configures the global maximum number of recovery attempts. The global value applies to all ports on all modules in the switch.

---

<b>parameter</b>	<b>default</b>
<i>max_attempts</i>	10

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Set the maximum number of recovery attempts value to 0 to disable this recovery mechanism.
- Enter a slot number to configure the number of recovery attempts for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the number of recovery attempts for a specific interface or a range of interfaces.
- When this command is used to configure the number of recovery attempts for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum number of attempts configured for the switch.
- When configuring the number of recovery attempts for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.
- The number of recovery attempts increments whenever a port recovers using automatic recovery timer mechanism. When the number of recovery attempts exceeds the configured threshold, the port is permanently shut down.

- Once an interface is permanently shut down, only the **interface clear-violations-all** command can be used to recover the interface.
- The recovery mechanism tracks the number of recoveries within a fixed time window (FTW). The  $FTW = 2 * \text{maximum recovery number} * \text{recovery timer}$ . For example, if the maximum number of recovery attempts is set to 4 and the recovery timer is set to 5, the FTW is 40 seconds ( $2 * 4 * 5=40$ ).

## Examples

```
-> interfaces violation-recovery-maximum 25
-> interfaces 2 violation-recovery-maximum 10
-> interfaces 2/3 violation-recovery-maximum 20
-> interfaces 2/4-9 violation-recovery-maximum 50
-> interfaces 2/4-9 violation-recovery-maximum default
-> interfaces 2/3 violation-recovery-maximum 0
-> interfaces violation-recovery-maximum 0
```

## Release History

Release 6.4.4; command was introduced.

## Related Commands

## interfaces violation-recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

**interface violation-recovery-trap {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the ports to send violation recovery traps.
<b>disable</b>	Disables the ports from sending violation recovery traps.

### Defaults

By default, the sending of a violation recovery trap is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This is a global command that is applied to all ports on all modules.

### Examples

```
-> interfaces violation-recovery-trap enable
-> interfaces violation-recovery-trap disable
```

### Release History

Release 6.4.3; command was introduced.

---

## interfaces clear-violation-all

Clears all port violations set by various applications on the switch for the given port.

**interfaces** {*slot* | *slot/port[-port2]*} **clear-violation-all**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

All application violations associated with a specific port are cleared when this command is used.

### Examples

```
-> interfaces 1/3 clear-violation-all
-> interfaces 1 clear-violation-all
-> interfaces 1/3-7 clear-violation-all
```

### Release History

Release 6.3.1; command was introduced.

---

## interfaces wait-to-restore

Configures the wait to restore timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link up event is detected. Other applications are notified of the link up event only after the wait to restore timer has elapsed.

**interfaces** {*slot* | *slot/port*[-*port2*]} **wait-to-restore** *seconds*

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>seconds</i>	The number of seconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 5.

### Defaults

By default, the timer is set to zero (disabled).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Set the wait-to-restore timer to zero to disable the timer.
- Enter a slot number to configure the timer value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.

### Example

```
-> interfaces 1 wait-to-restore 30
-> interfaces 1/1 wait-to-restore 10
-> interfaces 1/1-7 wait-to-restore 250
```

### Release History

Release 6.4.4; command introduced.

## Related Commands

### [show interfaces port](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

## MIB Objects

esmConfTable  
esmPortWaitToRestoreTimer

---

## interfaces transceiver ddm

Configures the DDM administrative status or trap capability.

**interfaces transceiver ddm [trap] {enable | disable}**

---

### Syntax Definitions

<b>trap</b>	Indicates the enable / disable parameter applies to the traps functionality.
<b>enable</b>	Enables DDM functionality or traps warning/alarm threshold violations.
<b>disable</b>	Disables DDM functionality or traps warning/alarm threshold violations.

### Defaults

---

parameter	default
<b>ddm</b>	<b>disable</b>
<b>trap</b>	<b>disable</b>

---

By default, the polling period is set to 60 seconds for the OS6850 and 1 second for the OS6400/6855.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.
- Information will be read sequentially from a different SFP at the predefined Polling intervals listed in the defaults table above. The number of SFPs in the switch will determine how often each SFP is polled.

### Examples

```
-> interfaces transceiver ddm enable
-> interfaces transceiver ddm trap enable
-> interfaces transceiver ddm trap disable
-> interfaces transceiver ddm disable
```

### Release History

Release 6.4.2; command was introduced.

```

---

## interfaces link-monitoring admin-status

Enables or disables link monitoring on a specific slot, port, or a range of specified ports.

**interfaces** {*slot* | *slot/port[-port2]*} **link-monitoring admin-status** {**enable** | **disable**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>enable</b>	Enables link monitoring for the specified port.
<b>disable</b>	Disables link monitoring for the specified port.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Configuring link monitoring parameters are allowed even if the link monitoring status is disabled for the specified ports.
- The Automatic Recovery Timer and link monitoring must not be enabled on Remote Fault Propagation (RFP) enabled ports.
- Enter a slot number to configure link monitoring for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure link monitoring for a specific interface or range of interfaces.

### Example

```
-> interfaces 1 link-monitoring admin-status enable
-> interfaces 1/1 link-monitoring admin-status enable
-> interfaces 1/1-7 link-monitoring admin-status enable
-> interfaces 2/5 link-monitoring admin-status disable
-> interfaces 2/5-20 link-monitoring admin-status disable
```

### Release History

Release 6.4.4; command introduced.

## Related Commands

---

## interfaces link-monitoring time-window

Configures the monitoring time window on a specific slot, port, or a range of specified ports. This is the length of time during which the link is monitored.

**interfaces** {*slot* | *slot/port[-port2]*} **link-monitoring time-window** *seconds*

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>seconds</i>	The length of time during which the link is monitored. The valid range is 0–3600 seconds.

### Defaults

By default, the time window value is set to 300 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to configure the monitoring time window for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the monitoring time window for a specific interface or a range of interfaces.

### Example

```
-> interfaces 1 link-monitoring time-window 20
-> interfaces 1/1 link-monitoring time-window 40
-> interfaces 1/1-7 link-monitoring time-window 2500
```

### Release History

Release 6.4.4; command introduced.

## interfaces link-monitoring link-flap-threshold

Configures the number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown.

**interfaces** {*slot* | *slot/port[-port2]*} **link-monitoring link-flap-threshold** *link\_flaps*

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>link_flaps</i>	The number of link flaps. The valid range is 2-10.

### Defaults

By default, the number of link flaps allowed is set to 5.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to configure the number of link flaps allowed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of link flaps allowed for a specific interface or a range of interfaces.

### Example

```
-> interfaces 1 link-monitoring link-flap-threshold 6
-> interfaces 1/1 link-monitoring link-flap-threshold 3
-> interfaces 1/1-7 link-monitoring link-flap-threshold 10
```

### Release History

Release 6.4.4; command introduced.

- show interfaces link-monitoring statistics** Displays the link monitoring statistics for the specified ports.

## MIB Objects

alaLinkMonConfigTable  
alaLinkMonLinkFlapThreshold

---

## interfaces link-monitoring link-error-threshold

Configures the number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown. MAC errors refer to lost frames, error frames, alignment frames and cyclic redundancy check (CRC).

**interfaces** {*slot* | *slot/port[-port2]*} **link-monitoring link-error-threshold** *mac\_errors*

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<i>mac_errors</i>	The number of MAC errors. The valid range is 1-100.

### Defaults

By default, the number of MAC errors allowed is set to 5.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to configure the number of MAC errors allowed on all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of MAC errors allowed on a specific interface or on a range of interfaces.

### Example

```
-> interfaces 1 link-monitoring link-error-threshold 30
-> interfaces 1/1 link-monitoring link-error-threshold 10
-> interfaces 1/1-7 link-monitoring link-error-threshold 35
```

### Release History

Release 6.4.4; command introduced.

## Related Commands

- show interfaces port** Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
- show interfaces link-monitoring config** Displays the link monitoring configuration for the specified ports.
- show interfaces link-monitoring statistics** Displays the link monitoring statistics for the specified ports.

## MIB Objects

alaLinkMonConfigTable  
alaLinkMonLinkErrorThreshold

---

## interfaces clear-link-monitoring-stats

Clears the link monitoring statistics on a specific slot, port, or a range of specified ports.

**interfaces** {*slot* | *slot/port[-port2]*} **clear-link-monitoring-stats**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to clear monitoring statistics for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to clear monitoring statistics for a specific interface or a range of interfaces.

### Example

```
-> interfaces 1 clear-link-monitoring-stats
-> interfaces 1/1 clear-link-monitoring-stats
-> interfaces 1/1-7 clear-link-monitoring-stats
```

### Release History

Release 6.4.4; command introduced.

### Related Commands

**show interfaces port** Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

**show interfaces link-monitoring config** Displays the link monitoring configuration for the specified ports.

**show interfaces link-monitoring statistics** Displays the link monitoring statistics for the specified ports.

### MIB Objects

```
alaLinkMonStatsTable
  alaLinkMonStatsClearStats
```

---

## interfaces hybrid preferred-fiber

Configures one or more combo ports to use the fiber SFP port(s) instead of the equivalent copper 10/100/1000 RJ-45 port(s), when both ports are enabled and have a valid link. In addition, this mode configures automatic failover to copper if a valid copper link is present on RJ-45 side and fiber link fails to come up.

**interfaces** {*slot* | *slot/port[-port2]*} **hybrid preferred-fiber**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

All combo ports are set to preferred fiber by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

This command is no longer required, preferred-fiber is the only mode supported.

### Examples

```
-> interfaces 1/47 hybrid preferred-fiber
-> interfaces 1/47-48 hybrid preferred-fiber
-> interfaces 1 hybrid preferred-fiber
```

### Release History

Release 6.1; command was introduced.

Release 6.4.4; preferred-fiber is the default setting and cannot be changed.

### Related Commands

**show interfaces hybrid status** Displays interface line settings (for example, speed, mode) for combo ports only.

### MIB Objects

```
esmHybridConfTable
  esmPortCfgHybridMode
  esmPortCfgHybridType
```

---

## interfaces hybrid autoneg

Enables or disables auto-negotiation on a single combo port, a range of combo ports, or all combo ports on a switch.

**interfaces** {*slot* | *slot/port[-port2]*} **hybrid** {**fiber** | **copper**} **autoneg** {**enable** | **disable** | **on** | **off**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that configuration changes will be made to the SFP port(s).
<b>copper</b>	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
<b>enable</b>	Enables auto negotiation.
<b>disable</b>	Disables auto negotiation.
<b>on</b>	Same as enable.
<b>off</b>	Same as disable.

### Defaults

By default, auto-negotiation is enabled for the interface.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the [interfaces autoneg](#) section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure auto-negotiation for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure auto-negotiation for a specific interface on a specific slot.

### Examples

```
-> interfaces 1/47 hybrid copper autoneg disable
-> interfaces 1/47-48 hybrid copper autoneg disable
-> interfaces 1 hybrid copper autoneg disable
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">interfaces hybrid speed</a>	Configures interface speed for combo ports.
<a href="#">interfaces hybrid crossover</a>	Configures crossover port settings for combo ports.
<a href="#">interfaces hybrid speed</a>	Enables or disables flow (pause).
<a href="#">show interfaces hybrid status</a>	Displays interface line settings for combo ports.
<a href="#">show interfaces hybrid capability</a>	Displays auto negotiation, speed, duplex, and crossover settings for combo ports.

## MIB Objects

esmHybridConfTable  
esmHybridPortCfgAutoNegotiation

---

## interfaces hybrid crossover

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {*slot* | *slot/port*[-*port2*]} **hybrid copper crossover** {**auto** | **mdix** | **mdi**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>copper</b>	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
<b>auto</b>	The interface will automatically detect crossover settings.
<b>mdix</b>	Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
<b>mdi</b>	Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

### Defaults

By default, the interface is configured to automatically detect crossover settings.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the [interfaces crossover](#) section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure the crossover settings for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the crossover settings for a specific interface or a range of interfaces.

### Examples

```
-> interfaces 1/47 hybrid copper crossover disable
-> interfaces 1/47-48 hybrid copper crossover mdix
-> interfaces hybrid copper crossover auto
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">interfaces hybrid speed</a>	Configures interface speed for combo ports.
<a href="#">interfaces hybrid autoneg</a>	Enables and disables auto negotiation for combo ports.
<a href="#">interfaces hybrid speed</a>	Enables or disables flow (pause) for combo ports.
<a href="#">show interfaces hybrid status</a>	Displays interface line settings for combo ports.
<a href="#">show interfaces hybrid capability</a>	Displays auto negotiation, speed, duplex, and crossover settings for combo ports.

## MIB Objects

esmHybridConfTable  
esmHybridPortCfgCrossover

---

## interfaces hybrid duplex

Configures duplex mode on combo ports. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

**interfaces** {*slot* | *slot/port[-port2]*} **hybrid** {**fiber** | **copper**} **duplex** {**full** | **half** | **auto**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that configuration changes will be made to the SFP port(s).
<b>copper</b>	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
<b>full</b>	Sets interface to full duplex mode.
<b>half</b>	Sets interface to half duplex mode.
<b>auto</b>	Switch will automatically set both the duplex mode settings to auto-negotiation.

### Defaults

By default, the duplex mode is set to full for the interface.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the [interfaces duplex](#) section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure the duplex mode for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the duplex mode for a specific interface or a range of interfaces.

### Examples

```
-> interfaces 1/47 hybrid copper duplex auto
-> interfaces 1/47-48 hybrid copper duplex half
-> interfaces 1 hybrid copper fiber full
```

## Release History

Release 6.1; command was introduced.

## Related Commands

- [interfaces hybrid speed](#) Configures interface line speed for combo ports. Set to **auto** to set speed and duplex mode to auto-sensing.
- [show interfaces hybrid status](#) Displays interface line settings (for example, speed, mode) for combo ports.

## MIB Objects

esmHybridConfTable  
esmHybridPortCfgDuplexMode

---

## interfaces hybrid speed

Configures interface line speed on combo ports.

```
interfaces {slot | slot/port[-port2]} hybrid {fiber | copper} speed {auto | 10 | 100 | 1000 | 10000 | max  
{100 | 1000}}
```

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that configuration changes will be made to the SFP port(s).
<b>copper</b>	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
<b>auto</b>	The switch will automatically set the line speed to match the attached device (auto-sensing).
<b>10</b>	Sets the interface to 10 Mbps.
<b>100</b>	Sets the interface to 100 Mbps.
<b>1000</b>	Sets the interface to 1 Gigabit.
<b>10000</b>	Sets the interface to 10 Gigabit. This option is currently not supported.
<b>max 100</b>	Sets the maximum speed to 100 megabits.
<b>max 1000</b>	Sets the maximum speed to 1000 megabits (1 Gigabit)

### Defaults

By default, the line speed is automatically set to match the speed of the attached device.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the [interfaces speed](#) section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure the line speed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the line speed for a specific interface or a range of interfaces.

## Examples

```
-> interfaces 1/47 hybrid copper speed auto
-> interfaces 1/47-48 hybrid copper speed 100
-> interfaces 1/47 hybrid fiber speed 1000
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">interfaces hybrid duplex</a>	Configures duplex mode for combo ports.
<a href="#">interfaces hybrid autoneg</a>	Enables and disables auto negotiation for combo ports.
<a href="#">show interfaces hybrid status</a>	Displays interface line settings for combo ports.

## MIB Objects

```
esmHybridConfTable
    esmHybridPortCfgSpeed
```

---

## interfaces hybrid pause

Configures whether or not the switch will transmit, honor, or transmit and accept flow control PAUSE frames on the specified combo port. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

**interfaces** {*slot* | *slot/port[-port2]*} **hybrid** {**fiber** | **copper**} **pause** {**tx** | **rx** | **tx-and-rx** | **disable**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that configuration changes will be made to the SFP port(s).
<b>copper</b>	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
<b>tx</b>	Transmits PAUSE frames to peer switches when traffic congestion occurs on the local interface. Does not honor PAUSE frames from peer switches.
<b>rx</b>	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer. Does not transmit PAUSE frames to peer switches.
<b>tx-and-rx</b>	Transmits and honors PAUSE frames when traffic congestion occurs between peer switches.
<b>disable</b>	Disables flow control on the interface.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Defaults

By default, flow control is disabled on all combo ports.

### Usage Guidelines

- Note that if the standalone switch is a 24-port unit, then only the **interfaces pause** command is required to enable end-to-end (E2E) flow control. However, if the switch is a 48-port unit, then a flow control VLAN, which is configured using the **interfaces e2e-flow-vlan** command, is required in addition to enabling RX/TX pause flow control.
- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported.

- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings, as shown in the following table, override the configured settings as long as autonegotiation and flow control are both enabled for the interface.

Configured Local Tx	Configured Local Rx	Configured Remote Tx	Configured Remote Rx	Negotiated Local Tx	Negotiated Local Rx
No	No	No	No	No	No
Yes	Yes	Yes	Yes	Yes	Yes
Yes	No	Yes	No	No	No
No	Yes	No	Yes	Yes	Yes
No	No	No	Yes	No	No
Yes	Yes	No	No	No	No
Yes	No	Yes	Yes	No	No
No	Yes	Yes	No	No	Yes
No	No	Yes	No	No	No
Yes	Yes	No	Yes	Yes	Yes
Yes	No	No	No	No	No
No	Yes	Yes	Yes	Yes	Yes
No	No	Yes	Yes	No	No
Yes	Yes	Yes	No	No	No
Yes	No	No	Yes	Yes	No
No	Yes	No	No	No	No

- If autonegotiation is disabled, the configured flow control setting is applied to the local interface.
- Enter a slot number to configure the flow control settings for all interfaces on a specific slot.
- Enter a slot and port number or range of port numbers to configure the flow control settings for a specific interface or a range of interfaces.

## Examples

```
-> interfaces 3/21 hybrid fiber pause tx
-> interfaces 4/24 hybrid copper pause rx
-> interfaces 1 hybrid fiber tx-and-rx
-> interfaces 3/21-24 hybrid copper pause tx
-> interfaces 3/21-24 hybrid copper disable
```

## Release History

Release 6.3.2; command was introduced.

## Related Commands

- [interfaces pause](#) Configures flow control settings for switch interfaces.

```

---

## show interfaces

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

**show interfaces** [*slot* | *slot/port*[-*port2*]]

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, interface information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces 1/2
Slot/Port 1/2 :

## show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **capability**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- The **show interfaces capability** command displays default settings in two rows of data for each port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the port. The second row, identified by the label **DEF**, displays the default settings for the port.

### Examples

```
-> show interfaces 5/1 capability
Slot/Port  AutoNeg      Flow  Crossover      Speed  Duplex
-----+-----+-----+-----+-----+-----
 5/1  CAP      EN/DIS  EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
 5/1  DEF          EN      EN      Auto        Auto      Auto
```

### output definitions

---

<b>Slot</b>	The slot number.
<b>Port</b>	The port number
<b>AutoNeg</b>	In the row labeled <b>CAP</b> , the field displays the valid auto negotiation configurations for the port. In the row label <b>DEF</b> , the field displays the default auto negotiation settings for the port. The possible values are <b>EN</b> (enabled) or <b>DIS</b> (disabled).

*output definitions (continued)*

---

<b>Flow</b>	In the row labeled <b>CAP</b> , the field displays the valid flow configurations for the port. In the row label <b>DEF</b> , the field displays the default flow settings for the port. The possible values are <b>EN</b> (enabled) or <b>DIS</b> (disabled).
<b>Crossover</b>	In the row labeled <b>CAP</b> , the field displays the valid cross over configurations for the port. In the row label <b>DEF</b> , the field displays the default cross over settings for the port. The possible values are <b>Auto</b> , <b>MDI/X/Auto</b> (MDI/MDIX/Auto), or <b>--</b> (not configurable and/or not applicable).
<b>Speed</b>	In the row labeled <b>CAP</b> , the field displays the valid line speed configurations for the port. In the row label <b>DEF</b> , the field displays the default line speed settings for the port. The possible values are <b>10/100</b> , <b>100</b> , <b>1G</b> , <b>10/100/1G</b> , <b>10G</b> , or <b>Auto</b> .
<b>Duplex</b>	In the row labeled <b>CAP</b> , the field displays the valid duplex configurations for the port. In the row label <b>DEF</b> , the field displays the default duplex settings for the port. The possible values are <b>Full</b> , <b>Full/Half</b> , or <b>Auto</b> .

## show interfaces flow control

Displays interface flow control wait time settings.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **flow** [**control**]

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>control</b>	Optional command syntax. It displays the same information as <b>show interfaces flow</b> .

### Defaults

By default, flow control wait time settings are displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces 3/20-24 flow
Slot/Port  Active  Wait time(usec)  Cfg-Flow  Cfg-Cross
-----+-----+-----+-----+-----
3/20      -        0                Pause     MDIX
3/21      -        0                Pause     MDIX
3/22      -        0                Pause     MDIX
3/23      -        0                Go        MDIX
3/24      -        0                Go        MDIX
```

#### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port number
<b>Active</b>	Interface status.
<b>Wait time</b>	Flow control wait time, in microseconds.
<b>Cfg-Flow</b>	Flow control status ( <b>Pause</b> or <b>Go</b> ).
<b>Cfg-Cross</b>	The user-configured cross-over setting ( <b>Auto</b> , <b>MDI</b> , or <b>MDIX</b> ).

---

## Release History

Release 6.1; command was introduced.

Release 6.3.2; command deprecated on the OmniSwitch 6855.

Release 6.4.3; command deprecated on OmniSwitch 6400 and OmniSwitch 6850.

## Related Commands

[interfaces crossover](#)

Configures crossover settings.

[show interfaces hybrid pause](#)

Displays interface flow control wait time settings for combo ports.

## show interfaces pause

Displays the flow control pause configuration for the specified interface(s).

**show interfaces** [*slot* | *slot/port*[-*port2*]] **pause**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, the flow control pause configuration is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces pause
Slot/Port  Active  Wait time(usec)  Cfg-Pause  Cfg-Cross  Hybrid  Type
-----+-----+-----+-----+-----+-----+-----

1/24      Active    65535 Tx-N-Rx Auto     C

```

### output definitions

<b>Slot/Port</b>	Interface slot and port number
<b>Active</b>	Interface status.
<b>Wait time</b>	The amount of time, in microseconds, the neighbor interface will wait after receiving a PAUSE frame from the local interface.
<b>Cfg-Pause</b>	The flow control setting ( <b>Tx</b> = transmit, <b>Rx</b> = receive, <b>Tx-N-Rx</b> = transmit and receive). Configured through the <a href="#">interfaces pause</a> command.
<b>Cfg-Cross</b>	The user-configured cross-over setting ( <b>Auto</b> , <b>MDI</b> , or <b>MDIX</b> ). Configured through the <a href="#">interfaces crossover</a> command.
<b>Hybrid Type</b>	The configured active media type for a hybrid port ( <b>F</b> = fiber, <b>C</b> = copper, <b>NA</b> = not applicable).

### Release History

## show interfaces e2e-flow-vlan

Displays the end-to-end (E2E) flow control VLAN configuration for the switch.

**show interfaces e2e-flow-vlan**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E

### Usage Guidelines

- This command is available only on standalone 48-port OmniSwitch 6400, 6850, and 6850E switches.
- There is only one dedicated E2E flow control VLAN configured per switch.

### Examples

```
-> show interfaces e2e-flow-vlan
Configured End-To-End Flow Vlan - 10
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[interfaces e2e-flow-vlan](#) Configures a dedicated VLAN for carrying end-to-end (E2E) flow control messages to remote systems.

[show interfaces pause](#) Displays the flow control pause configuration for the specified interface(s).

### MIB Objects

esmE2EFlowVlan

---

## show interfaces accounting

Displays interface accounting information (for example, packets received/transmitted and deferred frames received).

**show interfaces** [*slot* | *slot/port*[-*port2*]] **accounting**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, accounting information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces 1/2 accounting
1/2 ,
  Rx undersize packets           =                0,
  Tx undersize packets           =                0,
  Rx oversize packets            =                0,
  Tx oversize packets            =                0,
  Rx packets 64 Octets           =           3073753,
  Rx packets 65To127 Octets      =           678698,
  Rx packets 128To255 Octets     =           21616,
  Rx packets 256To511 Octets     =           21062,
  Rx packets 512To1023 Octets    =                2,
  Rx packets 1024To1518 Octets   =             84,
  Rx packets 1519to4095 Octets   =                0,
  Rx packets 4096ToMax Octets    =                0,
  Rx Jabber frames               =                0
```

#### *output definitions*

---

<b>Rx undersize packets</b>	Number of undersized packets received.
<b>Tx undersize packets</b>	Number of undersized packets transmitted.
<b>Rx oversize packets</b>	Number of oversized packets received.
<b>Tx oversize packets</b>	Number of oversized packets transmitted.

*output definitions (continued)*

---

<b>Rx packets Octets</b>	Number of packets received in each listed octet range.
<b>Rx Jabber frames</b>	Number of jabber packets received (longer than 1518 octets).
<b>Tx deferred frames</b>	Number of packets for which transmission was delayed (Ethernet only).

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">show interfaces</a>	Displays general interface information (for example, hardware, MAC address, and input/output errors).
<a href="#">show interfaces counters</a>	Displays interface counter information (for example, unicast packets received/transmitted).

---

## show interfaces counters

Displays interface counters information (for example, unicast, broadcast, and multi-cast packets received/transmitted).

**show interfaces** [*slot* | *slot/port*[-*port2*]] **counters**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.
- This command also displays sampling interval statistics that show an average traffic rate per second for active switch interfaces. These statistics are taken every 5 seconds. The actual statistics shown are those taken from the last completed 5-second time interval.
- Note that the sampling interval time period is set to five seconds and is not a configurable value at this time. In addition, the sampling interval is a global value that applies to all switch ports.

### Examples

```
-> show interfaces 3/1 counters
```

```
InOctets      = 54367578586897979,  OutOctets      = 5.78E19,

InBcastPkts  = 576567567567567576, OutBcastPkts  = 786876,  
InPauseFrames = 567798768768767,  OutPauseFrames= 786876,  
Sampling Interval 5 second  
  InPkts / s    =                11,    OutPkts / s    =                11,  
  Inbits / s    =                111111,  Outbits / s    =                111111,
```

*output definitions*

---

<b>InOctets</b>	Number of octets received.
<b>OutOctets</b>	Number of octets transmitted.
<b>InUcastPkts</b>	Number of unicast packets received.
<b>OutUcastPkts</b>	Number of unicast packets transmitted.
<b>InMcastPkts</b>	Number of multicast packets received.
<b>OutMcastPkts</b>	Number of unicast packets transmitted.
<b>InBcastPkts</b>	Number of broadcast packets received.
<b>OutBcastPkts</b>	Number of unicast packets transmitted.
<b>InPauseFrames</b>	Number of MAC control frames received.
<b>OutPauseFrames</b>	Number of MAC control frames transmitted.
<b>Sampling Interval</b>	The sampling interval used to determine the average rate per second.
<b>InPkts / s</b>	The average number of packets received per second.
<b>OutPkts / s</b>	The average number of packets transmitted per second.
<b>Inbits / s</b>	The average number of bits received per second.
<b>Outbits / s</b>	The average number of bits transmitted per second.

---

## show interfaces status

Displays interface line settings (for example, speed and mode).

**show interfaces** [*slot* | *slot/port*[-*port2*]] **status**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, line settings are displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

The following is an example for a non combo port:

```
-> show interfaces 1/2 status
                DETECTED                CONFIGURED
Slot/ AutoNego  Speed Duplex Hybrid  Speed Duplex Hybrid  Trap
Port          (Mbps)                Type  (Mbps)                Mode  LinkUpDown
-----+-----+-----+-----+-----+-----+-----+-----+-----+
  1/2   Enable   1000   Full   NA       Auto   Auto   NA       -
```

The following is an example for a combo port:

```
-> show interfaces 1/47 status
                DETECTED                CONFIGURED
Slot/ AutoNego  Speed Duplex Hybrid  Speed Duplex Hybrid  Trap
Port          (Mbps)                Type  (Mbps)                Mode  LinkUpDown
-----+-----+-----+-----+-----+-----+-----+-----+
  1/47   Enable   -      -      -       1000  Full   PF       -
  1/47   Enable   -      -      -        Auto   Auto   PF       -
```

FF - ForcedFiber PF - PreferredFiber F - Fiber  
 FC - ForcedCopper PC - PreferredCopper C - Copper

*output definitions*

---

<b>Slot/Port</b>	Interface slot/port number.
<b>AutoNego</b>	Autonegotiation status (Enable/Disable).
<b>Detected Speed</b>	Detected line speed (10/100/Auto/1000/10000 Mbps).
<b>Detected Duplex</b>	Detected line duplex (Half duplex/Full duplex/Auto).
<b>Detected Hybrid Type</b>	The detected combo port type, which can be <b>F</b> (fiber) or <b>C</b> (copper). (This field is only relevant for OmniSwitch 6800 Series switches.)
<b>Configured Speed</b>	Configured line speed (10/100/Auto/1000/10000 Mbps).
<b>Configured Duplex</b>	Configured line duplex (Half duplex/Full duplex/Auto).
<b>Configured Hybrid Type</b>	The configured combo port type, which can be <b>FF</b> (Forced Fiber), <b>PF</b> (Preferred Fiber), <b>FC</b> (Forced Copper), or <b>PC</b> (Preferred Copper).
<b>Trap Link Up/Down</b>	Trap Link status (up/down).

---

## show interfaces port

Displays the administrative status, link status, violations, recovery time, maximum recovery attempts and the value of the wait-to-restore timer for the specified port or ports.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **port**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- On a combo port with SFP fiber ports, the status of the SFP ports will be displayed. See the **show interfaces hybrid port** command for more information.
- The hash symbol (#) is displayed before the wait-to-restore value if the link state is WAIT (i.e., the wait-to-restore timer is running).

### Examples

```
-> show interfaces 1/1 port
Legends: WTR - Wait To Restore
          # - WTR Timer is Running & Port is in wait-to-restore state
          * - Permanent Shutdown
```

Slot/ Port	Admin Status	Link Status	Violations	Recovery Time	Recovery Max	WTR (sec)	Alias
1/1	enable	down	none	300	1	0	" "

```
-> show interfaces 1 port
```

```
Legends: WTR - Wait To Restore
```

```
# - WTR Timer is Running & Port is in wait-to-restore state
```

```
* - Permanent Shutdown
```

Slot/ Port	Admin Status	Link Status	Violations	Recovery Time	Recovery Max	WTR (sec)	Alias
1/1	enable	down	none	300	10	0	" "
1/2	enable	down	none	300	10	0	" "
1/3	enable	down	none	300	10	0	" "
1/4	enable	down	none	300	10	0	" "
1/5	enable	down	none	300	10	0	" "
1/6	enable	down	none	300	10	0	" "
1/7	enable	down	none	300	10	0	" "
1/8	enable	down	none	300	10	0	" "
1/9*	enable	down	LinkMon	30	2	0	" "
.							
.							
1/26	enable	down	none	0	0	0	" "

### output definitions

<b>Slot/Port</b>	Interface slot and port number. An asterisk (*) with slot/port indicates that the port is permanently shutdown.
<b>Admin Status</b>	Port status - <b>enable</b> , <b>disable</b> . Configured through the <b>interfaces admin</b> command.
<b>Link Status</b>	Operational status - <b>up</b> , <b>down</b> .
<b>Violations</b>	Applications that have blocked the port due to a specific violation.
<b>Recovery Time</b>	The recovery time for the port. Configured through the <b>interfaces violation-recovery-time</b> command.
<b>Recovery Max</b>	The maximum recovery attempts for the port Configured through the <b>interfaces violation-recovery-maximum</b> command.
<b>WTR (sec)</b>	The wait-to-restore timer value, in seconds, for the port. The value of 0 indicates the timer is disabled. Configured through the <b>interfaces wait-to-restore</b> command.
<b>Alias</b>	Interface alias. Configured through the <b>interfaces alias</b> command.

### Release History

Release 6.1; command was introduced.

Release 6.3.1; **Violations** field was added.

Release 6.4.4; **Recovery Time**, **Recovery Max**, **WTR (sec)** fields were added.

## Related Commands

[show interfaces hybrid port](#)

Displays interface port status (up or down) for combo ports.

[show interfaces violation-recovery](#)

Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show interfaces violation-recovery
UserPorts Shutdown Recovery Time: 200
UserPorts Shutdown Recovery Trap: Enable
UserPorts Shutdown Maximum Recovery: 2
```

### *output definitions*

---

<b>UserPorts Shutdown Recovery Time</b>	The recovery time configured for the port.
<b>UserPorts Shutdown Recovery Trap</b>	SNMP recovery trap status - <b>enable, disable</b> .
<b>UserPorts Shutdown Maximum Recovery</b>	The maximum recovery attempts configured for the port before a port is permanently shut down.

---

### Release History

Release 6.4.4; command was introduced.

## Related Commands

[interfaces violation-recovery-time](#)

Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.

[interfaces violation-recovery-maximum](#)

Configures the maximum number of recovery attempts before a port is permanently shut down.

[show interfaces port](#)

Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

## show interfaces flood rate

Displays interface peak flood rate settings.

**show interfaces** [*slot* | *slot/port* [-*port2*]] **flood rate**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces flood rate
```

Slot/ Port	Bcast Value	Bcast Type	Bcast Status	Ucast Value	Ucast Type	Ucast Status	Mcast Value	Mcast Type	Mcast Status
1/1	500	pps	enable	496	mbps	enable	496	mbps	enable
1/2	33	mbps	enable	496	mbps	enable	35	%	enable
1/3	496	mbps	enable	5	mbps	enable	496	mbps	enable
1/4	496	mbps	enable	496	mbps	enable	496	mbps	enable
1/5	496	mbps	enable	496	mbps	enable	496	mbps	enable

```
-> show interfaces 1/2 flood rate
```

Slot/ Port	Bcast Value	Bcast Type	Bcast Status	Ucast Value	Ucast Type	Ucast Status	Mcast Value	Mcast Type	Mcast Status
1/2	33	mbps	enable	496	mbps	enable	35	%	enable

### output definitions

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Bcast Value</b>	The broadcast storm value based on the type.
<b>Bcast Type</b>	The type of broadcast ( <b>mbps</b> , <b>pps</b> , <b>percentage</b> ).

*output definitions (continued)*

---

<b>Bcast Status</b>	The status of broadcast, <b>enable</b> or <b>disable</b> .
<b>Ucast Value</b>	The unknown-unicast storm value based on the type.
<b>Ucast Type</b>	The type of unknown-unicast ( <b>mbps, pps, percentage</b> )
<b>Ucast Status</b>	The status of unicast, <b>enable</b> or <b>disable</b> .
<b>Mcast Value</b>	The multicast storm value based on the type.
<b>Mcast Type</b>	The type of multicast ( <b>mbps, pps, percentage</b> )
<b>Mcast Status</b>	The status of multicast, <b>enable</b> or <b>disable</b> .

---

**Release History**

Release 6.1; command was introduced.

Release 6.4.3; **peak rate, flood-only, Multicast** parameters deprecated.

**Related Commands**

<a href="#">interfaces flood</a>	Enables traffic storm control on the specified interface.
<a href="#">interfaces flood rate</a>	Configures the peak flood rate for an interface.

## show interfaces traffic

Displays interface traffic statistics.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **traffic**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces traffic
```

Slot/Port	Input packets	Input bytes	Output packets	Output bytes
02/01	0	0	0	0
02/02	0	0	0	0
02/03	0	0	0	0
03/01	0	0	0	0
03/02	0	0	0	0

#### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Input packets</b>	Input packets detected.
<b>Input bytes</b>	Input bytes detected.
<b>Output packets</b>	Output packets detected.
<b>Output bytes</b>	Output bytes detected.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### [show interfaces](#)

Displays general interface information (for example, hardware, MAC address, and input/output errors).

### [show interfaces counters](#)

Displays interface counter information (for example, unicast packets received/transmitted).

## show interfaces transceiver

Displays the DDM information for the specified transceivers.

**show interfaces** [*slot* | *slot/port[-port2]*] **transceiver** [**ddm** | **w-low** | **w-high** | **a-low** | **a-high** | **actual**]

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>ddm</b>	Displays the administrative and trap status of the DDM feature.
<b>w-low</b>	Displays the Warning Low threshold for temperature, voltage, current, RX power and TX power.
<b>w-high</b>	Displays the Warning High threshold for temperature, voltage, current RX power and TX power.
<b>a-low</b>	Displays the Alarm Low threshold for temperature, voltage, current RX power and TX power.
<b>a-high</b>	Displays the Alarm High threshold for temperature, voltage, current RX power and TX power.
<b>actual</b>	Displays the Actual values for temperature, voltage, current RX power and TX power.

### Defaults

By default, information is displayed for all ports on all modules and for all DDM parameter options.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Transceiver DDM capability will vary based on the transceiver manufacturer.
- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces transceiver w-low
Slot/Port Temp C Voltage(V) Current (mA) Output (dBm) Input (dBm)
-----+-----+-----+-----+-----+-----+
1/1          48      5.15      50      2.50      2.50
1/2          47      5.35      49      2.43      2.43
1/3          NA       NA       NA       NA       NA
```

```
-> show interfaces transceiver a-high
```

```
Slot/Port Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
-----+-----+-----+-----+-----+-----+
1/1          50      5.75         75          3.22         3.22
1/2          50      5.95         65          3.22         3.22
1/3          NA       NA           NA           NA           NA
```

```
-> show interfaces 1/1 transceiver
```

```
Threshold      Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
-----+-----+-----+-----+-----+-----+
Actual         50    1.95(WL)    75          4.92(AH)    3.22
Alarm High     120    5.75       100         4.91         4.91
Warning High   90     3.00       90          4.77         4.77
Warning Low    10     2.00       60          0.00         0.00

```

### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Temp C</b>	The transceiver temperature, in degrees centigrade.
<b>Voltage (V)</b>	The transceiver supply voltage, in volts.
<b>Current (mA)</b>	The transceiver transmit bias current, in milliamps.
<b>Output (dBm)</b>	The transceiver output power, in decibels.
<b>Input (dBm)</b>	The transceiver received optical power, in decibels.
<b>DDM Status</b>	The administrative status of DDM.
<b>DDM Trap Status</b>	The administrative status of DDM traps.
<b>Actual</b>	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.
<b>Alarm High (AH)</b>	Indicates the value at which the transceiver's functionality may be affected.
<b>Warning High (WH)</b>	Indicates the transceiver is approaching the High Alarm value.
<b>Warning Low (WL)</b>	Indicates the transceiver is approaching the Low Alarm value.
<b>Alarm Low (AL)</b>	Indicates the value at which the transceiver's functionality may be affected.
<b>N/A</b>	Indicates the transceiver does support DDM.

---

### **Release History**

Release 6.4.2; command was introduced.

## show interfaces hybrid

Displays general interface information (for example, hardware, MAC address, input errors, output errors) for combo ports.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **hybrid** {**fiber** | **copper**}

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that the status of the SFP port(s) will be displayed.
<b>copper</b>	Specifies that the status of the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces 1/47 hybrid fiber

*output definitions*

---

<b>Slot/Port</b>	Interface slot and port.
<b>Operational Status</b>	Interface status (up/down).
<b>Last Time Link Changed</b>	The last time the configuration for this interface was changed.
<b>Number of Status Change</b>	The total number of times that the configuration of this interface has changed.
<b>Type</b>	Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).
<b>MAC address</b>	Interface MAC address.
<b>Bandwidth</b>	Bandwidth (in megabits).
<b>Duplex</b>	Duplex mode (Half/Full/Auto).
<b>Autonegotiation</b>	The auto negotiation settings for this interface.
<b>Long Accept</b>	Long Frames status (enable/disable).
<b>Runt Accept</b>	Runt Frames status (enable/disable).
<b>Long Frame Size</b>	Long Frame Size (in Bytes).
<b>Runt Size</b>	Runt Frame Size (in Bytes).
<b>Bytes Received</b>	Number of Bytes received.
<b>Rx Unicast Frames</b>	Number of unicast frames received.
<b>Rx Broadcast Frames</b>	Number of broadcast frames received.
<b>Rx M-cast Frames</b>	Number of multicast frames received.
<b>Rx Undersize Frames</b>	Number of undersized frames received.
<b>Rx Oversize Frames</b>	Number of r oversized frames received.
<b>Rx Lost Frames</b>	Number of Lost Frames received.
<b>Rx Error Frames</b>	Number of error frames received.
<b>Rx CRC Error Frames</b>	Number of CRC error frames received.
<b>Rx Alignments Err</b>	Number of Alignments Error frames received.
<b>Bytes Xmitted</b>	Number of Bytes transmitted.
<b>Tx Unicast Frames</b>	Number of unicast frames transmitted.
<b>Tx Broadcast Frames</b>	Number of broadcast frames transmitted.
<b>Tx M-cast Frames</b>	Number of multicast frames r transmitted.
<b>Tx Undersize Frames</b>	Number of undersized frames transmitted.
<b>Tx Oversize Frames</b>	Number of oversized frames transmitted.
<b>Tx Lost Frames</b>	Number of Lost Frames transmitted.
<b>Tx Collided Frames</b>	Number of collision frames received or transmitted.
<b>Tx Error Frames</b>	Number of error frames transmitted.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>show interfaces hybrid accounting</b>	Displays interface accounting information (for example, packets received/transmitted) for combo ports.
<b>show interfaces hybrid counters</b>	Displays interface counter information (for example, unicast packets received/transmitted) for combo ports.
<b>show interfaces hybrid counters errors</b>	Displays interface error frame information (for example, CRC errors, transit errors, receive errors) for combo ports.
<b>show interfaces hybrid collisions</b>	Displays interface collision information (for example, number of collisions, number of retries) for combo ports.
<b>show interfaces hybrid status</b>	Displays the interface line settings (for example, speed, mode) for combo ports.
<b>show interfaces hybrid traffic</b>	Displays interface traffic statistics (input/output bytes and packets) for combo ports.

- dot3StatsFCSErrors
- dot3StatsLateCollisions

---

## show interfaces hybrid status

Displays interface line settings (for example, speed, mode) for combo ports only.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **hybrid** {**fiber** | **copper**} **status**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that the status of the SFP port(s) will be displayed.
<b>copper</b>	Specifies that the status of the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces hybrid fiber status
```

Slot/ Port	AutoNego	DETECTED			CONFIGURED			Trap LinkUpDown
		Speed (Mbps)	Duplex	Hybrid Type	Speed (Mbps)	Duplex	Hybrid Mode	
1/45	Enable	-	-	-	1000	Full	PF	-
1/46	Enable	-	-	-	1000	Full	PF	-
1/47	Enable	-	-	-	1000	Full	PF	-
1/48	Enable	-	-	-	1000	Full	PF	-
2/45	Enable	-	-	-	1000	Full	PF	-
2/46	Enable	-	-	-	1000	Full	PF	-
2/47	Enable	-	-	-	1000	Full	PF	-
2/48	Enable	-	-	-	1000	Full	PF	-

FF - ForcedFiber PF - PreferredFiber F - Fiber  
 FC - ForcedCopper PC - PreferredCopper C - Copper

*output definitions*

---

<b>Slot/Port</b>	Interface slot/port number.
<b>AutoNego</b>	Autonegotiation status (Enable/Disable).
<b>Detected Speed</b>	Detected line speed (10/100/Auto/1000/10000 Mbps).
<b>Detected Duplex</b>	Detected line duplex (Half duplex/Full duplex/Auto).
<b>Detected Hybrid Type</b>	The detected combo port type, which can be <b>F</b> (fiber) or <b>C</b> (copper).
<b>Configured Speed</b>	Configured line speed (10/100/Auto/1000/10000 Mbps).
<b>Configured Duplex</b>	Configured line duplex (Half duplex/Full duplex/Auto).
<b>Configured Hybrid Type</b>	The configured combo port type, which can be <b>FF</b> (Forced Fiber), <b>PF</b> (Preferred Fiber), <b>FC</b> (Forced Copper), or <b>PC</b> (Preferred Copper).
<b>Trap Link Up/Down</b>	Trap Link status (up/down).

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">trap port link</a>	Enables/disables Trap LinkUpDown.
<a href="#">interfaces hybrid speed</a>	Configures interface line speed on combo ports.
<a href="#">interfaces hybrid duplex</a>	Configures duplex mode on combo ports.
<a href="#">interfaces hybrid preferred-fiber</a>	Configures one or more combo ports to use the fiber SFP port(s) instead of the equivalent copper 10/100/1000 RJ-45 port(s) when both ports are enabled and have a valid link.
<a href="#">interfaces hybrid autoneg</a>	Configures one or more combo ports to use the copper 10/100/1000 RJ-45 port(s) instead of the fiber SFP port(s) when both ports are enabled and have a valid link.

---

## show interfaces hybrid pause

Displays the flow control pause configuration for combo ports.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **hybrid** {**fiber** |**copper**} **pause**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that the configuration of the SFP port(s) will be displayed.
<b>copper</b>	Specifies that the configuration of the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces hybrid fiber pause
Slot/Port  Active  Wait time(usec)  Cfg-Pause  Cfg-Cross Hybrid Type
-----+-----+-----+-----+-----+-----+-----
  1/21      -        0                DIS        MDI        -
  1/22      -        0                DIS        MDI        -
  1/23      -        0                DIS        MDI        -
  1/24      -        0                Tx         MDI        -
```

```
-> show interfaces hybrid copper pause
Slot/Port  Active  Wait time(usec)  Cfg-Pause  Cfg-Cross Hybrid Type
-----+-----+-----+-----+-----+-----+-----
  1/21      -        0                DIS        Auto       -
  1/22      -        0                DIS        Auto       -
  1/23      -        0                DIS        Auto       -
  1/24      Active  65535           Tx-N-Rx    Auto       C
```

*output definitions*

---

<b>Slot/Port</b>	Interface slot and port number
<b>Active</b>	Interface status.
<b>Wait time</b>	The amount of time, in microseconds, the neighbor interface will wait after receiving a PAUSE frame from the local interface.
<b>Cfg-Pause</b>	The flow control setting ( <b>Tx</b> = transmit, <b>Rx</b> = receive, <b>Tx-N-Rx</b> = transmit and receive). Configured through the <a href="#">interfaces hybrid pause</a> command.
<b>Cfg-Cross</b>	The user-configured cross-over setting ( <b>Auto</b> , <b>MDI</b> , or <b>MDIX</b> ). Configured through the <a href="#">interfaces hybrid crossover</a> command.
<b>Hybrid Type</b>	The configured active media type for the hybrid port ( <b>F</b> = fiber, <b>C</b> = copper, <b>NA</b> = not applicable).

---

**Release History**

Release 6.3.2; command was introduced.

**Related Commands**

[show interfaces pause](#) Displays the interface flow control pause settings.

## show interfaces hybrid capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single combo port, a range of combo ports, or all combo ports on a switch.

**show interfaces** [*slot* | *slot/port[-port2]*] **hybrid** {**fiber** |**copper**} **capability**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that the configuration of the SFP port(s) will be displayed.
<b>copper</b>	Specifies that the configuration of the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, displays information for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- This command displays default settings in two rows of data for each combo port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the combo port. The second row, identified by the label **DEF**, displays the default settings for the combo port.
- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces 1/47 hybrid copper capability
  Slot/Port  AutoNeg      Flow  Crossover      Speed  Duplex
-----+-----+-----+-----+-----+-----
  1/47 CAP    EN/DIS      EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
  1/47 DEF          EN          EN          Auto        Auto        Auto
```

### output definitions

---

<b>Slot</b>	The slot number.
<b>Port</b>	The port number

*output definitions (continued)*

---

<b>AutoNeg</b>	In the row labeled <b>CAP</b> this field displays the valid auto negotiation configurations for the port. In the row label <b>DEF</b> this field displays the default auto negotiation settings for the port. The possible values are <b>EN</b> (enabled) or <b>DIS</b> (disabled).
<b>Flow</b>	In the row labeled <b>CAP</b> this field displays the valid flow configurations for the port. In the row label <b>DEF</b> this field displays the default flow settings for the port. The possible values are <b>EN</b> (enabled) or <b>DIS</b> (disabled).
<b>Crossover</b>	In the row labeled <b>CAP</b> this field displays the valid cross over configurations for the port. In the row label <b>DEF</b> this field displays the default cross over settings for the port. The possible values are <b>Auto</b> , <b>MDI/X/Auto</b> (MDI/MDIX/Auto), or <b>--</b> (not configurable and/or not applicable).
<b>Speed</b>	In the row labeled <b>CAP</b> this field displays the valid line speed configurations for the port. In the row label <b>DEF</b> this field displays the default line speed settings for the port. The possible values are <b>10/100</b> , <b>100</b> , <b>1G</b> , <b>10/100/1G</b> , or <b>Auto</b> .
<b>Duplex</b>	In the row labeled <b>CAP</b> this field displays the valid duplex configurations for the port. In the row label <b>DEF</b> this field displays the default duplex settings for the port. The possible values are <b>Full</b> , <b>Full/Half</b> , or <b>Auto</b> .

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">interfaces hybrid autoneg</a>	Enables and disables auto negotiation for combo ports.

## show interfaces hybrid accounting

Displays interface accounting information (for example, packets received/transmitted, deferred frames received) for combo ports.

**show interfaces** [*slot* | *slot/port[-port2]*] **hybrid** {**fiber** |**copper**} **accounting**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that statistics for the SFP port(s) will be displayed.
<b>copper</b>	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

### Examples

```
-> show interfaces 1/47 hybrid copper accounting
1/47 ,
  Rx undersize packets          =                0,
  Tx undersize packets          =                0,
  Rx oversize packets          =                0,
  Tx oversize packets          =                0,
  Rx packets 64 Octets         =            3073753,
  Rx packets 65To127 Octets    =            678698,
  Rx packets 128To255 Octets   =             21616,
  Rx packets 256To511 Octets   =             21062,
  Rx packets 512To1023 Octets  =                2,
  Rx packets 1024To1518 Octets =             84,
  Rx packets 1519to4095 Octets =                0,
  Rx packets 4096ToMax Octets  =                0,
  Rx Jabber frames             =                0
```

*output definitions*

---

<b>Rx undersize packets</b>	Number of undersized packets received.
<b>Tx undersize packets</b>	Number of undersized packets transmitted.
<b>Rx oversize packets</b>	Number of oversized packets received.
<b>Tx oversize packets</b>	Number of oversized packets transmitted.
<b>Rx packets Octets</b>	Number of packets received in each listed octet range.
<b>Rx Jabber frames</b>	Number of jabber packets received (longer than 1518 octets).
<b>Tx deferred frames</b>	Number of packets for which transmission was delayed (Ethernet only).

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

- show interfaces hybrid** Displays general interface information (for example, hardware, MAC address, input/output errors) for combo ports.
- show interfaces hybrid counters** Displays interface counter information (for example, unicast packets received/transmitted) for combo ports.

## show interfaces hybrid counters

Displays interface counters information (for example, unicast, broadcast, multi-cast packets received/transmitted) for combo ports.

**show interfaces** [*slot* | *slot/port[-port2]*] **hybrid** {**fiber** |**copper**} **counters**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that statistics for the SFP port(s) will be displayed.
<b>copper</b>	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

### Examples

```
-> show interfaces 1/47 hybrid copper counters
```

```
InOctets      = 54367578586897979,  OutOctets      = 5.78E19,

## show interfaces hybrid collisions

Displays interface collision information (for example, number of collisions, number of retries) for combo ports.

**show interfaces** [*slot* | *slot/port[-port2]*] **hybrid** {**fiber** |**copper**} **collisions**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that statistics for the SFP port(s) will be displayed.
<b>copper</b>	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

### Examples

```
-> show interfaces 1/47 hybrid copper collisions
```

```
02/01,  
Rx Collisions = 6.56E18, Rx Single Collision = 345464364,  
Rx Multiple Collisions = 6325235326, Rx Excessive Collisions = 5.65E19
```

*output definitions*

---

<b>Slot/Port</b>	Interface slot and port number.
<b>Tx Collisions</b>	Number of transmit collisions.
<b>Tx Single Collision</b>	Number of successfully transmitted frames for which transmission was inhibited by one collision.
<b>Tx Multiple Collisions</b>	Number of successfully transmitted frames for which transmission was inhibited by multiple collisions.
<b>Tx Excessive Retries</b>	Number of frames for which transmission fails due to excessive collisions.
<b>Rx Collisions</b>	Number of receive collisions.
<b>Rx Single Collision</b>	Number of successfully received frames for which reception was inhibited by one collision.
<b>Rx Multiple Collisions</b>	Number of successfully received frames for which reception was inhibited by multiple collisions.
<b>Rx Excessive Retries</b>	Number of frames for which reception fails due to excessive collisions.

---

## show interfaces hybrid traffic

Displays interface traffic statistics for combo ports.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **hybrid** {**fiber** |**copper**} **traffic**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that statistics for the SFP port(s) will be displayed.
<b>copper</b>	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

### Examples

```
-> show interfaces hybrid fiber traffic
```

Slot/Port	Input packets	Input bytes	Output packets	Output bytes
01/45	0		0	0
01/46	0		0	0
01/47	0		0	0
01/48	0		0	0

#### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Input packets</b>	Input packets detected.
<b>Input bytes</b>	Input bytes detected.
<b>Output packets</b>	Output packets detected.
<b>Output bytes</b>	Output bytes detected.

---

## show interfaces hybrid port

Displays interface port status (up or down) for combo ports.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **hybrid** {**fiber** |**copper**} **port**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that the status of the SFP combo port(s) will be displayed.
<b>copper</b>	Specifies that the status of the copper combo 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all hybrid ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all hybrid interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific hybrid interface or a range of hybrid interfaces.

### Examples

```
-> show interfaces hybrid fiber port
Legends: WTR - Wait To Restore
          # - WTR Timer is Running & Port is in wait-to-restore state
          * - Permanent Shutdown
```

Slot/ Port	Admin Status	Link Status	Violations	Recovery Time	Recovery Max	WTR (sec)	Alias
1/21	enable	up	none	300	10	0	" "
1/22#	enable	down	none	300	10	0	" "
1/23	enable	down	none	300	10	0	" "
1/24*	enable	down	none	300	10	0	" "

### output definitions

---

<b>Slot/Port</b>	Interface slot and port number.
<b>Admin Status</b>	Port status - <b>enable</b> , <b>disable</b> . Configured through the <a href="#">interfaces admin</a> command.
<b>Link Status</b>	Operational status - <b>up</b> , <b>down</b> .

*output definitions (continued)*

---

<b>Violations</b>	Applications that have blocked the port due to a specific violation.
<b>Recovery Time</b>	The recovery time for the port. Configured through the <b>interfaces violation-recovery-time</b> command.
<b>Recovery Max</b>	The maximum recovery attempts for the port Configured through the <b>interfaces violation-recovery-maximum</b> command.
<b>WTR (sec)</b>	The wait-to-restore timer value, in seconds, for the port. The value of 0 indicates the timer is disabled. Configured through the <b>interfaces wait-to-restore</b> command.
<b>Alias</b>	Interface alias. Configured through the <b>interfaces alias</b> command.

---

**Release History**

Release 6.1; command was introduced.

Release 6.4.4; **Recovery Time**, **Recovery Max**, **WTR (sec)** fields were added.

**Related Commands**

<b>show interfaces port</b>	Displays interface port status (up or down) for non-combo ports.
<b>show interfaces violation-recovery</b>	Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

**MIB Objects**

## show interfaces hybrid flood rate

Displays interface peak flood rate settings for combo ports.

**show interfaces** [*slot* | *slot/port[-port2]*] **hybrid** {**fiber** |**copper**} **flood rate**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that the status of the SFP port(s) will be displayed.
<b>copper</b>	Specifies that the status of the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces flood rate
```

```
Slot/Port   peak rate(Mb/second)   Enable
-----+-----+-----
02/01           12                   Flood only
02/02           47                   Flood only
02/03           16                   Flood only
02/04           47                   Flood only
02/05           47                   Flood only
02/06           47                   Flood only
02/07           47                   Flood only
02/08           47                   Flood only
02/09           47                   Flood only
02/10           47                   Flood only
02/11           47                   Flood only
02/12           47                   Flood only
02/13           47                   Flood only
02/14           47                   Flood only
02/15           47                   Flood only
02/16           47                   Flood only
```

02/17	47	Flood only
02/18	47	Flood only
02/19	47	Flood only

**output definitions**

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Peak Rate (Mbps)</b>	Configured peak flood rate.
<b>Enable</b>	Configuration enabled (Flood only/Flood Multicast/Multicast).

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

## show interfaces hybrid ifg

Displays interface inter-frame gap values for combo ports.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **hybrid** {**fiber** |**copper**} **ifg**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
<b>fiber</b>	Specifies that statistics for the SFP port(s) will be displayed.
<b>copper</b>	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

### Defaults

By default, information is displayed for all ports on all modules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Examples

```
-> show interfaces hybrid fiber ifg
Slot/Port   ifg(Bytes)
-----+-----
 1/45         12
 1/46         12
 1/47         12
 1/48         12
 2/45         12
 2/46         12
 2/47         12
 2/48         12
```

### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>ifg</b>	Inter-frame gap value (Gigabit Ethernet interface).

---

## Release History

Release 6.1; command was introduced.

## Related Commands

[interfaces ifg](#) Configures the inter-frame gap value.

---

## show interfaces link-monitoring config

Displays configuration information for the Link Monitoring feature. This includes the link monitoring status on a specific slot, port or a range of specified ports, time window, link flap threshold, and link error threshold.

**show interfaces** {*slot* | *slot/port*[-*port2*]} **link-monitoring config**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Example

```
-> show interfaces 1 link-monitoring config
```

Slot/ Port	Status	Time Window (sec)	Link-flap Threshold	Link-error Threshold
1/1	enabled	10	5	10
1/2	disabled	10	5	10
1/3	disabled	200	8	20
.				
1/24	disabled	150	2	99

```
-> show interfaces 1/1-3 link-monitoring config
```

Slot/ Port	Status	Time Window (sec)	Link-flap Threshold	Link-error Threshold
1/1	enabled	10	5	10
1/2	disabled	10	5	10
1/3	disabled	200	7	99

```
-> show interfaces 1/1 link-monitoring config
```

Slot/ Port	Status	Time Window (sec)	Link-flap Threshold	Link-error Threshold
1/1	enabled	10	5	10

```
-> show interfaces 1/2 link-monitoring config
```

Slot/ Port	Status	Time Window (sec)	Link-flap Threshold	Link-error Threshold
1/2	disabled	10	5	10

## Release History

### *output definitions*

<b>Slot/Port</b>	Interface slot and port number.
<b>Status</b>	Link monitoring status (enable/disable).
<b>Time Window</b>	Time interval, in seconds, for which the link is monitored.
<b>Link-flap threshold</b>	Number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.
<b>Link-error threshold</b>	Number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.

Release 6.4.4; command introduced.

## Related Commands

<a href="#">show interfaces port</a>	Displays information of the interface port status.
<a href="#">show interfaces link-monitoring statistics</a>	Displays the Link Monitoring statistics.
<a href="#">interfaces link-monitoring admin-status</a>	Enables or disables link monitoring.
<a href="#">interfaces link-monitoring time-window</a>	Configures the monitoring of the time-window of the link.
<a href="#">interfaces link-monitoring link-flap-threshold</a>	Configures the number of link flaps that are allowed before the port is shutdown.
<a href="#">interfaces link-monitoring link-error-threshold</a>	Configures the number of MAC errors that are allowed before the port is shutdown.

## show interfaces link-monitoring statistics

Displays the Link Monitoring statistics for a specific slot, port, or a range of specified ports.

**show interfaces** {*slot* | *slot/port*[-*port2*]} **link-monitoring statistics**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

### Example

```
-> show interfaces 1 link-monitoring statistics
Slot/   State      Current  Current  Current  Current  Current  Total  Total
Port    State      Flap     Error    CRC      Lost     Align    Flap   Error
-----+-----+-----+-----+-----+-----+-----+-----+-----+
1/1     shutdown   6        3        2        0        0        15    6
1/2     down       3        2        1        0        0        12    3
.
.
1/24    up         3        2        1        0        0        12    3

-> show interfaces 1/1-2 link-monitoring statistics
Slot/   State      Current  Current  Current  Current  Current  Total  Total
Port    State      Flap     Error    CRC      Lost     Align    Flap   Error
-----+-----+-----+-----+-----+-----+-----+-----+
1/1     shutdown   6        3        2        0        0        15    6
1/2     down       3        2        1        0        0        12    3

-> show interfaces 1/1 link-monitoring statistics
Slot/   State      Current  Current  Current  Current  Current  Total  Total
Port    State      Flap     Error    CRC      Lost     Align    Flap   Error
-----+-----+-----+-----+-----+-----+-----+-----+
1/1     shutdown   6        3        2        0        0        15    6
```

## debug interfaces set backpressure

Enables and disables fabric back pressure on a Network Interface (NI) or an entire chassis.

**debug interfaces set** [*slot*] **backpressure** {**enable** | **disable**}

---

### Syntax Definitions

<i>slot</i>	The slot number to enable or disable fabric back pressure.
<b>enable</b>	Enables fabric backpressure.
<b>disable</b>	Disables fabric backpressure.

### Defaults

By default, the fabric backpressure is disabled.

### Platforms Supported

OmniSwitch 6400

### Usage Guidelines

If the slot number is not specified, then the switch back pressure feature will be enabled or disabled on the entire chassis.

### Examples

```
-> debug interfaces set backpressure enable
-> debug interfaces set backpressure disable
-> debug interfaces set 3 backpressure enable
-> debug interfaces set 3 backpressure disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[debug interfaces backpressure](#) Displays whether fabric back pressure is enabled or disabled on an NI or an entire chassis.

### MIB Objects

N/A

---

**Related Commands**

**debug interfaces backpressure** Enables and disables fabric back pressure on an NI or on the entire chassis.

**MIB Objects**

---

## link-fault-propagation group

Configures a Link Fault Propagation (LFP) group to associate with source and destination ports.

**link-fault-propagation group** *group\_id* [admin-state {enable | disable}]

**no link-fault-propagation group** {*group\_id*[-*group\_id2*]}

---

### Syntax Definitions

<i>group_id</i>	A group ID number. The valid range is 1–8.
<i>group_id</i> [- <i>group_id2</i> ]	A group ID number to remove. Use a hyphen to specify a range of existing group ID numbers (5-8). Specifying a range is only used to remove group IDs, not to create them.
<b>enable</b>	Enables LFP for the specified group.
<b>disable</b>	Disables LFP for the specified group.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a LFP group or a range of groups.
- Up to eight LFP groups per switch are allowed.
- Once a LFP group is created, assign source and destination ports to that group.

### Example

```
-> link-fault-propagation group 1
-> no link-fault-propagation group 4
-> no link-fault-propagation group 4-7
```

### Release History

Release 6.4.4; command introduced.

## Related Commands

<b>link-fault-propagation group source</b>	Configures the source port assignments for the LFP group.
<b>link-fault-propagation group destination</b>	Configures the destination port assignments for the LFP group.
<b>link-fault-propagation group wait-to-shutdown</b>	Configures the amount of time LFP waits before shutting down the destination ports..
<b>show link-fault-propagation group</b>	Displays the LFP group configuration for the switch.

## MIB Objects

```
alaLFPGroupTable  
  alaLFPGroupId  
  alaLFPGroupRowStatus
```

---

## link-fault-propagation group source

Configures the source port assignments for a Link Fault Propagation (LFP) group.

**link-fault-propagation group** *group\_id* **source** {**port** *slot/port[-port2]* | **linkagg** *agg\_id[-agg\_id2]*}

**no link-fault-propagation group** *group\_id* **source** {**port** *slot/port[-port2]* | **linkagg** *agg\_id[-agg\_id2]*}

---

### Syntax Definitions

<i>group_id</i>	An existing LFP group ID number. The valid range is 1–8.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a source port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 48 source ports and 48 destination ports.
- A maximum of 48 link aggregates is supported, regardless of the number of ports in each aggregate in a group.
- A port/linkagg added as a source/destination port for a particular group cannot be added as a destination/source port for this group or for any other group.
- If a port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

### Example

```
-> link-fault-propagation group 1 source port 1/2
-> link-fault-propagation group 1 source port 1/2-5 2/3
-> link-fault-propagation group 1 source linkagg 1
-> link-fault-propagation group 1 source linkagg 1-3
-> link-fault-propagation group 1 source port 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 3/1-5 destination linkagg 6
-> no link-fault-propagation group 1 destination port 1/10
```

## Release History

Release 6.4.4; command introduced.

## Related Commands

<b>link-fault-propagation group</b>	Configures an LFP group, including the administrative status.
<b>link-fault-propagation group destination</b>	Configures the destination port assignments for the LFP group.
<b>link-fault-propagation group wait-to-shutdown</b>	Configures the amount of time LFP waits before shutting down the destination ports..
<b>show link-fault-propagation group</b>	Displays the LFP group configuration for the switch.

## MIB Objects

```
alaLFPGroupTable
  alaLFPGroupId
  alaLFPGroupRowStatus
  alaLFPConfigTable
    alaLFPConfigPort
    alaLFPConfigPortType
    alaLFPConfigRowStatus
```

---

## link-fault-propagation group destination

Configures the destination port assignments for a Link Fault Propagation (LFP) group.

```
link-fault-propagation group group_id destination {port slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
no link-fault-propagation group group_id destination {port slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<i>group_id</i>	An existing LFP group ID number. The valid range is 1–8.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a destination port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 48 source ports and 48 destination ports.
- A maximum of 48 link aggregates is supported regardless of the number of ports in each aggregate in a group.
- A port or link aggregate that is configured as a source port cannot be configured as a destination port for any group. However, a source port can be associated with multiple LFP groups.
- A port or link aggregate that is configured as a destination port cannot be configured as a source port for any group. However, a destination port can be associated with multiple LFP groups.
- If port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

## Example

```
-> link-fault-propagation group 1 destination port 1/4
-> link-fault-propagation group 1 destination port 1/5-8 2/3
-> link-fault-propagation group 1 destination linkagg 6
-> link-fault-propagation group 1 destination linkagg 6-10
-> link-fault-propagation group 1 source port 1/2 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 1/2 2/3 destination linkagg 6
-> link-fault-propagation group 1 source linkagg 3 destination port 1/6 1/9
-> link-fault-propagation group 1 source linkagg 3 destination linkagg 1

-> no link-fault-propagation group 1 source port 1/9
-> no link-fault-propagation group 1 destination port 1/10
```

## Release History

Release 6.4.4; command introduced.

## Related Commands

<b>link-fault-propagation group</b>	Configures an LFP group, including the administrative status.
<b>link-fault-propagation group source</b>	Configures the source port assignments for the LFP group.
<b>link-fault-propagation group wait-to-shutdown</b>	Configures the amount of time LFP waits before shutting down the destination ports.
<b>show link-fault-propagation group</b>	Displays the LFP group configuration for the switch.

## MIB Objects

```
alaLFPGroupTable
  alaLFPGroupId
  alaLFPGroupRowStatus
  alaLFPConfigTable
    alaLFPConfigPort
    alaLFPConfigPortType
    alaLFPConfigRowStatus
```

## link-fault-propagation group wait-to-shutdown

Configures the wait-to-shutdown timer value for the Link Fault Propagation (LFP) group. This is the amount of time after all the source ports go down that LFP waits before shutting down the destination ports.

**link-fault-propagation group** *group\_id* **wait-to-shutdown** *seconds*

---

### Syntax Definitions

<i>group_id</i>	An existing LFP group ID number. The valid range is 1–8.
<i>seconds</i>	The number of seconds LFP waits before shutting down the destination ports. The valid range is 0-300 in multiples of 5.

### Defaults

By default, the timer is set to zero (disabled).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Set the wait-to-shutdown timer value to 0 to disable the timer.
- Make sure the LFP group specified with this command already exists in the switch configuration.

### Example

```
-> link-fault-propagation group 1 wait-to-shutdown 40
-> link-fault-propagation group 3 wait-to-shutdown 70
-> link-fault-propagation group 5 wait-to-shutdown 0
```

### Release History

Release 6.4.4; command introduced.

### Related Commands

<a href="#">link-fault-propagation group</a>	Configures an LFP group, including the administrative status.
<a href="#">show link-fault-propagation group</a>	Displays the LFP group configuration for the switch.

### MIB Objects

```
alaLFPGroupTable
  alaLFPGroupId
  alaLFPGroupWaitToShutdown
  alaLFPGroupRowStatus
```

---

```
-> show link-fault-propagation group 6
Group Id : 6
Source Port(s)      : 1/2 1/6 1/9,
Destination Port(s) : 1/10-11 1/13,
Group-Src-Ports Status : down,
Admin Status        : enable,
Wait To Shutdown    : 5
```

## Release History

Release 6.4.4; command introduced.

## Related Commands

<a href="#">link-fault-propagation group</a>	Configures a LFP group, including the administrative status.
<a href="#">link-fault-propagation group wait-to-shutdown</a>	Configures the amount of time LFP waits before shutting down the destination ports..

## MIB Objects

```
alaLFPConfigTable

  alaLFPGroupAdminStatus
  alaLFPGroupOperStatus
  alaLFPGroupWaitToShutdown
```

---

## interfaces tdr-test-start

Initiates a Time Domain Reflectometry (TDR) cable diagnostics test on the specified port. The TDR feature sends a signal down a cable to determine the distance to a break or other discontinuity in the cable path. The length of time it takes for the signal to reach the break and return is used to estimate the distance to the discontinuity.

**interfaces** *slot/port* **tdr-test-start**

---

### Syntax Definitions

*slot/port*                      The slot and port number (3/1).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- TDR is an on-demand, out-of-service test. The test is not automatically triggered; data and protocol traffic is interrupted.
- Only one TDR test can be run at any given time.
- TDR is not supported on link aggregate ports, fiber ports, or stacking ports.
- TDR results are automatically cleared when a new test is started on the port or when the module for the port is reset.

### Examples

```
-> interfaces 1/1 tdr-test-start
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

- [interfaces no tdr-statistics](#)      Clears the statistics of the last test performed on the port
- [show interfaces tdr-statistics](#)    Displays the results of the last TDR test performed on a port.

### MIB Objects

```
esmTdrPortTable  
    esmTdrPortTest
```

---

## interfaces no tdr-statistics

Clears the statistics of the last TDR test performed on the port.

**interfaces** {*slot* | *slot/port*[-*port2*]} **no tdr-statistics**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

There is no global command to clear TDR statistics for all ports on all slots; statistics are cleared at the slot or the slot/port level.

### Examples

```
-> interfaces 2/1 no tdr-statistics
-> interfaces 2 no tdr-statistics
-> interfaces 2/1-7 no tdr-statistics
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

<a href="#">interfaces tdr-test-start</a>	Initiates the cable diagnostics on a port.
<a href="#">show interfaces tdr-statistics</a>	Displays the results of the last TDR test performed on a port.

### MIB Objects

```
esmTdrPortTable
  esmTdrPortClearResults
```

---

## show interfaces tdr-statistics

Displays the results of the last TDR test performed on a port.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **tdr-statistics**

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

### Defaults

By default, TDR statistics are shown for all ports on all modules

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

### Examples

```
-> show interfaces 1/3 tdr-statistics
```

```
Legend: Pair 1 - orange and white
        Pair 2 - green and white
        Pair 3 - blue and white
        Pair 4 - brown and white
```

```
Slot/ No of Cable Fuzzy  Pair1 Pair1  Pair2 Pair2  Pair3 Pair3  Pair4 Pair4  Test
port  pairs  State Length State Length State Length State Length State Length State Length Result
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/3   4    ok    0    ok    3    ok    3    ok    3    ok    3    success
```

### output definitions

<b>Legend</b>	Eight-conductor data cable contains 4 pairs of twisted Pair Copper Cable wires. Each pair consists of a solid (or predominantly) colored wire and a white wire with a strip of the same color. The pairs are twisted together.
<b>Slot/Port</b>	The interface slot and port number.
<b>No of pairs</b>	The number of pairs in the cable for which the test results are valid.

*output definitions (continued)*

---

<b>Cable State</b>	State of a cable as returned by the TDR test. The state of the cable wire. (a) <b>OK</b> - Wire is working properly (b) <b>Open</b> - Wire is broken (c) <b>Short</b> - Pairs of wire are in contact with each other (d) <b>Crosstalk</b> - Signal transmitted on one pair of wire creates an undesired effect in another wire. (e) <b>Unknown</b> - Cable diagnostic test unable to find the state of a cable.
<b>Fuzzy Length</b>	The error in the estimated length of the cable.
<b>Pair1 State</b>	The state of the Pair 1 cable wire ( <b>OK, Open, Short, Crosstalk, or Unknown</b> )
<b>Pair1 Length</b>	The length of the Pair 1 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
<b>Pair2 State</b>	The state of the Pair 2 cable wire ( <b>OK, Open, Short, Crosstalk, or Unknown</b> )
<b>Pair2 Length</b>	The length of the Pair 2 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
<b>Pair3 State</b>	The state of the Pair 3 cable wire ( <b>OK, Open, Short, Crosstalk, or Unknown</b> )
<b>Pair3 Length</b>	The length of the Pair 3 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
<b>Pair4 State</b>	The state of the Pair 4 cable wire ( <b>OK, Open, Short, Crosstalk, or Unknown</b> )
<b>Pair4 Length</b>	The length of the Pair 4 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
<b>Test Result</b>	The status of the TDR test performed, success or fail.

---

**Release History**

Release 6.4.4; command was introduced.

# 2 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, etc. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:

- Advertises port's identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

*Filename:* AlcatelIND1UDLD.mib  
*Module:* ALCATEL-IND1-UDLD-MIB

A summary of available commands is listed here:

---

**udld**  
**udld port**  
**udld mode**  
**udld probe-timer**  
**udld echo-wait-timer**  
**clear udld statistics port**  
**interfaces clear-violation-all**  
**show udld configuration**  
**show udld configuration port**  
**show udld statistics port**  
**show udld neighbor port**  
**show udld status port**

---

Configuration procedures for UDLD are explained in the “Configuring UDLD” chapter of the *OmniSwitch AOS Release 6 Network Configuration Guide*.

## udld

Globally enables or disables UDLD protocol on the switch.

**udld** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Globally enables UDLD on the switch.
<b>disable</b>	Globally disables UDLD on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The port that was shutdown by this command can be reset by using the **interfaces admin** command.

### Examples

```
-> udld enable
-> udld disable
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<a href="#">udld port</a>	Enables or disables UDLD status on a specific port or a range of ports.
<a href="#">show udld configuration</a>	Displays the global status of UDLD configuration.
<a href="#">show udld configuration port</a>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

### MIB Objects

alaUdldGlobalStatus

---

## udld port

Enables or disables UDLD status on a specific port or a range of ports.

**udld port** *slot/port*[-*port2*] {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<b>enable</b>	Enables UDLD status on a port.
<b>disable</b>	Disables UDLD status on a port.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The UDLD protocol must be enabled before using this command.

### Examples

```
-> udld port 1/3 enable
-> udld port 1/6-10 enable
-> udld port 2/4 disable
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<code>udld</code>	Globally enables or disables UDLD protocol on the switch.
<code>show udld configuration port</code>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable  
  alaUdldConfigUdldStatus

---

## udld mode

Configures the operational mode of UDLD on a specific port, a range of ports, or all the ports.

```
udld port [slot/port[-port2]] mode {normal | aggressive}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<b>normal</b>	Specifies UDLD operation in the normal mode.
<b>aggressive</b>	Specifies UDLD operation in the aggressive mode.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>normal   aggressive</b>	<b>normal</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is not supported on aggregate ports.
- When two UDLD enabled ports that are configured in aggressive mode of operation gets the link-up asynchronously, then the UDLD port which gets the link-up indication first is considered to be in the shutdown state. In such case, the link should be configured manually after both the links are up to start UDLD detection.
- In case of faulty cable connection, the port which is configured in normal mode of operation is determined to be in the shutdown state.

### Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/3 mode aggressive
-> udld port 2/4 mode normal
-> udld port 2/9-18 mode aggressive
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<code>udld</code>	Globally enables or disables UDLD protocol on the switch.
<code>show udld configuration port</code>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable  
  alaUdldPortConfigUdldMode

---

## udld probe-timer

Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports. Probe-messages are transmitted periodically after this timer expires.

**udld port** [*slot/port*[-*port2*]] **probe-timer** *seconds*

**no udld port** [*slot/port*[-*port2*]] **probe-timer**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>seconds</i>	The probe-message transmission interval, in seconds (7-90).

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>seconds</i>	15

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.
- The UDLD protocol must be enabled before using this command.
- Configure probe-advertisement timer with values varying in a range of 12-18 seconds for better convergence time and to avoid burst of probe advertisements.

### Examples

```
-> udld probe-timer 20
-> udld port 1/3 probe-timer 16
-> udld port 1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/3 probe-timer
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>udld</b>	Globally enables or disables UDLD protocol on the switch.
<b>show udld configuration port</b>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable  
alaUdldPortConfigUdldProbeIntervalTimer

---

## udld echo-wait-timer

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

**udld port** [*slot/port*[-*port2*]] **echo-wait-timer** *seconds*

**no udld port** [*slot/port*[-*port2*]] **echo-wait-timer**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>seconds</i>	The echo based detection period, in seconds (4-15).

### Defaults

parameter	default
<i>seconds</i>	8

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

### Examples

```
-> udld echo-wait-timer 9
-> udld port 1/5 echo-wait-timer 12
-> udld port 1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/3 echo-wait-timer
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>udld</b>	Globally enables or disables UDLD protocol on the switch.
<b>show udld configuration port</b>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable  
  alaUdldPortConfigUdldDetectionPeriodTimer

---

## clear udd statistics port

Clears the UDLD statistics for a specific port or for all the ports.

**clear udd statistics** [**port** *slot/port*]

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If the slot/port option is not specified, UDLD statistics for the switch is cleared.

### Examples

```
-> clear udd statistics port 1/4
-> clear udd statistics
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

**udd**

Globally enables or disables UDLD protocol on the switch.

**show udd statistics port**

Displays the UDLD statistics for a specific port.

### MIB Objects

alaUddGlobalClearStats

---

## interfaces clear-violation-all

Brings the port out of shutdown state.

**interfaces** *slot/port*[-*port2*] **clear-violation-all**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If any interface is in the admin down state because of UDLD, then the status of the interface can be confirmed using the **show interfaces port** command. The violation field indicates the reason of violation.
- The port may again go into shutdown state if the UDLD operation determine that UDLD violation is still not cleared.

### Examples

```
-> interfaces 1/8 clear-violation-all
-> interfaces 1/10-14 clear-violation-all
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show interfaces port](#) Displays interface port status (up or down).

### MIB Objects

```
alaUdldPortStatsTable
  alaUdldPortStatsClear
```

---

## show udld configuration

Displays the global status of UDLD configuration.

**show udld configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show udld configuration
Global UDLD Status : Disabled
```

#### *output definitions*

---

<b>Global UDLD Status</b>	Indicates the UDLD status on the switch. Options include <b>enabled</b> or <b>disabled</b> .
---------------------------	----------------------------------------------------------------------------------------------

---

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<b>udld</b>	Globally enables or disables UDLD protocol on the switch.
<b>show udld configuration port</b>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

### MIB Objects

alaUdldGlobalStatus

---

## show udld configuration port

Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

**show udld configuration port** [*slot/port*]

---

### Syntax Definitions

*slot/port*                                      The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

By default, a list of all UDLD ports is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show udld configuration port
Slot/Port      Admin State   Oper Mode     Probe-Timer    Echo-Wait-Timer
-----+-----+-----+-----+-----
1/1            disabled     normal        15             10
1/2            disabled     normal        45             10
1/17           disabled     normal        33             8
1/18           disabled     normal        33             8
1/19           disabled     normal        33             8
1/20           disabled     aggressive    55             8
1/21           disabled     aggressive    55             8
1/22           disabled     aggressive    55             8
1/41           disabled     aggressive    77             8
1/42           enabled      aggressive    77             8
1/43           enabled      aggressive    77             8
1/44           enabled      aggressive    77             8
1/45           enabled      aggressive    77             8
```

```
-> show udld configuration port 1/44
Global UDLD Status      : enabled,
Port UDLD Status        : enabled,
Port UDLD State         : bidirectional,
UDLD Op-Mode            : aggressive,
Probe Timer (Sec)       : 77,
Echo-Wait Timer (sec)   : 8
```

*output definitions*

---

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>UDLD-State</b>	Indicates the state of interface determined by UDLD operation, which can be <b>notapplicable</b> , <b>shutdown</b> , <b>undetermined</b> or <b>bidirectional</b> .
<b>Oper-Mode</b>	Indicates the operational mode of UDLD protocol. Options include <b>normal</b> or <b>aggressive</b> .
<b>Global UDLD Status</b>	Indicates the UDLD status on the switch. Options include <b>enabled</b> or <b>disabled</b> .
<b>Port UDLD Status</b>	Indicates the UDLD status on a port. Options include <b>enable</b> or <b>disable</b> .
<b>Probe Timer</b>	The probe-message expected after this time period.
<b>Echo-Wait Timer</b>	The detection of neighbor is expected with in this time period.

---

## show udld statistics port

Displays the UDLD statistics for a specific port.

**show udld statistics port** *slot/port*

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show udld statistics port 1/42
UDLD Port Statistics
  Hello Packet Send      :8,
  Echo Packet Send       :8,
  Flush Packet Recvd     :0
UDLD Neighbor Statistics
  Neighbor ID    Hello Pkts Recv      Echo Pkts Recv
-----+-----+-----
      1             8                 15
      2             8                 15
      3             8                 21
      4             8                 14
      5             8                 15
      6             8                 20
```

#### *output definitions*

---

<b>Hello Packet Send</b>	The number of hello messages sent by a port.
<b>Echo Packet Send</b>	The number of echo messages sent by a port.
<b>Flush Packet Recvd</b>	The number of UDLD-Flush message received by a port.
<b>Neighbor ID</b>	The name of the neighbor.
<b>Hello Pkts Recv</b>	The number of hello messages received from the neighbor.
<b>Echo Pkts Recv</b>	The number of echo messages received from the neighbor.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### **udld probe-timer**

Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports.

### **udld echo-wait-timer**

Configures the echo based detection timer on a specific port, a range of ports, or all the ports.

## show udld neighbor port

Displays the UDLD neighbor ports.

**show udld neighbor port** *slot/port*

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show udld neighbor port 1/42
Neighbor ID          Device Id           Port Id
-----+-----+-----
1                   00:d0:95:ea:b2:48  00:d0:95:ea:b2:78
2                   00:d0:95:ea:b2:48  00:d0:95:ea:b2:79
3                   00:d0:95:ea:b2:48  00:d0:95:ea:b2:74
4                   00:d0:95:ea:b2:48  00:d0:95:ea:b2:75
5                   00:d0:95:ea:b2:48  00:d0:95:ea:b2:76
6                   00:d0:95:ea:b2:48  00:d0:95:ea:b2:77
```

#### *output definitions*

---

<b>Neighbor ID</b>	The name of the neighbor.
<b>Device ID</b>	The device ID.
<b>Port ID</b>	The port ID.

# 3 Power over Ethernet (PoE) Commands

The Power over Ethernet (PoE) feature is supported on OmniSwitch chassis-based switches using PoE-capable Ethernet modules and a peripheral power shelf as well as on OmniSwitch PoE capable switches. Refer to the *OmniSwitch Hardware Users Guide* for further details.

---

**Note on Terminology.** There are several general terms used to describe this feature. The terms *Power over Ethernet (PoE)*, *Power over LAN (PoL)*, *Power on LAN (PoL)*, and *Inline Power* are synonymous terms used to describe the powering of attached devices via Ethernet ports. For consistency, this chapter and the *OmniSwitch CLI Reference Guide* refer to the feature as *Power over Ethernet (PoE)*.

Additional terms, such as *Powered Device (PD)* and *Power Source Equipment (PSE)* are terms that are not synonymous, but are directly related to PoE.

- *PD* refers to any attached device that uses a PoE data cable as its only source of power. Examples include access points such as IP telephones, Ethernet hubs, wireless LAN stations, etc.
- *PSE* refers to the actual hardware source of the electrical current for PoE such as OmniSwitch chassis-based switches with PoE modules or OmniSwitch PoE capable switches.

---

PoE commands documented in this section comply with IEEE 802.3, 802.af, and pre-802.3at.

MIB information for the PoE commands is as follows:

*Filename:* AlcatelIND1InLinePowerEthernet\_mib  
*Module:* ALCATEL-IND1-INLINE-POWER-MIB

*Filename:* AaIETF\_HUBMIB\_POWER\_ETHERNET\_DRAFT\_mib  
*Module:* POWER-ETHERNET-MIB

A summary of the available commands is listed here:

---

- lanpower start**
- lanpower stop**
- lanpower power**
- lanpower maxpower**
- lanpower priority**
- lanpower priority-disconnect**
- lanpower slot-priority**
- lanpower redundant-power**
- lanpower capacitor-detection**
- show lanpower**
- show lanpower capacitor-detection**
- show lanpower priority-disconnect**
- show lanpower slot-priority**

---

## lanpower start

Activates Power over Ethernet on a single specified PoE port *or* on all PoE ports in a specified slot.

**lanpower start** {*slot/port*[-*port2*] | *slot*}

---

**Important.** Inline power is *not activated* until the **lanpower start** *slot* syntax is issued for the applicable PoE slot(s).

---

---

### Syntax Definitions

<i>slot/port</i>	Activates inline power on the specified PoE port only. This syntax is used to re-enable power to an <i>individual port</i> that has been manually turned off via the <b>lanpower stop</b> command.
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>slot</i>	Activates inline power on all PoE ports in the corresponding slot.

### Defaults

Power over Ethernet operational status is globally disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *slot/port* syntax to activate power on a particular port. When all ports in a slot are manually turned off, use only the *slot* syntax in the command line. This activates power on all ports in the specified slot. As noted above, inline power is *not active* until the **lanpower start** *slot* syntax is issued for the applicable PoE slot(s).

### Examples

```
-> lanpower start 5/11
-> lanpower start 5
-> lanpower start 5/11-14
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### [lanpower stop](#)

Manually disconnects power on a single specified PoE port or on all PoE ports in a specified slot.

### [show lanpower](#)

Displays current inline power status and related statistics for all PoE ports in a specified slot.

## MIB Objects

```
alaPethMainPseGroup
  alaPethMainPseAdminStatus
pethPsePortTable
  pethPsePortAdminEnable
```

---

## lanpower stop

Manually disables power on a single specified PoE port *or* on all PoE ports in a specified slot.

**lanpower stop** {*slot/port[-port2]* | *slot*}

---

### Syntax Definitions

<i>slot/port</i>	Disables inline power on the specified PoE port only.
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>slot</i>	Disables inline power on all PoE ports in the corresponding slot.

### Defaults

Power over Ethernet operational status is globally disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> lanpower stop 5/22
-> lanpower stop 5
-> lanpower stop 5/22-27
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">lanpower start</a>	Activates inline power on a single specified PoE port <i>or</i> on all PoE ports in a specified slot.
<a href="#">show lanpower</a>	Displays current inline power status and related statistics for all PoE ports in a specified slot.

### MIB Objects

```
alaPethMainPseGroup
  alaPethMainPseAdminStatus
pethPsePortTable
  pethPsePortAdminEnable
```

---

## lanpower power

Specifies the maximum amount of inline power, in milliwatts, available to *a specific PoE port*. The value specified is used to supply inline power to devices such as IP telephones and wireless LAN devices.

**lanpower** {*slot/port* | *slot*} **power** *milliwatts*

---

### Syntax Definitions

*slot/port* A PoE port on which the maximum amount of inline power is being configured.

*milliwatts* The maximum amount of inline power, in milliwatts, being made available to the corresponding port. Refer to the *OmniSwitch Hardware Users Guide* PoE specifications.

### Defaults

parameter	default	Range
<i>milliwatts</i> (OS6400)	15400	3000-18000
<i>milliwatts</i> (OS6850 )	15400	3000-18000
<i>milliwatts</i> (OS6855)	15400	3000-20000
<i>milliwatts</i> (OS6850E/OS9000E)	30000	3000-30000

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Using this command does not immediately allocate the power to the slot or port. Any unused power is still available and remains a part of the overall PoE budget.
- To globally specify the amount of inline power available to *all ports in a slot*, refer to the [lanpower maxpower](#) command on page 3-8.
- Be sure that the value specified complies with specific power requirements for all attached IP telephones and wireless LAN devices.
- Note that the power value for the [lanpower power](#) command is specified in milliwatts (mW); the related command, [lanpower maxpower](#), is specified in watts (W).

### Examples

```
-> lanpower 3/1 power 3025
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[lanpower maxpower](#)

Specifies the maximum amount of inline power, in watts, available to all PoE ports in a specified slot.

[show lanpower](#)

Displays current inline power status and related statistics for all PoE ports in a specified slot.

## MIB Objects

alaPethPsePortTable

    alaPethPsePortPowerMaximum

---

## lanpower maxpower

Specifies the maximum amount of inline power, in watts, available to *all PoE ports in a specified slot*.

**lanpower slot maxpower watts**

---

### Syntax Definitions

<i>slot</i>	The slot containing PoE ports on which the maximum amount of inline power allowed is being configured.
<i>watts</i>	The maximum amount of inline power, in watts, available to all PoE ports in the corresponding slot. Refer to the <i>OmniSwitch Hardware Users Guide</i> for additional PoE specifications.

### Defaults

parameter	default
900W Power Supply	780W
510W Power Supply	390W
360W Power Supply	240W
OS6855-14	66W
OS6855-24	80W
OS9000E	720W

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- To specify the maximum amount of inline power available to a *single port*, refer to the [lanpower power command on page 3-6](#).
- Note that the power value for the **lanpower maxpower** command is specified in watts (W); the related command, **lanpower power**, is specified in milliwatts (mW).

### Examples

```
-> lanpower 3 maxpower 200
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**lanpower power**

Specifies the maximum amount of inline power, in milliwatts, available to a specific PoE port.

**show lanpower**

Displays current inline power status and related statistics for all PoE ports in a specified slot.

## MIB Objects

alaPethMainPseGroup

alaPethMainPseMaxPower

---

## lanpower priority

Specifies an inline power priority level to a port. Levels include critical, high, and low.

**lanpower** *slot/port* **priority** {**critical** | **high** | **low**}

---

### Syntax Definitions

<i>slot/port</i>	The particular port on which a priority level is being configured.
<b>critical</b>	Intended for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible.
<b>high</b>	Intended for ports that have important, but <i>not</i> mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority.
<b>low</b>	Intended for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

### Defaults

parameter	default
<b>low</b>   <b>high</b>   <b>critical</b>	low

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> lanpower 2/16 priority low
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show lanpower](#)

Displays current inline power status and related statistics for all PoE ports in a specified slot.

## MIB Objects

pethPsePortGroup

    pethPsePortPowerPriority

---

## lanpower priority-disconnect

Enables or disables the priority disconnect function on all ports in a specified slot. Priority disconnect is used by the system software in determining whether an incoming PD will be granted or denied power when there are too few watts remaining in the PoE power budget for an additional device. For detailed information on this function, refer to the “Managing Power over Ethernet (PoE)” chapter in the *OmniSwitch Hardware Users Guide*.

**lanpower slot priority-disconnect {enable | disable}**

---

### Syntax Definitions

<i>slot</i>	The particular slot on which the priority disconnect function is being enabled or disabled.
<b>enable</b>	Enables priority disconnect on a specified port. When this function is enabled <i>and</i> a power budget deficit occurs in which there is inadequate power for an incoming device, the system software uses priority disconnect rules to determine whether an incoming device will be granted or denied power. For information on priority disconnect rules, refer to the “Managing Power over Ethernet (PoE)” chapter in the <i>OmniSwitch Hardware Users Guide</i> .
<b>disable</b>	Disables priority disconnect on a specified port. When priority disconnect is disabled and there is inadequate power in the budget for an additional device, power will be denied to <i>any</i> incoming PD, regardless of its priority status.

### Defaults

parameter	default
<b>enable   disable</b>	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> lanpower 2 priority-disconnect disable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**lanpower priority**

Specifies an inline power priority level to a port. Levels include critical, high, and low.

**show lanpower priority-disconnect**

Displays the priority disconnect function status on all ports in a specified slot.

## MIB Objects

alaPethMainPseTable

alaPethMainPsePriorityDisconnect

---

## lanpower slot-priority

Configures an inline power priority level for a slot. If the power supply of the power shelf goes down, the order of a particular daughter module will be disabled based on priority, thus affecting the power budget available to the whole chassis. Levels include critical, high, and low.

**lanpower slot slot-priority {critical | high | low}**

---

### Syntax Definitions

<i>slot</i>	The particular slot on which a priority level is being configured.
<b>critical</b>	Intended for slots that have mission-critical devices attached and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible.
<b>high</b>	Intended for slots that have important, but <i>not</i> mission-critical devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority.
<b>low</b>	Intended for slots that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

### Defaults

parameter	default
low   high   critical	low

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Note that if all the POE NI modules are all configured with the same priority level, then priority is determined based on the slot number of the module; the lower the slot number the higher the priority. For example, if slots 1, 2, 7, and 8 are powered by two POE power supplies and one of the power supplies goes down, power is cut to slots 7 and 8 because they have a lower priority than slots 1 and 2.

### Examples

```
-> lanpower 1 slot-priority critical
-> lanpower 2 slot-priority high
-> lanpower 3 slot-priority low
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

[show lanpower slot-priority](#)

Displays the order in which a particular daughter module will be disabled if a power shelf power supply goes down, thus affecting the power budget available to the chassis.

## MIB Objects

alaPethMainPseTable

    alaPethMainPsePriority

---

## lanpower redundant-power

Enables or disables power supply redundancy for Power over Ethernet on the switch.

**lanpower redundant-power {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables redundant power on the switch.
<b>disable</b>	Disables redundant power on the switch.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	disable

---

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- In order to comply with 911 emergency requirements, PoE power redundancy status must be *enabled* at all times. For additional requirements, refer to the “Managing Power over Ethernet (PoE)” chapter in the *OmniSwitch Hardware Users Guide*.

### Examples

```
-> lanpower redundant-power enable
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

N/A

### MIB Objects

```
alaPethMainTable  
alaPethMainPowerRedundancy
```

---

## lanpower capacitor-detection

Enables or disables the capacitor detection method.

**lanpower slot capacitor-detection {enable | disable}**

---

### Syntax Definitions

**slot** The particular slot on which the capacitor detection method is being enabled or disabled.

**enable** Enables the capacitor detection method.

**disable** Disables the capacitor detection method.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The capacitor detection method should only be enabled if there are legacy IP phones attached to the corresponding slot—this feature is *not* compatible with IEEE specifications. Please contact your Alcatel-Lucent sales engineer or Customer Support representative to find out which Alcatel-Lucent IP phones models need capacitive detection enabled.

### Examples

```
-> lanpower 3 capacitor-detection enable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show lanpower capacitor-detection](#) Displays capacitor detection method status.

### MIB Objects

alaPethMainTable  
alaPethMainPseCapacitorDetect

---

## show lanpower

Displays current inline power status and related statistics for all PoE ports in a specified slot.

**show lanpower** *slot*

---

### Syntax Definitions

*slot* The slot for which current inline power status and related statistics are to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show lanpower 1
Port Maximum(mW) Actual Used(mW) Status Priority On/Off Class

48      18000           0      Undefined    Low         OFF        -
```

```
Slot 1 Max Watts 380
380 Watts Total Power Budget Remaining
380 Watts Total Power Budget Available
1 Power Supplies Available
```

### output definitions

---

<b>Port</b>	A PoE port for which current status and related statistics are being displayed.
<b>Maximum (mW)</b>	The current maximum amount of power available to the corresponding PoE port, in milliwatts. The default value is 15400. To change this setting, use the <b>lanpower power</b> command.

*output definitions (continued)*

<b>Actual Used (mW)</b>	The actual amount of power being used by an attached device (if applicable), in milliwatts. If no device is attached to the corresponding port, this row displays a value of 0.
<b>Status</b>	Displays the current operational status. Options include <b>Powered On</b> , <b>Powered Off</b> , and <b>Undefined</b> .
<b>Priority</b>	<p>The current priority level for the corresponding PoE port. Options include <b>Critical</b>, <b>High</b>, and <b>Low</b>. <b>Critical</b> should be reserved for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible. <b>High</b> indicates ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority. <b>Low</b> priority is for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical and high-priority ports).</p> <p>The default value is Low. Priority levels can be changed using the <b>lanpower priority</b> command.</p>
<b>On/Off</b>	Displays whether a port has been manually turned on or off by the user. <b>ON</b> indicates that the port has been turned on by the user via the <b>lanpower start</b> command. <b>OFF</b> indicates that the port has been turned off by the user via the <b>lanpower stop</b> command.
<b>Class</b>	PoE class detected on attached Powered Device.
<b>Max Watts</b>	The maximum watts available to the corresponding slot. The maximum watts value for a slot can be changed using the <b>lanpower maxpower</b> command.
<b>Total Power Budget Remaining</b>	The amount of power budget remaining for PoE modules. If the total power budget remaining is exceeded, a power error will occur and the switch's chassis management software will begin shutting down power to PoE ports according to their priority levels.
<b>Total Power Budget Available</b>	The total amount of power remaining, based upon the number of power supplies installed and operating in the power shelf.
<b>Power Shelf Power Supplies Available</b>	The number of power supplies currently installed and operating in the switch's power shelf. The power shelf is also referred to as Power Source Equipment (PSE).

**Release History**

# 4 Source Learning Commands

Source Learning is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chapter includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

*Filename:* AlcatelInd1MacAddress.mib  
*Module:* ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

---

**mac-address-table**  
**mac-address-table vpls permanent sap**  
**mac-address-table vpls permanent mesh-sdp**  
**mac-address-table static-multicast**  
**mac-address-table aging-time**  
**source-learning chassis-distributed**  
**source-learning**  
**show mac-address-table**  
**show mac-address-table all**

## mac-address-table

Configures a destination unicast MAC address. The configured (static) MAC address is assigned to a non-mobile switch port or link aggregate ID and VLAN. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static MAC address are forwarded to the specified port. Static destination MAC addresses are maintained in the Source Learning MAC address table.

**mac-address-table** [**permanent**] *mac\_address* {*slot/port* | **linkagg** *link\_agg*} *vid* [**bridging** | **filtering**]

**no mac-address-table** [**permanent** | **learned**] [*mac\_address* {*slot/port* | **linkagg** *link\_agg*} *vid*]

---

### Syntax Definitions

<b>permanent</b>	Defines a permanent static MAC Address that is not removed when the switch reboots.
<b>learned</b>	Specifies that the MAC address is a dynamically learned address.
<i>mac_address</i>	Enter the destination MAC Address to add to the MAC Address Table (e.g., 00:00:39:59:f1:0c).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>link_agg</i>	Enter a link aggregate ID number (0–31). See <a href="#">Chapter 8, “Link Aggregation Commands.”</a>
<i>vid</i>	VLAN ID number (1–4094).
<b>bridging</b>	Specifies that all packets to or from this MAC address are bridged.
<b>filtering</b>	Specifies that all packets to or from this MAC address are dropped.

### Defaults

parameter	default
<b>permanent</b>	permanent
<b>bridging</b>   <b>filtering</b>	bridging

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a MAC address from the Source Learning MAC Address Table.
- The specified slot/port or link aggregate ID must already belong to the specified VLAN. Use the **vlan port default** command to assign a port or link aggregate ID to a VLAN before you configure the static MAC address. Only traffic from other ports associated with the same VLAN is directed to the static MAC address slot/port.

- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, the packet is discarded.
- Static MACs are not supported on mobile ports.
- Only static MAC address entries with a **permanent** management status are captured when a snapshot of the switch's running configuration is taken.
- Use the **mac-address-table aging-time** command (see [page 4-10](#)) to set the aging time value for all static and dynamically learned MAC addresses. This is the value applied to static MAC addresses defined using the **mac-address-table timeout** form of this command.

## Examples

```
-> mac-address-table permanent 00:00:39:59:f1:0c 4/2 355
-> no mac-address-table
-> no mac-address-table 5/1 755
-> no mac-address-table permanent
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>mac-address-table aging-time</b>	Configures aging time, in seconds, for static and dynamically learned MAC addresses.
<b>show mac-address-table</b>	Displays Source Learning MAC Address Table information.
<b>show mac-address-table count</b>	Displays Source Learning MAC Address Table statistics.
<b>show mac-address-table aging-time</b>	Displays the current aging time value for the Source Learning MAC Address Table.

## MIB Objects

```
sLMacAddressTable
  sLMacAddress
  sLMacAddressManagement
  sLMacAddressDisposition
```

---

## mac-address-table vpls permanent sap

Configures a static MAC address and associates that address with the specified Service Access Point (SAP) ID for the specified Virtual Private LAN Service (VPLS).

**mac-address-table vpls** *service-id* **permanent** *mac-address* **sap** {*sap-id* | **linkagg** *sap-id*}

**no mac-address-table vpls** *service-id* **permanent** *mac-address*

**no mac-address-table vpls** *service-id* **learned** [**sap** *sap-id* | **linkagg** *sap-id*] *mac-address*

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.
<i>sap-id</i>	The access slot and port number or link aggregate ID (0–31) and encapsulation value for an existing SAP (e.g., 1/10:0, 1/12:all, 20:150, 10:all).
<b>learned</b>	Specifies that the MAC address is a dynamically learned address. This option is only available with the <b>no</b> form of this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the configured static MAC from the source learning FDB.
- The specified VPLS ID and SAP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SAP.
- A SAP ID is comprised of an access (customer-facing) port or link aggregate and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.
- Static MACs associated with a SAP are classified as local MACs. A local MAC is used by the associated VPLS so that MAC addresses are not learned on the edge device.
- A MAC address can participate in only one static MAC address entry (local or remote) for a specific VPLS.
- Static MAC addresses configured on one edge device are not propagated to other edge devices associated with the same VPLS instance. Each edge device has an independent forwarding database for the associated VPLS.

### Examples

```
-> mac-address-table vpls 10 permanent 00:00:da:3e:44:01 sap 1/2:100
-> mac-address-table vpls 10 permanent 00:00:da:3e:44:01 sap linkagg 10:100
```

```
-> no mac-address-table vpls 10 00:00:da:3e:44:01
-> no mac-address-table vpls 10 permanent 00:00:da:3e:44:01
-> no mac-address-table vpls 20 learned 00:2a:3e:11:22:10
-> no mac-address-table vpls 30 learned 1/10:all 00:2a:3e:11:22:09
-> no mac-address-table vpls 40 learned linkagg 10:all 00:2a:3e:11:22:08
```

## Release History

Release 6.4.2; command was introduced.

## mac-address-table vpls permanent mesh-sdp

Configures a static MAC address and associates that address with the specified Service Distribution Point (SDP) ID binding with the specified Virtual Private LAN Service (VPLS).

**mac-address-table vpls** *service-id* **permanent** *mac-address* **mesh-sdp** *sdp-id[:vc-id]*

**no mac-address-table vpls** *service-id* **permanent** *mac-address*

**no mac-address-table vpls** *service-id* **learned** [**mesh-sdp** *sdp-id[:vc-id]*] *mac-address*

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.
<i>sdp-id</i>	An existing SDP ID number that is bound to the specified service ID number.
<i>vc-id</i>	<i>Optional.</i> The VC ID number appended to the specified SDP ID number.
<b>learned</b>	Specifies that the MAC address is a dynamically learned address. This option is only available with the <b>no</b> form of this command.

### Defaults

parameter	default
<i>vc-id</i>	<i>service-id</i> value

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the configured static MAC from the source learning FDB.
- The specified VPLS ID and SDP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SDP.
- Static MACs associated with SDPs are classified as remote MACs. A remote MAC is used by the associated VPLS so that MAC addresses are not learned on the edge device.
- A MAC address can participate in only one static MAC address entry (local or remote) for a specific VPLS.
- Static MAC addresses configured on one edge device are not propagated to other edge devices associated with the same VPLS instance. Each edge device has an independent forwarding database for the associated VPLS.

## Examples

```
-> mac-address-table vpls 10 permanent 00:00:da:3e:44:01 mesh-sdp 10
-> no mac-address-table vpls 10 learned 00:00:da:3e:44:01
-> no mac-address-table vpls 20 learned mesh-sdp 20 00:2a:d5:11:2a:31
```

---

## mac-address-table static-multicast

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

**mac-address-table static-multicast** *multicast\_address* {*slot1/port1*[-*port1a*] [*slot2/port2*[-*port2a*]...]} / **linkagg** *link\_agg* } *vid*

**no mac-address-table static-multicast** [*multicast\_address* {*slot1/port1*[-*port1a*] [*slot2/port2*[-*port2a*]...]} / **linkagg** *link\_agg* } *vid*]

---

### Syntax Definitions

<i>multicast_address</i>	Enter the destination multicast MAC Address to add to the MAC Address Table (e.g., 01:00:39:59:f1:0c).
<i>slot1/port1</i> [- <i>port1a</i> ]	The egress slot and port combination that is assigned to the static multicast MAC address. You may enter multiple ports and port ranges.
<i>slot2/port2</i> [- <i>port2a</i> ]	Additional egress slot and port combinations may be assigned to the static multicast MAC address. You may enter multiple ports and port ranges.
<i>link_agg</i>	Enter a link aggregate ID number (0–29). See <a href="#">Chapter 8, “Link Aggregation Commands.”</a>
<i>vid</i>	VLAN ID number (1–4094).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that if no parameters are specified with this form of the command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, etc., are multicast MAC addresses.
- If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the **mac-address-table static-multicast** command. Also note that multicast addresses within the following ranges are not supported:

```
01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
01:80:C2:XX.XX.XX
33:33:XX:XX:XX:XX
```

- The configured (static) multicast MAC address is assigned to a non-mobile switch port or link aggregate ID and VLAN. Static multicast MACs are not supported on mobile ports.
- In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.
- The specified slot/port or link aggregate ID must already belong to the specified VLAN. Use the **vlan port default** command to assign a port or link aggregate ID to a VLAN before you configure the static MAC address. Only traffic from other ports associated with the same VLAN is directed to the static multicast MAC address slot/port.
- If the **configuration snapshot** or **write memory** command is entered after a static multicast MAC address is configured, the resulting ASCII file or **boot.cfg** file will include the following additional syntax for the **mac-address-table static-multicast** command:

**group** *num*

This syntax indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance. Up to 1022 such instances are supported per switch.

- Note that if the port assigned to a multicast MAC address is down or administratively disabled when the **configuration snapshot** or **write memory** command is used, the multicast MAC address is not saved to the resulting ASCII file or **boot.cfg** file.

## Examples

```
-> mac-address-table static-multicast 02:00:39:59:f1:0c 4/2 355
-> mac-address-table static-multicast 01:00:00:3a:44:11 1/12-24 255
-> mac-address-table static-multicast 03:00:00:3a:44:12 1/10 2/1-6 3/1-8 1500
-> mac-address-table static-multicast 04:00:00:3a:44:13 linkagg 10 455
-> no mac-address-table static-multicast 03:00:00:3a:44:12 1/10 1500
-> no mac-address-table static-multicast 04:00:00:3a:44:13 linkagg 10 455
-> no mac-address-table static-multicast
```

## Release History

Release 6.1.2; command was introduced.

## Related Commands

## mac-address-table aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

**mac-address-table aging-time** *seconds*

**no mac-address-table aging-time**

---

### Syntax Definitions

*seconds* Aging time value (in seconds). Do not use commas in value. The range is 60—1000000.

### Defaults

By default, the aging time is set to 300 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported on this platform.
- Note that an inactive MAC address may take up to twice as long as the aging time value specified to age out of the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC will age out any time between 60 and 120 seconds of inactivity.
- If the **timeout** parameter is not specified when using the **mac-address-table** command (see [page 4-2](#)) to configure a static MAC address, then the aging time value is not applied to the static MAC address.

### Examples

```
-> mac-address-table aging-time 1200  
-> no mac-address-table aging-time
```

### Release History

Release 6.1; command was introduced.

Release 6.1.1; **vlan** parameter not supported.

## MIB Objects

s1MacAddressAgingTable  
    s1MacAgingValue

---

## source-learning

Configures the status of source MAC address learning on a single port, a range of ports, or on a link aggregate of ports.

**source-learning** {port *slot/port1*[-*port2*] / linkagg *linkagg\_num*} {enable | disable}

---

### Syntax Definitions

<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>linkagg_num</i>	Specifies the link aggregate port ID.
<b>enable</b>	Enables source learning.
<b>disable</b>	Disables source learning.

### Defaults

By default, source learning is enabled on all ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring source learning is not supported on mobile ports, Learned Port Security ports, individual ports which are members of a link aggregate, or Access Guardian (802.1x) ports.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When source-learning is disabled on a port or link aggregate, all dynamically learned MAC addresses are removed from the MAC address table.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates even when source learning is disabled on them.
- Disabling source learning on a port or link aggregate is useful on a ring configuration where switch A does not have to learn MAC addresses from switch B or for a Transparent LAN Service, where service provider does not require the MAC addresses of the Customer network.

### Examples

```
-> source-learning port 1/2 disable
-> source-learning port 1/3-9 disable
-> source-learning linkagg 10 disable
```

## Release History

Release 6.4.2; command added.

## Related Commands

### [show source-learning](#)

s1MacLearningControlTable  
  s1MacLearningControlEntry  
  s1MacLearningControlStatus
```

---

---

## source-learning chassis-distributed

Enables or disables the distributed MAC source learning mode for the chassis. Enabling this mode increases the number of learned MAC addresses supported to 16K per module and up to 64K per chassis.

**source-learning chassis-distributed {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables distributed MAC source learning mode.
<b>disable</b>	Disables distributed MAC source learning mode.

### Defaults

By default distributed MAC source learning mode is disabled for the chassis.

### Platforms Supported

OmniSwitch 6850E, 9000E

### Usage Guidelines

- After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the **write memory** command and then reboot the switch.
- Distributed MAC source learning is not supported on an OmniSwitch stackable switches.
- When the distributed MAC source learning mode is disabled (the default), the maximum number of learned MAC addresses allowed per OmniSwitch chassis-based switch is 16K.

### Examples

```
-> source-learning chassis-distributed enable
-> source-learning chassis-distributed disable
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

**show source-learning chassis-distributed** Displays the current status of the distributed MAC source learning mode.

### MIB Objects

```
sLMacAddressTable
  sLDistributedMacMode
```

---

## show mac-address-table

Displays Source Learning MAC Address Table information.

**show mac-address-table** [**permanent** | **learned** | **quarantined**] [*mac\_address*] [**slot** *slot* | *slot/port*] [**link-agg** *link\_agg*] [*vid* | *vid1-vid2*]

---

### Syntax Definitions

<b>permanent</b>	Display static MAC addresses with a permanent status.
<b>learned</b>	Display dynamically learned MAC addresses.
<b>quarantined</b>	Display MAC addresses quarantined by the Quarantine Manager and Remediation (QMR) application.
<i>mac_address</i>	Enter a MAC Address (e.g., 00:00:39:59:f1:0c).
<i>slot</i>	Enter the slot number for a module to specify that the command should include all ports on that module (e.g., 6 specifies all ports on the module found in slot 6 of the switch chassis).
<i>slot/port</i>	Enter the slot number and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>link_agg</i>	Enter a link aggregate ID number (0–31). See <a href="#">Chapter 8, “Link Aggregation Commands.”</a>
<i>vid</i>	A single VLAN ID number (1–4094).
<i>vid1-vid2</i>	A range of VLAN IDs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, information is displayed for all MAC addresses contained in the table.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.
- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-address-table** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

## Examples

```
-> show mac-address-table
```

```
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VLAN	1	00:00:00:00:00:01	learned	0800	bridging	8/1
VLAN	1	00:d0:95:6a:73:9a	learned	aaaa0003	bridging	10/23

```
Total number of Valid MAC addresses above = 2
```

```
-> show mac-address-table 10-15
```

```
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VLAN	10	00:00:00:00:00:01	learned	0800	bridging	1/2
VLAN	10	00:d0:95:6a:73:9a	learned	aaaa0003	bridging	1/2
VLAN	11	00:d0:95:a3:e0:0d	learned	---	bridging	1/3
VLAN	11	00:d0:95:a3:e5:09	learned	---	bridging	1/3
VLAN	11	00:d0:95:a3:e7:75	learned	---	bridging	1/4

VLAN	12	00:d0:95:a8:2a:b6	learned	---	bridging	2/1
VLAN	12	00:d0:95:ad:e3:cc	learned	---	bridging	2/1
VLAN	13	00:d0:95:ae:3b:f6	learned	---	bridging	2/8
VLAN	13	00:d0:95:b2:3d:fa	learned	---	bridging	2/8
VLAN	14	00:00:0a:00:00:00	quarantined	---	filtered	5/1
VLAN	14	00:00:0a:00:00:01	quarantined	---	filtered	5/1
VLAN	14	00:00:0a:00:00:02	quarantined	---	filtered	5/1
VLAN	14	00:00:0a:00:00:03	quarantined	---	filtered	5/1

```
Total number of Valid MAC addresses above = 14
```

```
-> show mac-address-table quarantined
```

```
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VLAN	14	00:00:0a:00:00:00	quarantined	---	filtered	5/1
VLAN	14	00:00:0a:00:00:01	quarantined	---	filtered	5/1
VLAN	14	00:00:0a:00:00:02	quarantined	---	filtered	5/1
VLAN	14	00:00:0a:00:00:03	quarantined	---	filtered	5/1

```
Total number of Valid MAC addresses above = 14
```

### output definitions

<b>Domain</b>	The domain to which the MAC address belongs ( <b>VLAN</b> or <b>VPLS</b> ).
<b>VLAN/SrvId</b>	Vlan ID number or VPLS ID number associated with the MAC address.
<b>Mac Address</b>	MAC address that is currently learned or statically assigned.
<b>Type</b>	MAC address management status: <b>learned</b> , <b>permanent</b> , or <b>quarantined</b> . Configured through the <b>mac-address-table</b> command.
<b>Protocol</b>	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.

*output definitions*

---

<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default) or <b>filtering</b> . Configured through the <b>mac-address-table</b> command.
<b>Interface</b>	The slot number for the module and the physical port number on that module that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29).

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.3; *vid* parameter modified to support a range of VLAN IDs.

Release 6.3.1; **quarantined** type added.

Release 6.4.2; **Domain** field added and **SrvId** added to **Vlan** field.

**Related Commands**

**show mac-address-table all** Displays MAC addresses associated with both VLANs and Virtual Private LAN Service (VPLS) services.

**show mac-address-table count** Displays Source Learning MAC Address Table statistics.

**show mac-address-table aging-time** Displays the current aging time value for the Source Learning MAC Address Table.

**MIB Objects**

```
s1MacAddressTable
  s1MacAddress
  s1MacAddressManagement
  s1MacAddressDisposition
  s1MacAddressProtocol
```

---

## show mac-address-table all

Displays MAC addresses associated with both VLANs and Virtual Private LAN Service (VPLS) services.

**show mac-address-table all** [**permanent** | **learned**]

---

### Syntax Definitions

**permanent**                      Displays static MAC addresses with a permanent status.

**learned**                         Displays dynamically learned MAC addresses.

### Defaults

By default, information is displayed for all MAC addresses contained in the table.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-address-table** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

### Examples

```
SW-D-> show mac-address-table all
```

Legend: Mac Address: \* = address not valid

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VLAN	13	00:d0:95:e9:cf:86	learned	---	bridging	16/1
VLAN	13	00:e0:b1:9c:8a:3c	learned	---	bridging	16/1
VLAN	15	00:e0:b1:87:8d:68	learned	---	bridging	16/12
VLAN	15	00:e0:b1:9c:87:2f	learned	---	bridging	16/12
VPLS	1000	00:01:bd:01:01:01	learned	---	servicing	sdp:222:1000
VPLS	1000	00:01:bd:01:01:02	learned	---	servicing	sdp:222:1000
VPLS	1000	00:01:bd:01:01:03	learned	---	servicing	sdp:222:1000
VPLS	1000	00:01:bd:01:01:04	learned	---	servicing	sdp:222:1000
VPLS	1000	00:01:bd:01:01:05	learned	---	servicing	sdp:222:1000

Total number of Valid MAC addresses above = 14

### output definitions

---

<b>Domain</b>	The domain to which the MAC address belongs ( <b>VLAN</b> or <b>VPLS</b> ).
<b>VLAN/SrvId</b>	Vlan ID number or VPLS ID number associated with the MAC address.
<b>Mac Address</b>	MAC address that is currently learned or statically assigned.

<b>Type</b>	MAC address management status: <b>learned, permanent, or quarantined</b> .
<b>Protocol</b>	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.
<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default), <b>filtering</b> , or <b>servicing</b> .
<b>Interface</b>	The slot/port number that is associated with the MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29). If the MAC is associated with a VPLS service, this field contains the mesh-SDP or SAP binding information.

---

## show mac-address-table vpls

Displays Source Learning MAC Address Table contents for VPLS services.

**show mac-address-table vpls** [*service-id*] [**permanent** | **learned**] [*mac-address*]

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<b>permanent</b>	Display static MAC addresses.
<b>learned</b>	Display dynamically learned MAC addresses.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

By default, all MAC addresses for all services are displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the optional parameters with this command to display information for specific services and MAC address types.

### Example

```
-> show mac-address-table vpls 1002 00:01:db:07:03:02
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvcId	Mac Address	Type	Protocol	Operation	Interface
VPLS	1002	00:01:db:07:03:02	learned	---	servicing	sap:0/16:1006

```
-> show mac-address-table vpls 1002 permanent
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvcId	Mac Address	Type	Protocol	Operation	Interface
VPLS	1002	00:00:00:00:00:05	permanent	---	servicing	sap:0/16:1005

Total number of Valid MAC addresses above = 1

```
-> show mac-address-table vpls 1002 learned
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvcId	Mac Address	Type	Protocol	Operation	Interface
VPLS	1002	00:01:bd:01:02:01	learned	---	servicing	sdp:222:1002

---

```

VPLS 1002      00:01:db:07:03:06  learned  ---  servicing sap:0/16:1010
VPLS 1002      00:d0:95:e5:30:f2  learned  ---  servicing sap:0/16:1005

```

Total number of Valid MAC addresses above = 13

### *output definitions*

---

<b>Domain</b>	The domain to which the MAC address belongs: <b>VLAN</b> or <b>VPLS</b> .
<b>VLAN/SrvId</b>	VLAN ID number or VPLS ID number associated with the MAC address.
<b>Mac Address</b>	MAC address that is currently learned or statically assigned.
<b>Type</b>	MAC address management status: <b>learned</b> or <b>permanent</b> .
<b>Protocol</b>	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.
<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default), <b>filtering</b> , or <b>servicing</b> .
<b>Interface</b>	The VPLS mesh-SDP or SAP binding information.

---

### **Release History**

Release 6.4.2; command introduced

### **Related Commands**

[mac-address-table vpls permanent sap](#) Configures a static MAC address for a VPLS Service Access Point binding.

[mac-address-table vpls permanent mesh-sdp](#) Configures a static MAC address for a VPLS mesh-Service Distribution Point binding.

### **Related MIB Objects**

```

s1MacAddressGlobalTable
  s1ServiceId
  s1MacAddressGbl
  s1MacAddressGblmanagement

```

---

## show mac-address-table vpls sap

Displays Source Learning MAC Address Table information for the specified VPLS Service Access Point (SAP) binding.

```
show mac-address-table vpls service-id sap {sap-id | linkagg sap-id} mac-address
```

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sap-id</i>	The access slot and port number or link aggregate ID (0–31) and encapsulation value for an existing SAP (e.g., 1/10:0, 1/12:all, 20:150, 10:all).
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The specified VPLS ID and SAP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SAP.
- A SAP ID is comprised of an access (customer-facing) port or link aggregate and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

### Example

```
-> show mac-address-table vpls 1002 sap linkagg 16:1006
```

```
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VPLS	1002	00:01:db:07:03:02	learned	---	servicing	sap:0/16:1006

```
Total number of Valid MAC addresses above = 1
```

#### output definitions

---

<b>Domain</b>	The domain to which the MAC address belongs: <b>VLAN</b> or <b>VPLS</b> .
<b>VLAN/SrvId</b>	The VPLS ID number associated with the MAC address.
<b>Mac Address</b>	MAC address that is currently learned or statically assigned.
<b>Type</b>	MAC address management status: <b>learned</b> or <b>permanent</b> .
<b>Protocol</b>	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.

*output definitions*

---

<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default), <b>filtering</b> , or <b>servicing</b> .
<b>Interface</b>	The VPLS SAP binding to which the MAC address is associated.

---

**Release History**

Release 6.4.2; command introduced

**Related Commands**

[mac-address-table vpls permanent sap](#) Configures a static MAC address for a VPLS SAP binding.

[show source-learning chassis-distributed](#) Displays the Source Learning MAC Address Table contents for VPLS service MAC addresses.

  s1SubId:
```

---

## show mac-address-table vpls mesh-sdp

Displays Source Learning MAC Address Table information for the specified VPLS mesh-SDP binding.

**show mac-address-table vpls** *service-id* **mesh-sdp** *sdp-id[:vc-id]* *mac-address*

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number that is bound to the specified service ID number.
<i>vc-id</i>	<i>Optional.</i> The VC ID number appended to the specified SDP ID number.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

parameter	default
<i>vc-id</i>	<i>service-id</i> value

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The specified VPLS ID and SDP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SAP.

### Example

```
SW-D-> show mac-address-table vpls 1002 mesh-sdp 222
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VPLS	1002	00:01:bd:01:02:01	learned	---	servicing	sdp:222:1002
VPLS	1002	00:01:bd:01:02:02	learned	---	servicing	sdp:222:1002
VPLS	1002	00:01:bd:01:02:03	learned	---	servicing	sdp:222:1002
VPLS	1002	00:01:bd:01:02:04	learned	---	servicing	sdp:222:1002
VPLS	1002	00:01:bd:01:02:05	learned	---	servicing	sdp:222:1002
VPLS	1002	00:01:bd:01:02:06	learned	---	servicing	sdp:222:1002

Total number of Valid MAC addresses above = 6

### output definitions

---

<b>Domain</b>	The domain to which the MAC address belongs: <b>VLAN</b> or <b>VPLS</b> .
<b>VLAN/SrvId</b>	The VPLS ID number associated with the MAC address.

*output definitions (continued)*

---

<b>Mac Address</b>	MAC address that is currently learned or statically assigned.
<b>Type</b>	MAC address management status: <b>learned</b> or <b>permanent</b> .
<b>Protocol</b>	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.
<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default), <b>filtering</b> , or <b>servicing</b> .
<b>Interface</b>	The VPLS mesh-SDP binding to which the MAC address is associated.

---

**Release History**

Release 6.4.2; command introduced

**Related Commands**

<a href="#">mac-address-table vpls permanent mesh-sdp</a>	Configures a static MAC for a VPLS mesh-SDP binding.
<a href="#">show source-learning chassis-distributed</a>	Displays Source Learning MAC Address Table information for VPLS service MAC addresses.

**Related MIB Objects**

```

---

## show mac-address-table static-multicast

Displays the static multicast MAC address configuration for the switch.

**show mac-address-table static-multicast** [*multicast\_address*] [**slot** *slot* | *slot/port*] [**linkagg** *link\_agg*] [*vid* | *vid1-vid2*]

---

### Syntax Definitions

<i>multicast_address</i>	Enter a multicast MAC Address (e.g., 01:00:39:59:f1:0c).
<i>slot</i>	Enter the slot number for a module to specify that the command should include all ports on that module (e.g., 6 specifies all ports on the module found in slot 6 of the switch chassis).
<i>slot/port</i>	Enter the slot number and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>link_agg</i>	Enter a link aggregate ID number (0–29). See Chapter 12, “Link Aggregation Commands.”
<i>vid</i>	VLAN ID number (1–4094).
<i>vid1-vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, information is displayed for all static multicast MAC addresses contained in the MAC address table.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.
- Note that if a static multicast MAC address is configured on a port link that is down or disabled, the configured multicast address does not appear in the **show mac-address-table static-multicast** command display.
- The **show mac-address-table** command display, however, includes all static multicast addresses regardless of whether or not the port assigned to the address is up or down. See the second example below.
- When the **show mac-address-table** command is used to display MAC addresses known to the switch, an asterisk appears to the left of all static MAC addresses that are configured on a port link that is down or disabled. The asterisk indicates that MAC address is invalid. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

## Examples

In the example below, the static multicast address 01:00:00:00:00:01 is associated with port 1/1, which is down. As a result, this address does not appear in the **show mac-address-table static-multicast** display but is included in the **show mac-address-table** display with an asterisk.

```
-> show mac-address-table static-multicast
```

```
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
VLAN	1	01:00:00:00:00:02	static-mcast	---	bridging	2/6

```
Total number of Valid MAC addresses above = 1
```

```
-> show mac-address-table
```

```
Legend: Mac Address: * = address not valid
```

Domain	Vlan/SrvId	Mac Address	Type	Protocol	Operation	Interface
* VLAN	1	01:00:00:00:00:01	static-mcast	0	bridging	1/1
VLAN	24	00:d0:95:e4:cf:5a	learned	---	bridging	1/2
VLAN	24	00:d0:95:e5:af:52	learned	---	bridging	1/2
VLAN	24	00:e0:4c:bc:ce:a1	learned	---	bridging	1/2
VLAN	1	01:00:00:00:00:02	static-mcast	---	bridging	2/6
VLAN	1	00:d0:95:e2:77:38	learned	---	bridging	3/19

```
Total number of Valid MAC addresses above = 5
```

### output definitions

<b>Domain</b>	The domain to which the MAC address belongs: <b>VLAN</b> or <b>VPLS</b> .
<b>VLAN/SrvId</b>	The VPLS ID number associated with the MAC address.
<b>Mac Address</b>	The multicast MAC address that is statically assigned to the VLAN and slot/port.
<b>Type</b>	Indicates the MAC address is a static multicast ( <b>static-mcast</b> ) address. Configured through the <b>mac-address-table static-multicast</b> command.
<b>Protocol</b>	Protocol type for the MAC address entry.
<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default) or <b>filtering</b> . Note that this value is always set to <b>bridging</b> for static multicast addresses.
<b>Interface</b>	The slot number for the module and the physical port number on that module that is associated with the static multicast MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29).

### Release History

Release 6.1.2; command was introduced.

Release 6.1.3; *vid* parameter modified to support a range of VLAN IDs.

## Related Commands

- show mac-address-table** Displays Source Learning MAC Address Table information.
- show mac-address-table count** Displays Source Learning MAC Address Table statistics.

## MIB Objects

```
slMacAddressTable
  slMacAddress
  slMacAddressManagement
  slMacAddressDisposition
  slMacAddressProtocol
```

---

## show mac-address-table count

Displays Source Learning MAC Address Table statistics for VLAN MAC addresses.

**show mac-address-table count** [*mac\_address*] [*slot slot | slot/port*] [*linkagg link\_agg*] [*vid | vid1-vid2*]

---

### Syntax Definitions

<i>mac_address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.
<i>slot   slot/port</i>	Slot number for the module or the slot number and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>link_agg</i>	Enter a link aggregate ID number (0–31). See <a href="#">Chapter 8, “Link Aggregation Commands.”</a>
<i>vid</i>	VLAN ID number (1–4094).

### Defaults

By default, the count statistics are displayed for all MAC addresses contained in the MAC address table.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- To display statistics for all ports on one slot, specify only the slot number for the **slot** parameter value.
- Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.

### Examples

```
-> show mac-address-table count
Mac Address Table count:
  Permanent Address Count           = 1
  DeleteOnReset Address Count       = 0
  DeleteOnTimeout Address Count     = 0
  Dynamic Learned Address Count     = 6
  Static Multicast Address Count    = 0,
  Total MAC Address In Use         = 7
```

```
-> show mac-address-table count 10-20
Mac Address Table count:
  Permanent Address Count           = 0
  DeleteOnReset Address Count       = 0
  DeleteOnTimeout Address Count     = 0
  Dynamic Learned Address Count     = 28
  Static Multicast Address Count    = 0,
  Total MAC Address In Use         = 28
```

*output definitions*

---

<b>Permanent Address Count</b>	The number of static MAC addresses configured on the switch with a <b>permanent</b> management status (MAC address is never aged out).
<b>DeleteOnReset Address Count</b>	The number of static MAC addresses configured on the switch with a <b>reset</b> management status (MAC address is deleted on the next switch reboot).
<b>DeleteOnTimeout Address Count</b>	The number of static MAC addresses configured on the switch with a <b>timeout</b> management status (MAC address ages out according to the MAC address table aging timer value).
<b>Dynamic Learned Address Count</b>	The number of MAC addresses learned by the switch. These are MAC addresses that are not statically configured addresses.
<b>Total MAC Address In Use</b>	The total number of MAC addresses (learned and static) that are known to the switch.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.3; *vid* parameter modified to support a range of VLAN IDs.

**Related Commands**

<b>show mac-address-table</b>	Displays Source Learning MAC Address Table information.
<b>show mac-address-table aging-time</b>	Displays the current aging time value for the Source Learning MAC Address Table.
<b>show mac-address-table all count</b>	Displays the Source Learning MAC Address Table statistics for both VLAN and VPLS MAC addresses.
<b>show mac-address-table vpls count</b>	Displays the Source Learning MAC Address Table statistics for VPLS service MAC addresses.

---

## show mac-address-table vpls count

Displays Source Learning MAC address table statistics for VPLS service MAC addresses.

**show mac-address-table vpls *service-id* count** [*mac-address*]

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

By default, all VPLS addresses are counted.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Enter a MAC address to display statistics for a specific VPLS service MAC address.

### Example

```
SW-D-> show mac-address-table vpls 1002 count
Mac Address Table Count:
  Permanent VPLS Address Count      = 1,
  Dynamic Learned VPLS Address Count = 13,
  Total MAC Address In Use          = 14
```

### *output definitions*

---

<b>Permanent VPLS Address Count</b>	The number of static VPLS MAC addresses configured on the switch with a <b>permanent</b> management status (MAC address is never aged out).
<b>Dynamic Learned VPLS Address Count</b>	The number of VPLS MAC Addresses learned by the switch. These addresses are not user-configured permanent addresses.
<b>Total MAC Address In Use</b>	The total number of MAC addresses (learned and static) that are known to the switch.

---

### Release History

Release 6.4.2; command introduced

## Related Commands

- show mac-address-table all count** Displays Source Learning MAC Address Table statistics for both VLAN and VPLS service MAC addresses.
- show mac-address-table count** Displays Source Learning MAC Address Table statistics for VLAN MAC addresses.

## Related MIB Objects

```
slMacAddressGlobalTable  
  slServiceId  
  slMacAddressGbl  
  slMacAddressGblmanagement
```

---

## show mac-address-table all count

Displays Source Learning MAC Address Table statistics for both VLAN and VPLS MAC addresses.

**show mac-address-table all count**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- This command displays dynamically learned and permanent MAC address for both VLANs and VPLS services. For more information on VPLS, see the “VPLS Commands“ chapter in this guide.
- Use the **show mac-address-table count** command to display statistics for VLAN MAC addresses only.

### Examples

```
-> show mac-address-table all count
Mac Address Table Count:
  Permanent Address Count           = 0,
  DeleteOnReset Address Count      = 0,
  DeleteOnTimeout Address Count    = 0,
  Dynamic Learned Address Count    = 5,
  Static Multicast Address Count    = 0,
  Permanent VPLS Address Count     = 1,
  Dynamic Learned VPLS Address Count = 21038,
  Total MAC Address In Use         = 21044
```

### *output definitions*

---

<b>Permanent Address Count</b>	The number of static MAC addresses configured on the switch with a <b>permanent</b> management status (MAC address is never aged out).
<b>DeleteOnReset Address Count</b>	The number of static MAC addresses configured on the switch with a <b>reset</b> management status (MAC address is deleted on the next switch reboot).
<b>DeleteOnTimeout Address Count</b>	The number of static MAC addresses configured on the switch with a <b>timeout</b> management status (MAC address ages out according to the MAC address table aging timer value).
<b>Dynamic Learned Address Count</b>	The number of MAC addresses learned by the switch. These are MAC addresses that are not statically configured addresses.

---

*output definitions (continued)*

---

<b>Static Multicast Address Count</b>	The number of static multicast addresses configured on the switch.
<b>Permanent VPLS Address Count</b>	The number of static VPLS MAC addresses configured on the switch with a <b>permanent</b> management status (MAC address is never aged out).
<b>Dynamic Learned VPLS Address Count</b>	The number of VPLS MAC Addresses learned by the switch. These addresses are not user-configured permanent addresses.
<b>Total MAC Address In Use</b>	The total number of MAC addresses (learned and static) that are known to the switch.

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

<b>show mac-address-table count</b>	Displays Source Learning MAC Address Table statistics for VLAN MAC addresses.
<b>show mac-address-table vpls count</b>	Displays Source Learning MAC Address Table statistics for VPLS service MAC addresses.

---

## show mac-address-table aging-time

Displays the current aging time value.

**show mac-address-table aging-time**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The MAC Address Table aging time applies to static MAC addresses that were defined using the **time-out** parameter (see [page 4-2](#)) and to dynamically learned MAC addresses.
- Note that the aging time is the same for all VLANs and Virtual Private LAN Service (VPLS) services because it is not configurable on a per-VLAN or per-service basis. The aging time value on this platform is a global parameter that applies to all VLANs and VPLS services.

### Examples

```
-> show mac-address-table aging-time  
Mac Address Aging Time (seconds) = 300
```

### Release History

Release 6.1; command was introduced.

Release 6.1.1; **vlan** parameter not supported.

Release 6.4.2; aging time value applied to VPLS services.

### Related Commands

[show mac-address-table](#) Displays Source Learning MAC Address Table information.

[show mac-address-table count](#) Displays Source Learning MAC Address Table statistics.

### MIB Objects

sLMacAgingValue

---

## show source-learning

Displays the source learning status of a port or link aggregate of ports.

**show source-learning** [**port** *slot/port*[-*port2*] | **linkagg** *linkagg\_num*]

---

### Syntax Definitions

<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g., 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>linkagg_num</i>	Specifies the link aggregate identifier.

### Defaults

By default, the source learning status for all switch ports and link aggregates is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **port** *slot/port* or **linkagg** *linkagg\_num* parameters to display the source learning status for a specific port or link aggregate ID.
- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, source learning status cannot be configured on individual ports which are members of the link aggregate.

### Example

```
-> show source-learning
port source-learning
-----+-----
1/1    disabled
1/2    enabled
1/3    disabled

-> show source-learning port 1/2
port source-learning
-----+-----
1/2    disabled

-> show source-learning linkagg 10
port source-learning
-----+-----
0/10   disabled
```

*output definitions*

---

<b>port</b>	The slot/port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29).
<b>source-learning</b>	The source learning status of the port or link aggregate ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>source-learning</b> command.

---

**Release History**

Release 6.4.2; command introduced

**Related Commands**

**source-learning** Configures the status of source MAC address learning on a single port, a range of ports or on a link aggregate of ports.

**Related MIB Objects**

```

s1MacLearningControlTable  
  s1MacLearningControlEntry  
  s1MacLearningControlStatus
```

---

## show source-learning chassis-distributed

Displays the current status (enabled or disabled) of the distributed MAC source learning mode.

**show source-learning chassis-distributed**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- This command is not supported on OmniSwitch stackable switches.
- When the distributed MAC mode is enabled, the MAC address table size is increased to allow more learned MAC addresses (16K per module; up to 64K per chassis).
- When the distributed MAC mode is disabled (the default), the maximum number of learned MAC addresses defaults to 16K for all OmniSwitch chassis-based switches.

### Examples

```
-> show source-learning chassis-distributed
Distributed MAC Mode Configuration = disabled
```

```
-> show source-learning chassis-distributed
Distributed MAC Mode Configuration = enabled
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[source-learning chassis-distributed](#)

Enables or disables the distributed MAC source learning mode.

### MIB Objects

```
sLMacAddressTable
  sLDistributedMacMode
```

---

# 5 VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP) and Authentication on a VLAN, add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

The VLAN management commands comply with RFC 2674.

MIB information is as follows:

*Filename:* AlcatelIND1VlanManager.mib  
*Module:* ALCATEL-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

---

**vlan**  
**vlan stp**  
**vlan mobile-tag**  
**vlan authentication**  
**vlan source-learning**  
**vlan mtu-ip**  
**vlan port default**  
**show vlan**  
**show vlan port**  
**show vlan router mac status**  
**show vlan gvrp**  
**show vlan ipmvlan**

---

## vlan

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

**vlan** *vid1*[-*vid2*] [**enable** | **disable**] [**name** *description*]

**no vlan** *vid1*[-*vid2*]

---

### Syntax Definitions

<i>vid1</i>	An existing VLAN ID number (1–4094).
- <i>vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).
<i>description</i>	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. “Alcatel-Lucent Marketing VLAN”).
<b>enable</b>	Enable VLAN administrative status.
<b>disable</b>	Disable VLAN administrative status.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>description</i>	VLAN ID

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration. All VLAN ports and routers are detached before the VLAN is removed. Ports return to their default VLANs or VLAN 1, if the VLAN deleted is the port’s configured default VLAN.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (e.g., `vlan 10-15 500-510 850`).
- A VLAN is not operationally active until at least one active port is assigned to the VLAN.
- When a VLAN is administratively disabled, static port and dynamic mobile port assignments are retained but traffic on these ports is not forwarded. However, VLAN rules remain active and continue to classify mobile port traffic for VLAN membership.
- Ports are manually configured or dynamically assigned to VLANs.

## Examples

```
-> vlan 850 name "Marketing Admin"  
-> vlan 200  
-> vlan 720 disable  
-> no vlan 1020  
-> vlan 100-105 355 400-410 "Sales Admin"  
-> vlan 10 250-260  
-> vlan 250-260 disable  
-> no vlan 10-15  
-> no vlan 10 20 200-210
```

## Release History

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

## Related Commands

<a href="#">vlan port default</a>	Statically assigns ports to a VLAN.
<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan port</a>	Displays VLAN port assignments.

## MIB Objects

```
vlanTable  
  vlanNumber  
  vlanDescription  
  vlanAdmStatus  
  vlanOperStatus  
  vlanStatus
```

---

## vlan stp

Enables or disables the Spanning Tree status for a VLAN.

```
vlan vid1[-vid2] [1x1 | flat] stp {enable | disable}
```

---

### Syntax Definitions

<i>vid1</i>	An existing VLAN ID number (1–4094).
<i>-vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).
<b>1x1</b>	Specifies that the Spanning Tree status for the VLAN applies when the switch is running in the 1x1 Spanning Tree mode.
<b>flat</b>	Specifies that the Spanning Tree status for the VLAN applies when the switch is running in the flat Spanning Tree mode.
<b>enable</b>	Enables Spanning Tree for the specified VLAN.
<b>disable</b>	Disables Spanning Tree for the specified VLAN.

### Defaults

By default, the Spanning Tree status is enabled in both the 1x1 and flat mode when the VLAN is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- STP is not active until at least one active port is assigned to the VLAN.
- If the *vid* specified is that of a VLAN that does not exist, the VLAN is automatically created.
- Note that specifying multiple VLAN ID entries and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (e.g., `vlan 10-15 500-510 850 stp enable`).
- Use the optional **1x1** or **flat** parameter with this command to configure the Spanning Tree status only for the Spanning Tree mode specified by the parameter. For example, if the **flat** parameter is specified when disabling STP for VLAN 10, then the Spanning Tree status for VLAN 10 is disabled when the switch is running in the flat mode. However, the current Spanning Tree status for VLAN 10 in the 1x1 mode remains unchanged.
- If this command is used without specifying the **1x1** or **flat** parameter, then the Spanning Tree status for the specified VLAN is changed for both operating modes.
- Up to 252 Spanning Tree instances per switch are supported in the 1x1 Spanning Tree mode. Since each VLAN with Spanning Tree enabled uses one of these instances, only 252 VLANs can have an active Spanning Tree instance at any given time.
- To create more than 252 VLANs in the 1x1 Spanning Tree mode, use the **vlan stp disable**, **vlan 1x1 stp disable**, or **vlan flat stp disable** command to create a VLAN with Spanning Tree disabled.

- When STP is disabled on a VLAN, it remains disabled even if the switch Spanning Tree operating mode is set to **1x1** (one STP instance per VLAN). In addition, all active ports for the disabled VLAN remain in a forwarding state in both the 1x1 and flat Spanning Tree modes.
- If a switch is running in the flat Spanning Tree mode, disabling Spanning Tree on VLAN 1 disables the instance across all VLANs. Disabling STP on any other VLAN disables the instance only for that VLAN.

## Examples

```
-> vlan 850 stp enable
-> vlan 720 stp disable
-> vlan 500 1x1 stp disable
-> vlan 500 flat stp enable
-> vlan 100-110 stp disable
-> vlan 500-510 600 720-725 stp enable
-> vlan 250 350 400-410 stp 1x1 enable
-> vlan 10 20 stp flat disable
```

## Release History

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

## Related Commands

<a href="#">vlan</a>	Creates a VLAN.
<a href="#">bridge mode</a>	Selects a flat Spanning Tree or 1x1 Spanning Tree operating mode for a switch.
<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan port</a>	Displays VLAN port assignments.

## MIB Objects

```
vlanTable
  vlanNumber
  vlanStpStatus
  vlan1x1StpStatus
  vlanflatStpStatus
```

---

## vlan mobile-tag

Enables or disables classification of tagged packets received on mobile ports. If a mobile port receives a tagged packet with a VLAN ID that matches the specified VLAN ID, the port and packet are dynamically assigned to that VLAN. If `vlan mobile-tag` is disabled, the packets tagged with a VLAN ID that does not match the mobile port's default VLAN or a rule VLAN that the traffic qualifies for, the packet is dropped.

**vlan** *vid1*[-*vid2*] **mobile-tag** {**enable** | **disable**}

---

### Syntax Definitions

<i>vid1</i>	An existing VLAN ID number (1–4094).
- <i>vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).
<b>enable</b>	Enables dynamic assignment of tagged mobile port packets to the specified VLAN.
<b>disable</b>	Disables dynamic assignment of tagged mobile port packets to the specified VLAN.

### Defaults

By default, mobile port tagging is disabled when a VLAN is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Note that specifying multiple VLAN ID entries and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (e.g., `vlan 10-15 500-510 850 mobile-tag enable`).
- This command is VLAN based but only applies to tagged packets received on mobile ports.
- Packets received on mobile ports tagged with the VLAN ID are discarded.

### Examples

```
-> vlan 850 mobile-tag enable
-> vlan 720 mobile-tag enable
-> vlan 1020 mobile-tag disable
-> vlan 500 410-420 mobile-tag enable
-> vlan 201-210 301-310 mobile-tag enable
-> vlan 450 550 mobile-tag disable
```

### Release History

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

## Related Commands

<code>vlan</code>	Creates a VLAN.
<code>show vlan</code>	Displays a list of existing VLANs.
<code>show vlan port</code>	Displays VLAN port assignments.

## MIB Objects

```
vlanTable  
  vlanNumber  
  vlanTagMobilePortStatus
```

---

## vlan authentication

Enables or disables authentication for a VLAN.

**vlan *vid* authentication {enable | disable}**

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<b>enable</b>	Enables authentication for the specified VLAN.
<b>disable</b>	Disables authentication for the specified VLAN.

### Defaults

By default, authentication is disabled when a VLAN is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Note that specifying multiple VLAN ID entries and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (e.g., `vlan 10-15 500-510 850 authentication`).
- A maximum of 128 authenticated VLANs per switch is supported. See [Chapter 36, “AAA Commands,”](#) for more information about configuring Layer 2 Authentication.

### Examples

```
-> vlan 850 authentication enable
-> vlan 720 authentication enable
-> vlan 1020 authentication disable
-> vlan 900-905 authentication enable
-> vlan 2 10-15 450-455 authentication enable
-> vlan 420 1500 authentication disable
```

### Release History

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

## Related Commands

<code>vlan</code>	Creates a VLAN.
<code>show vlan</code>	Displays list of existing VLANs.
<code>show vlan port</code>	Displays VLAN port assignments.

## MIB Objects

```
vlanTable  
  vlanNumber  
  vlanAuthentStatus
```

---

## vlan mtu-ip

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

**vlan** *vid* **mtu-ip** *size*

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>size</i>	Packet size value specified in bytes (1280–9198).

### Defaults

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (e.g. 10/100 Ethernet, gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. For example, if the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.
- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the **icmp type** command to enable the “frag needed but DF bit set” control (for example, **icmp type 3 code 4 enable**).

### Examples

```
-> vlan 200 mtu-ip 1000
-> vlan 1503 mtu-ip 10222
```

### Release History

Release 6.4.1; command was introduced.

### Related Commands

**show vlan** Displays the VLAN configuration for the switch.

### MIB objects

```
vlanTable
  vlanMtu
```

---

## vlan port default

Configures a new default VLAN for a single port or an aggregate of ports. The VLAN specified with this command is referred to as the *configured default VLAN* for the port.

**vlan vid port default** {slot/port | link\_agg}

**vlan vid no port default** {slot/port | link\_agg}

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094) of the VLAN to assign as the port’s configured default VLAN.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16) and a space to specify multiple slots (e.g. 3/1-16 5/10-20 8/2-9).
<i>link_agg</i>	The link aggregate ID number (0–31) to assign to the specified VLAN. See <a href="#">Chapter 8, “Link Aggregation Commands.”</a>

### Defaults

VLAN 1 is the default VLAN for all ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- Every switch port or link aggregate has only one configured default VLAN. Mobile and 802.1Q tagged ports, however, may have additional VLAN assignments, which are often referred to as *secondary* VLANs.
- Mobile ports that are assigned to a default VLAN other than VLAN 1 are still eligible for dynamic assignment to other VLANs.

### Examples

```
-> vlan 10 port default 3/1
-> vlan 20 port default 4/1-24
-> vlan 30 port default 5/1-8 6/12-24
-> vlan 200 port default 29
-> vlan 10 no port default 3/1
-> vlan 20 no port default 4/1-24
-> vlan 30 no port default 5/1-8 6/12-24
-> vlan 200 no port default 29
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">vlan</a>	Creates a VLAN.
<a href="#">show vlan</a>	Displays list of existing VLANs.
<a href="#">show vlan port</a>	Displays VLAN port assignments.

## MIB Objects

vpaTable  
    vpaVlanNumber  
    vpaIfIndex  
    vpaType  
    vpaState  
    vpaStatus

---

## vlan source-learning

Configures the status of source learning on a VLAN, a range of VLANs, or on an IP Multicast VLAN (IMPVLAN).

```
vlan {vid1[-vid2] | ipvlan ipmvlan-id} source-learning {enable | disable}
```

---

### Syntax Definitions

<i>vid1</i>	The VLAN ID number (2–4094).
<i>-vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).
<i>ipmvlan-id</i>	Specifies the IP Multicast VLAN number. The valid range is 1–4094.
<b>enable</b>	Enables source MAC address learning.
<b>disable</b>	Disables source MAC address learning.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>enable</b>

---

### Platforms Supported

OmniSwitch 6400, 6855-U24X, 9000E

### Usage Guidelines

- The **vlan ipvlan source-learning** command does not accept multiple VLAN IDs.
- Disabling source learning on a VLAN or IMPVLAN clears all the dynamically learned MAC addresses associated with the VLAN or IMPVLAN from the MAC address table. It causes traffic to flood the VLAN.
- Static MAC addresses associated with a VLAN or IMPVLAN are *not* cleared when source learning is disabled for the VLAN or IMPVLAN.

### Examples

```
-> vlan 10-15 source-learning disable  
-> vlan ipvlan 10 source-learning disable
```

### Release History

Release 6.4.2; command introduced.

## Related Commands

**show vlan**

Displays the VLAN configuration for the switch.

**show vlan ipmvlan**

Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.

## MIB Objects

vlanTable

    vlanEntry

    vlanNumber

    vlanStatus

    vlanMacLearningControlStatus

---

## show vlan

Displays a list of VLANs and their attributes configured on the switch.

**show vlan** [*vid1* [-*vid2*]]

---

### Syntax Definitions

<i>vid1</i>	The VLAN ID number (2–4094).
- <i>vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, a list of all VLANs and their attributes are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Specify a VLAN ID with this command to display information about a specific VLAN.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., show vlan 10-15). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.

### Examples

```
-> show vlan
```

vlan	type	admin	oper	1x1	stree	flat	auth	ip	ipx	mble	src	name
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----
1	std	on	on	on	on	off	off	off	NA	off	on	VLAN 1
100	vstk	on	off	off	on	off	off	off	NA	off	off	VLAN 100

```
-> show vlan 1
```

```
Name           : VLAN 1,
Administrative State: enabled,
Operational State  : enabled,
1x1 Spanning Tree State : enabled,
Flat Spanning Tree State : enabled,
Authentication     : disabled,
IP Router Port     : off,
IPX Router Port    : none,
Mobile Tag         : off,
Source Learning    : enabled
```

```
-> show vlan 100
```

```
Name           : VLAN 100,
Administrative State: enabled,
Operational State  : disabled,
1x1 Spanning Tree State : disabled,
Flat Spanning Tree State : enabled,
Authentication     : disabled,
IP Router Port     : off,
IP MTU             : 1500,
IPX Router Port    : none,
Mobile Tag         : off,
Source Learning    : disabled,
Traffic-Type: ethernet-service Customer SVLAN,
Priority-Map: x->0
```

### *output definitions*

<b>vlan</b>	The numerical VLAN ID. Use the <b>vlan</b> command to create or remove VLANs.
<b>type</b>	The type of VLAN ( <b>std</b> , <b>vstk</b> , <b>gvrp</b> , or <b>ipmv</b> ).
<b>admin</b>	VLAN administrative status: <b>on</b> enables VLAN functions to operate; <b>off</b> disables VLAN functions without deleting the VLAN. Use the <b>vlan</b> command to change the VLAN administrative status.
<b>oper</b>	VLAN operational status: <b>on</b> (enabled) or <b>off</b> (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (e.g. router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.
<b>stree 1x1</b>	VLAN Spanning Tree status for the VLAN in the 1x1 mode: <b>on</b> (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); <b>off</b> (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the <b>vlan stp</b> command.
<b>stree flat</b>	VLAN Spanning Tree status for the VLAN in the flat mode: <b>on</b> (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); <b>off</b> (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the <b>vlan stp</b> command.
<b>auth</b>	VLAN Authentication status: <b>on</b> (enabled) or <b>off</b> (disabled). Use the <b>vlan authentication</b> command to change the VLAN Authentication status.
<b>ip</b>	IP router interface status: <b>on</b> (IP interface exists for the VLAN) or <b>off</b> (no IP router interface exists for the VLAN). Use the <b>ip interface</b> command to define an IP router interface for a VLAN.
<b>mble tag</b>	Mobile tagging status: <b>on</b> (enabled); <b>off</b> (disabled). Configured through the <b>vlan mobile-tag</b> command.
<b>src lrn</b>	Source learning status: <b>on</b> (enabled) ; <b>off</b> (disabled). Configured through the <b>vlan source-learning</b> command. Note that disabling source learning is not supported on the OmniSwitch 6850 and 6850E.

*output definitions (continued)*

---

<b>name</b>	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the VLAN description.
<b>Traffic-Type</b>	Type of traffic passing through the VLAN port.
<b>Priority-Map</b>	Priority map value set for the VLAN.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Release 6.2.1; **type** field added.

Release 6.4.2; **src lrn** field added.

**Related Commands**

<a href="#">show vlan port</a>	Displays VLAN port assignments.
<a href="#">show vlan router mac status</a>	Displays the current MAC router operating mode (single or multiple) and VLAN router interface statistics.
<a href="#">show vlan gvrp</a>	Displays a list of VLANs learned through GVRP and their details.
<a href="#">show vlan ipmvlan</a>	Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.
<a href="#">show ip interface</a>	Displays IP router information.

## show vlan port

Displays VLAN port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port. Information is also included that shows the VPA type (configured default VLAN, 802.1Q tagged VLAN, dynamically assigned secondary VLAN, or mirrored port VLAN assignment) and the status of that association (inactive, blocking, forwarding, or filtering).

**show vlan** [*vid1*[-*vid2*]] **port** [*slot/port* | *link\_agg*]

---

### Syntax Definitions

<i>vid1</i>	VLAN ID number (1–4094).
- <i>vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>link_agg</i>	Enter the link aggregate ID number (0–31) to assign to the specified VLAN.

### Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the *vid* is specified without a *slot/port* or *link\_agg*, then all port assignments for that VLAN are displayed.
- If the *slot/port* or *link\_agg* is specified without a *vid*, then all VLAN assignments for that port are displayed.
- If both the *vid* and *slot/port* or *link\_agg* are specified, then information only for that VLAN and slot/port or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., show vlan 10-15 port). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.

### Examples

```
-> show vlan port
vlan   port      type      status
-----+-----+-----+-----+
  1     1/1     default   inactive
  2     1/2     default   blocking
        1/3     mobile    forwarding
        11/4    qtagged   forwarding
```

```

3      1/2    qtagged  blocking
      11/4   default  forwarding
      2/5    dynamic  forwarding
-> show vlan 10 port
  port  type      status
+-----+-----+-----+
  1/1   default   forwarding
  1/2   qtagged   forwarding
  1/3   mobile    forwarding

-> show vlan port 3/2
vlan   type      status
+-----+-----+-----+
  1     default   forwarding
  2     qtagged   forwarding
  5     dynamic   blocking
  3     qtagged   blocking

-> show vlan 500 port 8/16
type      :default
status     :blocking
vlan admin :on
vlan oper  :off
port admin :on
port oper  :off

```

### *output definitions*

<b>vlan</b>	Numerical VLAN ID. Identifies the port's VLAN assignment.
<b>port</b>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<b>type</b>	The type of VPA: <b>default</b> (configured default VLAN assignment for the port), <b>qtagged</b> (802.1Q tagged secondary VLAN assignment for the port), <b>mobile</b> (dynamic secondary VLAN assignment for the port), <b>mirror</b> (port is mirroring the VLAN assignment of another port), or <b>dynamic</b> (VPAs that are learnt through GVRP).
<b>status</b>	The VPA status: <b>inactive</b> (port is not active), <b>forwarding</b> (traffic is forwarding on this VPA), <b>blocking</b> (traffic is not forwarding on this VPA), or <b>filtering</b> (a mobile port's VLAN is administratively off or the port's default VLAN status is disabled; does not apply to fixed ports).
<b>vlan admin</b>	VLAN administrative status: <b>on</b> enables VLAN functions to operate; <b>off</b> disables VLAN functions without deleting the VLAN. Use the <a href="#">vlan</a> command to change the VLAN administrative status.
<b>vlan oper</b>	VLAN operational status: <b>on</b> (enabled) or <b>off</b> (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (e.g. router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

*output definitions*

---

<b>port admin</b>	Port administrative status: <b>on</b> (enabled) allows the port to send and receive data when it is active; <b>off</b> (disabled) prevents the port from sending and receiving traffic even if it has an active connection.
<b>port oper</b>	Port operational status: <b>on</b> (enabled) or <b>off</b> (disabled). If a port is currently in use, then the operational status is enabled. A port must have an enabled administrative status before it can become operationally enabled.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

```

---

## show vlan router mac status

Displays current status of multiple MAC router mode, the number of VLANs configured on the switch, the number of VLANs with router interfaces and the number of IP router interfaces configured.

**show vlan router mac status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Only single MAC router mode is supported at this time, so multiple MAC router mode always displays as disabled.
- In single MAC router mode, a maximum of 4094 VLANs can have IP router interfaces defined. Note that these limits are subject to the availability of switch resources.

### Examples

```
-> show vlan router mac status
  router-mac-multiple  total vlans  router vlans  ip vlans  ipx vlans
-----+-----+-----+-----+-----
                disabled                7                6                4                NA
```

#### *output definitions*

---

<b>router-mac-multiple</b>	Multiple MAC router mode status: <b>enabled</b> or <b>disabled</b> . If this mode is disabled, the switch is running in single MAC router mode.
<b>total vlans</b>	The total number of VLANs configured on the switch. Use the <a href="#">vlan</a> command to create or remove VLANs.
<b>router vlans</b>	The total number of VLANs configured on the switch that have at least one router interface defined. Use the <a href="#">ip interface</a> command to define an IP router interface for a VLAN.
<b>ip vlans</b>	The total number of VLANs configured on the switch that have an IP router interface defined. Use the <a href="#">ip interface</a> command to define an IP router for a VLAN.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">show vlan</a>	Displays list of VLANs configured on the switch.
<a href="#">show vlan port</a>	Displays VLAN port assignments.
<a href="#">show ip interface</a>	Displays VLAN IP router interface information.

## MIB Objects

```
vlanMgrVlanSet
  vlanSetMultiRtrMacStatus
  vlanSetVlanCount
  vlanSetVlanRouterCount
  vlanSetIpRouterCount
  vlanSetIpxRouterCount
```

---

## show vlan gvrp

Displays a list of VLANs learned through GVRP.

**show vlan gvrp** [*vid1*[-*vid2*]]

---

### Syntax Definitions

<i>vid1</i>	The VLAN ID number (2–4094).
- <i>vid2</i>	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, all VLANs learned through GVRP are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *vid* parameter with this command to display information for a specific VLAN or for a specific range of VLANs.

### Examples

-> show vlan gvrp

```

vlan  type  admin oper  lxl  flat  auth  ip  ipx  tag  name
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
5  gvrp  on   on   on   on   off  NA  off  off  GVRP1
6  gvrp  on   on   off  off  off  NA  off  off  GVRP12

```

### output definitions

---

<b>vlan</b>	The VLAN ID. Use the <b>vlan</b> command to create or remove VLANs.
<b>type</b>	The type of VLAN ( <b>std</b> , <b>vstk</b> , <b>gvrp</b> , or <b>ipmv</b> )
<b>admin</b>	VLAN administrative status: <b>on</b> enables VLAN functions to operate; <b>off</b> disables VLAN functions without deleting the VLAN. Use the <b>vlan</b> command to change the VLAN administrative status.
<b>oper</b>	VLAN operational status: <b>on</b> (enabled) or <b>off</b> (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (e.g. router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

*output definitions (continued)*

---

<b>stree 1x1</b>	VLAN Spanning Tree status for the VLAN in the 1x1 mode: <b>on</b> (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); <b>off</b> (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the <b>vlan stp</b> command.
<b>stree flat</b>	VLAN Spanning Tree status for the VLAN in the flat mode: <b>on</b> (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); <b>off</b> (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the <b>vlan stp</b> command.
<b>auth</b>	VLAN Authentication status: <b>on</b> (enabled) or <b>off</b> (disabled). Use the <b>vlan authentication</b> command to change the VLAN Authentication status.
<b>ip</b>	IP router interface status: <b>on</b> (IP interface exists for the VLAN) or <b>off</b> (no IP router interface exists for the VLAN). Use the <b>ip interface</b> command to define an IP router interface for a VLAN.
<b>mble tag</b>	Mobile tagging status: <b>on</b> (enabled); <b>off</b> (disabled). Configured through the <b>vlan mobile-tag</b> command.
<b>name</b>	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the VLAN description.

---

**Release History**

Release 6.2.1; command was introduced.

**Related Commands**

<b>show vlan</b>	Displays a list of VLANs configured on the switch.
<b>show vlan port</b>	Displays VLAN port assignments.

## show vlan ipmvlan

Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.

**show vlan ipmvlan** [*ipmvlan-id1*[-*ipmvlan-id2*]]

---

### Syntax Definitions

<i>ipmvlan-id1</i>	The IPMVLAN ID number (1–4094).
<i>-ipmvlan-id2</i>	The last IPMVLAN ID number in a range of IPMVLANs that you want to display (e.g. 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, the configuration for all IPMVLANs is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *ipmvlan-id* parameter with this command to display information for a specific IPMVLAN or a range of IPMVLANs.

### Examples

```
-> show vlan ipmvlan
```

vlan	type	admin	oper	stree		name
				1x1	flat	
1201	Vstk ipmtv	on	on	on	on	VLAN 1201
1202	Vstk ipmtv	on	on	off	off	VLAN 1202
1203	Entp ipmtv	on	on	off	off	VLAN 1203
1204	Vstk ipmtv	on	on	on	on	VLAN 1204
1205	Entp ipmtv	on	off	on	off	VLAN 1205

```
-> show vlan ipmvlan 1201-1203
```

vlan	type	admin	oper	stree		name
				1x1	flat	
1201	Vstk ipmtv	on	on	on	on	VLAN 1201
1202	Vstk ipmtv	on	on	off	off	VLAN 1202
1203	Entp ipmtv	on	on	off	off	VLAN 1203

```
-> show vlan ipmvlan 50
```

```
Name           : VLAN 50,
IPMV Mode      : Enterprise IPMVLAN
Administrative State: enabled,
Operational State  : disabled,
1x1 Spanning Tree State : disabled,
Flat Spanning Tree State: disabled,
```

```
-> show vlan ipmvlan 51
```

```
Name                : VLAN 51,  
IPMV Mode           : Vlan Stacking IPMVLAN  
Administrative State : enabled,  
Operational State   : disabled,  
1x1 Spanning Tree State : enabled,  
Flat Spanning Tree State: enabled,
```

### *output definitions*

---

<b>vlan</b>	The IPMVLAN ID.
<b>type</b>	Indicates if the IPMVLAN is in Enterprise mode ( <b>Entp ipmtv</b> ) or VLAN Stacking mode ( <b>Vstk ipmtv</b> ).
<b>admin</b>	Indicates IPMVLAN administrative status: <b>on</b> (enables IPMVLAN functions to operate) or <b>off</b> (disables IPMVLAN functions without deleting the IPMVLAN).
<b>oper</b>	IPMVLAN operational status: <b>on</b> (enabled) or <b>off</b> (disabled). Operational status remains disabled until an active port is assigned to the IPMVLAN. When operational status is enabled, IPMVLAN properties (e.g. router interfaces, Spanning Tree) are applied to ports and traffic flow. An IPMVLAN must have an enabled administrative status before it can become operationally enabled.
<b>Name</b>	The user-defined text description for the IPMVLAN. By default, the IPMVLAN ID is specified for the IPMVLAN description.
<b>IPMV mode</b>	Indicates the mode ( <b>Enterprise IPMVLAN</b> or <b>Vlan Stacking IPMVLAN</b> ) of the IPMVLAN.
<b>Administrative State</b>	Indicates the administrative status of the IPMVLAN, which can be <b>enabled</b> or <b>disabled</b> .
<b>Operational State</b>	Indicates the operational status of the IPMVLAN, which can be <b>enabled</b> or <b>disabled</b> .
<b>stree 1x1</b>	VLAN Spanning Tree status for the VLAN in the 1x1 mode: <b>on</b> (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); <b>off</b> (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the <b>vlan stp</b> command.
<b>stree flat</b>	VLAN Spanning Tree status for the VLAN in the flat mode: <b>on</b> (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); <b>off</b> (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the <b>vlan stp</b> command.

# 6 802.1Q Commands

Alcatel-Lucent's 802.1Q is an IEEE standard for sending frames through the network tagged with VLAN identification. This chapter details configuring and monitoring 802.1Q tagging on a single port in a switch or an aggregate of ports on a switch.

Alcatel-Lucent's version of 802.1Q complies with the Draft Standard *P802.1Q/D11 IEEE Standards for Local And Metropolitan Area Network: Virtual Bridged Local Area Networks, July 30, 1998*.

MIB information for the 802.1Q commands is as follows:

*Filename:* alcatelIND1Dot1Q.mib  
*Module:* ALCATEL-IND1-DOT1Q-MIB

A summary of available commands is listed here:

---

[vlan 802.1q](#)  
[vlan 802.1q frame type](#)  
[show 802.1q](#)

---

---

**Note.** Before using 802.1Q, the VLAN for 802.1Q must be created using the commands described in [Chapter 5, "VLAN Management Commands."](#)

---

Configuration procedures for 802.1Q are explained in "Configuring 802.1Q," *OmniSwitch AOS Release 6 Network Configuration Guide*.

## vlan 802.1q

Creates, deletes, or modifies 802.1Q tagging on a single port or on an aggregate of ports.

```
vlan vid 802.1q {slot/port | aggregate_id} [description]
```

```
vlan vid no 802.1q {slot/port | aggregate_id}
```

---

### Syntax Definitions

<i>vid</i>	The VLAN identification number for a preconfigured VLAN that will handle the 802.1Q traffic for this port. The valid range is 1 to 4094.
<i>slot</i>	The slot number for the 802.1Q tagging.
<i>port</i>	The port number for the 802.1Q tagging.
<i>aggregate_id</i>	The link aggregation ID, which allows you to configure 802.1Q tagging on an aggregate of ports. The valid range is 1 to 31.
<i>description</i>	An optional textual description (up to 32 characters) for this 802.1Q tag. Spaces must be unclosed within quotation marks (e.g., "802.1Q tag 2").

### Defaults

The default description for 802.1Q tagging on a port is **TAG PORT** *slot/port* **VLAN** *vid* (where the *slot/port* and *vid* are as entered when inputting the command) when you configure 802.1Q tagging on a single port, and **TAG AGGREGATE** *aggregate\_id* **VLAN** *vid* (where the *slot/port* and *vid* are as entered when inputting the command) when you configure 802.1q tagging on an aggregate link.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete 802.1Q tagging on a port or an aggregate of ports.
- The VLAN specified for the port or aggregate link before 802.1Q tagging can be specified. See [Chapter 5, "VLAN Management Commands"](#) for information on how to create a VLAN.
- You *must* enable link aggregation before you can tag an aggregate of ports. See [Chapter 8, "Link Aggregation Commands"](#) for more information on link aggregation.
- The port's default VLAN can never be configured to accepted tagged frames.

### Examples

```
-> vlan 2 802.1q 3/1
-> vlan 10 802.1q 100
-> vlan 5 802.1q 4/2 "802.1q tag 2"
-> vlan 6 no 802.1q 3/1
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[vlan 802.1q frame type](#)

Configures a port to accept only VLAN-tagged frames or all frames.

[show 802.1q](#)

Displays 802.1Q tagging status and configuration.

## MIB Objects

qAggregateVlanAggregateId

qAggregateVlanStatus

qAggregateVlanDescription

---

## vlan 802.1q frame type

Configures a port to accept all frames or accept only VLAN-tagged frames.

**vlan 802.1q *slot/port* frame type {all | tagged}**

---

### Syntax Definitions

<i>slot</i>	The slot number to configure 802.1Q tagging.
<i>port</i>	The port number to configure 802.1Q tagging.
<b>all</b>	Configures this port to accept all frames.
<b>tagged</b>	Configures this port to accept only VLAN-tagged frames.

### Defaults

parameter	default
<b>all   tagged</b>	all

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you configure a port to accept only VLAN-tagged frames, then any frames received on this port that do not carry a VLAN ID (i.e., untagged frames or priority-tagged frames) will be discarded by the ingress rules for this port. Frames that are not discarded by this ingress rule are classified and processed according to the ingress rules for this port.

### Examples

```
-> vlan 802.1q 3/1 frame type all
```

### Release History

Release 6.1; command was introduced.

# 7 Distributed Spanning Tree Commands

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the Alcatel-Lucent STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. In the case of a stack of switches, the STP load is distributed between the primary management switch and other switches in the stack. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), 802.1Q 2005 (MSTP), and RRSTP.
- A *flat* Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- Support for maximum MSTIs per switch. In addition, there is always one Common and Internal Spanning Tree (CIST) instance 0 on each switch.
- Ring Rapid Spanning Tree Protocol (RRSTP) supports up to a maximum range supported per switch. Note that there can be no alternate connections for the same instance between any two switches within an RRSTP ring topology.
- A *1x1* Spanning Tree operating mode, which applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

*Filename:* AlcatelIND1VlanSTP.MIB  
*Module:* STP-MGMT-MIB

---

A summary of the available commands is listed here:

## bridge mode

Selects a flat Spanning Tree or 1x1 Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when changing modes.

**bridge mode {flat | 1x1}**

---

### Syntax Definitions

<b>flat</b>	One Spanning Tree instance per switch.
<b>1x1</b>	One Spanning Tree instance for each VLAN configured on a switch.

### Defaults

By default, the bridge mode for the switch is set to 1x1 Spanning Tree.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 both connect to the same switch, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If **1x1** mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max age, and forward delay.
- When operating in 1x1 mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port may participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in 1x1 Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.
- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see [Chapter 5, “VLAN Management Commands”](#)).

---

**Note.** Active ports associated with VLANs that have Spanning Tree disabled on them are excluded from any Spanning Tree calculations. These VLANs remain in a forwarding state.

---

### Examples

```
-> bridge mode flat
-> bridge mode 1x1
```

### Release History

Release 6.1; command introduced.

### Related Commands

[bridge protocol](#)

Selects the Spanning Tree protocol for the specified instance.

[bridge bpdu-switching](#)

Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.

[show spantree](#)

Displays VLAN Spanning Tree parameter values.

### MIB Objects

```
vStpTable
  vStpNumber
  vStpMode
```

---

## bridge protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the 1x1 mode.

**bridge** [*instance*] **protocol** {**stp** | **rstp** | **mstp**}

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance (1) or an existing 1x1 mode VLAN ID instance number (1–4094).
<b>stp</b>	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
<b>rstp</b>	IEEE 802.1W Rapid Spanning Tree Protocol.
<b>mstp</b>	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol.

### Defaults

RSTP is the default protocol for the flat mode CIST instance and for the 1x1 mode VLAN instance.

parameter	default
<i>instance</i>	flat mode instance

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the protocol for the associated VLAN instance.
- To configure the protocol for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Selecting MSTP is the only option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).
- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or 1x1 Spanning Tree mode.
- Delete all existing MSTIs before changing the protocol from MSTP to STP or RSTP.

---

**Note.** When changing the protocol to MSTP or from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to its default value. See the [bridge path cost mode](#) command page for more information.

---

## Examples

```
-> bridge mode flat
-> bridge protocol mstp
-> bridge protocol rstp
-> bridge protocol stp

-> bridge mode 1x1
-> bridge 10 protocol rstp
-> bridge 200 protocol stp
-> bridge protocol mstp
WARNING: Changing to MSTP(802.1s) resets flat bridge priority and path
-> bridge protocol rstp
WARNING: Changing from MSTP(802.1s) resets flat bridge priority and path
```

## Release History

Release 6.1; command introduced.

Release 6.1.2; default protocol changed to RSTP.

## Related Commands

<a href="#">bridge mode</a>	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
<a href="#">bridge cist protocol</a>	Explicit command for changing the Spanning Tree protocol for the flat mode instance.
<a href="#">bridge 1x1 protocol</a>	Explicit command for changing the Spanning Tree protocol for a VLAN instance.

## MIB Objects

```
vStpInsTable
  vStpInsNumber
  vStpInsMode
  vStpInsProtocolSpecification
```

---

## bridge cist protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance (bridge 1).

**bridge cist protocol {stp | rstp | mstp}**

---

### Syntax Definitions

<b>stp</b>	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
<b>rstp</b>	IEEE 802.1w Rapid Spanning Tree Protocol.
<b>mstp</b>	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol.

### Defaults

RSTP is the default protocol for the flat mode CIST instance and for the 1x1 mode VLAN instance.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- Use this command to select STP, RSTP, or MSTP as the protocol for the flat mode CIST instance.
- Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).
- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or 1x1 Spanning Tree mode.
- You can also use bridge instance 1 instead of **cist** keyword to specify the CIST instance.
- If the switch is running in 1x1 mode when this command is used, the specified protocol is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.

---

#### Note.

When changing the protocol to MSTP or from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to its default value. See the [bridge path cost mode](#) command page for more information..

---

#### Note.

When a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

---

## Examples

```
-> bridge cist protocol rstp
-> bridge cist protocol mstp
-> bridge cist protocol stp

-> bridge mode 1x1
-> bridge cist protocol mstp
WARNING: Changing to MSTP(802.1s) resets flat bridge priority and path
```

## Release History

```

---

## bridge port loop-guard

Enables or disables the STP loop-guard on a port or link aggregate.

**bridge port** {*slot/port* | **linkagg** *linkagg\_id* } **loop-guard** {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>linkagg_id</i>	The number corresponding to the link aggregate group. Valid range is a unique integer in the range 0–31.
<b>enable</b>	Enables STP loop-guard.
<b>disable</b>	Disables STP loop-guard.

### Defaults

STP loop-guard is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When you enable loop-guard on a port, it is automatically applied to all the active instances or VLANs associated to the port.
- Loop-guard cannot be enabled on a port if root-guard is already enabled on the port or link aggregate related to the port. Root-guard must be disabled before configuring loop-guard. Similarly, when loop-guard configuration is enabled on a port or chassis, root-guard cannot be configured on the port/s.
- Loop-guard can be enabled on all types of ports including designated (forwarding), non-designated (alternate, secondary, or root) ports. However, STP loop-guard configuration does not affect designated ports. Hence, loop-guard is not effective when applied on designated ports.
- When loop-guard is enabled on root ports, they change to blocking mode when a loop-guard error occurs. In such an instance the alternate or secondary ports takeover until the root port recovers from the error state.
- If a set of ports that are already blocked by loop-guard are grouped together to form a link aggregate, the new link aggregate gets a new designated role. The link aggregate can also obtain a forwarding state depending on the STP state.
- If a spanning tree channel is blocked by loop-guard and spanning tree loses all the state information. The individual physical ports obtain the designated role, even if one or more of the links that formed the channel are unidirectional. New link aggregate might obtain a forwarding state but new port state is defined.
- The ports that are configured as fast-forwarding or edge-ports do not receive BPDUs. Loop-guard is not effective on such ports.

- Loop-guard error state is recovered when the administrative state of the port is enabled or disabled.
- When a VLAN is disabled, all the VLAN port associations recover from the error state.
- The loop-guard feature can be enabled on the ports that have STP (RSTP, MRSTP or MSTP) enabled.
- STP loop-guard on link aggregate protects all ports that are members of the link aggregation group.

## Examples

```
-> bridge port 1/2 loop-guard enable
-> bridge port linkagg 1 loop-guard enable
-> bridge port 1/2 loop-guard disable
-> bridge port linkagg 1 loop-guard disable
```

## Release History

Release 6.4.4; command introduced.

## Related Commands

[show spantree ports](#) Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

## MIB Objects

```
vStpPortConfigTable
  vStpPortConfigIfIndex
  vStpPortConfigLoopGuard
```

---

## bridge 1x1 protocol

Configures the Spanning Tree protocol for an individual VLAN instance.

**bridge 1x1** *vid* protocol {stp | rstp}

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4096).
<b>stp</b>	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
<b>rstp</b>	IEEE 802.1w Rapid Spanning Tree Protocol.

### Defaults

RSTP is the default protocol for the flat mode CIST instance and for the 1x1 mode VLAN instance.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that applies only to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in flat mode when this command is used, the specified protocol is not active for the specified VLAN instance until the operating mode for the switch is changed to 1x1.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge 1x1 2 protocol stp
-> bridge 1x1 455 protocol rstp
```

### Release History

Release 6.1; command introduced.

Release 6.1.2; default protocol changed to RSTP.

### Related Commands

<a href="#">bridge protocol</a>	Implicit command for changing the Spanning Tree protocol for the flat mode instance or for a 1x1 mode VLAN instance.
<a href="#">bridge cist protocol</a>	Explicit command for changing the Spanning Tree protocol for the flat mode instance.

## **MIB Objects**

vStpInsTable

    vStpInsIxlVlanNumber

    vStpInsMode

    vStpInsProtocolSpecification

---

## bridge mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

**bridge mst region name** *name*

**bridge mst region no name**

---

### Syntax Definitions

*name* An alphanumeric string up to 32 characters. Use quotes around string if the name contains multiple words with spaces between them (for example "Alcatel-Lucent Marketing").

### Defaults

By default, the MST region name is left blank.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the MST region name. Note that it is not necessary to specify the region name to remove it.
- To change an existing region name, use this same command but specify a string value that is different than the existing name. It is *not* necessary to first remove the old name.
- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

### Examples

```
-> bridge mst region name SalesRegion
-> bridge mst region name "Alcatel-Lucent Marketing"
-> bridge mst region no name
```

### Release History

Release 6.1; command introduced.

## Related Commands

- bridge mst region revision level** Defines the revision level for an MST region.
- bridge mst region max hops** Defines the maximum number of hops for the MST region.
- bridge msti** Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
- bridge msti vlan** Defines an association between a range of VLANs and a single MSTI.

## MIB Objects

vStpMstRegionTable  
    vStpMstRegionNumber  
    vStpMstRegionConfigName

---

## bridge mst region revision level

Defines the revision level for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

**bridge mst region revision level** *rev\_level*

---

### Syntax Definitions

*rev\_level* A numeric value (0–65535) that identifies the MST region revision level for the switch.

### Defaults

By default, the MST revision level is set to zero.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Specifying an MST region revision level is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as revision level, only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

### Examples

```
-> bridge mst region revision level 1000
-> bridge mst region revision level 2000
```

### Release History

Release 6.1; command introduced.

### Related Commands

<a href="#">bridge mst region name</a>	Defines the name for an MST region.
<a href="#">bridge mst region max hops</a>	Defines the maximum number of hops for the MST region.
<a href="#">bridge msti</a>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
<a href="#">bridge msti vlan</a>	Defines an association between a range of VLANs and a single MSTI.

### MIB Objects

```
vStpMstRegionTable
  vStpMstRegionNumber
  vStpMstRegionConfigRevisionLevel
```

---

## bridge mst region max hops

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to designate how many hops a BPDU is allowed to traverse before it is discarded and related information is aged.

**bridge mst region max hops** *max\_hops*

---

### Syntax Definitions

*max\_hops*                                  A numeric value (1–40) that designates the maximum number of hops.

### Defaults

By default, the maximum number of hops is set to 20.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The value configured with this command is a regional value that applies to all instances and in essence is used to determine the size of the region.
- The maximum hop count value is the initial value of the Remaining Hops parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the Remaining Hops count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.
- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

### Examples

```
-> bridge mst region max hops 40  
-> bridge mst region max hops 10
```

### Release History

Release 6.1; command introduced.

## Related Commands

<b>bridge mst region name</b>	Defines the name for an MST region.
<b>bridge mst region revision level</b>	Defines the revision level for an MST region.
<b>bridge msti</b>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
<b>bridge msti vlan</b>	Defines an association between a range of VLANs and a single MSTI.

## MIB Objects

vStpMstRegionTable  
    vStpMstRegionNumber  
    vStpMstRegionMaxHops

---

## bridge msti

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

**bridge msti** *msti\_id* [**name** *name*]

**bridge no msti** *msti\_id*

**bridge msti** *msti\_id* **no name**

---

### Syntax Definitions

<i>msti_id</i>	A numeric value (1–4094) that uniquely identifies an MSTI.
<i>name</i>	An alphanumeric string up to 32 characters. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

### Defaults

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no msti** form of this command to remove the MSTI from the switch configuration.
- Use the **no name** form of this command to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- Up to 16 MSTIs are allowed per switch; select a number from 1 to 4094 for the MSTI number. In addition, there is always one Common and Internal Spanning Tree (CIST) instance 0 per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the 1x1 or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

### Examples

```
-> bridge msti 10
-> bridge msti 20 name BldgOneST10
-> bridge msti 20 no name
-> bridge no msti 10
```

### Release History

Release 6.1; command introduced.

## Related Commands

- bridge mst region name** Defines the name for an MST region.
- bridge mst region revision level** Defines the revision level for an MST region.
- bridge mst region max hops** Defines the maximum number of hops for the MST region.
- bridge msti vlan** Defines an association between a range of VLANs and a single MSTI.

## MIB Objects

```
vStpMstInstanceTable  
  vStpMstInstanceNumber  
  vStpMstInstanceName  
  vStpMstInstanceVlanBitmapAddition  
  vStpMstInstanceVlanBitmapDeletion  
  vStpMstInstanceVlanBitmapState
```

---

## bridge msti vlan

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

**bridge msti** *msti\_id* **vlan** *vid\_range*

**bridge msti** *msti\_id* **no vlan** *vid\_range*

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number (0–4094).
<i>vid_range</i>	A VLAN ID number (1–4094) To associate multiple VLANs in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).

### Defaults

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.
- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.
- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.
- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the 1x1 or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. However, the MSTI configuration is not active unless the switch is running in the flat mode.

### Examples

```
-> bridge msti 10 vlan 100-115
-> bridge msti 20 vlan 122 135 200-210
-> bridge msti 10 no vlan 112 200-204
```

## Release History

Release 6.1; command introduced.

## Related Commands

<b>bridge mst region name</b>	Defines the name for an MST region.
<b>bridge mst region revision level</b>	Defines the revision level for an MST region.
<b>bridge mst region max hops</b>	Defines the maximum number of hops for the MST region.
<b>bridge msti</b>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.

---

## bridge priority

Configures the bridge priority value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a 1x1 mode VLAN instance. Bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge.

**bridge** [*instance*] **priority** *priority*

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance or an existing VLAN ID number (1–4094).
<i>priority</i>	A bridge priority value within the range of 0–65535. Do not use commas in the value. If MSTP is the active protocol on the switch, then a bridge priority value that is a multiple of 4096 is required.

### Defaults

By default, the bridge priority value is set to 32768.

<b>parameter</b>	<b>default</b>
<i>instance</i>	flat mode instance

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the priority value for the associated VLAN instance.
- To configure the priority value for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the [bridge cist priority](#) or [bridge msti priority](#) commands instead.
- Note that when the protocol is changed to MSTP or from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.

## Examples

```
-> bridge mode flat
-> bridge priority 8192
-> bridge priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
      8192, 12288, 16384 ... 61440

-> bridge mode 1x1
-> bridge 255 priority 16384
-> bridge 355 priority 3500
-> bridge priority 8192
```

## Release History

---

## bridge cist priority

Configures the Spanning Tree priority value for the flat mode Common and Internal Spanning Tree (CIST) instance. Bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge.

**bridge cist priority** *priority*

---

### Syntax Definitions

*priority* A bridge priority value within the range of 0–65535. Do not use commas in the value. If MSTP is the active protocol on the switch, then a bridge priority value that is a multiple of 4096 is required.

### Defaults

By default, the bridge priority value is set to 32768.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified priority value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the protocol is changed to MSTP or from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- In regards to the priority for a Multiple Spanning Tree Instance (MSTI), only the four most significant bits are used.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge mode flat
-> bridge cist priority 16384
-> bridge cist priority 53800
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
      8192, 12288, 16384 ... 61440

-> bridge mode 1x1
-> bridge cist priority 16384
-> bridge cist priority 12288
```

## Release History

Release 6.1; command introduced.

## Related Commands

<b>bridge mode</b>	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
<b>bridge priority</b>	Implicit command for changing the Spanning Tree priority for the flat mode CIST instance or a 1x1 mode VLAN instance.
<b>bridge msti priority</b>	Explicit command for changing the Spanning Tree priority for an MSTI when the switch is operating in either the flat or 1x1 mode.
<b>bridge 1x1 protocol</b>	Explicit command for changing the Spanning Tree priority for a VLAN instance when the switch is operating in either the flat or 1x1 mode.

## MIB Objects

```
vStpInsTable  
  vStpInsNumber  
  vStpInsPriority  
  vStpInsBridgeAddress
```

---

## bridge msti priority

Configures the bridge priority value for an Multiple Spanning Tree Instance (MSTI). Bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge.

**bridge msti *msti\_id* priority *priority***

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number (0–4094).
<i>priority</i>	A bridge priority value that is a multiple of 4096 and within the range of 0–65535. Do not use commas in the value.

### Defaults

By default, the bridge priority value is set to 32768.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- This command is an explicit Spanning Tree command that only applies to the specified MSTI regardless of which operating mode (flat or 1x1) is active on the switch. If MSTP is not the selected flat mode protocol, however, the priority value for any MSTI is not configurable in either mode.
- Note that if zero is entered for the *msti\_id* value, the specified priority value is applied to the CIST instance. The flat mode CIST instance 0 is also known as MSTI 0.
- If the switch is running in 1x1 mode when this command is used, the specified priority value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- Note that when the protocol is changed to MSTP or from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- In regards to the priority for an MSTI, only the four most significant bits are used.

## Examples

```
-> bridge mode flat
-> bridge msti 2 priority 4096
-> bridge msti 10 priority 53800
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
      8192, 12288, 16384 ... 61440

-> bridge mode 1x1
-> bridge msti 2 priority 61440
-> bridge msti 10 priority 12288
```

## Release History

## bridge 1x1 priority

Configures the bridge priority value for an individual VLAN instance.

**bridge 1x1** *vid* **priority** *priority*

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>priority</i>	A bridge priority value within the range of 0–65535. Do not use commas in the value.

### Defaults

By default, the bridge priority value is set to 32768.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified priority value is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge mode flat
-> bridge 1x1 2 priority 16384
-> bridge 1x1 10 priority 53800

-> bridge mode 1x1
-> bridge 1x1 2 priority 16384
-> bridge 1x1 10 priority 53800
```

### Release History

```

---

## bridge hello time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a 1x1 mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

**bridge** [*instance*] **hello time** *seconds*

---

### Syntax Definitions

*instance*                                      The flat mode CIST instance or an existing VLAN ID number (1–4094).  
*seconds*                                      Hello Time value, in seconds (1–10).

### Defaults

By default, the bridge hello time value for is set to 2 seconds.

<b>parameter</b>	<b>default</b>
<i>instance</i>	flat mode instance

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the hello time value for the associated VLAN instance.
- To configure the hello time value for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.

### Examples

```
-> bridge mode flat
-> bridge hello time 5

-> bridge mode 1x1
-> bridge 10 hello time 8
-> bridge hello time 5
```

```

---

## bridge max age

Configures the Spanning Tree bridge max age time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a 1x1 mode VLAN instance. This value is the amount of time, in seconds, that Spanning Tree information learned from the network on any port is retained. When this information has aged beyond the max age value, the information is discarded.

**bridge** [*instance*] **max age** *seconds*

---

### Syntax Definitions

*instance*                                      The flat mode CIST instance or an existing VLAN ID number (1–4094).  
*seconds*                                      Max age time in seconds (6–40).

### Defaults

By default, the bridge max age time value is set to 20 seconds.

<b>parameter</b>	<b>default</b>
<i>instance</i>	flat mode instance

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A low max age time causes the Spanning Tree Algorithm to reconfigure more often.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the max age value for the associated VLAN instance.
- To configure the max age value for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Note that for Multiple Spanning Tree Instances (MSTI), the max age value is inherited from the CIST instance and is not a configurable parameter.

### Examples

```
-> bridge mode flat
-> bridge max age 40

-> bridge mode 1x1
-> bridge 255 max age 40
-> bridge max age 10
```

## Release History

Release 6.1; command introduced.

---

## bridge forward delay

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for 1x1 mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

**bridge** [*instance*] **forward delay** *seconds*

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance or an existing VLAN ID number (1–4094).
<i>seconds</i>	Forward delay time, in seconds (4–30).

### Defaults

By default, the bridge forward delay time value is set to 15 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the forward delay time for the associated VLAN instance.
- To configure the forward delay time for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

### Examples

```
-> bridge mode flat
-> bridge forward delay 30

-> bridge mode 1x1
-> bridge 255 forward delay 10
-> bridge forward delay 30
```

## bridge cist forward delay

Configures the bridge forward delay time value for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

**bridge cist forward delay** *seconds*

---

### Syntax Definitions

*seconds* Forward delay time in seconds (4–30).

### Defaults

By default, the bridge forward delay time value is set to 15 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- This command is an explicit Spanning Tree command that only applies to the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified forward delay time value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge mode flat
-> bridge cist forward delay 10
-> bridge cist forward delay 30

-> bridge mode 1x1
-> bridge cist forward delay 25
-> bridge cist forward delay 4
```

### Release History

Release 6.1; command introduced.

## Related Commands

```
vStpInsTable  
  vStpInsNumber  
  vStpInsBridgeForwardDelay
```

---

## bridge 1x1 forward delay

Configures the bridge forward delay time value for an individual VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

**bridge 1x1** *vid* forward delay *seconds*

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>seconds</i>	Forward delay time in seconds (4–30).

### Defaults

By default, the bridge forward delay time value is set to 15 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified max age time value is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge mode flat
-> bridge 1x1 2 forward delay 30
-> bridge 1x1 10 forward delay 4

-> bridge mode 1x1
-> bridge 1x1 255 forward delay 25
-> bridge 1x1 455 forward delay 10
```

### Release History

Release 6.1; command introduced.

## Related Commands

**bridge mode**

Selects the Spanning Tree operating mode (flat or 1x1) for the switch.

**bridge forward delay**

Implicit command for changing the Spanning Tree forward delay time value for the flat mode CIST instance or for a 1x1 mode VLAN instance.

**bridge cist forward delay**

Explicit command for changing the Spanning Tree forward delay time value for the CIST instance when the switch is operating in either the flat or 1x1 mode.

---

## bridge mode 1x1 pvst+

Enables or disables PVST+ mode on the switch, enabling it to operate with Cisco switches.

**bridge mode 1x1 pvst+ {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the pvst+ mode.
<b>disable</b>	Disables the pvst+ mode.

### Defaults

PVST+ is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in 1x1 mode.
- This command enables the ports to handle PVST+ BPDUs.
- In this mode, the bridge priority field of the bridge ID can only be changed by a multiple of 4096.

### Examples

```
-> bridge mode 1x1 pvst+ enable  
-> bridge mode 1x1 pvst+ disable
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

[bridge port pvst+](#) Configures the type of BPDU to be used on a port when PVST+ mode is enabled.

```

---

## bridge bpdu-switching

Enables the switching of Spanning Tree BPDU on the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the 1x1 mode.

**bridge** [*instance*] **bpdu-switching** {**enable** | **disable**}

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance (bridge 1) or an existing 1x1 mode VLAN ID instance number (bridge 1–4094).
<b>enable</b>	Enables BPDU switching for the specified instance.
<b>disable</b>	Disables BPDU switching for the specified instance.

### Defaults

By default, BPDU switching is disabled for an instance.

parameter	default
<i>instance</i>	CIST (flat mode)

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.
- The **bridge bpdu-switching** command is an implicit Spanning Tree command. When issued in the 1x1 mode, the *instance* number specified implies a VLAN ID. When issued in the flat mode, the *instance* number specified implies an MSTI number.
- If an *instance* is not specified with this command, the BPDU switching status is configured for the flat mode CIST instance by default regardless of which mode (flat or 1x1) is active on the switch.
- Note that if the switch is running in the flat mode, specifying a value greater than 1 for the *instance* returns an error message. BPDU switching is only configured for the flat mode instance (bridge 1), regardless of which protocol is active (STP, RSTP, or MSTP).

### Examples

```
-> bridge mode flat
-> bridge bpdu-switching enable
-> bridge 1 bpdu-switching disable

-> bridge mode 1x1
-> bridge 100 bpdu-switching enable
-> bridge 100 bpdu-switching disable
```

---

## bridge path cost mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

**bridge path cost mode {auto | 32bit}**

---

### Syntax Definitions

<b>auto</b>	The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).
<b>32bit</b>	Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

### Defaults

By default, the path cost mode is set to **auto**.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Note that all path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the **bridge path cost mode** command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value

### Examples

```
-> bridge path cost mode 32bit  
-> bridge path cost mode auto
```

### Release History

Release 6.1; command introduced.

### Related Commands

vStpBridge

vStpPathCostMode

---

## bridge auto-vlan-containment

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

**bridge** [*msti msti\_id*] **auto-vlan-containment** {**enable** | **disable**}

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number (0–4094).
<b>enable</b>	Enables automatic VLAN containment.
<b>disable</b>	Disables automatic VLAN containment.

### Defaults

By default, automatic VLAN containment is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the **bridge auto-vlan-containment** command but do not specify an *msti\_id*.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, use the **disable** form of this command and specify the *msti\_id* for the instance.
- Use the **enable** form of this command and specify an *msti\_id* to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. The exception to this is if the port path cost is administratively set to zero, which resets the path cost to the default value.
- Note that when AVC is disabled that a port assigned to a VLAN not mapped to a specific instance can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.

### Examples

```
-> bridge auto-vlan-containment enable
-> bridge auto-vlan-containment disable
-> bridge msti 1 auto-vlan-containment disable
-> bridge msti 1 auto-vlan containment enable
```

### Release History

Release 6.1.1; command introduced.

## Related Commands

**bridge path cost**

Defines a Spanning Tree path cost for a port.

**show spantree msti ports**

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

---

## bridge port pvst+

Configures the type of BPDU to be used on a port when PVST+ mode is enabled.

**bridge port** {*slot/port* | *agg\_num*} **pvst+** {**auto** | **enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	Specifies the aggregate group.
<i>auto</i>	IEEE BPDUs are used until a PVST+ BPDU is detected.
<i>enable</i>	Specifies that PVST+ BPDUs can be used.
<i>disable</i>	Specifies that IEEE BPDUs can be used.

### Defaults

parameters	default
<b>auto</b>   <b>enable</b>   <b>disable</b>	<b>auto</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in 1x1 mode.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

### Examples

```
-> bridge port 1/3 pvst+ enable
-> bridge port 2/2 pvst+ auto
```

### Release History

Release 6.3.1; command introduced.

## Related Commands

## bridge

Enables or disables the Spanning Tree status on a single port or an aggregate of ports for the specified flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

**bridge** *instance* {*slot/port* | *logical\_port*} {**enable** | **disable**}

---

### Syntax Definitions

<i>instance</i>	The CIST instance number or an existing VLAN ID number (1–4094).
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	The Link aggregate ID number (0–31).
<b>enable</b>	Enables Spanning Tree on the specified port for the specified instance.
<b>disable</b>	Disables Spanning Tree on the specified port for the specified instance.

### Defaults

By default, the Spanning Tree status is enabled on eligible ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the port Spanning Tree status for the associated VLAN instance.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist** command instead.
- Note that for Multiple Spanning Tree Instances (MSTI), the port Spanning Tree status is inherited from the CIST instance and is not a configurable parameter.
- When STP is disabled on a port, the port is set to a forwarding state for the specified STP instance.
- If STP is disabled on a VLAN in the 1x1 mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that ports at this point are *not* switching BPDU, unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

## Examples

```
-> bridge mode flat
-> bridge 1 4/1 disable
-> bridge 1 1/24 enable

-> bridge mode 1x1
-> bridge 255 5/10 enable
-> bridge 455 16 enable
```

## Release History

Release 6.1; command introduced.

```

---

## bridge cist

Enables or disables the Spanning Tree status on a single port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

**bridge cist** {*slot/port* | *logical\_port*} {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	The Link aggregate ID number (0–31).
<b>enable</b>	Enables Spanning Tree on the specified port for the CIST instance.
<b>disable</b>	Disables Spanning Tree on the specified port for the CIST instance.

### Defaults

By default, the Spanning Tree status is enabled on eligible ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port Spanning Tree status for the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the 1x1 mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that ports at this point are *not* switching BPDU, unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

## Examples

```
-> bridge mode flat
-> bridge cist 4/1 enable
-> bridge cist 16 enable

-> bridge mode 1x1
-> bridge cist 5/10 enable
-> bridge cist 22 enable
```

## Release History

---

## bridge priority

Configures the Spanning Tree priority for a single port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance. The Spanning Tree Algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

**bridge** *instance* {*slot/port* | *logical\_port*} **priority** *priority*

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance or an existing VLAN ID number (1–4095).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>priority</i>	Port priority value (0–15). The lower the number, the higher the priority.

### Defaults

By default, the bridge port priority value is set to 7.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the port priority value for the associated VLAN instance.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the [bridge cist priority](#) command instead.

### Examples

```
-> bridge mode flat
-> bridge 1 4/1 priority 0

-> bridge mode 1x1
-> bridge 255 1/24 priority 5
-> bridge 455 3/12 priority 15
```

### Release History

Release 6.1; command introduced.

## bridge msti priority

Configures the Spanning Tree priority value for a port or an aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). The Spanning Tree algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

**bridge msti** *msti\_id* {*slot/port* | *logical\_port*} **priority** *priority*

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number (0–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>priority</i>	Port priority value (0–15). The lower the number, the higher the priority.

### Defaults

By default, the bridge port priority value is set to 7.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- This command is an explicit Spanning Tree command that only applies to the specified MSTI regardless of which operating mode (flat or 1x1) is active on the switch. If MSTP is not the selected flat mode protocol, however, the port priority value for any MSTI is not configurable in either mode.
- Note that if zero is entered for the *msti\_id* value, the specified priority value is applied to the CIST instance. The flat mode CIST instance 0 is also known as MSTI 0.
- The port priority value configured with this command is only applied to the specified MSTI. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.
- If the switch is running in 1x1 mode when this command is used, the specified priority value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

## Examples

```
-> bridge mode flat
-> bridge msti 0 1/24 priority 12
-> bridge msti 2 1/24 priority 5

-> bridge mode 1x1
-> bridge msti 0 1/24 priority 12
-> bridge msti 2 1/24 priority 5
```

## Release History

Release 6.1; command introduced.

## Related Commands

<a href="#">bridge mode</a>	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.

  vStpInsPortNumber
  vStpInsPortPriority
```

---

## bridge 1x1 priority

Configures the Spanning Tree priority value for a port or an aggregate of ports for the specified 1x1 mode VLAN instance. The Spanning Tree algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

**bridge 1x1** *vid* {*slot/port* | *logical\_port*} **priority** *priority*

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4096).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>priority</i>	Port priority value (0–15). The lower the number, the higher the priority.

### Defaults

By default, the bridge port priority value is set to 7.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified priority value for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge mode flat
-> bridge 1x1 100 4/1 priority 2
-> bridge 1x1 200 1/24 priority 4

-> bridge mode 1x1
-> bridge 1x1 255 5/10 priority 1
-> bridge 1x1 455 1/16 priority 15
```

## Release History

Release 6.1; command introduced.

## MIB Objects

vStpInsPortTable  
    vStpInsPortNumber  
    vStpInsPortPriority

---

## bridge path cost

Configures the Spanning Tree path cost value for a single port or an aggregate of ports that applies to the specified flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

**bridge** *instance* {*slot/port* | *logical\_port*} **path cost** *path\_cost*

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance or an existing VLAN ID number (0–4095).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>path_cost</i>	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the port path cost for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist path cost** command instead.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **bridge path cost mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path\_cost* is set to zero, the following recommended default path cost values based on link speed are used:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

<b>Link Speed</b>	<b>Aggregate Size (number of links)</b>	<b>Default Path Cost Value</b>
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

### Examples

```
-> bridge mode flat
-> bridge 1 4/1 path cost 19
-> bridge 1 5/1 path cost 0

-> bridge mode 1x1
-> bridge 455 1/24 path cost 2000
-> bridge 955 3/12 path cost 500
```

### Release History

---

## bridge cist path cost

Configures the Spanning Tree path cost value for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

**bridge cist** {*slot/port* | *logical\_port*} **path cost** *path\_cost*

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>path_cost</i>	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **bridge path cost mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- If a 32-bit path cost value is in use and the *path\_cost* is set to zero, the following recommended default path cost values based on link speed are used:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

<b>Link Speed</b>	<b>Aggregate Size (number of links)</b>	<b>Default Path Cost Value</b>
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

### Examples

```
-> bridge mode flat
-> bridge cist 4/1 path cost 19
-> bridge cist 16 path cost 12000

-> bridge mode 1x1
-> bridge cist 5/10 path cost 19
-> bridge cist 11 path cost 12000
```

### Release History

```
vStpInsPortTable  
  vStpInsPortNumber  
  vStpInsPortPathCost
```

---

## bridge msti path cost

Configures the Spanning Tree path cost value for a port or an aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

**bridge msti** *msti\_id* {*slot/port* | *logical\_port*} **path cost** *path\_cost*

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number (0–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>path_cost</i>	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified MSTI regardless of which operating mode (flat or 1x1) is active on the switch. If MSTP is not the selected flat mode protocol, however, the path cost value for any MSTI is not configurable.
- Note that if zero is entered for the *msti\_id* value, the specified path cost value is applied to the CIST instance. The flat mode CIST instance 0 is also known as MSTI 0.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 200000 for MSTI 3.
- If the switch is running in 1x1 mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. You cannot use a 16-bit path cost value is option when the MSTP protocol is active on the switch.

- If zero is entered for the *path\_cost* value, then the following default path cost values are used based on the link speed:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If the *path\_cost* value for a link aggregate is set to zero, the following default values are used based on link speed and link aggregate size:

<b>Link Speed</b>	<b>Aggregate Size (number of links)</b>	<b>Default Path Cost Value</b>
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

## Examples

```
-> bridge mode flat
-> bridge msti 0 4/1 path cost 200000
-> bridge msti 2 4/1 path cost 20000

-> bridge mode 1x1
-> bridge msti 0 1/24 path cost 200000
-> bridge msti 2 1/24 path cost 20000
```

## Release History

## bridge 1x1 path cost

Configures the Spanning Tree path cost value for a port or an aggregate of ports for the specified 1x1 mode VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
bridge 1x1 vid {slot/port | logical_port} path cost path_cost
```

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<i>path_cost</i>	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the [bridge path cost mode](#) command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- All Spanning Tree commands are saved in their explicit format when a configuration snapshot is taken of the switch.
- If a 32-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 892.1S recommended default path cost values are used based on link speed:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 802.1D recommended default path cost values are used based on the link speed:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values are used based on the link speed and link aggregate size:

<b>Link Speed</b>	<b>Aggregate Size (number of links)</b>	<b>Default Path Cost Value</b>
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values are used based on the link speed and link aggregate size:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

---

**Note.** The aggregate size is not applicable for Gigabit ports when a 16-bit path cost value is set.

---

## Examples

```
-> bridge mode flat
-> bridge 1x1 200 4/1 path cost 4
-> bridge 1x1 300 16 path cost 200000

-> bridge mode 1x1
-> bridge 1x1 400 5/10 path cost 19
-> bridge 1x1 500 1/24 path cost 20000
```

## Release History

Release 6.1; command introduced.

## Related Commands

<b>bridge mode</b>	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
<b>bridge path cost</b>	Implicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports that applies to the specified CIST or VLAN instance.
<b>bridge cist path cost</b>	Explicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
<b>bridge msti path cost</b>	Explicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports for an MSTI when the switch is operating in either the 1x1 or flat Spanning Tree mode.

## MIB Objects

```
vStpInsPortTable  
  vStpInsPortNumber  
  vStpInsPortPathCost
```

---

## bridge mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance. Dynamic mode defers the configuration of the port state to the Spanning Tree Protocol.

**bridge** *instance* {*slot/port* | *logical\_port*} **mode** {**forwarding** | **blocking** | **dynamic**}

---

### Syntax Definitions

<i>instance</i>	The CIST instance or an existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>forwarding</b>	Set port state to forwarding.
<b>blocking</b>	Set port state to blocking.
<b>dynamic</b>	Port state is determined by Spanning Tree Protocol.

### Defaults

By default, the port Spanning Tree mode is set to dynamic.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and configures the port Spanning Tree mode (**forwarding**, **blocking**, or **dynamic**) for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist mode** command instead.
- For Multiple Spanning Tree Instances (MSTI), the port Spanning Tree mode is inherited from the CIST instance. The spanning tree mode cannot be configured explicitly when the CIST instance is active.
- When a port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree Algorithm.

## Examples

```
-> bridge mode flat
-> bridge 1 4/1 mode forwarding

-> bridge mode 1x1
-> bridge 200 4/1 mode dynamic
-> bridge 300 1/24 mode forwarding
```

## Release History

---

## bridge cist mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

**bridge cist** {*slot/port* | *logical\_port*} **mode** {**dynamic** | **blocking** | **forwarding**}

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>dynamic</b>	Port state is determined by Spanning Tree algorithm.
<b>blocking</b>	Sets port state to blocking.
<b>forwarding</b>	Sets port state to forwarding.

### Defaults

By default, the port Spanning Tree mode is set to dynamic.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

### Examples

```
-> bridge mode flat
-> bridge cist 4/1 mode forwarding
-> bridge cist 10 mode blocking

-> bridge mode 1x1
-> bridge cist 2/2 mode blocking
-> bridge cist 11 mode forwarding
```

## Release History

Release 6.1; command introduced.

## Related Commands

[bridge mode](#)

Selects the Spanning Tree operating mode (flat or 1x1) for the switch.

[bridge mode](#)

Implicit command for configuring the Spanning Tree mode for a port or an aggregate of ports for the CIST instance or a VLAN instance.

[bridge 1x1 mode](#)

Explicit command for configuring the Spanning Tree mode for a port or an aggregate of ports for the specified VLAN instance when the switch is operating in either the 1x1 or flat Spanning Tree mode.

## MIB Objects

vStpInsPortTable

    vStpInsPortNumber

    vStpInsPortManualMode

---

## bridge 1x1 mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or an aggregate of ports for the specified 1x1 mode VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

**bridge 1x1** *vid* {*slot/port* | *logical\_port*} **mode** {**dynamic** | **blocking** | **forwarding**}

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>dynamic</b>	Port state is determined by Spanning Tree algorithm.
<b>blocking</b>	Sets port state to blocking.
<b>forwarding</b>	Sets port state to forwarding.

### Defaults

By default, the port Spanning Tree mode is set to dynamic.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

## Examples

```
-> bridge mode flat
-> bridge 1x1 255 4/1 mode forwarding
-> bridge 1x1 355 1/24 mode dynamic

-> bridge mode 1x1
-> bridge 1x1 255 2/2 mode blocking
-> bridge 1x1 355 3/12 mode forwarding
```

## Release History

Release 6.1; command introduced.

  vStpInsPortNumber
  vStpInsPortManualMode
```

---

## bridge connection

Configures the connection type for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

**bridge** *instance* {*slot/port* | *logical\_port*} **connection** {**noptp** | **ptp** | **autoptp** | **edgeport**}

---

### Syntax Definitions

<i>instance</i>	The flat mode CIST instance or an existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31). <i>This parameter is not available on OmniSwitch 6850 and OmniSwitch 6855 switches.</i>
<b>noptp</b>	Defines port connection type as no point-to-point link.
<b>ptp</b>	Defines port connection type as point-to-point link.
<b>autoptp</b>	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.
<b>edgeport</b>	<i>This parameter is currently not supported.</i> Use the <b>bridge cist admin-edge</b> or <b>bridge cist auto-edge</b> command to configure edge port status.

### Defaults

By default the link connection type is set to auto point-to-point.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and configures the port connection type for the associated VLAN instance.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist connection** command instead.
- Note that for Multiple Spanning Tree Instances (MSTI), the port connection type is inherited from the CIST instance and is not a configurable parameter.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines if the port should run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.

- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

## Examples

```
-> bridge mode flat
-> bridge 1 1/24 connection noptp

-> bridge mode 1x1
-> bridge 200 8/2 connection ptp
-> bridge 300 10 connection autoptp
```

## Release History

Release 6.1; command introduced.

Release 6.1.3; **edgeport** parameter was deprecated.

## bridge cist connection

Configures the connection type for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
bridge cist {slot/port | logical_port} connection {noptp | ptp | autoptp | edgeport}
```

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>noptp</b>	Defines port connection type as no point-to-point link.
<b>ptp</b>	Defines port connection type as point-to-point link.
<b>autoptp</b>	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.
<b>edgeport</b>	<i>This parameter is currently not supported.</i> Use the <b>bridge cist admin-edge</b> or <b>bridge cist auto-edge</b> command to configure edge port status.

### Defaults

By default, the link connection type is set to auto point-to-point.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port connection type for the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port should run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

## Examples

```
-> bridge mode flat
-> bridge cist 7/24 connection noptp

-> bridge mode 1x1
-> bridge cist 2/2 connection noptp
```

## bridge 1x1 connection

Configures the connection type for a port or an aggregate of ports for a 1x1 mode VLAN instance.

**bridge 1x1** *vid* {*slot/port* | *logical\_port*} **connection** {**noptp** | **ptp** | **autoptp** | **edgeport**}

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>noptp</b>	Defines port connection type as no point-to-point link.
<b>ptp</b>	Defines port connection type as point-to-point link.
<b>autoptp</b>	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point <i>and</i> whether or not the port is an edge port.
<b>edgeport</b>	<i>This parameter is currently not supported.</i> Use the <b>bridge 1x1 admin-edge</b> or <b>bridge 1x1 auto-edge</b> command to configure edge port status.

### Defaults

By default, the link connection type is set to auto point-to-point.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified connection type for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port should run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

## Examples

```
-> bridge mode flat
-> bridge 1x1 255 7/24 connection noptp

-> bridge mode 1x1
-> bridge 1x1 200 2/2 connection noptp
```

## Release History

Release 6.1; command introduced.

Release 6.1.3; **edgeport** parameter was deprecated.

  vStpInsPortNumber
  vStpInsPortAdminConnectionType
  vStpInsPortOperConnectionType
```

---

## bridge cist admin-edge

Configures the administrative edge port status for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

**bridge cist** {*slot/port* | *logical\_port*} **admin-edge** {**on** | **off** | **enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>on</b>	Turns on the administrative edge port status for the specified port-CIST instance.
<b>off</b>	Turns off the administrative edge port status for the specified port-CIST instance.
<b>enable</b>	Enables the administrative edge port status for the specified port-CIST instance.
<b>disable</b>	Disables the administrative edge port status for the specified port-CIST instance.

### Defaults

By default, the administrative edge port status is disabled (off).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port connection type for the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

## Examples

```
-> bridge mode flat
-> bridge cist 15 admin-edge enable
-> bridge cist 8/23 admin-edge disable

-> bridge mode 1x1
-> bridge cist 2/2 admin-edge enable
-> bridge cist 8/23 admin-edge off
```

## Release History

Release 6.1.3; command introduced.

  vStpInsPortNumber
  vStpInsPortAutoEdge
```

---

## bridge cist restricted-role

Configures whether or not to prevent a port (or an aggregate of ports) from becoming the root port. When this parameter is enabled, the port does not become the root even if the port is the most likely candidate for the root. Once another port is selected as the root port, the restricted port becomes the Alternate Port.

**bridge cist** {*slot/port* | *logical\_port*} {**restricted-role** | **root-guard**} {**on** | **off** | **enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>root-guard</b>	Optional command syntax. Enter <b>root-guard</b> instead of <b>restricted-role</b> ; both parameters specify the same functionality for this command.
<b>on</b>	Turns on (enables) the restricted role status for the specified port.
<b>off</b>	Turns off (disables) the restricted role status for the specified port.
<b>enable</b>	Enables the restricted role status for the specified port.
<b>disable</b>	Disables the restricted role status for the specified port.

### Defaults

By default, the port is not restricted from becoming the root port.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.
- Note that preventing an eligible root port from becoming the root may impact connectivity within the network.
- Network administrators exclude certain ports from becoming the root to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

## Examples

```
-> bridge mode flat
-> bridge cist 15 restricted-role on
-> bridge cist 8/23 root-guard disable

-> bridge mode 1x1
-> bridge cist 2/2 root-guard enable
-> bridge cist 10 restricted-role off
```

## Release History

Release 6.1.3; command introduced.  
Release 6.3.3; **root-guard** parameter was added.

### Related Commands

<b>bridge mode</b>	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
<b>bridge 1x1 restricted-role</b>	Configures the restricted role status for a port or an aggregate of ports for the 1x1 mode VLAN instance.

## MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortRestrictedRole
```

---

## bridge 1x1 restricted-role

Configures whether or not to prevent a port (or an aggregate of ports) for the specified 1x1 mode VLAN instance from becoming the root port. When this parameter is enabled, the port does not become the root even if the port is the most likely candidate for the root. Once another port is selected as the root port, the restricted port becomes the Alternate Port.

**bridge 1x1** *vid* {*slot/port* | *logical\_port*} {**restricted-role** | **root-guard**} {**on** | **off** | **enable** | **disable**}

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>root-guard</b>	Optional command syntax. Enter <b>root-guard</b> instead of <b>restricted-role</b> ; both parameters specify the same functionality for this command.
<b>on</b>	Turns on (enables) the restricted role status for the specified port-VLAN instance.
<b>off</b>	Turns off (disables) the restricted role status for the specified port-VLAN instance.
<b>enable</b>	Enables the restricted role status for the specified port-VLAN instance.
<b>disable</b>	Disables the restricted role status for the specified port-VLAN instance.

### Defaults

By default, the port is not restricted from becoming the root port.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Note that preventing an eligible port from becoming the root may impact connectivity within the network.
- Network administrators exclude certain ports from becoming the root to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- This command is an explicit Spanning Tree command that only applies to the VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the restricted status of the port is not active for the VLAN instance until the switch is running in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

## Examples

```
-> bridge mode flat
-> bridge 1x1 3 15 restricted-role on
-> bridge 1x1 255 8/23 root-guard disable

-> bridge mode 1x1
-> bridge 1x1 4 2/2 root-guard enable
-> bridge 1x1 255 10 restricted-role off
```

## Release History

Release 6.1.3; command introduced.  
Release 6.3.3; **root-guard** parameter was added.

## Related Commands

<b>bridge mode</b>	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
<b>bridge cist restricted-role</b>	Configures the restricted role status for a port or an aggregate of ports for the flat mode CIST instance.

## MIB Objects

```

  vStpInsPortNumber
  vStpInsPortRestrictedRole
```

---

## bridge cist restricted-tcn

Configures the restricted TCN status for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

**bridge cist** {*slot/port* | *logical\_port*} **restricted-tcn** {**on** | **off** | **enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>on</b>	Turns on (enables) the restricted TCN status for the specified port-CIST instance.
<b>off</b>	Turns off (disables) the restricted TCN status for the specified port-CIST instance.
<b>enable</b>	Enables the restricted TCN status for the specified port-CIST instance.
<b>disable</b>	Disables the restricted TCN status for the specified port-CIST instance.

### Defaults

By default, the restricted TCN status for the port is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

## Examples

```
-> bridge mode flat
-> bridge cist 15 restricted-tcn on
-> bridge cist 8/23 restricted-tcn disable
```

```
-> bridge mode 1x1
-> bridge cist 2/2 restricted-tcn enable
-> bridge cist 10 restricted-tcn off
```

## Release History

Release 6.1.3; command introduced.

## Related Commands

---

## bridge 1x1 restricted-tcn

Configures the restricted TCN status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance. When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

**bridge 1x1** *vid* {*slot/port* | *logical\_port*} **restricted-tcn** {**on** | **off** | **enable** | **disable**}

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1–4094).
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>logical_port</i>	Link aggregate ID number (0–31).
<b>on</b>	Turns on (enables) the restricted TCN status for the specified port-VLAN instance.
<b>off</b>	Turns off (disables) the restricted TCN status for the specified port-VLAN instance.
<b>enable</b>	Enables the restricted TCN status for the specified port-VLAN instance.
<b>disable</b>	Disables the restricted TCN status for the specified port-VLAN instance.

### Defaults

By default, the restricted TCN is set to disable.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted TCN status for the port is not active for the VLAN instance until the switch is running in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

## Examples

```
-> bridge mode flat
-> bridge 1x1 2 15 restricted-tcn on
-> bridge 1x1 255 8/23 restricted-tcn disable

-> bridge mode 1x1
-> bridge 1x1 5 2/2 restricted-tcn enable
-> bridge 1x1 255 10 restricted-tcn off
```

---

## bridge cist txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the flat mode Common and Internal Spanning Tree (CIST) instance.

**bridge cist txholdcount** *value*

---

### Syntax Definitions

*value* A numeric value (1–10) that controls the transmission of BPDU through the port.

### Defaults

By default, the **txholdcount** value is set to 3.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified **txholdcount** status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

### Examples

```
-> bridge cist txholdcount 3
```

### Release History

Release 6.1.3; command introduced.

### MIB Objects

vStpInsTable  
vStpInsBridgeTxHoldCount

---

## bridge rrstp

Enables or disables RRSTP on a switch.

**bridge rrstp**

**no bridge rrstp**

---

### Syntax Definitions

N/A

### Defaults

By default, RRSTP is disabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable RRSTP on the switch.
- RRSTP can be enabled on the switch only when the **flat** mode is active. If you try to enable RRSTP in 1x1 mode, you get an error message: “Failed to enable RRSTP because STP Mode is 1x1”.

### Examples

```
-> bridge mode flat
-> bridge rrstp
-> no bridge rrstp
```

```
-> bridge mode 1x1
-> bridge rrstp
ERROR: Failed to enable Rrstp because STP Mode is 1x1
```

### Release History

Release 6.2.1; command introduced.

### Related Commands

[bridge rrstp ring](#)

Creates a RRSTP ring consisting of two ports.

[show bridge rrstp configuration](#)

Displays the current RRSTP status for the switch.

### MIB Objects

vStpInfo

---

## bridge rrstp ring

Creates a RRSTP ring consisting of two ports.

```
bridge rrstp ring ring_id port1 {slot/port | linkagg agg_num} port2
{slot/port | linkagg agg_num} vlan-tag vlan_id [status {enable | disable}]
```

```
no bridge rrstp ring [ring_id]
```

---

### Syntax Definitions

<i>ring_id</i>	A numeric value (1–128) that identifies the RRSTP ring.
<i>slot/port</i>	The slot number of the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the static aggregate group. Must be a unique integer in the range 0–31.
<i>vlan_id</i>	VLAN identifier with which ring ports should be 802.1q tagged before ring creation.
<b>enable</b>	Enables the RRSTP ring.
<b>disable</b>	Disables the RRSTP ring.

### Defaults

Parameters	Defaults
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a specific RRSTP ring.
- This command is used to create a ring or modify ports in an existing ring or modify the ring status.
- The ring ports must be 802.1q tagged with the VLAN before using this command.
- Note that there can be no alternate connections for the same instance between any two switches within an RRSTP ring topology.
- If RRSTP ring consists of NNI ports then they must be tagged with SVLAN (VLAN stacking) and not with standard VLAN before ring creation. For tagged RRSTP frame generation same SVLAN must be specified as ring vlan-tag. Also RRSTP ring ports must be of same type (both ring ports should be NNI ports or both should be conventional ports).
- RRSTP ring cannot be created on UNI ports.

## Examples

```
-> bridge rrstp ring 1 port1 1/1 port2 1/3 vlan-tag 10 status enable  
-> no bridge rrstp ring 1
```

## Release History

Release 6.2.1; command introduced.

## Related Commands

[bridge rrstp](#)

Enables or disables RRSTP on a switch.

[show bridge rrstp ring](#)

Displays information for all the rings or a specific ring present in the system.

## MIB Objects

```
vStpRrstpRingConfigTable  
  vStpRrstpRingId  
  vStpRrstpRingPort1  
  vStpRrstpRingPort2  
  vStpRrstpRingVlanTag  
  vStpRrstpRingState  
  vStpRrstpRingRowStatus
```

---

## bridge rrstp ring vlan-tag

Modifies the unique VLAN tag associated with the ring. The previous ring VLAN tag is replaced when this command is used.

**bridge rrstp ring** *ring\_id* **vlan-tag** *vid*

---

### Syntax Definitions

<i>ring_id</i>	A numeric value (1–128) that identifies the RRSTP ring.
<i>vid</i>	The VLAN identification number of an existing VLAN with which ring ports are 802.1Q tagged. The RRSTP ring frames shall be 802.1Q tagged with this VLAN.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The RRSTP ring can have only one VLAN tag associated with it.
- Untagged RRSTP frames shall be generated if the specified **vlan-tag** is the default VLAN of the ports.
- The ring ports must be 802.1Q tagged with the new **vlan-tag** before modifying the ring **vlan-tag**.
- RRSTP frames have 802.1Q priority similar to STP BPDUs. In order to retain this priority, use the [qos trust ports](#) command.

### Examples

```
-> bridge rrstp ring 1 vlan-tag 10
-> bridge rrstp ring 5 vlan-tag 20
-> bridge rrstp ring 11 vlan-tag 11
```

### Release History

Release 6.3.1; command introduced.

## bridge rrstp ring status

Modifies the RRSTP status of an existing ring.

**bridge rrstp ring** *ring\_id* status {enable | disable}

---

### Syntax Definitions

<i>ring_id</i>	A numeric value (1–128) that identifies the RRSTP ring.
<b>enable</b>	Enables the RRSTP ring.
<b>disable</b>	Disables the RRSTP ring.

### Defaults

Parameters	Defaults
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The RRSTP status can also be modified by using the [bridge rrstp ring](#) command.

### Examples

```
-> bridge rrstp ring 1 status enable
```

*output definitions*

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ). Configured through the <b>bridge path cost mode</b> command.
<b>VLAN</b>	The VLAN ID when RSTP or STP mode is configured.
<b>MSTI</b>	The MSTI ID when MSTP mode is configured.
<b>Bridge</b>	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode.
<b>STP Status / Spanning Tree Status</b>	The Spanning Tree state for the CIST instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the instance ( <b>STP</b> or <b>RSTP</b> ). Configured through the <b>bridge protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>1x1</b> or <b>flat</b> ). Configured through the <b>bridge mode</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>Tx Hold Count</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the <b>bridge max age</b> command.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the <b>bridge forward delay</b> command.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the <b>bridge hello time</b> command.

*output definitions (continued)*

---

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ). Configured through the <b>bridge path cost mode</b> command.
<b>Spanning Tree PVST+ Mode</b>	Indicates whether the PVST + status is enabled or disabled. Configured through the <b>bridge mode 1x1 pvst+</b> command.
<b>Vlan</b>	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the <b>vlan</b> commands
<b>STP Status</b>	The Spanning Tree state for the instance ( <b>ON</b> or <b>OFF</b> ). Configured through the <b>vlan stp</b> command.
<b>Protocol</b>	The Spanning Tree protocol applied to this instance ( <b>STP</b> or <b>RSTP</b> ). Configured through the <b>bridge protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>PVST+</b> , <b>1x1</b> or <b>flat</b> ). Configured through <b>bridge mode</b> command.

*output definitions (continued)*

---

<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>Tx Hold Count</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the <b>bridge max age</b> command.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the <b>bridge forward delay</b> command.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the <b>bridge hello time</b> command.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Hello Time</b>	The Hello Time value for the root bridge.

## show spantree cist

Displays the Spanning Tree bridge configuration for the flat mode Common and Internal Spanning Tree (CIST) instance.

**show spantree cist**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guideline

This is an explicit Spanning Tree command that displays Spanning Tree bridge information for the flat mode CIST instance regardless of which mode (1x1 or flat) is active on the switch. Note that minimal information is displayed when this command is used in the 1x1 mode, as the CIST is not active in this mode. See second example below.

### Examples

```
-> bridge mode flat
-> show spantree cist
```

```

### output definitions

---

<b>STP Status</b>	The Spanning Tree state for the instance ( <b>on</b> or <b>off</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the CIST ( <b>STP</b> , <b>RSTP</b> , or <b>MSTP</b> ). Configured through the <b>bridge protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>1x1</b> or <b>flat</b> ). Configured through the <b>bridge mode</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>CST Designated Root</b>	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Cost to CST Root</b>	The cost of the path to the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Next CST Best Cost</b>	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>Tx Hold Count</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the <b>bridge max age</b> command.

*output definitions (continued)*

---

<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the <b>bridge forward delay</b> command.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the <b>bridge hello time</b> command.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.

---

**Release History**

Release 6.1; command introduced.

Release 6.1.3; **Tx Hold Count** field added.

**Related Commands**

<b>show spantree</b>	Implicit command for displaying the Spanning Tree bridge configuration for the flat mode CIST instance or a 1x1 mode VLAN instance.
<b>show spantree msti</b>	Explicit command for displaying the Spanning Tree bridge configuration for an MSTI regardless of which mode (1x1 or flat) is active on the switch.
<b>show spantree 1x1</b>	Explicit command for displaying the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch.

## show spantree msti

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

```
show spantree msti [msti_id]
```

---

### Syntax Definitions

*msti\_id* An existing MSTI ID number (0-4094).

### Defaults

parameter	default
<i>instance</i>	all MSTIs

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If an *msti\_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This is an explicit Spanning Tree command that displays Spanning Tree bridge information for an MSTI regardless of which mode (1x1 or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the 1x1 mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti\_id* number.

### Examples

```
-> bridge mode flat
-> bridge protocol mstp
-> show spantree msti
  Spanning Tree Path Cost Mode : AUTO
  Msti STP Status Protocol Priority (Prio:SysID)
-----+-----+-----+-----
    0      ON      MSTP   32768 (0x8000:0x0000)
    2      ON      MSTP   32770 (0x8000:0x0002)
    3      ON      MSTP   32771 (0x8000:0x0003)

### *output definitions*

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ). Configured through the <b>bridge path cost mode</b> command.
<b>Msti</b>	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the <b>bridge msti</b> command.
<b>STP Status</b>	The Spanning Tree state for the instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the instance ( <b>STP</b> , <b>RSTP</b> , or <b>MSTP</b> ). This value is not configurable for an MSTI. Configured through the <b>bridge protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>1x1</b> or <b>flat</b> ). Configured through the <b>bridge mode</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>bridge msti priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>CST Designated Root</b>	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Cost to CST Root</b>	The cost of the path to the root for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Next CST Best Cost</b>	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.

*output definitions (continued)*

---

<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>TxHoldCount</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. MSTIs inherit this value from the CIST instance.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. MSTIs inherit this value from the CIST instance.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. MSTIs inherit this value from the CIST instance.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.

---

**Release History**

Release 6.1; command introduced.

Release 6.1.3; **Tx Hold Count** field added.

**Related Commands**

<b>show spantree</b>	Implicit command for displaying the Spanning Tree bridge configuration for the flat mode CIST instance or a 1x1 mode VLAN instance.
<b>show spantree cist</b>	Explicit command for displaying the Spanning Tree bridge configuration for the CIST instance regardless of which mode (1x1 or flat) is active on the switch.
<b>show spantree 1x1</b>	Explicit command for displaying the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch.

## show spantree 1x1

Displays Spanning Tree bridge information for a 1x1 mode VLAN instance.

**show spantree 1x1** [*vid*]

---

### Syntax Definitions

*vid* An existing VLAN ID number (1-4094).

### Defaults

parameter	default
<i>vid</i>	all VLAN instances

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a *vid* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vid* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show spantree 1x1 10-15**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.
- This is an explicit Spanning Tree command that displays Spanning Tree bridge information for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

### Examples

```
-> show spantree
```

```
Spanning Tree Path Cost Mode : AUTO
Bridge STP Status Protocol Priority(Prio:SysID)
-----+-----+-----+-----
  1      ON      RSTP   32768 (0x8000:0x0000)
```

```
-> show spantree 1x1
```

```
Spanning Tree Path Cost Mode : AUTO
Vlan STP Status Protocol Priority

### output definitions

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ) Configured through the <b>bridge path cost mode</b> command.
<b>Vlan</b>	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the <b>vlan</b> commands
<b>STP Status</b>	The Spanning Tree state for the instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the VLAN instance ( <b>STP</b> or <b>RSTP</b> ). Note that MSTP is not supported for a VLAN instance. Configured through the <b>bridge protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>1x1</b> or <b>flat</b> ). Configured through the <b>bridge mode</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.

*output definitions (continued)*

---

<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>Tx Hold Count</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the <b>bridge max age</b> command.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the <b>bridge forward delay</b> command.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the <b>bridge hello time</b> command.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.

---

**Release History**

Release 6.1; command introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Release 6.1.3; **Tx Hold Count** field added.

Release 6.4.4; **Loop Guard** and **Note** fields added.

## Related Commands

<b>show spantree</b>	Implicit command for displaying the Spanning Tree bridge configuration for the flat mode CIST instance or a 1x1 mode VLAN instance.
<b>show spantree cist</b>	Explicit command for displaying the Spanning Tree bridge configuration for the CIST instance regardless of which mode (1x1 or flat) is active on the switch.
<b>show spantree msti</b>	Explicit command for displaying the Spanning Tree bridge information for an MSTI when the switch is operating in the 1x1 or flat Spanning Tree mode.

## show spantree ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

**show spantree** [*instance*] **ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<i>instance</i>	The CIST instance or an existing VLAN ID number (1–4094).
<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for all ports associated with the specified instance. Note that this parameter is only available if an <i>instance</i> value is specified with this command.

### Defaults

parameter	default
<i>instance</i>	all instances
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If an instance number is *not* specified, this command displays the Spanning Tree operational status, path cost, and role for all ports and their associated instances.
- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and displays Spanning Tree port information for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the [show spantree cist ports](#) or [show spantree msti ports](#) commands instead.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

## Examples

```
-> show spantree 1x1
```

```

## Spanning Tree Port Summary for Vlan 1

Port	Oper St	Path Cost	Desig Cost	Role	Prim. Port	Op Cnx	Op Edg	Loop Guard	Desig	Bridge ID	Note
1/1	FORW	19	52	ROOT	1/1	PTP	EDG	DIS	8000-00:d0:95:f3:96:76		

*output definitions*

<b>Vlan</b>	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode.
<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: <b>disabled</b> , <b>blocking</b> , <b>learning</b> , and <b>forwarding</b> .
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <b>bridge path cost</b> command.
<b>Desig Cost</b>	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>ROOT</b> - root, <b>DIS</b> - disable, <b>DESG</b> - designated, <b>ALT</b> - alternate, <b>MSTR</b> - master (valid only when MSTP mode is active), and <b>BKP</b> - backup.
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <b>bridge connection</b> command for more information.
<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port connection type. See the <b>bridge connection</b> command on page 7-93 for more information.
<b>Loop Guard</b>	Operational status of the loop-guard on a particular port or link aggregate ( <b>ENA</b> or <b>DIS</b> )
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for this port segment.
<b>Note</b>	Specifies if an Error has occurred on the particular loop-guard enabled port. ( <b>ERR</b> )

```
-> show spantree msti 1 ports configured
```

*output definitions*

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Adm St</b>	The Spanning Tree administrative status of the port: <b>enabled</b> or <b>disabled</b> . Configured through the <b>bridge</b> command to enable or disable Spanning Tree on a port.
<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>bridge mode</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>bridge path cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>bridge connection</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>bridge connection</b> command.
<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>bridge cist auto-edge</b> or <b>bridge 1x1 auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>bridge cist restricted-tcn</b> or <b>bridge 1x1 restricted-tcn</b> command.
<b>Rstr Role</b>	The restricted role port status: <b>yes</b> indicates that the port is a restricted role port; <b>no</b> indicates that the port is not a restricted role port. Configured through the <b>bridge cist restricted-role</b> or <b>bridge 1x1 restricted-role</b> command.
<b>10G Opt.</b>	Indicates whether the 10 GB port interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ).

*output definitions*

---

<b>PVST+ Cfg</b>	Indicates the current PVST+ port configuration ( <b>auto</b> , <b>enable</b> or <b>disable</b> ).
<b>PVST+ Stat</b>	Indicates the current status of the PVST+ port ( <b>On</b> or <b>Off</b> ).

### output definitions

<b>Msti</b>	The Multiple Spanning Tree Instance (MSTI) instance number. Configured through the <b>bridge msti</b> command. <b>Note.</b> MSTI 0 also represents the CIST instance that is always present on the switch.
<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper Status</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: <b>DIS</b> - disabled, <b>BLOCK</b> - blocking, <b>LIST</b> - listening, <b>LEARN</b> - learning, and <b>FORW</b> - forwarding.
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <b>bridge path cost</b> command.

*output definitions (continued)*

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port. The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Adm St</b>	The Spanning Tree administrative status of the port: <b>enabled</b> or <b>disabled</b> . Configured through the <b>bridge</b> command to enable or disable Spanning Tree on a port.
<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>bridge mode</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>bridge path cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>bridge connection</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>bridge connection</b> command.
<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>bridge cist auto-edge</b> or <b>bridge 1x1 auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>bridge cist restricted-tcn</b> or <b>bridge 1x1 restricted-tcn</b> command.
<b>Rstr Role</b>	The restricted role port status: <b>yes</b> indicates that the port is a restricted role port; <b>no</b> indicates that the port is not a restricted role port. Configured through the <b>bridge cist restricted-role</b> or <b>bridge 1x1 restricted-role</b> command.
<b>OS8800 10G Opt.</b>	Indicates whether the 10 GB port interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ).
<b>PVST+ Cfg</b>	Indicates the current PVST+ port configuration ( <b>auto</b> , <b>enable</b> or <b>disable</b> ).
<b>PVST+ Stat</b>	Indicates the current status of the PVST+ port ( <b>On</b> or <b>Off</b> ).

## show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

**show spantree cist ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for the CIST instance.

### Defaults

parameter	default
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This is an explicit Spanning Tree command that displays Spanning Tree port information for the flat mode CIST instance regardless of which mode (1x1 or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the 1x1 mode, as the CIST is not active in this mode.

### Examples

```
-> show spantree cist ports
```

```
Spanning Tree Port Summary
```

Port	Oper St	Path Cost	Desig Cost	Role	Prim. Port	Op Cnx	Op Edg	Loop Guard	Desig	Bridge ID	Note

1/2	DIS	0	0	DIS	1/2	NS	EDG	DIS	0000-00:00:00:00:00:00		

```
-> show spantree cist ports active
```

## Spanning Tree Port Summary

Port	Oper St	Path Cost	Desig Cost	Role	Prim. Port	Op Cnx	Op Edg	Loop Guard	Desig Bridge ID	Note
1/19	FORW	4	8	DESG	1/19	PTP	NO	DIS	8000-00:d0:95:d5:e5:a2	
1/23	FORW	4	4	ROOT	1/23	PTP	NO	DIS	8000-00:d0:95:ea:b2:48	

*output definitions*

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: <b>disabled</b> , <b>blocking</b> , <b>listening</b> , <b>learning</b> , and <b>forwarding</b> .
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <b>bridge path cost</b> command.
<b>Desig Cost</b>	The path cost of the designated port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>ROOT</b> - root, <b>DIS</b> - disable, <b>DESG</b> - designated, <b>ALT</b> - alternate, <b>MSTR</b> - master (valid only when MSTP mode is active), and <b>BKP</b> - backup.
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <b>bridge connection</b> command for more information.
<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port connection type. See the <b>bridge connection</b> command on <a href="#">page 7-93</a> for more information.
<b>Loop Guard</b>	Operational status of the loop-guard on a particular port or link aggregate ( <b>ENA</b> or <b>DIS</b> ).
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for this port segment.
<b>Note</b>	Indicates whether a loop-guard error ( <b>ERR</b> ) has occurred on the MSTI instance.

-> show spantree cist ports configured

```
Spanning Tree Port Admin Configuration for Vlan 1
```

Port	Pri	Adm St.	Man. Mode	Config Cost	Adm Cnx	Adm Edg	Aut Edg	Rstr Tcn	Rstr Root	Role/Guard	OS8800 10G Opt	PVST+ Cfg Stat

1/2	7	ENA	No	0	AUT	No	Yes	No	No	DIS	AUT	Off
1/3	7	ENA	No	0	AUT	No	Yes	No	No	DIS	AUT	Off
1/4	7	ENA	No	0	AUT	No	Yes	No	No	DIS	AUT	Off

### output definitions

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the <b>bridge priority</b> command.
<b>Adm St.</b>	The Spanning Tree administrative status of the port: <b>enabled</b> or <b>disabled</b> . Configured through the <b>bridge</b> command to enable or disable Spanning Tree on a port.
<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>bridge mode</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>bridge path cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>bridge connection</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>bridge connection</b> command.
<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>bridge cist auto-edge</b> or <b>bridge 1x1 auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>bridge cist restricted-tcn</b> or <b>bridge 1x1 restricted-tcn</b> command.
<b>Rstr Role/Root Guard</b>	The restricted status of the port: <b>Yes</b> indicates that the port is restricted from becoming the root; <b>No</b> indicates that the port is not restricted from becoming the root. Configured through the <b>bridge cist restricted-role</b> or <b>bridge 1x1 restricted-role</b> command.
<b>OS8800 10G Opt.</b>	Indicates whether the 10 GB port interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ).

*output definitions (continued)*

---

<b>PVST+ Cfg Stat</b>	The PVST+ status on the switch: <b>enabled</b> or <b>disabled</b> . Configured through the command to enable or disable PVST+ mode on the switch.
<b>PVST+ Stat</b>	Indicates whether or not the PVST+ interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ) for the port. Configured through the command.

---

## show spantree msti ports

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

**show spantree msti** [*msti\_id*] **ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number (0-4094).
<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for the CIST instance.

### Defaults

---

parameter	default
<i>msti_id</i>	all MSTIs
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If an *msti\_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.
- This is an explicit Spanning Tree command that displays Spanning Tree port information for an MSTI regardless of which mode (1x1 or flat) is active on the switch.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

**Note.**

- Minimal information is displayed when this command is used in the 1x1 mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.
- MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti\_id* number.

**Examples**

```
-> show spantree msti ports
```

Msti	Port	Oper Status	Path Cost	Role	Loop Guard	Note
0	1/1	DIS	0	DIS	DIS	
0	1/2	DIS	0	DIS	DIS	
2	1/5	FORW	10	MSTR	ENA	
2	1/6	DIS	0	DIS	DIS	

```
-> show spantree msti 2 ports
```

```
Spanning Tree Port Summary for Msti 2
```

Port	Oper St	Path Cost	Desig Cost	Prim. Role	Op Port	Op Cnx	Op Edg	Loop Guard	Desig	Bridge ID	Note
1/5	FORW	0	0	MSTR	1/1	NS	EDG	ENA	0000-00:00:00:00:00:00		
1/6	DIS	0	0	DIS	1/2	NS	EDG	DIS	0000-00:00:00:00:00:00		

```
-> show spantree msti 2 ports active
```

```
Spanning Tree Port Summary for Msti 2
```

Port	Oper St	Path Cost	Desig Cost	Prim. Role	Op Port	Op Cnx	Op Edg	Loop Guard	Desig	Bridge ID	Note
1/1	FORW	200000	0	DESG	1/1	PTP	EDG	DIS	8002-00:d0:95:57:3a:9e		

**output definitions**

<b>Msti</b>	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the <b>bridge msti</b> command.
<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: <b>disabled</b> , <b>blocking</b> , <b>listening</b> , <b>learning</b> , and <b>forwarding</b> .
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <b>bridge msti path cost</b> command.

*output definitions (continued)*

<b>Desig Cost</b>	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>ROOT</b> - root, <b>DIS</b> - disable, <b>DESG</b> - designated, <b>ALT</b> - alternate, <b>MSTR</b> - master (valid only when MSTP mode is active), and <b>BKP</b> - backup.
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <a href="#">bridge connection</a> command for more information.
<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port connection type. See the <a href="#">bridge connection</a> command on <a href="#">page 7-93</a> for more information.
<b>Loop Guard</b>	Operational status of the loop-guard on a particular port or link aggregate ( <b>ENA</b> or <b>DIS</b> ).
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for this port segment.
<b>Note</b>	Indicates whether a loop-guard error ( <b>ERR</b> ) has occurred on the MSTI instance.

## show spantree 1x1 ports

Displays Spanning Tree port information for a 1x1 mode VLAN instance.

**show spantree 1x1** [*vid*] **ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<i>vid</i>	An existing VLAN ID number (1-4094).
<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for the CIST instance.

### Defaults

parameter	default
<i>vid</i>	all VLAN instances
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a *vid* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show spantree 1x1 10-15 ports**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.
- This is an explicit Spanning Tree command that displays Spanning Tree port information for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

## Examples

-> show spantree 1x1 ports

## Spanning Tree Port Summary for Vlan 11

Oper Port	Path St	Desig Cost	Prim. Cost	Op Role	Op Port	Op Cnx	Op Edg	Loop Guard	Desig Bridge ID	Note
1/9	DIS	0	0	DIS	1/36	NS	EDG	DIS	0000-00:00:00:00:00:00	
1/10	DIS	0	0	DIS	1/42	NS	EDG	DIS	0000-00:00:00:00:00:00	

*output definitions*

<b>Vlan</b>	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the <b>vlan</b> commands
<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: <b>disabled</b> , <b>blocking</b> , <b>listening</b> , <b>learning</b> , and <b>forwarding</b> .
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <b>bridge 1x1 path cost</b> command.
<b>Desig Cost</b>	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>ROOT</b> - root, <b>DIS</b> - disable, <b>DESG</b> - designated, <b>ALT</b> - alternate, <b>MSTR</b> - master (valid only when MSTP mode is active), and <b>BKP</b> - backup.
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <b>bridge connection</b> command for more information.
<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port connection type. See the <b>bridge connection</b> command on <a href="#">page 7-93</a> for more information.
<b>Loop Guard</b>	Operational status of the loop-guard on a particular port or link aggregate ( <b>ENA</b> or <b>DIS</b> ).
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for the segment related to this port.
<b>Note</b>	Indicates whether a loop-guard error ( <b>ERR</b> ) has occurred on the MSTI instance.

### output definitions

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the <b>bridge 1x1 priority</b> command.
<b>Adm St</b>	The Spanning Tree administrative status of the port: <b>enabled</b> or <b>disabled</b> . Configured through the <b>bridge</b> command to enable or disable Spanning Tree on a port.
<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>bridge mode</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>bridge 1x1 path cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>bridge connection</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>bridge connection</b> command.

*output definitions (continued)*

---

<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>bridge cist auto-edge</b> or <b>bridge 1x1 auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>bridge cist restricted-tcn</b> or <b>bridge 1x1 restricted-tcn</b> command.
<b>Rstr Role/Root Guard</b>	The restricted status of the port: <b>Yes</b> indicates that the port is restricted from becoming the root; <b>No</b> indicates that the port is not restricted from becoming the root. Configured through the <b>bridge cist restricted-role</b> or <b>bridge 1x1 restricted-role</b> command.
<b>10G Opt.</b>	Indicates whether the 10 GB port interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ).
<b>PVST+ Cfg</b>	The type of BPDU used on the port: <b>AUTO</b> indicates that IEEE BPDUs are used until a PVST+ BPDU is detected; <b>ENA</b> indicates that PVST+ BPDUs are used; <b>DIS</b> indicates that IEEE BPDUs are used. Configured through the <b>bridge port pvst+</b> command.
<b>PVST+ Stat</b>	Indicates whether or not the PVST+ interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ) for the port. Configured through the command.

## show spantree mst region

Displays the Multiple Spanning Tree (MST) region information for the switch.

**show spantree mst region**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.
- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.

### Examples

```
-> show spantree mst region
```

```
Configuration Name      = ,
Revision Level         = 0,
Configuration Digest    = 0xac36177f 50283cd4 b83821d8 ab26de62,
Revision Max hops      = 20,
Cist Instance Number    = 0
```

### *output definitions*

---

<b>Configuration Name</b>	An alphanumeric string that identifies the name of the MST region. Use the <b>bridge mst region name</b> command to define this value.
<b>Revision Level</b>	A numeric value that identifies the MST region revision level for the switch.
<b>Configuration Digest</b>	An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the <b>bridge msti</b> and <b>bridge msti vlan</b> commands to define VLAN to MSTI associations.

*output definitions (continued)*

---

<b>Revision Max hops</b>	The number of maximum hops authorized for region information. Configured through the <b>bridge mst region max hops</b> command.
<b>Cist Instance Number</b>	The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch.  <b>Note:</b> This instance is known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

---

**Release History**

Release 6.1; command introduced.

**Related Commands**

<b>show spantree msti vlan-map</b>	Displays the range of VLANs associated to the specified MSTI.
<b>show spantree cist vlan-map</b>	Displays the range of VLANs associated to the CIST instance.
<b>show spantree map-msti</b>	Displays the MSTI that is associated to the specified VLAN

**MIB Objects**

```
vStpMstRegionTable  
  vStpMstRegionNumber  
  vStpMstRegionConfigDigest  
  vStpMstRegionConfigName  
  vStpMstRegionConfigRevisionLevel  
  vStpMstRegionCistInstanceNumber  
  vStpMstRegionMaxHops
```

---

## show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

**show spantree mst** [*msti\_id*] **vlan-map**

---

### Syntax Definitions

*msti\_id*                                      An existing MSTI ID number (0–4094).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If an *msti\_id* is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance (also known as MSTI 0).

### Examples

```
-> show spantree msti vlan-map
```

```
Cist
Name           :
VLAN list      : 1-9,14-4094
```

```
Msti 1
Name           :
VLAN list      : 10-11
```

```
Msti 2
Name           :
VLAN list      : 12-13
```

```
-> show spantree msti 2 vlan-map
```

```
Spanning Tree Msti Vlan map
-----
```

```
Msti 2
Name           :
VLAN list      : 12-13
```

*output definitions*

---

<b>Cist Instance</b>	Identifies MSTI VLAN mapping information for the CIST instance.
<b>Msti</b>	The MSTI ID number that identifies an association between a Spanning Tree instance and a range of VLANs.
<b>Name</b>	An alphanumeric value that identifies an MSTI name. Use the <b>bridge msti</b> command to define an MSTI name.
<b>VLAN list</b>	The range of VLAN IDs that are associated with this MSTI.

---

**Release History**

Release 6.1; command introduced.

**Related Commands**

<b>show spantree mst region</b>	Displays the MST region information for the switch.
<b>show spantree cist vlan-map</b>	Displays the range of VLANs associated to the CIST instance.
<b>show spantree map-msti</b>	Displays the MSTI that is associated to the specified VLAN

## show spantree cist vlan-map

Displays the range of VLANs associated with the flat mode Common and Internal Spanning Tree (CIST) instance.

**show spantree cist vlan-map**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance 0 (also known as MSTI 0).

### Examples

```
-> show spantree cist vlan-map
```

```
Cist
  Name           : ,
  VLAN list      : 1-9,14-4094
```

### *output definitions*

---

<b>Name</b>	An alphanumeric value that identifies the name of the CIST. Use the <b>bridge msti</b> command to define a name for this instance.
<b>VLAN list</b>	The range of VLAN IDs that are associated with the CIST instance.

---

### Release History

Release 6.1; command introduced.

### Related Commands

<b>show spantree mst region</b>	Displays the MST region information for the switch.

  vStpMstInstanceNumber  
  vStpMstInstanceName  
  vStpMstInstanceVlanBitmapState

---

## show spantree map-msti

Displays the Multiple Spanning Tree Instance (MSTI) that is associated to the specified VLAN.

**show spantree mst *vid* vlan-map**

---

### Syntax Definitions

*vid* An existing VLAN ID number (1–4094).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance (also known as MSTI 0).

### Examples

```
-> show spantree 200 map-msti
```

```
Vlan    Msti/Cist(0)
-----+-----
    200         0
```

### Release History

Release 6.1; command introduced.

### Related Commands

- [show spantree mst region](#) Displays the MST region information for the switch.
- [show spantree msti vlan-map](#) Displays the range of VLANs associated to the specified MSTI.
- [show spantree cist vlan-map](#) Displays the range of VLANs associated to the CIST instance.

### MIB Objects

```
vStpMstVlanAssignmentTable
  vStpMstVlanAssignmentVlanNumber
  vStpMstVlanAssignmentMstiNumber
```

---

## show spantree mst port

Displays a summary of Spanning Tree connection information and instance associations for the specified port or a link aggregate of ports.

```
show spantree mst port {slot/port | logical_port}
```

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*logical\_port* The link aggregate ID number (0–31).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

---

**Note.** MST 0 also represents the flat mode CIST instance, that all ports are associated with when the switch is running in the flat Spanning Tree mode.

---

### Examples

```
-> bridge mode flat
-> show spantree mst port 1/2
```

```
MST  Role  State Pth Cst  Edge Boundary Op Cnx Loop Guard  Note  Vlans
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
    0  DIS   DIS    0   YES   YES    NS    DIS    1
```

```
-> bridge mode 1x1
-> show spantree mst port 1/10
```

```
MST  Role  State Pth Cst  Edge Boundary Op Cnx Loop Guard  Note  Vlans
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
    0  ROOT  ENA    0   YES   YES    NS    DIS    1
    2  DIS   DIS    0   YES   YES    NS    DIS
```

#### output definitions

---

<b>MST</b>	Indicates the MSTI ID.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>ROOT</b> - root, <b>DIS</b> - disable, <b>DESG</b> - designated, <b>ALT</b> - alternate, <b>MSTR</b> - master (valid only when MSTP mode is active), and <b>BKP</b> - backup.

*output definitions*

---

<b>State</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: <b>disabled</b> , <b>blocking</b> , <b>listening</b> , <b>learning</b> , and <b>forwarding</b> .
<b>Pth Cst</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.
<b>Edge</b>	Indicates whether or not the port is an <b>edge port</b> ( <b>YES</b> or <b>NO</b> ).
<b>Boundary</b>	Indicates whether or not the port is a <b>boundary port</b> ( <b>YES</b> or <b>NO</b> ). A boundary port connects an MST bridge to a LAN that belongs to a different MST region.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <a href="#">bridge connection</a> command for more information.
<b>Loop Guard</b>	Operational status of the loop-guard on a particular port or link aggregate ( <b>ENA</b> or <b>DIS</b> )
<b>Note</b>	Indicates whether a loop-guard error ( <b>ERR</b> ) has occurred on the MSTI instance.
<b>Vlans</b>	The VLAN ID of the default VLAN for the port.

---

**Release History**

Release 6.1; command introduced.

## show bridge rrstp configuration

Displays the current RRSTP status for the switch.

**show bridge rrstp configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show bridge rrstp configuration  
RRSTP Global state is Enabled
```

### Release History

Release 6.2.1; command introduced.

### Related Commands

<a href="#">bridge rrstp</a>	Enables or disables RRSTP on a switch.
<a href="#">show bridge rrstp ring</a>	Displays information for all the rings or a specific ring present in the system.

### MIB Objects

vStpInfo  
VStpRrstpGlobalState

---

## show bridge rrstp ring

Displays information for all the rings or for a specific ring that exists in the switch configuration.

**show bridge rrstp ring** [*ring\_id*]

---

### Syntax Definitions

*ring\_id*                                An existing ring ID number (1–128).

### Defaults

By default displays information for all rings.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *ring\_id* parameter with this command to display information for a specific ring.

### Examples

```
-> show bridge rrstp ring
```

RingId	Vlan-Tag	Ring-Port1	Ring-Port2	Ring Status
2	1000	1/19	1/10	enabled
6	20	1/1	1/8	disabled
128	1	0/1	0/31	enabled

### output definitions

---

<b>RingId</b>	The numeric ID of the RRSTP ring.
<b>Vlan-Tag</b>	The VLAN to which the RRSTP ring frames are tagged.
<b>Ring-Port-1</b>	The first port in the RRSTP ring.
<b>Ring-Port-2</b>	The second port in the RRSTP ring.
<b>Ring Status</b>	The current state of the RRSTP ring ( <b>Enabled</b> or <b>Disabled</b> ).

---

### Release History

Release 6.2.1; command introduced.

Release 6.3.1; **ring** parameter and **Vlan-Tag** field added.

## Related Commands

**bridge rrstp ring**

Creates a RRSTP ring consists of two ports.

**show bridge rrstp  
configuration**

Displays the current RRSTP status for the switch.

# 8 Link Aggregation Commands

Link aggregation is a way of combining multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

*Filename:* AlcatelIND1LAG.MIB  
*Module:* ALCATEL-IND1-LAG-MIB

A summary of available commands is listed here:

<b>Static link aggregates</b>	<b>static linkagg size</b> <b>static linkagg name</b> <b>static linkagg admin state</b> <b>static agg agg num</b>
<b>Dynamic link aggregates</b>	<b>lACP linkagg size</b> <b>lACP linkagg name</b> <b>lACP linkagg admin state</b> <b>lACP linkagg actor admin key</b> <b>lACP linkagg actor system priority</b> <b>lACP linkagg actor system id</b> <b>lACP linkagg partner system id</b> <b>lACP linkagg partner system priority</b> <b>lACP linkagg partner admin key</b> <b>lACP agg actor admin key</b> <b>lACP agg actor admin state</b> <b>lACP agg actor system id</b> <b>lACP agg actor system priority</b> <b>lACP agg partner admin state</b> <b>lACP agg partner admin system id</b> <b>lACP agg partner admin key</b> <b>lACP agg partner admin system priority</b> <b>lACP agg actor port priority</b> <b>lACP agg partner admin port</b> <b>lACP agg partner admin port priority</b>
<b>Dual Home Link (DHL) Active-Standby</b>	<b>lACP agg standby</b> <b>lACP linkagg pre-empt</b> <b>lACP linkagg pre-empt timer</b>
<b>Dual Home Link (DHL) Active-Active</b>	<b>dhl num</b> <b>dhl num linka linkb</b> <b>dhl num admin-state</b> <b>dhl num vlan-map linkb</b> <b>dhl num pre-emption-time</b> <b>dhl num mac-flushing</b> <b>show dhl</b> <b>show dhl num</b> <b>show dhl num link</b>
<b>Static and dynamic</b>	<b>show linkagg</b> <b>show linkagg port</b>

## static linkagg size

Creates a static aggregate group between two switches. A static aggregate group contains static links.

**static linkagg** *agg\_num* **size** *size* [**name** *name*] [**admin state** {**enable** | **disable**}]

**no static linkagg** *agg\_num*

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the static aggregate group. Must be a unique integer in the range 0–31 (stackable products) or 0–127 (chassis-based products).
<i>size</i>	The maximum number of links allowed in the aggregate group. Values may be 2, 4, or 8.
<i>name</i>	The name of the static aggregate group. May be any alphanumeric string up to 255 characters long. Spaces must be contained within quotes (e.g., “Static Group 1”).
<b>enable</b>	Specifies that the static aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the static aggregate group is inactive and not able to aggregate links.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	enable

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static aggregate group from the configuration.
- The maximum number of link aggregate groups allowed on the switch (static and dynamic combined) is 32 for stackable products and 128 for chassis-based products.
- Note that a maximum of 256 link aggregation ports are supported. The number of link aggregation ports per group will determine the maximum number of groups that can be configured. The table below provides some example configurations:

Number of Ports in Group	Maximum Number of Groups
2	128
4	64
8	32

- If the static aggregate has any attached ports you must delete them with the **static agg agg num** command before you can delete it.
- Use the **lacp linkagg size** command to create a dynamic aggregation (i.e., LACP) group. See [page 8-9](#) for more information about this command.

## Examples

```
-> static linkagg 3 size 8
-> static linkagg 4 size 2 admin state disable
-> no static linkagg 3
```

## Release History

Release 6.1; command was introduced.

## Related Commands

### [show linkagg](#)

Displays information about static and dynamic (LACP) link aggregate groups.

## MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggSize
  alclnkaggAggLacpType
  alclnkaggAggName
  alclnkaggAggAdminState
```

---

## static linkagg name

Configures a name for an existing static aggregate group.

**static linkagg** *agg\_num* **name** *name*

**static linkagg** *agg\_num* **no name**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the static aggregate group.
<i>name</i>	The name of the static aggregation group, an alphanumeric string up to 255 characters. Spaces must be contained within quotes (e.g., “Static Group 1”).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to remove a name from a static aggregate.

### Examples

```
-> static linkagg 2 name accounting
-> static linkagg 2 no name
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">static linkagg size</a>	Creates a static aggregate group.
<a href="#">show linkagg</a>	Displays information about static and dynamic (LACP) aggregate groups.

### MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggName
```

---

## static linkagg admin state

Configures the administrative state (whether the static aggregate group is active or inactive) of a static aggregate group.

```
static linkagg agg_num admin state {enable | disable}
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the static aggregate group.
<b>enable</b>	Specifies that the static aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the static aggregate group is inactive and not able to aggregate links.

### Defaults

parameter	default
<b>enable   disable</b>	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

When the administrative state is set to **disable**, the static aggregate group is disabled.

### Examples

```
-> static linkagg 2 admin state disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">static linkagg size</a>	Creates a static aggregate group.
<a href="#">show linkagg</a>	Displays information about static and dynamic (LACP) aggregate groups.

### MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggAdminState
```

---

## static agg agg num

Configures a slot and port for a static aggregate group.

```
static agg [ethernet | fastethernet | gigaehternet] slot/port agg num agg_num
```

```
static agg no [ethernet | fastethernet | gigaehternet] slot/port
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>agg_num</i>	The number corresponding to the static aggregate group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove one or more ports from a static aggregate group.
- Mobile ports cannot be aggregated.
- A port may belong to only one aggregate group.
- Ports in a static aggregate must all be the same speed (e.g., all 10 Mbps, all 100 Mbps, all 1 Gigabit, or all 10 Gigabit).
- Ports that belong to the same static aggregate group do not have to be configured sequentially and can be on any Network Interface (NI) or unit within a stack.
- The **ethernet**, **fastethernet**, and **gigaehternet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> static agg 2/1 agg num 4  
-> static agg no 2/1
```

### Release History

Release 6.1; command was introduced.

## Related Commands

alclnkaggAggPortLacpType

alclnkaggAggPortSelectedAggNumber

---

## lacp linkagg size

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

```
lacp linkagg agg_num size size
  [name name]
  [admin state {enable | disable}]
  [actor admin key actor_admin_key]
  [actor system priority actor_system_priority]
  [actor system id actor_system_id]
  [partner system id partner_system_id]
  [partner system priority partner_system_priority]
  [partner admin key partner_admin_key]
```

```
no lacp linkagg agg_num
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group. Must be a unique integer in the range 0–31 (stackable products) or 0–127 (chassis-based products).
<i>size</i>	The maximum number of links that may belong to the aggregate. Values may be 2, 4, or 8.
<i>name</i>	The name of the dynamic aggregate group. May be any alphanumeric string up to 255 characters long. Spaces must be contained within quotes (e.g., “Dynamic Group 1”).
<b>enable</b>	Specifies that the dynamic aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
<i>actor_admin_key</i>	The administrative key value associated with the dynamic aggregate group. Possible values are 0–65535.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group. Possible values are 0–65535.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch.
<i>partner_system_id</i>	The MAC address of the remote system’s aggregate group to which the switch’s aggregate group is attached.
<i>partner_system_priority</i>	The priority of the remote system to which the aggregation group is attached. Possible values are 0–65535.
<i>partner_admin_key</i>	The administrative key for the aggregation group’s remote partner. Possible values are 0–65535.

## Defaults

parameter	default
enable   disable	enable

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- The maximum number of link aggregate groups allowed on the switch (static and dynamic combined) is 32 for stackable products and 128 for chassis-based products.
- Note that a maximum of 256 link aggregation ports are supported. The number of link aggregation ports per group will determine the maximum number of groups that can be configured. The table below provides some example configurations:

Number of Ports in Group	Maximum Number of Groups
2	128
4	64
8	32

- If the dynamic group has any attached ports, you must disable the group with the **lacp linkagg admin state** command before you can delete it.
- Optional parameters for the dynamic aggregate group may be configured when the aggregate is created or the dynamic aggregate group may be modified later.
- Use the **static linkagg size** command to create static aggregate groups. See [page 8-3](#) for more information about this command.

## Examples

```
-> lacp linkagg 2 size 4
-> lacp linkagg 3 size 2 admin state disable actor system priority 65535
```

## Release History

Release 6.1; command was introduced.

## Related Commands

alclnkaggAggPartnerSystemID  
alclnkaggAggPartnerSystemPriority  
alclnkaggAggPartnerAdminKey
```

---

## lacp linkagg name

Configures a name for a dynamic aggregate group.

```
lacp linkagg agg_num name name
```

```
lacp linkagg agg_num no name
```

---

### Syntax Definitions

*agg\_num*

The number corresponding to the dynamic aggregate group.

*name*

The name of the dynamic aggregate group. May be any alphanumeric string up to 255 characters long. Spaces must be contained within quotes (e.g., "Dynamic Group 1").

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to remove a name from a dynamic aggregate group.

### Examples

```
-> lacp linkagg 2 name finance
```

```
-> lacp linkagg 2 no name
```

### Release History

Release 6.1; command was introduced.

alclnkaggAggNumber

alclnkaggAggName

---

## lacp linkagg admin state

Configures the administrative state of the dynamic aggregate (whether it is up and active, or down and inactive) group.

**lacp linkagg *agg\_num* admin state {enable | disable}**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<b>enable</b>	Specifies that the dynamic aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the operation of a dynamic aggregate group cannot be performed.

### Defaults

---

parameter	default
<b>enable   disable</b>	enable

---

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

When the administrative state is set to **disable**, the operation of a dynamic aggregation (LACP) group cannot be performed.

### Examples

```
-> lacp linkagg 2 admin state disable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<code>lacp linkagg size</code>	Creates a dynamic aggregate group.
<code>show linkagg</code>	Displays information about static and dynamic (LACP) aggregate groups.
<code>show linkagg port</code>	Displays information about static and dynamic (LACP) aggregate groups.

## MIB Objects

```
alclnkaggAggTable  
  alclnkaggAggNumber  
  alclnkaggAggAdminState
```

---

## lacp linkagg actor admin key

Configures the administrative key associated with a dynamic aggregate group.

```
lacp linkagg agg_num actor admin key actor_admin_key
```

```
lacp linkagg agg_num no actor admin key
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<i>actor_admin_key</i>	The administrative key value associated with the dynamic aggregate group. The valid range is 0–65535.

### Defaults

parameter	default
<i>actor_admin_key</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to remove an actor admin key from a dynamic aggregate group.

### Examples

```
-> lacp linkagg 3 actor admin key 2  
-> lacp linkagg 3 no actor admin key
```

### Release History

Release 6.1; command was introduced.

### Related Commands

  alclnkaggAggNumber  
  alclnkaggAggActorAdminKey
```

---

## lacp linkagg actor system priority

Configures the priority of the dynamic aggregate group.

**lacp linkagg** *agg\_num* **actor system priority** *actor\_system\_priority*

**lacp linkagg** *agg\_num* **no actor system priority**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the link aggregate group.
<i>actor_system_priority</i>	The priority of the switch's dynamic aggregate group in relation to other aggregate groups. Possible values are 0–65535.

### Defaults

parameter	default
<i>actor_system_priority</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.

### Examples

```
-> lacp linkagg 3 actor system priority 100
-> lacp linkagg 3 no actor system priority
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">lacp linkagg size</a>	Creates a dynamic aggregate group.

### MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggActorSystemPriority
```

---

## lacp linkagg actor system id

Configures the MAC address of a dynamic aggregate group on the switch.

```
lacp linkagg agg_num actor system id actor_system_id
```

```
lacp linkagg agg_num no actor system id
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

parameter	default
<i>actor_system_id</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to remove an actor system ID from a dynamic aggregate group.

### Examples

```
-> lacp linkagg 3 actor system id 00:20:da:81:d5:b0  
-> lacp linkagg 3 no actor system id
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">lacp linkagg size</a>	Creates a dynamic aggregate group.

### MIB Objects

```
alclnkaggAggTable  
  alclnkaggAggNumber  
  alclnkaggAggActorSystemID
```

---

## lacp linkagg partner system id

Configures the MAC address of the remote system's dynamic aggregate group to which the local switch's dynamic aggregate group is attached.

**lacp linkagg** *agg\_num* **partner system id** *partner\_system\_id*

**lacp linkagg** *agg\_num* **no partner system id**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group on the switch.
<i>partner_system_id</i>	The MAC address of the remote switch's dynamic aggregate group in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

parameter	default
<i>partner_system_id</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a partner system ID from a dynamic aggregate group.
- The *partner\_system\_id* and the *partner\_system\_priority* specify the remote system's priority.

### Examples

```
-> lacp linkagg 2 partner system id 00:20:da4:32:81
-> lacp linkagg 2 no partner system id
```

### Release History

Release 6.1; command was introduced.

## lacp linkagg partner system priority

Configures the priority of the remote switch's dynamic aggregate group to which the local switch's aggregate group is attached.

**lacp linkagg** *agg\_num* **partner system priority** *partner\_system\_priority*

**lacp linkagg** *agg\_num* **no partner system priority**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<i>partner_system_priority</i>	The priority of the remote switch's dynamic aggregate group to which the local switch's aggregate group is attached. Possible values are 0–65535.

### Defaults

parameter	default
<i>partner_system_priority</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to return to the priority value to its default.

### Examples

```
-> lacp linkagg 3 partner system priority 65535
-> lacp linkagg 3 no partner system priority
```

### Release History

Release 6.1; command was introduced.

## lacp linkagg partner admin key

Configures the administrative key for the dynamic aggregation group's remote partner.

```
lacp linkagg agg_num partner admin key partner_admin_key
```

```
lacp linkagg agg_num no partner admin key
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<i>partner_admin_key</i>	The administrative key for the dynamic aggregation group's remote partner. Possible values are 0–65535.

### Defaults

parameter	default
<i>partner_admin_key</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to remove a partner admin key from a dynamic aggregate group.

### Examples

```
-> lacp linkagg 3 partner admin key 1  
-> lacp linkagg 3 no partner admin key
```

### Release History

Release 6.1; command was introduced.

### Related Commands

  alclnkaggAggPartnerAdminKey
```

---

## lacp agg actor admin key

Configures an actor administrative key for a port, which allows the port to join a dynamic aggregate group.

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port actor admin key actor_admin_key
  [actor admin state {[no] active} [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect]
  [[no] distribute] [[no] default] [[no] expire] | none}]
  [actor system id actor_system_id]
  [actor system priority actor_system_priority]
  [partner admin system id partner_admin_system_id]
  [partner admin key partner_admin_key]
  [partner admin system priority partner_admin_system_priority]
  [partner admin state {[no] active} [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect]
  [[no] distribute] [[no] default] [[no] expire] | none}]
  [actor port priority actor_port_priority]
  [partner admin port partner_admin_port]
  [partner admin port priority partner_admin_port_priority]
```

```
lacp agg no [ethernet | fastethernet | gigaehternet] slot/port
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>actor_admin_key</i>	The administrative key associated with this dynamic aggregate group. Possible values are 0–65535.
<b>actor admin state</b>	See the <a href="#">lacp agg actor admin state command on page 8-25</a> .
<i>actor_system_id</i>	The MAC address of this dynamic aggregate group on the switch.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group. Possible values are 0–255.
<i>partner_admin_system_id</i>	The MAC address of the remote switch's dynamic aggregate group.
<i>partner_admin_key</i>	The administrative key for the dynamic aggregation group's remote partner. Possible values are 0–65535.
<i>partner_admin_system_priority</i>	The priority of the remote system to which the dynamic aggregation group is attached. Possible values are 0–255.
<b>partner admin state</b>	See the <a href="#">lacp agg partner admin state command on page 8-31</a> .
<i>actor_port_priority</i>	The priority of the actor port. Possible values are 0–255.

<i>partner_admin_port</i>	The administrative state of the partner port. Possible values are 0–65535.
<i>partner_admin_port_priority</i>	The priority of the partner port. Possible values are 0–255.

## Defaults

parameter	default
[active] [timeout] ...	active, timeout, aggregate

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove a slot and port from a dynamic aggregate group.
- Mobile ports cannot be aggregated.
- A port may belong to only one aggregate group.
- Ports in a dynamic aggregate must all be in the same speed (e.g., all 100 Mbps, 1 Gigabit, or all 10 Gigabit).
- Ports that belong to the same dynamic aggregate group do not have to be configured sequentially and can be on any Network Interface (NI).
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

## Examples

```
-> lacp agg 3/1 actor admin key 0  
-> lacp agg no 3/1
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">lacp linkagg size</a>	Creates a dynamic aggregate group.
<a href="#">show linkagg port</a>	Displays information about ports associated with a particular aggregate group or all aggregates.

alclnkaggAggPortActorPortPriority  
alclnkaggAggPortPartnerAdminPort  
alclnkaggAggPortPartnerAdminPortPriority
```

---

## lacp agg actor admin state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port actor admin state {[active] [timeout]
[aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}
```

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port
actor admin state {[no] active} [[no] timeout] [[no] aggregate] [[no] synchronize]
[[no] collect] [[no] distribute] [[no] default] [[no] expire] | none}
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<b>active</b>	Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
<b>timeout</b>	Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
<b>aggregate</b>	Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
<b>synchronize</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.
<b>collect</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
<b>distribute</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
<b>default</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indi-

cates that the actor is using the defaulted partner information administratively configured for the partner.

**expire**

Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.

**none**

Resets all administrative states to their default configurations.

**Defaults**

parameter	default
[active] [timeout] ....	active, timeout, aggregate

**Platforms Supported**

OmniSwitch 6400, 6850,6850E, 6855, 9000E

**Usage Guidelines**

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin state is set to **none**, all bit values are restored to their default configurations.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

**Examples**

```
-> lacp agg 4/2 actor admin state synchronize no collect distribute
-> lacp agg 4/2 actor admin state no synchronize collect
-> lacp agg 4/2 actor admin state none
```

**Release History**

Release 6.1; command was introduced.

**Related Commands****lacp linkagg size**

Creates a dynamic aggregate group.

**show linkagg port**

Displays information about ports associated with a particular aggregate group or all aggregate groups.

**MIB Objects**

```
alclnkaggAggPortTable
  alclnkaggAggPortGlobalPortNumber
  alclnkaggAggPortActorAdminState
```

## lacp agg actor system id

Configures the system ID (i.e., MAC address) for the local port associated with a dynamic aggregate group.

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port actor system id actor_system_id
```

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port no actor system id
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>actor_system_id</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an actor system ID from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaehternet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp 3/1 actor system id 00:20:da:06:ba:d3  
-> lacp 3/1 no actor system id
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[lacp linkagg size](#)

Creates a dynamic aggregate group.

[show linkagg port](#)

Displays information about ports associated with a particular aggregate group or all aggregate groups.

## MIB Objects

alclnkaggAggPortTable

alclnkaggAggPortGlobalPortNumber

alclnkaggAggPortActorSystemID

---

## lacp agg actor system priority

Configures the system priority of the port on the switch that belongs to the dynamic aggregate group.

**lacp agg** [ethernet | fastethernet | gigaethernet] *slot/port* **actor system priority** *actor\_system\_priority*

**lacp agg** [ethernet | fastethernet | gigaethernet] *slot/port* **no actor system priority**

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaethernet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group. Possible values are 0–255.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>actor_system_priority</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an actor system priority value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg ethernet 3/2 actor system priority 65
-> lacp agg ethernet 3/2 no actor system priority
```

### Release History

Release 6.1; command was introduced.

## Related Commands

alclnkaggAggPortGlobalPortNumber

alclnkaggAggPortActorSystemPriority

---

## lacp agg partner admin state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the remote switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port partner admin state
{[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}
```

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port partner admin state
{[[no] active] [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect] [[no] distribute]
[[no] default] [[no] expire] | none}
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<b>active</b>	Specifies that bit 0 in the partner state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
<b>timeout</b>	Specifies that bit 1 in the partner state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
<b>aggregate</b>	Specifies that bit 2 in the partner state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
<b>synchronize</b>	Specifies that bit 3 in the partner state octet is enabled. When this bit is set, the port is allocated to the correct dynamic aggregation group. If this bit is not enabled, the port is not allocated to the correct aggregation group. By default, this value is disabled.
<b>collect</b>	Specifying this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
<b>distribute</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
<b>default</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indi-

cates that the partner is using the defaulted actor information administratively configured for the actor.

**expire**

Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the partner cannot receive LACPDU frames.

**none**

Resets all administrative states to their default configurations.

**Defaults**

parameter	default
[active] [timeout] ....	active, timeout, aggregate

**Platforms Supported**

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

**Usage Guidelines**

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the partner admin state is set to **none**, all bit values are restored to their default configurations.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

**Examples**

```
-> lacp agg 4/2 partner admin state synchronize collect distribute
-> lacp agg 4/2 partner admin state no synchronize no collect
```

**Release History**

Release 6.1; command was introduced.

**Related Commands****lacp linkagg size**

Creates a dynamic aggregate group.

**show linkagg port**

Displays information about ports associated with a particular aggregate group or all aggregate groups.

**MIB Objects**

```
alclnkaggAggPortTable
  alclnkaggAggPortGlobalPortNumber
  alclnkaggAggPortPartnerAdminState
```

## lacp agg partner admin system id

Configures the partner administrative system ID for a dynamic aggregate group port.

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port partner admin system id  
partner_admin_system_id
```

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port no partner admin system id
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>partner_admin_system_id</i>	The MAC address of the remote dynamic aggregate group in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>partner_admin_system_id</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a partner administrative system ID from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaehternet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 3/1 partner admin system id 00:20:da:05:f6:23
```

### Release History

Release 6.1; command was introduced.

## Related Commands

---

## lacp agg partner admin key

Configures the partner administrative key for a dynamic aggregate group port.

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port partner admin key partner_admin_key
```

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port no partner admin key
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaethernet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>partner_admin_key</i>	The administrative key for the dynamic aggregation group's remote partner. Possible values are 0–65535.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>partner_admin_key</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a partner admin key value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 2/1 partner admin key 0  
-> lacp agg 2/1 no partner admin key
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<code>lacp linkagg size</code>	Creates a dynamic aggregate group.
<code>show linkagg port</code>	Displays detailed information about ports associated with a particular aggregate group or all aggregate groups.
<code>show linkagg port</code>	Displays information about slots and ports associated with all aggregate groups.

## MIB Objects

```

## lacp agg partner admin system priority

Configures the partner system priority for a dynamic aggregate group port.

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port partner admin system priority  
partner_admin_system_priority
```

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port no partner admin system priority
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaethernet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>partner_admin_system_priority</i>	The priority of the remote switch's dynamic aggregate group to which the aggregation group is attached. Possible values are 0–255.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>partner_admin_system_priority</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a *partner\_system\_priority* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 2/1 partner admin system priority 65  
-> lacp agg 2/1 no partner admin system priority
```

### Release History

Release 6.1; command was introduced.

## lacp agg actor port priority

Configures the priority for an actor port.

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port actor port priority actor_port_priority
```

```
lacp agg [ethernet | fastethernet | gigaehternet] slot/port no actor port priority
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaehternet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>actor_port_priority</i>	The priority of the actor port. Possible values are 0–255.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>actor_port_priority</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an *actor\_port\_priority* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaehternet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 2/1 actor port priority 100  
-> lacp agg 2/1 no actor port priority
```

### Release History

Release 6.1; command was introduced.

## Related Commands

## lacp agg partner admin port

Configures the administrative status of a partner port.

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port partner admin port partner_admin_port
```

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port no partner admin port
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaethernet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>partner_admin_port</i>	The administrative state of the partner port. Possible values are 0–65535.

### Defaults

parameter	default
<i>partner_admin_port</i>	0

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a *partner\_admin\_port* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 2/1 partner admin port 255
-> lacp agg 2/1 no partner admin port
```

### Release History

Release 6.1; command was introduced.

alclnkaggAggPortPartnerAdminPort

---

## lacp agg partner admin port priority

Configures the priority for a partner port.

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port partner admin port priority
partner_admin_port_priority
```

```
lacp agg [ethernet | fastethernet | gigaethernet] slot/port no partner admin port priority
```

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaethernet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
<i>partner_admin_port_priority</i>	The priority of the partner port. Possible values are 0–255.

### Defaults

parameter	default
<i>partner_admin_port_priority</i>	0

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a *partner\_admin\_port\_priority* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 2/1 partner admin port priority 100
-> lacp agg 2/1 no partner admin port priority
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[lacp linkagg size](#)

Creates a dynamic aggregate group.

[show linkagg port](#)

Displays information about ports associated with a particular aggregate group or all aggregate groups.

## MIB Objects

AlcLnkAggAggPortTable

alclnkaggAggPortGlobalPortNumber

alclnkaggAggPortPartnerAdminPortPriority

---

## lacp agg standby

Configures the standby status for a switch port. When this status is enabled, the port is eligible to participate in a dual-home link aggregate as a standby port.

**lacp agg** [**ethernet** | **fastethernet** | **gigaethernet**] *slot/port* **standby** {**enable** | **disable**}

---

### Syntax Definitions

<b>ethernet</b>	Documents that the port is 10 Mbps Ethernet.
<b>fastethernet</b>	Documents that the port is 100 Mbps Fast Ethernet.
<b>gigaethernet</b>	Documents that the port is Gigabit Ethernet.
<i>slot</i>	The slot number for the standby port.
<i>port</i>	The port number for the standby port.

### Defaults

By default, the standby functionality is disabled on a switch port.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A dual home link aggregate consists of one active primary port and one standby port. Enabling the standby status makes a port eligible to serve as the standby port in this type of aggregate. Use this command to enable the standby status before the port is associated with the link aggregate.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See [Chapter 1, "Ethernet Port Commands,"](#) for information on CLI commands to configure Ethernet ports.

### Examples

```
-> lacp agg 2/1 standby enable  
-> lacp agg 2/1 standby disable
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

[lacp linkagg size](#)

Creates a dynamic aggregate group.

[show linkagg port](#)

Displays information about ports associated with a particular aggregate group or all aggregate groups.

## MIB Objects

AlcLnkAggAggPortTable

alclnkaggAggPortGlobalPortNumber

alclnkaggAggPortStandbyState

---

## lacp linkagg pre-empt

Configures the pre-emption status for a dynamic dual-home link aggregate. When the pre-emption status is enabled, the switch will restore a downed primary port as the primary link when the port comes back up and after a configurable period of time (pre-emption delay time).

**lacp linkagg *agg\_num* pre-empt {enable | disable}**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<b>enable</b>	Enables the pre-emption status for the aggregate group.
<b>disable</b>	Disables the pre-emption status for the aggregate group.

### Defaults

By default, the pre-emption status is disabled.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- The dynamic aggregate group number specified with this command must already exist in the switch configuration. In addition, the aggregate should have Spanning Tree disabled.
- The amount of time the switch waits to restore a port as the primary link is determined by the value of a pre-emption delay timer. This timer value is configurable using the [lacp linkagg pre-empt timer](#) command.
- If the primary port fails again before the length of the pre-emption timer has elapsed, the timer value is reset and will start again when the port comes back up.
- If the pre-emption status is disabled, the standby port retains the primary status even when the original primary port comes back up. The original primary port then becomes the standby link.

### Examples

```
-> lacp linkagg 2 pre-empt enable
-> lacp linkagg 2 pre-empt disable
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<code>lacp linkagg size</code>	Creates a dynamic aggregate group.
<code>lacp agg standby</code>	Configures the standby status for a port. A standby port is required to configure a dual-home link aggregate.
<code>lacp linkagg pre-empt timer</code>	Configures the pre-emption delay timer value for the dynamic dual-home link aggregate group.
<code>show linkagg</code>	Displays information about static and dynamic (LACP) aggregate groups.

## MIB Objects

```
alclnkaggAggTable  
  alclnkaggAggNumber  
  alclnkaggPreemptState
```

---

## lacp linkagg pre-empt timer

Configures the pre-emption delay timer value for a dynamic dual-home link aggregate. This value is the length of time the switch will wait before restoring a port to primary link status.

**lacp linkagg** *agg\_num* **pre-empt timer** *seconds*

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<i>seconds</i>	The pre-emption delay timer value, in seconds. The range is 30–300.

### Defaults

By default, the timer value is set to 30 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When the primary port for a dual-home link aggregate fails and then comes back up, the switch will wait the length of the pre-emption timer value before restoring the port as the primary link for the aggregate.
- The pre-emption delay timer is only used when the pre-emption status for the specified aggregate group is enabled. The timer starts when a failed primary port comes back up.
- If the primary port goes down before the timer runs out, the timer is reset and then started again the next time the port comes back up.

### Examples

```
-> lacp linkagg 2 pre-empt timer 120  
-> lacp linkagg 3 pre-empt timer 300
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**lacp linkagg size**

Creates a dynamic aggregate group.

**lacp agg standby**

Configures the standby status for a port. A standby port is required to configure a dual-home link aggregate.

**lacp linkagg pre-empt**

Configures the pre-emption status for a dynamic dual-home link aggregate group.

**show linkagg**

Displays information about static and dynamic (LACP) aggregate groups.

## MIB Objects

alclnkaggAggTable  
    alclnkaggAggNumber  
    alclnkaggPreemptValue

---

## show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

**show linkagg** [*agg\_num*]

---

### Syntax Definitions

*agg\_num* Specifies the aggregate group. Configured through the **static linkagg size** or **lACP linkagg size** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If no aggregation number is specified, information for all aggregate groups is displayed. If an aggregate number is specified, information about that aggregate group is displayed only. The fields included in the display depend on whether the aggregate group is a static or dynamic.
- Use the **show linkagg port** command to display information about aggregate group ports.

### Examples

No aggregate group is specified:

```
-> show linkagg
```

Number	Aggregate	SNMP Id	Size	Admin State	Oper State	Att/Sel Ports
1	Static	40000001	8	ENABLED	UP	2 2
2	Dynamic	40000002	4	ENABLED	DOWN	0 0
3	Dynamic	40000003	8	ENABLED	DOWN	0 2
4	Dynamic	40000004	8	ENABLED	UP	3 3
5	Static	40000005	2	DISABLED	DOWN	0 0

Output fields are defined here:

#### *output definitions*

---

<b>Number</b>	The aggregate group number.
<b>Aggregate</b>	The type of aggregate group, which can be <b>Static</b> or <b>Dynamic</b> .
<b>SNMP Id</b>	The SNMP ID associated with the aggregate group.
<b>Size</b>	The number of links in this aggregate group.

*output definitions (continued)*

---

<b>Admin State</b>	The current administrative state of the aggregate group, which can be <b>ENABLED</b> or <b>DISABLED</b> . You can modify this parameter with the <b>static linkagg admin state</b> command (see <a href="#">page 8-6</a> ) for static aggregate groups and with the <b>lacp linkagg admin state</b> command (see <a href="#">page 8-13</a> ) for dynamic aggregate groups.
<b>Oper State</b>	The current operational state of the aggregate group, which can be <b>UP</b> or <b>DOWN</b> .
<b>Att Ports</b>	The number of ports actually attached to this aggregate group.
<b>Sel Ports</b>	The number of ports that could possibly attach to the aggregate group.

---

A static aggregate is specified:

```
-> show linkagg 5
Static Aggregate
SNMP Id           : 40000005,
Aggregate Number  : 5,
SNMP Descriptor   : Omnichannel Aggregate Number 5 ref 40000005 size 2,
Name              : AGG5,
Admin State       : ENABLED,
Operational State : DOWN,
Aggregate Size    : 2,
Number of Selected Ports : 0,
Number of Reserved Ports : 0,
Number of Attached Ports : 0,
Primary Port      : NONE
```

*output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with this static aggregate group.
<b>Aggregate Number</b>	The group number.
<b>SNMP Descriptor</b>	The standard MIB name for this static aggregate group.
<b>Name</b>	The name of this static aggregate group. You can modify this parameter with the <b>static linkagg name</b> command (see <a href="#">page 8-5</a> ).
<b>Admin State</b>	The administrative state of this static aggregate group, which can be <b>ENABLED</b> or <b>DISABLED</b> . You can modify this parameter with the <b>static linkagg admin state</b> command (see <a href="#">page 8-6</a> ).
<b>Operational State</b>	The operational state of this static aggregate group, which can be <b>UP</b> or <b>DOWN</b> .
<b>Aggregate Size</b>	The number of links configured for this static aggregate group.
<b>Number of Selected Ports</b>	The number of ports that could possibly attach to this static aggregate group.
<b>Number of Reserved Ports</b>	The total number of ports reserved for use in link aggregation by this static aggregate group. ( <b>Note:</b> This field is not relevant for static aggregate groups.)
<b>Number of Attached Ports</b>	The number of ports actually attached to this static aggregate group.
<b>Primary Port</b>	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

---

A dynamic aggregate group is specified:

```
-> show linkagg 2
Dynamic Aggregate
  SNMP Id           : 40000002,
  Aggregate Number  : 2,
  SNMP Descriptor   : Dynamic Aggregate Number 2 ref 40000002 size 4,
  Name              : AGG 2,
  Admin State       : ENABLED,
  Operational State : DOWN,
  Aggregate Size    : 4,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port      : NONE,
LACP
  MACAddress        : [00:1f:cc:00:00:00],
  Actor System Id   : [00:20:da:81:d5:b0],
  Actor System Priority : 50,
  Actor Admin Key   : 120,
  Actor Oper Key    : 0,
  Partner System Id : [00:20:da:81:d5:b1],
  Partner System Priority : 70,
  Partner Admin Key : 220,
  Partner Oper Key  : 0
  Pre-emption       : ENABLED
  Pre-empt Value    : 250
```

### *output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with this dynamic aggregate group.
<b>Aggregate Number</b>	The group number of this dynamic aggregate group.
<b>SNMP Descriptor</b>	The standard MIB name for this dynamic aggregate group.
<b>Name</b>	The name of this dynamic aggregate group. You can modify this parameter with the <b>lacp linkagg name</b> command (see <a href="#">page 8-12</a> ).
<b>Admin State</b>	The administrative state of this dynamic aggregate group, which can be <b>ENABLED</b> or <b>DISABLED</b> . You can modify this parameter with the <b>lacp linkagg admin state</b> command (see <a href="#">page 8-13</a> ).
<b>Operational State</b>	The operational state of this dynamic aggregate group, which can be <b>UP</b> or <b>DOWN</b> .
<b>Aggregate Size</b>	The number of links configured for this dynamic aggregate group.
<b>Number of Selected Ports</b>	The number of ports available to this dynamic aggregate group.
<b>Number of Reserved Ports</b>	The total number of ports reserved for use in link aggregation by this dynamic aggregate group.
<b>Number of Attached Ports</b>	The number of ports actually attached to this dynamic aggregate group.
<b>Primary Port</b>	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate group is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
<b>MACAddress</b>	The MAC address associated with the primary port.
<b>Actor System Id</b>	The MAC address of this dynamic aggregate group. You can modify this parameter with the <b>lacp linkagg actor system id</b> command (see <a href="#">page 8-17</a> ).

*output definitions (continued)*

---

<b>Actor System Priority</b>	The priority of this dynamic aggregate group. You can modify this parameter with the <b>lacp linkagg actor system priority</b> command (see <a href="#">page 8-16</a> ).
<b>Actor Admin Key</b>	The administrative key associated with this dynamic aggregate group. You can modify this parameter with the <b>lacp linkagg actor admin key</b> command (see <a href="#">page 8-15</a> ).
<b>Actor Oper Key</b>	The operational key associated with this dynamic aggregate group.
<b>Partner System Id</b>	The MAC address of the remote dynamic aggregate group. You can modify this parameter with the <b>lacp linkagg partner system id</b> command (see <a href="#">page 8-18</a> ).
<b>Partner System Priority</b>	The priority of the remote system to which this dynamic aggregation group is attached. You can modify this parameter with the <b>lacp linkagg partner system priority</b> command (see <a href="#">page 8-20</a> ).
<b>Partner Admin Key</b>	The administrative key for this dynamic aggregation group's remote partner. You can modify this parameter with the <b>lacp linkagg partner admin key</b> command (see <a href="#">page 8-21</a> ).
<b>Partner Oper Key</b>	The operational key of the remote system to which the dynamic aggregation group is attached.
<b>Pre-emption</b>	The pre-emption status of the link agg ID.
<b>Pre-empt Value</b>	The value of the pre-emption timer.

---

**Release History**

Release 6.1; command was introduced.

Release 6.4.3: **Pre-emption** and **Pre-empt Value** fields added.

**Related Commands**

<a href="#">static linkagg size</a>	Creates a static aggregate group.

## show linkagg port

Displays the aggregate group information about a particular slot and port.

**show linkagg** [*agg\_num*] **port** [*slot/port*]

---

### Syntax Definitions

<i>agg_num</i>	Specifies the aggregate group. Configured through the <b>static linkagg size</b> or <b>lACP linkagg size</b> command
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port number for this aggregate.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If no *slot/port* is specified, the information for all ports is displayed. If a particular slot or port is specified, the fields displayed depend upon whether or not the port belongs to a static aggregate group or dynamic (LACP) aggregate group.
- If no *agg\_num* is specified, the information for all aggregates is displayed.

### Examples

```
-> show linkagg port
Slot/Port Aggregate SNMP Id   Status   Agg  Oper Link Prim Standby
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
  1/9      Static      1009  ATTACHED   1  UP   UP   YES  NO
  1/10     Static      1010  ATTACHED   1  UP   UP   NO   YES
  1/11     Static      1011  ATTACHED   2  UP   UP   YES  NO
```

```
-> show linkagg 1 port
Slot/Port Aggregate SNMP Id   Status   Agg  Oper Link Prim Standby
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
  1/9      Static      1009  ATTACHED   1  UP   UP   YES  NO
  1/10     Static      1010  ATTACHED   1  UP   UP   NO   YES
```

### *output definitions*

---

<b>Slot/Port</b>	The slot/port associated with the aggregate group.
<b>Aggregate</b>	The type of aggregate group associated with the port, either <b>Static</b> or <b>Dynamic</b> .

*output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with the aggregate group.
<b>Status</b>	The current status of the port ( <b>ATTACHED</b> , <b>CONFIGURED</b> , <b>PENDING</b> , <b>SELECTED</b> , or <b>RESERVED</b> ).
<b>Agg</b>	The number of the aggregate groups associated with this port.
<b>Oper</b>	The current operational state of the port ( <b>UP</b> or <b>DOWN</b> ).
<b>Link</b>	The current operational state of the link from this port to its remote partner ( <b>UP</b> or <b>DOWN</b> ).
<b>Prim</b>	Whether or not the port is the primary port in the link agg.
<b>Standby</b>	Whether or not the port is a standby port. A standby port is one of two ports that participate in a dynamic dual-home link aggregate. Configured through the <b>lacp agg standby</b> command.

---

A port that belongs to a static aggregate is specified:

```
-> show linkagg port 4/1
Static Aggregable Port
  SNMP Id           : 4001,
  Slot/Port         : 4/1,
  Administrative State : ENABLED,
  Operational State  : DOWN,
  Port State        : CONFIGURED,
  Link State         : DOWN,
  Selected Agg Number : 2,
  Port position in the aggregate: 0,
  Primary port      : NONE
```

*output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with this port.
<b>Slot/Port</b>	The slot and port number.
<b>Administrative State</b>	The current administrative state of this port ( <b>ENABLED</b> or <b>DISABLED</b> ).
<b>Operational State</b>	The current operational state of the port ( <b>UP</b> or <b>DOWN</b> ).
<b>Port State</b>	The current operational state of the port ( <b>CONFIGURED</b> , <b>PENDING</b> , <b>SELECTED</b> , or <b>RESERVED</b> ).
<b>Link State</b>	The current operational state of the link from this port to its remote partner ( <b>UP</b> or <b>DOWN</b> ).
<b>Selected Agg Number</b>	The number associated with the static aggregate group to which the port is attached.
<b>Port position in the aggregate</b>	The rank of this port within the static aggregate group (0–15).
<b>Primary Port</b>	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

---

A port that belongs to a dynamic aggregate is specified:

```
-> show linkagg port 2/1
Dynamic Aggregable Port
  SNMP Id           : 2001,
  Slot/Port         : 2/1,
```

```

Administrative State      : ENABLED,

Standby State           : ENABLED

```

**output definitions**

---

<b>SNMP Id</b>	The SNMP ID associated with this port.
<b>Slot/Port</b>	The slot and port number.
<b>Administrative State</b>	The current administrative state of this port ( <b>ENABLED</b> or <b>DISABLED</b> ).
<b>Operational State</b>	The current operational state of the port ( <b>UP</b> or <b>DOWN</b> ).
<b>Port State</b>	The current operational state of the port ( <b>CONFIGURED</b> , <b>PENDING</b> , <b>SELECTED</b> , or <b>AGGREGATED</b> ).
<b>Link State</b>	The current operational state of the link from this port to its remote partner ( <b>UP</b> or <b>DOWN</b> ).
<b>Selected Agg Number</b>	The number associated with the dynamic aggregate group to which the port is attached.
<b>Primary Port</b>	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
<b>Actor System Priority</b>	The actor system priority of this port. Configured through the <b>lacp agg actor system priority</b> command.
<b>Actor System Id</b>	The actor system ID (i.e., MAC address) of this port. Configured through the <b>lacp agg actor system id</b> command.
<b>Actor Admin Key</b>	The actor administrative key value for this port. Configured through the <b>lacp agg actor admin key</b> command.

*output definitions (continued)*

<b>Actor Oper Key</b>	The actor operational key associated with this port.
<b>Partner Admin System Priority</b>	The administrative priority of the remote system to which this port is attached. Configured through the <b>lACP agg partner admin system priority</b> command.
<b>Partner Oper System Priority</b>	The operational priority of the remote system to which this port is attached.
<b>Partner Admin System Id</b>	The administrative MAC address associated with the remote partner's system ID. This value is used along with Partner Admin System Priority, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. Configured through the <b>lACP agg partner admin system id</b> command.
<b>Partner Oper System id</b>	The MAC address that corresponds to the remote partner's system ID.
<b>Partner Admin Key</b>	The administrative value of the key for the remote partner. This value is used along with Partner Admin System Priority, Partner Admin System, Partner Admin Port, and Partner Admin Port Priority to manually configure aggregation. Configured through the <b>lACP agg partner admin key</b> command.
<b>Partner Oper Key</b>	The current operational value of the key for the protocol partner.
<b>Attached Agg ID</b>	The ID of the aggregate group that the port has attached itself to. A value of zero indicates that the port is not attached to an aggregate group.
<b>Actor Port</b>	The port number locally assigned to this port.
<b>Actor Port Priority</b>	The actor priority value assigned to the port. Configured through the <b>lACP agg actor port priority</b> command.
<b>Partner Admin Port</b>	The administrative value of the port number for the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. Configured through the <b>lACP agg partner admin port</b> command.
<b>Partner Oper Port</b>	The operational port number assigned to the port by the port's protocol partner.
<b>Partner Admin Port Priority</b>	The administrative port priority of the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, and Partner Admin Key to manually configure aggregation. Configured through the <b>lACP agg partner admin port priority</b> command.
<b>Partner Oper Port Priority</b>	The priority value assigned to the this port by the partner.
<b>Actor Admin State</b>	The administrative state of the port. Configured through the <b>lACP agg actor admin state</b> command.
<b>Actor Oper State</b>	The current operational state of the port.
<b>Partner Admin State</b>	The administrative state of the partner's port. Configured through the <b>lACP agg partner admin state</b> command.

*output definitions (continued)*

---

<b>Partner Oper State</b>	The current operational state of the partner's port.
<b>Standby State</b>	The standby state of the port. This value indicates if the port will participate as a standby port in a dynamic dual-home link aggregate. Configured through the <b>lACP agg standby</b> command.

---

**Release History**

Release 6.1; command was introduced.

Release 6.3.4; *agg\_num* parameter added.

Release 6.4.3; **Standby** field added.

**Related Commands**

## dhl num

Configures a Dual-homed Link (DHL) session associated with the specified session ID number.

**dhl num** *dhl\_num* [**name** *name*]

**no dhl num** *dhl\_num*

---

### Syntax Definitions

*dhl\_num*                                   The DHL session ID number. Valid range is 1–1000.

*name*                                       The name of the DHL session.

### Defaults

By default, if a name is not assigned to a DHL session, the session is configured as DHL-1.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a DHL session ID from the switch configuration.
- Use the optional **name** parameter to specify a name for the DHL session.
- Only one DHL session can be configured per switch.
- Once the DHL session ID is created, assign a link A port and a link B port to the session. This is required before administratively enabling the DHL session is allowed.

### Examples

```
-> dhl num 1 name dhl_session1  
-> no dhl num 1
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

**dhl num linka linkb**

Associates a pair of links (port or linkagg) with the DHL session.

**dhl num admin-state**

Configures the administrative status of the DHL session.

**show dhl num**

Displays information about a specific DHL session.

## MIB Objects

alaDHLSessionTable

    alaDHLSessionIndex

    alaDHLSessionDescr

---

## dhl num linka linkb

Configures two ports or two link aggregates or a combination of both as linkA and linkB for the specified DHL session. Only two links are allowed per DHL session; only one DHL session per switch is allowed.

**dhl num** *dhl\_num* **linka** {port *slot/port* | linkagg *agg\_id*} **linkb** {port *slot/port* | linkagg *agg\_id*}

**no dhl num** *dhl\_num* **linka** {port *slot/port* | linkagg *agg\_id*} **linkb** {port *slot/port* | linkagg *agg\_id*}

---

### Syntax Definitions

<i>dhl_num</i>	An existing DHL session ID number.
<i>slot/port</i>	The slot number and the physical port number to designate as a link for the DHL session. (for example, 3/1 specifies port 1 on slot 3).
<i>agg_id</i>	The link aggregate ID number to designate as a link for the DHL session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the linkA and linkB ports from the specified session ID. Before attempting to remove the links, administratively disable the DHL session.
- Make sure that DHL linkA *and* linkB are associated with each VLAN that the DHL session will protect. Any VLAN not associated with either link or only associated with one of the links is unprotected.
- DHL linkA *and* linkB should belong to the same default VLAN. In addition, select a default VLAN that is one of the VLANs that the DHL session will protect. For example, if the session is going to protect VLANs 10-20, then assign one of those VLANs as the default VLAN for linkA and linkB.
- Only one DHL session per switch is allowed. Each session can have only two links (linkA and linkB). Specify a physical switch port or a link aggregate (linkagg) ID as a DHL link. The same port or link aggregate is not configurable as both linkA or linkB.
- DHL is not supported on mobile, 802.1x-enabled, GVRP, or UNI ports. DHL is also not supported on a port that is a member of a link aggregate or a port that is enabled for transparent bridging.
- The administrative state of a DHL session is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.
- Changing the port designations for linkA and linkB is not recommended while the DHL session is enabled.
- Removing a link aggregate from the switch configuration is not allowed if the aggregate is configured as a link for a DHL session.

## Examples

```
-> dhl num 1 linka port 1/1 linkb port 1/2
-> dhl num 1 linka linkagg 1 linkb port 1/2
-> dhl num 1 linka port 1/1 linkb linkagg 1
-> dhl num 1 linka linkagg 1 linkb linkagg 2
-> no dhl num 1 linka port 1/1 linkb port 1/2
```

## Release History

Release 6.4.4; command was introduced.

## Related Commands

<a href="#">dhl num</a>	Configures a session ID for the DHL session.
<a href="#">dhl num admin-state</a>	Configures the administrative status for the DHL session.
<a href="#">show dhl</a>	Displays the global status of the DHL configuration.
<a href="#">show dhl num</a>	Displays information about a specific DHL session.
<a href="#">show dhl num link</a>	Displays information about a specific link.

## MIB Objects

```
AlaDHLLinksTable
  alaDHLLinksSessionIndex
  alaDHLLinkslinkA
  alaDHLLinkslinkB
```

---

## dhl num admin-state

Enables or disables the administrative state of a DHL session.

```
dhl num dhl_num admin-state {enable | disable}
```

---

### Syntax Definitions

<i>dhl_num</i>	An existing DHL session ID number.
<b>enable</b>	Enables the DHL session.
<b>disable</b>	Disables the DHL session.

### Defaults

---

parameter	default
<b>enable   disable</b>	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The DHL session ID specified with this command must already exist in the switch configuration.
- The administrative state is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.

### Examples

```
-> dhl num 1 admin-state enable  
-> dhl num 1 admin-state disable
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

<b>dhl num</b>	Configures a session ID for the DHL session.
<b>dhl num linka linkb</b>	Configures the two links required for a DHL session.
<b>show dhl</b>	Displays the global status of the DHL configuration.
<b>show dhl num</b>	Displays information about a specific DHL session.

### MIB Objects

```
alaDHLSessionTable  
alaDHLSessionAdminStatus
```

---

## dhl num vlan-map linkb

Configures a VLAN-MAP (a single VLAN or a range of VLANs) from a common pool of VLANs to operate on DHL link B.

**dhl num** *dhl\_num* **vlan-map linkb** {*vlan\_id*[-*vlan\_id*]}

**no dhl num** *dhl\_num* **vlan-map linkb** {*vlan\_id*[-*vlan\_id*]}

---

### Syntax Definitions

<i>dhl_num</i>	Specifies the DHL session ID number.
<i>vlan_id</i> [- <i>vlan_id</i> ]	A VLAN ID number or a range of VLAN IDs to map to linkB. The valid range is 1- 4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A DHL session has to be created before a VLAN-MAP can be configured.
- When the DHL session is active, the common VLAN that both the dual homed links belong to is treated as a protected VLAN. The VLAN containing only one dual homed link is treated as an unprotected VLAN. Traffic is forwarded only on the dual homed links belonging to the protected VLAN.
- If a VLAN is removed globally and if the VLAN belongs to a particular dual homed link, then the VLAN will automatically be removed from the dual homed link.
- If one dual homed link, for example linkA, is moved out of a protected VLAN, then the VLAN becomes unprotected and the VPA is removed from the second dual homed link, for example linkB.
- If the admin state of a VLAN is changed to disabled, and if the VLAN is part of a protected VLAN, then the disabled VLAN is removed from the operational DHL VLAN list but will be present in the protected VLAN list.
- If the admin state of a dual homed link, for example linkA, is changed to disabled, then the protected VLANs of the disabled linkA is moved to the other link, for example linkB. When linkA is re-enabled, then the VLANs are moved back to linkA.
- If the VLAN-MAP of linkB is removed, then the VPAs for the linkB will also be removed and the VLANs configured on linkB is moved to linkA.
- If a VLAN is configured as default on one dual homed link, for example linkA, then the same VLAN cannot be configured as tagged on the other link, for example linkB.

### Examples

```
-> vlan 10-30
```

```
-> vlan 10-20 802.1q 1/1
-> vlan 4
-> vlan port default 1/1-2
-> dhl num 1 name dhl_session1
-> dhl num 1 linka port 1/1 linkb port 1/2
-> dhl num 1 vlan-map linkb 18-20
-> no dhl num 1 vlan-map linkb 18-20
```

## Release History

Release 6.4.4; command was introduced.

## Related Commands

<b>dhl num</b>	Configures a session ID for the DHL session.
<b>dhl num linka linkb</b>	Configures a port or a link aggregate as dual homed links (linkA, linkB) of a DHL session.
<b>show dhl</b>	Displays the global status of the DHL configuration.
<b>show dhl num</b>	Displays information about a specific DHL session.
<b>show dhl num link</b>	Displays information about a specific DHL link.

## MIB Objects

  alaDHLVlanMapSessionIndex
  alaDHLVlanMapVlanStart
  alaDHLVlanMapVlanEnd
  alaDHLVlanMapRowStatus
```

---

## dhl num pre-emption-time

Configures the pre-emption timer for the DHL session. A pre-emption timer is a recovery-delay timer that is used to delay the switchover of VLANs to their primary links. It is the delay in the resumption of traffic when a link that is down is brought up.

**dhl num** *dhl\_num* **pre-emption-time** *num*

---

### Syntax Definitions

<i>dhl_num</i>	Specifies the number of the DHL session.
<i>num</i>	Specifies the number of seconds for the delay in the switchover of VLANs to their primary links. The valid range is 0 - 600.

### Defaults

parameter	default
<i>num</i>	30 seconds

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Pre-emption timer is applicable only when a failed port is brought up. If both ports are down, the pre-emption timer is activated only when the second port is brought up.
- If the pre-emption value is set to 0, then there will be no delay in the VLANs being moved back to their primary link.
- If a link fails when the pre-emption value is active, that is when the pre-emption value is not equal to 0, then the time will be halted.
- When the pre-emption timer is active for a particular link and port and if the other port goes down, then the VLANs of the port that is down is automatically moved to the port for which the pre-emption timer is active.
- When DHL ports spanned across the NIs or DHC ports are on the same NI but data port is on different NI, it is advised to configure mac-flush mechanism (either Raw/MVRP) for faster convergence.

### Examples

```
-> dhl num 1 pre-emption-time 40sec
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

<b>dhl num</b>	Configures a session ID for the DHL session.
<b>show dhl</b>	Displays the global status of the DHL configuration.
<b>show dhl num</b>	Displays information about a specific DHL session.
<b>show dhl num link</b>	Displays information about a specific dual homed link.

## MIB Objects

alaDHLSessionTable  
alaDHLSessionPreemptionTime

---

## dhl num mac-flushing

Configures the MAC-flushing technique for the DHL session. The MAC-flushing technique is used to correct any stale MAC entries that are caused when a dual homed link goes down.

**dhl num** *dhl\_num* **mac-flushing** {**none** | **raw** | **mvrp**}

---

### Syntax Definitions

<i>dhl_num</i>	Specifies the number of the DHL session.
<b>none</b>	Flushing of the MAC address tables does not occur.
<b>raw</b>	Method of flushing when VPAs of the links moved across them due to link up/down or configuration change(VLAN-map). The switch determines the MAC addresses within the affected VLANs
<b>mvrp</b>	Method of flushing when one link fails, and the other link issues 'join' declarations to establish connectivity. These new joins are flagged as 'new' and they are forwarded by the core devices causing flushing on the core network for the active VLANs.

### Defaults

parameter	default
<b>none</b>   <b>raw</b>   <b>mvrp</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Before enabling MVRP on dual homed links, the Registrar Mode should be set to 'forbidden', failing which an error message is displayed when configuring DHL. If the Registrar Mode is set to 'not forbidden', then changes cannot be made to the MVRP configuration on the dual homed links.
- If the mac-flushing technique is set to MVRP and if MVRP is not enabled on the dual homed links, then the **show dhl** command displays the active mac-flushing technique as **none**. When MVRP is enabled on the dual homed links, then the mac-flushing technique changes to **MVRP** and the Registrar Mode of the links is automatically set to 'forbidden'.
- If VLANs are moved across the dual homed links as a result of configuration changes, then mac-flushing is automatically enabled, if configured, excepting dual homed links that are changed on the fly..

### Examples

```
-> dhl num 1 mac-flushing none
-> dhl num 1 mac-flushing raw
```

### Release History

Release 6.4.4; command was introduced.

N/A

### Examples

```
-> show dhl num 1
DHL session name      : Arice,
Admin state           : Up,
Operational state     : Up,
Pre-emption time     : 40 sec,
Mac-flushing         : Raw-Flushing,
Active Mac-flushing  : Raw-Flushing,

Protected VLANs      : 10-20,23,25,30-100,600,700,800,

linkA:
  Port                : 1/2,
  Operational state   : Up

  Un protected VLANs : 900,1980,1987,234,
  Active VLAN        : 10-20,23,25,30-100,600,700,800,

linkB:
  Port                : 1/1,
  Operational state   : Down,
  Un protected VLANs : 1730-1800,
  Vlan-map           : 30-100,600,
  Active Vlans       : none,
```

### *output definitions*

---

<b>DHL session Name</b>	The user-defined text description of the DHL session.
<b>Admin state</b>	The current administrative status of the DHL session.
<b>Operational state</b>	The operational state of the DHL session.

*output definitions*

---

<b>Pre-emption time</b>	The delay-interval in seconds to move the VLANs back to their original links.
<b>Mac-flushing</b>	Mac-flushing technique on the DHL session.
<b>Active Mac-flushing</b>	The active Mac-flushing technique that is enabled on the specified DHL session.
<b>Protected VLANs</b>	The common VLANs that contain both the dual homed links, for example linkA and linkB.
<b>LinkA</b>	A dual homed link that is part of a pair of DHL links that can be configured per switch.
<b>Port</b>	The port number of linkA.
<b>Operational state</b>	The operational state of the port. The operational states are UP or DOWN.
<b>Un protected VLANs</b>	The VLANs containing only one dual homed link.
<b>Active VLANs</b>	The VLANs that are in an active state.
<b>LinkB</b>	A dual homed link that is part of a pair of DHL links that can be configured per switch.
<b>Port</b>	The port number of linkB.
<b>Operational state</b>	The operational state of the port. The operational states are UP or DOWN.
<b>Un protected VLANs</b>	The VLANs containing only one dual homed link.
<b>VLAN-map</b>	The DHL VLAN map for linkB. This specifies the VLANs that are operational on DHL linkB from the common pool of VLANs between DHL linkA and linkB.
<b>Operational VLANs</b>	The VLANs that are in an operational state.

# 9 Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. This implementation of ERP is based on Recommendation ITU-T G.8032 and uses the ring Automatic Protection Switching (APS) protocol to coordinate the prevention of network loops within a bridged Ethernet ring.

Loop prevention is achieved by allowing the traffic to flow on all but one of the links within the protected Ethernet ring. This link is blocked and is referred to as the Ring Protection Link (RPL). When a ring failure condition occurs, the RPL is unblocked to allow the flow of traffic to continue through the ring.

ERP and the Ring Rapid Spanning Tree Protocol (RRSTP) are both used for the prevention of loops in ring-based topologies but have the following differences in their implementation and functionality:

- RRSTP uses a different destination MAC address for each ring, based on the ring ID. ERP uses the same destination MAC address for all ERP protocol frames and identifies the ring based on a unique Service VLAN associated with each ring, which carries the ERP protocol frames.
- When a link failure is detected, RRSTP quickly sets the blocking ports to a forwarding state but relies on MSTP for actual protocol convergence. ERP does not require any support from MSTP. ERP has an inherent mechanism to recover from a failed state once the failed link is active again.
- MSTP determines which ports of a fully active RRSTP ring are blocked. The blocked ports (Ring Protection Link) for an ERP ring is pre-determined and configured by the user.
- RRSTP requires a ring of contiguous RRSTP nodes. ERP allows non-ERP nodes to participate in the ring by using the connectivity monitoring capabilities of Ethernet OAM to alert ERP of a link failure through non-ERP nodes.

MIB information for the Ethernet ring protection command is as follows:

*Filename:* AlcatelIND1Erp.mib  
*Module:* ALCATEL-IND1-ERP-MIB

A summary of available commands is listed here:

---

**erp-ring**  
**erp-ring protected-vlan**  
**erp-ring rpl-node**  
**erp-ring wait-to-restore**  
**erp-ring enable**  
**erp-ring ethoam-event remote-endpoint**  
**erp-ring guard-timer**  
**clear erp statistics**  
**show erp**  
**show erp protected-vlan**  
**show erp statistics**

---

## erp-ring

Creates an Ethernet Ring Protection (ERP) ring using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring and the specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

```
erp-ring ring_id port1 {slot/port | linkagg agg_num} port2 {slot/port | linkagg agg_num} service-vlan
vlan_id level level_num [guard-timer guard_timer] [wait-to-restore-timer wtr_timer] [enable | disable]
```

```
no erp-ring ring_id
```

---

### Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.
<i>vlan_id</i>	The service VLAN ID number. The valid range is 1- 4094.
<i>level_num</i>	The MEG level number for the service VLAN. The valid range is 0-7.
<i>guard-timer</i>	The guard timer value, in centi-secs, for the ring node.
<i>wtr-timer</i>	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
<b>enable</b>	Administratively enables the ERP ring.
<b>disable</b>	Administratively disables the ERP ring.

### Defaults

parameter	default
<i>guard_timer</i>	50
<i>wtr_timer</i>	5
<b>enable</b>   <b>disable</b>	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a ring from the switch configuration. Note that administratively disabling ring ports is recommended before deleting the ring to avoid creating any network loops. Once the ring is deleted, then ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.

- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that will participate in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. Up to four rings per switch are allowed.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. This may require changing the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- An ERP type NNI-SVLAN binding should be created before establishing an ERP ring on that SVLAN-NNI binding.

## Examples

```
-> erp-ring 1 port1 1/1 port2 2/4 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/10 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.
<a href="#">show erp protected-vlan</a>	Displays the protected VLAN configuration for the switch.
<a href="#">show erp statistics</a>	Displays ERP ring statistics.
<a href="#">ethernet-service svlan nni</a>	Creates a NNI-SVLAN binding.

## **MIB Objects**

```
alaErpRingId
  alaErpRingServiceVid
  alaErpRingMEGLevel
  alaErpRingStatus
  alaErpRingPort1
  alaErpRingPort2
  alaErpRingWaitToRestore
  alaErpRingGuardTimer
  alaErpRingRowStatus
```

---

## erp-ring protected-vlan

Configures a VLAN as a protected VLAN for an ERP ring. The ring ports associated with the specified ring ID are tagged with the protected VLAN ID.

```
erp-ring ring_id protected-vlan vlan_id1[-vlan_id2] [vlan_id1[-vlan_id2]]
```

```
no erp-ring ring_id protected-vlan [vlan_id1[-vlan_id2]]
```

---

### Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1- 2147483647.
<i>vlan_id1[-vlan_id2]</i>	The VLAN ID number. To specify multiple VLAN IDs in a single command, use a hyphen to indicate a contiguous range of VLAN IDs and a space to separate multiple VLAN ID entries (e.g., 10-20 30 100).

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a protected VLAN from the ERP ring configuration.
- The ERP ring ID number specified must already exist in the switch configuration, unless the VLAN ID specified belongs to a VLAN Stacking SVLAN.
- The VLAN ID specified must already exist in the switch configuration.
- Specify only static VLAN IDs; dynamic VLANs are not configurable as protected VLANs.
- A protected VLAN can belong to only one ERP ring at a time.
- The specified protected VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. This may require changing the Spanning Tree configuration for the VLAN ID prior to using this command.
- A SVLAN with two ERP VPA type NNI ports will be automatically configured as an ERP protected VLAN on a ring if the two NNI ports constitute its ring ports.
- Deletion of SVLAN-NNI binding results in removal of the SVLAN from the corresponding ERP protected VLAN database.

### Examples

```
-> erp-ring 1 protected-vlan 11
-> erp-ring 1 protected-vlan 12-20 25-40 100
-> erp-ring 2 protected-vlan 30-50
-> no erp-ring 1 protected-vlan
-> no erp-ring 1 protected-vlan 25-40
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

<a href="#">erp-ring</a>	Configures an ERP ring.
<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.
<a href="#">show erp protected-vlan</a>	Displays the protected VLAN configuration for the switch.

## MIB Objects

```
alaErpRingId  
  alaErpRingVlanProtectedVid  
  alaErpRingVlanRowStatus
```

---

## erp-ring rpl-node

Configures a switch as a Ring Protection Link (RPL) node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

```
erp-ring ring_id rpl-node {port slot/port | linkagg agg_num}
```

```
no erp-ring ring_id rpl-node
```

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled; RPL configuration applied to the ring while it is enabled will be rejected.
- The specified ERP ring ID must already exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.

### Examples

```
-> erp-ring 1 rpl-node port 2/1
-> erp-ring 2 rpl-node linkagg 2
-> no erp-ring 2 rpl-node
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

<a href="#">erp-ring</a>	Configures an ERP ring.
<a href="#">erp-ring wait-to-restore</a>	Configures the wait-to-restore timer value for the Ring Protection Link (RPL) node.

## MIB Objects

```
alaErpRingId  
  alaErpRingPortIfIndex  
  alaErpRingPortType
```

---

## erp-ring wait-to-restore

Configures the wait-to-restore timer value for the Ring Protection Link (RPL) switch. This timer determines the number of minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

**erp-ring** *ring\_id* **wait-to-restore** *wtr\_timer*

**no erp-ring** *ring\_id* **wait-to-restore**

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>wtr_timer</i>	The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1-12.

### Defaults

By default, the wait-to-restore timer value is set to 5 minutes.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must already exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

### Examples

```
-> erp-ring 1 wait-to-restore 6
-> no erp-ring 1 wait-to-restore
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">erp-ring</a>	Configures an ERP ring.
<a href="#">erp-ring rpl-node</a>	Configures a Ring Protection Link (RPL) port connection.
<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.

### MIB Objects

```
alaErpRingId
  alaErpRingWaitToRestoreTimer
```

---

## erp-ring enable

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

**erp-ring** *ring\_id* {**enable** / **disable**}

---

### Syntax Definitions

*ring\_id* An existing ERP ring ID number. The valid range is 1- 2147483647.

### Defaults

By default, ERP rings are disabled when they are created.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The specified ring ID must already exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

### Examples

```
-> erp-ring 1 enable  
-> erp-ring 1 disable
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[erp-ring](#) Configures an ERP ring.  
[show erp](#) Displays the ERP ring configuration for the switch.

### MIB Objects

```
alaErpRingId  
  alaErpRingStatus
```

---

## erp-ring ethoam-event remote-endpoint

Configures an ERP ring port to accept or drop a loss of connectivity event for a Remote Ethernet OAM Maintenance End Point (MEP). This command allows ERP to interact with Ethernet OAM to monitor non-ERP nodes that may exist in an ERP ring.

**erp-ring** *ring\_id* **ethoam-event** {**port** *slot/port* | **linkagg** *agg\_num*} **remote-endpoint** *mep\_id*

**no erp-ring** *ring\_id* **ethoam-event** {**port** *slot/port* | **linkagg** *agg\_num*}

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.
<i>mep_id</i>	The remote MEP ID number. The valid range is 1-8191.

### Defaults

By default, ERP ports will drop Ethernet OAM loss of connectivity events.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to configure the ERP ring port to drop loss of connectivity events.
- The specified ring ID must already exist in the switch configuration.
- The specified remote MEP ID number is only allowed on one ring port within the same ERP ring.

### Examples

```
-> erp-ring 1 ethoam-event port 1/1 remote-endpoint 10
-> erp-ring 1 ethoam-event linkagg 1 remote-endpoint 20
-> no erp-ring 1 ethoam-event port 1/1
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

[erp-ring](#)

Configures an ERP ring.

[show erp](#)

Displays the ERP ring configuration for the switch.

## MIB Objects

alaErpRingId

alaErpRingPortEthOAMEvent

alaErpRingPortRmepId

---

## erp-ring guard-timer

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

**erp-ring** *ring\_id* **guard-timer** *guard\_timer*

**no erp-ring** *ring\_id* **guard-timer**

---

### Syntax Definitions

*ring\_id* An existing ERP ring ID number. The valid range is 1–2147483647.  
*guard\_timer* The guard timer value. The valid range is 1–200 centi-secs.

### Defaults

parameter	default
<i>guard_timer</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must already exist in the switch configuration.

### Examples

```
-> erp-ring 1 guard-timer 10
-> no erp-ring 1 guard-timer
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[erp-ring](#) Configures an ERP ring.  
[show erp](#) Displays the ERP ring configuration for the switch.

### MIB Objects

alaErpRingId

---

## clear erp statistics

Clears ERP statistics for all rings, a specific ring, or a specific ring port.

**clear erp statistics** [**ring** *ring\_id* [**port** *slot/port* | **linkagg** *agg\_num*]]

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

By default, statistics are cleared for all ERP rings in the switch configuration.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Enter a ring ID to clear the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to clear the statistics for a specific port or link aggregate.
- The specified ring ID must already exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

### Examples

```
-> clear erp statistics
-> clear erp statistics ring 5
-> clear erp statistics ring 5 port 1/2
-> clear erp statistics ring 5 linkagg 10
```

### Release History

Release 6.3.4; command was introduced.

```

---

## show erp

Displays the ERP configuration information for all rings, a specific ring, or for a specific ring port.

**show erp** [**ring** *ring\_id*] [**port** *slot/port* | **linkagg** *agg\_num*]

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

By default, configuration information is displayed for all ERP rings in the switch configuration.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Enter a ring ID to display the configuration for a specific ring.
- Enter a ring port number or a link aggregate ID to display the configuration for a specific port or link aggregate.
- The specified ring ID must already exist in the switch configuration.

### Examples

```
-> show erp
```

```
Legends: * - Inactive Configuration
          WTR - Wait To Restore
          MEG - Maintenance Entity Group
```

Ring ID	Ring Port1	Ring Port2	Ring Status	Serv VLAN	WTR Timer (min)	Guard Timer (csec)	MEG Level	Ring State	Ring Node
1	1/15	1/1	enabled	4094	3	50	2	idle	rpl
2	6/7	4/1	enabled	4093	1	50	1	idle	rpl
3	4/7	6/1	enabled	4092	1	50	3	idle	rpl
4	4/8	6/23	enabled	4091	5	50	4	idle	non-rpl

```
Total number of rings configured = 4
```

```
-> show erp ring 1
```

```
Legend: * - Inactive Configuration
```

```
Ring Id           : 1,
Ring Port1        : 1/15,
```

```

Ring Port2           : 1/1,
Ring Status          : enabled,
Service VLAN         : 4094,
WTR Timer (min)     : 3,
Guard Timer (centi-sec) : 50,
MEG Level            : 2,
Ring State           : idle,
Ring Node Type       : rpl,
RPL Port             : 1/1,
Last State Change    : SUN DEC 25 06:50:17 2016 (sysUpTime 00h:01m:31s)

```

**output definitions**

---

<b>Ring ID</b>	The ERP ring ID number.
<b>Ring Ports</b>	The slot and port number of the ring ports.
<b>Ring Status</b>	The ring status ( <b>enabled</b> or <b>disabled</b> ).
<b>Service VLAN</b>	The Service VLAN ID.
<b>WTR Timer</b>	The wait-to-restore timer value in minutes for RPL node.
<b>Guard Timer</b>	The guard timer value in centi-secs for the ring node.
<b>MEG Level</b>	The Service VLAN Management Entity Group (MEG) level.
<b>Ring State</b>	Indicates the state of the ring.
<b>Ring Node Type</b>	Indicates the type of the ring node.
<b>Last State Change</b>	Indicates the time when the last state change occurred.

---

```

-> show erp port 1/15
Legend: * - Inactive Configuration

```

```

Ring-Id : 1
  Ring Port Status   : forwarding,
  Ring Port Type     : non-rpl,
  Ethoam Event       : disabled

```

```

-> show erp port 1/1
Legend: * - Inactive Configuration

```

```

Ring Id : 1
  Ring Port Status   : blocking,
  Rint Port Type     : RPL,
  Ethoam Event       : enabled,
  Rmepid             : 10

```

**output definitions**

---

<b>Ring ID</b>	The ERP ring ID number.
<b>Ring Port Status</b>	The status of the ring port ( <b>blocking</b> or <b>forwarding</b> ).
<b>Ring Port Type</b>	The type of ring port ( <b>RPL</b> or <b>non-RPL</b> ).
<b>Ethoam Event</b>	Indicates whether or not the ring port will accept Ethernet OAM loss of connectivity events ( <b>enabled</b> or <b>disabled</b> ).
<b>Rmepid</b>	The remote Ethernet OAM MEP ID number from which this port accepts loss of connectivity events. This field displays only when the ring port is configured to receive such events.

## show erp statistics

Displays the ERP statistics for all rings, a specific ring, or a specific ring port.

**show erp statistics** [**ring** *ring\_id* [**port** *slot/port* | **linkagg** *agg\_num*]]

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

By default, statistics are displayed for all ERP rings in the switch configuration.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Enter a ring ID to display the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to display the statistics for a specific port or link aggregate.
- The specified ring ID must already exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

### Examples

```
-> show erp statistics

# 10 GVRP Commands

The GARP VLAN Registration Protocol (GVRP) facilitates control of virtual local area networks (VLANs) within a larger network. It is an application of General Attribute Registration Protocol (GARP) that provides the VLAN registration service. The GARP provides a generic framework whereby devices in a bridged LAN can register and de-register attribute values, such as VLAN identifiers.

GVRP is compliant with 802.1q and dynamically learns and further propagates VLAN membership information across a bridged network. It dynamically maintains and updates the registration and de-registration of VLANs and prunes unnecessary broadcast and unicast traffic. Through propagation of GVRP information, a switch can continuously update its knowledge on the set of VLANs that currently have active nodes and on ports through which those nodes can be reached.

A summary of the available commands is listed here:

---

- gvrp**
- gvrp port**
- gvrp transparent switching**
- gvrp maximum vlan**
- gvrp registration**
- gvrp applicant**
- gvrp timer**
- gvrp restrict-vlan-registration**
- gvrp restrict-vlan-advertisement**
- gvrp static-vlan restrict**
- clear gvrp statistics**
- show gvrp statistics**
- show gvrp last-pdu-origin**
- show gvrp configuration**
- show gvrp configuration port**
- show gvrp configuration linkagg/port**
- show gvrp timer**

---

## **gvrp**

Enables GVRP on the switch globally.

**gvrp**

**no gvrp**

---

### **Syntax Definitions**

N/A

### **Defaults**

By default, GVRP is disabled on the switch.

### **Platforms Supported**

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### **Usage Guidelines**

- Use the **no** form of this command to disable GVRP globally on the switch.
- Disabling GVRP globally will delete all the learned VLANs.
- GVRP is supported only when the switch is operating in the flat Spanning Tree mode; it is not supported in the 1x1 mode.

### **Examples**

```
-> gvrp  
-> no gvrp
```

### **Release History**

Release 6.2.1; command was introduced.

### **Related Commands**

[show gvrp configuration](#)      Displays the global configuration for GVRP.

### **MIB Objects**

dot1qGvrpStatus

---

## Related Commands

- show gvrp configuration port** Displays the GVRP configuration for all the ports.
- show gvrp configuration linkagg/port** Displays the GVRP configuration for a specific port or an aggregate of ports.

## MIB Objects

dot1qPortVlanTable  
dot1qPortGvrpStatus

---

## **gvrp transparent switching**

Enables transparent switching on the switch. When transparent switching is enabled, the switch propagates GVRP information to other switches but does not register itself in the GVRP process.

**gvrp transparent switching**

**no gvrp transparent switching**

---

### **Syntax Definitions**

N/A

### **Defaults**

By default, transparent switching is disabled on the switch.

### **Platforms Supported**

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### **Usage Guidelines**

- Use the **no** form of this command to disable transparent switching on the device.
- If GVRP is globally disabled and transparent switching is enabled, the router will flood the GVRP messages.
- If GVRP is globally disabled and transparent switching is disabled, the router will discard the GVRP messages.
- If GVRP is globally enabled transparent switching will not have any effect on the functional behavior of the device.

### **Examples**

```
-> gvrp transparent switching  
-> no gvrp transparent switching
```

### **Release History**

Release 6.2.1; command was introduced.

Release 6.3.1; support for OmniSwitch chassis-based switches added.

### **Related Commands**

[show gvrp configuration](#) Displays the global configuration for GVRP.

### **MIB Objects**

alaGvrpTransparentSwitching

---

## gvrp maximum vlan

Configures the maximum number of dynamic VLANs that can be created by GVRP.

**gvrp maximum vlan** *vlanlimit*

---

### Syntax Definitions

*vlanlimit* The maximum number of VLANs to be created by GVRP. The valid range is 32–4094.

### Defaults

parameter	default
<i>vlanlimit</i>	256

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command can be used even when GVRP is not enabled on the switch. However, GVRP should be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration will take effect only after the GVRP is disabled and enabled again on the switch. If this operation is not done, the VLANs learnt earlier will be maintained.

### Examples

```
-> gvrp maximum vlan 100
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show gvrp configuration](#) Displays the global configuration for GVRP.

### MIB Objects

alaGvrpMaxVlanLimit

---

## gvrp registration

Configures the GVRP registration mode for a specific port or an aggregate of ports.

**gvrp registration** {**normal** | **fixed** | **forbidden**} {**linkagg** *agg\_num* | **port** *slot/port*}

**no gvrp registration** {**linkagg** *agg\_num* | **port** *slot/port*}

---

### Syntax Definitions

<b>normal</b>	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through GVRP) or statically (through management application) on such a port.
<b>fixed</b>	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
<b>forbidden</b>	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLAN created earlier will be de-registered.
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

parameter	default
<b>normal</b>   <b>fixed</b>   <b>forbidden</b>	<b>normal</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the registration mode to the default value.
- GVRP should be enabled on the port before configuring the GVRP registration mode.
- The registration mode for the default VLANs of all the ports in the switch will be set to fixed.
- To use the *agg\_num* parameter, the link aggregate group should be created and enabled.

### Examples

```
-> gvrp registration forbidden port 3/2
-> no gvrp registration port 3/2
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**show gvrp configuration  
linkagg/port**

Displays the GVRP configuration for a specific port or an aggregate of ports.

## MIB Objects

alaGvrpPortConfigtable  
alaGvrpPortConfigRegistrarMode

---

## gvrp applicant

Configures the applicant mode of a specific port or an aggregate of ports on the switch. The applicant mode determines whether or not GVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

**gvrp applicant** {**participant** | **non-participant** | **active**} {**linkagg** *agg\_num* | **port** *slot/port*}

**no gvrp applicant** {**linkagg** *agg\_num* | **port** *slot/port*}

---

### Syntax Definitions

<b>participant</b>	Specifies that GVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
<b>non-participant</b>	Specifies that no GVRP PDU exchanges are allowed on the port, regardless of the STP status of the port.
<b>active</b>	Specifies that GVRP PDU exchanges are allowed when the port is either in the STP forwarding or STP blocking state.
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

parameter	default
<b>participant</b>   <b>non-participant</b>   <b>active</b>	<b>participant</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the applicant mode to the default value.
- GVRP should be enabled on the port before configuring the GVRP applicant mode.
- To use the *agg\_num* parameter, the link aggregate group should be created and enabled.

### Examples

```
-> gvrp applicant active port 2/2
-> no gvrp applicant port 2/2
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**show gvrp configuration  
linkagg/port**

Displays the GVRP configuration for a specific port or an aggregate of ports.

## MIB Objects

alaGvrpPortConfigtable  
  alaGvrpPortConfigApplicantMode

---

## gvrp timer

Configures the Join, Leave, or LeaveAll timer values for the switch ports.

**gvrp timer** {**join** | **leave** | **leaveall**} *timer-value* {**linkagg** *agg\_num* | **port** *slot/port*}

**no gvrp timer** {**join** | **leave** | **leaveall**} {**linkagg** *agg\_num* | **port** *slot/port*}

---

### Syntax Definitions

<b>join</b>	Specifies the value of the Join timer in milliseconds.
<b>leave</b>	Specifies the value of the Leave timer in milliseconds.
<b>leaveall</b>	Specifies the value of the LeaveAll timer in milliseconds.
<i>timer-value</i>	The value of the specified timer in milliseconds. The valid range is 1–2,147,483,647 for Join timer, 3–2,147,483,647 for Leave timer, and 3–2,147,483,647 for LeaveAll timer.
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

parameter	default
<i>timer-value</i> ( <b>join</b> )	600 ms
<i>timer-value</i> ( <b>leave</b> )	1800 ms
<i>timer-value</i> ( <b>leaveall</b> )	30000 ms

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the timer for a particular slot or port to the default value.
- GVRP should be enabled on the port before configuring the timer value for that port.
- Leave timer value should be greater than or equal to three times the Join timer value.
- Leaveall timer value should be greater than or equal to the Leave timer value.
- To use the *agg\_num* parameter, the link aggregate group should be created and enabled.

## Examples

```
-> gvrp timer join 300 port 3/2
-> no gvrp timer join 3/2
-> gvrp timer leave 900 port 3/2
-> no gvrp timer leave port 3/2
-> gvrp timer leaveall 950 port 3/2
-> no gvrp timer leaveall port 3/2
```

## Release History

Release 6.2.1; command was introduced.

## Related Commands

<a href="#">show gvrp timer</a>	Displays the timer values configured for all the ports or a specific port.
<a href="#">show gvrp configuration linkagg/port</a>	Displays the GVRP configuration for a specific port or an aggregate of ports.

## MIB Objects

```
alaGvrpPortConfigTable
  alaGvrpPortConfigJoinTimer
  alaGvrpPortConfigLeaveTimer
  alaGvrpPortConfigLeaveAllTimer
```

---

## gvrp restrict-vlan-registration

Restricts GVRP processing from dynamically registering the specified VLAN(s) on the switch.

**gvrp restrict-vlan-registration** {linkagg *agg\_num* | port *slot/port*} *vlan-list*

**no gvrp restrict-vlan-registration** {linkagg *agg\_num* | port *slot/port*} *vlan-list*

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>vlan-list</i>	The VLAN ID or the VLAN ID range (e.g., 1-10).

### Defaults

By default, GVRP dynamic VLAN registration is not restricted.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through GVRP processing.
- GVRP should be enabled on the port before restricting dynamic VLAN registrations on that port.
- This command can be used only if the GVRP registration mode is set to normal.
- If the specified VLAN already exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg\_num* parameter, the link aggregate group should be created and enabled.

### Examples

```
-> gvrp restrict-vlan-registration port 3/1 5
-> no gvrp restrict-vlan-registration port 3/1 5
-> gvrp restrict-vlan-registration port 3/1 6-10
-> no gvrp restrict-vlan-registration port 3/1 6-10
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

## gvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

**gvrp restrict-vlan-advertisement** {linkagg *agg\_num* | port *slot/port*} *vlan-list*

**no gvrp restrict-vlan-advertisement** {linkagg *agg\_num* | port *slot/port*} *vlan-list*

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>vlan-list</i>	The VLAN ID or the VLAN ID range (e.g., 1-10).

### Defaults

By default, VLAN advertisement is not restricted.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to allow the propagation of VLANs.
- GVRP should be enabled on the port before restricting VLAN advertisements on that port.
- This command affects the GVRP processing only if the applicant mode is set to participant or active.
- To use the *agg\_num* parameter, the link aggregate group should be created and enabled.

### Examples

```
-> gvrp restrict-vlan-advertisement port 3/1 4
-> no gvrp restrict-vlan-advertisement port 3/1 4
-> gvrp restrict-vlan-advertisement port 3/1 6-9
-> no gvrp restrict-vlan-advertisement port 3/1 6-9
-> gvrp restrict-vlan-advertisement linkagg 3 10
-> no gvrp restrict-vlan-advertisement linkagg 3 10
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**gvrp applicant**

Configures the applicant mode for the switch port.

**show gvrp configuration  
linkagg/port**

Displays the GVRP configuration for a specific port or an aggregate of ports.

---

## **gvrp static-vlan restrict**

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

**gvrp static-vlan restrict** {linkagg *agg\_num* | port *slot/port*} *vlan-list*

**no gvrp static-vlan restrict** {linkagg *agg\_num* | port *slot/port*} *vlan-list*

---

### **Syntax Definitions**

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>vlan-list</i>	The VLAN ID or the VLAN ID range (e.g., 1-10).

### **Defaults**

By default, ports are assigned to the static VLAN based on GVRP PDU processing.

### **Platforms Supported**

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### **Usage Guidelines**

- Use the **no** form of this command to set the specified port and VLAN to the default value.
- GVRP should be enabled on the port before restricting static VLAN registrations on that port.
- This command does not apply to dynamic VLANs.
- To use the *agg\_num* parameter, the link aggregate group should be created and enabled.

### **Examples**

```
-> gvrp static-vlan restrict port 3/2 5
-> no gvrp static-vlan restrict port 3/2 5
-> gvrp static-vlan restrict port 3/2 6-9
-> no gvrp static-vlan restrict port 3/2 6-9
-> gvrp static-vlan restrict linkagg 3 4-5
-> no gvrp static-vlan aggregate linkagg 3 4-5
```

## clear gvrp statistics

Clears GVRP statistics for all the ports, an aggregate of ports, or a specific port.

**clear gvrp statistics** [**linkagg** *agg\_num* | **port** *slot/port*]

---

### Syntax Definitions

*agg\_num*

The number corresponding to the aggregate group.

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

By default, the GVRP statistics are deleted for all the ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *agg\_num* or *slot/port* parameter with this command to clear GVRP statistics for a specific port.

### Examples

```
-> clear gvrp statistics port 3/2
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show gvrp statistics](#)

Displays the GVRP statistics or all the ports, an aggregate of ports, or a specific port.

### MIB Objects

```

---

## show gvrp statistics

Displays the GVRP statistics for all the ports, an aggregate of ports, or a specific port.

**show gvrp statistics** [**linkagg** *agg\_num* | **port** *slot/port*]

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

By default, the GVRP statistics are displayed for all ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *agg\_num* or *slot/port* parameter with this command to display GVRP statistics for a specific port.

### Examples

```
-> show gvrp statistics port 1/21
Port 1/21:
  Join Empty Received      : 8290,
  Join In Received        : 1526,

## show gvrp last-pdu-origin

Displays the source MAC address of the last GVRP message received on a specific port or an aggregate of ports.

**show gvrp last-pdu-origin** {linkagg *agg\_num* | port *slot/port*}

---

### Syntax Definitions

*agg\_num*

The number corresponding to the aggregate group.

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show gvrp last-pdu-origin port 1/21
Last-PDU Origin : 00:d0:95:ee:f4:64
```

#### *output definitions*

---

**Last-PDU Origin**

The source MAC address of the last PDU message received on the specific port.

## show gvrp configuration

Displays the global configuration for GVRP.

**show gvrp configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show gvrp configuration
GVRP Enabled                : yes,
Transparent Switching Enabled : no,
Maximum VLAN Limit          : 256
```

### *output definitions*

---

<b>GVRP Enabled</b>	Indicates whether or not GVRP is globally enabled.
<b>Transparent Switching Enabled</b>	Indicates whether transparent switching is enabled ( <b>Yes</b> ) or disabled ( <b>No</b> ). When enabled, GVRP messages are flooded even if GVRP is disabled for the switch.
<b>Maximum VLAN Limit</b>	The maximum number of VLANs that can be learned by GVRP in the system.

---

### Release History

Release 6.2.1; command was introduced.

## show gvrp timer

Displays the timer values configured for all the ports or a specific port.

```
show gvrp timer [[join | leave | leaveall] {linkagg agg_num | port slot/port}]
```

---

### Syntax Definitions

<b>join</b>	Displays the Join timer value.
<b>leave</b>	Displays the Leave timer value.
<b>leaveall</b>	Displays the LeaveAll timer value.
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

By default the timer values configured on all the ports are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **join**, **leave**, or **leaveall** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg\_num* or *slot/port* parameter with this command to display the timer values configured for a specific port.

### Examples

```
-> show gvrp timer
```

# 11 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs. Note that if MVRP is configured on a switch, GVRP cannot be configured on that switch.

A summary of the available commands is listed here:

---

- vlan registration-mode**
- mvrp**
- mvrp port**
- mvrp transparent-switching**
- mvrp port**
- mvrp maximum vlan**
- mvrp registration**
- mvrp applicant**
- mvrp timer join**
- mvrp timer join**
- mvrp timer leave**
- mvrp timer leaveall**
- mvrp timer periodic-timer**
- mvrp restrict-vlan-registration**
- mvrp restrict-vlan-advertisement**
- mvrp static-vlan-restrict**
- show mvrp configuration**
- show mvrp configuration**
- show mvrp configuration**
- show mvrp configuration**
- show mvrp port**
- show mvrp linkagg**
- show mvrp linkagg**
- show mvrp timer**
- show mvrp statistics**
- show mvrp last-pdu-origin**
- show vlan registration-mode**
- show mvrp vlan-restrictions**
- mvrp clear-statistics**
- mvrp clear-statistics**

---

## vlan registration-mode

Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.

**vlan registration-mode {gvrp | mvrp}**

---

### Syntax Definitions

*gvrp* Dynamic registration protocol mode is GVRP.

*mvrp* Dynamic registration protocol mode is MVRP.

### Defaults

parameter	default
gvrp  mvrp	mvrp

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Before configuring MVRP, change the VLAN registration mode to MVRP.
- When the mode is changed from MVRP to GVRP or GVRP to MVRP, all static and dynamic configurations of the previous mode is deleted.
- An INFO message “All [GVRP/MVRP] static and dynamic configurations has been deleted” is given to the user on changing the mode from GVRP to MVRP.
- On configuring the same mode, no INFO message is given to the user.
- While running in MVRP mode, all GVRP configurations is rejected and when in GVRP mode, all MVRP configuration is rejected.
- Even though the default mode of the switch is MVRP, when you are upgrading the image from a previous release which does not support MVRP, the GVRP commands is accepted by the switch. The VLAN registration mode is internally changed to GVRP.

### Examples

```
-> vlan registration-mode mvrp
INFO: All GVRP configurations and learnings have been deleted.
```

```
-> vlan registration-mode gvrp
INFO: All MVRP configurations and learnings have been deleted.
```

### Release History

Release 6.4.3; command was introduced.

### **Related Commands**

**show vlan registration-mode** Displays the VLAN registration operational mode.

### **MIB Objects**

alaVlanRegistrationProtocolType

---

## mvrp

Enables or disables MVRP globally on the switch.

**mvrp {enable | disable}**

---

### Syntax Definitions

<i>enable</i>	Enables MVRP globally on the switch.
<i>disable</i>	Disables MVRP globally on the switch.

### Defaults

By default, MVRP is disabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Disabling MVRP globally will delete all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the 1x1 mode.

### Examples

```
-> mvrp enable  
-> mvrp disable
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

<a href="#">vlan registration-mode</a>	Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.
<a href="#">show mvrp configuration</a>	Displays the global configuration for MVRP.

### MIB Objects

alaMvrpGlobalStatus

---

## mvrp port

Enables or disables MVRP on specific ports on the switch.

**mvrp port** *slot/port* [*- port2*] {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>enable</i>	Enables MVRP on a port.
<i>disable</i>	Disables MVRP on a port.

### Defaults

By default, mvrp is disabled on all the ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP should be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- MVRP should not be enabled on ERP ring ports.

### Examples

```
-> mvrp port 1/2 enable
-> mvrp port 1/2 disable
-> mvrp port 1/1-10 enable
-> mvrp port 1/1-10 disable
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp statistics](#)

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

## MIB Objects

alaMvrpPortConfigTable  
alaMvrpPortStatus

---

## mvrp linkagg

Enables or disables MVRP on specific aggregates on the switch.

**mvrp linkagg** *agg\_num* [-*agg\_num2*] {**enable** | **disable**}

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>enable</i>	Enables MVRP on a port.
<i>disable</i>	Disables MVRP on a port.

### Defaults

By default, mvrp is disabled on all the ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP should be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the *agg\_num* parameter, the link aggregate group must be created.

### Examples

```
-> mvrp linkagg 10 enable
-> mvrp linkagg 10 disable
-> mvrp linkagg 2-5 enable
-> mvrp linkagg 1-5 disable
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp statistics](#)

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

## MIB Objects

alaMvrpPortConfigTable  
alaMvrpPortStatus

---

## mvrp transparent-switching

Enables or disables transparent switching on the switch. When transparent switching is enabled, the switch propagates MVRP information to other switches but does not participate in the MVRP protocol.

**mvrp transparent-switching {enable | disable}**

---

### Syntax Definitions

*enable* Enables transparent switching globally on a switch.

*disable* Disables transparent switching globally on a switch.

### Defaults

By default, transparent switching is disabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If MVRP is globally disabled and transparent switching is enabled, the switch floods the MVRP messages.
- If MVRP is globally disabled and transparent switching is disabled, the switch discards the MVRP messages.
- If MVRP is globally enabled, transparent switching has no effect on the functional behavior of the switch.

### Examples

```
-> mvrp transparent-switching enable  
-> mvrp transparent-switching disable
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[show mvrp configuration](#) Displays the global configuration for MVRP.

### MIB Objects

alaMvrpTransparentSwitching

---

---

## mvrp maximum vlan

Configures the maximum number of dynamic VLANs that can be created by MVRP.

**mvrp maximum vlan** *vlanlimit*

---

### Syntax Definitions

*vlanlimit*                      The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

### Defaults

The default value is 256.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP must be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration will take effect only after the MVRP is disabled and enabled again on the switch. If this operation is not done, the VLANs learnt earlier is retained.

### Examples

```
-> mvrp maximum vlan 100
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[show mvrp configuration](#)            Displays the global configuration for MVRP.  
[show vlan mvrp](#)                      Displays the list of VLANS learned through MVRP and their details.

### MIB Objects

alaMvrpMaxVlanLimit

---

## mvrp registration

Configures the MVRP registration mode for specific ports or aggregates.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} registration {normal | fixed | forbidden}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>normal</b>	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
<b>fixed</b>	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
<b>forbidden</b>	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLAN created earlier will be deregistered.

### Defaults

---

parameter	default
normal   fixed   forbidden	normal

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 registration forbidden
-> mvrp port 1/5 registration normal
-> mvrp linkagg 10 registration fixed
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/5-10 registration normal
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp linkagg](#)

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

alaMvrpPortConfigTable

alaMvrpPortConfigRegistrarMode

---

## mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **applicant** {**participant** | **non-participant** | **active**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>participant</b>	Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
<b>non-participant</b>	Specifies that MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected.
<b>active</b>	Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state. This is applicable for both advertisement and registration.

### Defaults

parameter	default
<b>participant</b>   <b>non-participant</b>   <b>active</b>	<b>active</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 applicant active
-> mvrp port 1/3 applicant participant
-> mvrp port 1/4 applicant non-participant
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15 applicant participant
-> mvrp linkagg 20 applicant non-participant
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp linkagg](#)

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

alaMvrpPortConfigtable  
  alaMvrpPortConfigApplicantMode

---

## mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer join** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the join timer in milliseconds. The valid range is 250 milliseconds to 1073741773 milliseconds.

### Defaults

---

parameter	default
<i>timer-value</i>	600 milliseconds

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer join 600
-> mvrp port 1/2-12 timer join 600
-> mvrp linkagg 3 timer join 600
-> mvrp linkagg 3-6 timer join 600
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**show mvrp timer**

Displays the timer values configured for all the ports or a specific port.

**show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## mvrp timer leave

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer leave** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

### Defaults

---

parameter	default
<i>timer-value</i>	1800 milliseconds

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- Leave timer value must be greater than or equal to twice the Join timer value, plus six times the timer resolution (i.e. 16.66 milliseconds). Leave timer should be at least be greater than twice the join timer plus 100 milliseconds.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer leave 1800
-> mvrp port 1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**show mvrp timer**

Displays the timer values configured for all the ports or a specific port.

**show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTime
```

---

## mvrp timer leaveall

Specifies the frequency with which the LeaveAll messages are communicated.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer leaveall** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

### Defaults

---

parameter	default
<i>timer-value</i>	30000 milliseconds

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- Leaveall timer value should be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer leaveall 30000
-> mvrp port 1/2-12 timer leaveall 30000
-> mvrp linkagg 3 timer leaveall 30000
-> mvrp linkagg 3-6 timer leaveall 30000
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**show mvrp timer**

Displays the timer values configured for all the ports or a specific port.

**show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## mvrp timer periodic-timer

Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer periodic-timer** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the Periodic Timer in seconds. The valid range is between 1 to 2147483647 milliseconds.

### Defaults

---

parameter	default
<i>timer-value</i>	<i>1 second</i>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp linkagg 3 timer periodic-timer 1
-> mvrp linkagg 3-6 timer periodic-timer 1
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**show mvrp timer**

Displays the timer values configured for all the ports or a specific port.

**show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

```
mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} periodic-transmission {enable|disable}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>enable</b>	Enables periodic transmission status on a port.
<b>disable</b>	Disables periodic transmission status on a port.

### Defaults

By default, periodic-transmission status would be disabled on all the ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 periodic-transmission enable
-> mvrp port 1/2 periodic-transmission disable
-> mvrp linkagg 10 periodic-transmission enable
-> mvrp linkagg 10 periodic-transmission disable
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

<a href="#">show mvrp port</a>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
<a href="#">show mvrp linkagg</a>	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

### MIB Objects

```
alaMvrpPortConfigTable
  alaMvrpPortConfigPeriodicTransmissionStatus
```

---

## mvrp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **restrict-vlan-registration** **vlan** *vlan-list*

**no mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **restrict-vlan-registration** **vlan** *vlan-list*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>vlan-list</i>	The VLAN ID or the VLAN ID range (e.g., 1-10).

### Defaults

By default, MVRP dynamic VLAN registrations are not restricted.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 restrict-vlan-registration vlan 5
-> no mvrp port 1/2 restrict-vlan-registration vlan 5
-> mvrp linkagg 10 restrict-vlan-registration vlan 6-10
-> no mvrp port 3/1 restrict-vlan-registration vlan 6-10
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

- show mvrp port** Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
- show mvrp linkagg** Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortRestrictVlanConfigTable  
  alaMvrpPortRestrictRowStatus  
  alaMvrpPortRestrictVlanAttributeType  
  alaMvrpPortRestrictVlanID
```

---

## mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

**mvrp** {port *slot/port* [-*port2*] | linkagg *agg\_num* [-*agg\_num2*]} **restrict-vlan-advertisement**

**vlan** *vlan-list*

**no mvrp** {port *slot/port* [-*port2*] | linkagg *agg\_num* [-*agg\_num2*]} **restrict-vlan-advertisement**

**vlan** *vlan-list*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>vlan_list</i>	The list of VLAN IDs or the VLAN ID range (e.g., 1-10).

### Defaults

By default, MVRP VLAN advertisement is not restricted.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the **no** form of this command to allow the propagation of VLANs.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1-2 restrict-vlan-advertisement vlan 6-10
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<b>mvrp applicant</b>	Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
<b>mvrp timer join</b>	Configures the applicant mode of specific link aggregates on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
<b>show mvrp port</b>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
<b>show mvrp linkagg</b>	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortRestrictVlanConfigTable  
  alaMvrpPortRestrictRowStatus  
  alaMvrpPortRestrictVlanAttributeType  
  alaMvrpPortRestrictVlanID
```

---

## mvrp static-vlan-restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

**mvrp** {linkagg *agg\_num* [-*agg\_num2*] | port *slot/port* [- *port2*]} **static-vlan-restrict** vlan *vlan-list*

**no mvrp** {linkagg *agg\_num* [-*agg\_num2*] | port *slot/port* [- *port2*]} **static-vlan-restrict** vlan *vlan-list*

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>vlan_list</i>	The list of VLAN IDs or the VLAN ID range (e.g., 1-10).

### Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the **no** form of this command to set the specified port and VLAN to the default value.
- Use the *agg\_num* or *slot/port* parameter with this command to display GVRP statistics for a specific port.

### Examples

```
-> mvrp port 1/2 static-vlan-restrict vlan 5
-> no mvrp port 1/2 static-vlan-restrict vlan 5
-> mvrp port 1/2 static-vlan-restrict vlan 6-9
-> no mvrp port 1/2 static-vlan-restrict vlan 6-9
-> mvrp linkagg 3 static-vlan-restrict vlan 4-5
-> no mvrp linkagg 3 static-vlan-restrict aggregate vlan 4-5
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

### **show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### **show mvrp linkagg**

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortRestrictVlanConfigTable  
  alaMvrpPortRestrictRowStatus  
  alaMvrpPortRestrictVlanAttributeType  
  alaMvrpPortRestrictVlanID  
  alaMvrpPortConfigRegistrationToStaticVlan  
  alaMvrpPortConfigRegistrationToStaticVlanLearn  
  alaMvrpPortConfigRegistrationToStaticVlanRestrict
```

---

## show mvrp configuration

Displays the global configuration for MVRP.

**show mvrp configuration**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

NA

### Examples

```
-> show mvrp configuration
MVRP Enabled           : yes,
Transparent Switching Enabled : no,
Maximum VLAN Limit     : 256
```

### *output definitions*

---

<b>MVRP Enabled</b>	Indicates whether MVRP is globally enabled.
<b>Transparent Switching Enabled</b>	Indicates whether transparent switching is enabled ( <b>Yes</b> ) or disabled ( <b>No</b> ). When enabled, MVRP messages are flooded even if MVRP is disabled for the switch.
<b>Maximum VLAN Limit</b>	The maximum number of VLANs that can be learned by MVRP in the system.

---

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<b>mvrp</b>	Enables or disables MVRP globally on the switch.
<b>vlan registration-mode</b>	Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.
<b>mvrp port</b>	Enables or disables transparent switching on the switch. When transparent switching is enabled, the switch propagates MVRP information to other switches but does not participate in the MVRP protocol.
<b>mvrp maximum vlan</b>	Configures the maximum number of dynamic VLANs that can be created by MVRP.

## MIB Objects

```
alaMvrpGlobalStatus  
alaMvrpTransparentSwitching  
alaMvrpMaxVlanLimit
```

---

## show mvrp port

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

**show mvrp port** {*slot/port* [-*port2*]} [**enabled** | **disabled**]

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

**enabled** To display only the enabled ports.

**disabled** To display only the disabled ports.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

-> show mvrp port enabled

Port	Join Timer (msec)	Leave Timer (msec)	LeaveAll Timer (msec)	Periodic Timer (sec)	Registration Mode	Applicant Mode	Periodic Tx Status

## show mvrp timer

Displays the timer values configured for all the ports or a specific port.

```
show mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} timer {join | leave | leaveall |
periodic-timer}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>join</b>	To display only the join timer.
<b>leave</b>	To display only the leave timer.
<b>leaveall</b>	To display only the leaveall timer.
<b>periodic-timer</b>	To display only the periodic-timer.

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **join**, **leave**, **leaveall**, or **periodic-timer** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg\_num* or *slot/port* parameter with this command to display the timer values configured for a specific port.

### Examples

```
-> show mvrp timer
Port      Join Timer      Leave Timer      LeaveAll Timer      Periodic Timer

<b>LeaveALL Timer</b>	Displays the value of the LeaveAll Timer in milliseconds.
<b>Periodic Timer</b>	Displays the value of the Periodic Timer in seconds.

---

### **Release History**

Release 6.4.3; command was introduced.

## Related Commands

<b>mvrp timer join</b>	Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
<b>mvrp timer leave</b>	Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
<b>mvrp timer leaveall</b>	Specifies the frequency with which the LeaveAll messages are communicated.
<b>mvrp timer periodic-timer</b>	Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
<b>show mvrp port</b>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

```
show mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2] } statistics
```

---

### Syntax Definitions

*slot/port*                                The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num*                                 The number corresponding to the aggregate group.

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If no port or link aggregate is specified the MVRP statistics are displayed for all ports.
- Use the *agg\_num* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

### Examples

```
-> show mvrp port 1/21 statistics
Port 1/21:
New Received           : 0,
Join In Received      : 1526,
Join Empty Received   : 8290,
Leave Received         : 0,
In Received           : 1,
Empty Received        : 0,
Leave All Received     : 283,
New Transmitted       : 826,

---

## show mvrp last-pdu-origin

Displays the source MAC address of the last MVRP message received on specific ports or aggregates.

**show mvrp {port slot/port [- port2] | linkagg agg\_num [-agg\_num2]} last-pdu-origin**

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num* The number corresponding to the aggregate group.

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

None

### Examples

```
-> show mvrp port 1/1-3 last-pdu-origin
```

```
Port      Last PDU Origin
-----+-----
1/1       00:d0:95:ee:f4:64
1/2       00:d0:95:ee:f4:65
1/3       00:d0:95:ee:f4:66
```

```
->show mvrp port 1/21 last-pdu-origin
```

```
Port      Last PDU Origin
-----+-----
1/1       00:d0:95:ee:f4:64
```

### output definitions

---

<b>Port</b>	Displays the slot/port number.
<b>Last PDU origin</b>	The source MAC address of the last PDU message received on the specific port.

---

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**show mvrp linkagg**

Displays the MVRP configuration for a specific port or an aggregate of ports.

**show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

alaMvrpPortStatsTable  
alaMvrpPortLastPduOrigin

---

---

## show vlan registration-mode

Displays the VLAN registration operational mode.

**show vlan registration-mode**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

None

### Examples

```
-> show vlan registration-mode
VLAN dynamic registration mode : mvrp
```

#### *output definitions*

---

<b>VLAN dynamic registration mode</b>	Displays the VLAN dynamic registration mode, mvrp or <b>gvrp</b> .
---------------------------------------	--------------------------------------------------------------------

---

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[vlan registration-mode](#) Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.

### MIB Objects

alaVlanDynamicRegistrationProtocolType

---

## show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

**show mvrp {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} vlan-restrictions**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the *agg\_num* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

### Examples

```
-> show mvrp port 1/21 vlan-restrictions
```

VLAN Id	Static Registration	Restricted Registration	Restricted Applicant
1	LEARN	FALSE	FALSE
2	LEARN	FALSE	FALSE
3	LEARN	FALSE	FALSE
4	LEARN	FALSE	FALSE
5	LEARN	FALSE	FALSE
6	LEARN	FALSE	FALSE
7	LEARN	FALSE	FALSE
11	RESTRICT	FALSE	FALSE
12	RESTRICT	FALSE	FALSE
53	LEARN	TRUE	FALSE
55	LEARN	FALSE	TRUE

*output definitions*

---

<b>VLAN ID</b>	The VLAN identification number for a preconfigured VLAN that handles the MVRP traffic for this port.
<b>Static Registration</b>	Indicates if the port is restricted ( <b>RESTRICT</b> ) or not restricted ( <b>LEARN</b> ) from becoming a member of the static VLAN.
<b>Restricted Registration</b>	Indicates if the VLAN is restricted ( <b>TRUE</b> ) or not restricted ( <b>FALSE</b> ) from dynamic registration on the port.
<b>Restricted Applicant</b>	Indicates if the VLAN is restricted for advertisement from the port ( <b>TRUE</b> ) or not ( <b>FALSE</b> ).

---

**Release History**

Release 6.4.3; command was introduced.

**Related Commands**

<b>show mvrp port</b>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
<b>show mvrp linkagg</b>	Displays the MVRP configuration for a specific port or an aggregate of ports.

**MIB Objects**

```

alaMvrpPortConfigTable
  alaMvrpPortConfigRestrictedRegistrationBitmap
  alaMvrpPortConfigRestrictedApplicantBitmap
  alaMvrpPortConfigRegistrationToStaticVlan

```

---

## show vlan mvrp

Displays the list of VLANs learned through MVRP and their details.

**show vlan mvrp** [**vlan-id** | **vlan-range**]

---

### Syntax Definitions

**vlan-id** VLAN ID number you want to display (1-4094)  
**vlan-range** The VLAN ID range (e.g. 1-10)

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

None

### Examples

-> show vlan mvrp

```

                                stree    mble
vlan  type admin oper 1x1  flat  auth  ip  ipx  tag  name
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
5      mvrp  on   on   on   on   off   NA  off  off  MVRP1
6      mvrp  on   on   off  off  off   NA  off  off  MVRP12

```

### output definitions

---

<b>VLAN</b>	The VLAN ID. Use the <b>vlan</b> command to create or remove VLANs.
<b>Type</b>	The type of VLAN ( <b>std</b> , <b>vstk</b> , <b>gvrp</b> , <b>mvrp</b> , or <b>ipmv</b> )
<b>Admin</b>	VLAN administrative status: <b>on</b> enables VLAN functions to operate; <b>off</b> disables VLAN functions without deleting the VLAN. Use the <b>vlan</b> command to change the VLAN administrative status.
<b>Oper</b>	VLAN operational status: <b>on</b> (enabled) or <b>off</b> (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (e.g. router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.
<b>stree 1x1</b>	Specifies that the MVRP status for the VLAN applies when the switch is running in the 1x1 MVRP mode.
<b>stree Flat</b>	Specifies that the MVRP status for the VLAN applies when the switch is running in the flat MVRP mode.

*output definitions (continued)*

---

<b>Auth</b>	VLAN Authentication status: <b>on</b> (enabled) or <b>off</b> (disabled). Use the <b>vlan authentication</b> command to change the VLAN Authentication status.
<b>IP</b>	IP router interface status: <b>on</b> (IP interface exists for the VLAN) or <b>off</b> (no IP router interface exists for the VLAN). Use <b>the ip interface command</b> to define an IP router interface for a VLAN.
<b>mble Tag</b>	Mobile tagging status: <b>on</b> (enabled); <b>off</b> (disabled). Configured through the <b>vlan mobile-tag</b> command.
<b>Name</b>	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the VLAN description.

---

**Release History**

Release 6.4.3; command was introduced.

**Related Commands**

**mvrp maximum vlan** Configures the maximum number of dynamic VLANs that can be created by MVRP.

**MIB Objects**

```

vlanMgrVlan
vlanTable
  vlanNumber
  vlanDescription
  vlanAdmStatus
  vlanOperStatus
  vlanStatus
  vlanStpStatus
  vlanAuthentStatus
  vlanIpAddress
  vlanIpMask
  vlanIpEnacp
  vlanIpForward
  vlanIpStatus
  vlanTagMobilePortStatus

```

---

## mvrp clear-statistics

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

**mvrp** [**port** *slot/port* [-*port2*] | **linkagg** *agg\_num* [-*agg\_num2*]] **clear-statistics**

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num* The number corresponding to the aggregate group.

### Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *agg\_num* or *slot/port* parameter with this command to clear MVRP statistics for a specific port.

### Examples

```
-> mvrp clear-statistics
-> mvrp port 1/2 clear-statistics
-> mvrp linkagg 10 clear-statistics
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[show mvrp statistics](#) Displays the MVRP statistics for all the ports, aggregates, or specific ports.

### MIB Objects

```
alaMvrpGlobalClearStats
  alaMvrpPortStatsTable
  alaMvrpPortStatsClearStats
```

---

# 12 802.1AB Commands

Alcatel-Lucent's 802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of the information. The information is exchanged using the LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

Alcatel-Lucent's version of 802.1AB complies with the IEEE 802.1AB-2005 Station and Media Access Control Discovery and ANSI-TIA 1057-2006 Link Layer Discovery Protocol for Media End Point Devices.

MIB information for the 802.1AB commands is as follows:

*Filename:* IEEE\_LLDP\_Base.mib

*Module:* LLDP-MIB

*Filename:* IEEE\_LLDP\_Dot1.mib

*Module:* LLDP-EXT-DOT1-MIB

*Filename:* IEEE\_LLDP\_Dot3.mib

*Module:* LLDP-EXT-DOT3-MIB

*Filename:* ANSI\_TIA\_LLDP\_MED.mib

*Module:* LLDP-EXT-DOT3-MIB

Link Layer Discovery Protocol (LLDP) Security Mechanism in AOS prevents rogue LLDP agent from being connected to OmniSwitch. This ensures secured access to the device and the network.

LLDP Security Mechanism ensures having only one trusted LLDP agent on a network port. When more than one LLDP agent is learned on a port, the port is moved to violation state.

MIB information for the LLDP commands is as follows:

*Filename:* AlcatelINDLLDP.mib

*Module:* LLDP (IEEE802.1ab)

A summary of the available commands is listed here.

---

<b>LLDP</b>	<b>lldp destination mac-address</b> <b>lldp transmit fast-start-count</b> <b>lldp transmit interval</b> <b>lldp transmit hold-multiplier</b> <b>lldp transmit delay</b> <b>lldp reinit delay</b> <b>lldp network-policy</b> <b>lldp med network-policy</b> <b>lldp notification interval</b> <b>lldp lldpdu</b> <b>lldp notification</b> <b>lldp tlv management</b> <b>lldp tlv dot1</b> <b>lldp tlv dot3 mac-phy</b> <b>lldp tlv med</b> <b>show lldp config</b> <b>show lldp network-policy</b> <b>show lldp med network-policy</b> <b>show lldp system-statistics</b> <b>show lldp statistics</b> <b>show lldp local-system</b> <b>show lldp local -port</b> <b>show lldp local-management-address</b> <b>show lldp remote-system</b> <b>show lldp remote-system med</b>
<b>LLDP Security Mechanism</b>	<b>lldp trust-agent</b> <b>lldp trust-agent violation-action</b> <b>show lldp trusted remote-agent</b> <b>show lldp trust-agent</b>

---

Configuration procedures for 802.1AB are explained in the “Configuring 802.1AB” chapter of the *OmniSwitch AOS Release 6 Network Configuration Guide*.

## lldp destination mac-address

Sets the lldp destination mac-address sent in LLPDUs.

**lldp destination mac-address {nearest-bridge | nearest-edge}**

---

### Syntax Definitions

**nearest-bridge** Specifies the destination mac-address as 01:80:C2:00:00:0E.  
**nearest-edge** Specifies the destination mac-address as 01:20:DA:02:01:73.

### Defaults

---

parameter	default
mac-address	nearest-bridge

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **nearest-edge** MAC address is used in conjunction with the Auto Download Configuration feature to advertise the management VLAN.

### Examples

```
-> lldp destination mac-address nearest-edge  
-> lldp destination mac-address nearest-bridge
```

### Release History

Release 6.4.4; command introduced.

### Related Commands

[show lldp local-system](#) Displays local system information.

### MIB Objects

lldpDestMac

---

## lldp transmit fast-start-count

Configures the fast start count for an LLDP Media Endpoint Device (MED). The fast start count specifies the number of LLDPDUs to be sent as soon as a MED is detected by the switch. The LLDPDUs contain the LLDP MED Network Policy TLVs.

**lldp transmit fast-start-count** *num*

---

### Syntax Definitions

*num* Specifies the number of LLDPDUs to send when a MED is detected. The valid range is 1–10.

### Defaults

parameter	default
<i>num</i>	3

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The LLDP MED fast start is only applicable when the MED is detected by the switch.

### Examples

```
-> lldp transmit fast-start-count 4
```

### Release History

Release 6.4.3; command introduced.

### Related Commands

<a href="#">lldp network-policy</a>	Configures a MED Network Policy on the switch for a specific application type.
<a href="#">lldp med network-policy</a>	Associates an existing MED Network Policy with one or more LLDP ports.
<a href="#">show lldp local-system</a>	Displays local system information.

### MIB Objects

lldpXMedFastStartRepeatCount

---

## lldp transmit interval

Sets the transmit time interval for LLDPDUs. This is the amount of time the switch waits between each transmission of an LLDPDU.

**lldp transmit interval** *seconds*

---

### Syntax Definitions

*seconds*                                      The transmit interval value, in seconds. The valid range is 5–32768.

### Defaults

---

parameter	default
<i>seconds</i>	30

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command applies only to LLDP-enabled ports.
- LLDP also multiplies the transmit time interval by the transmit hold multiplier to determine the time to live (TTL) value that is advertised in the LLDPDU.

### Examples

```
-> lldp transmit interval 40
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

**lldp transmit hold-multiplier**      Sets the transmit hold multiplier value. This value is used to calculate the Time To Live (TTL) value that is advertised in an LLDPDU.

**show lldp local-system**                Displays local system information.

### MIB Objects

lldpConfiguration  
  lldpMessageTxInterval

---

## lldp transmit hold-multiplier

Sets the transmit hold multiplier value. This value is used to calculate the Time To Live (TTL) value that is advertised in an LLDPDU.

**lldp transmit hold-multiplier** *num*

---

### Syntax Definitions

*num* The transmit hold multiplier value. The valid range is 2–10.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>num</i>	4

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command applies only to LLDP-enabled ports.
- LLDP multiples the transmit hold multiplier by the transmit interval value to determine the TTL value that is advertised in an LLDPDU.

### Examples

```
-> lldp transmit hold-multiplier 6
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

- [lldp transmit interval](#) Sets the transmit time interval for LLDPDUs. This is the amount of time the switch waits between each transmission of an LLDPDU.
- [show lldp local-system](#) Displays local system information.

### MIB Objects

```
lldpConfiguration  
  lldpMessageTxHoldMultiplier
```

---

## lldp transmit delay

Sets the minimum amount of time that must elapse between successive LLDPDUs that are transmitted as the result of a value or status change in the LLDP local systems MIB.

**lldp transmit delay** *seconds*

---

### Syntax Definitions

*seconds*                                    The transmit delay value, in seconds. The valid range is 1–8192.

### Defaults

parameter	default
<i>seconds</i>	2

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command applies only to LLDP-enabled ports.
- The following formula determines the recommended transmit delay value:  
 $1 \leq \text{transmit delay} \leq (0.25 * \text{transmit interval})$ .

### Examples

```
-> lldp transmit delay 20
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

- [lldp transmit interval](#)                    Sets the transmit time interval for LLDPDUs. This is the amount of time the switch waits between each transmission of an LLDPDU.
- [show lldp local-system](#)                Displays local system information.

### MIB Objects

lldpConfiguration  
  lldpTxDelay

---

## lldp reinit delay

Sets the amount of time that must elapse before an LLDP port is re-initialized after the status for the port was disabled.

**lldp reinit delay** *seconds*

---

### Syntax Definitions

*seconds*                                   The re-initialize value, in seconds. The valid range is 1–10.

### Defaults

parameter	default
<i>seconds</i>	2

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command applies only to LLDP-enabled ports.

### Examples

```
-> lldp reinit delay 4
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

<a href="#">lldp transmit delay</a>	Sets the minimum time interval between successive LLDPDUs that are transmitted as the result of a value or status change in the LLDP local systems MIB.
<a href="#">show lldp local-system</a>	Displays local system information.

### MIB Objects

```
lldpConfiguration
  lldpReinitDelay
```

---

## lldp notification interval

Sets the amount of time that must elapse before an LLDP notification about a remote systems MIB change is generated.

**lldp notification interval** *seconds*

---

### Syntax Definitions

*seconds* The notification time interval, in seconds. The valid range is 5–3600.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command applies only to LLDP-enabled ports that also have the LLDP notification status enabled.
- Within a given notification time interval, generating more than one notification event is not allowed.

### Examples

```
-> lldp notification interval 25
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

**lldp notification** Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.

**show lldp local-system** Displays local system information.

### MIB Objects

lldpConfiguration  
lldpNotificationInterval

---

## lldp lldpdu

Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.

**lldp** {*slot/port* | *slot* / **chassis**} **lldpdu** {**tx** | **rx** | **tx-and-rx** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>chassis</b>	All ports on the switch.
<b>tx</b>	Transmits LLDPDUs.
<b>rx</b>	Receives LLDPDUs.
<b>tx-and-rx</b>	Transmits and receives LLDPDUs.
<b>disable</b>	Disables the LLDPDU status.

### Defaults

parameter	default
<b>tx</b>   <b>rx</b>   <b>tx-and-rx</b>   <b>disable</b>	<b>tx-and-rx</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the LLDPDU status is disabled, LLDPDUs are not transmitted and any that are received are dropped.
- Using the *slot* or **chassis** parameter with this command overrides the existing status configuration for any individual ports on the specified slot number or for all ports on the switch.

### Examples

```
-> lldp 1/2 lldpdu tx-and-rx
-> lldp 3 lldpdu rx
-> lldp chassis lldpdu disable
```

### Release History

Release 6.3.1; command introduced.

## Related Commands

<b>lldp notification</b>	Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.
<b>show lldp local -port</b>	Displays information about local system ports.
<b>show lldp config</b>	Displays the general LLDP configuration information for LLDP ports.

## MIB Objects

```
lldpPortConfigTable  
  lldpPortConfigPortNum  
  lldpPortConfigAdminStatus
```

---

## lldp notification

Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.

**lldp** {*slot/port* | *slot* / **chassis**} **notification** {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>chassis</b>	All switch ports.
<b>enable</b>	Enables the notification of local system MIB changes.
<b>disable</b>	Disables the notification.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
- Using the *slot* or **chassis** parameter with this command overrides the existing notification status configuration for any individual ports on the specified slot number or for all ports on the switch.

### Examples

```
-> lldp 1/2 notification enable
-> lldp 1 notification disable
```

### Release History

Release 6.3.1; command introduced.

## Related Commands

### **lldp notification interval**

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

### **lldp lldpdu**

Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.

## MIB Objects

lldpPortConfigTable

    lldpPortConfigPortNum

    lldpPortConfigNotificationEnable

---

## lldp network-policy

Configures a local Network Policy on the switch for a specific application type.

**lldp network-policy** *policy\_id* - [*policy\_id2*] **application** {**voice** | **voice-signaling** | **guest-voice** | **guest-voice-signaling** | **softphone-voice** | **video-conferencing** | **streaming-video** | **video-signaling**} **vlan** {**untagged** | **priority-tag** | *vlan-id*} [**l2-priority** *802.1p\_value*] [**dscp** *dscp\_value*]

**no lldp network-policy** *policy\_id* - [*policy\_id2*]

---

### Syntax Definitions

<i>policy_id</i> - [ <i>policy_id2</i> ]	A network policy identifier (0-31) which is associated to a port.
<b>voice</b>	Specifies a voice application type.
<b>voice-signaling</b>	Specifies a voice-signaling application type.
<b>guest-voice</b>	Specifies a guest-voice application type.
<b>guest-voice-signaling</b>	Specifies a guest-voice-signaling application type.
<b>softphone-voice</b>	Specifies a softphone-voice application type.
<b>video-conferencing</b>	Specifies a video-conferencing application type.
<b>streaming-video</b>	Specifies a streaming-video application type.
<b>video-signaling</b>	Specifies a video-signaling application type.
<b>untagged</b>	Specifies that a VLAN port is untagged.
<b>priority-tag</b>	Specifies the internal priority that would be assigned to the VLAN.
<i>vlan_id</i>	VLAN identifier. Valid range is 1–4094.
<i>802.1p_value</i>	The Layer-2 priority value assigned to the VLAN. Valid range is 0–7.
<i>dscp_value</i>	Priority value assigned to the DSCP (Differentiated Service Code Point) header. Valid range is 0–63.

### Defaults

parameter	default
<i>802.1p_value</i>	0
<i>dscp_value</i>	0

- By default the VLAN ID is configured in the voice network profile.
- By default the *802.1p\_value* is 5 for voice application.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove the configured network policy from the system.
- When a network policy is deleted, all the associated values and port bindings are also deleted.
- A maximum of 32 network policies can be configured on a single VLAN.
- Once a policy is created, the application type, VLAN ID, 802.1p, and DSCP values can be modified.
- If a network policy ID is bound to a port, it cannot be modified.
- Use a hyphen to specify a range of Policy IDs and a space to separate multiple Policy IDs in the command.
- The range for Policy IDs is supported only with the **no** form of this command.

## Examples

```
-> lldp network-policy 10 application voice vlan 20
-> lldp network-policy 11 application guest-voice-signaling vlan untagged
12-priority 3
-> lldp network-policy 20 application voice vlan priority-tag dscp 39
-> lldp network-policy 20 application voice-signaling vlan 23 12-priority 2 dscp 43
-> no lldp network-policy 10
-> no lldp network-policy 10-20
```

## Release History

Release 6.4.3; command introduced.

## Related Commands

### lldp tlv med

Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.

### show lldp network-policy

Displays the network policy details for a given policy ID.

### show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

## MIB Objects

```
aLldpXMedLocMediaPolicyTable
  alaLldpXMedLocMediaPolicyId
  alaLldpXMedLocMediaPolicyAppType
  alaLldpXMedLocMediaPolicyVlanType
  alaLldpXMedLocMediaPolicyVlanID
  alaLldpXMedLocMediaPolicyPriority
  alaLldpXMedLocMediaPolicyDscp
  alaLldpXMedLocMediaPolicyUnknown
  alaLldpXMedLocMediaPolicyTagged
  alaLldpXMedLocMediaPolicyRowStatus
```

---

## lldp med network-policy

Associates an existing network policy to a port, slot, or chassis.

**lldp** {*slot/port* | *slot* | **chassis**} **med network-policy** *policy\_id* - [*policy\_id2*]

**no lldp** {*slot/port* | *slot* | **chassis**} **med network-policy** *policy\_id* - [*policy\_id2*]

---

### Syntax Definition

<i>slot/port</i>	The slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>chassis</b>	All switch ports.
<i>policy_id</i> - [ <i>policy_id2</i> ]	A network policy identifier (0–31).

### Defaults

NA

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disassociate a network policy from a port.
- The network policy should already be configured in the system before associating it with a port.
- A maximum of 8 network policies can be associated to a port.
- Two or more network policy IDs with the same application type cannot be associated to a port.

### Examples

```
-> lldp chassis med network-policy 22
-> lldp 1 med network-policy 1-4 5 6
-> lldp 2/3 med network-policy 12
-> no lldp 2/3 med network-policy 12
```

### Release History

Release 6.4.3; command introduced.

## Related Commands

- lldp tlv med** Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
- show lldp network-policy** Displays the MED Network Policy details for a given policy ID.
- show lldp med network-policy** Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

## MIB Objects

```
alaLldpXMedLocMediaPolicyPortTable  
  alaLldpXMedLocMediaPolicyPortIfIndex  
  alaLldpXMedLocMediaPolicyId  
  alaLldpXMedLocMediaPolicyPortRowStatus
```

---

## lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

**lldp** {*slot/port* | *slot* / **chassis**} **tlv management** {**port-description** | **system-name** | **system-description** | **system-capabilities** | **management-address**} {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>port-description</b>	Enables or disables the transmission of port description TLV in LLDPDU.
<b>system-name</b>	Enables or disables the transmission of system name TLV in LLDPDU.
<b>system-description</b>	Enables or disables transmission of system description TLV in LLDPDU.
<b>system-capabilities</b>	Enables or disables transmission of system capabilities TLV in LLDPDU.
<b>management-address</b>	Enables or disables transmission of management address on per port.
<b>enable</b>	Enables management TLV LLDPDU transmission.
<b>disable</b>	Disables management TLV LLDPDU transmission.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.

### Examples

```
-> lldp 1/2 tlv management port-description enable
-> lldp 2 tlv management management-address enable
-> lldp 3 tlv management system-name disable
```

## Release History

Release 6.3.1; command introduced.

## Related Commands

<b>lldp lldpdu</b>	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
<b>show lldp local-system</b>	Displays local system information.
<b>show lldp local -port</b>	Displays local port information.
<b>show lldp remote-system</b>	Displays port information of remote system.

## MIB Objects

```
lldpPortConfigTable
  lldpLocPortPortNum
  lldpPortConfigTLVsTxEnable
lldpConfigManAddrTable
  lldpConfigManAddrPortsTxEnable
```

---

## lldp tlv dot1

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

**lldp** {*slot/port* | *slot* / **chassis**} **tlv dot1** {**port-vlan** | **vlan-name**} {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>port-vlan</b>	Enables or disables transmission of port VLAN TLV in LLDPDU.
<b>vlan-name</b>	Enables or disables transmission of VLAN name TLV in LLDPDU.
<b>enable</b>	Enables 802.1 TLV LLDPDU transmission.
<b>disable</b>	Disables 802.1 TLV LLDPDU transmission.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.
- If one TLV is included then the other TLV is automatically included when you use this command.

### Examples

```
-> lldp 5/1 tlv dot1 port-vlan enable
-> lldp 3 tlv dot1 vlan-name enable
-> lldp 3 tlv dot1 vlan-name disable
```

### Release History

Release 6.3.1; command introduced.

## Related Commands

```

---

## lldp tlv dot3 mac-phy

Configures whether or not 802.3 TLVs are included in transmitted LLDPDUs.

```
lldp {slot/port | slot / chassis} tlv dot3 mac-phy {enable | disable}
```

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>chassis</b>	All ports on the switch.
<b>enable</b>	Enables the transmission of 802.3 TLVs in LLDPDUs.
<b>disable</b>	Disables the transmission of 802.3 TLVs in LLDPDUs.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The ports specified with this command must already be configured to transmit LLDPDUs.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.

### Examples

```
-> lldp 2/4 tlv dot3 mac-phy enable
-> lldp 2 tlv dot3 mac-phy disable
```

### Release History

Release 6.3.1; command introduced.

## Related Commands

<b>lldp lldpdu</b>	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.
<b>lldp tlv management</b>	Configures whether or not management TLVs are included in transmitted LLDPDUs.
<b>lldp tlv dot1</b>	Configures whether or not 802.1 TLVs are included in transmitted LLDPDUs.
<b>show lldp statistics</b>	Displays per port statistics.

```
lldpPortConfigTable  
  lldpPortConfigPortNum  
lldpXdot3PortConfigTable  
  lldpXdot3PortConfigTLVsTxEnable
```

---

## lldp tlv med

Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.

**lldp** {*slot/port* | *slot* / **chassis**} **tlv med** {**power** | **capability** | **network policy**} {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>chassis</b>	All ports on the switch.
<b>power</b>	Includes the extended POE TLV in transmitted LLDPDUs.
<b>capability</b>	Includes the Capabilities TLV in transmitted LLDPDUs.
<b>network policy</b>	Includes the Network Policy TLV in transmitted LLDPDUs.
<b>enable</b>	Enables the transmission of LLDP-MED TLV in LLDPDUs.
<b>disable</b>	Disables the transmission of LLDP-MED TLV in LLDPDUs.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The ports specified with this command must already be configured to transmit LLDPDUs.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.
- The **lldp tlv med power** version of this command applies only to PoE units.
- Before enabling the Power MED TLV, use the **lanpower start** command to activate PoE on a port or on all ports in a specific slot.

### Examples

```
-> lldp 4/4 tlv med power enable
-> lldp 4/3 tlv med capability enable
-> lldp 4 tlv med power disable
-> lldp 4 tlv med network-policy enable
-> lldp chassis tlv med network-policy enable
```

## Release History

Release 6.3.1; command introduced.  
Release 6.4.3; **network policy** option added.

## Related Commands

<b>lldp lldpdu</b>	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.
<b>lldp tlv management</b>	Configures whether or not management TLVs are included in transmitted LLDPDUs.
<b>lldp tlv dot1</b>	Configures whether or not 802.1 TLVs are included in transmitted LLDPDUs.
<b>lldp tlv dot3 mac-phy</b>	Configures whether or not 802.3 TLVs are included in transmitted LLDPDUs.
<b>show lldp med network-policy</b>	Displays the MED Network Policy configuration.

## MIB Objects

```
lldpPortConfigTable  
    lldpPortConfigPortNum  
lldpXMedPortConfigTable  
    lldpXMedPortConfigTLVsTxEnable
```

---

## show lldp config

Displays the general LLDP configuration information for LLDP ports.

**show lldp** {*slot* / *slot/port*} **config**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

### Defaults

By default, a list of all LLDP ports with their configuration parameters is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

### Examples

-> show lldp config

Slot/Port	Admin Status	Notify Trap	Std TLV Mask	Mgmt Address	802.1 TLV	802.3 Mask	MED Mask
2/1	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/2	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/3	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/4	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/5	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00

### output definitions

---

<b>Slot/Port</b>	The LLDP slot and port number.
<b>Admin Status</b>	Indicates the Administrative status of the LLDP port. The options are - <b>Disabled</b> , <b>Rx</b> , <b>Tx</b> , and <b>Rx+Tx</b> .
<b>Notify Trap</b>	Indicates if the Notify Trap feature is disabled or enabled on a particular port
<b>Std TLV Mask</b>	The standard TLV mask set for the port.
<b>Mgmt Address</b>	Indicates whether transmission of the per port IPv4 management address is enabled or disabled.
<b>802.1 TLV</b>	Indicates whether 802.1 TLV status is enabled or disabled on the LLDP port.

*output definitions*

---

<b>802.3 Mask</b>	The standard 802.3 mask set for the port.
<b>MED Mask</b>	The standard MED mask set for the port.

---

**Release History**

Release 6.4.3; command introduced.

**Related Commands**

<b>lldp lldpdu</b>	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.

---

## show lldp network-policy

Displays the MED Network Policy details for a given policy ID.

**show lldp network-policy** [*policy\_id*]

---

### Syntax Definitions

*policy\_id* Policy identifier for a network policy definition. Valid range is between 0 and 31.

### Defaults

By default, all configured policies are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Network policy should be configured on the system before using this command.
- Enter a policy ID with this command to display information for a specific policy.

### Examples

```
-> show lldp network-policy
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan
```

Network Policy ID	Application Type	Vlan Id	Layer2 Priority	DSCP Value
1	voice	4000	7	33
12	guest-voice	-	-	44
21	streaming-voice	0	4	11
31	guest-voice-signaling	23	2	1

```
-> show lldp network-policy 1
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan
```

Network Policy ID	Application Type	Vlan Id	Layer2 Priority	DSCP Value
1	voice	4000	7	33

*output definitions*

---

<b>Network Policy ID</b>	Policy identifier for a network policy definition.
<b>Application Type</b>	Indicates the type of application configured on the port or VLAN.
<b>VLAN ID</b>	The VLAN ID assigned to the port on which the network policy is configured.
<b>Layer2 Priority</b>	Layer 2 priority to be used for the specified application type.
<b>DSCP Value</b>	DSCP value to be used to provide Diffserv node behavior for the specified application type.

---

**Release History**

Release 6.4.3; command introduced.

**Related Commands**

[lldp network-policy](#) Configures a local network policy on a switch for an application type.

```

---

## show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

**show lldp** [*slot* / *slot/port*] **med network-policy**

---

### Syntax Definitions

<i>slot</i>	Specifies the slot number on a specific module or chassis.
<i>slot/port</i>	Specifies the slot number for the module and physical port number on that module (for example 3/1 specifies port 1 of slot 3).

### Defaults

By default, all ports with associated policies are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Network policy should be configured on the system before using this command.
- Enter a slot or slot/port number with this command to display information for a specific slot or port.

### Examples

```
-> show lldp med network-policy
```

slot/port	Network Policy ID
1/1	1 3 5 7 21 23 30 31
1/2	1 2 3 4 7 8 9 10
.	
.	
.	
2/1	1 3 5
.	
.	

```
-> show lldp 1/1 med network-policy
```

Legend: 0 Priority Tagged Vlan  
- Untagged Vlan

Slot/ Port	Network Policy ID	Application Type	Vlan Id	Layer2 Priority	DSCP Value
1/1	1	guest-voice-signaling	-	-	0

*output definitions*

---

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>Network Policy ID</b>	Policy identifier for a network policy definition.
<b>Application Type</b>	Indicates the type of application configured on the port or VLAN.
<b>VLAN ID</b>	The VLAN ID assigned to the port on which the network policy is configured.
<b>Layer2 Priority</b>	Layer 2 priority to be used for the specified application type.

---

## show lldp system-statistics

Displays system-wide statistics.

**show lldp system-statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show lldp system-statistics
Local LLDP Agent System Statistics:
  Remote Systems Last Change = 0 days 0 hours 3 minutes and 10 seconds,
  Remote Systems MIB Inserts = 2,
  Remote Systems MIB Deletes = 0,
  Remote Systems MIB Drops = 0,
  Remote Systems MIB Age Outs = 0
```

#### *output definitions*

---

<b>Remote Systems Last Change</b>	The last change recorded in the tables associated with the remote system.
<b>Remote Systems MIB Inserts</b>	The total number of complete inserts in the tables associated with the remote system.
<b>Remote Systems MIB Deletes</b>	The total number of complete deletes in tables associated with the remote system.
<b>Remote Systems MIB Drops</b>	The total number of LLDPDUs dropped because of insufficient resources.
<b>Remote Systems MIB Age Outs</b>	The total number of complete age-outs in the tables associated with the remote system.

---

### Release History

Release 6.3.1; command introduced.

## Related Commands

### **lldp notification**

Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.

### **lldp notification interval**

Sets the amount of time that must elapse before an LLDP notification about a remote systems MIB change is generated.

## MIB Objects

lldpStatistics

lldpStatsRemTablesLastChangeTime

lldpStatsRemTablesInserts

lldpStatsRemTablesDeletes

lldpStatsRemTablesDrops

lldpStatsRemTablesAgeouts

---

## show lldp statistics

Displays per port statistics.

**show lldp** [*slot/slot/port*] **statistics**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

### Defaults

By default, statistics are displayed for all LLDP ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter a slot or slot/port number to display statistics for a specific slot or port.
- If the statistics are zero they are not displayed.

### Examples

```
-> show lldp statistics
```

Slot/Port	Tx	LLDPDU Rx	Errors	Discards	TLV Unknown	Device Discards	Ageouts
1/23	52	0	0	0	0	0	0
2/47	50	50	0	0	0	0	0
2/48	50	50	0	0	0	0	0

#### output definitions

---

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>LLDPDU Tx</b>	The total number of LLDPDUs transmitted on the port.
<b>LLDPDU Rx</b>	The total number of valid LLDPDUs received on the port.
<b>LLDPDU Errors</b>	The total number of invalid LLDPDUs discarded on the port.
<b>LLDPDU Discards</b>	The total number of LLDPDUs discarded on the port.
<b>TLV Unknown</b>	The total number of unrecognized LLDP TLVs on the port.
<b>TLV Discards</b>	The total number of LLDP TLVs discarded on the port.
<b>Device Ageouts</b>	The total number of complete age-outs on the port.

## show lldp local-system

Displays local system information.

**show lldp local-system**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show lldp local-system
Local LLDP Agent System Data:
  Chassis ID Subtype      = 4 (MAC Address),
  Chassis ID              = 00:d0:95:e9:c9:2e,
  System Name             = Kite2_Stack_of_2,
  System Description      = 6.3.1.636.R01 Development, September 07, 2007.,
  Capabilities Supported  = Bridge, Router,
  Capabilities Enabled    = Bridge, Router,
  LLDPDU Transmit Interval = 30 seconds,
  TTL Hold Multiplier     = 4,
  LLDPDU Transmit Delay   = 2 seconds,
  Reinitialization Delay  = 2 seconds,
  MIB Notification Interval = 5 seconds,
  Fast Start Count        = 4,
  Management Address Type = 1 (IPv4),
  Management IP Address   = 10.255.11.100,
```

#### *output definitions*

---

<b>Chassis ID Subtype</b>	The subtype that describe chassis ID.
<b>Chassis ID</b>	The chassis ID (MAC address).
<b>System Name</b>	The name of the system.
<b>System Description</b>	The description of the system.
<b>Capabilities Supported</b>	The capabilities of the system.
<b>Capabilities Enabled</b>	The enabled capabilities of the system.
<b>LLDPDU Transmit Interval</b>	The LLDPDU transmit interval.
<b>TTL Hold Multiplier</b>	The hold multiplier used to calculate TTL.

*output definitions (continued)*

---

<b>LLDPDU Transmit Delay</b>	The minimum transmit time between successive LLDPDUs.
<b>Reinitialization Delay</b>	The minimum time interval before the reinitialization of local port objects between port status changes.
<b>MIB Notification Interval</b>	The minimum time interval between consecutive notifications of local system MIB change.
<b>Fast Start Count</b>	Specifies the number of LLDPDUs to be sent as soon as a MED is detected by system.
<b>Management Address Type</b>	The type of management address used in LLDPDU.
<b>Management IP Address</b>	The management IP address. This will be the Loopback0 IP address if configured, otherwise it is the first IP interface configured on the switch.

---

**Release History**

Release 6.3.1; command introduced.

Release 6.4.3; **Fast Start Count** field added to output.

**Related Commands**

<b>lldp transmit fast-start-count</b>	Configures the fast start count for an LLDP Media Endpoint Device (MED). The fast start count specifies the number of LLDPDUs to be sent as soon as a MED is detected by the switch. The LLDPDUs contain the LLDP MED Network Policy TLVs.
<b>lldp reinit delay</b>	Sets the amount of time that must elapse before an LLDP port is re-initialized after the status for the port was disabled.
<b>lldp transmit hold-multiplier</b>	Sets the transmit hold multiplier value. This value is used to calculate the Time To Live (TTL) value that is advertised in an LLDPDU.
<b>lldp transmit delay</b>	Sets the minimum amount of time that must elapse between successive LLDPDUs that are transmitted as the result of a value or status change in the LLDP local systems MIB.

---

## show lldp local-port

Displays local LLDP port information.

**show lldp** [*slot/port* | *slot*] **local-port**

---

### Syntax Definitions

*slot/port* Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*slot* The slot number for a specific module.

### Defaults

By default, a list of all LLDP ports is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

### Examples

```
-> show lldp local-port
Local Slot 1/Port 1 LLDP Info:
  Port ID           = 1001 (Locally assigned),
  Port Description  = Alcatel 1/1 6.3.1.636.R01,
Local Slot 1/Port 2 LLDP Info:
  Port ID           = 1002 (Locally assigned),
  Port Description  = Alcatel 1/2 6.3.1.636.R01,
.
.
.
Local Slot 2/Port 48 LLDP Info:
  Port ID           = 2048 (Locally assigned),
  Port Description  = Alcatel 2/48 6.3.1.636.R01,
```

#### *output definitions*

---

<b>Port ID</b>	The port ID (Port MAC).
<b>Port Description</b>	The description of the port (which includes the port number and the AOS version).

---

### Release History

Release 6.3.1; command introduced.

## Related Commands

### [lldp tlv management](#)

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

### [lldp tlv dot1](#)

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

## MIB Objects

```

---

## show lldp local-management-address

Displays the local management address information.

```
show lldp local-management-address
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show lldp local-management-address
Local LLDP Agent Management Address:
  Management Address Type      = 1 (IPv4),
  Management IP Address        = 10.255.11.100
```

#### *output definitions*

---

<b>Management Address Type</b>	The address type used to define the interface number (IPv4 or IPv6).
<b>Management IP Address</b>	The management IP address. The Loopback0 IP address is configured for the management IP address to be transmitted.

---

### Release History

Release 6.3.1; command introduced.

### Related Commands

## show lldp remote-system

Displays remote system information for a single port or all ports on a slot.

**show lldp** [*slot/port* | *slot*] **remote-system**

---

### Syntax Definitions

*slot/port* Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*slot* The slot number for a specific module.

### Defaults

By default, a list of all LLDP ports is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

### Examples

```
-> show lldp remote-system
Remote LLDP Agents on Local Slot/Port 1/22:
  Remote ID 1:
    Chassis ID Subtype      = 4 (MAC Address),
    Chassis ID              = 00:d0:95:ea:7c:3a,
    Port ID Subtype         = 3 (MAC address),
    Port ID                 = 00:d0:95:ea:7c:45,
    Port Description        = (null),
    System Name             = (null),
    System Description      = (null),
    Capabilities Supported  = Bridge, Router,
    Capabilities Enabled    = Bridge, Router,
    MED Device Type         = Network Connectivity,
    MED Capabilities        = Capabilities | Power via MDI-PSE (09),
    MED Extension TLVs Present = Network Policy, Inventory Management,
    Remote port MAC/PHY AutoNeg = Supported, Enabled, Capability 0x6c01,
    Mau Type=1000BaseTFD - Four-pair Category 5 UTP, full duplex mode
```

#### *output definitions*

---

<b>Remote LLDP Agents on Local Slot/Port</b>	The Slot number to which the remote system entry is associated and the physical port number on that module.
<b>Chassis ID Subtype</b>	The sub type that describes chassis ID.
<b>Chassis ID</b>	The chassis ID (MAC address).
<b>Port ID Subtype</b>	The sub type that describes port ID

*output definitions (continued)*

---

<b>Port ID</b>	The port ID (Port MAC).
<b>Port Description</b>	The description of the port (which includes the port number and the AOS version).
<b>System Name</b>	The name of the system.
<b>System Description</b>	The description of the system.
<b>Capabilities Supported</b>	The capabilities of the system such as bridge or router.
<b>Capabilities Enabled</b>	The enabled capabilities of the system.
<b>MED Device Type</b>	The type of device such as Network Connectivity or Endpoint Device.
<b>MED Capabilities</b>	MED capabilities supported.
<b>MED Extension TLVs Present</b>	MED Extension TLVs present.
<b>Remote port MAC/PHY AutoNeg</b>	The MAC/PHY settings of the remote port such as speed, duplex, and auto-negotiation.

## show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

**show lldp** [*slot/port* | *slot*] **remote-system** [**med** {**network-policy** | **inventory**}]

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>network-policy</b>	Display network-policy TLVs from remote Endpoint Devices
<b>inventory</b>	Display inventory management TLVs from remote Endpoint Devices

### Defaults

By default, a list of all LLDP ports is displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

### Examples

```
-> show lldp 1/22 remote-system med network-policy
Slot/ Remote  Application      Unknown   Tagged   Vlan   Layer2   DSCP
Port  ID      Type             Policy Flag Flag    Id      Priority  Value
-----+-----+-----+-----+-----+-----+-----+-----
1/22  1       Voice(01)        Defined   Untagged 345     4         34
1/22  2       Guest Voice(4)   Defined   Untagged 50      3         46
```

#### output definitions

---

<b>Slot/Port</b>	The Slot number to which the remote system entry is associated and the physical port number on that module.
<b>Remote ID</b>	The Index of the Remote Device.
<b>Application Type</b>	The Application type of the peer entity. 1. Voice 2. Voice Signaling 3. Guest Voice 4. Guest Voice Signaling 5. Softphone Voice 6. Video Conferencing 7. Streaming Video 8. Video Signaling

*output definitions (continued)*

---

<b>Unknown Policy Flag</b>	Whether the network policy for the specified application type is currently defined or unknown.
<b>Tagged Flag</b>	Whether the specified application type is using a <b>tagged</b> or an <b>untagged</b> VLAN.
<b>VLAN ID</b>	The VLAN identifier (VID) for the port.
<b>Layer 2 Priority</b>	Layer 2 priority to be used for the specified application type.
<b>DSCP Value</b>	DSCP value to be used to provide Diffserv node behavior for the specified application type.

---

```
-> show lldp 1/22 remote-system med inventory

```

---

## lldp trust-agent

Enables or disables the security mechanism globally (chassis level) or for a slot or a single port. By enabling LLDP security mechanism on a port, LLDP CMM task brings the LLDP status of the port as trusted and monitors the port for any LLDP security violation.

**lldp** {*slot/port* | *slot* | **chassis**} **trust-agent** {**enable** | **disable**} [**chassis-id-subtype** {**chassis-component** | **interface-alias** | **port-component** | **mac-address** | **network-address** | **interface-name** | **locally-assigned** | **any**}]

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for the module (for example, 3 specifies slot 3)
<b>chassis</b>	Specifies all the ports in the chassis.
<b>enable</b>	Enables LLDP security mechanism.
<b>disable</b>	Disables LLDP security mechanism.
<b>chassis-component</b>	The chassis component is used for validating the remote agent.
<b>interface-alias</b>	The alias configured for the interface is used for validating the remote agent.
<b>port-component</b>	The port component is used for validating the remote agent.
<b>mac-address</b>	The MAC address is used for validating the remote agent.
<b>network-address</b>	The network address is used for validating the remote agent.
<b>interface-name</b>	The interface name is used for validating the remote agent.
<b>locally-assigned</b>	The locally assigned component is used for validating the remote agent, that is the chassis information, which can be locally assigned (the local configuration)
<b>any</b>	The remote agent with any chassis ID sub type is accepted as a trust agent.

### Defaults

'any' - If the chassis ID sub type is not configured for validating the remote agent, by default, the first remote agent is accepted as a trust agent considering any of the chassis ID sub types.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- By enabling security on chassis/slot level, the ports that come under the respective level are monitored for any LLDP security violation.
- If the chassis ID sub type is not configured for validating the remote agent, then the LLDP learns the first remote agent with available chassis ID TLV (Time, Length, Value) received in the PDU.
- After a link up is received on a LLDP security enabled port, LLDP CMM waits for three times the LLDP timer interval (30 seconds). If no LLDP PDU is received after link up that has no remote agent, the port is moved to a violation state.
- If a trusted remote agent already exists, and if no LLDP remote agent is learned even after three times the LLDP timer interval (30 seconds), the port is moved to a violation state. If a new LLDP remote agent is learned after the link toggle, then the port is moved to a violation state.
- If the same chassis ID and port ID already exist in the trusted remote agent database but on a different port, then the port remote agent is learned and the port is moved to a violation state. If a new LLDP remote agent is learned on a port that has a trusted LLDP remote agent, then the port is moved to a violation state.

## Examples

```
-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype chassis-component
```

## Release History

Release 6.4.4; command introduced.

## Related Commands

<a href="#">lldp trust-agent violation-action</a>	Sets the action to be performed when a violation is detected.
<a href="#">show lldp trusted remote-agent</a>	Displays information on trusted remote-agents.
<a href="#">show lldp trust-agent</a>	Displays information on local LLDP agent or port.

## MIB Objects

```
alaLldpTrustAdminStatus
  alaLldpTrustChassisIdSubType
```

---

## lldp trust-agent violation-action

Sets the action to be performed when a violation is detected.

**lldp** {*slot/port/ slot* | **chassis**} **trust-agent violation-action** {**trap-and-shutdown** | **trap** | **shutdown**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for the module (for example, 3 specifies slot 3)
<b>chassis</b>	All switch ports.
<b>trap-and-shutdown</b>	Shuts down the port and sends a trap notification when a violation is detected.
<b>trap</b>	Sends a trap notification when a violation is detected.
<b>shutdown</b>	Shuts down the port when a violation is detected.

### Defaults

By default, trust agent violation action is set to 'trap'.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the port is in a shutdown state, clear the violation on the port by using the command “**interfaces slot[/port[-port2]] clear-violation-all**”
- Clearing the violation on a port does not clear the trusted remote agent existing on that port. To clear the trusted remote agent, disable the LLDP security mechanism on the port.
- If the port is in a shutdown state due to violation and the port link is toggled, only the link goes up. The port still remains in the violation state and the trusted remote agent existing on that port is not cleared.

### Examples

```
-> lldp chassis trust-agent violation-action trap
-> lldp 3 trust-agent violation-action shutdown
```

### Release History

Release 6.4.4; command introduced.

**Related Commands****lldp trust-agent**

Sets the status of trust admin status for a port.

**show lldp trusted remote-agent**

Displays information on trusted remote-agents.

**show lldp trust-agent**

Displays information on local LLDP agent or port.

**MIB Objects**`alaLldpTrustAction`

---

## show lldp trusted remote-agent

Displays information on trusted remote-agents.

**show lldp** [*num* | *slot/port*] **trusted remote-agent**

---

### Syntax Definitions

<i>num</i>	The slot number for the module (for example, 3 specifies slot 3)
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the slot/port or slot parameter to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trusted remote-agent** command output.

### Examples

```
-> lldp chassis trust-agent enable
-> lldp chassis trust-agent chassis-id-subtype mac-address
-> show lldp trusted remote-agent
```

```
Trusted Remote LLDP Agents on Local Slot/Port: 1/7
  Chassis ID Subtype      = 4 (MAC Address),
  Chassis ID              = 00:e0:b1:7a:e6:3c,
  Port ID Subtype         = 7 (Locally assigned),
  Port ID                  = 1017
```

#### *output definitions*

---

<b>Trusted Remote LLDP Agents on Local Slot/Port</b>	The slot number to which the remote trusted agent is associated and the physical port number on that module.
<b>Chassis ID Subtype</b>	The sub type that describes the chassis ID.
<b>Chassis ID</b>	The chassis ID (MAC address).
<b>Port ID Subtype</b>	The sub type that describes port ID.
<b>Port ID</b>	The port ID (Port MAC).

---

## Release History

Release 6.4.4; command introduced.

## Related Commands

[lldp trust-agent](#)

Sets the status of trust admin status for a port.

[lldp trust-agent violation-action](#)

Sets the action to be performed when a violation is detected.

[show lldp trust-agent](#)

Displays information on local LLDP agent/port.

## MIB Objects

N/A

---

## show lldp trust-agent

Displays information of the local LLDP agent or port.

**show lldp** [*slot* | *slot/port*] **trust-agent**

---

### Syntax Definitions

*slot* The slot number for the module (for example, 3 specifies slot 3)

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the *slot/port* or *num* (slot number) values to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trust-agent** command output correctly.
- If LLDP security is disabled this command correctly displays the 'Admin Status' as 'Disabled'; however the other output parameters will display their default values.

### Examples

```
-> lldp chassis trust-agent enable
```

```
-> lldp chassis trust-agent chassis-id-subtype chassis-component
```

```
-> show lldp trust-agent
```

Slot/Port	Admin Status	Violation Action	Violation Status	Chassis Subtype
1/1	Enabled	Trap Only	Trusted	1(Chassis Component)
1/2	Enabled	Trap Only	Trusted	1(Chassis Component)
1/3	Enabled	Trap Only	Trusted	1(Chassis Component)
1/4	Disabled	Shutdown	Violated	1(Chassis Component)
1/5	Enabled	Shutdown	Trusted	1(Chassis Component)
1/6	Enabled	Trap-and-Shutdown	Trusted	1(Chassis Component)
1/7	Disabled	Trap-and-Shutdown	Violated	1(Chassis Component)
1/8	Enabled	Trap Only	Trusted	1(Chassis Component)
1/9	Enabled	Trap Only	Trusted	1(Chassis Component)
1/10	Enabled	Trap Only	Trusted	1(Chassis Component)

*output definitions*

---

<b>Slot/Port</b>	The LLDP slot and port number.
<b>Admin Status</b>	Indicates the administrative status of the LLDP port, <b>Enabled</b> or <b>Disabled</b>
<b>Violation Action</b>	Indicates the action performed when a violation is detected. The options are - <b>Trap Only</b> , <b>Trap-and-Shutdown</b> , and <b>Shutdown Only</b> .
<b>Violation Status</b>	The violation status of the port, <b>Trusted</b> or <b>Violated</b>
<b>Chassis Subtype</b>	The sub type that describes the chassis ID.

---

**Release History**

# 13 Interswitch Protocol Commands

Alcatel-Lucent Interswitch Protocols (AIP) are used to discover and advertise adjacent switch information. Only one protocol is supported:

- Alcatel-Lucent Mapping Adjacency Protocol (AMAP), used to discover the topology of OmniSwitches and Omni Switch/Routers (Omni S/R).

This chapter includes descriptions of AMAP commands.

MIB information for AMAP commands is as follows:

*Filename:* alcatelIND1InterswitchProtocol.MIB  
*Module:* ALCATEL-IND1-INTERSWITCH-PROTOCOL-MIB

A summary of the available commands is listed here:

---

<b>Mapping Adjacency Protocol</b>	<b>amap</b>
	<b>amap discovery time</b>
	<b>amap common time</b>
	<b>show amap</b>

---

## amap

Enables or disables the Alcatel-Lucent Mapping Adjacency Protocol (AMAP) on the switch. AMAP discovers adjacent switches by sending and responding to Hello update packets on active Spanning Tree ports.

**amap {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables AMAP.
<b>disable</b>	Disables AMAP.

### Defaults

By default, AMAP is enabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Adjacent switches are defined as those having a Spanning Tree path between them and no other switch between them on the same Spanning Tree path that has AMAP enabled.

### Examples

```
-> amap disable  
-> amap enable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>amap discovery time</b>	Sets the discovery transmission time interval used by active Spanning Tree ports in the discovery transmission state.
<b>amap common time</b>	Sets the common transmission time interval used by active Spanning Tree ports in the common transmission state.
<b>show amap</b>	Displays adjacent switches and associated MAC addresses, ports, VLANs, and IP addresses.

### MIB Objects

aipAMAPstate

---

## amap discovery time

Sets the discovery transmission time interval. In the discovery transmission state, an active port sends AMAP Hello packets to detect adjacent switches. The discovery transmission time specifies the number of seconds to wait between each Hello packet transmission.

**amap discovery** [**time**] *seconds*

---

### Syntax Definitions

*seconds* Discovery transmission time value, in seconds (1–65535). Do not use commas in the value.

### Defaults

By default, the discovery transmission time is set to 30 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use of the **time** command keyword is optional.
- When AMAP is enabled, all active Spanning Tree ports start out in the discovery transmission state.
- Ports that receive Hello packets before three discovery transmission times expire, send a Hello reply and transition to the common transmission state.
- Ports that do not receive Hello packets before three discovery transmission times expire, revert to the passive reception state.
- Ports in the passive reception state do not send Hello packets and do not use any timer to determine how long to wait for Hello packets.
- The discovery transmission time value is also used by ports in the common transmission state to determine how long to wait for Hello packets (see [page 13-5](#)).

### Examples

```
-> amap discovery 1200
-> amap discovery time 600
```

### Release History

Release 6.1; command was introduced.

**Related Commands**

<b>amap</b>	Enables (default) or disables AMAP on a switch.
<b>amap common time</b>	Sets the common transmission time interval used by active Spanning Tree ports in the common transmission state.
<b>show amap</b>	Displays adjacent switches and associated MAC addresses, ports, VLANs, and IP addresses.

**MIB Objects**

aipAMAPdisctime

---

## amap common time

Sets the common phase transmission time interval. In the common transmission state, an active port sends AMAP Hello packets to determine adjacent switch failures and disconnects. The common transmission time specifies the number of seconds to wait between each Hello packet transmission.

**amap common** [**time**] *seconds*

---

### Syntax Definitions

*seconds* Common transmission time value in seconds (1–65535). Do not use commas in the value.

### Defaults

By default, the common transmission time is set to 300 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use of the **time** command keyword is optional.
- To avoid synchronization with adjacent switches, the common transmission time is jittered randomly by plus or minus ten percent. For example, if the default time is used (300 seconds), the jitter is plus or minus 30 seconds.
- The common transmission time value is only used by ports in the common transmission state.
- If a Hello packet is received from an adjacent switch before the common transmission time has expired, the switch sends a Hello reply and restarts the common transmission timer.
- A port reverts to the discovery transmission state if a Hello response is not received after the discovery time interval (see [page 13-3](#)) has expired.

### Examples

```
-> amap common 1200
-> amap common time 600
```

### Release History

Release 6.1; command was introduced.

**Related Commands**

<b>amap</b>	Enables (default) or disables AMAP on a switch.
<b>amap discovery time</b>	Sets the discovery transmission time interval used by the active Spanning Tree ports in the discovery transmission state.
<b>show amap</b>	Displays adjacent switches and associated MAC addresses, ports, VLANs, and IP addresses.

**MIB Objects**

aipAMAPcommontime

---

## show amap

Displays adjacent switches and associated MAC addresses, ports, VLANs, IP addresses, and system names.

**show amap**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Remote switches that stop sending Hello packets and are connected to an AMAP switch via a hub may take up to two times the common transmission time to age out of the AMAP database, and no longer appear in this show command display.

### Examples

```
-> show amap
AMAP is currently enabled,
AMAP Common Phase Timeout Interval (seconds) = 300,
AMAP Discovery Phase Timeout Interval (seconds) = 30
```

```
Remote Host Description = falconCmm
Remote Host Base MAC = 00:00:00:00:00:00
Local Interface = 1/2, VLAN = 200
Remote Interface = 3/1, VLAN = 200
Remote IP Address Configured = 1
2.0.0.10
```

```
Remote Host Description = falconCmm
Remote Host Base MAC = 00:d0:95:6b:09:40
Local Interface = 3/1, VLAN = 1
Remote Interface = 6/1, VLAN = 1
Remote IP Address Configured = 1
2.0.0.11
```

### *output definitions*

---

<b>AMAP is currently</b>	The AMAP status: <b>enabled</b> (default) or <b>disabled</b> . Use the <b>amap</b> command to change the AMAP status for the switch.
<b>AMAP Common Phase Timeout Interval (seconds)</b>	The number of seconds to wait between each Hello packet transmission during the common phase. Use the <b>amap common time</b> command to change this value.

---

*output definitions (continued)*

---

<b>AMAP Discovery Phase Time-out Interval (seconds)</b>	The number of seconds to wait between each Hello packet transmission during the discovery phase. Use the <b>amap discovery time</b> command to change this value.
<b>Remote Host Description</b>	The system name for the adjacent switch.
<b>Remote Host Base MAC</b>	The chassis base MAC address for the adjacent switch.
<b>Local Interface</b>	The local switch port/VLAN that received the AMAP packet.
<b>Remote Interface</b>	The adjacent switch port/VLAN that sent the AMAP packet.
<b>Remote IP Address Configured</b>	The number of IP addresses configured on the adjacent switch. The actual IP address values are listed below this field.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>amap</b>	Enables (default) or disables AMAP on a switch.
<b>amap discovery time</b>	Sets the discovery transmission time interval used by active Spanning Tree ports in the discovery transmission state.
<b>amap common time</b>	Sets the common transmission time interval used by the active Spanning Tree ports in the common transmission state.

---

# 14 IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- Address Resolution Protocol (ARP)—Used to match the IP address of a device with its physical (MAC) address.
- Internet Control Message Protocol (ICMP)—Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the [ping](#) command used to determine if hosts are online.
- Transmission Control Protocol (TCP)—A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.
- User Datagram Protocol (UDP)—A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.
- Web Cache Communication Protocol (WCCP)—It provides a mechanism to transparently redirect traffic flows to a cluster of cache servers. The WCCPv2 enabled routers would redirect the traffic on configured protocol (TCP/UDP) ports to the cache engine instead of the intended hosts directly.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

---

**Note.** Packets can be forwarded using IP if all devices are on the same VLAN, or if IP interfaces are created on multiple VLANs to enable routing of packets. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: [Chapter 17, “RIP Commands,”](#) [Chapter 22, “OSPF Commands.”](#) For more information on VLANs and RIP see the applicable chapter(s) in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide*.

---

MIB information for the IP commands is as follows:

*Filename:* IpForward.mib  
*Module:* IpForward

*Filename:* Ip.mib  
*Module:* Ip

*Filename:* AlcatelIND1Ip.mib  
*Module:* alcatelIND1IPMIB

*Filename:* AlcatelIND1Iprm.mib

---

## ip interface

Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

**ip interface** *name* [**address** *ip\_address*] [**mask** *subnet\_mask*] [**admin** [**enable** | **disable**]] [**vlan** *vid*] [**forward** | **no forward**] [**local-proxy-arp** | **no local-proxy-arp**] [**eth2** | **snap**] [**primary** | **no primary**]

**no ip interface** *name*

---

### Syntax Definitions

<i>name</i>	Text string up to 20 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. “Alcatel-Lucent Marketing”). Note that this value is case sensitive.
<i>ip_address</i>	An IP host address (e.g. 10.0.0.1, 171.15.0.20) to specify the IP router network.
<i>subnet_mask</i>	A valid IP address mask (e.g., 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.
<b>enable</b>	Enables the administrative status for the IP interface.
<b>disable</b>	Disables the administrative status for the IP interface.
<i>vid</i>	An existing VLAN ID number (1–4094).
<b>forward</b>	Enables forwarding of IP frames to other subnets.
<b>no forward</b>	Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.
<b>local-proxy-arp</b>	Enables Local Proxy ARP on the specified interface.
<b>no local-proxy-arp</b>	Disables Local Proxy ARP on the specified interface.
<b>eth2</b>	Specifies Ethernet-II encapsulation.
<b>snap</b>	SNAP encapsulation.
<b>primary</b>	Designates the specified IP interface as the primary interface for the VLAN.
<b>no primary</b>	Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.

## Defaults

parameter	default
<i>ip_address</i>	0.0.0.0
<i>subnet_mask</i>	IP address class
<b>enable   disable</b>	<b>enable</b>
<i>vid</i>	none (unbound)
<b>forward   no forward</b>	<b>forward</b>
<b>local-proxy-arp   no local-proxy-arp</b>	<b>no local-proxy-arp</b>
<b>eth2   snap</b>	<b>eth2</b>
<b>primary   no primary</b>	First interface bound to a VLAN.

## Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove an IP interface.
- IP multinetting is supported. As a result, it is possible to configure up to eight IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- Note that when Local Proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. Note that the same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured in order to use Local Proxy ARP. The two features are independent of each other.
- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the **primary** keyword with this command to configure a different IP interface as the primary.
- To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it will always remain operationally active. The Loopback0 address can be configured in the same subnet as an existing IP interface.

## Examples

```
-> ip interface "Marketing"
-> ip interface "Payroll address" 18.12.6.3 vlan 255
-> ip interface "Human Resources" 10.200.12.101 vlan 500 no forward snap
-> ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp primary
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**show ip interface** Displays the status and configuration of IP interfaces.

## MIB Objects

```
alaIpInterfaceTable

  alaIpInterfaceRouterMac  
  alaIpInterfaceBcastAddr  
  alaIpInterfacePrimAct
```

---

## ip managed-interface

Specifies the source IP address for the outgoing packets sent by the applications.

**ip managed-interface** {*Loopback0* | *interface-name*} **application** [**ldap-server**] [**tacacs**] [**radius**] [**snmp**] [**sflow**] [**ntp**] [**syslog**] [**dns**] [**telnet**] [**ftp**] [**ssh**] [**tftp**] [**all**]

**no ip managed-interface** {*Loopback0* | *interface-name*} **application** [**ldap-server**] [**tacacs**] [**radius**] [**snmp**] [**sflow**] [**ntp**] [**syslog**] [**dns**] [**telnet**] [**ftp**] [**ssh**] [**tftp**] [**all**]

---

### Syntax Definitions

<i>Loopback0</i>	Specifies the Loopback0 IP address, if configured.
<i>Interface-name</i>	Specifies the name of the interface.
ldap-server	Configures the source IP address to be used by the LDAP Server.
tacacs	Configures the source IP address to be used by TACACS.
radius	Configures the source IP address to be used by RADIUS.
snmp	Configures the source IP address to be used by SNMP.
sflow	Configures the source IP address to be used by sFlow.
ntp	Configures the source IP address to be used by NTP.
syslog	Configures the source IP address to be used by Syslog.
dns	Configures the source IP address to be used by DNS.
telnet	Configures the source IP address to be used by TELNET.
ftp	Configures the source IP address to be used by FTP.
ssh	Configures the source IP address to be used by SSH.
tftp	Configures the source IP address to be used by TFTP.
all	Configures the source IP address to be used by all the application protocols.

## Defaults

<b>Application</b>	<b>Default behavior (selecting the source IP address)</b>
<i>LDAP-SERVER</i>	Loopback0, if configured or the outgoing interface
<i>TACACS</i>	Outgoing interface
<i>RADIUS</i>	Loopback0, if configured or the outgoing interface
<i>SNMP</i>	Loopback0, if configured or the outgoing interface
<i>sFlow</i>	Loopback0, if configured or the outgoing interface
<i>NTP</i>	Loopback0, if configured or the outgoing interface
<i>Syslog</i>	Outgoing interface
<i>DNS</i>	Outgoing interface
<i>Telnet</i>	Outgoing interface
<i>FTP</i>	Outgoing interface
<i>SSH</i>	Outgoing interface
<i>TFTP</i>	Outgoing interface

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use this command to configure the source IP address to be used by the application to send the outgoing packets.
- Use the **no** form of this command to revert to it's default behavior of choosing the source IP address.
- Use **all** in this command to configure a common source IP address to those applications that use the default source IP address.
- This command supports only the default VRF.

## Examples

```
-> ip managed-interface loopback0 application ntp  
-> no ip managed-interface loopback0 application ntp
```

## Release History

Release 6.4.3; command was introduced.

## Related Commands

<code>show ip managed-interface</code>	Displays the application name and the corresponding interface name.
<code>show ip interface</code>	Displays the configuration and status of IP interfaces.
<code>ip interface</code>	Configures an IP interface to enable IP routing on a VLAN.

## MIB Objects

```
alaIpManagedIntfTable  
  AlaIpManagedIntfAppIndex  
  alaIpManagedIntfEntry  
  alaIpManagedIntfName  
  alaIpManagedRowStatus
```

---

## ip interface dhcp-client

Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.

```
ip interface dhcp-client [vlan vid] [release | renew] [option-60 opt60_string] [admin {enable | disable}]
```

```
no ip interface dhcp-client
```

---

### Syntax Definitions

<b>dhcp-client</b>	Reserved IP interface name indicating this interface should use DHCP to obtain an IP address from a DHCP server.
<i>vid</i>	An existing VLAN ID number (1–4094).
<b>release</b>	Releases the DHCP server assigned IP address.
<b>renew</b>	Renews the DHCP server assigned IP address.
<i>opt60_string</i>	The option-60 field value to be included in DHCP discover/request packets.
<b>enable</b>	Enables the administrative status for the IP interface.
<b>disable</b>	Disables the administrative status for the IP interface.

### Defaults

---

parameter	default
<i>opt60_string</i>	OmniSwitch-xxxx (xxxx = Platform i.e. 6850)
<b>enable   disable</b>	enable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the dhcp-client IP interface.
- Only one DHCP client IP interface can be assigned per switch but it can belong to any VLAN and any VRF instance.
- If the system name has not been configured, it will be updated using the option-12 field. If the option-12 string is greater than 19 characters the remaining characters will be truncated.
- The minimum lease time accepted on the dhcp-client interface is 5 minutes.

### Examples

```
-> ip interface dhcp-client vlan 100
```

```
-> ip interface dhcp-client admin enable
-> ip interface dhcp-client release
-> ip interface dhcp-client renew
-> ip interface dhcp-client option-60 OmniSwitch
-> no ip interface dhcp-client
```

## Release History

Release 6.4.3; command was introduced.

## Related Commands

[show ip interface](#) Displays the status and configuration of IP interfaces.

## MIB Objects

```
alaIpInterfaceTable
  alaIpInterfaceDhcpStatus
  alaIpInterfaceDhcpIpRelease
  alaIpInterfaceDhcpIpRenew
  alaIpInterfaceDhcpOption60String
```

---

## ip interface tunnel

Configures the end points for the GRE and IPIP tunnels.

```
ip interface name tunnel [source ip_address] [destination ip_address] [protocol {ipip | gre}]
```

---

### Syntax Definitions

<i>name</i>	Text string up to 20 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. "Alcatel-Lucent Marketing"). Note that this value is case sensitive.
<b>source</b> <i>ip_address</i>	Source IP address of the tunnel.
<b>destination</b> <i>ip_address</i>	Destination IP address of the tunnel.
<b>ipip</b>	Specifies the tunneling protocol as IPIP.
<b>gre</b>	Specifies the tunneling protocol as GRE.

### Defaults

---

parameter	default
<b>ipip</b>   <b>gre</b>	<b>ipip</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You can configure an interface as either a vlan or tunnel interface.
- The maximum number of GRE tunnel interfaces that can be configured on a switch is 8.
- The maximum number of IPIP tunnel interfaces that can be configured on a switch is 127 (16 on an OmniSwitch 6400).

### Examples

```
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; **tunnel** parameter added.

## Related Commands

**show ip interface** Displays the status and configuration of IP interfaces.

## MIB Objects

```
alaIpInterfaceTable  
  alaIpInterfaceName  
  alaIpInterfaceTunnelSrc  
  alaIpInterfaceTunnelDst  
  alaIpInterfaceDeviceType
```

---

## ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

**ip router primary-address** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The router primary address should be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router router-id is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis or stacked routers.

### Examples

```
-> ip router primary-address 172.22.2.115
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip router router-id](#)                      Configures the router ID for the router.

### MIB Objects

```
alaDcrTmConfig  
  alaDrcTmIpRouterPrimaryAddress
```

---

## ip router router-id

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

**ip router router-id** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis or stacked routers.
- The router ID is used by OSPF and BGP to uniquely identify the router in the network.

### Examples

```
-> ip router router-id 172.22.2.115
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip router primary-address](#)      Configures the router primary IP address.

### MIB Objects

alaDcrTmConfig  
  alaDrcTmIpRouterId

---

## ip static-route

Creates/deletes an IP static route or recursive static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

**ip static-route** *ip\_address* [**mask** *mask*] {**gateway** | **follows**} *ip\_address* [**metric** *metric*]

**no ip static-route** *ip\_address* [**mask** *mask*] {**gateway** | **follows**} *ip\_address* [**metric** *metric*]

---

### Syntax Definitions

<i>ip_address</i>	Destination IP address of the static route.
<i>mask</i>	Subnet mask corresponding to the destination IP address.
<b>gateway</b> <i>ip_address</i>	IP address of the next hop used to reach the destination IP address.
<b>follows</b> <i>ip_address</i>	The recursive static route follows this IP address. The recursive route will use the same gateway/nexthop that is used to reach this host address.
<i>metric</i>	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–65535.

### Defaults

parameter	default
<i>metric</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Static routes do not age out of the routing tables; however, they can be deleted. Use the **no** form of this command to delete a static route.
- Use the **follows** parameter to create a recursive static route. The route to this IP address can be dynamically learned.
- A static route is not active unless the gateway it is using is active.
- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.
- Use the **ip static-route** command to configure default route. For example, to create a default route through gateway 171.11.2.1, you would enter: **ip static-route 0.0.0.0 mask 0.0.0.0 gateway 171.11.2.1**.

## Examples

```
-> ip static-route 171.11.1.1 gateway 171.11.2.1
-> ip static-route 0.0.0.0 mask 0.0.0.0 gateway 171.11.2.1
-> ip static-route 0.0.0.0 mask 0.0.0.0 follows 171.14.2.1
```

## Release History

Release 6.1; command was introduced.

Release 6.4.3; **follows** parameter was added.

```

---

## ip route-pref

Configures the route preference of a router.

**ip route-pref** {static | ospf | rip | ebgp | ibgp} *value*

---

### Syntax Definitions

<b>static</b>	Configures the route preference of static routes.
<b>ospf</b>	Configures the route preference of OSPF routes.
<b>rip</b>	Configures the route preference of RIP routes.
<b>ebgp</b>	Configures the route preference of external BGP routes.
<b>ibgp</b>	Configures the route preference of internal BGP routes.
<i>value</i>	Route preference value.

### Defaults

<b>parameter</b>	<b>default</b>
<b>static</b> <i>value</i>	2
<b>ospf</b> <i>value</i>	110
<b>rip</b> <i>value</i>	120
<b>ebgp</b> <i>value</i>	190
<b>ibgp</b> <i>value</i>	200

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Route preference of local routes cannot be changed.

### Examples

```
-> ip route-pref ebgp 20  
-> ip route-pref rip 60
```

### Release History

Release 6.1.1; command was introduced.

Release 6.1.3; **bgp** parameter deprecated; **ebgp** and **ibgp** parameters added.

## Related Commands

### `show ip route-pref`

Displays the configured route-preference of a router.

`alaIprmRtPrefRip`

`alaIprmRtPrefEbgp`

`alaIprmRtPrefIbgp`

---

## ip default-ttl

Configures the Time To Live value (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet will travel before being discarded.

**ip default-ttl** *hops*

---

### Syntax Definitions

*hops* TTL value, in hops. Valid range is 1–255.

### Defaults

parameter	default
<i>hops</i>	64

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

### Examples

```
-> ip default-ttl 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip config](#) Displays IP configuration parameters.

### MIB Objects

IpDefaultTTL

---

## ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the **ping** command and enter either the destination IP address or hostname. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described in the command.

```
ping {ip_address | hostname} [source-interface ip_interface] [[sweep-range start_size | end_size / diff_size] | [count count] [size packet_size] [interval seconds] [timeout seconds] [tos tos_val] [dont-fragment] [data-pattern hex_string]
```

---

### Syntax Definitions

<i>ip_address</i>	IP address of the system to ping.
<i>hostname</i>	DNS name of the system to ping.
<i>ip_interface</i>	IP interface name of the source interface.
<i>start_size</i>	Size of the first echo packet that is sent. The valid range is from 4 to 60000.
<i>end_size</i>	Maximum size of the echo packet that is sent. The range is greater than the start size and less than 60000.
<i>diff_size</i>	The increment factor of size for the next echo packet. The diff size must be greater than 0 and less than end size.
<i>count</i>	Number of packets to be transmitted. The range is between 1 and 4294967295 (0xFFFFFFFF).
<i>packet_size</i>	Size of the data portion of the packet sent for this ping, in bytes. The valid range is 1–60000.
<b>interval</b> <i>seconds</i>	The time interval in seconds with which the ICMP packets are sent out. The range is between 1 and the maximum integer value (4294967295).
<b>timeout</b> <i>seconds</i>	Number of seconds the program has to wait for a response before timing out. The range is between 1 and the maximum integer value (4294967295).
<i>tos_val</i>	Specifies the type of service for the probe. The valid range is between 0 and 255.
<b>dont-fragment</b>	Specifies whether the Don't Fragment (DF) bit is to be set on the ping packet. The value 1 sets the Don't Fragment bit in the packet and 0 unsets the same.
<i>hex_string</i>	Specifies the data pattern in a plain string of two characters. Different data patterns are used to troubleshoot framing errors and clocking problems on serial lines. For example, <b>ab</b> , <b>xy</b> , <b>12</b> and so on.

## Defaults

parameter	default
<i>ip_interface</i>	Outgoing IP interface as per route lookup
<i>start_size</i>	4
<i>end_size</i>	> 4
<i>diff_size</i>	5
<i>count</i>	6
<i>packet_size</i>	64 bytes (default 6)
<b>interval</b> <i>seconds</i>	1
<b>timeout</b> <i>seconds</i>	1
<i>tos_val</i>	0
<b>dont-fragment</b>	0
<i>hex_string</i>	Repeating sequence of ASCII characters from 0x4 to 0xff

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- If you change the default values they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When specifying the source-interface, specify either the name of any operational interface or the Loopback0 interface. The IP address of the source interface must be reachable from the destination.
- When you specify the *sweep-range* in the **ping** command, you cannot configure the *count* and *size* parameters.
- The Don't Fragment (DF) bit must not be larger than the MTU of the IP interface.
- The command does not support Loose, Strict, and route record options.
- The command is VRF aware and is available only from CLI. It does not support IPv6.

## Examples

```
-> ping 20.1.1.2 source-interface Loopback0 interval 2 data-pattern ab sweep-range  
500 1000 100 tos 7 dont-fragment
```

```
PING 20.1.1.2: 500 data bytes  
508 bytes from 20.1.1.2: icmp_seq=0. time=69. ms  
608 bytes from 20.1.1.2: icmp_seq=1. time=70. ms  
708 bytes from 20.1.1.2: icmp_seq=2. time=69. ms  
808 bytes from 20.1.1.2: icmp_seq=3. time=69. ms  
908 bytes from 20.1.1.2: icmp_seq=4. time=69. ms
```

## Release History

Release 6.4.1; command was introduced.

Release 6.4.3; **source-interface**, **sweep-range**, **dont-fragment**, and **data-pattern** parameters were added.

## Related Commands

### [traceroute](#)

Finds the path taken by an IP packet from the local switch to a specified destination.

---

## traceroute

Finds the path taken by an IP packet from the local switch to a specified destination. This command is used to discover the paths that packets take to a remote destination, as well as where routing breaks down.

**traceroute** {*ip\_address* | *hostname*} [**source-interface** *ip\_interface*] [**min-hop** *min\_hop\_count*] [**max-hop** *max\_hop\_count*] [**probes** *probe\_count*] [**time-out** *seconds*] [**port-number** *port\_number*]

---

### Syntax Definitions

<i>ip_address</i>	IP address of the host whose route you want to trace.
<i>hostname</i>	DNS name of the host whose route you want to trace.
<i>ip_interface</i>	IP interface name of the source interface.
<i>min_hop_count</i>	Minimum hop count for the first traceroute packet. The value must be greater than 0 and less than the max hop count.
<i>max_hop_count</i>	Maximum hop count for the destination address. The range is between 1 and the maximum integer value (4294967295).
<i>probe_count</i>	The number of probes to be sent at each TTL level hop-count. The range is between 1 and the maximum integer value (4294967295).
<i>seconds</i>	The period in seconds to wait for the response of each probe packet.
<i>port_number</i>	The destination port number used for probing packets. The value must be greater than 1024. This value is incremented by one in each probe. The valid range is between 1024 and 65535.

### Defaults

parameter	default
<i>min_hop_count</i>	1
<i>max_hop_count</i>	30
<i>probe_count</i>	3
<i>seconds</i>	5 seconds
<i>port_number</i>	33334

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When using this command, enter the name of the destination as part of the command line (either the IP address or host name).
- When specifying the source-interface, specify either the name of any operational interface or Loopback0 interface. The IP address of the source interface must be reachable from the destination.
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.
- The command is VRF aware and is available only from CLI. It does not support IPv6.

## Examples

```
-> traceroute 135.254.170.199 max-hop 5 min-hop 1 port-number 1025 source-inter-  
face Loopback0 timeout 5
```

```
traceroute to 135.254.170.199, 5 hops max, 40 byte packets  
 1  10.135.33.1  2 ms  2 ms  11 ms  
 2  135.250.9.97  6 ms  6 ms  4 ms  
 3  135.250.9.153 4 ms  4 ms  3 ms  
 4  135.254.170.199 3 ms  3 ms  3 ms
```

## Release History

Release 6.4.1; command was introduced.

Release 6.4.3; **source-interface**, **min-hop**, **probes**, **time-out**, and **port-number** parameters were added.

## Related Commands

[show ip route](#) Displays the IP Forwarding table.

---

## ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1's in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

**ip directed-broadcast {on | off}**

---

### Syntax Definitions

N/A

### Defaults

The default value is **off**.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Directed broadcasts are used in denial-of-service “smurf” attacks. In a smurf attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address, resulting in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Typically, directed broadcasts should not be enabled.

### Examples

```
-> ip directed-broadcast off
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ip interface</a>	Displays the status and configuration of IP interfaces.
<a href="#">show ip managed-interface</a>	Displays the IP Forwarding table.
<a href="#">show ip config</a>	Displays IP configuration parameters.

### MIB Objects

```
alaIpDirectedBroadcast
```

---

## ip service

Enables (opens) or disables (closes) well-known TCP/UDP service ports (i.e., SSH, telnet, FTP, etc.). Selectively enabling or disabling these types of ports provides an additional method for protecting against denial of service (DoS) attacks.

**ip service** {**all** | *service\_name* | **port** *service\_port*}

**no ip service** {**all** | *service\_name* | **port** *service\_port*}

---

### Syntax Definitions

<b>all</b>	Configures access to all TCP/UDP ports.
<i>service_name</i>	The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section below for a list of supported service names.)
<i>service_port</i>	A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the “Usage Guidelines” section below for a list of supported service names.)

### Defaults

All TCP/UDP ports are open by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, etc.
- Use the **all** option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Note that specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the examples below.
- When specifying a service port number, note that the **port** keyword is required and that only one port number is allowed in a single command.
- The following table lists the **ip service** command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

<b>service name</b>	<b>port</b>
<b>ftp</b>	21
<b>ssh</b>	22

<b>service name</b>	<b>port</b>
<b>telnet</b>	23
<b>http</b>	80
<b>secure-http</b>	443
<b>avlan-http</b>	260
<b>avlan-secure-http</b>	261
<b>avlan-telnet</b>	259
<b>udp-relay</b>	67
<b>network-time</b>	123
<b>snmp</b>	161
<b>avlan-http-proxy</b>	262

### Examples

```
-> ip service all
-> ip service ftp telnet snmp
-> ip service port 261
-> no ip service ftp snmp
-> no ip service all
```

### Release History

Release 6.1; command was introduced.

### Related Commands

#### [show ip service](#)

Displays a list of all well-known TCP/UDP ports and their current status (enabled or disabled).

### MIB Objects

```
alaIpServiceTable
  alaIpServiceType
  alaIpServicePort
  alaIpServiceStatus
alaIpPortServiceTable
  alaIpPortServicePort
  alaIpPortServiceStatus
```

---

## ip redist

Controls the conditions for redistributing IPv4 routes between different protocols.

```
ip redist {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} route-map route-map-name
[status {enable | disable}]
```

```
no ip redist {local | static | rip | ospf | isis | bgp} into {rip | ospf | bgp} [route-map route-map-name]
```

---

### Syntax Definitions

<b>local</b>	Redistributes local routes.
<b>static</b>	Redistributes static routes.
<b>rip</b>	Specifies RIP as the source or destination (into) protocol.
<b>ospf</b>	Specifies OSPF as the source or destination (into) protocol.
<b>isis</b>	Specifies IS-IS as the source or destination (into) protocol.
<b>bgp</b>	Specifies BGP as the source or destination (into) protocol.
<i>route-map-name</i>	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
<b>enable</b>	Enables the administrative status of the redistribution configuration.
<b>disable</b>	Disables the administrative status of the redistribution configuration.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- If the metric calculated for the redistributed route, as described above, is greater than 15 (RIP\_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.
- Use the **ip route-map** commands described in this chapter to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about how to create a route map.

## Examples

```
-> ip redist rip into bgp route-map rip-to-bgp1
-> ip redist rip into bgp route-map rip-to-bgp2
-> no ip redist rip into bgp route-map rip-to-bgp2
-> ip redist ospf into rip route-map ospf-to-rip
-> ip redist ospf into rip route-map ospf-to-rip disable
```

## Release History

Release 6.1.3; command was introduced.

Release 6.2.1; **isis** parameter support added.

## Related Commands

[show ip redist](#)

Displays the route map redistribution configuration.

[ip route-map action](#)

Creates a route map for redistribution and sets the status of the route map to permit or deny.

## MIB Objects

```
alaRouteMapRedistProtoTable
  alaRouteMapRedistSrcProtoId
  alaRouteMapRedistDestProtoId
  alaRouteMapRedistRouteMapIndex
  alaRouteMapRedistStatus
  alaRouteMapRedistAddressType
  alaRouteMapRedistRowStatus
```

---

## ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

**ip access-list** *access-list-name*

**no ip access-list** *access-list-name*

---

### Syntax Definitions

*access-list-name*                      Name of the access list (up to 20 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to delete the access list.

### Examples

```
-> ip access-list access1  
-> no ip access-list access1
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[ip access-list address](#)                      Adds IPv4 addresses to the specified IPv4 access list.

[show ip access-list](#)                      Displays the details of the access list.

### MIB Objects

```
alaRouteMapAccessListNameTable  
  alaRouteMapAccessListName  
  alaRouteMapAccessListNameIndex  
  alaRouteMapAccessListNameAddressType  
  alaRouteMapAccessListNameRowStatus
```

---

## ip access-list address

Adds multiple IPv4 addresses to the specified IPv4 access list.

```
ip access-list access-list-name address address/prefixLen [action {permit | deny}]  
[redist-control {all-subnets | no-subnets | aggregate}]
```

```
no ip access-list access-list-name address address/prefixLen
```

---

### Syntax Definitions

<i>access-list-name</i>	Name of the access list.
<i>address/prefixLen</i>	IP address/prefix length to be added to the access list.
<b>permit</b>	Permits the IP address for redistribution.
<b>deny</b>	Denies the IP address for redistribution.
<b>all-subnets</b>	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length
<b>no-subnets</b>	Redistributes or denies only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

### Defaults

---

parameter	default
<b>permit</b>   <b>deny</b>	<b>permit</b>
<b>all-subnets</b>   <b>no-subnets</b>   <b>aggregate</b>	<b>all-subnets</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* should exist before you add multiple addresses to it.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets**, **no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

## Examples

```
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
-> ip access-list access1 address 10.1.1.0/24 redistrib-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

## Release History

Release 6.1.3; command was introduced.

## Related Commands

<a href="#">ip access-list</a>	Creates an access list for adding multiple IPv4 addresses to route maps.
<a href="#">show ip access-list</a>	Displays the contents of an IPv4 access list.

## MIB Objects

```
alaRouteMapAccessListTable
  alaRouteMapAccessListIndex
  alaRouteMapAccessListAddress
  alaRouteMapAccessListAddressType
  alaRouteMapAccessListPrefixLength
  alaRouteMapAccessListAction
  alaRouteMapAccessListRedistControl
  alaRouteMapAccessListRowStatus
```

---

## ip route-map action

Creates a route map for redistribution and sets the status of the route map to permit or deny.

**ip route-map** *route-map-name* [**sequence-number** *number*] **action** {**permit** | **deny**}

**no ip route-map** *route-map-name* [**sequence-number** *number*]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>permit</b>	Permits route redistribution.
<b>deny</b>	Denies route redistribution.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the entire route map by specifying only the *route-map-name*.
- Use the **no** form of this command to delete a specific sequence in the route map by specifying the **sequence-number**.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

### Examples

```
-> ip route-map routel sequence-number 10 action permit
-> no ip route-map routel
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

**show ip route-map**                      Displays the configured IP route maps.

## MIB Objects

```
alaRouteMapSequenceTable  
  alaRouteMapSequenceIndex  
  alaRouteMapSequenceNumber  
  alaRouteMapSequenceAction  
  alaRouteMapSequenceRowStatus
```

---

## ip route-map match ip address

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-address** {*access-list-name* | *ip\_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-address** {*access-list-name* | *ip\_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The name of an IPv4 access list that contains IPv4 addresses to match.
<i>ip_address/prefixLen</i>	The destination IP address along with the prefix length of the routes to be redistributed.
<b>all-subnets</b>	Redistributes all the subnet routes that match the network portion of the IP address as specified by the mask length.
<b>no-subnets</b>	Redistributes only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match the IP address.
<b>permit</b>	Permits a route based on the IP address or prefix constrained by redist-control.
<b>deny</b>	Denies a route based on the IP address or prefix constrained by redist-control.

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match ip-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.

- Note that configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type **deny**, then the route is not redistributed. If the best matching address is type **permit** and the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number**, and *access-list-name* (if used) should exist before you configure this **match** criteria.

## Examples

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redist-control no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ip-address list1
-> no ip route-map route1 sequence-number 10 match ip-address list1
```

## Release History

Release 6.1.3; command was introduced.

  alaRouteMapValue
  alaRouteMapRowStatus
```

## ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-address** { *access-list-name* | *ipv6\_address/prefixLen* [**redist-control** { **all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-address** *ipv6\_address/prefixLen* [**redist-control** { **all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The name of an IPv4 access list that contains IPv4 addresses to match.
<i>ipv6_address/prefixLen</i>	The destination IPv6 address along with the prefix length of the routes to be redistributed.
<b>all-subnets</b>	Redistributes all the subnet routes that match the network portion of the IP address as specified by the mask length.
<b>no-subnets</b>	Redistributes only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match the IPv6 address.
<b>permit</b>	Permits a route based on the IPv6 address or prefix constrained by <b>redist-control</b> .
<b>deny</b>	Denies a route based on the IPv6 address or prefix constrained by <b>redist-control</b> .

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.

- Note that configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type **deny**, then the route is not redistributed. If the best matching address is type **permit** and the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **match** criteria.

## Examples

```
-> ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> no ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> ip route-map routel sequence-number 10 match ipv6-address list1
-> no ip route-map routel sequence-number 10 match ipv6-address list1
```

## Release History

Release 6.1.3; command was introduced.

```

## ip route-map match ip-nexthop

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-nexthop**  
{*access-list-name* | *ip\_address/prefixLen* [**permit** | **deny**]}

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-nexthop**  
{*access-list-name* | *ip\_address/prefixLen* [**permit** | **deny**]}

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The access list that matches the route nexthop IP address.
<i>ip_address/prefixLen</i>	The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
<b>permit</b>	Permits a route based on the IP nexthop.
<b>deny</b>	Denies a route based on the IP nexthop.

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match ip-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny**, then the route is not redistributed. If the best matching nexthop is type **permit** and the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number**, and *access-list-name* should exist before you configure this **match** criteria.

## Examples

```
-> ip route-map routel sequence-number 10 match ip-nexthop list1
-> no ip route-map routel sequence-number 10 match ip-nexthop list1
-> ip route-map routel sequence-number 10 match ip-nexthop 10.0.0.0/8
-> no ip route-map routel sequence-number 10 match ip-nexthop 10.0.0.0/8
```

## Release History

Release 6.1.3; command was introduced.

## ip route-map match ipv6-nexthop

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-nexthop**  
{*access-list-name* | *ipv6\_address/prefixLen* [**permit** | **deny**]}

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-nexthop**  
{*access-list-name* | *ipv6\_address/prefixLen* [**permit** | **deny**]}

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The access list that matches the route nexthop IPv6 address.
<i>ipv6_address/prefixLen</i>	The IPv6 address along with the prefix length that matches any nexthop IPv6 address within the specified subnet.
<b>permit</b>	Permits a route based on the IPv6 nexthop.
<b>deny</b>	Denies a route based on the IPv6 nexthop.

### Defaults

<b>parameter</b>	<b>default</b>
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny**, then the route is not redistributed. If the best matching nexthop is type **permit** but the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number**, and *access-list-name* should exist before you configure this **match** criteria.

## Examples

```
-> ip route-map routel sequence-number 10 match ipv6-nexthop list1
-> no ip route-map routel sequence-number 10 match ipv6-nexthop list1
-> ip route-map routel sequence-number 10 match ipv6-nexthop 2001::/64
-> no ip route-map routel sequence-number 10 match ipv6-nexthop 2001::/64
```

## ip route-map match tag

Matches the tag value specified in the route map with the one that the routing protocol learned the route on.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match tag** *tag-number*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match tag** *tag-number*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>tag-number</i>	The tag number.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **match** criteria.

### Examples

```
-> ip route-map routel sequence-number 10 match tag 4  
-> no ip route-map routel sequence-number 10 match tag 4
```

## ip route-map match ipv4-interface

Matches the IPv4 interface name specified in the route map with the one that the routing protocol learned the route on.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv4-interface** *interface-name*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv4-interface** *interface-name*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>interface-name</i>	Specifies the interface name of the route's outgoing interface.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match ipv4-interface** parameter in the route map.

## ip route-map match metric

Matches the metric value specified in the route map with the actual metric value of the route.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match metric** *metric* [**deviation** *deviation*]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match metric** *metric* [**deviation** *deviation*]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>metric</i>	The metric value that matches a specified metric.
<i>deviation</i>	The deviation value. If deviation is included, the route metric can have any value within the range (metric-deviation to metric+deviation).

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	50

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **match** criteria.

### Examples

```
-> ip route-map routel sequence-number 10 match metric 4  
-> no ip route-map routel sequence-number 10 match metric 4
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

```

---

## ip route-map match route-type

Matches the specified route type with actual route type of the route.

```
ip route-map route-map-name [sequence-number number] match route-type {internal | external  
[type1 | type2] | level1 | level2}
```

```
no ip route-map route-map-name [sequence-number number] match route-type {internal | external  
[type1 | type2] | level1 | level2}
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>internal</b>	Matches OSPF/BGP internal routes.
<b>external</b>	Matches OSPF/BGP external routes.
<b>type1</b>	Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
<b>type2</b>	Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
<b>level1</b>	Matches IS-IS Level-1 routes only.
<b>level2</b>	Matches IS-IS Level-2 routes only.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **match route-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **match** criteria.

## Examples

```
-> ip route-map 111 sequence-number 50 match route-type internal
-> no ip route-map 111 sequence-number 50 match route-type internal
```

## Release History

Release 6.1.3; command was introduced.

Release 6.2.1; **level1** and **level2** parameter support added.

## Related Commands

<a href="#">ip route-map action</a>	Creates a route map for redistribution and sets the status of the route map to permit or deny.
<a href="#">show ip route-map</a>	Displays the configured IP route maps.

```

---

## ip route-map set metric

Configures the metric value of the route being distributed.

```
ip route-map route-map-name [sequence-number number] set metric metric  
[effect {add | subtract | replace | none}]
```

```
no ip route-map route-map-name [sequence-number number] set metric metric  
[effect {add | subtract | replace | none}]
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>metric</i>	Configures the metric value of the route being distributed. A value of 0 is not allowed.
<b>add</b>	Adds the configured metric value to the actual metric value.
<b>subtract</b>	Subtracts the configured metric value from the actual metric value.
<b>replace</b>	Replaces the actual metric value with the configured metric value.
<b>none</b>	Redistributes the actual metric value. The configured metric value is ignored. Use any value except 0.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	50

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set metric 30 effect add  
-> no ip route-map 111 sequence-number 50 set metric 30 effect add
```

### Release History

## ip route-map set metric-type

Configures the metric type for the redistributed route.

```
ip route-map route-map-name [sequence-number number] set metric-type  
{internal | external [type1 | type2]}
```

```
no ip route-map route-map-name [sequence-number number] set metric-type  
{internal | external [type1 | type2]}
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>internal</b>	Sets the metric type to internal for routes redistributed into BGP.
<b>external</b>	Sets the metric type to external for routes redistributed into BGP.
<b>type1</b>	Sets the metric type to external type1 for routes redistributed into OSPF, which gives the full metric calculation for the complete path including internal as well as external cost.
<b>type2</b>	Sets the metric type to external type2 for routes redistributed into OSPF, which gives the external redistribution metric only to the ASBR.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set metric-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set metric-type internal  
-> no ip route-map 111 sequence-number 50 set metric-type internal
```

## ip route-map set community

Configures the community name of the route being redistributed into BGP.

**ip route-map** *route-map-name* [**sequence-number** *number*] **set community** *community-string*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **set community** *community-string*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>community-string</i>	Defines a community for an aggregate route. Community names range from 0 to 70 characters.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set community** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set community 29  
-> no ip route-map 111 sequence-number 50 set community 29
```

  alaRouteMapIndex

  alaRouteMapSequence

  alaRouteMapType

  alaRouteMapValue

  alaRouteMapRowStatus

---

## ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

**ip route-map** *route-map-name* [**sequence-number** *number*] **set local-preference** *value*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **set local-preference** *value*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>value</i>	Configures the local-preference value for routes being redistributed in to BGP. The value is between 0 and 4294967295.

### Defaults

---

parameter	default
<i>number</i>	50

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set local-preference** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.
- The local preference attribute is used to set preference to an exit point from the local autonomous system (AS).
- If there are multiple exit points from the AS, the local preference attribute is used to select the exit point for a specific route.

### Examples

```
-> ip route-map 111 sequence-number 50 set local-preference 4
-> no ip route-map 111 sequence-number 50 set local-preference 4
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

### **ip route-map action**

Creates a route map for redistribution and sets the status of the route map to permit or deny.

### **show ip route-map**

Displays the configured IP route maps.

---

## ip route-map set level

Configures the level of the ISIS route being redistributed.

```
ip route-map route-map-name [sequence-number number] set level {level1 | level2 | level1-2}
```

```
no ip route-map route-map-name [sequence-number number] set level {level1 | level2 | level1-2}
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>level1</b>	Matches IS-IS Level-1 routes only.
<b>level2</b>	Matches IS-IS Level-2 routes only.
<b>level1-2</b>	Matches IS-IS Level1-2 routes.

### Defaults

<b>parameter</b>	<b>default</b>
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set level** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set level level1  
-> no ip route-map 111 sequence-number 50 set level level1
```

### Release History

Release 6.2.1; command was introduced.

## ip route-map set ip-next-hop

Configures the IP address of the next hop in a route map.

```
ip route-map route-map-name [sequence-number number] set ip-next-hop ip_address
```

```
no ip route-map route-map-name [sequence-number number] set ip-next-hop ip_address
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>ip_address</i>	IP address of the next hop.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set ip-next-hop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 222 sequence-number 50 set ip-next-hop 128.251.17.224  
-> no ip route-map 222 sequence-number 50 set ip-next-hop 128.251.17.224
```

### Release History

Release 6.1.5; command was introduced.

## Related Commands

## ip route-map set ipv6-nexthop

Configures the IPv6 address of the next hop in a route map.

```
ip route-map route-map-name [sequence-number number] set ipv6-nexthop ipv6_address
```

```
no ip route-map route-map-name [sequence-number number] set ipv6-nexthop ipv6_address
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>ipv6_address</i>	IPv6 address of the next hop.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the **set ipv6-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** should exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1  
-> no ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
```

### Release History

Release 6.1.5; command was introduced.

---

## vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

**vrf** [*name* / **default**]

**no vrf** *name*

---

### Syntax Definitions

*name* The alphanumeric name (1–20 characters) assigned to the VRF instance.

**default** Optional. Selects the default VRF instance.

### Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

Parameter	Default
<i>name</i> / <b>default</b>	default VRF instance

### Platforms Supported

OmniSwitch 9000E, 6855-U24X

### Usage Guidelines

- Use the **no** form of this command to delete a VRF instance. Note that deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
- To return to the default VRF instance from within the context of another instance, enter the **vrf** command with or without the optional **default** parameter (for example, **vrf** or **vrf default**).
- Configuring a VRF instance name is case sensitive. In addition, if the name specified does not exist, a VRF instance is automatically created. As a result, it is possible to accidentally create instances or delete the wrong instance. Use the [show ip dynamic-proxy-arp](#) command to verify the VRF instance configuration before adding or removing instances.
- If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.
- It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the **vrf** command followed by the instance name. For example, entering **vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100** is applied to the IpOne instance even though IpOne is not the active CLI context.

## Examples

```
-> vrf IpOne  
IpOne: ->
```

```
IpOne: -> vrf IpTwo  
IpTwo: ->
```

```
IpTwo: -> vrf  
->
```

```
IpTwo: -> vrf default  
->
```

```
-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100  
->
```

## Release History

Release 6.4.1; command was introduced.

## Related Commands

[show vrf](#) Displays the VRF instance configuration for the switch.

## MIB Objects

```
alaVirtualRouterNameTable  
  alaVirtualRouterName
```

---

## arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

**arp** *ip\_address hardware\_address* [**alias**] [**arp-name** *name*]

**no arp** *ip\_address* [**alias**]

---

### Syntax Definitions

<i>ip_address</i>	IP address of the device you are adding to the ARP table.
<i>hardware_address</i>	MAC address of the device in hexadecimal format (e.g., 00.00.39.59.f1.0c).
<b>alias</b>	<p>Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address.</p> <p>You can also enable the proxy feature for an IP interface using the <b>ip interface</b> command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.</p>
<i>name</i>	The name to assign to this ARP entry.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a permanent ARP entry.
- Configuring a permanent ARP entry with a multicast address is also supported. This is done by specifying a multicast address for the *ip\_address* parameter instead of a unicast address. ( OS6850 24-port models only)
- Note that using the **arp alias** command is not related to proxy ARP as defined in RFC 925. Instead, **arp alias** is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only *one* IP address.
- Because most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), you generally do not need to specify permanent ARP cache entries.
- Only the IP address is required when deleting an ARP entry from the table.

## Examples

```
-> arp 171.11.1.1 00:05:02:c0:7f:11
```

## Release History

Release 6.1; command was introduced.

Release 6.3.4; static multicast ARP support added on 6850 24-port models.

## Related Commands

### [clear arp-cache](#)

Deletes all dynamic entries from the ARP table.

### [ip interface](#)

Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.

### [show arp](#)

Displays the ARP table.

## MIB Objects

- ipNetToMediaIfIndex
- ipNetToMediaNetAddress
- ipNetToMediaPhyAddress
- ipNetToMediaType

alaIpNetToMediaTable

- alaIpNetToMediaPhyAddress
- alaIpNetToMediaProxy

---

## clear arp-cache

Deletes all dynamic entries from the ARP table.

**clear arp-cache**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This commands only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the **no** form of the **arp** command.
- Dynamic entries remain in the ARP table until they time out after a period of eight minutes.

### Examples

```
-> clear arp-cache
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>arp</b>	Adds a permanent entry to the ARP table.
<b>show arp</b>	Displays the ARP table.

### MIB Objects

alaIpClearArpCache

---

## arp filter

Configures an ARP filter that will determine if ARP Request packets containing a specific IP address are processed by the switch or discarded.

**arp filter** *ip\_address* [**mask** *ip\_mask*] [*vid*] [**sender** | **target**] [**allow** | **block**]

**no arp filter** *ip\_address*

---

### Syntax Definitions

<i>ip_address</i>	The IP address to use for filtering ARP packet IP addresses.
<i>ip_mask</i>	An IP mask that identifies which part of the ARP packet IP address is examined for filtering (e.g. mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
<i>vid</i>	A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
<b>sender</b>	The sender IP address in the ARP packet is used for ARP filtering.
<b>target</b>	The target IP address in the ARP packet is used for ARP filtering.
<b>allow</b>	ARP packets that meet filter criteria are processed.
<b>block</b>	ARP packets that meet filter criteria are discarded.

### Defaults

<b>parameter</b>	<b>default</b>
<i>vid</i>	0 (no VLAN)
<i>ip_mask</i>	255.255.255.255
<b>sender</b>   <b>target</b>	<b>target</b>
<b>allow</b>   <b>block</b>	<b>block</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
- If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.
- ARP filtering is generally used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

## Examples

```
-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[clear arp filter](#)

Clears all ARP filters from the filter database.

[ip interface](#)

Enables or disables the Local Proxy ARP feature on an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.

[show arp summary](#)

Displays the ARP filter configuration.

## MIB Objects

```
alaIpArpFilterTable
  alaIpArpFilterIpAddr
  alaIpArpFilterIpMask
  alaIpArpFilterVlan
  alaIpArpFilterMode
  alaIpArpFilterType
```

---

## clear arp filter

Clears the ARP filter database of all entries.

**clear arp filter**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This commands clears all ARP filters configured on the switch. To remove an individual filter entry, use the **no** form of the [arp filter](#) command.

### Examples

```
-> clear arp filter
```

### Release History

Release 6.1; command was introduced.

### Related Commands

### MIB Objects

```
alaIpClearArpFilter
```

---

## icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp type** *type* **code** *code* **{{enable | disable} | min-pkt-gap** *gap*

---

### Syntax Definitions

<i>type</i>	The ICMP packet type. This in conjunction with the ICMP code determines the type of ICMP message being specified.
<i>code</i>	The ICMP code type. This in conjunction with the ICMP type determines the type of ICMP message being specified.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	disabled
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- This command allows the user to enable or disable all types of ICMP messages and set the minimum packet gap between messages of the specified type. The ICMP message types are specified in RFC 792, and are listed below:

ICMP Message	Type	Code
echo reply	0	0
network unreachable	0	3
host unreachable	3	1
protocol unreachable	3	2
port unreachable	3	3
frag needed but DF bit set	3	4
source route failed	3	5
destination network unknown	3	6
destination host unknown	3	7
source host isolated	3	8
dest network admin prohibited	3	9
host admin prohibited by filter	3	10
network unreachable for TOS	3	11
host unreachable for TOS	3	12
source quench	4	0
redirect for network	5	0
redirect for host	5	1
redirect for TOS and network	5	2
redirect for TOS and host	5	3
echo request	8	0
router advertisement	9	0
router solicitation	10	0
time exceeded during transmit	11	0
time exceeded during reassembly	11	1
ip header bad	12	0
required option missing	12	1
timestamp request	13	0
timestamp reply	14	0
information request (obsolete)	15	0
information reply (obsolete)	16	0
address mask request	17	0
address mask reply	18	0

- While this command can be used to enable or disable all ICMP messages, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP message have specific commands to enable and disable:

ICMP Message	Command
Network unreachable (type 0, code 3)	<a href="#">icmp unreachable</a>
Host unreachable (type 3, code 1)	<a href="#">icmp unreachable</a>
Protocol unreachable (type 3, code 2)	<a href="#">icmp unreachable</a>
Port unreachable (type 3, code 3)	<a href="#">icmp unreachable</a>
Echo reply (type 0, code 0)	<a href="#">icmp echo</a>
Echo request (type 8, code 0)	<a href="#">icmp echo</a>
Timestamp request (type 13, code 0)	<a href="#">icmp timestamp</a>
Timestamp reply (type 14, code 0)	<a href="#">icmp timestamp</a>
Address Mask request (type 17, code 0)	<a href="#">icmp addr-mask</a>
Address Mask reply (type 18, code 0)	<a href="#">icmp addr-mask</a>

- Enabling **Host unreachable** and **Network unreachable** messages is not recommended. Enabling these messages can cause switch instability due to high-CPU conditions, depending upon the volume of traffic required by these messages.

## Examples

```
-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[icmp messages](#)

Enables or disables all ICMP messages.

[show icmp control](#)

Allows the viewing of the ICMP control settings.

## MIB Objects

```
alaIcmpCtrlTable
  alaIcmpCtrlType
alaIcmpCtrlTable
  alaIcmpCtrlCode
  alaIcmpCtrlStatus
  alaIcmpCtrlPktGap
```

## icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp unreachable** [**net-unreachable** | **host-unreachable** | **protocol-unreachable** | **port-unreachable**] [{**enable** | **disable**} | **min-pkt-gap** *gap*]

---

### Syntax Definitions

<b>net-unreachable</b>	Sets the unreachable network ICMP message.
<b>host-unreachable</b>	Sets the unreachable host ICMP message.
<b>protocol-unreachable</b>	Sets the unreachable protocol ICMP message.
<b>port-unreachable</b>	Sets the unreachable port ICMP message.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	disabled
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the unreachable ICMP messages.

### Examples

```
-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
```

```
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
-> icmp unreachable port-unreachable min-pkt-gap 50
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**show icmp control**                      Allows the viewing of the ICMP control settings.

## MIB Objects

```
alaIcmpCtrlTable
  alaIcmpCtrlType
alaIcmpCtrlTable
  alaIcmpCtrlCode
  alaIcmpCtrlStatus
  alaIcmpCtrlPktGap
```

---

## icmp echo

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp echo** [**request** | **reply**] **{{enable | disable}** | **min-pkt-gap** *gap*}

---

### Syntax Definitions

<b>request</b>	Specifies the echo request ICMP message.
<b>reply</b>	Specifies the echo reply ICMP message.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>enable</b>
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply will enable, disable, or set the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the echo ICMP messages.

### Examples

```
-> icmp echo reply enable
-> icmp echo enable
-> icmp echo request enable
-> icmp echo request min-pkt-gap 50
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### **show icmp control**

Allows the viewing of the ICMP control settings.

## MIB Objects

alaIcmpCtrlTable

    alaIcmpCtrlType

alaIcmpCtrlTable

    alaIcmpCtrlCode

    alaIcmpCtrlStatus

    alaIcmpCtrlPktGap

---

## icmp timestamp

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp timestamp** [**request** | **reply**] {{**enable** | **disable**} | **min-pkt-gap** *gap*}

---

### Syntax Definitions

<b>request</b>	Specifies timestamp request messages.
<b>reply</b>	Specifies timestamp reply messages.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.
- Using this command without specifying a request or reply will enable, disable, or set the minimum packet gap for both types.
- The timestamp ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the timestamp ICMP messages.

### Examples

```
-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**show icmp control**                      Allows the viewing of the ICMP control settings.

```

---

## icmp addr-mask

Enables or disables ICMP address mask messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp addr-mask** [**request** | **reply**] {{**enable** | **disable**} | **min-pkt-gap** *gap*}

---

### Syntax Definitions

<b>request</b>	Specifies request address mask messages.
<b>reply</b>	Specifies reply address mask messages.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A gateway receiving an address mask request should return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.
- Using this command without specifying a request or reply will enable, disable, or set the minimum packet gap for both types.
- The address mask ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the address mask ICMP messages.

### Examples

```
-> icmp addr-mask reply enable
-> icmp addr-mask enable
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50
```

### Release History

Release 6.1; command was introduced.

---

## ip dos scan close-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

**ip dos scan close-port-penalty** *penalty\_value*

---

### Syntax Definitions

*penalty\_value* A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

parameter	default
<i>penalty_value</i>	10

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command creates a point value that is added to the total port scan penalty value when a TCP or UDP packet is received that is destined for a closed port.

### Examples

```
-> ip dos scan close-port-penalty 25
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip dos scan threshold** Sets the threshold for the port scan value, at which a DoS attack is recorded.

**ip dos trap** Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

alaDoSConfig  
  alaDoSPortScanClosePortPenalty

---

## ip dos scan tcp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

**ip dos scan tcp open-port-penalty** *penalty\_value*

---

### Syntax Definitions

*penalty\_value*                      A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

parameter	default
<i>penalty_value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a TCP packet is received that is destined for an open port.
- The switch does not distinguished between a legal TCP packet and a port scan packet.

### Examples

```
-> ip dos scan tcp open-port-penalty 10
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- [ip dos scan threshold](#)                      Sets the threshold for the port scan value, at which a DoS attack is recorded.
- [ip dos trap](#)                                      Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

    alaDoSPortScanTcpOpenPortPenalty

---

## ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

**ip dos scan udp open-port-penalty** *penalty\_value*

---

### Syntax Definitions

*penalty\_value*                      A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

parameter	default
<i>penalty_value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguished between a legal UDP packet and a port scan packet.

### Examples

```
-> ip dos scan udp open-port-penalty 15
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- ip dos scan threshold**                      Sets the threshold for the port scan value, at which a DoS attack is recorded.
- ip dos trap**                                      Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

alaDoSConfig  
     alaDoSPortScanUdpOpenPortPenalty

---

## ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

**ip dos scan threshold** *threshold\_value*

---

### Syntax Definitions

*threshold\_value*

A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

### Defaults

parameter	default
<i>threshold_value</i>	1000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added together. The commands for setting the packet penalty value are the [ip dos scan close-port-penalty](#), [ip dos scan tcp open-port-penalty](#), and [ip dos scan udp open-port-penalty](#) commands.

### Examples

```
-> ip dos scan threshold 1200
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip dos scan close-port-penalty</b>	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.
<b>ip dos scan tcp open-port-penalty</b>	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.
<b>ip dos scan udp open-port-penalty</b>	Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.
<b>show ip dos config</b>	Displays the configuration parameters of the DoS scan for the switch.

## MIB Objects

alaDoSConfig  
  alaDoSPortScanThreshold

---

## ip dos trap

Sets whether the switch generates SNMP DoS traps when an attack is detected.

**ip dos trap {enable | disable}**

---

### Syntax Definitions

**enable** Enables the generation of DoS traps.  
**disable** Disables the generation of DoS traps.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the [ip dos scan threshold](#) command.

### Examples

```
-> ip dos trap enable  
-> ip dos trap disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip dos scan threshold](#) Sets the threshold for the port scan value, at which a DoS attack is recorded.  
[show ip dos config](#) Displays the configuration parameters of the DoS scan for the switch.

### MIB Objects

alaDoSConfig  
alaDoSTrapCnt1

---

---

## ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

**ip dos scan decay** *decay\_value*

---

### Syntax Definitions

*decay\_value*                      The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

### Defaults

parameter	default
<i>decay_value</i>	2

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

### Examples

```
-> ip dos scan decay 10
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip dos scan threshold](#)                      Sets the threshold for the port scan value, at which a DoS attack is recorded.

[show ip dos config](#)                      Displays the configuration parameters of the DoS scan for the switch.

### MIB Objects

alaDoSConfig  
  alaDoSPortScanDecay

---

## show ip traffic

Displays IP datagram traffic and errors.

**show ip traffic**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command will include statistics regarding the spoofed traffic.
- Note that the presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

### Examples

```
-> show ip traffic
```

```
IP statistics
Datagrams received
  Total                = 621883,
  IP header error      = 0,
  Destination IP error = 51752,
  Unknown protocol     = 0,
  Local discards       = 0,
  Delivered to users   = 567330,
  Reassemble needed    = 0,
  Reassembled          = 0,
```

```

Reassemble failed          =          0

Datagrams sent
  Forwarded                 =       2801,
  Generated                 =    578108,
  Local discards           =          0,
  No route discards       =          9,
  Fragmented               =       2801,
  Fragment failed         =          0,
  Fragments generated     =          0

Event      Source      Total      Last 33 seconds
-----+-----+-----+-----
spoof      5/26   18          2      last mac 00:08:02:e2:17:70

```

**output definitions**

<b>Total</b>	Total number of input datagrams received including those received in error.
<b>IP header error</b>	Number of IP datagrams discarded due to errors in the IP header (e.g., bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).
<b>Destination IP error</b>	Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported classes (e.g., Class E).
<b>Unknown protocol</b>	Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
<b>Local discards</b>	Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (e.g., lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. Typically, this value should be zero.
<b>Delivered to users</b>	Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).
<b>Reassemble needed</b>	Number of IP fragments received that needed to be reassembled.
<b>Reassembled</b>	Number of IP datagrams received that were successfully reassembled.
<b>Reassemble failed</b>	Number of IP failures detected by the IP reassembly algorithm for all reasons (e.g., timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
<b>Fragmented</b>	Number of successfully fragmented IP datagrams.
<b>Fragment failed</b>	Number of packets received and discarded by IP because they needed to be fragmented but could not be. This situation could happen if a large packet has the "Don't Fragment" flag set.
<b>Forwarded</b>	Number of IP datagrams forwarded by the switch.
<b>Generated</b>	Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as "Forwarded."

*output definitions (continued)*

---

<b>Local discards</b>	Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (e.g., lack of buffer space). This number includes datagrams counted as “Forwarded” if the packets are discarded for these reasons.
<b>No route discards</b>	Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as “Forwarded” if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.
<b>Fragments generated</b>	The of IP datagram fragments generated as a result of fragmentation.
<b>Routing entry discards</b>	Number of packets received and discarded by IP even though no problems were encountered to prevent their transmission to their destination (e.g., discarded because of lack of buffer space).
<b>Event</b>	The type of event ( <b>spoof</b> ).
<b>Source</b>	The slot and port number of the port that has received spoofed packets and is also a member of the UserPorts group. Ports are configured as members of the UserPorts group through the <b>policy port group</b> command.
<b>Total</b>	The total number of spoofed packets received on the source port.
<b>Last <i>xx</i> seconds</b>	The number of spoofed packets blocked in the last number of seconds indicated. Also includes the source MAC address of the last spoofed packet received.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**show icmp statistics**                      Displays ICMP statistics and errors.

---

## show ip interface

Displays the configuration and status of IP interfaces.

**show ip interface** [*name* / **emp** | **vlan** *vlan id* / **dhcp-client**]

---

### Syntax Definitions

<i>name</i>	The name associated with the IP interface.
<b>emp</b>	Displays the configuration and status of the Ethernet Management Port interface. This parameter is available on OmniSwitch 9000 Series switches only.
<i>vlan_id</i>	VLAN ID (displays a list of IP interfaces associated with a VLAN).
<b>dhcp-client</b>	Displays the configuration and status of the DHCP-Client interface.

### Defaults

By default, all IP interfaces are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The basic **show ip interface** command displays information about all configured IP interfaces on the switch.
- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Specify an optional interface *name* to display detailed information about an individual interface.
- Use the optional **emp** parameter to display detailed information about the EMP interface. This parameter is available on OmniSwitch 9000 Series switches only.

### Examples

```
-> show ip interface
Total 13 interfaces
```

Name	IP Address	Subnet Mask	Status	Forward	Device
EMP	172.22.16.115	255.255.255.0	UP	NO	EMP
GMRULE	40.1.1.1	255.255.255.0	DOWN	NO	vlan 40
Loopback	127.0.0.1	255.0.0.0	UP	NO	Loopback
dhcp-client	172.16.105.10	255.255.255.0	UP	NO	vlan 60
gbps	5.5.5.5	255.255.255.0	DOWN	NO	vlan 7
if222	30.1.5.1	255.0.0.0	UP	YES	vlan 222
ldap_client1	173.22.16.115	255.255.255.0	UP	YES	vlan 173
ldap_server1	174.22.16.115	255.255.255.0	UP	YES	vlan 174
radius_client3	110.1.1.101	255.255.255.0	UP	YES	vlan 30
vlan-2	0.0.0.0	0.0.0.0	DOWN	NO	unbound
gre-1	24.24.24.1	255.255.255.0	UP	YES	GRE tunnel
ipip-1	25.25.25.1	255.255.255.0	UP	YES	IPIP tunnel

```
vlan-23          23.23.23.1      255.255.255.0    UP      YES vlan 23
```

*output definitions*

---

<b>Name</b>	Interface name. Generally, this is the name configured for the interface (e.g., Accounting). <b>EMP</b> refers to the Ethernet Management Port. <b>Loopback</b> refers to a loopback interface configured for testing.
<b>IP Address</b>	IP address of the interface. Configured through the <b>ip interface</b> command.
<b>Subnet Mask</b>	IP subnet mask for the interface IP address. Configured through the <b>ip interface</b> command.
<b>Status</b>	Interface status: <ul style="list-style-type: none"> <li>• <b>UP</b>—Interface is ready to pass packets.</li> <li>• <b>DOWN</b>—Interface is down.</li> </ul>
<b>Forward</b>	Indicates whether or not the interface is actively forwarding packets ( <b>YES</b> or <b>NO</b> ).
<b>Device</b>	The type of device bound to the interface: <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>vlan</b>—The VLAN ID that is bound to the interface.</li> <li>• <b>EMP</b>—The Ethernet Management Port is bound to the interface.</li> <li>• <b>Loopback</b>—A loopback interface is configured for testing.</li> <li>• <b>GRE tunnel</b>—GRE tunnel is configured for the interface.</li> <li>• <b>IPIP tunnel</b>—IPIP tunnel is configured for the interface.</li> </ul> Configured through the <b>ip interface</b> command.

### *output definitions*

<b>SNMP Interface Index</b>	Interface index.
<b>IP Address</b>	IP address associated with the interface. Configured through the <b>ip interface</b> command.
<b>Subnet Mask</b>	IP subnet mask for the interface. Configured through the <b>ip interface</b> command.
<b>Broadcast Address</b>	Broadcast address for the interface.
<b>Device</b>	The type of device bound to the interface: <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>vlan</b>—The VLAN ID that is bound to the interface.</li> <li>• <b>EMP</b>—The Ethernet Management Port is bound to the interface.</li> <li>• <b>Loopback</b>—A loopback interface is configured for testing.</li> <li>• <b>GRE tunnel</b>—GRE tunnel is configured for the interface.</li> <li>• <b>IPIP tunnel</b>—IPIP tunnel is configured for the interface.</li> </ul> Configured through the <b>ip interface</b> command.
<b>Forwarding</b>	Indicates whether or not IP forwarding is active for the interface ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>ip interface</b> command.
<b>Administrative State</b>	Administrative state of the IP interface ( <b>enabled</b> or <b>disabled</b> ), which is independent of the state of the underlying device. Configured through the <b>ip interface</b> command.
<b>Operational State</b>	Indicates whether or not the interface is active ( <b>up</b> or <b>down</b> ).
<b>Operation State Reason</b>	Indicates why the operational state of the interface is down: <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>device-down</b>—Device bound to the interface is down.</li> <li>• <b>admin-down</b>—The admin state of the interface is down.</li> <li>• <b>no-such-device</b>—Device does not exist.</li> <li>• <b>no-router-mac</b>—No MAC address available for the interface.</li> <li>• <b>tunnel-src-invalid</b>—Tunnel's source IP address is invalid.</li> <li>• <b>tunnel-dst-unreachable</b>—Tunnel's destination IP address is not reachable.</li> </ul> Note that the <b>tunnel-src-invalid</b> and <b>tunnel-dst-unreachable</b> are only applicable for the <b>GRE tunnel</b> and <b>IPIP tunnel</b> device types. Note that <b>Operational State Reason</b> field is only included in the display output when the operational state of the interface is <b>down</b> .
<b>Router MAC</b>	Switch MAC address assigned to the interface. Note that each interface assigned to the same VLAN will share the same switch MAC address.
<b>Local Proxy ARP</b>	Indicates whether or not Local Proxy ARP is active for the interface ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>ip interface</b> command.
<b>Maximum Transfer Unit</b>	The Maximum Transmission Unit size set for the interface. Configured through the <b>ip interface</b> command.
<b>DHCP-CLIENT Parameter Details</b>	(Parameters below are only applicable to the 'dhcp-client' interface)
<b>Client Status</b>	DHCP Client Status ( <b>In-active, Inactive</b> )
<b>Server IP</b>	The IP address of the DHCP server.
<b>Lease Time Remaining</b>	The lease time remaining for the DHCP client IP address.

*output definitions (continued)*

---

<b>Option-60</b>	The option-60 string that shall be included in DHCP discover/request packets.
<b>HostName</b>	The system name of the OmniSwitch.

---

The following are examples of the output display on OmniSwitch stackable and chassis-based switches:

```
-> show ip interface ipip-1
Interface Name = ipip-1
SNMP Interface Index      = 13600001,
IP Address                 = 25.25.25.1,

<b>Subnet Mask</b>	IP subnet mask for the interface. Configured through the <a href="#">ip interface</a> command.
<b>Device</b>	The type of device bound to the interface: <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>vlan</b>—The VLAN ID that is bound to the interface.</li> <li>• <b>EMP</b>—The Ethernet Management Port is bound to the interface.</li> <li>• <b>Loopback</b>—A loopback interface is configured for testing.</li> <li>• <b>GRE tunnel</b>—GRE tunnel is configured for the interface.</li> <li>• <b>IPIP tunnel</b>—IPIP tunnel is configured for the interface.</li> </ul> Configured through the <a href="#">ip interface</a> command.
<b>Tunnel Source Address</b>	The source IP address for the tunnel.
<b>Tunnel Destination Address</b>	The destination IP address for the tunnel.
<b>Forwarding</b>	Indicates whether or not IP forwarding is active for the interface ( <b>enabled</b> or <b>disabled</b> ). Configured through the <a href="#">ip interface</a> command.

*output definitions (continued)*

---

<b>Administrative State</b>	Administrative state of the IP interface ( <b>enabled</b> or <b>disabled</b> ), which is independent of the state of the underlying device. Configured through the <b>ip interface</b> command.
<b>Operational State</b>	Indicates whether or not the interface is active ( <b>up</b> or <b>down</b> ).
<b>Operational State Reason</b>	Indicates why the operational state of the interface is down: <ul style="list-style-type: none"> <li>• <b>interface-up</b>—The admin state of the interface is up.</li> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>device-down</b>—Device bound to the interface is down.</li> <li>• <b>admin-down</b>—The admin state of the interface is down.</li> <li>• <b>no-such-device</b>—Device does not exist.</li> <li>• <b>no-router-mac</b>—No MAC address available for the interface.</li> <li>• <b>tunnel-src-invalid</b>—Tunnel's source IP address is invalid.</li> <li>• <b>tunnel-dst-unreachable</b>—Tunnel's destination IP address is not reachable.</li> </ul> <p>Note that this field is only included in the display output when the operational state of the interface is <b>down</b>.</p>
<b>Maximum Transfer Unit</b>	The Maximum Transmission Unit size set for the interface. Configured through the <b>ip interface</b> command.

---

**Release History**

Release 6.1; command was introduced.

Release 6.3.1; **Tunnel Source Address** and **Tunnel Destination Address** fields added.

Release 6.4.3; **DHCP Client** options added.

**Related Commands**

<b>ip interface</b>	Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.
<b>ip interface dhcp-client</b>	Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.
<b>ip interface tunnel</b>	Configures the end points for the GRE and IPIP tunnels.
<b>show icmp statistics</b>	Displays ICMP statistics and errors.

## show ip managed-interface

Displays the application name and the corresponding interface name.

**show ip managed-interface**

---

### Syntax Definitions

N/A.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to view the interface name used by the application.

### Examples

```
-> show ip managed-interface
Application      Interface-Name
-----+-----
tacacs          -
sflow           -
ntp             Loopback0
syslog          -
dns             -
dhcp-server     -
telnet          management
ssh             -
tftp            -
ldap-server     -
radius          -
snmp            -
ftp             -
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

### **ip managed-interface**

Specifies the source IP address for the outgoing packets that are sent by the applications.

  AlaIpManagedIntfAppIndex  
  alaIpManagedIntfEntry  
  alaIpManagedIntfName  
  alaIpManagedRowStatus

---

## show ip route

Displays the IP Forwarding table.

**show ip route [summary]**

---

### Syntax Definitions

**summary** Displays a summary of routing protocols that appear in the IP Forwarding table.

### Defaults

By default, all routes are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (e.g., RIP, OSPF).
- Use the optional **summary** keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.

### Examples

```
-> show ip route
```

```
+ = Equal cost multipath routes
```

```
* = BFD Enabled
```

```
Total 8 routes
```

Dest Address	Subnet Mask	Gateway Addr	Age	Protocol
20.20.20.0	255.255.255.0	20.20.20.10	01:56:01	LOCAL
32.32.32.0	255.255.255.0	*20.20.20.152	00:00:01	NETMGMT
60.60.60.0	255.255.255.0	*20.20.20.152	00:01:22	NETMGMT
70.70.70.0	255.255.255.0	70.70.70.151	00:01:22	LOCAL
71.71.71.0	255.255.255.0	71.71.71.151	00:01:22	LOCAL
78.78.78.0	255.255.255.0	*80.80.80.142	00:01:22	NETMGMT
79.79.79.0	255.255.255.0	79.79.79.151	00:01:23	LOCAL
127.0.0.1	255.255.255.255	127.0.0.1	01:57:15	LOCAL

```
-> show ip route summary
```

Protocol	Route Count
All	8
Local	5
Netmgmt	3
RIP	0
ISIS	0

OSPF	0
BGP	0
Other	0

### *output definitions*

---

<b>Dest Addr</b>	Destination IP address.
<b>Subnet Mask</b>	Destination IP address IP subnet mask.
<b>Gateway Addr</b>	IP address of the gateway from which this address was learned.
<b>Age</b>	Age of the entry. If the entry is less than a day old, it is displayed in <i>hh/mm/ss</i> format. If it is more than a day old, it is displayed in <i>dd/hh</i> format (e.g., a route that is 2 days and 12 hours old is displayed as 2d12h).
<b>Protocol</b>	Protocol by which this IP address was learned (e.g., RIP). NETMGT indicates a static route. LOCAL indicates a local interface.
<b>Route Count</b>	The number of routes that appear in the IP Forwarding table for each protocol type listed.

---

### **Release History**

Release 6.1; command was introduced.  
Release 6.3.4; **BFD Enabled** field added.

### **Related Commands**

<b>ping</b>	Used to test whether an IP destination can be reached from the local switch.
<b>traceroute</b>	Used to find the path taken by an IP packet from the local switch to a specified destination.
<b>show ip managed-interface</b>	Displays a list of all routes (static and dynamic) that exist in the IP router database.

---

## show ip route-pref

Displays the IPv4 routing preferences of a router.

```
show ip route-pref
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip route-pref
  Protocol      Route Preference Value
-----+-----
  Local         1
  Static        2
  OSPF          110
  RIP           100
  EBGP          190
  IBGP          200
```

### Release History

Release 6.1.1; command was introduced.

Release 6.1.3; **bgp** parameter deprecated; **ebgp** and **ibgp** parameters added.

### Related Commands

[ip route-pref](#) Configures the route preference of a router.

## **MIB Objects**

```
alaIprmRtPrefTable  
  alaIprmRtPrefLocal  
  alaIprmRtPrefStatic  
  alaIprmRtPrefOspf  
  alaIprmRtPrefRip  
  alaIprmRtPrefEbgp  
  alaIprmRtPrefIbgp
```

---

## show ip redist

Displays the IPv4 route map redistribution configuration.

**show ip redist** [**rip** | **ospf** | **bgp**]

---

### Syntax Definitions

<b>rip</b>	Displays route map redistribution configurations that use RIP as the destination (into) protocol.
<b>ospf</b>	Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.
<b>bgp</b>	Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

### Defaults

By default all route map redistribution configurations are shown.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

### Release History

Release 6.1.3; command was introduced.

### Examples

```
-> show ip redist
```

Source Protocol	Destination Protocol	Status	Route Map
RIP	OSPF	Enabled	ipv4rm
BGP	RIP	Enabled	ipv4rm

```
-> show ip redist rip
```

Source Protocol	Destination Protocol	Status	Route Map
BGP	RIP	Enabled	ipv4rm

*output definitions*

---

<b>Source Protocol</b>	The protocol from which the routes are learned.
<b>Destination Protocol</b>	The protocol into which the source protocol routes are redistributed.
<b>Status</b>	The administrative status ( <b>Enabled</b> or <b>Disabled</b> ) of the route map redistribution configuration.
<b>Route Map</b>	The name of the route map that is applied with this redistribution configuration.

---

**Related Commands**

**ip redistrib** Controls the conditions for redistributing different IPv6 routes between protocols.

**MIB Objects**

```
alaRouteMapRedistProtoTable  
  alaRouteMapRedistSrcProtoId  
  alaRouteMapRedistDestProtoId  
  alaRouteMapRedistRouteMapIndex  
  alaRouteMapRedistStatus  
  alaRouteMapRedistAddressType  
  alaRouteMapRedistRowStatus
```

---

## show ip access-list

Displays the details of the access list.

**show ip access-list** [*access-list-name*]

---

### Syntax Definitions

*access-list-name*                      Name of the access list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists will be displayed.

### Examples

```
-> show ip access-list
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_3	10.0.0.0/8	permit	all-subnets
al_3	11.0.0.0/8	permit	all-subnets
al_4	1.0.0.0/8	permit	no-subnets
al_4	10.0.0.0/8	permit	all-subnets

```
-> show ip access-list al_4
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_4	1.0.0.0/8	permit	no-subnets
al_4	10.0.0.0/8	permit	all-subnets

### output definitions

---

<b>Name</b>	Name of the access list.
<b>Address/Prefix Length</b>	IP address that belongs to the access list.
<b>Effect</b>	Indicates whether the IP address is permitted or denied for redistribution.
<b>Redistribution Control</b>	Indicates the conditions specified for redistributing the matched routes.

---

## Release History

Release 6.1.3; command was introduced.

## Related Commands

- |                                        |                                                                          |

```

---

## show ip route-map

Displays the IP route maps configured on the switch.

```
show ip route-map [route-map-name]
```

---

### Syntax Definitions

*route-map-name*                      The name of the specific route map.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If the *route-map-name* is not specified in this command, all the route maps are displayed.

### Examples

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redistrib-control all-subnets permit
  set metric 100 effect replace
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

<b>ip route-map action</b>	Creates a route map for redistribution and sets the status of route map to permit or deny.
<b>ip route-map match ip address</b>	Matches the route with the specified IPv4 address or with addresses contained in an IPv4 access list specified by the access list name.
<b>ip route-map match ipv6 address</b>	Matches the route with the specified IPv6 address or with addresses contained in an IPv6 access list specified by the access list name.
<b>ip route-map match ip-nexthop</b>	Matches the routes that have a next-hop router address permitted by the specified access list.
<b>ip route-map match ipv6-nexthop</b>	Matches the routes that have an IPv6 next-hop router address permitted by the specified access list.
<b>ip route-map match tag</b>	Permits or denies a route based on the specified next-hop IP address.
<b>ip route-map match tag</b>	Matches the tag value specified in the route map with the one that the routing protocol learned the route on.
<b>ip route-map match metric</b>	Matches the metric value specified in the route map with the one that the routing protocol learned the route on.
<b>ip route-map match route-type</b>	Matches the specified route type with the one that the routing protocol learned the route on.

## MIB Objects

alaRouteMapTable
  alaRouteMapIndex
  alaRouteMapSequence
  alaRouteMapType
  alaRouteMapValue
  alaRouteMapRowStatus
```

---

---

## show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

```
show ip router database [protocol type / gateway ip_address / dest {ip_address/prefixLen / ip_address}]
```

---

### Syntax Definitions

<i>type</i>	Routing protocol type (local, static, OSPF, RIP, or BGP).
<i>ip_address</i>	Destination IP address.
<i>ip_address/prefixLen</i>	The destination IP address along with the prefix length of the routes processed for redistribution.

### Defaults

By default, all routes are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the **protocol** and **dest** options to display only those routes that are of a specific protocol type and have the specified destination network.
- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ip route** command to view the forwarding table.
- If an expected route does not appear in the IP forwarding table, use the **show ip router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSPF, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ip router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

## Examples

```
-> show ip router database
Legend: + indicates routes in-use
        * indicates BFD-enabled static route
        r indicates recursive static route, with following address in brackets
```

Total IPRM IPv4 routes: 9

Destination	Gateway	Protocol	Metric	Tag	Misc-Info
+ 10.212.31.0/24	10.212.60.27	OSPF	2	44	
+ 10.212.31.0/24	10.212.61.27	OSPF	2	43	
+ 10.212.59.0/24	10.212.59.17	LOCAL	1	45	
+ 10.212.60.0/24	10.212.60.17	LOCAL	1	44	
+ 10.212.61.0/24	10.212.61.17	LOCAL	1	43	
+ 10.212.66.0/24	10.212.66.17	LOCAL	1	46	
+r 143.209.92.0/24	172.28.6.254	STATIC	1	N/A	[192.168.10.1]
+ 172.28.6.0/24	172.28.6.2	LOCAL	1	6	
+ 172.28.6.0/24	10.212.66.18	OSPF	1	46	

Inactive Static Routes

Destination	Gateway	Metric
1.0.0.0/8	8.4.5.3	1

```
-> show ip router database dest 10.212.62.0/24 protocol ospf
```

Destination	Gateway	Protocol	Metric	Tag	Misc-Info
10.212.62.0/24	10.212.60.27	OSPF	2	44	
10.212.62.0/24	10.212.61.27	OSPF	2	43	

Inactive Static Routes

Destination	Gateway	Metric
1.0.0.0/8	8.4.5.3	1

### output definitions

<b>Destination</b>	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, /24 indicates the destination IP address has a 24-bit mask (255.255.255.0)
	+ indicates routes in-use * indicates BFD-enabled static route 'r' indicates a recursive static route.
<b>Gateway</b>	IP address of the gateway from which this route was learned.
<b>Protocol</b>	Protocol by which this IP address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
<b>Metric</b>	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.

**output definitions**

---

<b>Tag</b>	The VLAN on which the route was <i>learned</i> , not forwarded. Note that <b>N/A</b> appears in this field for static routes as they are not learned on a VLAN.
<b>Misc-Info</b>	Used for various output such as IP address of the recursive static route or IP address of backup routes.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.5; mask parameter deleted; /prefixLen parameter added.

Release 6.4.3; 'r' added to indicate recursive static route.

**Related Commands**

[show ip route](#) Displays the IP Forwarding table.

---

## show ip emp-route

Displays the IP routes associated with the Ethernet Management Port (EMP).

**show ip emp-route**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.

### Examples

```
-> show ip emp-route
```

Dest Address	Subnet Mask	Gateway Addr	Age	Protocol
127.0.0.1	255.255.255.255	127.0.0.1	2d 4h	LOCAL
172.17.1.10	255.255.255.255	10.255.11.225	1d 5h	LOCAL

#### *output definitions*

---

<b>Dest Addr</b>	Destination IP address.
<b>Subnet Mask</b>	Destination IP address IP subnet mask.
<b>Gateway Addr</b>	IP address of the gateway from which this address was learned.
<b>Age</b>	Age of the entry. If the entry is less than a day old, it is displayed in <i>hh/mm/ss</i> format. If it is more than a day old, it is displayed in <i>dd/hh</i> format (e.g., a route that is 2 days and 12 hours old is displayed as 2d12h).
<b>Protocol</b>	Protocol by which this IP address was learned (e.g., RIP). NETMGT indicates a static route. LOCAL indicates a local interface.

---

### Release History

Release 6.1; command was introduced.

**Related Commands****ping**

Tests whether an IP destination can be reached from the local switch.

**traceroute**

Finds the path taken by an IP packet from the local switch to a specified destination.

---

## show ip config

Displays IP configuration parameters.

**show ip config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip config
IP directed-broadcast = OFF,
IP default TTL       = 64
```

### *output definitions*

---

<b>IP directed-broadcast</b>	Indicates whether the IP directed-broadcast feature is on or off.
<b>IP default TTL</b>	IP default TTL interval.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

- [ip directed-broadcast](#) Enables or disables IP directed broadcasts routed through the switch.
- [ip default-ttl](#) Sets TTL value for IP packets.
-

## show ip protocols

Displays switch routing protocol information and status.

**show ip protocols**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command also displays the switch's primary IP address and router ID, if configured, and debug information.

### Examples

```
-> show ip protocols
Router ID                = 10.255.11.243,
Primary addr            = 10.255.11.243,

RIP status              = Not Loaded,
OSPF status             = Not Loaded,
BGP status              = Not Loaded,
DVMRP status           = Not Loaded,
PIMSM status           = Not Loaded,

Debug level             = 1,
Debug sections         = error,
```

### *output definitions*

---

<b>Router ID</b>	The set routing ID. The router ID is how the router is identified in IP.
<b>Primary addr</b>	The primary interface address the route uses.
<b>RIP status</b>	Whether RIP is loaded or not.
<b>OSPF status</b>	Whether OSPF is loaded or not.
<b>BGP status</b>	Whether BGP is loaded or not.
<b>DVMRP status</b>	Whether DVMRP is loaded or not.
<b>PIMSM status</b>	Whether PIMSM is loaded or not.
<b>Debug level</b>	What the current router debug level is.
<b>Debug sections</b>	What types of debugging information are being tracked.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

**ip router primary-address** Configures the router primary IP address.  
**ip router router-id** Configures the router ID for the router.

## MIB Objects

alaIpRouteSumTable  
    alaIpRouteProtocol

---

## show ip service

Displays the current status of TCP/UDP service ports.

**show ip service**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The display output from this command also includes the service port number.

### Examples

```
-> show ip service
```

Name	Port	Status
ftp	21	enabled
ssh	22	disabled
telnet	23	disabled
udp-relay	67	disabled
http	80	disabled
network-time	123	disabled
snmp	161	disabled
avlan-telnet	259	disabled
avlan-http	260	disabled
avlan-secure-http	261	disabled
secure_http	443	enabled
avlan-http-proxy	262	disabled

#### *output definitions*

---

<b>Name</b>	Name of the TCP/UDP service.
<b>Port</b>	The TCP/UDP well-known port number associated with the service.
<b>Status</b>	The status of the well-known service port: <b>enabled</b> (port is closed) or <b>disabled</b> (port is open).

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### [ip service](#)

Enables (opens) or disables (closes) well-known TCP/UDP service ports.

## MIB Objects

```

  alaIpServiceType
  alaIpServicePort
  alaIpServiceStatus
alaIpPortServiceTable
  alaIpPortServicePort
  alaIpPortServiceStatus
```

---

## show ip dynamic-proxy-arp

Displays the dynamic proxy ARP table. The ARP table contains a listing of router IP addresses and their corresponding translations to physical MAC addresses.

**show ip dynamic-proxy-arp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The OmniSwitch will provide the proxy arp functionality for the addresses contained in this table.
- Dynamic proxy arp is used in conjunction with the DHCP Snooping and Port Mapping features.

### Examples

```
-> show ip dynamic-proxy-arp
```

Router IP Addr	Hardware Addr	VLAN	Interfaces
172.18.16.1	00:d0:95:3a:e8:08	10	1/1
172.18.16.100	00:1a:92:42:ac:63	20	3/2

#### *output definitions*

---

<b>Router IP Addr</b>	Router IP address.
<b>Hardware Addr</b>	Router MAC address.
<b>VLAN</b>	The VLAN the entry is learned on.
<b>Interface</b>	The interface the entry is learned on.

---

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**port mapping dynamic-proxy-arp** Enables or disables the dynamic proxy arp functionality on a port mapping session.

**ip helper dhcp-snooping** Enables or disables dhcp snooping.

## MIB Objects

```
alaIpNetToMediaDpGroup
  alaIpNetToMediaDpaPhysAddress
  alaIpNetToMediaDpaIpType
  alaIpNetToMediaDpaIp
  alaIpNetToMediaDpaSlot
  alaIpNetToMediaDpaPort
```

---

---

## show vrf

Displays the Multiple VRF instance configuration for the switch.

`show vrf`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E, 6855-U24X

### Usage Guidelines

Information is displayed for all VRF instances configured on the switch.

### Examples

```
-> show vrf
Virtual Routers   Protocols
-----
      default
      IpOne      RIP
      IpTwo      BGP
```

### Release History

Release 6.4.1; command was introduced.

### Related Commands

[vrf](#) Configures a Multiple VRF instance for the switch.

### MIB Objects

```
alaVirtualRouterNameTable
  alaVirtualRouterNameIndex
  alaVirtualRouterName
```

---

## show arp

Displays the ARP table. The ARP table contains a listing of IP addresses and their corresponding translations to physical MAC addresses.

**show arp** [*ip\_address* | *hardware\_address*]

---

### Syntax Definitions

*ip\_address* IP address of the entry you want to view.  
*hardware\_address* MAC address of the entry you want to view.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the basic command (**show arp**) to view all of the entries in the table. Enter a specific IP address or MAC address to view a specific entry.

### Examples

```
-> show arp
Total 8 arp entries
Flags (P=Proxy, A=Authentication, V=VRRP)
```

IP Addr	Hardware Addr	Type	Flags	Port	Interface	Name
10.255.11.59	00:50:04:b2:c9:ee	DYNAMIC		3/20	vlan 1	
10.255.11.48	00:50:04:b2:ca:11	DYNAMIC		3/20	vlan 1	
10.255.11.201	00:10:83:03:e7:e4	DYNAMIC		3/20	vlan 1	
10.255.11.14	00:10:5a:04:19:a7	DYNAMIC		3/20	vlan 1	
10.255.11.64	00:b0:d0:62:fa:f1	DYNAMIC		3/20	vlan 1	
10.255.13.25	00:b0:d0:42:80:24	DYNAMIC		0/20	vlan 13	agg20
10.255.13.26	00:b0:d0:42:82:59	DYNAMIC		0/20	vlan 13	agg20
10.255.11.254	11:50:04:11:11:11	STATIC		3/20	vlan 1	demoarp

### output definitions

---

<b>IP Address</b>	Device IP address.
<b>Hardware Addr</b>	MAC address of the device that corresponds to the IP address.
<b>Type</b>	Indicates whether the ARP cache entries are dynamic or static.
<b>Flags</b>	Indicates the type of entry: <ul style="list-style-type: none"> <li>• P = Proxy</li> <li>• A = Authentication (AVLAN)</li> <li>• V = VRRP</li> </ul>
<b>Port</b>	The port or link aggregate on the switch attached to the device identified by the IP address.

---

*output definitions (continued)*

---

<b>Interface</b>	The interface to which the entry belongs (e.g., VLAN, EMP).
<b>Name</b>	User configured name of static arp entry.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands****ip service**

Adds a permanent entry to the ARP table.

**clear arp-cache**

Deletes all dynamic entries from the ARP table.

**MIB Objects**

```
ipNetToMediaTable
  ipNetToMediaIfIndex
  ipNetToMediaNetAddress
  ipNetToMediaPhyAddress
  ipNetToMediaType
ipNetToMediaAugTable
  ipNetToMediaSlot
  ipNetToMediaPort
alaIpNetToMediaTable
  alaIpNetToMediaPhyAddress
  alaIpNetToMediaProxy
  alaIpNetToMediaVRRP
  alaIpNetToMediaAuth
```

---

## show arp summary

Displays the number of each ARP entry type.

**show arp summary**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

-> show arp summary

Type	Count
-----+-----	
Total	105
Static	2
Dynamic	100
Authenticated	3
Proxy	0
VRRP	0

### *output definitions*

---

<b>Type</b>	The type of ARP entry.
<b>Count</b>	The number of entries for that type.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

[show arp](#) Displays the ARP table.

## show arp filter

Displays a list of ARP filters configured for the switch.

**show arp filter** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP address of the filter entry you want to view.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

### Examples

```
-> show arp filter
```

IP Addr	IP Mask	Vlan	Type	Mode
171.11.1.1	255.255.255.255	0	target	block
172.0.0.0	255.0.0.0	0	target	block
198.0.0.0	255.0.0.0	0	sender	block
198.172.16.1	255.255.255.255	200	target	allow

```
-> show arp filter 198.172.16.1
```

IP Addr	IP Mask	Vlan	Type	Mode
198.0.0.0	255.0.0.0	0	sender	block
198.172.16.1	255.255.255.255	200	target	allow

### output definitions

---

<b>IP Addr</b>	The ARP packet IP address to which the filter is applied.
<b>IP Mask</b>	The IP mask that specifies which part of the IP address to which the filter is applied.
<b>Vlan</b>	A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.
<b>Type</b>	Indicates which IP address in the ARP packet ( <b>sender</b> or <b>target</b> ) is used to identify if a filter exists for that address.
<b>Mode</b>	Indicates whether or not to <b>block</b> or <b>allow</b> a switch response to an ARP packet that matches the filter.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

[arp filter](#)

Adds a permanent entry to the ARP table.

[clear arp filter](#)

Deletes all dynamic entries from the ARP table.

## MIB Objects

alaIpArpFilterTable

  alaIpArpFilterIpAddr

  alaIpArpFilterIpMask

  alaIpArpFilterVlan

## show icmp control

Allows the viewing of the ICMP control settings.

**show icmp control**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to view the status of the various ICMP messages. It is also useful to determine the type and code of the less common ICMP messages.

### Examples

```
-> show icmp control
```

Name	Type	Code	Status	min-pkt-gap(us)
echo reply	0	0	enabled	0
network unreachable	3	0	enabled	0
host unreachable	3	1	enabled	0
protocal unreachable	3	2	enabled	0
port unreachable	3	3	enabled	0
frag needed but DF bit set	3	4	enabled	0
source route failed	3	5	enabled	0
destination network unknown	3	6	enabled	0
destination host unknown	3	7	enabled	0
source host isolated	3	8	enabled	0
dest network admin prohibited	3	9	enabled	0
host admin prohibited by filter	3	10	enabled	0
network unreachable for TOS	3	11	enabled	0
host unreachable for TOS	3	12	enabled	0
source quench	4	0	enabled	0
redirect for network	5	0	enabled	0
redirect for host	5	1	enabled	0
redirect for TOS and network	5	2	enabled	0
redirect for TOS and host	5	3	enabled	0
echo request	8	0	enabled	0
router advertisement	9	0	enabled	0
router solicitation	10	0	enabled	0
time exceeded during transmit	11	0	enabled	0
time exceeded during reassembly	11	1	enabled	0
ip header bad	12	0	enabled	0
required option missing	12	1	enabled	0
timestamp request	13	0	enabled	0

timestamp reply	14	0	enabled	0
information request(obsolete)	15	0	enabled	0
information reply(obsolete)	16	0	enabled	0
address mask request	17	0	enabled	0
address mask reply	18	0	enabled	0

### *output definitions*

---

<b>Name</b>	The name of the ICMP message.
<b>Type</b>	The ICMP message type. This along with the ICMP code specify the kind of ICMP message.
<b>Code</b>	The ICMP message code. This along with the ICMP type specify the kind of ICMP message.
<b>Status</b>	Whether this message is <b>Enabled</b> or <b>Disabled</b> .
<b>min-pkt-gap</b>	The minimum packet gap, in microseconds, for this ICMP message. The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

---

### **Release History**

Release 6.1; command was introduced.

### **Related Commands**

<b>icmp type</b>	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
<b>icmp unreachable</b>	Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.
<b>icmp echo</b>	Enables or disables ICMP echo messages, and sets the minimum packet gap.
<b>icmp timestamp</b>	Enables or disables ICMP timestamp messages, and sets the minimum packet gap.
<b>icmp addr-mask</b>	Enables or disables ICMP address mask messages, and sets the minimum packet gap.
<b>icmp messages</b>	Enables or disables all ICMP messages.

---

## show icmp statistics

Displays Internet Control Message Protocol (ICMP) statistics and errors. ICMP is a network layer protocol within the IP protocol suite that provides message packets to report errors and other IP packet processing information back to the source. ICMP generates several kinds of useful messages, including Destination Unreachable, Echo Request and Reply, Redirect, Time Exceeded, and Router Advertisement and Solicitation. If an ICMP message cannot be delivered, no second one is generated. This is to avoid an endless flood of ICMP messages.

**show icmp [statistics]**

---

### Syntax Definitions

**statistics** Optional syntax.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the ICMP Table to monitor and troubleshoot the switch.

### Examples

```
-> show icmp
```

Messages	Received	Sent
Total	2105	2105
Error	0	0
Destination unreachable	0	0
Time exceeded	0	0
Parameter problem	0	0
Source quench	0	0
Redirect	0	0
Echo request	2105	0
Echo reply	0	2105
Time stamp request	0	0
Time stamp reply	0	0
Address mask request	0	0
Address mask reply	0	0

#### *output definitions*

<b>Total</b>	Total number of ICMP messages the switch received or attempted to send. This counter includes all those counted as errors.
<b>Error</b>	Number of ICMP messages the switch sent/received but was unable to process because of ICMP-specific errors (e.g., bad ICMP checksums, bad length).
<b>Destination unreachable</b>	Number of “destination unreachable” messages that were sent/received by the switch.

**output definitions (continued)**

---

<b>Time exceeded</b>	Number of “time exceeded” messages that were sent/received by the switch. These occur when a packet is dropped because the TTL counter reaches zero. When a large number of these occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.
<b>Parameter problem</b>	Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending host’s IP software or possibly the gateway’s software.
<b>Source quench</b>	Number of messages sent/received that tell a host that it is sending too many packets. A host should attempt to reduce its transmissions upon receiving these messages.
<b>Redirect</b>	Number of ICMP redirect messages sent/received by the switch.
<b>Echo request</b>	Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.
<b>Echo reply</b>	Number of echo reply messages received by the switch.
<b>Time stamp request</b>	Number of time stamp request messages sent/received by the switch.
<b>Time stamp reply</b>	Number of time stamp reply messages sent/received by the switch.
<b>Address mask request</b>	Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.
<b>Address mask reply</b>	Number of address mask reply messages that were sent/received by the switch.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[show udp statistics](#) Displays UDP errors and statistics.

---

## show tcp statistics

Displays TCP statistics.

**show tcp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show tcp statistics
Total segments received = 235080,
Error segments received = 0,
Total segments sent = 363218,
Segments retransmitted = 38,
Reset segments sent = 97,
Connections initiated = 57185,
Connections accepted = 412,
Connections established = 1,
Attempt fails = 24393,
Established resets = 221
```

#### *output definitions*

<b>Total segments received</b>	Total number of segments received, including those received in error. This count includes segments received on currently established connections.
<b>Error segments received</b>	Total number of segments received in error (e.g., bad TCP checksums).
<b>Total segments sent</b>	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
<b>Segments retransmitted</b>	Number of TCP segments transmitted containing one or more previously transmitted octets.
<b>Reset segments sent</b>	Number of TCP segments containing the reset flag.
<b>Connections initiated</b>	Number of connections attempted.
<b>Connections accepted</b>	Number of connections allowed.
<b>Connections established</b>	Number of successful connections.

*output definitions (continued)*

---

<b>Attempt fails</b>	Number of times attempted TCP connections have failed.
<b>Established resets</b>	Number of times TCP connections have been reset from the "Established" or "Close Wait" state to the "Closed" state.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">show icmp statistics</a>	Displays ICMP statistics and errors.
<a href="#">show tcp ports</a>	Displays the TCP connection table.

---

## show tcp ports

Displays the TCP connection table.

**show tcp ports**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this table to check the current available TCP connections.

### Examples

-> show tcp ports

Local Address	Local Port	Remote Address	Remote Port	State
0.0.0.0	21	0.0.0.0	0	LISTEN
0.0.0.0	23	0.0.0.0	0	LISTEN
0.0.0.0	80	0.0.0.0	0	LISTEN
0.0.0.0	260	0.0.0.0	0	LISTEN
0.0.0.0	261	0.0.0.0	0	LISTEN
0.0.0.0	443	0.0.0.0	0	LISTEN
0.0.0.0	6778	0.0.0.0	0	LISTEN
10.255.11.223	23	128.251.16.224	1867	ESTABLISHED
10.255.11.223	2509	10.255.11.33	389	TIME-WAIT
10.255.11.223	2510	10.255.11.25	389	TIME-WAIT
10.255.11.223	2513	10.255.11.33	389	TIME-WAIT
10.255.11.223	2514	10.255.11.25	389	TIME-WAIT
10.255.11.223	2517	10.255.11.33	389	TIME-WAIT
10.255.11.223	2518	10.255.11.25	389	TIME-WAIT
10.255.11.223	2521	10.255.11.33	389	TIME-WAIT

10.255.11.223	2526	10.255.11.25	389	TIME-WAIT
10.255.11.223	2529	10.255.11.33	389	TIME-WAIT
10.255.11.223	2530	10.255.11.25	389	TIME-WAIT

#### *output definitions*

<b>Local Address</b>	Local IP address for this TCP connection. If a connection is in the LISTEN state and will accept connections for any IP interface associated with the node, IP address 0.0.0.0 is used.
<b>Local Port</b>	Local port number for this TCP connection. The range is 0–65535.
<b>Remote Address</b>	Remote IP address for this TCP connection.

*output definitions (continued)*

---

<b>Remote Port</b>	Remote port number for this TCP connection. The range is 0–65535.
<b>State</b>	<p>State of the TCP connection, as defined in RFC 793. A connection progresses through a series of states during its lifetime:</p> <ul style="list-style-type: none"><li>• Listen—Waiting for a connection request from any remote TCP and port.</li><li>• Syn Sent—Waiting for a matching connection request after having sent a connection request.</li><li>• Syn Received—Waiting for a confirming connection request acknowledgment after having both received and sent a connection request.</li><li>• Established—Open connection. Data received can be delivered to the user. This is the normal state for the data transfer phase of the connection.</li><li>• Fin Wait 1—Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent.</li><li>• Fin Wait 2—Waiting for a connection termination request from the remote TCP.</li><li>• Close Wait—Waiting for a connection termination request from the local user.</li><li>• Closing—Waiting for a connection termination request acknowledgment from the remote TCP.</li><li>• Last Ack—Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request).</li><li>• Time Wait—Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request.</li><li>• Closed—No connection state.</li></ul>

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">show ip interface</a>	Displays the status and configuration of IP interfaces.
<a href="#">show tcp statistics</a>	Displays TCP statistics.

---

---

## show udp statistics

Displays UDP errors and statistics.

**show udp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

### Examples

```
-> show udp statistics
Total datagrams received = 214937,
Error datagrams received = 0,
No port datagrams received = 32891,
Total datagrams sent = 211884
```

#### *output definitions*

---

<b>Total datagrams received</b>	Total number of UDP datagrams delivered to UDP applications.
<b>Error datagrams received</b>	Number of UDP datagrams that could not be delivered for any reason.
<b>No port datagrams received</b>	Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.
<b>Total datagrams sent</b>	Total number of UDP datagrams sent from this switch.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

[show udp ports](#) Displays the UDP Listener table.

---

## show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

**show udp ports**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

### Examples

```
-> show udp port
Local Address      Local Port
-----+-----
 0.0.0.0           67
 0.0.0.0           161
 0.0.0.0           520
```

#### *output definitions*

---

<b>Local Address</b>	Local IP address for this UDP connection.
<b>Local Port</b>	Local port number for this UDP connection.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

[show udp statistics](#) Displays UDP errors and statistics.

---

## show ip dos config

Displays the configuration parameters of the DoS scan for the switch.

**show ip dos config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

### Examples

```
-> show ip dos config
```

Dos type	Status
-----+-----	
port scan	ENABLED
tcp sync flood	ENABLED
ping of death	ENABLED
smurf	ENABLED
pepsi	ENABLED
land	ENABLED
teardrop/bonk/boink	ENABLED
loopback-src	ENABLED
invalid-ip	ENABLED
invalid-multicast	ENABLED
unicast dest-ip/multicast-mac	ENABLED
ping overload	DISABLED
arp flood	ENABLED
arp poison	ENABLED
DoS trap generation	= ENABLED,
DoS port scan threshold	= 1000,
DoS port scan decay	= 2,
DoS port scan close port penalty	= 10,
DoS port scan TCP open port penalty	= 0,
DoS port scan UDP open port penalty	= 0,
Dos MAXimum Ping Rate	= 100
Dos Maximum ARP Request Rate	= 500

*output definitions*

---

<b>DoS trap generation</b>	Displays the status of DoS trap generation. It is either <b>ENABLED</b> or <b>DISABLED</b> . This is set using the <b>ip dos trap</b> command.
<b>DoS port scan threshold</b>	The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. This is set using the <b>ip dos scan threshold</b> command.
<b>DoS port scan decay</b>	The decay value for the switch. The penalty value of the switch is decreased by this number every minute. This is set using the <b>ip dos scan decay</b> command.
<b>DoS port scan close port penalty</b>	The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. This is set using the <b>ip dos scan close-port-penalty</b> command.
<b>DoS port scan TCP open port penalty</b>	The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. This is set using the <b>ip dos scan tcp open-port-penalty</b> command.
<b>DoS port scan UDP open port penalty</b>	The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. This is set using the <b>ip dos scan udp open-port-penalty</b> command.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**show ip dos statistics** Displays the statistics on detected DoS attacks for the switch.

**MIB Objects**

alaDosTable  
alaDoSType

---

## show ip dos statistics

Displays the statistics on detected DoS attacks for the switch.

**show ip dos statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- Just because an attack is detected and reported, doesn't necessarily mean an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.

### Examples

```
-> show ip dos statistics
DoS type           Attacks detected
-----+-----
port scan          0
tcp sync flood     0
ping of death      0
smurf              0
pepsi              0
land               0
teardrop/bonk/boink 0
loopback-src       0
invalid-ip         0
invalid-multicast  0
unicast dest-ip/multicast-mac 0
ping overload      0
arp flood          0
arp poison         0
```

### *output definitions*

---

<b>DoS type</b>	The type of DoS attack. The most common seven are displayed.
<b>Attacks detected</b>	The number of attacks noted for each DoS type.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

[show ip dos config](#)

Displays the configuration parameters of the DoS scan for the switch.

## MIB Objects

alaDoSTable

alaDoSType

---

## show ip dos arp-poison

Displays the number of attacks detected for configured ARP poison restricted-addresses.

```
show ip dos arp-poison
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip dos arp-poison
  IP Address                               Attacks
-----+-----
192.168.1.1                               0
192.168.1.2                               0
192.168.1.3                               0
```

#### *output definitions*

---

<b>IP Address</b>	The configured ARP Poison restricted-addresses.
<b>Attacks detected</b>	The number of ARP Poison attacks detected for each address.

---

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[ip dos arp-poison restricted-address](#) Adds or deletes an ARP Poison restricted address.

### MIB Objects

```
alaDoSArpPoisonTable
  alaDoSArpPoisonIpAddr
  alaDoSArpPoisonDetected
```

---

## ip wccp admin-state

Enables or disables the Web Cache Communication Protocol (WCCP) globally on the switch.

**ip wccp admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the administrative status for the WCCP feature.
<b>disable</b>	Disables the administrative status for the WCCP feature.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to enable or disable the WCCP globally on the switch.

### Examples

```
-> ip wccp admin-state enable
-> ip wccp admin-state disable
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

<a href="#">clear ip wccp</a>	Clears the statistics for the given service group.
<a href="#">show ip wccp service-group</a>	Displays the global statistics related to WCCP.
<a href="#">show ip wccp service-group</a>	Displays the WCCP statistics related to the specified service group.

### MIB Objects

wccpAdminEnabled

---

## ip wccp service-group web-cache md5

Configures one or a range of service groups and sets the MD5 authentication.

**ip wccp service-group** {web-cache | *service-id*[-*service-id2*]} [**md5 password** *string*]

**no ip wccp service-group** {web-cache | *service-id*[-*service-id2*]}

---

### Syntax Definitions

<b>web-cache</b>	The well-known service (ID = 0).
<i>service-id</i>	A WCCP service ID number (1 to 255). Use a hyphen to specify a range of service IDs (5-10).
<i>string</i>	The MD5 password for the service group (0 to 8 characters).

### Defaults

parameter	default
md5 authentication	disabled

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove the service group.

### Examples

```
-> ip wccp service-group web-cache
-> ip wccp service-group web-cache md5 password san
-> ip wccp service-group 10
-> ip wccp service-group 10 md5 password san
-> no ip wccp service-group web-cache
-> no ip wccp service-group 10
-> no ip wccp service-group 2-8
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

[clear ip wccp](#)

Clears the statistics for the given service group.

[show ip wccp services](#)

Displays the list of service groups created on the switch and their related information.

## MIB Objects

wccpServiceTable

    wccpServiceId

    wccpServicePassword

---

## ip wccp service-group web-cache restrict

Restricts a port, VLAN or IP in a service group from processing WCCP messages.

```
ip wccp service-group {web-cache | service-id} restrict { port slot/port | vlan vlan_id | ip ipv4 [mask mask]}
```

```
no ip wccp service-group {web-cache | service-id} restrict { port slot/port | vlan vlan_id | ip ipv4 [mask mask]}
```

---

### Syntax Definitions

<b>web-cache</b>	The well-known service (ID = 0).
<i>service-id</i>	A WCCP service ID number (1 to 255).
<i>slot/port</i>	Restricts the specified port from processing the WCCP messages.
<i>vlan_id</i>	Restricts the specified VLAN from processing the WCCP messages.
<i>ipv4</i>	Restricts the specified cache server IP from processing the WCCP messages.
<i>mask</i>	Specifies an optional mask when an IPv4 address is used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove the restriction from the service group.

### Examples

```
-> ip wccp service-group web-cache restrict port 1/20
-> no ip wccp service-group web-cache restrict port 1/20
-> ip wccp service-group 10 restrict vlan 20
-> no ip wccp service-group 10 restrict vlan 20
-> ip wccp service-group 10 restrict ip 30.0.0.20
-> no ip wccp service-group 10 restrict ip 30.0.0.20
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

### **show ip wccp restricts**

Displays the restricted ports, VLANs and server IPs for the service groups created on the switch.

## MIB Objects

wccpRestrictPortTable

    wccpRestrictPortServiceId

    wccpRestrictPortIndex

wccpRestrictVlanTable

    wccpRestrictVlanServiceId

    wccpRestrictVlanVlanId

wccpRestrictWebCacheTable

    wccpRestrictWebCacheServiceId

    wccpRestrictWebCacheIpAddress

    wccpRestrictWebCacheIpMask

---

---

## clear ip wccp

Clears the statistics for the given service group.

**clear ip wccp [service-group {web-cache | *service-id*}] statistics**

---

### Syntax Definitions

**web-cache**                      The well-known service (ID = 0).  
*service-id*                      A WCCP service ID number (1 to 255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If no service group is specified, then the statistics for all the service groups are cleared.

### Examples

```
-> clear ip wccp service-group web-cache statistics  
-> clear ip wccp statistics
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

[show ip wccp service-group](#)      Displays the global statistics related to WCCP.

### MIB Objects

```
wccpStatisticsTable  
  wccpStatsServiceId
```

---

## show ip wccp status

Displays the WCCP admin status.

**show ip wccp status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A.

### Examples

```
-> show ip wccp status
Admin status           : Enabled
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

[ip wccp admin-state](#) Enable or disable the WCCP globally on the switch.

### MIB Objects

```
wccpServiceTable
  wccpAdminEnabled
```

---

## show ip wccp services

Displays the list of service groups created on the switch and their related information.

**show ip wccp services**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip wccp services
```

Service	Status	RcvId	Chgs	Caches	Type	Version	Password	Redirects
95	Enable	42	20	1	Dynamic	2	Yes	0

#### *output definitions*

---

<b>Service</b>	Indicates the WCCP service ID.
<b>Status</b>	Indicates the admin status of the WCCP service.
<b>RcvId</b>	Indicates the current Receive Id from the router for the WCCP service. This is incremented every time a WCCP message is sent.
<b>Chgs</b>	Indicates the current change number for the service. This gets updated each time there is a WCCP topology change.
<b>Caches</b>	Indicates the total number of cache servers currently active on the WCCP service.
<b>Type</b>	Indicates the WCCP service type.
<b>Version</b>	Indicates the WCCP service version.
<b>Password</b>	Indicates if password has been specified for the WCCP service.
<b>Redirects</b>	Indicates the number of packets WCCP has redirected for the service.

---

### Release History

Release 6.4.4; command was introduced.

## Related Commands

- ip wccp admin-state** Enable or disable the WCCP globally on the switch.
- ip wccp service-group web-cache md5** Allows to configure or remove a service group.

## MIB Objects

```

  wccpServiceWebCacheCount  
  wccpServiceType  
  wccpServiceVersion  
  wccpServicePassword  
  wccpStatsPacketsRedir
```

---

## show ip wccp cache-engines

Displays the various cache servers learned for the service groups created and their related information.

**show ip wccp cache-engines**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip wccp cache-engines
Service      Status      RcvId      Chgs      IP          RcvId      Chgs      Routers      Caches
-----+-----+-----+-----+-----+-----+-----+-----+-----
          95      Enable      14781      161        40.1.1.2   14781      1           1           1
```

#### *output definitions*

---

<b>Service</b>	Indicates the WCCP service ID.
<b>Status</b>	Indicates the admin status of the WCCP service..
<b>RcvId</b>	Indicates the current Receive Id from the router for the WCCP service. This is incremented every time a WCCP message is sent.
<b>Chgs</b>	Indicates the current change number for the service. This gets updated each time there is a WCCP topology change.
<b>IP</b>	Indicates the IP address of the Cache-Engine.
<b>Routers</b>	Indicates how many WCCP routers the Cache-Engine is in contact with.
<b>Caches</b>	Indicates the total count of cache servers currently active on the WCCP service.

---

### Release History

Release 6.4.4; command was introduced.

## Related Commands

**ip wccp admin-state** Enable or disable the WCCP globally on the switch.

## MIB Objects

    wccpServiceWebCacheCount

---

## show ip wccp restricts

Displays the restricted ports, VLANs and cache server IPs for the created service group.

**show ip wccp [service-group {web-cache | *service-id*}] restricts**

---

### Syntax Definitions

**web-cache**                                The well-known service (ID = 0).  
*service-id*                                A WCCP service ID number (1 to 255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If no service group is specified, the restrictions for all the service groups created is displayed..

### Examples

```
-> show ip wccp restricts
Service      Port
-----+-----
95           1/23

Service      VLAN
-----+-----
95           100

Service      IP              Mask
-----+-----+-----
65           50.0.0.90       255.255.255.255
95           60.0.0.0         255.255.255.0
```

#### *output definitions*

---

<b>Service</b>	Indicates the WCCP service ID.
<b>Port</b>	Indicates the restricted port number for the respective service group.
<b>VLAN</b>	Indicates the restricted VLAN Id for the respective service group.
<b>IP</b>	Indicates the restricted IP address for the respective service group.
<b>Mask</b>	Indicates the IP mask of the restricted IP address.

---

### Release History

Release 6.4.4; command was introduced.

## Related Commands

**ip wccp service-group web-cache restrict**

Allows to restrict a port, VLAN or IP in a service group from processing WCCP messages.

## MIB Objects

wccpRestrictPortTable

    wccpRestrictPortServiceId

    wccpRestrictPortIndex

wccpRestrictVlanTable

    wccpRestrictVlanServiceId

    wccpRestrictVlanVlanId

wccpRestrictWebCacheTable

    wccpRestrictWebCacheServiceId

    wccpRestrictWebCacheIpAddress

    wccpRestrictWebCacheIpMask

---

## show ip wccp service-group

Displays the WCCP statistics related to the specified service group.

```
show ip wccp service-group {web-cache | service-id}
```

---

### Syntax Definitions

**web-cache** The well-known service (ID = 0).

**service-id** A WCCP service ID number (1 to 255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If no service group is specified the information for all the service groups created is displayed.

### Examples

```
-> show ip wccp service-group web-cache
```

Global WCCP Information:

```
Service Name/ID      : web-cache,
Protocol             : TCP,
Ports                : 80, 0, 0, 0, 0, 0, 0, 0, 0,
Port Type           : Source,
Precedence           : 240,
Number of Cache Engines : 1,
Number of Routers    : 1,
Type of Message      : Unicast,
Total Packets Redirected : 50,
Total WCCP Messages Dropped : 0,
Total Authentication failures : 0
```

### output definitions

---

<b>Service Name/ID</b>	Indicates the WCCP service ID.
<b>Protocol</b>	Indicates the protocol type for the WCCP service.
<b>Ports</b>	Indicates the list of TCP/UDP ports identified for the service group.
<b>Port Type</b>	Indicates the port type.
<b>Precedence</b>	Indicates the priority of the service group. The lowest priority is 0, the highest is 255.
<b>Number of Cache Engines</b>	Indicates the total number of cache servers currently active on the WCCP service.

*output definitions (continued)*

---

<b>Number of Routers</b>	Indicates the total number WCCP routers the Cache-Engine is connected.
<b>Type of Message</b>	Indicates the mode of WCCP message exchange used (unicast/multicast).
<b>Total Packets Redirected</b>	Indicates the count of how many packet the WCCP has redirected for the service.
<b>Total WCCP Messages Dropped</b>	Indicates the count of how many WCCP packet were dropped for the service.
<b>Total Authentication failures</b>	Indicates the count of how many WCCP packets resulted in authentication failure because of mismatch in the password used for the service on the Router and Cache-Engine.

---

**Release History**

Release 6.4.4; command was introduced.

**Related Commands**

[ip wccp service-group web-cache md5](#) Allows to configure or remove a service group.

```

---

## show ip wccp service-group detail

Displays detailed statistics of the switch and the cache engine for specified service group.

**show ip wccp [service-group {web-cache | *service-id*}] detail**

---

### Syntax Definitions

**web-cache**                               The well-known service (ID = 0).  
*service-id*                               A WCCP service ID number (1 to 255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If the service group is not specified, then the statistics related to all the service groups are displayed.

### Examples

```
-> show ip wccp service-group web-cache detail
WCCP Detail:
Service ID: web-cache
  Router information:
    IP Address       : 10.135.38.120,
    Protocol Version : 2.0

  Cache-Engine Information
    IP Address       : 135.254.38.155,
    Protocol Version : 2.0,
    State            : Usable,
    Connect Time     : 01:10:55

-> show ip wccp detail
WCCP Detail:
Service ID: web-cache
  Router information:
    IP Address       : 10.135.38.120,
    Protocol Version : 2.0

  Cache-Engine Information
    IP Address       : 135.254.38.155,
    Protocol Version : 2.0,
    State            : Usable,
    Connect Time     : 01:10:55

Service ID: 95
  Router information:
    IP Address       : 10.135.38.120,
```

```
Protocol Version      : 2.0

Cache-Engine Information
IP Address           : 135.254.38.107,
Protocol Version     : 2.0,
State                : Usable,
Connect Time        : 00:10:17
```

### *output definitions*

---

<b>Service ID</b>	Indicates the WCCP service ID.
<b>Router information</b>	Indicates the IP address of the router and the WCCP service version supported by the Router.
<b>Cache-Engine Information</b>	
<b>IP Address</b>	Indicates the IP address of the Cache-Engine.
<b>Protocol Version</b>	Indicates the WCCP service version supported by the Cache-Engine.
<b>State</b>	Indicates the state of the Cache-Engine.
<b>Connect Time</b>	Indicates the time at which the cache server became active for the service.

---

### **Release History**

Release 6.4.4; command was introduced.

### **Related Commands**

[ip wccp admin-state](#) Enable or disable the WCCP globally on the switch.

## show ip wccp service-group view

Displays the WCCP view for the specified service group.

**show ip wccp [service-group {web-cache | *service-id*}] view**

---

### Syntax Definitions

**web-cache**                                The well-known service (ID = 0).  
*service-id*                                A WCCP service ID number (1 to 255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If the service group is not specified, then the information related to all the service groups are displayed.

### Examples

```
-> show ip wccp service-group 95 view
WCCP View:
Service ID : 95
  Routers Participating:
    10.135.38.120,
    10.135.38.140
  Cache Engines Usable:
    135.254.38.155, Connect Since: 01:10:55,
    135.254.38.170, Connect Since: 01:10:30
  Cache Engines Un-Usable:
    -none-

-> show ip wccp view
WCCP View:
Service ID: web-cache
  Routers Participating:
    10.135.38.120,
    10.135.38.140
  Cache Engines Usable:
    135.254.38.155, Connected Since: 01:10:55,
    135.254.38.170, Connected Since: 01:10:30
  Cache Engines Un-Usable:
    -none-

Service ID : 95
  Routers Participating:
    10.135.38.120
  Cache Engines Usable:
    135.254.38.20, Connected Since: 02:50:06,
```

```
135.254.38.50, Connected Since: 00:30:10
Cache Engines Un-Usable:
135.254.38.80, Disconnected Since: 00:35:10
```

### *output definitions*

---

<b>Service ID</b>	Indicates the WCCP service ID.
<b>Routers Participating</b>	Indicates the IP addresses of the routers participating in the service group.
<b>Cache Engines Usable</b>	Indicates the IP addresses of the Usable Cache-Engines participating in the service group, and the time when the cache server became active.
<b>Cache Engines Un-Usable</b>	Indicates the IP addresses of the Un-Usable Cache-Engines participating in the service group, and the time when the cache server became inactive.

---

### **Release History**

Release 6.4.4; command was introduced.

### **Related Commands**

<a href="#">ip wccp admin-state</a>	Enable or disable the WCCP globally on the switch.
<a href="#">show ip wccp service-group</a>	Displays the global statistics related to the WCCP.

### **MIB Objects**

```

  wccpRouterIpAddress
```

---

## show ip wccp service-group statistics

Displays the total number of WCCP messages transmitted, received and dropped for the specified service group.

**show ip wccp [service-group {web-cache | *service-id*}] statistics**

---

### Syntax Definitions

**web-cache**                                The well-known service (ID = 0).  
*service-id*                                A WCCP service ID number (1 to 255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If the service group is not specified, then the statistics related to all the service groups will be displayed including the total of all such statistics, along with the total number of invalid WCCP messages received.

### Examples

```
-> show ip wccp service-group 95 statistics
Service ID: 95
    Total WCCP messages Received      : 338,
    Total WCCP messages Transmitted   : 339,
    Total WCCP messages Dropped       : 0

-> show ip wccp statistics
Service ID: web-cache
    Total WCCP messages Received      : 0,
    Total WCCP messages Transmitted   : 0,
    Total WCCP messages Dropped       : 0

Service ID: 95
    Total WCCP messages Received      : 358,
    Total WCCP messages Transmitted   : 359,
    Total WCCP messages Dropped       : 0

Total:
    Total WCCP messages Received      : 358,
    Total WCCP messages Transmitted   : 359,
    Total WCCP messages Dropped       : 0,
    Total WCCP messages Invalid       : 12
```

**output definitions**

---

<b>Service ID</b>	Indicates the WCCP service ID.
<b>Total WCCP messages Received</b>	Indicates the total number of WCCP messages received by the router for the service group (if specified), else it displays the total for all the service groups created.
<b>Total WCCP messages Transmitted</b>	Indicates the total number of WCCP messages transmitted by the router for the service group (if specified), else it displays the total for all the service groups created.
<b>Total WCCP messages Dropped</b>	Indicates the total number of WCCP Messages dropped due to WCCP restrictions applied to Port/Vlan/Ip for a service group (if specified), else it displays the total for all the service groups created.

---

**Release History**

Release 6.4.4; command was introduced.

**Related Commands**

<a href="#">ip wccp admin-state</a>	Enable or disable the WCCP globally on the switch.
<a href="#">clear ip wccp</a>	Clears the statistics for the given service group.

**MIB Objects**

```
wccpStatisticsTable
  wccpServiceId
  wccpStatsMessagesReceived
  wccpStatsMessagesTransmitted
  wccpStatsMessagesDropped
```

---

# 15 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch (including RIPng commands). IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

**Expanded Routing and Addressing Capabilities** - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

**Header Format Simplification** - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

**Anycast Addressing** - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

**Improved Support for Options** - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

**Authentication and Privacy Capabilities** - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

*Filename:* Ipv6.mib  
*Module:* Ipv6-MIB, Ipv6-TCP-MIB, Ipv6-UDP-MIB

*Filename:* AlcatelIND1Ipv6.mib  
*Module:* alcatelIND1IPV6MIB

*Filename:* AlcatelIND1Iprmv6.mib  
*Module:* alcatelIND1Iprmv6MIB

*Filename:* AlcatelIND1Ripng.mib  
*Module:* alcatelIND1RipngMIB

A summary of the IPv6 commands is listed here:

---

## ipv6 interface

Configures an IPv6 interface on a VLAN or IPv6 tunnel.

```

ipv6 interface if_name [vlan vid | tunnel {tid | 6to4}] [enable | disable]
[base-reachable-time time]
[ra-send {yes | no}]
[ra-max-interval interval]
[ra-managed-config-flag {true | false}]
[ra-other-config-flag {true | false}]
[ra-reachable-time time]
[ra-retrans-timer time]
[ra-default-lifetime time / no ra-default-lifetime]
[ra-send-mtu] {yes | no}

no ipv6 interface if_name

```

---

### Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<b>vlan</b>	Creates a VLAN interface.
<i>vid</i>	VLAN ID number.
<b>tunnel</b>	Creates a tunnel interface.
<i>tid</i>	Tunnel ID number.
<b>6to4</b>	Enables 6to4 tunneling.
<b>base-reachable-time</b> <i>time</i>	Base value used to compute the reachable time for neighbors reached via this interface.
<b>ra-send</b>	Specifies whether the router advertisements are sent on this interface.
<b>ra-max-interval</b> <i>interval</i>	Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4 - 1,800.
<b>ra-managed-config-flag</b>	Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.
<b>ra-other-config-flag</b>	Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.
<b>ra-reachable-time</b> <i>time</i>	Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The range is 0 - 3,600,000. The special value of zero indicates that this time is unspecified by the router.
<b>ra-retrans-timer</b> <i>time</i>	Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.

<b>ra-default-lifetime</b> <i>time</i>	Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of “ra-max-interval” and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The “no ra-default-lifetime” option will calculate the value using the formula (3 * ra-max-interval).
<b>enable   disable</b>	Administratively enable or disable the interface.
<b>ra-send-mtu</b>	Specifies whether the MTU option is included in the router advertisements sent on the interface.

## Defaults

parameter	default
<b>ra-send</b>	yes
<b>ra-max-interval</b>	600
<b>ra-managed-config-flag</b>	false
<b>ra-reachable-time</b>	0
<b>ra-retrans-timer</b>	0
<b>ra-default-lifetime</b>	no
<b>ra-send-mtu</b>	no

## Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN and tunnel interfaces must have a name.
- When creating an IPv6 interface you must specify a VLAN ID, Tunnel ID, or **6to4**. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- A 6to4 interface cannot send advertisements (**ra-send**).
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See [Chapter 5, “VLAN Management Commands,”](#) for information on creating VLANs.
- To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the **ipv6 address global-id** command.

## Examples

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
-> ipv6 interface Test_6to4 tunnel 6to4
```

## Release History

Release 6.1; command was introduced.

Release 6.1.1; **base-reachable-time** parameter added.

## Related Commands

[show ipv6 interface](#)

Displays IPv6 Interface Table.

[show ipv6 tunnel](#)

Displays IPv6 Tunnel information and whether the 6to4 tunnel is enabled.

- alaIPv6InterfaceRowStatus

---

## ipv6 address

Configures an IPv6 address for an IPv6 interface on a VLAN, configured tunnel, or a 6to4 tunnel. There are different formats for this command depending on the address type.

```
ipv6 address ipv6_address /prefix_length [anycast] {if_name | loopback}
```

```
no ipv6 address ipv6_address [anycast] {if_name | loopback}
```

```
ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

```
no ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (3..128).
<b>anycast</b>	Indicates the address is an anycast address.
<b>eui-64</b>	Append an EUI-64 identifier to the prefix.
<i>if_name</i>	Name assigned to the interface.
<b>loopback</b>	Configures the loopback interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See [Chapter 5, “VLAN Management Commands,”](#) for information on creating VLANs.
- To route IPv6 traffic over and IPv4 network, you must create an IPv6 tunnel using the **ipv6 address global-id** command.

## Examples

```
-> ipv6 address 4132:86::19A/64 Test_Lab  
-> ipv6 address 2002:d423:2323::35/64 Test_6to4
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[show ipv6 interface](#) Displays IPv6 Interface Table.

## MIB Objects

```
IPv6IfIndex  
alaIPv6InterfaceAddressTable  
  alaIPv6InterfaceAddress  
  alaIPv6InterfaceAddressAnycastFlag  
  alaIPv6InterfaceEUI64AddressPrefixLength  
  alaIPv6InterfaceEUI64AddressRowStatus
```

For EUI-64 Addresses:

```
alaIPv6InterfaceEUI64AddresssTable  
  alaIPv6InterfaceEUI64Address  
  alaIPv6InterfaceEUI64AddressPrefixLength  
  alaIPv6InterfaceEUI64AddressRowStatus
```

---

## ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

```
ipv6 address global-id {generate | globalID}
```

---

### Syntax Definitions

<b>generate</b>	Automatically generates the global ID.
<i>globalID</i>	A 5-byte global ID value specified in the form hh:hhh:hhh

### Defaults

By default, the IPv6 global ID is set to all zeros.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added via the [ipv6 address local-unicast](#) command or when the [ipv6 address global-id](#) command is executed.

### Examples

```
-> ipv6 address global-id generate
-> ipv6 address global-id 32:57a3:8fed
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">ipv6 address local-unicast</a>	Creates a IPv6 local unicast address using the configured global ID.
<a href="#">ipv6 bgp unicast</a>	Enables or disables unicast IPv6 updates for the BGP routing process.
<a href="#">show ip bgp</a>	Displays the current global settings for the local BGP speaker.

### MIB Objects

alaIPv6GlobalID

---

## ipv6 address local-unicast

Creates a IPv6 local unicast address using the configured global ID.

**ipv6 address local-unicast** [**global-id** *globalID*] [**subnet-id** *subnetID*] {**interface-id** *interfaceID* | **eui-64**} [**prefix-length** *prefixLength*] {*if-name* | **loopback**}

**[no] ipv6 address local-unicast** [**global-id** *globalID*] [**subnet-id** *subnetID*] {**interface-id** *interfaceID* | **eui-64**} [**prefix-length** *prefixLength*] {*if-name* | **loopback**}

---

### Syntax Definitions

<i>globalID</i>	A 5-byte global ID value specified in the form hh:hhh:hhh.
<i>subnetID</i>	A 2-byte Subnet ID specified in the form 0xhhh. The valid range is 0x0000-0xffff or 0-65535.
<i>interfaceID</i>	An interface identifier specified in the form hhhh:hhh:hhh:hhh.
<b>eui-64</b>	Automatically-generated EUI-64 value to be used for interface identifier.
<i>prefixLength</i>	The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value should rarely be overridden.
<i>if-name</i>	The name assigned to the interface.
<b>loopback</b>	The loopback for the loopback interface.

### Defaults

parameter	default
<i>prefixLength</i>	64

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the local unicast address. However, addresses are normally deleted using the **ipv6 address** command.
- If the global ID value is not explicitly specified, the default global ID set by the **ipv6 address global-id** command is used.
- If the global ID value is explicitly configured using the **ipv6 address local-unicast** command, the address' global ID will not be changed if the **ipv6 address global-id** command is executed.
- The use of a double-colon abbreviation for the interface identifier similar to that used for full IPv6 addresses is allowed.

## Examples

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id  
215:60ff:fe7a:adc0 prefix-length 64 loopback
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

**ipv6 address global-id** Automatically generates or allows a new global ID to be entered.

.

**show ipv6 information** Displays IPv6 information.

## MIB Objects

```
alaIPv6LocalUnicastGlobalID  
alaIPv6LocalUnicastSubnetID  
alaIPv6LocalUnicastInterfaceID  
alaIPv6LocalUnicastEUI64  
alaIPv6LocalUnicastPrefixLength
```

---

## ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

```
ipv6 interface if_name tunnel {[source ipv4_source] [destination ipv4_destination]}
```

---

### Syntax Definitions

<i>if_name</i>	Name assigned to the tunnel interface.
<i>ipv4_source</i>	Source IPv4 address for the configured tunnel.
<i>ipv4_destination</i>	Destination IPv4 address for the configured tunnel.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the [ipv6 interface](#) command to create an IPv6 tunnel interface.

### Examples

```
-> ipv6 interface Test tunnel 2 source 10.255.11.242 destination 10.255.11.12
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ipv6 interface</a>	Creates an IPv6 tunnel interface.
<a href="#">show ipv6 tunnel</a>	Displays IPv6 tunnel information.

### MIB Objects

IPv6IfIndex  
alaIPv6ConfigTunnelv4Source  
alaIPv6ConfigTunnelv4Dest  
alaIPv6ConfigTunnelRowStatus

---

---

## ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

```
ipv6 dad-check ipv6_address if_name
```

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address.
<i>if_name</i>	Name assigned to the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The switch performs DAD check when an interface is attached to the stack and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

### Examples

```
-> ipv6 dad-check fe80::2d0:95ff:fe6a:f458/64 Test_Lab
```

### Release History

Release 6.1; command was introduced.

### Related Commands

N/A

### MIB Objects

```
alaIPv6InterfaceAddressTable  
  alaIPv6InterfaceAddressDADStatus
```

---

## ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

**ipv6 hop-limit** *value*

**no ipv6 hop-limit**

---

### Syntax Definitions

*value* Hop limit value. The range is 0 - 255.

### Defaults

parameter	default
<i>value</i>	64

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

### Examples

```
-> ipv6 hop-limit 64
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ipv6 information](#) Displays IPv6 information.

### MIB Objects

ipv6MibObjects  
Ipv6DefaultHopLimit

---

## ipv6 pmtu-lifetime

Configures the minimum lifetime for entries in the path MTU Table.

**ipv6 pmtu-lifetime** *time*

---

### Syntax Definitions

*time* Minimum path MTU entry lifetime, in minutes. Valid range is 10–1440.

### Defaults

parameter	default
<i>time</i>	60

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ipv6 pmtu-lifetime 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ipv6 pmtu table</a>	Displays the IPv6 path MTU Table.
<a href="#">show ipv6 information</a>	Displays IPv6 information.
<a href="#">clear ipv6 pmtu table</a>	Removes all the entries from the IPv6 path MTU Table.

### MIB Objects

alaIPv6ConfigTable  
alaIPv6PMTUMinLifetime

---

## ipv6 host

Configures a static host name to IPv6 address mapping to the local host table.

**ipv6 host** *name ipv6\_address*

**no ipv6 host** *name ipv6\_address*

---

### Syntax Definitions

<i>name</i>	Host name associated with the IPv6 address (1 - 255 characters).
<i>ipv6_address</i>	IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to remove the mapping from the host table.

### Examples

```
-> ipv6 host Lab 4235::1200:0010
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ipv6 hosts](#) Displays IPv6 Local Hosts Table.

### MIB Objects

```
alaIPv6HostTable  
  alaIPv6HostName  
  alaIPv6HostAddress  
  alaIPv6HostRowStatus
```

---

## ipv6 neighbor stale-lifetime

Configures the minimum lifetime for all neighbor entries.

**ipv6 neighbor stale-lifetime** *stale-lifetime*

---

### Syntax Definitions

*stale-lifetime* Minimum lifetime for neighbor entries in the stale state (5–2800).

### Defaults

parameter	default
<i>stale-lifetime</i>	1440

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ipv6 neighbor stale-lifetime 1400
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

[show ipv6 neighbors](#) Displays IPv6 Neighbor Table.  
[show ipv6 information](#) Displays IPv6 information.

### MIB Objects

IPv6IfIndex  
alaIPv6NeighborTable  
alaIPv6NeighborStaleLifetime

---

## ipv6 neighbor

Configures a static entry in IPv6 Neighbor Table.

**ipv6 neighbor** *ipv6\_address hardware\_address {if\_name} slot/port*

**no ipv6 neighbor** *ipv6\_address {if\_name}*

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address that corresponds to the hardware address.
<i>hardware_address</i>	MAC address in hex format (e.g., 00:00:39:59:F1:0C).
<i>if_name</i>	Name assigned to the interface on which the neighbor resides.
<i>slot/port</i>	Slot/port used to reach the neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to remove an entry from IPv6 Neighbor Table.

### Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test 1/1
```

### Release History

Release 6.1; command was introduced.

---

## ipv6 prefix

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

```
ipv6 prefix ipv6_address /prefix_length if_name  
[valid-lifetime time]  
[preferred-lifetime time]  
[on-link-flag {true | false}]  
[autonomous-flag {true | false}] if_name  
no ipv6 prefix ipv6_address /prefix_length if_name
```

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address of the interface.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (1...127).
<b>valid-lifetime</b> <i>time</i>	Length of time, in seconds, that this prefix will remain valid, i.e. time until deprecation. A value of 4,294,967,295 represents infinity.
<b>preferred-lifetime</b> <i>time</i>	Length of time, in seconds, that this prefix will remain preferred, i.e. time until deprecation. A value of 4,294,967,295 represents infinity.
<b>on-link-flag</b>	On-link configuration flag. When “true” this prefix can be used for on-link determination.
<b>autonomous-flag</b>	Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
<i>if_name</i>	Name assigned to the interface.

### Defaults

parameter	default
<b>valid-lifetime</b> <i>time</i>	2,592,000
<b>preferred-lifetime</b> <i>time</i>	604,800
<b>on-link-flag</b>	true
<b>autonomous-flag</b>	true

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to delete a prefix.

### Examples

```
-> ipv6 prefix 4132:86::/64 Test
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**show ipv6 prefixes**                      Displays IPv6 prefixes used in router advertisements.

## MIB Objects

```
IPv6IfIndex  
alaIPv6InterfacePrefixTable  
  alaIP6vInterfacePrefix

  alaIP6vInterfacePrefixonLinkFlag  
  alaIP6vInterfacePrefixAutonomousFlag  
  alaIP6vInterfacePrefixRowStatus
```

---

## ipv6 route

Configures a static entry in the IPv6 route. *This command is currently not supported. Please use the new [ipv6 static-route](#) command.*

**ipv6 route** *ipv6\_prefix/prefix\_length ipv6\_address [if\_name]*

**no ipv6 route** *ipv6\_prefix/prefix\_length ipv6\_address [if\_name]*

---

### Syntax Definitions

<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (0...128).
<i>ipv6_address</i>	IPv6 address of the next hop used to reach the specified network.
<i>if_name</i>	If the next hop is a link-local address, the name of the interface used to reach it.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to remove a static route.

### Examples

```
-> ipv6 route 212:95:5::/64 fe80::2d0:95ff:fe6a:f458 v6if-137
```

### Release History

Release 6.1; command was introduced.

Release 6.1.3; command was deprecated.

### Related Commands

[show ipv6 routes](#) Displays IPv6 Forwarding Table.

### MIB Objects

```
alaIPv6StaticRouteTable  
  alaIPv6StaticRouteNextHop  
  alaIPv6StaticRouteIfIndex  
  alaIPv6StaticRouteDest  
  alaIPv6StaticRoutePrefixLength  
  alaIPv6StaticRouteRowStatus
```

---

## ipv6 static-route

Creates/deletes an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

**ipv6 static-route** *ipv6\_prefix/prefix\_length* **gateway** *ipv6\_address* [*if\_name*] [**metric** *metric*]

**no ipv6 static-route** *ipv6\_prefix/prefix\_length* **gateway** *ipv6\_address* [*if\_name*]

---

### Syntax Definitions

<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits (0...128) that are significant in the IPv6 address (mask).
<b>gateway</b> <i>ipv6_address</i>	IPv6 address of the next hop used to reach the destination IPv6 address.
<i>if_name</i>	If the next hop is a link-local address, the name of the interface used to reach it.
<i>metric</i>	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

### Defaults

parameter	default
<i>metric</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to remove a static route.

### Examples

```
-> ipv6 static-route 212:95:5::/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

**show ipv6 routes**

Displays IPv6 Forwarding Table.

**show ipv6 router database**

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database.

## MIB Objects

```
alaIprmv6StaticRouteTable  
  alaIprmv6StaticRouteDest  
  alaIprmv6StaticRoutePrefixLength  
  alaIprmv6StaticRouteNextHop  
  alaIprmv6StaticRouteIfIndex  
  alaIprmv6StaticRouteMetric  
  alaIprmv6StaticRouteRowStatus
```

---

## ipv6 route-pref

Configures the route preference of a router.

```
ipv6 route-pref {static | ospf | rip | ebgp | ibgp} value
```

---

### Syntax Definitions

<b>static</b>	Configures the route preference of static routes.
<b>ospf</b>	Configures the route preference of OSPF3 routes.
<b>rip</b>	Configures the route preference of RIPng routes.
<b>ebgp</b>	Configures the route preference of external BGP routes.
<b>ibgp</b>	Configures the route preference of internal BGP routes.
<i>value</i>	Route preference value.

### Defaults

parameter	default
<b>static</b> <i>value</i>	2
<b>ospf</b> <i>value</i>	110
<b>rip</b> <i>value</i>	120
<b>ebgp</b> <i>value</i>	190
<b>ibgp</b> <i>value</i>	200

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Route preference of local routes cannot be changed.
- The valid route preference range is 1–255.
- The IPv6 version of BGP is not supported currently.

### Examples

```
-> ipv6 route-pref ospf 20
-> ipv6 route-pref rip 60
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

**show ipv6 route-pref**

Displays the configured route preference of a router.

## MIB Objects

```
alaIprmRtPrefTable  
  alaIprmRtPrefLocal  
  alaIprmRtPrefStatic  
  alaIprmRtPrefOspf  
  alaIprmRtPrefRip  
  alaIprmRtPrefEbgp  
  alaIprmRtPrefIbgp
```

---

## ping6

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the **ping6** command and enter either the destination's IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

```
ping6 {ipv6_address / hostname} [if_name] [count count] [size data_size] [interval seconds]
```

---

### Syntax Definitions

<i>ipv6_address</i>	IP address of the system to ping.
<i>hostname</i>	DNS name of the system to ping.
<i>if_name</i>	If the target is a link-local address, the name of the interface used to reach it.
<i>count</i>	Number of packets to be transmitted.
<i>size</i>	Size of the data portion of the packet sent for this ping, in bytes.
<i>seconds</i>	Interval, in seconds, at which ping packets are transmitted.

### Defaults

parameter	default
<i>count</i>	6
<i>size</i>	56
<b>interval</b> <i>seconds</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

## Examples

```
-> ping6 fe80::2d0:95ff:fe6a:f458/64
```

## Release History

Release 6.1; command was introduced.

## Related Commands

### [traceroute6](#)

Finds the path taken by an IPv6 packet from the local switch to a specified destination.

---

## traceroute6

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

**traceroute6** {*ipv6\_address* | *hostname*} [*if\_name*] [**max-hop** *hop\_count*] [**wait-time** *time*] [**port** *port\_number*] [**probe-count** *probe*]

---

### Syntax Definitions

<i>ipv6_address</i>	Destination IPv6 address. IPv6 address of the host whose route you want to trace.
<i>hostname</i>	DNS name of the host whose route you want to trace.
<i>if_name</i>	If the target is a link-local address, the name of the interface used to reach it.
<i>hop_count</i>	Maximum hop count for the trace.
<i>time</i>	Delay time, in seconds between probes
<i>port</i>	Specific UDP port destination. By default, the destination port is chosen by traceroute6.
<i>probe</i>	Number of probes to be sent to a single hop.

### Defaults

parameter	default
<i>hop_count</i>	30
<i>time</i>	5
<i>probe</i>	3

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

### Examples

```
-> traceroute6 41EA:103::65C3
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[ping6](#)

Tests whether an IPv6 destination can be reached from the local switch.

---

## show ipv6 hosts

Displays IPv6 Local Hosts Table.

**show ipv6 hosts** [*substring*]

---

### Syntax Definitions

*substring* Limits the display to host names starting with the specified substring.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you do not specify a substring, all IPv6 hosts are displayed.

### Examples

-> show ipv6 hosts

Name	IPv6 Address
-----+-----	
ipv6-test1.alcatel-lucent.com	4235::1200:0010
ipv6-test2.alcatel-lucent.com	4235::1200:0020
otheripv6hostname	4143:1295:9490:9303:00d0:6a63:5430:9031

### output definitions

---

<b>Name</b>	Name associated with the IPv6 address.
<b>IPv6 Address</b>	IPv6 address associated with the host name.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 host](#) Configures a static host name to the IPv6 address mapping to the local host table.

### MIB Objects

alaIPv6HostTable  
 alaIPv6HostName  
 alaIPv6HostAddress

---

## show ipv6 icmp statistics

Displays IPv6 ICMP statistics.

**show ipv6 icmp statistics** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                      Display statistics only for this interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the ICMP table to monitor and troubleshoot the switch.

### Examples

-> show ipv6 icmp statistics

Message	Received	Sent
Total	0	0
Errors	0	0
Destination Unreachable	0	0
Administratively Prohibited	0	0
Time Exceeded	0	0
Parameter Problems	0	0
Packet Too Big	0	0
Echo Requests	0	0
Echo Replies	0	0
Router Solicitations	0	0
Router Advertisements	0	0
Neighbor Solicitations	0	0
Neighbor Advertisements	0	0
Redirects	0	0
Group Membership Queries	0	0
Group Membership Responses	0	0
Group Membership Reductions	0	0

### output definitions

---

<b>Total</b>	Total number of ICMPv6 messages the switch received or attempted to send.
<b>Errors</b>	Number of ICMPv6 messages the switch sent or received but was unable to process because of ICMPv6-specific errors (bad checksums, bad length, etc.).
<b>Destination Unreachable</b>	Number of Destination Unreachable messages that were sent or received by the switch.

*output definitions (continued)*

---

<b>Administratively Prohibited</b>	Number of Destination Unreachable/Communication Administratively Prohibited messages sent or received by the switch.
<b>Time Exceeded</b>	Number of Time Exceeded messages sent or received by the switch.
<b>Parameter Problems</b>	Number of Parameter Problem messages sent or received by the switch.
<b>Packet Too Big</b>	Number of Packet Too Big messages sent or received by the switch.
<b>Echo Requests</b>	Number of Echo Request messages sent or received by the switch.
<b>Echo Replies</b>	Number of Echo Reply messages sent or received by the switch.
<b>Router Solicitations</b>	Number of Router Solicitations sent or received by the switch.
<b>Router Advertisements</b>	Number of Router Advertisements sent or received by the switch.
<b>Neighbor Solicitations</b>	Number of Neighbor Solicitations sent or received by the switch.
<b>Neighbor Advertisements</b>	Number of Neighbor Advertisements sent or received by the switch.
<b>Redirects</b>	Number of Redirect messages sent or received by the switch.
<b>Group Membership Queries</b>	Number of Group Membership Queries sent or received by the switch.
<b>Group Membership Responses</b>	Number of Group Membership Responses sent or received by the switch.
<b>Group Membership Reductions</b>	Number of Group Membership Reductions sent or received by the switch.

---

**Release History**

---

## show ipv6 interface

Displays IPv6 Interface Table.

**show ipv6 interface** [*if\_name* / **loopback**]

---

### Syntax Definitions

*if\_name* Interface name. Limits the display to a specific interface.

**loopback** Limits display to loopback interfaces.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If you do not specify an interface name, all IPv6 interfaces are displayed.
- Specify an interface name (e.g., VLAN 12) to obtain a more detailed information about a specific interface.

### Examples

-> show ipv6 interface

Name	IPv6 Address/Prefix Length	Status	Device
smbif-5	fe80::2d0:95ff:fe12:f470/64	Active	VLAN 955
	212:95:5::35/64		
	212:95:5::/64		
v6if-to-eagle	fe80::2d0:95ff:fe12:f470/64	Disabled	VLAN 1002
	195:35::35/64		
	195:35::/64		
V6if-6to4-137	2002:d423:2323::35/64	Active	6to4 Tunnel
	2002:d423:2323::/64		
v6if-tunnel-137	fe80::2d0:95ff:fe12:f470/64	Disabled	Tunnel 2
	137:35:35::35/64		
	137:35:35::/64		
loopback	::1/128	Active	loopback

#### output definitions

---

<b>Name</b>	Interface name. This is usually the VLAN on which the interface is configured.
<b>IPv6 Address/Prefix Length</b>	IPv6 address and prefix length assigned to the interface. If an interface has more than one IPv6 address assigned to it, each address is shown on a separate line.
<b>Status</b>	Interface status (e.g., Active/Inactive).
<b>Device</b>	The device on which the interface is configured (e.g., VLAN 955).

---

### *output definitions*

<b>IPv6 interface index</b>	IPv6IfIndex value that should be used in SNMP requests pertaining to this interface.
<b>Administrative status</b>	Administrative status of this interface (Enabled/Disabled).
<b>Operational status</b>	Indicates whether the physical interface is connected to a device (Active/Inactive).
<b>Hardware address</b>	Interface's MAC address.
<b>Link-local address</b>	Link-local address assigned to the interface.
<b>Global unicast address(es)</b>	Global unicast address(es) assigned to the interface.
<b>Joined group address(es)</b>	Addresses of the multicast groups that this interface has joined.
<b>Maximum Transfer Unit</b>	Interface MTU value.
<b>Send Router Advertisements</b>	Indicates if the router sends periodic router advertisements and responds to router solicitations on the interface.
<b>Maximum RA interval (sec)</b>	Maximum time between the transmission of unsolicited router advertisements over the interface.
<b>Minimum RA interval (sec)</b>	Minimum time between the transmission of unsolicited router advertisements over the interface (0.33 * Maximum RA Interval).

*output definitions (continued)*

---

<b>RA managed config flag</b>	True/False value in the managed address configuration flag field in router advertisements.
<b>RA other config flag</b>	The True/False value in the other stateful configuration flag field in router advertisements sent over this interface.
<b>RA reachable time (ms)</b>	Value placed in the reachable time field in the router advertisements sent over this interface.
<b>RA retransmit timer (ms)</b>	Value placed in the retransmit timer field in router advertisements sent over this interface.
<b>RA default lifetime (ms)</b>	The value placed in the router lifetime field in the router advertisements sent over this interface.
<b>Packets received</b>	Number of IPv6 packets received since the last time the counters were reset.
<b>Packets sent</b>	Number of IPv6 packets sent since the last time the counters were reset.
<b>Bytes received</b>	Number of bytes of data received since the last time the counters were reset.
<b>Bytes sent</b>	Number of bytes of data sent since the last time the counters were reset.

## show ipv6 neighbors

Displays IPv6 Neighbor Table.

**show ipv6 neighbors** [*ipv6\_prefix/prefix\_length* | *if\_name* | **hw** *hardware\_address* | **static**]

---

### Syntax Definitions

<i>ipv6_prefix/prefix_length</i>	IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.
<i>if_name</i>	Interface name. Restricts the display to those neighbors reached via the specified interface.
<i>hardware_address</i>	MAC address. Restricts the display to the specified MAC address.
<b>static</b>	Restricts display to statically configured neighbors.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you do not specify an option (e.g., *if\_name*), all IPv6 neighbors are displayed.

### Examples

-> show ipv6 neighbors

IPv6 Address	Hardware Address	State	Type	Port	Interface
fe80::02d0:c0ff:fe86:1207	00:d0:c0:86:12:07	Probe	Dynamic	1/15	vlan_4
fe80::020a:03ff:fe71:fe8d	00:0a:03:71:fe:8d	Reachable	Dynamic	1/ 5	vlan_17

#### *output definitions*

---

<b>IPv6 Address</b>	The neighbor's IPv6 address.
<b>Hardware Address</b>	The MAC address corresponding to the IPv6 address.
<b>State</b>	The neighbor's state: - <b>Unknown</b> - <b>Incomplete</b> - <b>Reachable</b> - <b>Stale</b> - <b>Delay</b> - <b>Probe</b> .
<b>Type</b>	Indicates whether the neighbor entry is a <b>Static</b> or <b>Dynamic</b> entry.
<b>Port</b>	The port used to reach the neighbor.
<b>Interface</b>	The neighbor's interface name (e.g., <i>vlan_1</i> )

---

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

-> show ipv6 prefixes

Legend: Flags: A = Autonomous Address Configuration, L = OnLink

Name	IPv6 Address/Prefix Length	Valid Lifetime	Preferred Lifetime	Flags	Source
vlan 955	212:95:5::/64	2592000	604800	LA	dynamic
vlan 1002	195:35::/64	2592000	604800	LA	dynamic
6to4tunnel	2002:d423:2323::/64	2592000	604800	LA	dynamic
tunnel 2	137:35:35::/64	2592000	604800	LA	dynamic

#### output definitions

---

<b>Name</b>	The interface name. This is usually the VLAN on which the interface is configured.
<b>IPv6 Address/Prefix Length</b>	The IPv6 prefix and prefix length for a Router Advertisement Prefix Option.
<b>Valid Lifetime</b>	Length of time, in seconds, that this prefix will remain valid (i.e., time until deprecation). A value of 4,294,967,295 represents infinity.
<b>Preferred Lifetime</b>	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
<b>Flags</b>	<b>L</b> - Prefix can be used for onlink determination. <b>A</b> - Prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
<b>Source</b>	<b>config</b> - Prefix has been configured by management. <b>dynamic</b> - Router Advertisements are using interface prefixes.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

### **ipv6 prefix**

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

## show ipv6 routes

Displays IPv6 Forwarding Table.

**show ipv6 routes** [*ipv6\_prefix/prefix\_length* | **static**]

---

### Syntax Definitions

*ipv6\_prefix/prefix\_length* IPv6 prefix. Restricts the display to those routes starting with the specified prefix.

**static** Restricts display to statically configured routes.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you do not specify an option (e.g., “static”), all IPv6 interfaces are displayed.

### Examples

-> show ipv6 routes

Legend:Flags:U = Up, G = Gateway, H = Host, S = Static, C = Cloneable, D = Dynamic,  
M = Modified, R = Unreachable, X = Externally resolved, B = Discard,  
L = Link-layer, 1 = Protocol specific, 2 = Protocol specific

Destination Prefix	Gateway Address	Interface	Age	Protocol	Flags
::/0	2002:d468:8a89::137	v6if-6to4-137	18h 47m 26s	Static	UGS
137:35:35::/64	fe80::2d0:95ff:fe12:f470	v6if-tunnel-137	18h 51m 55s	Local	UC
195:35::/64	fe80::2d0:95ff:fe12:f470	v6if-to-eagle	18h 51m 55s	Local	UC
212:95:5::/64	fe80::2d0:95ff:fe12:f470	smbif-5	18h 51m 55s	Local	UC
2002::/16	2002:d423:2323::35	v6if-6to4-137	18h 51m 55s	Other	U

### output definitions

---

<b>Destination Prefix</b>	IPv6 destination address and prefix.
<b>Gateway Address</b>	IPv6 address of the gateway used to reach the destination network.
<b>Interface</b>	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
<b>Age</b>	Age of the entry. Entries less than 1 day old are displayed in hh:mm:ss format. Entries more than 1 day old are displayed in dd:hh format.
<b>Protocol</b>	Protocol by which the route was learned.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

**ipv6 route** Configures a static entry in the IPv6 route.

## MIB Objects

```
IPv6RouteTable
  IPv6Routes
  IPv6RoutesPrefix

alaIPv6StaticRouteTable
  alaIPv6StaticRouteEntry
```

---

## show ipv6 route-pref

Displays the IPv6 routing preference of the router.

```
show ipv6 route-pref
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The IPv6 version of BGP is not supported currently.

### Examples

```
-> show ipv6 route-pref
  Protocol      Route Preference Value
-----+-----
  Local         1
  Static        2
  OSPF          110
  RIP           120
  EBGP          190
  IBGP          200
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

[ipv6 route-pref](#) Configures the IPv6 route preference of a router.

---

## show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

**show ipv6 router database** [**protocol** *type* / **gateway** *ipv6\_address* / **dest** *ipv6\_prefix/prefix\_length*]

---

### Syntax Definitions

<i>type</i>	Routing protocol type (local, static, OSPF, RIP, or BGP).
<b>gateway</b> <i>ipv6_address</i>	IPv6 address of the next hop used to reach the destination IPv6 address.
<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (0...128).

### Defaults

By default, all routes are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ipv6 routes** command to view the forwarding table.
- If an expected route does not appear in the IPv6 forwarding table, use the **show ipv6 router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSPF, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

## Examples

-> show ipv6 router database  
Legend: + indicates routes in use

Total IPRM IPv6 routes: 5

Destination/Prefix	Gateway Address	Interface	Protocol	Metric
::/0	2002:d468:8a89::137	v6if-6to4-137	Static	1
137:35:35::/64	fe80::2d0:95ff:fe12:f470	v6if-tunnel-137	OSPF	2
195:35::/64	fe80::2d0:95ff:fe12:f470	v6if-to-eagle	OSPF	2
212:95:5::/64	fe80::2d0:95ff:fe12:f470	smbif-5	Local	1
2002::/16	2002:d423:2323::35	v6if-6to4-137	Local	1

Inactive Static Routes:

VLAN	Destination/Prefix	Gateway Address	Metric
1510	212:95:5::/64	fe80::2d0:95ff:fe6a:f458	1

### output definitions

<b>Destination/Prefix</b>	IPv6 destination address and prefix.
<b>Gateway Address</b>	IPv6 address of the gateway used to reach the destination network.
<b>Interface</b>	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
<b>Protocol</b>	Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
<b>Metric</b>	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
<b>VLAN</b>	The VLAN on which the route was <i>learned</i> , not forwarded. Note that <b>N/A</b> appears in this field for static routes as they are not learned on a VLAN.

## Release History

Release 6.1.3; command was introduced.

## Related Commands

[show ipv6 routes](#) Displays the IPv6 Forwarding Table.

## show ipv6 tcp ports

Displays TCP Over IPv6 Connection Table. This table contains information about existing TCP connections between IPv6 endpoints.

**show ipv6 tcp ports**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Only connections between IPv6 addresses are contained in this table.

### Examples

-> show ipv6 tcp ports

Local Address	Port	Remote Address	Port	Interface	State
::	21	::	0		listen
::	23	::	0		listen
2002:d423:2323::35	21	212:61:61:0:2b0:d0ff:fe43:d4f8	34144	v6if-6to4-137	established
2002:d423:2323::35	49153	212:61:61:0:2b0:d0ff:fe43:d4f8	34144	v6if-6to4-137	established

#### output definitions

---

<b>Local Address</b>	Local address for this TCP connection. For ports in the “Listen” state, which accepts connections on any IPv6 interface, the address is ::0.
<b>Port</b>	Local port number for the TCP connection.
<b>Remote Address</b>	Remote IPv6 address for the connection. If the connection is in the “Listen” state, the address is ::0.
<b>Port</b>	Remote port number for the TCP connection. If the connection is in the “Listen” state, the port number is 0.
<b>Interface</b>	Name of the interface (or “unknown”) over which the connection is established.
<b>State</b>	State of the TCP connection as defined in RFC 793.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

  IPv6TcpConnEntry  
  IPv6TcpConnLocalAddress  
  IPv6TcpConnLocalPort  
  IPv6TcpConnRemAddress  
  IPv6TcpConnRemPort  
  IPv6TcpConnIfIndex  
  IPv6TcpConnState

---

## show ipv6 traffic

Displays IPv6 traffic statistics.

**show ipv6 traffic** [*if\_name*]

---

### Syntax Definitions

*if\_name* Interface name. Restricts the display to the specified interface instead of global statistics.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The statistics show the cumulative totals since the last time the switch was powered on, the last reset of the switch was executed or the traffic statistics were cleared using the command.

### Examples

```
-> show ipv6 traffic
```

```
Global IPv6 Statistics
Packets received
  Total                = 598174
  Header errors        = 0
  Too big              = 12718
  No route             = 4
  Address errors       = 0
  Unknown protocol     = 0
  Truncated packets    = 0
  Local discards        = 0
  Delivered to users   = 582306
  Reassembly needed    = 0
  Reassembled          = 0
  Reassembly failed    = 0
  Multicast Packets    = 118
Packets sent
  Forwarded            = 3146
  Generated             = 432819
  Local discards        = 0
  Fragmented           = 0
  Fragmentation failed = 0
  Fragments generated  = 0
  Multicast packets     = 265
```

*output definitions*

---

<b>Total</b>	Total number of input packets received, including those received in error.
<b>Header errors</b>	Number of input packets discarded due to errors in their IPv6 headers (e.g., version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).
<b>Too big</b>	Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.
<b>No route</b>	Number of input packets discarded because no route could be found to transmit them to their destination.
<b>Address errors</b>	Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0) and unsupported addresses (e.g., addresses with unallocated prefixes).
<b>Unknown protocol</b>	Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.
<b>Truncated packets</b>	Number of input packets discarded because the packet frame did not carry enough data.
<b>Local discards</b>	Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.
<b>Delivered to users</b>	Total number of packets successfully delivered to IPv6 user protocols (including ICMP).
<b>Reassembly needed</b>	Number of IPv6 fragments received that needed to be reassembled.
<b>Reassembled</b>	Number of IPv6 packets successfully reassembled.
<b>Reassembly failed</b>	Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.).
<b>Multicast packets</b>	Number of multicast packets received.
<b>Forwarded</b>	Number of output packets that this entity received and forwarded to their final destinations.
<b>Generated</b>	Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.
<b>Local discards</b>	Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (e.g., for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.
<b>Fragmented</b>	Number of IPv6 packets successfully fragmented.
<b>Fragmentation failed</b>	Number of IPv6 packets discarded because they needed to be fragmented but could not be.
<b>Fragments generated</b>	Number of output packet fragments generated as a result of fragmentation.
<b>Multicast packets</b>	Number of multicast packets transmitted.

## show ipv6 tunnel

Displays IPv6 tunnel information and whether the 6to4 tunnel is enabled.

**show ipv6 tunnel**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 tunnel
```

```
IPv6 6to4 tunnel: Enabled
```

```
Configured Tunnels:
```

Tunnel	IPv6 Address/Prefix Length	Source IPv4	Destination IPv4
1	2001:0000:0200::101/48	192.16.10.101	192.28.5.254
23	2001:0000:0200::102/48	192.15.10.102	10.27.105.25
v6if-tunnel-137	fe80::2d0:95ff:fe12:f470/64	212.35.35.35	212.104.138.137

### *output definitions*

---

<b>IPv6 6to4 tunnel</b>	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
<b>Tunnel</b>	Tunnel ID.
<b>IPv6 Address/Prefix Length</b>	IPv6 address associated with the tunnel.
<b>Source IPv4</b>	Source IPv4 address for the tunnel.
<b>Destination IPv4</b>	Destination IPv4 address for the tunnel.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

[ipv6 address global-id](#)

Configures the source and destination IPv4 addresses for a configured tunnel.

## show ipv6 udp ports

Displays UDP Over IPv6 Listener Table. This table contains information about UDP/IPv6 endpoints.

**show ipv6 udp ports**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Only endpoints utilizing IPv6 addresses are displayed in this table.

### Examples

```
-> show ipv6 udp ports
```

```
Local Address                               Port  Interface
-----+-----+-----
::                                           521
```

#### *output definitions*

---

<b>Local Address</b>	Local IPv6 address for this UDP listener. If a UDP listener accepts packets for any IPv6 address associated with the switch, the value is ::0.
<b>Port</b>	Local Port number for the UDP connection.
<b>Interface</b>	Name of the interface the listener is using or “unknown.”

## show ipv6 information

Displays the global IPv6 configuration values.

**show ipv6 information**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 information
```

```
Default hop limit                = 64
Path MTU entry minimum lifetime (min) = 60
Neighbor stale lifetime (min)    = 1440
Local Unicast Global ID          = 32:57a3:8fed
```

### *output definitions*

---

<b>Default hop limit</b>	The value placed in the hop limit field in router advertisements
<b>Path MTU entry minimum lifetime</b>	Minimum lifetime for entries in the path MTU.
<b>Neighbor stale lifetime</b>	Minimum lifetime for neighbor entries in the stale state.
<b>Local Unicast Global ID</b>	40-bit global identifier which makes the local IPv6 address prefixes globally unique.

---

### Release History

Release 6.1.1; command was introduced.

Release 6.3.4; **Local Unicast Global ID** field added.

## Related Commands

**ipv6 neighbor**

Configures a static entry in the IPv6 Neighbor Table.

**ipv6 pmtu-lifetime**

Configures the minimum lifetime for entries in the path MTU Table.

**ipv6 hop-limit**

Configures the value placed in the hop limit field in the header of all IPv6 packet.

## MIB Objects

ipv6MibObjects

    Ipv6DefaultHopLimit

alaIPv6ConfigTable

    alaIPv6PMTUMinLifetime

alaIPv6NeighborTable

    alaIPv6NeighborStaleLifetime

alaIPv6GlobalID

---

## ipv6 redist

Controls the conditions for redistributing IPv6 routes between different protocols.

```
ipv6 redist {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} route-map route-map-name
[status {enable | disable}]
```

```
no ipv6 redist {local | static | ospf | isis | bgp} into {rip | ospf | isis | bgp} [route-map route-map-name]
```

---

### Syntax Definitions

<b>local</b>	Redistributes local IPv6 routes.
<b>static</b>	Redistributes static IPv6 routes.
<b>rip</b>	Specifies RIP as the source or destination (into) protocol.
<b>ospf</b>	Specifies OSPF as the source or destination (into) protocol.
<b>bgp</b>	This parameter is currently not supported.
<b>isis</b>	This parameter is currently not supported.
<i>route-map-name</i>	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
<b>enable</b>	Enables the administrative status of the redistribution configuration.
<b>disable</b>	Disables the administrative status of the redistribution configuration.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported currently.
- Use the **ip route-map** commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about how to create a route map.

## Examples

```
-> ipv6 redist rip into ospf route-map rip-to-ospf1
-> ipv6 redist rip into ospf route-map rip-to-ospf2
-> no ipv6 redist rip into ospf route-map rip-to-ospf2
-> ipv6 redist local into rip route-map local-to-rip
-> ipv6 redist local into rip route-map local-to-rip disable
```

## Release History

Release 6.1.3; command was introduced.

## Related Commands

[show ipv6 redist](#) Displays the route map redistribution configuration.

## MIB Objects

```
alaRouteMapRedistProtoTable
  alaRouteMapRedistSrcProtoId
  alaRouteMapRedistDestProtoId
  alaRouteMapRedistRouteMapIndex
  alaRouteMapRedistStatus
  alaRouteMapRedistAddressType
  alaRouteMapRedistRowStatus
```

---

## ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

**ipv6 access-list** *access-list-name*

**no ipv6 access-list** *access-list-name*

---

### Syntax Definitions

*access-list-name*                      Name of the IPv6 access list (up to 20 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to delete the access list.

### Examples

```
-> ipv6 access-list access1  
-> no ipv6 access-list access1
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

**ipv6 access-list address**              Adds IPv6 addresses to an existing IPv6 access list.

**show ipv6 access-list**                Displays the contents of an IPv6 access list.

### MIB Objects

```
alaRouteMapAccessListNameTable  
  alaRouteMapAccessListName  
  alaRouteMapAccessListNameIndex  
  alaRouteMapAccessListNameAddressType  
  alaRouteMapAccessListNameRowStatus
```

---

## ipv6 access-list address

Adds IPv6 addresses to the specified IPv6 access list.

**ipv6 access-list** *access-list-name* **address** *address/prefixLen* [**action** {**permit** | **deny**}]  
[**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}]

**no ipv6 access-list** *access-list-name* **address** *address/prefixLen*

---

### Syntax Definitions

<i>access-list-name</i>	Name of the IPv6 access list (up to 20 characters).
<i>address/prefixLen</i>	IPv6 address along with the prefix length to be added to the access list.
<b>permit</b>	Permits the IPv6 address for redistribution.
<b>deny</b>	Denies the IPv6 address for redistribution.
<b>all-subnets</b>	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
<b>no-subnets</b>	Redistributes or denies only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

### Defaults

parameter	default
<b>permit</b>   <b>deny</b>	<b>permit</b>
<b>all-subnets</b>   <b>no-subnets</b>   <b>aggregate</b>	<b>all-subnets</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets**, **no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

## Examples

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

## Release History

Release 6.1.3; command was introduced.

## Related Commands

<a href="#">ipv6 access-list</a>	Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.
<a href="#">show ipv6 access-list</a>	Displays the contents of an IPv6 access list.

## MIB Objects

```
alaRouteMapAccessListTable
  alaRouteMapAccessListIndex
  alaRouteMapAccessListAddress
  alaRouteMapAccessListAddressType
  alaRouteMapAccessListPrefixLength
  alaRouteMapAccessListAction
  alaRouteMapAccessListRedistControl
  alaRouteMapAccessListRowStatus
```

---

## show ipv6 redist

Displays the IPv6 route map redistribution configuration.

```
show ipv6 redist [rip | ospf | bgp]
```

---

### Syntax Definitions

<b>rip</b>	Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.
<b>ospf</b>	Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.
<b>bgp</b>	This parameter is not supported.

### Defaults

By default all route map redistribution configurations are shown.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.
- The IPv6 version of BGP is not supported currently.

### Release History

Release 6.1.3; command was introduced.

### Examples

```
-> show ipv6 redist
```

Source Protocol	Destination Protocol	Status	Route Map
localIPv6	RIPng	Enabled	ipv6rm
RIPng	OSPFv3	Enabled	ipv6rm

```
-> show ipv6 redist ospf
```

Source Protocol	Destination Protocol	Status	Route Map
RIPng	OSPFv3	Enabled	ipv6rm

---

*output definitions*

---

<b>Source Protocol</b>	The protocol from which the routes are learned.
<b>Destination Protocol</b>	The protocol into which the source protocol routes are redistributed..
<b>Status</b>	The administrative status ( <b>Enabled</b> or <b>Disabled</b> ) of the route map redistribution configuration.
<b>Route Map</b>	The name of the route map that is applied with this redistribution configuration.

---

**Related Commands**

**ipv6 redistrib** Controls the conditions for redistributing IPv6 routes between different protocols.

**MIB Objects**

```
alaRouteMapRedistProtoTable  
  alaRouteMapRedistSrcProtoId  
  alaRouteMapRedistDestProtoId  
  alaRouteMapRedistRouteMapIndex  
  alaRouteMapRedistStatus  
  alaRouteMapRedistAddressType  
  alaRouteMapRedistRowStatus
```

---

## show ipv6 access-list

Displays the contents of the specified IPv6 access list.

**show ip access-list** [*access-list-name*]

---

### Syntax Definitions

*access-list-name*                      Name of the IPv6 access list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists will be displayed.

### Examples

```
-> show ipv6 access-list
Name                Address /
                   Prefix Length    Effect    Redistribution
-----+-----+-----+-----
al_3                128::/64      permit   all-subnets
al_4                124::/64      permit   no-subnets
```

```
-> show ipv6 access-list 4
Name                Address /
                   Prefix Length    Effect    Redistribution
-----+-----+-----+-----
al_4                124::/64      permit   no-subnets
```

### *output definitions*

---

<b>Name</b>	Name of the IPv6 access list.
<b>Address/Prefix Length</b>	IPv6 address that belongs to the access list.
<b>Effect</b>	Indicates whether the IPv6 address is permitted or denied for redistribution.
<b>Redistribution Control</b>	Indicates the conditions specified for redistributing the matched routes.

---

### Release History

Release 6.1.3; command was introduced

## Related Commands

- ipv6 access-list** Creates an IPv6 access list for adding multiple IPv6 addresses to route maps.
- ipv6 access-list address** Adds multiple IPv6 addresses to the IPv6 access list.

## MIB objects

```
alaRouteMapAccessListIndex  
  alaRouteMapAccessListAddressType  
  alaRouteMapAccessListAddress  
  alaRouteMapAccessListPrefixLength  
  alaRouteMapAccessListAction  
  alaRouteMapAccessListRedistControl
```

---

## ipv6 load rip

Loads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

**ipv6 load rip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the [ipv6 rip status](#) command to enable RIPng on the switch.

### Examples

```
-> ipv6 load rip
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip status](#)

Enables/disables RIPng routing on the switch.

[show ipv6 rip](#)

Displays RIPng status and general configuration parameters.

### MIB Objects

alaDrcTmConfig

alaDrcTmIPRipngStatus

---

## ipv6 rip status

Enables or disables RIPng on the switch.

```
ipv6 rip status {enable | disable}
```

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

RIPng must be loaded on the switch ([ipv6 load rip](#)) to enable RIP on the switch.

### Examples

```
-> ipv6 rip status enable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 load rip](#)

Loads RIPng into memory.

[show ipv6 rip](#)

Displays RIPng status and general configuration parameters.

### MIB Objects

alaProtocolripng

alaRipngProtoStatus

---

## ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

**ipv6 rip invalid-timer** *seconds*

---

### Syntax Definitions

*seconds* Time, in seconds, that a route will remain in an "Active" state. Valid range is 1 - 300.

### Defaults

parameter	default
<i>seconds</i>	180

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

This timer is reset each time a routing update is received.

### Examples

```
-> ipv6 rip invalid-timer 300
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.  
[ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

### MIB Objects

alaProtocolripng  
alaRipngInvalidTimer

---

## ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

**ipv6 rip garbage-timer** *seconds*

---

### Syntax Definitions

*seconds* Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the [ipv6 rip invalid-timer](#) command to set the Invalid Timer Value.

### Examples

```
-> ipv6 rip garbage-timer 180
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

[ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

### MIB Objects

alaProtocolripng  
alaRipngGarbageTimer

---

## ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

**ipv6 rip holddown-timer** *seconds*

---

### Syntax Definitions

*seconds* Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

### Examples

```
-> ipv6 rip holddown-timer 60
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.

### MIB Objects

```
alaProtocolripng  
  alaRipngHolddownTimer
```

---

## ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

**ipv6 rip jitter** *value*

---

### Syntax Definitions

*value* Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0 - 300).

### Defaults

parameter	default
<i>value</i>	5

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

### Examples

```
-> ipv6 rip jitter 10
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip update-interval](#) Configures the RIPng update interval.  
[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

alaProtocolripng  
 alaRipngJitter

---

## ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

**ipv6 rip route-tag** *value*

---

### Syntax Definitions

*value* Route tag value. Valid range is 0 – 65535.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

### Examples

```
-> ipv6 rip route-tag 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

```
alaProtocolripng  
  alaRipngRouteTag
```

---

## ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

**ipv6 rip update-interval** *seconds*

---

### Syntax Definitions

*seconds* Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use this command, along with the [ipv6 rip jitter](#) command to configure RIPng updates.

### Examples

```
-> ipv6 rip update-interval 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip jitter](#) Configures an offset value for RIPng updates.  
[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

alaRipng  
 alaRipngUpdateInterval

---

## ipv6 rip triggered-sends

Configures the behavior of triggered updates.

**ipv6 rip triggered-sends {all | updated-only | none}**

---

### Syntax Definitions

<b>all</b>	All RIPng routes are added to any triggered updates.
<b>updated-only</b>	Only route changes that are causing the triggered update are included in the update packets.
<b>none</b>	RIPng routes are not added to triggered updates.

### Defaults

---

parameter	default
all   updated-only   none	updated-only

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

### Examples

```
-> ipv6 rip triggered-sends none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

alaProtocolripng  
alaRipngTriggeredSends

---

## ipv6 rip interface

Creates or deletes a RIPng interface.

**ipv6 rip interface** *if\_name*

**[no] ipv6 rip interface** *if\_name*

---

### Syntax Definitions

*if\_name* IPv6 interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see [Chapter 5, "VLAN Management Commands"](#).
- RIPng will support a maximum of 20 interfaces.

### Examples

```
-> ipv6 rip interface Test_Lab
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ipv6 redist</b>	Loads RIPng into memory.
<b>ipv6 rip status</b>	Enables or disables RIPng on the switch.
<b>ipv6 rip interface rcv-status</b>	Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
<b>ipv6 rip interface send-status</b>	Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
<b>show ipv6 rip interface</b>	Displays information for all or specified RIPng interfaces.

## MIB Objects

alaRipngInterfaceTable  
    alaRipngInterfaceStatus

---

## ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

**ipv6 rip interface** *if\_name* **metric** *value*

---

### Syntax Definitions

*if\_name* IPv6 interface name.

*value* Metric value. Valid range is 1 - 15.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.

### Examples

```
-> ipv6 rip Test_Lab metric 1
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 rip interface](#) Creates or deletes a RIPng interface.

[show ipv6 rip interface](#) Displays information for all or specified RIPng interfaces.

### MIB Objects

alaRipngInterfaceTable  
 alaRipngInterfaceMetric

---

## ipv6 rip interface recv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

**ipv6 rip interface *if\_name* recv-status {enable | disable}**

---

### Syntax Definitions

*if\_name* IPv6 interface name.  
**enable | disable** Interface “Receive” status.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>enable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

RIPng must be loaded ([ipv6 load rip](#)) and enabled ([ipv6 rip status](#)) on the switch to send or receive packets on the interface.

### Examples

```
-> ipv6 rip interface Test_Lab recv-status disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ipv6 redist](#) Loads RIPng into memory.  
[ipv6 rip status](#) Enables/disables RIPng on the switch.  
[ipv6 rip interface send-status](#) Configures IPv6 RIPng interface “Send” status.

### MIB Objects

alaRipngInterfaceTable  
  alaRipngInterfaceRecvStatus

---

## ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.

**ipv6 rip interface *if\_name* send-status {enable | disable}**

---

### Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<b>enable   disable</b>	Interface “Send” status.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

RIPng must be loaded ([ipv6 load rip](#)) and enabled ([ipv6 rip status](#)) on the switch to send or receive packets on the interface.

### Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ipv6 redistrib</a>	Loads RIPng into memory.
<a href="#">ipv6 rip status</a>	Enables/disables RIPng on the switch.
<a href="#">ipv6 rip interface rcv-status</a>	Configures IPv6 RIPng interface “Receive” status.

### MIB Objects

alaRipngInterfaceTable  
 alaRipngInterfaceSendStatus

---

## ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

```
ipv6 rip interface if_name horizon {none | split-only | poison}
```

---

### Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<b>none</b>   <b>split-only</b>   <b>poison</b>	<b>none</b> - Disables loop prevention mechanisms. <b>split-only</b> - Enables split-horizon, without poison-reverse. <b>poison</b> - Enables split-horizon with poison-reverse.

### Defaults

---

parameter	default
<b>none</b>   <b>split-only</b>   <b>poison</b>	<b>poison</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

### Examples

```
-> ipv6 rip interface Test_Lab none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ipv6 rip interface</a>	Displays information for all or specified RIPng interfaces.
<a href="#">show ipv6 rip routes</a>	Displays all or a specific set of routes in the RIPng Routing Table.

### MIB Objects

```
alaRipngInterfaceTable  
  alaRipngInterfaceHorizon
```

---

## show ipv6 rip

Displays the RIPng status and general configuration parameters.

```
show ipv6 rip
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 rip
```

```
Status                = Enabled,
Number of routes      = 10,
Route tag             = 0,
Update interval       = 30,
Invalid interval      = 180,
Garbage interval      = 120,
Holddown interval     = 0,
Jitter interval       = 5,
Triggered Updates     = All Routes,
```

### *output definitions*

---

<b>Status</b>	RIPng protocol status (enabled or disabled).
<b>Number of routes</b>	Number of RIPng routes in Forwarding Information Base (FIB).
<b>Route tag</b>	Route tag value for RIP routes generated by the switch. Valid range is 0-65535. Default is 0.
<b>Invalid interval</b>	Invalid Timer setting, in seconds.
<b>Garbage interval</b>	Garbage Timer setting, in seconds.
<b>Holddown interval</b>	Holddown Timer setting, in seconds.
<b>Jitter interval</b>	Jitter setting.
<b>Triggered updates</b>	Triggered Updates setting (All Routes, Updated Routes, and None).

---

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>ipv6 rip status</b>	Enables or disables RIPng routing on the switch.
<b>ipv6 rip route-tag</b>	Configures the route tag value for RIP routes generated by the switch.
<b>ipv6 rip update-interval</b>	Configures the Interval, in seconds, so that RIPng routing updates are sent out.
<b>ipv6 rip invalid-timer</b>	Configures the amount of time a route remains active in RIB before being moved to the "garbage" state.
<b>ipv6 rip invalid-timer</b>	Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received.
<b>ipv6 rip holddown-timer</b>	Configures the amount of time a route is placed in a holddown state.
<b>ipv6 rip jitter</b>	Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval.
<b>ipv6 rip triggered-sends</b>	Configures the behavior of triggered updates.

## show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

**show ipv6 rip interface** [*if\_name*]

---

### Syntax Definitions

*if\_name* IPv6 interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you do not specify an interface, all IPv6 RIP interfaces are displayed.

### Examples

```
-> show ipv6 rip interface
```

Interface Name	Status	Packets		Metric
		Recvd	Sent	
Test_Lab	Active	12986	12544	1
Test_Lab_2	Active	12556	12552	1

```
-> show ipv6 rip interface if3
```

```
Name = Test_Lab,
IPv6 interface index = 3,
Interface status = Active,
Next Update = 27 secs,
Horizon Mode = Split and Poison-reverse,
MTU size = 1500,
Metric = 1,
Send status = Enabled,
Receive status = Enabled,
Packets received = 12986,
Packets sent = 12544,
```

### output definitions

---

<b>Interface name</b>	Interface name.
<b>IPv6 interface index</b>	IPv6 index of this interface.
<b>Status</b>	Interface status (Active/Inactive).
<b>Packets Recvd</b>	Number of packets received by the interface.

*output definitions (continued)*

---

<b>Packets Sent</b>	Number of packets sent by the interface.
<b>Metric</b>	RIPng metric (cost) configured for the interface.
<b>IPv6 interface index</b>	IPv6 interface index number.
<b>Interface status</b>	Interface status (Active/Inactive).
<b>Next update</b>	Seconds remaining until the next update on this interface.
<b>Horizon mode</b>	Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse.
<b>MTU size</b>	Maximum transmission size for RIPng packets on the interface.
<b>Send status</b>	Interface "Send" status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
<b>Receive status</b>	Interface "Receive" status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
<b>Packets received</b>	Number of packets received by the interface.
<b>Packets sent</b>	Number of packets sent by the interface.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>ipv6 rip interface</b>	IPv6 interface name.
<b>ipv6 rip status</b>	Enables or disables RIPng routing on the switch.

---

## show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

**show ipv6 rip peer** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address* IPv6 address of the peer.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

### Examples

```
-> show ipv6 peer
```

Address	Seen on Interface	Packets Recv	Last Update
fe80::200:39ff:fe1f:710c	vlan172	23	20
fe80::2d0:95ff:fe12:da40	bkbone20	33	2
fe80::2d0:95ff:fe12:da40	vlan150	26	25
fe80::2d0:95ff:fe6a:5d41	nssa23	20	25

```
-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40
```

```
Peer#1 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = bkbone20,
Last Update         = 8 secs,
Received packets    = 33,
Received bad packets = 0
Received routes     = 5,
Received bad routes = 0
```

```
Peer#2 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = vlan150,
Last Update         = 1 secs,
Received packets    = 27,
Received bad packets = 0
Received routes     = 2,
Received bad routes = 0
```

*output definitions*

---

<b>Address</b>	IPv6 address of the peer.
<b>Seen on Interface</b>	Interface used to reach the peer.
<b>Packets Recvd</b>	Number of packets received from the peer.
<b>Last Update</b>	Number of seconds since the last update was received from the peer.
<b>Peer address</b>	Peer IPv6 address.
<b>Received packets</b>	Number of packets received from the peer.
<b>Received bad packets</b>	Number of bad packets received from the peer.
<b>Received routes</b>	Number of RIPng routes received from the peer.
<b>Received bad routes</b>	Number of bad RIPng routes received from the peer.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">show ipv6 rip interface</a>	Displays all or specified RIPng interface status.
<a href="#">show ipv6 rip routes</a>	Displays all or a specific set of routes in RIPng Routing Table.

**MIB Objects**

```
alaRipngPeerTable
  alaRipngPeerEntry
  alaRipngPeerAddress
  alaRipngPeerIndex
  alaRipngPeerLastUpdate
  alaRipngPeerNumUpdates
  alaRipngPeerBadPackets
  alaRipngPeerNumRoutes
  alaRipngPeerBadRoutes
```

---

## show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

```
show ipv6 rip routes [dest <ipv6_prefix/prefix_length>] / [gateway <ipv6_addr>] | [detail <ipv6_prefix/prefix_length>]
```

---

### Syntax Definitions

<b>dest</b>	Displays all routes whose destination matches the IPv6 prefix/prefix length.
<b>gateway</b>	Displays all routes whose gateway matches the specified IPv6 address.
<b>detail</b>	Displays detailed information about a single route matching the specified destination.
<i>ipv6_addr</i>	IPv6 address.
<i>ipv6_prefix/prefix length</i>	IPv6 address and prefix/prefix length.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

If you do not enter one of the optional parameters, all IPv6 RIP routes are displayed.

### Examples

```
-> show ipv6 rip routes
```

Legends: State: A = Active, H = Holddown, G = Garbage

Destination	Gateway	State	Metric	Proto
100::1/128	+fe80::200:39ff:fe1f:710c	A	2	Rip
100::100:1/128	+fe80::200:39ff:fe1f:710c	A	2	Rip
400::/100	+fe80::2d0:95ff:fe12:e050	A	1	Local
900::/100	+fe80::2d0:95ff:fe12:e050	A	1	Local
8900::/100	+fe80::2d0:95ff:fe12:da40	A	2	Rip
9800::/100	+fe80::2d0:95ff:fe12:da40	A	2	Rip
9900::/100	+fe80::2d0:95ff:fe12:e050	A	1	Local

```
-> show ipv6 rip routes detail 9900::/100
```

```

Destination      = 9900::,
Mask length      = 100,
Gateway(1)       = fe80::2d0:95ff:fe12:e050,
Protocol         = Local,
Out Interface    = nssa23,
Metric           = 1,
Status           = Installed,
State            = Active,

# 16 IPsec commands

IPsec is a suite of protocols for securing IPv6 communications by authenticating and/or encrypting each IPv6 packet in a data stream. IPsec provides security services such as encrypting traffic, integrity validation, authenticating the peers, and anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

This implementation of IPsec supports the transport mode of operation. In this mode, only the data you transfer (payload) in the IPv6 packet is encrypted and/or authenticated and only the payloads that are originated and destined between two endpoints are processed with IPsec.

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g encryption using 3DES, authentication with HMAC-SHA1). A security association is a bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations are manually configured.

A summary of the available commands is listed here:.

---

- [ipsec key](#)
- [ipsec security-key](#)
- [ipsec policy](#)
- [ipsec policy rule](#)
- [ipsec sa](#)
- [show ipsec policy](#)
- [show ipsec sa](#)
- [show ipsec key](#)
- [show ipsec ipv6 statistics](#)

---

## ipsec key

Configures the authentication and encryption keys for a manually configured IPsec SA.

**ipsec key** *key\_name* {**sa-authentication** | **sa-encryption**} *key*

**no ipsec key** *key\_name* {**sa-authentication** | **sa-encryption**}

---

### Syntax Definitions

<i>key_name</i>	The name of this key (maximum 20 characters).
<b>sa-authentication</b>	Indicates that the key value is used by an authentication algorithm.
<b>sa-encryption</b>	Indicates that the key value is used by an encryption algorithm.
<i>key</i>	Specifies the key value. The key value can be either in the hexadecimal format or as a string.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the authentication key or the encryption key from a manually configured IPsec SA.
- The *name* parameter should be the same as the name of the manually configured SA that will use this SA authentication or encryption key.
- The length of the key value must match the value that is required by the encryption or authentication algorithm that will use the key. The required key length for the supported algorithm are as follows:

algorithm	key length
des-cbc	64 bits
3des-cbc	192 bits
aes-cbc	128, 192, or 256 bits
aes-ctr	160, 224, or 288 bits
hmac-md5	128 bits
hmac-sha1	160 bits
aes-xcbc-mac	128 bits

- The combination of the key's name and type must be unique.
- The **encrypted** option will be used when the key commands are written to the **boot.cfg** or other snapshot file. This option should not be specified when entering this command through the switch CLI.

## Examples

```
-> ipsec key sal_ah sa-authentication 0x11223344556677889900112233445566  
-> ipsec key sal_esp sa-encryption "Quoth, Nevermore"
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

<a href="#">ipsec sa</a>	Configures an IPsec Security Association (SA).
<a href="#">show ipsec key</a>	Displays the keys for the manually configured IPsec SA.

## MIB Objects

```
AlaIPsecKeyTable  
  alaIPsecKeyName  
  alaIPsecKeyType  
  alaIPsecKeyEncrypted  
  alaIPsecKey
```

---

## ipsec security-key

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys that are saved to permanent storage (e.g., **boot.cfg** file).

**ipsec security-key** [*old\_key*] *new\_key*

---

### Syntax Definitions

<i>old_key</i>	The current master security key. The key can be specified either in the hexadecimal format (16 bytes in length) or as a string (16 characters in length).
<i>new_key</i>	The new key value. The key can be specified either in the hexadecimal format (16 bytes in length) or as a string (16 characters in length).

### Defaults

By default, no master security key is set for the switch.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- The *old\_key* parameter should always be specified when you modify an existing key. Setting the key for first time does not require the *old\_key*.
- If the value of the *old\_key* is incorrect, the attempt to set a new key will fail.
- When there is no master security key configured for the switch, the SA key values are written unencrypted to permanent storage (**boot.cfg** or other configuration file). A warning message is logged when this occurs.
- If the master security key is reset using **debug clear ipsec security-key** command, the currently configured SA keys will be deleted.
- When the master security key is set or changed, its value is immediately propagated to the secondary CMM. In a stacked configuration, the master security key is saved to all modules in case a stack split occurs or there is a simultaneous failure of both CMM modules. When the master security key is changed, save and synchronize the current configuration to ensure the proper operation of IPsec in the event of a switch reboot or takeover.

### Examples

```
-> ipsec security-key alcatel_corp_001 alcatel_lucent01
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### [ipsec key](#)

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

## MIB Objects

```
AlaIPsecSecurityKeyTable  
  alaIPsecSecurityKeyCurrent  
  alaIPsecSecurityKeyNew
```

---

## ipsec policy

Configures a security policy.

**ipsec policy** *policy\_name* [**priority** *priority*] [**source** {*ipv6\_address* [/*prefix\_length*]}] [**port** *port*] [**destination** {*ipv6\_address* [/*prefix\_length*]}] [**port** *port*] [**protocol** *protocol*] [**in** | **out**] [**discard** | **ipsec** | **none**] [**description** *description*] [**no shutdown** | **shutdown**]

**no ipsec policy** *policy\_name*

---

### Syntax Definitions

<i>policy_name</i>	The name for the policy
<i>priority</i>	The priority for the policy. Values range from 1 to 1000. The higher the value, the higher the priority.
<i>ipv6_address</i>	The IPv6 address to which the policy applies.
<i>prefix_length</i>	An IPv6 address prefix used to identify a range of addresses to which the policy applies.
<i>port</i>	The upper-layer protocol port number to which the policy applies.
<i>protocol</i>	Specifies the upper-layer protocol to which the policy applies (refer to the table in the “Usage Guidelines” section below for various protocol options).
<b>in</b>	Specifies that the policy is applied to the inbound IPv6 traffic.
<b>out</b>	Specifies that the policy is applied to the outbound IPv6 traffic.
<b>discard</b>	Specifies that traffic to which this policy applies is discarded.
<b>ipsec</b>	Specifies that IPsec processing is required on traffic to which this policy applies.
<b>none</b>	Specifies that no IPsec processing is done on traffic to which this policy applies.
<i>description</i>	The detailed description of the policy.
<b>no shutdown</b>	Administratively enables the policy.
<b>shutdown</b>	Administratively disables the policy.

## Defaults

<b>parameter</b>	<b>default</b>
<i>priority</i>	100
<i>port</i>	any port
<b>any   icmp6   tcp   udp   ospf   vrrp   number</b>	<b>any</b>
<b>discard   ipsec   none</b>	<b>ipsec</b>
<b>no shutdown   shutdown</b>	<b>no shutdown</b>

## Platforms Supported

OmniSwitch 6850, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove an IPsec policy rule from the switch configuration.
- If traffic matches more than one policy, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.
- The following table lists the various **protocol** options for this command:

<b>protocol</b>
<b>any</b>
<b>icmp6</b> [ <i>type type</i> ]
<b>tcp</b>
<b>udp</b>
<b>ospf</b>
<b>vrrp</b>
<b>number</b> <i>protocol</i>

The **any** option should be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional *type* parameter of **icmp6** can also be specified to restrict the policy for certain type of ICMPv6 packets.

- If the **ipsec** option is specified, then the IPv6 packets that matches the criteria will be processed by the the IPsec as defined with the **ipsec policy rule** command and this policy may not be enabled until at least one rule has been defined.

## Examples

```
-> ipsec policy tcp_in source ::/0 destination 3ffe:200:200:4001::99 protocol tcp
in ipsec description "IPsec on all inbound TCP" no shutdown
-> no ipsec policy tcp_in
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

<a href="#">ipsec policy rule</a>	Adds, modifies, or removes an IPsec rule for a security policy.
<a href="#">show ipsec policy</a>	Displays information about the security policies.

  alaIPsecSecurityPolicyDescription
  alaIPsecSecurityPolicyAdminState
```

---

## ipsec policy rule

Configures an IPsec rule for an IPsec security policy.

**ipsec policy** *policy\_name* **rule** *index* [**ah** | **esp**]

**no ipsec policy** *policy\_name* **rule** *index*

---

### Syntax Definitions

<i>policy_name</i>	The name of an existing IPsec security policy.
<i>index</i>	The index of this rule. Values range from 1 to 10.
<b>ah</b>	Specifies that the rule requires the presence of an Authentication Header (AH).
<b>esp</b>	Specifies that the rule requires the presence of an Encrypted Security Payload (ESP).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- The IPsec security policy name specified with this command must already exist in the switch configuration. Use the **ipsec policy** command to create a new security policy.
- The index value configured for the IPsec policy rule determines the order in which a rule is applied to the original payload. For example, to first enclose the original contents of an IPv6 packet in an ESP and then authenticate the encrypted payload with an AH, configure the ESP rule with an index of one and the AH rule with an index of two.

### Examples

```
-> ipsec policy tcp_in rule 1 esp
-> ipsec policy tcp_in rule 2 ah
-> no ipsec policy tcp_in rule 2
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">ipsec policy</a>	Configures an IPsec security policy.
<a href="#">show ipsec policy</a>	Displays the IPsec security policy configuration for the switch.

**MIB Objects**

AlaIPsecSecurityPolicyRuleTable  
  alaIPsecSecurityPolicyName  
  alaIPsecSecurityPolicyRuleIndex  
  alaIPsecSecurityPolicyRuleProtocol

---

## ipsec sa

Configures an IPsec Security Association (SA).

```
ipsec sa sa_name {esp | ah} [source ipv6_address] [destination ipv6_address] [spi spi] [encryption
{null | des-cbc | 3des-cbc | aes-cbc [key-size key_length] | aes-ctr [key-size key_length]}] [authentication
{none | hmac-md5 | hmac-sha1 | aes-xcbc-mac}] [description description] [no shutdown | shut-
down]
```

**no ipsec sa** *name*

---

### Syntax Definitions

<i>sa_name</i>	The name assigned to this IPsec SA.
<b>esp</b>	Specifies the type of security association as ESP.
<b>ah</b>	Specifies the type of security association as AH.
<b>source</b> <i>ipv6_address</i>	Specifies the source address of the IPv6 traffic that will be covered by the SA.
<b>destination</b> <i>ipv6_address</i>	Specifies the destination address of the IPv6 traffic that will be covered by the SA.
<i>spi</i>	The Security Parameters Index (SPI) for the SA.
<b>encryption</b>	Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter is used only when the SA type is ESP.
<i>key_length</i>	Key length for the specified encryption algorithm.
<b>authentication</b>	Specifies the authentication algorithm to be used for traffic covered by the SA.
<i>description</i>	The detailed description of the SA.
<b>no shutdown</b>	Administratively enables the SA.
<b>shutdown</b>	Administratively disables the SA.

### Defaults

parameter	Defaults
<b>authentication</b> { <b>none</b>   <b>hmac-md5</b>   <b>hmac-sha1</b>   <b>aes-xcbc-mac</b> }	<b>none</b> (ESP SAs only; no default value for AH SAs)
<b>no shutdown</b>   <b>shutdown</b>	<b>no shutdown</b>

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

## Usage Guidelines

- When using **ESP** to verify integrity only, use the **null** option with the **encryption** parameter.
- If the **null** option is used with the **encryption** parameter, specify an integrity algorithm using the **authentication** parameter.
- To override the default key length for the **aes-cbc** or **aes-ctr** encryption algorithm, specify the key length value after the protocol name. The following key length values are supported:

encryption algorithm	key length (in bits)
aes-cbc	128(default), 192, and 256
aes-ctr	160(default), 224, and 288

- There are two ways to configure an ESP confidentiality-only SA: use the **none** option with the **authentication** parameter, or simply omit the **authentication** parameter from the command.
- For an integrity-only SA or an encryption and integrity SA, specify one of the authentication algorithms (**aes-xcbc-mac**, **hmac-md5** or **hmac-sha1**).
- For AH SAs, specify one of the authentication algorithms (**aes-xcbc-mac**, **hmac-md5** or **hmac-sha1**).
- Note that enabling an SA is not allowed if the required encryption and/or authentication keys have not been configured.

## Examples

```
-> ipsec sa ah_in ah source 3ffe:200:200:4001::99 destination 3ffe:200:200:4001::1
spi 9901 authentication hmac-sha1 description "HMAC SHA1 on traffic from 99 to 1"
-> ipsec sa esp_out esp source 3ffe:200:200:4001::1 destination
3ffe:200:200:4001::1ae7 spi 12901 encryption aes-cbc authentication aes-xcbc-mac
description "ESP confidentiality and integrity on traffic from 1 to 1ae7"
-> no ipsec sa ah_in
```

## show ipsec policy

Displays the IPsec security policy configuration for the switch.

```
show ipsec policy [policy_name]
```

---

### Syntax Definitions

*policy\_name*                      The name of an existing IPsec policy.

### Defaults

By default, information is displayed for all security policies configured for the switch.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the *policy\_name* parameter to display information about a specific security policy.

### Examples

```
-> show ipsec policy
Name          Priority  Source-> Destination      Protocol Direction Action  State
-----+-----+-----+-----+-----+-----+-----+-----
ftp-in-drop   100      ::/0->fe80::1:1::1      TCP      in      discard active
telnet-in-1   100      2000::/48->3ffe::200(23) TCP      in      ipsec  active
telnet-out-1  100      3ffe::200(23)->2000::/48 TCP      out     ipsec  active
```

#### *output definitions*

---

<b>Name</b>	The name of the security policy.
<b>Priority</b>	The priority value assigned to the policy. If the same traffic is covered by multiple policies, the policy with the highest priority is applied.
<b>Source -&gt; Destination</b>	Indicates the source and destination of traffic covered by this policy.
<b>Protocol</b>	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) will be displayed in this field.
<b>Direction</b>	Indicates whether the policy has been applied to the incoming or outgoing traffic.
<b>Action</b>	Indicates the action to be taken on the traffic covered by this policy.
<b>State</b>	Indicates the operational state of this policy.

---

```
-> show ipsec policy telnet-out-1
Name          = telnet-out-1
Priority      = 100
Source        = 3ffe::200(23)
Destination   = 2000::/48
Protocol      = TCP
Direction     = out
Action        = ipsec
State         = active
Rules:
  1) esp
  2) ah
Description:
  Require AH and ESP headers on outgoing telnet traffic.
```

### *output definitions*

## show ipsec sa

Displays information about manually configured IPsec Security Associations.

**show ipsec sa** [*sa\_name* | **esp** | **ah**]

---

### Syntax Definitions

<i>sa_name</i>	The name of the Security Association (SA).
<b>esp</b>	Restricts the display to ESP SAs.
<b>ah</b>	Restricts the display to AH SAs.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the *sa\_name* parameter to display information about a specific SA.
- Use the **esp** or **ah** options to display information about a specific SA type.

### Examples

```
-> show ipsec sa
Name          Type  Source-> Destination[SPI]      Encryption  Authentication State
-----+-----+-----+-----+-----+-----+-----
telnet-in-esp ESP  2000::/49->3ffe::200[8920]  aes-cbc(128) hmac-shal active
telnet-out-esp ESP  3ffe::200->2000::/48[100120]  aes-cbc(128) hmac-shal active
```

#### *output definitions*

---

<b>Name</b>	The SA name.
<b>Type</b>	The SA type ( <b>AH</b> or <b>ESP</b> ).
<b>Source -&gt; Destination [SPI]</b>	The traffic source, destination, and SPI for this SA.
<b>Encryption</b>	The encryption algorithm used for this SA.
<b>Authentication</b>	The authentication algorithm used for this SA.
<b>State</b>	The operational state of this SA.

---

```

-> show ipsec sa telnet-in-esp

Name          = telnet-in-esp
Type          = ESP
Source        = 2000::/49
Destination   = 3ffe::200
SPI           = 8920
Encryption    = aes-cbc(128)
Authentication = hmac-shal
State         = active
Description:
  Security association for traffic from 2000::/49 to
  3ffe::200.

```

### *output definitions*

---

<b>Name</b>	The SA name.
<b>Type</b>	The SA type ( <b>AH</b> or <b>ESP</b> ).
<b>Source</b>	The traffic source for this SA.
<b>Destination</b>	The traffic destination for this SA.
<b>SPI</b>	The SPI for this SA.
<b>Encryption</b>	The encryption algorithm used for this SA.
<b>Authentication</b>	The authentication algorithm used for this SA.
<b>State</b>	The operational state of this SA.
<b>Description</b>	The description for this SA.

## Release History

Release 6.3.4; command was introduced.

## Related Commands

[ipsec sa](#) Configures an IPsec Security Association (SA).

## MIB Objects

```

AlaIPsecSAConfigTable
  alaIPsecSAConfigName
  alaIPsecSAConfigType
  alaIPsecSAConfigSource
  alaIPsecSAConfigSourceType
  alaIPsecSAConfigDestination
  alaIPsecSAConfigDestinationType
  alaIPsecSAConfigSPI
  alaIPsecSAConfigOperationalState
  alaIPsecSAConfigEncryptionAlgorithm
  alaIPsecSAConfigEncryptionKeyLength
  alaIPsecSAConfigAuthenticationAlgorithm
  alaIPsecSAConfigAuthenticationKeyLength
  alaIPsecSAConfigDescription

```

---

## show ipsec key

Displays the encryption and authentication key values for the manually configured IPsec security association (SA).

```
show ipsec key {sa-encryption | sa-authentication}
```

---

### Syntax Definitions

**sa-encryption**                      Displays encryption SA key information.

**sa-authentication**                 Displays authentication SA key information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

The key values will not be displayed due to security reasons.

### Examples

```
-> show ipsec key sa-encryption
Encryption Keys
Name                               Length (bits)
-----+-----
sa_1                               192
sa_2                               160
sa_3                               64

-> show ipsec key sa-authentication

Authentication Keys
Name                               Length (bits)
-----+-----
sa_1                               128
sa_5                               160
```

#### *output definitions*

---

<b>Name</b>	The name of the manually configured SA for which the key will be used. The keys may be created for SAs that do not exist.
<b>Length</b>	The length of the key, in bits.

---

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### [ipsec key](#)

Configures the authentication and encryption keys for a manually configured IPsec SA.

## MIB Objects

AlaIPsecKeyTable

    alaIPsecKeyName

    alaIPsecKey

---

## show ipsec ipv6 statistics

Displays IPsec statistics.

**show ipsec ipv6 statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

Inbound:

```
Successful                = 2787
Discarded                  = 18
Policy violation           = 0
No SA found                = 0
Unknown SPI                = 0
AH replay check failed    = 0
ESP replay check failed   = 0
AH authentication success = 93
AH authentication failure = 0
ESP authentication success = 25
ESP authentication failure = 0
Packet not valid          = 0
No memory available       = 0
```

Outbound:

```
Successful                = 5135
Discarded                  = 0
Policy violation           = 0
No SA found                = 19
Packet not valid          = 0
No memory available       = 0
```

### *output definitions*

---

<b>Successful (inbound)</b>	The number of incoming packets requiring IPsec processing that were successfully handled.
<b>Discarded (inbound)</b>	The number of incoming packets discarded because they matched a discard policy.
<b>Policy violation (inbound)</b>	The number of incoming packets dropped due to policy violations.

*output definitions*

---

<b>No SA found (inbound)</b>	The number of incoming packets dropped because no matching SA was found.
<b>Unknown SPI (inbound)</b>	The number of incoming packets dropped because the SPI was unknown.
<b>AH replay check failed (inbound)</b>	The number of incoming packets that failed the AH replay check.
<b>ESP replay check failed (inbound)</b>	The number of incoming packets that failed the ESP replay check.
<b>AH authentication success (inbound)</b>	The number of incoming packets that successfully passed AH authentication.
<b>AH authentication failure (inbound)</b>	The number of incoming packets that failed AH authentication.
<b>ESP authentication success (inbound)</b>	The number of incoming packets that successfully passed ESP authentication.
<b>ESP authentication failure (inbound)</b>	The number of incoming packets that failed ESP authentication.
<b>Packet not valid (inbound)</b>	The number of incoming packets requiring IPsec processing that were not valid.
<b>No memory available (inbound)</b>	The number of incoming packets requiring IPsec processing that were dropped because memory was not available.
<b>Successful (outbound)</b>	The number of outgoing packets requiring IPsec processing that were successfully handled.
<b>Discarded (outbound)</b>	The number of outbound packets discarded because they matched a discard policy.
<b>Policy violation (outbound)</b>	The number of outgoing packets dropped due to policy violation.
<b>No SA found (outbound)</b>	The number of outgoing packets dropped because no matching SA was found.
<b>Packet not valid (outbound)</b>	The number of outgoing packets requiring IPsec processing that were not valid.
<b>No memory available (outbound)</b>	The number of outgoing IPsec packets dropped because memory was not available.

---

**Release History**

# 17 RIP Commands

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIPv2 that is compatible with RIPv1. It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, and RFC1724.

MIB information for the RIP commands is as follows:

*Filename:* RIPv2.mib

*Module:* rip2

*Filename:* AlcatelIND1Rip.mib

*Module:* alaRipMIB

A summary of the available commands is listed here:

---

**ip load rip**  
**ip rip status**  
**ip rip interface**  
**ip rip interface status**  
**ip rip interface metric**  
**ip rip interface send-version**  
**ip rip interface recv-version**  
**ip rip force-holddowntimer**  
**ip rip host-route**  
**ip rip route-tag**  
**ip rip interface auth-type**  
**ip rip interface auth-key**  
**ip rip update-interval**  
**ip rip invalid-timer**  
**ip rip garbage-timer**  
**ip rip holddown-timer**  
**show ip rip**  
**show ip rip routes**  
**show ip rip interface**  
**show ip rip peer**

---

## ip load rip

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

### ip load rip

---

#### Syntax Definitions

N/A

#### Defaults

N/A

#### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

#### Usage Guidelines

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.
- To remove RIP from switch memory, you must manually edit the **boot.cfg** file. The **boot.cfg** file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.
- Use the [ip rip status](#) command to enable RIP on the switch.

#### Examples

```
-> ip load rip
```

#### Release History

Release 6.1; command was introduced.

#### Related Commands

<a href="#">ip rip status</a>	Enables/disables RIP routing on the switch.
<a href="#">show ip rip</a>	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

#### MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPRipStatus
```

---

## ip rip status

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

**ip rip status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables RIP routing on the switch.
<b>disable</b>	Disables RIP routing on the switch.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- RIP must be loaded on the switch (**ip load rip**) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

### Examples

```
-> ip rip status enable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>ip load rip</b>	Loads RIP into the switch memory.
<b>show ip rip</b>	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaProtocolRip  
  alaRipProtoStatus
```

---

## ip rip interface

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN's IP router interface.

```
ip rip interface {interface_name}
```

```
no ip rip interface {interface_name}
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the [ip rip interface status](#) command.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see [Chapter 5, "VLAN Management Commands"](#).

### Examples

```
-> ip rip interface rip-1
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

<a href="#">ip interface</a>	Creates a VLAN router interface.
<a href="#">ip load rip</a>	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
<a href="#">ip rip status</a>	Enables/disables RIP routing on the switch.
<a href="#">ip rip interface status</a>	Enables/disables a RIP interface.

## MIB Objects

```
rip2IfConfTable  
    rip2IfConfAddress  
    rip2IfConfStatus
```

---

## ip rip interface status

Enables/disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

```
ip rip interface {interface_name} status {enable | disable}
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- You must first create a RIP interface by using the [ip rip interface](#) command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see [Chapter 5, “VLAN Management Commands”](#).

### Examples

```
-> ip rip interface rip-1 status enable
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

**ip interface**

Creates a VLAN router interface.

**ip load rip**

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

**ip rip status**

Enables/disables RIP routing on the switch.

**ip rip interface**

Creates/deletes a RIP interface.

## MIB Objects

rip2IfConfTable

    rip2IfConfAddress

    rip2IfConfStatus

---

## ip rip interface metric

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

**ip rip interface** *{interface\_name}* **metric** *value*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*value*                                      Metric value. Valid range is 1–15.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

### Examples

```
-> ip rip interface rip-1 metric 2
```

### Release History

Release 6.1; command was introduced.  
Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

**ip rip interface**                      Enables/disables RIP on a specific interface.

**show ip rip peer**                      Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

### MIB Objects

rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfDefaultMetric

---

## ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

**ip rip interface** {*interface\_name*} **send-version** {**none** | **v1** | **v1compatible** | **v2**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>none</b>	RIP packets will not be sent by the interface.
<b>v1</b>	Only RIPv1 packets will be sent by the interface.
<b>v1compatible</b>	Only RIPv2 broadcast packets (not multicast) will be sent by the interface.
<b>v2</b>	Only RIPv2 packets will be sent by the interface.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>none   v1   v2   v1compatible</b>	<b>v2</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

### Examples

```
-> ip rip interface rip-1 send-version v1
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

**ip rip interface recv-version** Configures the receive option for a RIP interface.

## MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfSend
```

---

## ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

**ip rip interface** {*interface\_name*} **recv-version** {**v1** | **v2** | **both** | **none**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>v1</b>	Only RIPv1 packets will be received by the interface.
<b>v2</b>	Only RIPv2 packets will be received by the interface.
<b>both</b>	Both RIPv1 and RIPv2 packets will be received by the interface.
<b>none</b>	Interface ignores any RIP packets received.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>v1   v2   both   none</b>	<b>both</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

### Examples

```
-> ip rip interface rip-1 recv-version both
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

**ip rip interface send-version** Configures the send option for a RIP interface.

## MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfReceive
```

---

## ip rip force-holddowntimer

Configures the forced hold-down timer value, in seconds, that defines an amount of time during which routing information regarding better paths is suppressed. A route enters into a forced hold-down state when an update packet is received that indicates the route is unreachable and when this timer is set to a non-zero value. After this timer has expired and if the value is less than 120 seconds, the route enters a hold-down state for the rest of the period until the remainder of the 120 seconds has also expired. During this time the switch will accept any advertisements for better paths that are received.

**ip rip force-holddowntimer** *seconds*

---

### Syntax Definitions

*seconds*                      The forced hold-down time interval, in seconds. The valid range is 0–120.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The forced hold-down timer is not the same as the RIP hold-down timer. The forced hold-down timer defines a separate interval that overlaps the hold-down state. During the forced hold-down timer interval, the switch will not accept *better* routes from other gateways.
- The forced hold-down time interval can become a subset of the hold-down timer (120 seconds) by using this command to set a value less than 120.
- To allow the routing switch to use better routes advertised during the entire hold-down time period, leave the forced hold-down timer set to the default value of 0.

### Examples

```
-> ip rip force-holddowntimer 10
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### `show ip rip`

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

## MIB Objects

`alaProtocolRip`

`alaRipForceHolddownTimer`

---

## ip rip host-route

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

**ip rip host-route**

**no ip rip host-route**

---

### Syntax Definitions

N/A

### Defaults

The default is to enable a default host route.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

### Examples

```
-> ip rip host-route
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip rip routes](#) Displays the RIP Routing Database.

### MIB Objects

```
alaProtocolRip  
  alaRipHostRouteSupport
```

---

---

## ip rip route-tag

Configures the route tag value for RIP routes generated by the switch.

**ip rip route-tag** *value*

---

### Syntax Definitions

*value* Route tag value. Valid range is 0–2147483647.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Only RIPv2 supports route tags.

### Examples

```
-> ip rip route-tag 0
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaRipRedistRouteTag

---

## ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

```
ip rip interface {interface_name} auth-type {none | simple | md5}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>none</b>	No authentication will be used.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	MD5 authentication will be used.

### Defaults

---

parameter	default
<b>none   simple</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

### Examples

```
-> ip rip interface rip-1 auth-type none
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[ip rip interface auth-key](#) Configures the text string that will be used as the password for the RIP interface.

### MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfAuthType
```

---

## ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

```
ip rip interface {interface_name} auth-key string
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>string</i>	16-byte text string.

### Defaults

The default authentication string is a null string.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

### Examples

```
-> ip rip interface rip-1 auth-key nms
```

### Release History

Release 6.1; command was introduced.  
Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

<a href="#">ip rip interface auth-type</a>	Configures the type of authentication that will be used for the RIP interface.
--------------------------------------------	--------------------------------------------------------------------------------

### MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfAuthKey
```

---

## ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

**ip rip update-interval** *seconds*

---

### Syntax Definitions

*seconds*                                      The RIP routing update interval, in seconds. The valid range is 1–120.

### Defaults

---

parameter	default
<i>seconds</i>	30

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The update interval value must be less than or equal to one-third the invalid interval value.

### Examples

```
-> ip rip update-interval 45
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ip rip](#)                                      Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaProtocolRip  
  alaRipUpdateInterval

---

## ip rip invalid-timer

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

**ip rip invalid-timer** *seconds*

---

### Syntax Definition

*seconds*                                          The RIP invalid timer value, in seconds. The valid range is 3–360.

### Defaults

parameter	default
<i>seconds</i>	180

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The invalid time interval value must be three times the update interval value.

### Examples

```
-> ip rip invalid-timer 270
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

**show ip rip**                                          Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaProtocolRip
  alaRipInvalidTimer
```

---

## ip rip garbage-timer

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

**ip rip garbage-timer** *seconds*

---

### Syntax Definition

*seconds* The RIP garbage timer value, in seconds. The valid range is 0–180.

### Defaults

---

parameter	default
<i>seconds</i>	120

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

### Examples

```
-> ip rip garbage-timer 180
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaProtocolRip  
alaRipGarbageTimer

---

## ip rip holddown-timer

Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold-down state.

**ip rip holddown-timer** *seconds*

---

### Syntax Definition

*seconds* The hold-down time interval, in seconds. The valid range is 0–120.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

When RIP detects a route with higher metric than the route in the RIB, the route with the higher metric goes into the hold-down state. The route updates with a metric of INFINITY are rejected.

### Examples

```
-> ip rip holddown-timer 10
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaProtocolRip  
  alaRipHolddownTimer
```

---

## show ip rip

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**show ip rip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip rip
```

```
Status = Enabled
Number of routes = 9
Host Route Support = Enabled
Route Tag = 42
Update interval = 30
Invalid interval = 180
Garbage interval = 120
Holddown interval = 0
Forced Hold-Down Timer = 0
```

#### *output definitions*

---

<b>Status</b>	RIP status ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Number of routes</b>	Number of network routes in the RIP routing table.
<b>Host Route Support</b>	Host route status ( <b>Enabled</b> or <b>Disabled</b> ). Indicates whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.
<b>Route Tag</b>	Route tag value for RIP routes generated by the switch. Valid values are 0–2147483647.
<b>Update interval</b>	The RIP routing update interval, in seconds. Valid range is 1–120. Default is 30.
<b>Invalid interval</b>	The RIP invalid timer value, in seconds. Valid range is 3–360. Default is 180.
<b>Garbage interval</b>	The RIP garbage timer value, in seconds. Valid range is 0–180. Default is 120.

*output definitions*

---

<b>Holddown interval</b>	The hold-down time interval, in seconds. Valid range is 0–120. Default is 0.
<b>Forced Hold-Down Timer</b>	The forced hold-down time interval, in seconds. The valid range is 0–120. Default is 0.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.5; new fields added.

**Related Commands**

<b>ip rip status</b>	Enables/disables RIP routing on the switch.
<b>ip rip force-holddowntimer</b>	Configures the interval during which a RIP route remains in the forced hold-down state.
<b>ip rip update-interval</b>	Configures the time interval during which RIP routing updates are sent out.
<b>ip rip invalid-timer</b>	Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.
<b>ip rip garbage-timer</b>	Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.
<b>ip rip holddown-timer</b>	Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold down state.

  alaRipRouteNumber
  alaRipHostRouteSupport
  alaRipRedistRouteTag
  alaRipUpdateInterval
  alaRipInvalidTimer
  alaRipGarbageTimer
  alaRipHolddownTimer
  alaRipForceHolddownTimer

```

---

## show ip rip routes

Displays the RIP routing database. The routing database contains all of the routes learned through RIP.

**show ip rip routes** [*ip\_address ip\_mask*]

---

### Syntax Definitions

*ip\_address*                                32-bit IP address.

*ip\_mask*                                    The mask corresponding to the IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

To view all RIP routes, enter the basic command syntax (**show ip rip routes**). To view a specific route, enter the destination IP address and mask.

### Examples

-> show ip rip routes

Legends: State: A = Active, H = Holddown, G = Garbage

Destination	Gateway	State	Metric	Proto
2.0.0.0/8	+5.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
4.0.0.0/8	+5.0.0.14	A	3	Rip
	2.0.0.14	A	3	Rip
5.0.0.0/8	+2.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
10.0.0.0/8	+4.0.0.7	A	2	Rip
	5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
22.0.0.0/8	+5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
128.251.40.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	3	Rip
	2.0.0.14	A	3	Rip
150.0.0.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
152.0.0.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	3	Rip

*output definitions*

---

<b>Destination</b>	Destination network IP address.
<b>Gateway</b>	The Gateway IP address (switch from which the destination address was learned).
<b>State</b>	The associated state of the route, which can be <b>A (Active)</b> , <b>H (Holddown)</b> , or <b>G (Garbage)</b> .
<b>Metric</b>	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
<b>Proto</b>	The type of route ( <b>Local</b> , <b>Rip</b> , or <b>Redist</b> ).

---

```
-> show ip rip routes 2.0.0.0 255.0.0.0
```

```

Destination          = 2.0.0.0,
Mask length          = 8,
Gateway(1)           = 5.0.0.14,
  Protocol            = Rip,
  Out Interface       = intf5,
  Metric              = 2,
  Status              = Installed,
  State                = Active,
  Age                  = 19s,
  Tag                  = 0,
Gateway(2)           = 4.0.0.7,
  Protocol            = Rip,
  Out Interface       = intf4,
  Metric              = 3,
  Status              = Not Installed,
  State                = Active,
  Age                  = 12s,
  Tag                  = 0,

```

*output definitions*

---

<b>Destination</b>	Destination network IP address.
<b>Mask length</b>	Length of the destination network IP subnet mask.
<b>Gateway</b>	The Gateway IP address (switch from which the destination address was learned).
<b>Protocol</b>	The type of the route ( <b>Local</b> , <b>Rip</b> , or <b>Redist</b> ).
<b>Out Interface</b>	The RIP interface through which the next hop is reached.
<b>Metric</b>	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
<b>Status</b>	The RIP interface status (Installed or Not Installed).
<b>State</b>	The associated state of the route ( <b>Active</b> , <b>Holddown</b> , or <b>Garbage</b> ).
<b>Age</b>	The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct).
<b>Tag</b>	The associated route tag.

---

## Release History

Release 6.1; command was introduced.

Release 6.1.5; new fields added.

## Related Commands

[ip rip host-route](#)

Enables/disables a host route to an individual host on a network.

## MIB Objects

```
alaRipEcmpRouteTable
  alaRipEcmpRouteDest
  alaRipEcmpRouteMask
  alaRipEcmpRouteNextHop

  alaRipEcmpAge
  alaRipEcmpTag
  alaRipEcmpRouteState
  alaRipEcmpRouteStatus
```

---

## show ip rip interface

Displays RIP interface status and configuration.

**show ip rip interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Enter an IP address to view a specific interface. Enter the basic **show ip rip interface** command to show status for all interfaces.

### Examples

```
-> show ip rip interface rip-1
```

```
Interface IP Name           = rip-1,
Interface IP Address        = 11.11.11.1
IP Interface Number (VLANId) = 4,
Interface Admin status     = enabled,
IP Interface Status        = enabled,
Interface Config AuthType  = None,
Interface Config AuthKey Length = 0,
Interface Config Send-Version = v2,
Interface Config Receive-Version = both,
Interface Config Default Metric = 1,
Received Packets           = 154,
Received Bad Packets       = 0,
Received Bad Routes        = 0,
Sent Updates                = 8
```

#### *output definitions*

---

<b>Interface IP Name</b>	The IP Interface name.
<b>Interface IP Address</b>	Interface IP address.
<b>IP Interface Number</b>	Interface VLAN ID number.
<b>Interface Admin Status</b>	The RIP administrative status (enabled/disabled).
<b>IP Interface Status</b>	Interface status (enabled /disabled).
<b>Interface Config AuthType</b>	The type of authentication that will be used for the RIP interface (None or Simple).

*output definitions (continued)*

---

<b>Interface Config AuthKey Length</b>	The authentication key length used for the RIP interface.
<b>Interface Config Send-Version</b>	Interface send option (none, v1, v2, and v1 compatible). Default is v2.
<b>Interface Config Receive-Version</b>	Interface receive option (none, v1, v2, and both). Default is both.
<b>Interface Config Default Metric</b>	Default redistribution metric. Default is 1.
<b>Received Packets</b>	Number of packets received on the interface.
<b>Received Bad Packets</b>	Number of bad packets received and discarded. Normally this value is zero (0).
<b>Received Bad Routes</b>	Number of bad routes received and discarded. Normally this value is zero (0).
<b>Sent Updates</b>	Number of RIP routing table updates sent.

---

**Release History**

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

Release 6.1.5; **Interface IP Name**, **Interface Admin Status**, **Interface Config AuthKey Length**, and **Received Packets** fields added; **Interface IP Broadcast Address**, **Interface Config AuthKey**, and **RIP Config Status** fields removed.

**Related Commands**

[ip rip interface](#) Enables/disables RIP for a specific interface.

**MIB Objects**

```

  rip2IfStatRcvBadRoutes
  rip2IfStatSentUpdates
```

---

## show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

```
show ip rip peer [ip_address]
```

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip rip peer
```

```

      Total   Bad   Bad           Secs since
      IP Address  Recvd  Packets  Routes  Version  last update
-----+-----+-----+-----+-----+-----
      100.10.10.1    1     0       0       2         3

```

#### *output definitions*

---

<b>IP Address</b>	Peer IP address.
<b>Total recvd</b>	Total number of RIP packets received from the peer.
<b>Bad Packets</b>	Number of bad packets received from peer.
<b>Bad Routes</b>	Number of bad routes received from peer.
<b>Version</b>	Peer's RIP version as seen on the last packet received.
<b>Secs since last update</b>	Number of seconds since the last packet was received from the peer.

---

### Release History

# 18 RDP Commands

This chapter details Router Discovery Protocol (RDP) commands for the switch. RDP is an extension of the Internet Control Message Protocol (ICMP) that provides a mechanism for end hosts to discover at least one router in the same network.

This implementation of RDP is based on the router requirements specified in RFC 1256. Switches that serve as a router can enable RDP to advertise themselves to clients on the same network at random intervals between a configurable range of time and in response to client solicitations.

MIB information for the RDP commands is as follows:

*Filename:* AlcatelIND1Rdp.mib  
*Module:* alcatelIND1RDPMIB

A summary of the available commands is listed here:

---

**ip router-discovery**  
**ip router-discovery interface**  
**ip router-discovery interface advertisement-address**  
**ip router-discovery interface max-advertisement-interval**  
**ip router-discovery interface min-advertisement-interval**  
**ip router-discovery interface advertisement-lifetime**  
**ip router-discovery interface preference-level**  
**show ip router-discovery**  
**show ip router-discovery interface**

---

---

## ip router-discovery

Enables or disables the Router Discovery Protocol (RDP) for the switch.

**ip router-discovery {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables RDP on the switch.
<b>disable</b>	Disables RDP on the switch.

### Defaults

By default, RDP is disabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The **ip router-discovery** command only activates RDP for the switch. No advertisements occur until an IP interface is configured with RDP.
- Note that if VRRP is enabled but there is no VRRP master on the network, RDP will not transmit advertisements. If a VRRP master is identified or VRRP is disabled, however, RDP will transmit advertisements as described in this chapter.

### Examples

```
-> ip router-discovery enable  
-> ip router-discovery disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip router-discovery interface** Enables or disables an RDP interface.

### MIB Objects

```
alaRDPConfig  
  alaRDPStatus
```

---

## ip router-discovery interface

Enables or disables RDP for the specified IP interface. An RDP interface is created for the specified IP interface name, which is then advertised by RDP as an active router on the local network.

**ip router-discovery interface** *name* [**enable** | **disable**]

**no router-discovery interface** *name*

---

### Syntax Definitions

<i>name</i>	The IP interface name that was defined at the time the IP interface was configured.
<b>enable</b>	Enables an RDP interface for the specified IP interface.
<b>disable</b>	Disables an RDP interface for the specified IP interface.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>enable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the RDP interface from the switch configuration.
- Do *not* use the **enable** option the first time this command is used to create an RDP interface, as it is not necessary and will return an error message. Once RDP is enabled and then is subsequently disabled, however, the **enable** option is then required the next time this command is used to enable the RDP interface.
- The RDP interface is not active unless RDP is also enabled for the switch.

## Examples

```
-> ip router-discovery interface Marketing
-> ip router-discovery interface Marketing disable
-> ip router-discovery interface Marketing enable
-> no ip router-discovery interface Marketing
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">ip router-discovery</a>	Enables or disables RDP for the switch.
<a href="#">ip interface</a>	Configures an IP router interface.

## MIB Objects

```
alaRDPIfTable
  alaRDPIfStatus
```

---

## ip router-discovery interface advertisement-address

Configures the destination address to which RDP will send router advertisement packets from the specified interface. Advertisement packets are sent at configurable intervals by routers to announce their IP addresses on the network.

**ip router-discovery interface** *name* **advertisement-address** {**all-systems-multicast** | **broadcast**}

---

### Syntax Definitions

<i>name</i>	The IP interface name that was defined at the time the IP interface was configured.
<b>all-systems-multicast</b>	Specifies 224.0.0.1 as the destination address for RDP advertisement packets.
<b>Broadcast</b>	Specifies 255.255.255.255 as the destination address for RDP advertisement packets. Use this address if IP multicast links are not available.

### Defaults

parameter	default
<b>all-systems-multicast</b>   <b>broadcast</b>	<b>all-systems-multicast</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The RDP interface advertisement address is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- RFC 1256 recommends the use of **all-system-multicast** on all links with “listening hosts” that support IP multicast.

### Examples

```
-> ip router-discovery interface Marketing advertisement-address all-systems-multicast
-> ip router-discovery interface Accounting advertisement-address broadcast
```

### Release History

Release 6.1; command was introduced.

## Related Commands

- [ip router-discovery](#) Enables or disables RDP on the switch.
- [ip router-discovery interface](#) Enables or disables an RDP interface.

## MIB Objects

alaRDPIfTable

alaRDPIfAdvtAddress

---

## ip router-discovery interface max-advertisement-interval

Configures the maximum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

**ip router-discovery interface** *name* **max-advertisement-interval** *seconds*

---

### Syntax Definitions

*name* The IP interface name that was defined at the time the IP interface was configured.

*seconds* The maximum amount of time allowed before the next advertisement occurs. The range is 4 to 1800 seconds.

### Defaults

parameter	default
<i>seconds</i>	600

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The RDP interface maximum advertisement time is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- Do not specify a value for the maximum advertisement interval that is *less* than the value specified for the minimum advertisement interval. To set the minimum advertisement interval value, use the **ip router-discovery interface min-advertisement-interval** command.
- Note that the minimum and maximum advertisement values define an interval of time in which RDP transmits advertisement packets. RDP transmits packets at random times within this interval, waiting no longer than the maximum time specified and no sooner than the minimum time specified before the next transmission.

### Examples

```
-> ip router-discovery interface Marketing max-advertisement-interval 350
-> ip router-discovery interface Accounting max-advertisement-interval 20
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip router-discovery</b>	Enables or disables RDP on the switch.
<b>ip router-discovery interface</b>	Enables or disables an RDP interface.
<b>ip router-discovery interface min-advertisement-interval</b>	Configures the minimum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.
<b>ip router-discovery interface advertisement-lifetime</b>	Configures the maximum amount of time, in seconds, that router IP addresses received in advertisement packets are considered valid.

## MIB Objects

alaRDPIfTable  
alaRDPIfMaxAdvtInterval

---

## ip router-discovery interface min-advertisement-interval

Configures the minimum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

**ip router-discovery interface** *name* **min-advertisement-interval** *seconds*

---

### Syntax Definitions

<i>name</i>	The IP interface name that was defined at the time the IP interface was configured.
<i>seconds</i>	The minimum amount of time allowed before the next advertisement occurs. The range is 3 seconds to the value set for the maximum advertisement interval.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>seconds</i>	0.75 * maximum advertisement interval

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The RDP interface minimum advertisement time is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- Do not specify a value for the minimum advertisement interval that is *greater* than the value specified for the maximum advertisement interval. To set the maximum advertisement interval value, use the **ip router-discovery interface max-advertisement-interval** command.
- Note that the minimum and maximum advertisement values define an interval of time in which RDP transmits advertisement packets. RDP transmits packets at random times within this interval, waiting no longer than the maximum time specified and no sooner than the minimum time specified before the next transmission.

### Examples

```
-> ip router-discovery interface Marketing min-advertisement-interval 20
-> ip router-discovery interface Accounting min-advertisement-interval 3
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">ip router-discovery</a>	Enables or disables RDP on the switch.
<a href="#">ip router-discovery interface</a>	Enables or disables an RDP interface.

<a href="#">ip router-discovery interface advertisement-lifetime</a>	Configures the maximum amount of time, in seconds, that router IP addresses received in advertisement packets are considered valid.

## MIB Objects

alaRDPIfTable  
alaRDPIfMinAdvtInterval

---

## ip router-discovery interface advertisement-lifetime

Configures the maximum amount of time, in seconds, that router IP addresses advertised from the specified interface are considered valid. This value is set in the lifetime field of the advertisement packets transmitted on the specified RDP interface.

**ip router-discovery interface** *name* **advertisement-lifetime** *seconds*

---

### Syntax Definitions

<i>name</i>	The IP interface name that was defined at the time the IP interface was configured.
<i>seconds</i>	The length of time, in seconds, that advertised IP addresses are considered valid by the receiving host.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>seconds</i>	3 * maximum advertisement interval

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The RDP interface advertisement lifetime value is not active unless RDP is enabled on the switch, and the specified interface is also enabled.
- Do not specify an advertisement lifetime value that is less than the value specified for the maximum advertisement interval. To set the maximum advertisement interval value, use the **ip router-discovery interface max-advertisement-interval** command.

### Examples

```
-> ip router-discovery interface Marketing advertisement-lifetime 2000  
-> ip router-discovery interface Accounting advertisement-lifetime 750
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip router-discovery**

Enables or disables RDP on the switch.

**ip router-discovery interface**

Enables or disables an RDP interface.

**ip router-discovery interface  
min-advertisement-interval**

Configures the minimum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

**ip router-discovery interface  
max-advertisement-interval**

Configures the maximum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

## MIB Objects

alaRDPIfTable

alaRDPIfAdvLifeTime

---

## ip router-discovery interface preference-level

Configures the preference level for each IP address advertised on the specified RDP interface. The end host selects the address with the highest preference level to use as its default router, if the host is not already redirected or configured to use another default router for a particular destination.

**ip router-discovery interface** *name* **preference-level** *level*

---

### Syntax Definitions

<i>name</i>	The IP interface name that was defined at the time the IP interface was configured.
<i>level</i>	Any positive, integer value. The higher the value, the higher the precedence.

### Defaults

<b>parameter</b>	<b>default</b>
<i>level</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The RDP interface preference level value is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- Set the preference level higher to encourage the use of an advertised router IP address.
- Set the preference level lower to discourage the use of an advertised router IP address.
- The preference level of an advertised router IP address is compared only to the preference levels of other addresses on the same subnet.

### Examples

```
-> ip router-discovery interface Marketing preference-level 10  
-> ip router-discovery interface Accounting preference-level 50
```

### Release History

Release 6.1; command was introduced.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Each time RDP is enabled on the switch, all statistic parameter values are reset to zero for the new session. For example, if the RDP uptime was 160000 seconds when RDP was last disabled, the uptime starts out at zero the next time RDP is enabled.
- Use the **show ip router-discovery interface** command to display information about a specific RDP interface.

### Examples

```
-> show ip router-discovery
Status                = Enabled,
RDP uptime            = 161636 secs
#Packets Tx           = 4,
#Packets Rx           = 0,
#Send Errors          = 0,
#Recv Errors          = 0,
```

### *output definitions*

---

<b>Status</b>	The status of RDP. <b>Enabled</b> allows RDP interfaces to advertise router IP addresses; <b>Disabled</b> stops RDP traffic on all switch interfaces. Use the <b>ip router-discovery</b> command to enable or disable RDP on the switch.
<b>RDP uptime</b>	Indicates the amount of time, in seconds, that RDP has remained active on the switch.
<b>#Packets Tx</b>	The number of RDP packets transmitted from all active RDP interfaces on the switch.
<b>#Packets Rx</b>	The number of RDP packets received on all active RDP interfaces on the switch.
<b>#Send Errors</b>	The number of RDP packet transmission errors that have occurred.
<b>#Recv Errors</b>	The number of errors that occurred when receiving RDP packets.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

[show ip router-  
discovery interface](#)

Displays the current RDP status and related statistics for one or more switch router port interfaces.

## MIB Objects

alaRDPConfig  
    alaRDPStatus

---

## show ip router-discovery interface

Displays the current RDP status, related parameter values, and RDP traffic statistics for one or more switch router interfaces.

**show ip router-discovery interface** [*name*]

---

### Syntax Definitions

*name* The IP interface name that was defined at the time the IP interface was configured.

### Defaults

By default, the information for all RDP interfaces is displayed with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When an optional IP interface name is specified with this command, additional information about the RDP interface is displayed.
- Use the **show ip router-discovery** command to display global RDP status and statistics for the entire switch.

### Examples

```
-> show ip router-discovery interface
      Name      IP i/f  RDP i/f  VRRP i/f  Next  #Pkts
                status  status  status(#mast)  Advt sent/recvd
-----+-----+-----+-----+-----+-----
Marketing      Disabled Enabled Disabled(0)  9    0    0
Accounting     Disabled Enabled Disabled(0)  3    0    0
```

### output definitions

---

<b>Name</b>	The user-defined IP interface name defined at the time the IP interface was configured.
<b>IP i/f status</b>	The IP status for this interface ( <b>Enabled</b> or <b>Disabled</b> ).
<b>RDP i/f status</b>	The RDP status for this interface ( <b>Enabled</b> or <b>Disabled</b> ).
<b>VRRP i/f status (#mast)</b>	The VRRP status for this interface ( <b>Enabled</b> or <b>Disabled</b> ), and the number of VRRP masters on the network for this interface.
<b>Next Advt</b>	Time remaining until the next advertisement is sent.
<b>#Pkts sent/recvd</b>	Number of advertisement packets sent from this interface; the number of solicitation packets received on this interface.

---

```

-> show ip router-discovery interface Marketing
Name = Marketing,
IP Address = 11.255.4.1,
IP Mask = 255.0.0.0,
IP Interface status = Enabled,
RDP Interface status = Enabled,
VRRP Interface status = Disabled,
Advertisement address = 224.0.0.1,
Max Advertisement interval = 600 secs,
Min Advertisement interval = 450 secs,
Advertisement lifetime = 1800 secs,
Preference Level = 0x0,
#Packets sent = 3,
#Packets received = 0,

```

### *output definitions*

<b>Name</b>	The user-defined IP interface name defined at the time the IP interface was configured.
<b>IP Address</b>	The IP address associated with the IP interface name.
<b>IP Mask</b>	The subnet mask associated with the interface IP address.
<b>IP Interface status</b>	The IP status for this interface ( <b>Enabled</b> or <b>Disabled</b> ).
<b>RDP Interface status</b>	The RDP status for this interface ( <b>Enabled</b> or <b>Disabled</b> ).
<b>VRRP Interface status</b>	The VRRP status for this interface ( <b>Enabled</b> or <b>Disabled</b> ). See <a href="#">Chapter 21, “VRRP Commands,”</a> for more information.
<b>Advertisement address</b>	The destination address for RDP advertisement packets: <b>224.0.0.1</b> (all-systems-multicast) or <b>255.255.255.255</b> (broadcast). Configured using the <a href="#">ip router-discovery interface advertisement-address</a> command.
<b>Max Advertisement interval</b>	The maximum time, in seconds, RDP allows between each advertisement packet the router transmits from this interface. Configured using the <a href="#">ip router-discovery interface max-advertisement-interval</a> command.
<b>Min Advertisement interval</b>	The minimum time, in seconds, RDP allows between each advertisement packet the router transmits from this interface. Configured using the <a href="#">ip router-discovery interface min-advertisement-interval</a> command.
<b>Advertisement lifetime</b>	The maximum amount of time, in seconds, that router IP addresses advertised from this interface are considered valid. Configured using the <a href="#">ip router-discovery interface advertisement-lifetime</a> command.
<b>Preference Level</b>	The preference level, displayed in hex, for each IP address advertised on this interface. Configured using the <a href="#">ip router-discovery interface preference-level</a> command.
<b>#Packets sent</b>	The number of advertisement packets transmitted from this interface.
<b>#Packets received</b>	The number of solicitation packets received on this interface.

## Release History

Release 6.1; command was introduced.

## Related Commands

# 19 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, OSPF, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

BFD can be operated in three different modes: Asynchronous mode, Demand mode or Echo mode.

In Asynchronous mode, the systems continuously send BFD control packets between each other as part of a BFD session. If there are no packets received for a minimum time interval negotiated between the systems, then the neighbor system is considered down.

In Demand mode, a poll sequence is initiated for which there is an exchange of BFD control packets. If the demand mode is active and no control packets are received in response to the poll sequence, the session is declared down.

In Echo mode, a stream of BFD echo packets are transmitted in a forwarding path for which the neighboring system would loop the packets and send them back. If the number of packets transmitted is not echoed back, then the system is declared down. Echo mode can be operated along with Asynchronous mode and Demand mode.

MIB information for the BFD commands is as follows:

*Filename:* ALCATEL-IND1-BFD-MIB  
*Module:* ALCATEL-IND-BFD-MIB

---

A summary of the available commands is listed here:

---

<b>Global BFD commands</b>	<b>ip bfd-std status</b> <b>ip bfd-std transmit</b> <b>ip bfd-std receive</b> <b>ip bfd-std mode</b> <b>ip bfd-std echo interval</b> <b>ip bfd-std l2-hold-timer</b> <b>show ip bfd-std</b> <b>show ip bfd-std sessions</b> <b>show ip bfd-std session</b>
<b>BFD Interface commands</b>	<b>ip bfd-std interface</b> <b>ip bfd-std interface status</b> <b>ip bfd-std interface transmit</b> <b>ip bfd-std interface receive</b> <b>ip bfd-std interface multiplier</b> <b>ip bfd-std interface mode</b> <b>ip bfd-std interface echo-interval</b> <b>ip bfd-std interface l2-hold-timer</b> <b>show ip bfd-std interfaces</b>
<b>Commands to configure BFD supported protocols</b>	<b>ip ospf bfd-std status</b> <b>ip ospf bfd-std all-interfaces</b> <b>ip ospf interface bfd-std</b> <b>ip ospf interface bfd-std drs-only</b> <b>ip ospf interface bfd-std all-nbrs</b> <b>ip bgp bfd-std status</b> <b>ip bgp bfd-std all-neighbors</b> <b>ip bgp neighbors bfd-std</b> <b>vrrp bfd-std</b> <b>vrrp track address bfd-std</b> <b>ip static-route all bfd-std</b> <b>ip static-routes bfd-std status</b>

---

## ip bfd-std status

Enables or disables the global BFD protocol status for the switch.

**ip bfd-std status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables BFD.
<b>disable</b>	Disables BFD.

### Defaults

By default, BFD is disabled for the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

### Examples

```
-> ip bfd-std status enable  
-> ip bfd-std status disable
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

**show ip bfd-std** Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalAdminStatus

---

## ip bfd-std transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

**ip bfd-std transmit** *transmit-interval*

---

### Syntax Definitions

*transmit-interval*                      The transmit time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>transmit-interval</i>	100 milliseconds

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std transmit** command does not override the value set for the interface using the **ip bfd-std interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd-std transmit 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

- ip bfd-std interface transmit**      Configures the transmit time interval for a specific BFD interface.
- show ip bfd-std**                      Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalTxInterval

---

## ip bfd-std receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

**ip bfd-std receive** *receive-interval*

---

### Syntax Definitions

*receive-interval*                      The receive time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>receive-interval</i>	100 milliseconds

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std receive** command does not override the value set for the interface using the **ip bfd-std interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd-std receive 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

- [ip bfd-std interface receive](#)            Configures the receive time interval for a specific BFD interface.
- [show ip bfd-std](#)                            Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalRxInterval

---

## ip bfd-std mode

Configures the global operational mode and echo status for the BFD protocol.

```
ip bfd-std mode {echo-only | demand echo {enable | disable} | asynchronous echo {enable|disable}}
```

---

### Syntax Definitions

<b>echo-only</b>	Specifies echo only mode.
<b>demand echo enable</b>	Specifies demand mode with the echo function enabled.
<b>demand echo disable</b>	Specifies demand mode with the echo function disabled.
<b>asynchronous echo enable</b>	Specifies asynchronous mode with the echo function enabled.
<b>asynchronous echo disable</b>	Specifies asynchronous mode with the echo function disabled.

### Defaults

By default, BFD is set to globally operate in demand mode with the echo function enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global operational mode and echo status is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std mode** command does not override the value set for the interface using the **ip bfd-std interface mode** command.
- The global operational mode and echo status serves as the default mode and status for a BFD interface. The default mode and status is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd-std mode echo-only  
-> ip bfd-std mode demand echo enable
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

**ip bfd-std interface mode**

Configures the operational mode and echo status for a BFD interface.

**show ip bfd-std**

Displays the BFD global status and general configuration parameters.

## MIB Objects

alaBfdGlobalOperMode

alaBfdGlobalEchoStatus

---

## ip bfd-std echo interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous or demand mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

**ip bfd-std echo interval** *echo-interval*

---

### Syntax Definitions

*echo-interval*                      The echo time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>echo-interval</i>	100 milliseconds

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std echo interval** command does not override the value set for the interface using the **ip bfd-std interface echo interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd-std echo interval 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

- ip bfd-std interface echo-interval**                      Configures the echo packet time interval for a BFD interface.
- show ip bfd-std**                      Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalEchoRxInterval

---

## ip bfd-std l2-hold-timer

Configures the global Layer 2 hold-down (convergence) timer value for the BFD protocol. This command specifies the amount of time BFD remains in a hold-down state after a Layer 2 topology change occurs.

**ip bfd-std l2-hold-timer** *l2-holdtimer-interval*

---

### Syntax Definitions

*l2-holdtimer-interval*                      The Layer 2 hold-down time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>l2-holdtimer-interval</i>	100 milliseconds

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global Layer 2 hold-down timer is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std l2-hold-timer** command does not override the value set for the interface using the **ip bfd-std interface l2-hold-timer** command.
- The global Layer 2 hold-down timer serves as the default value for a BFD interface. The default timer value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd-std l2-holdtimer 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

- [ip bfd-std interface l2-hold-timer](#)                      Configures the Layer 2 hold-down timer value for a BFD interface.
- [show ip bfd-std](#)                                      Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalL2HoldTimer

---

## ip bfd-std interface

Configures a BFD interface.

**ip bfd-std interface** *interface\_name*

**no ip bfd-std interface** *interface\_name*

---

### Syntax Definitions

*interface\_name*                      The name of an existing IP interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a BFD interface.
- The interface name must be an existing IP interface name that is configured with an IP address.

### Examples

```
-> ip bfd-std interface bfd-vlan-101
-> no ip bfd-std interface bfd-vlan-101
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">ip bfd-std interface status</a>	Configures the administrative status of a BFD interface.
<a href="#">show ip bfd-std interfaces</a>	Displays the status and statistics of a BFD interface.
<a href="#">show ip bfd-std sessions</a>	Displays the status and statistics of the BFD sessions.

### MIB Objects

```
alaBfdIntfTable
  alaBfdIntfAddrType
  alaBfdIntfAddr
  alaBfdIntfIndex
```

---

## ip bfd-std interface status

Enables or disables the administrative status of a BFD interface.

**ip bfd-std interface** *interface\_name* **status {enable | disable}**

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing BFD interface.
<b>enable</b>	Enables the BFD interface.
<b>disable</b>	Disables the BFD interface.

### Defaults

By default, a BFD interface is disabled when it is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

### Examples

```
-> ip bfd-std interface bfd-vlan-101 status enable
-> ip bfd-std interface bfd-vlan-101 status disable
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<b>ip bfd-std interface</b>	Creates a BFD interface.
<b>show ip bfd-std interfaces</b>	Displays the status and statistics of a BFD interface.
<b>show ip bfd-std sessions</b>	Displays the status and statistics of BFD sessions.

### MIB Objects

```
alaBfdIntfTable
  alaBfdIntfAdminStatus
```

---

## ip bfd-std interface transmit

Configures the transmit time interval for the BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

**ip bfd-std interface** *interface\_name* **transmit** *transmit-interval*

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing BFD interface.
<i>transmit-interval</i>	The transmit time interval, in milliseconds. The valid range is 100–999.

### Defaults

The global transmit time interval value is used by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd-std interface transmit** command does not change the global value configured with the **ip bfd-std transmit** command.

### Examples

```
-> ip bfd-std interface bfd-vlan-101 transmit 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<b>ip bfd-std interface</b>	Creates a BFD interface.
<b>ip bfd-std transmit</b>	Configures a global BFD transmit time interval.
<b>show ip bfd-std interfaces</b>	Displays the status and statistics of a BFD interface.
<b>show ip bfd-std sessions</b>	Displays the status and statistics of the BFD sessions.

### MIB Objects

alaBfdIntfTable  
  alaBfdIntfDesiredMinTxInterval

---

## ip bfd-std interface receive

Configures the receive time interval for the BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

**ip bfd-std interface** *interface\_name* **receive** *receive-interval*

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing BFD interface.
<i>receive-interval</i>	The receive time interval, in milliseconds. The valid range is 100–999.

### Defaults

The global receive time interval value is used by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd-std interface receive** command does not change the global value configured with the **ip bfd-std receive** command.

### Examples

```
-> ip bfd-std interface bfd-vlan-101 receive 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<b>ip bfd-std interface</b>	Creates a BFD interface.
<b>ip bfd-std receive</b>	Configures a global BFD receive time interval.
<b>show ip bfd-std interfaces</b>	Displays the BFD interface configuration table.
<b>show ip bfd-std sessions</b>	Displays the BFD interface configuration table.

### MIB Objects

alaBfdIntfTable  
alaBfdIntfMinRxInterval

---

## ip bfd-std interface multiplier

Configures the BFD interface dead interval multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

```
ip bfd-std interface interface_name multiplier multiplier_value
```

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing BFD interface.
<i>multiplier_value</i>	The dead interval multiplier number. The valid range is 1–10.

### Defaults

By default, the multiplier value is set to 3.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the dead interval multiplier.

### Examples

```
-> ip bfd-std interface bfd-vlan-101 multiplier 5
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">ip bfd-std interface</a>	Creates a BFD interface.
<a href="#">show ip bfd-std interfaces</a>	Displays the BFD interface configuration table.
<a href="#">show ip bfd-std sessions</a>	Displays the BFD interface configuration table.

### MIB Objects

```
alaBfdIntfTable  
  alaBfdIntfDetectMult
```

---

## ip bfd-std interface echo-interval

Configures the echo time interval for the BFD interface. The echo function is available with the asynchronous or demand mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

**ip bfd-std interface** *interface\_name* **echo-interval** *echo-interval*

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing IP interface.
<i>echo-interval</i>	The echo time interval, in milliseconds. The valid range is 100–999.

### Defaults

The global echo interval value is used by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global echo time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface echo time interval using the **ip bfd-std interface echo-interval** command does not change the global value configured with the **ip bfd-std echo-interval** command.

### Examples

```
-> ip bfd-std interface bfd-vlan-101 echo-interval 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<b>ip bfd-std interface</b>	Creates a BFD interface.
<b>ip bfd-std echo interval</b>	Configures a global BFD echo time interval.
<b>show ip bfd-std interfaces</b>	Displays the BFD interface configuration table.
<b>show ip bfd-std sessions</b>	Displays the BFD interface configuration table.

### MIB Objects

alaBfdIntfTable  
alaBfdIntfReqMinEchoRxInterval

---

## ip bfd-std interface mode

Configures the operational mode and echo status for the BFD interface.

```
ip bfd-std interface interface_name mode {echo-only | demand [echo {enable | disable}] | asynchronous [echo {enable|disable}]}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing IP interface.
<b>echo-only</b>	Specifies echo only mode.
<b>demand echo enable</b>	Specifies demand mode with the echo function enabled.
<b>demand echo disable</b>	Specifies demand mode with the echo function disabled.
<b>asynchronous echo enable</b>	Specifies asynchronous mode with the echo function enabled.
<b>asynchronous echo disable</b>	Specifies asynchronous mode with the echo function disabled.

### Defaults

By default, the BFD interface is set to operate in demand mode with the echo function enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global operational mode and echo status serves as the default mode and status for a BFD interface. The default mode and status is overridden when a specific value is configured for the interface.
- Note that configuring the interface mode and echo status using the **ip bfd-std interface mode** command does not change the global value configured with the **ip bfd-std mode** command.

### Examples

```
-> ip bfd-std mode echo-only  
-> ip bfd-std mode demand echo enable
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

**ip bfd-std interface**

Creates a BFD interface.

**ip bfd-std mode**

Configures the global BFD operational mode and echo status.

**show ip bfd-std interfaces**

Displays the BFD interface configuration table.

**show ip bfd-std sessions**

Displays the BFD interface configuration table.

    alaBfdIntfOperMode

    alaBfdIntfEchoMode

---

## ip bfd-std interface l2-hold-timer

Configures the Layer 2 hold-down (convergence) timer value for the BFD interface. This command specifies the amount of time the interface remains in a hold-down state after a Layer 2 topology change occurs.

**ip bfd-std interface** *interface\_name* **l2-hold-timer** *l2-holdtimer-interval*

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing BFD interface.
<i>l2-holdtimer-interval</i>	The Layer 2 hold-down time interval, in milliseconds. The valid range is 100–999.

### Defaults

The global Layer 2 hold-down time interval is used by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The global Layer 2 hold-down time interval serves as the default interval for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the Layer 2 hold-down time interval using the **ip bfd-std interface l2-hold-timer** command does not change the global value configured with the **ip bfd-std l2-hold-timer** command.

### Examples

```
-> ip bfd-std interface bfd-vlan-101 l2-hold-timer 500
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<b>ip bfd-std interface</b>	Creates a BFD interface.
<b>ip bfd-std l2-hold-timer</b>	Configures the global BFD Layer 2 hold-down time interval.
<b>show ip bfd-std interfaces</b>	Displays the BFD interface configuration table.
<b>show ip bfd-std sessions</b>	Displays the BFD interface configuration table.

### MIB Objects

alaBfdIntfTable  
alaBfdIntfL2HoldTimer

---

## ip ospf bfd-std status

Enables or disables the BFD status for the OSPF protocol.

```
ip ospf bfd-std status {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD Status.
<b>disable</b>	Disables BFD Status.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

### Examples

```
-> ip ospf bfd-std status enable  
-> ip ospf bfd-std status disable
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

<b>ip ospf bfd-std all-interfaces</b>	Enables or disables BFD for all OSPF interfaces configured.
<b>ip ospf interface bfd-std</b>	Enables or disables BFD for a specific OSPF interface.
<b>ip ospf interface bfd-std drs-only</b>	Establishes BFD sessions only on neighbors in full state.
<b>ip ospf interface bfd-std all-nbrs</b>	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

## MIB Objects

```
alaProtocolospf  
  alaOspfBfdStatus
```

---

## ip ospf bfd-std all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

**ip ospf bfd-std all-interfaces**

**no ip ospf bfd-std all-interfaces**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the BFD status for all OSPF interfaces.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

### Examples

```
-> ip ospf bfd-std all-interfaces  
-> no ip ospf bfd-std all-interfaces
```

### Release History

Release 6.3.4; command was introduced.

---

## ip ospf interface bfd-std drs-only

Establishes BFD sessions only with neighbors that are in the full state.

**ip ospf interface** *interface-name* **bfd-std drs-only**

---

### Syntax Definitions

*interface-name*                      The name of an existing OSPF interface.

### Defaults

By default, BFD is enabled for DR neighbors only.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

### Examples

```
-> ip ospf interface int1 bfd-std drs-only
```

### Release History

Release 6.3.4; command was introduced.

---

## vrrp bfd-std

Enables or disables VRRP with the BFD protocol.

```
vrrp bfd-std {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD for VRRP.
<b>disable</b>	Disables BFD for VRRP.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

### Examples

```
-> ip vrrp bfd-std enable  
-> ip vrrp bfd-std disable
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

```

---

## vrrip track address bfd-std

Enables or disable BFD for a specific track policy.

```
vrrip track num address address bfd-std {enable| disable}
```

---

### Syntax Definitions

<i>num</i>	The VRRP track number.
<i>address</i>	The remote IP address.
<b>enable</b>	Enables BFD.
<b>disable</b>	Disables BFD.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>enable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

### Examples

```
-> vrrip track 2 address 10.1.1.1 bfd-std enable  
-> vrrip track 3 address 10.1.1.2 bfd-std disable
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[vrrip bfd-std](#) Enables or disables VRRP with BFD protocol.

### MIB Objects

```

---

---

## ip static-route all bfd-std

Enables BFD for all static routes.

```
ip static-route all bfd-std {enable| disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD.
<b>disable</b>	Disables BFD.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When there are static route configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

### Examples

```
-> ip static-route all bfd-std enabled  
-> ip static-route all bfd-std disabled
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

## ip static-routes bfd-std status

Enables or disables BFD for a specific static route.

```
ip static-routes ip-address/prefixLen gateway ip-address bfd-std status {enable| disable}
```

---

### Syntax Definitions

<i>ip_address</i>	The destination IP address.
<i>prefixLen</i>	The prefix length for the destination IP address.
gateway <i>ip_address</i>	The gateway IP address.
enable	Enables BFD.
disable	Disables BFD.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

BFD is enabled to track the gateway of static routes.

### Examples

```
-> ip static-route 10.1.1.1 255.0.0.0 gateway 10.1.1.25 bfd-std status enable
-> ip static-route 10.1.1.2 255.0.0.0 gateway 10.1.1.25 bfd-std status disabled
```

# 20 DHCP Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (i.e. clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur.

MIB information for DHCP Relay commands is as follows:

*Filename:* AlcatelIND1UDPRelay.MIB  
*Module:* ALCATEL-IND1-UDP-RELAY-MIB

---

A summary of the available commands is listed here.

---

**ip helper address**  
**ip helper address vlan**  
**ip helper standard**  
**ip helper avlan only**  
**ip helper per-vlan only**  
**ip helper forward delay**  
**ip helper maximum hops**  
**ip helper agent-information**  
**ip helper agent-information policy**  
**ip helper pxe-support**  
**ip helper dhcp-snooping**  
**ip helper dhcp-snooping mac-address verification**  
**ip helper dhcp-snooping option-82 data-insertion**  
**ip helper dhcp-snooping option-82 format**  
**ip helper dhcp-snooping option-82 format ascii circuit-id**  
**ip helper dhcp-snooping option-82 format ascii remote-id**  
**ip helper dhcp-snooping bypass option-82-check**  
**ip helper dhcp-snooping vlan**  
**ip helper dhcp-snooping port**  
**ip helper dhcp-snooping linkagg**  
**ip helper dhcp-snooping port traffic-suppression**  
**ip helper dhcp-snooping port ip-source-filtering**  
**ip helper dhcp-snooping binding**  
**ip helper dhcp-snooping ip-source-filter**  
**ip helper dhcp-snooping binding timeout**  
**ip helper dhcp-snooping binding action**  
**ip helper dhcp-snooping binding persistency**  
**ip helper boot-up**  
**ip udp relay**  
**ip udp relay vlan**  
**show ip helper**  
**show ip helper stats**  
**show ip helper dhcp-snooping vlan**  
**show ip helper dhcp-snooping port**  
**show ip helper dhcp-snooping binding**  
**show ip udp relay service**  
**show ip udp relay statistics**  
**show ip udp relay destination**  
**dhcp-server**  
**clear dhcp-server statistics**  
**clear dhcp-server statistics**  
**show dhcp-server leases**  
**show dhcp-server statistics**  
**ip helper dhcp-snooping ip-source-filter**  
**show ip helper dhcp-snooping ip-source-filter**

---

## ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

**ip helper address** *ip\_address*

**ip helper no address** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* DHCP server IP address (e.g. 21.0.0.10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You may only configure one or the other.
- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- UPD Relay is automatically enabled on a switch when a DHCP server IP address is defined. There is no separate command for enabling or disabling the relay service.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- You can configure up to 256 server IP addresses for one relay service.

### Examples

```
-> ip helper address 75.0.0.10  
-> ip helper no address 31.0.0.20
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip helper address vlan</b>	Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.
<b>ip helper forward delay</b>	Sets the forward delay time value. DHCP Relay will not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
<b>ip helper maximum hops</b>	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
<b>show ip helper</b>	Displays current DHCP Relay configuration information.
<b>show ip helper stats</b>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## MIB Objects

```
iphelperTable  
    iphelperService  
    iphelperForwAddr
```

---

## ip helper address vlan

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when using a standard relay service.

**ip helper address** *ip\_address* **vlan** *vlan\_id*

**ip helper no address** *ip\_address* **vlan** *vlan\_id*

---

### Syntax Definitions

*ip\_address* IP address (e.g. 21.0.0.10) of the DHCP server VLAN.

*vlan\_id* VLAN identification number (e.g. 3) of the DHCP server VLAN.

### Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.
- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (e.g., 10-15 500-510 850).
- The **ip helper address vlan** command does not work if the **per-vlan only** forwarding option is not active. Use the **ip helper per-vlan only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The per-VLAN only relay service supports a maximum of 256 VLANs.

### Examples

```
-> ip helper address 75.0.0.10 3
-> ip helper no address 31.0.0.20 4
-> ip helper address 198.206.15.2 250-255
-> ip helper address 10.11.4.1 550-555 1500 1601-1620
-> ip helper no address 198.206.15.2 1601-1620
```

### Release History

Release 6.1; command was introduced.

Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

## Related Commands

### **ip helper per-vlan only**

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.

### **show ip helper**

Displays current DHCP Relay configuration information.

### **show ip helper stats**

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## MIB Objects

iphelperTable

    iphelperService

    iphelperVlan

---

## ip helper standard

Sets DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

### ip helper standard

---

#### Syntax Definitions

N/A

#### Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

#### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

#### Usage Guidelines

- To limit forwarding of DHCP packets to only packets that originate from authenticated ports, use the [ip helper avlan only](#) command.
- To process DHCP packets on a per VLAN basis, use the [ip helper per-vlan only](#) command.

#### Examples

```
-> ip helper standard
```

#### Release History

Release 6.1; command was introduced.

#### Related Commands

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper stats](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

#### MIB Objects

```
iphelperStatTable  
iphelperForwOption
```

---

## ip helper avlan only

Sets DHCP Relay forwarding option to process only DHCP packets received on authenticated VLAN ports.

**ip helper avlan only**

---

### Syntax Definitions

N/A

### Defaults

By default, the UDP forwarding option is set to **standard**.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

When the forwarding option is set to **avlan only**, all other DHCP packets are not processed.

### Examples

```
-> ip helper avlan only
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip helper standard</a>	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
<a href="#">ip helper per-vlan only</a>	Sets the DHCP Relay forwarding option to process only DHCP packets received on authenticated ports from a specific, identified VLAN.
<a href="#">ip helper forward delay</a>	Sets the forward delay time value. DHCP Relay will not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
<a href="#">ip helper maximum hops</a>	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
<a href="#">show ip helper</a>	Displays current DHCP Relay configuration information.
<a href="#">show ip helper stats</a>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperStatTable  
iphelperForwOption

---

## ip helper per-vlan only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

**ip helper per-vlan only**

---

### Syntax Definitions

N/A

### Defaults

By default, the UDP forwarding option is set to **standard**.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- When the forwarding option is set to **per-vlan only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- Using the **per-vlan only** forwarding option requires you to specify a DHCP server IP address for each VLAN that will provide a relay service. The **ip helper address vlan** command performs this function and at the same time enables relay for the specified VLAN.

### Examples

```
-> ip helper per-vlan only
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip helper address vlan</a>	Configures a DHCP Relay service for the specified VLAN.
<a href="#">ip helper standard</a>	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
<a href="#">ip helper avlan only</a>	Sets DHCP Relay forwarding option to process only DHCP packets received on authenticated VLAN ports from clients that are not yet authenticated.
<a href="#">show ip helper</a>	Displays current DHCP Relay configuration information.
<a href="#">show ip helper stats</a>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperStatTable

iphelperForwOption

---

## ip helper forward delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet the client sends contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay will not process the packet unless the client's elapsed boot time value is equal to or greater than the configured value of the forward delay time.

**ip helper forward delay** *seconds*

---

### Syntax Definitions

*seconds* Forward delay time value in seconds (1–65535). Do not use commas in the value.

### Defaults

By default, the forward delay time is set to three seconds.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- The time specified applies to all defined IP helper addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

### Examples

```
-> ip helper forward delay 300
-> ip helper forward delay 120
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip helper address</a>	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
<a href="#">ip helper maximum hops</a>	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
<a href="#">show ip helper</a>	Displays current DHCP Relay configuration information.
<a href="#">show ip helper stats</a>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperForwDelay

---

## **MIB Objects**

iphelperStatTable  
iphelperMaxHops

---

## ip helper agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

**ip helper agent-information {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the relay agent Option-82 feature for the switch.
<b>disable</b>	Disables the relay agent Option-82 feature for the switch.

### Defaults

By default, this feature is disabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-VLAN basis.
- When the DHCP Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, it will process the packet based on the agent information policy configured for the switch. This policy is configured using the **ip help agent-information policy** command.

### Examples

```
-> ip helper agent-information enable
-> ip helper agent-information disable
```

### Release History

Release 6.1.2; command was introduced.

### Related Commands

<a href="#">ip helper agent-information policy</a>	Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.
<a href="#">show ip helper</a>	Displays current DHCP Relay configuration information.
<a href="#">show ip helper stats</a>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

`iphelperAgentInformation`

---

## ip helper agent-information policy

Configures a policy that determines how the DHCP relay agent will handle DHCP packets that already contain an Option-82 field.

**ip helper agent-information policy {drop | keep | replace}**

---

### Syntax Definitions

<b>drop</b>	Drop DHCP packets that already contain an Option-82 field.
<b>keep</b>	Keep the existing Option-82 field information and continue to relay the DHCP packet.
<b>replace</b>	Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.

### Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The policy configured with this command is only applied if the DHCP Option-82 feature is enabled for the switch.
- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent will not insert the relay agent information option into the DHCP packet and will forward the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

### Examples

```
-> ip helper agent-information policy drop
-> ip helper agent-information policy keep
-> ip helper agent-information policy replace
```

### Release History

Release 6.1.2; command was introduced.

## Related Commands

| <b>show ip helper stats</b>        | Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations. |

## MIB Objects

`iphelperAgentInformationPolicy`

---

## ip helper pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

**ip helper pxe-support {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PXE support.
<b>disable</b>	Disables PXE support.

### Defaults

By default, PXE support is disabled for the switch.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

PXE support was enabled by default in previous releases. Note that PXE is currently disabled by default and is now a user-configurable option using the **ip helper pxe-support** command.

### Examples

```
-> ip helper pxe-support enable  
-> ip helper pxe-support disable
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show ip helper](#) Displays current DHCP Relay configuration information.

### MIB Objects

iphelperPXESupport

---

## ip helper traffic-suppression

Globally enables or disables the suppression of DHCP broadcast traffic on the switch. When this feature is enabled, all DHCP broadcast packets are forwarded to the relay agent for processing even if the client and server reside in the same VLAN.

*This command is currently not supported. Traffic suppression is automatically enabled when DHCP Snooping is enabled for the switch or for specific VLANs.*

**ip helper traffic-suppression {enable | disable}**

---

### Syntax Definitions

**enable** Enables traffic suppression for the switch.

**disable** Disables traffic suppression for the switch.

### Defaults

By default, traffic suppression is disabled for the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When traffic suppression is enabled, any active relay agent features (e.g., Option-82 data insertion, DHCP Snooping) are also effected on all DHCP broadcast traffic, regardless of the VLAN in which the traffic originated.
- Enabling traffic suppression requires the configuration of IP helper addresses for all DHCP servers, even if the server resides in the same VLAN as the DHCP clients.
- Note that enabling DHCP traffic suppression for the switch overrides any traffic suppression status configured for an individual DHCP Snooping port.
- If the per-VLAN UDP Relay mode is active for the switch, DHCP broadcast traffic originating in a VLAN that does not have an IP helper address configured is still broadcast whether or not traffic suppression is enabled for the switch.
- When traffic suppression is disabled, DHCP packets are flooded on the default VLAN for the port. Any DHCP server in the same VLAN domain as the client will receive and respond to such packets without the involvement of the relay agent.

### Examples

```
-> ip helper traffic-suppression enable  
-> ip helper traffic-suppression disable
```

### Release History

Release 6.1.3; command was introduced.

Release 6.1.5; command was deprecated.

**Related Commands**

- ip helper dhcp-snooping** Enables or disables DHCP Snooping for the switch.
- ip helper dhcp-snooping vlan** Enables or disables DHCP Snooping on a per VLAN basis.
- show ip helper** Displays the current DHCP configuration for the switch.

**MIB Objects**

iphelperTrafficSuppressionStatus

---

## ip helper dhcp-snooping

Globally enables or disables DHCP Snooping for the switch. When this feature is enabled, all DHCP packets received on all switch ports are filtered.

**ip helper dhcp-snooping {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables DHCP Snooping for the switch.
<b>disable</b>	Disables DHCP Snooping for the switch.

### Defaults

By default, this feature is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

### Examples

```
-> ip helper dhcp-snooping enable
-> ip helper dhcp-snooping disable
```

### Release History

Release 6.1.2; command was introduced.

### Related Commands

[ip helper dhcp-snooping vlan](#) .Enables or disables DHCP Snooping on a per VLAN basis.  
[show ip helper](#) Displays the current DHCP configuration for the switch.

### MIB Objects

iphelperDhcpSnooping

---

## ip helper dhcp-snooping mac-address verification

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

**ip helper dhcp-snooping mac-address verification {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables DHCP MAC address verification for the switch.
<b>disable</b>	Disables DHCP MAC address verification for the switch.

### Defaults

By default, this feature is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.
- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

### Examples

```
-> ip helper dhcp-snooping mac-address verification enable
-> ip helper dhcp-snooping mac-address verification disable
```

### Release History

Release 6.1.2; command was introduced.

### Related Commands

<a href="#">ip helper dhcp-snooping</a>	.Globally enables or disables DHCP Snooping for the switch.
<a href="#">ip helper dhcp-snooping option-82 data-insertion</a>	Globally enables or disables DHCP Option-82 data insertion for DHCP packets.

### MIB Objects

iphelperDhcpSnoopingMacAddressVerificationStatus

---

## ip helper dhcp-snooping option-82 data-insertion

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

**ip helper dhcp-snooping option-82 data-insertion {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables inserting the DHCP Option-82 field into DHCP packets.
<b>disable</b>	Disables inserting the DHCP Option-82 field into DHCP packets.

### Defaults

By default, this feature is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

When DHCP Snooping is enabled at the switch level, Option-82 data insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

### Examples

```
-> ip helper dhcp-snooping option-82 data-insertion enable
-> ip helper dhcp-snooping option-82 data-insertion disable
```

### Release History

Release 6.1.2; command was introduced.

### Related Commands

<a href="#">ip helper dhcp-snooping option-82 format</a>	Configures the type of information that is inserted in both the Circuit ID and Remote ID suboption of the Option-82 field.
<a href="#">ip helper dhcp-snooping</a>	.Globally enables or disables DHCP Snooping for the switch.
<a href="#">ip helper dhcp-snooping ip-source-filter</a>	Enables or disables the DHCP Snooping binding table functionality
<a href="#">show ip helper</a>	Displays the current DHCP configuration for the switch.

## **MIB Objects**

`iphelperDhcpSnoopingOpt82DataInsertionStatus`

---

## ip helper dhcp-snooping option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

**ip helper dhcp-snooping option-82 format** {**base-mac** | **system-name** | **user-string** *string* / **interface-alias** | **auto-interface-alias**}

---

### Syntax Definitions

<b>base-mac</b>	The base MAC address of the switch.
<b>system-name</b>	The system name of the switch.
<i>string</i>	A user-defined text string up to 64 characters.
<b>interface-alias</b>	The alias configured for the interface.
<b>auto-interface-alias</b>	The switch automatically generates the interface-alias in the following format: <i>SystemName_slot_port</i> .

### Defaults

parameter	value
<b>base-mac</b>   <b>system-name</b>   <b>user-string</b> <i>string</i>	<b>base-mac</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The *string* parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The interface-alias parameter will use the alias configured with the **interfaces alias** command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** and **auto-interface-alias** commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

## Examples

```
-> ip helper dhcp-snooping option-82 format user-string "Building B Server"  
-> ip helper dhcp-snooping option-82 format system-name  
-> ip helper dhcp-snooping option-82 format base-mac  
-> ip helper dhcp-snooping option-82 format interface-alias  
-> ip helper dhcp-snooping option-82 format auto-interface-alias
```

## Release History

Release 6.3.1; command was introduced.

Release 6.4.2; **interface-alias** and **auto-interface-alias** parameters introduced.

## Related Commands

Globally enables or disables DHCP Snooping for the switch.

[show ip helper](#)

Displays the current DHCP configuration for the switch.

[interfaces alias](#)

Configures an alias for a port.

## MIB Objects

```
iphelperDhcpSnoopingOption82FormatType  
iphelperDhcpOption82FormatInterfaceAliasAutoGen  
iphelperDhcpSnoopingOption82StringValue
```

---

## ip helper dhcp-snooping option-82 format ascii circuit-id

Configures the type of information that is inserted into the Option-82 Circuit ID suboption. The information is inserted into the Circuit ID field in ASCII text string format.

```
ip helper dhcp-snooping option-82 format ascii circuit-id {base-mac | system-name | vlan |  
user-string string / interface-alias | auto-interface-alias | cvlan} {delimiter character}
```

```
no ip helper dhcp-snooping option-82 format ascii circuit-id
```

---

### Syntax Definitions

<b>base-mac</b>	The base MAC address of the switch.
<b>system-name</b>	The system name of the switch.
<b>vlan</b>	The VLAN ID of which the client is a member.
<i>string</i>	A user-defined text string up to 64 characters.
<b>interface-alias</b>	The alias configured for the interface.
<b>auto-interface-alias</b>	The switch automatically generates the interface-alias in the following format: <i>SystemName_slot_port</i> .
<b>cvlan</b>	The Customer VLAN ID.
<i>character</i>	The delimiter character that separates fields within the Circuit ID ASCII string value. Valid characters are   (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space).

### Defaults

By default, the base MAC address of the switch is used in ASCII format.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guideline

- This command is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID suboption. Each parameter provided with this command represents a different type of information.
- Configuring the Circuit ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with this command is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- The *string* parameter specifies user-defined information to insert into the Circuit ID ASCII field.

- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The **interface-alias** parameter will use the alias configured with the **interfaces alias** command. If no alias is configured, a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** and **auto-interface-alias** commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is inserted into the Circuit ID suboption only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

## Examples

```
-> ip helper dhcp-snooping option-82 format ascii circuit-id user-string "Bldg A
Server"
-> ip helper dhcp-snooping option-82 format ascii circuit-id vlan system-name
delimiter /
-> ip helper dhcp-snooping option-82 format ascii circuit-id user-string "Bldg. B
Server" base-mac system name vlan interface-alias auto-interface-alias delimiter |
```

## Release History

Release 6.4.4; command was introduced.

## ip helper dhcp-snooping option-82 format ascii remote-id

Configures the type of information that is inserted into the Option-82 Remote ID suboption. The information is inserted into the Remote ID field in ASCII text string format.

```
ip helper dhcp-snooping option-82 format ascii remote-id {base-mac | system-name | vlan |  
user-string string / interface-alias | auto-interface-alias | cvlan} {delimiter character}
```

```
no ip helper dhcp-snooping option-82 format ascii remote-id
```

---

### Syntax Definitions

<b>base-mac</b>	The base MAC address of the switch.
<b>system-name</b>	The system name of the switch.
<b>vlan</b>	The VLAN ID of which the client is a member.
<i>string</i>	A user-defined text string up to 64 characters.
<b>interface-alias</b>	The alias configured for the interface.
<b>auto-interface-alias</b>	The switch automatically generates the interface-alias in the following format: <i>SystemName_slot_port</i> .
<b>cvlan</b>	The Customer VLAN ID.
<i>character</i>	The delimiter character that separates fields within the Circuit ID ASCII string value. Valid characters are   (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space).

### Defaults

By default, the base MAC address of the switch is used in ASCII format.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guideline

- This command is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Remote ID suboption. Each parameter provided with this command represents a different type of information.
- Configuring the Remote ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with this command is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- The *string* parameter specifies user-defined information to insert into the Remote ID ASCII field.

- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The **interface-alias** parameter will use the alias configured with the **interfaces alias** command. If no alias is configured, a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** and **auto-interface-alias** commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is inserted into the Remote ID suboption only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

## Examples

```
-> ip helper dhcp-snooping option-82 format ascii remote-id user-string "Bldg A
Server"
-> ip helper dhcp-snooping option-82 format ascii remote-id vlan system-name delimit
er /
-> ip helper dhcp-snooping option-82 format ascii remote-id user-string "Bldg. B
Server" base-mac system name vlan interface-alias auto-interface-alias delimiter |
```

## ip helper dhcp-snooping bypass option-82-check

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

**ip helper dhcp-snooping bypass option-82-check {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Bypasses the Option-82 field check.
<b>disable</b>	Checks DHCP packets for the Option-82 field.

### Defaults

By default, this feature is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.
- When this feature is enabled, DHCP packets ingressing on untrusted ports are *not* checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.
- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

### Examples

```
-> ip helper dhcp-snooping bypass option-82-check enable
-> ip helper dhcp-snooping bypass option-82-check disable
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<a href="#">ip helper dhcp-snooping</a>	Globally enables or disables DHCP Snooping for the switch.
<a href="#">show ip helper</a>	Displays the current DHCP configuration for the switch.

### MIB Objects

iphelperDHCPsnoopingBypassOpt82CheckStatus

---

## ip helper dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

**ip helper dhcp-snooping vlan** *vlan\_id* [**mac-address verification** {enable | disable}] [**option-82 data-insertion** {enable | disable}]

**no ip helper dhcp-snooping vlan** *vlan\_id*

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN identification number (1–4094).
<b>mac-address verification</b>	Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet.
<b>option-82 data-insertion</b>	Enables or disables inserting Option-82 information into DHCP packets.

### Defaults

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

parameter	default
<b>mac-address verification</b>	Enabled
<b>option-82 data-insertion</b>	Enabled

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable DHCP Snooping for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- Note that disabling the Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

### Examples

```
-> ip helper dhcp-snooping vlan 100 enable
-> ip helper dhcp-snooping vlan 100 disable
```

## Release History

Release 6.1.2; command was introduced.

---

## ip helper dhcp-snooping port

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

**ip helper dhcp-snooping port** *slot1/port1[-port1a]* {**block** | **client-only** | **trust**}

---

### Syntax Definitions

<i>slot1/port1[-port1a]</i>	Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (e.g. 3/1-16).
<b>block</b>	Blocks all DHCP traffic on the port.
<b>client-only</b>	Allows only DHCP client traffic on the port.
<b>trust</b>	Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled.

### Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.
- Use the [show ip helper dhcp-snooping port](#) command to display the current trust mode for a port and statistics regarding the number of packets dropped due to DHCP Snooping violations.

### Examples

```
-> ip helper dhcp-snooping port 1/24 trust
-> ip helper dhcp-snooping port 2/1-10 block
-> ip helper dhcp-snooping port 4/8 client-only
```

### Release History

Release 6.1.2; command was introduced.

## Related Commands

- ip helper dhcp-snooping** Globally enables or disables DHCP Snooping for the switch.
- ip helper dhcp-snooping vlan** Enables or disables DHCP Snooping on a per-VLAN basis.

## MIB Objects

---

## ip helper dhcp-snooping linkagg

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

**ip helper dhcp-snooping linkagg *num* {block | client-only | trust| ip-source-filtering}**

---

### Syntax Definitions

<i>num</i>	Specifies the link aggregate ID number.
<b>block</b>	Blocks all DHCP traffic on the port.
<b>client-only</b>	Allows only DHCP client traffic on the port.
<b>trust</b>	Allows all DHCP traffic on the link aggregate. The port behaves as if DHCP Snooping was not enabled.
<b>ip-source-filter</b>	Traffic on the port is restricted to packets received on the port that contain the client MAC address and IP address. All other packets are dropped.

### Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the **show ip helper dhcp-snooping port** command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

### Examples

```
-> ip helper dhcp-snooping linkagg 1 trust
-> ip helper dhcp-snooping linkagg 2 block
-> ip helper dhcp-snooping linkagg 3 client-only
```

### Release History

Release 6.1.2; command was introduced.

Release 6.4.4; ip-source-filtering parameter deprecated, use **ip helper dhcp-snooping ip-source-filter**.

## Related Commands

- ip helper dhcp-snooping** Globally enables or disables DHCP Snooping for the switch.
- ip helper dhcp-snooping vlan** Enables or disables DHCP Snooping on a per-VLAN basis.

## MIB Objects

iphelperDhcpSnoopingPortTable  
iphelperDhcpSnoopingPortIfIndex  
iphelperDhcpSnoopingPortTrustMode

---

## ip helper dhcp-snooping port traffic-suppression

Configures the traffic suppression status for the port. When this function is enabled, DHCP packets are not flooded on the default VLAN for the specified port. This will prevent DHCP communications between a DHCP server and a client when both devices belong to the same VLAN domain.

*This command is currently not supported. Traffic suppression is automatically enabled when DHCP Snooping is enabled for the switch or for specific VLANs.*

**ip helper dhcp-snooping port *slot1/port1[-port1a]* traffic-suppression {enable | disable}**

---

### Syntax Definitions

<i>slot1/port1[-port1a]</i>	Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (e.g. 3/1-16).
<b>enable</b>	Enables traffic suppression for the specified port.
<b>disable</b>	Disables traffic suppression for the specified port.

### Defaults

By default, traffic suppression is disabled for the port.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Traffic suppression applies only to ports that are associated with a VLAN that has DHCP Snooping enabled or to all ports when DHCP Snooping is globally enabled for the switch.
- When traffic suppression is disabled, then DHCP packets are flooded on the default VLAN for the port. Any DHCP server in the same VLAN domain as the client will receive and respond to such packets; DHCP Snooping is not invoked in this scenario.

### Examples

```
-> ip helper dhcp-snooping port 1/24 traffic-suppression enable
-> ip helper dhcp-snooping port 2/1-10 traffic-suppression enable
-> ip helper dhcp-snooping port 4/8 traffic-suppression disable
-> ip helper dhcp-snooping port 3/1-5 traffic-suppression disable
```

### Release History

Release 6.1.2; command was introduced.

Release 6.1.5; command was deprecated.

<a href="#">ip helper dhcp-snooping port ip-source-filtering</a>	Configures the IP source filtering status for a DHCP Snooping port.

## MIB Objects

iphelperDhcpSnoopingPortTable  
    iphelperDhcpSnoopingPortIfIndex  
    iphelperDhcpSnoopingPortIpTrafficSuppression

---

## ip helper dhcp-snooping port ip-source-filtering

Configures the IP source filtering status for the port. When this function is enabled, traffic on the port is restricted to packets received on the port that contain the client MAC address and IP address. All other packets are dropped.

**ip helper dhcp-snooping port *slot1/port1[-port1a]* ip-source-filtering {enable | disable}**

---

### Syntax Definitions

<i>slot1/port1[-port1a]</i>	Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (e.g. 3/1-16).
<b>enable</b>	Enables IP source filtering for the specified port.
<b>disable</b>	Disables IP source filtering for the specified port.

### Defaults

By default, IP source filtering is disabled for the port.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- IP source filtering applies only to ports that are associated with a VLAN that has DHCP Snooping enabled or to all ports when DHCP Snooping is globally enabled for the switch.
- The DHCP Snooping binding table is used to verify client information.
- If a device connected to a DHCP Snooping port with IP source filtering enabled does not have a valid IP address lease from the trusted DHCP server, then all IP traffic for that device is blocked on the port.
- Disable IP source filtering for the DHCP Snooping port to allow a device to obtain a valid IP address lease.
- Once a device obtains a valid lease or if a device already has a valid lease, then only source bound traffic is allowed.

### Examples

```
-> ip helper dhcp-snooping port 1/24 ip-source-filtering enable
-> ip helper dhcp-snooping port 2/1-10 ip-source-filtering enable
-> ip helper dhcp-snooping port 4/8 ip-source-filtering disable
-> ip helper dhcp-snooping port 3/1-5 ip-source-filtering disable
```

### Release History

Release 6.1.2; command was introduced.

Release 6.4.4; ip-source-filtering parameter deprecated, use [ip helper dhcp-snooping ip-source-filter](#).

    iphelperDhcpSnoopingPortIfIndex  
    iphelperDhcpSnoopingPortIpSourceFiltering

---

## ip helper dhcp-snooping binding

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch. In addition, this command is also used to configure a static entry in the binding table.

```
ip helper dhcp-snooping port binding {[enable | disable] | [mac_address port slot/port address
ip_address vlan vlan_id]}
```

```
no ip helper dhcp-snooping port binding mac_address port slot/port address ip_address vlan vlan_id
```

---

### Syntax Definitions

<b>enable</b>	Enables the creation of binding table entries.
<b>disable</b>	Disables the creation of binding table entries.
<i>mac_address</i>	The client MAC address.
<i>slot/port</i>	The slot and port number that received the DHCP request.
<i>ip_address</i>	The IP address that the DHCP server offered to the client.
<i>vlan_id</i>	The VLAN identification number (1–4094) of the VLAN to which the client belongs.

### Defaults

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 9000, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static entry from the DHCP Snooping binding table.
- The **enable** and **disable** parameters are independent of the other parameters, in that they are only used to turn the binding table functionality on and off. Enabling or disabling binding table functionality and creating a static binding table entry is not allowed on the same command line.
- Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.
- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

### Examples

```
-> ip helper dhcp-snooping binding disable
-> ip helper dhcp-snooping binding enable
```

```
-> ip helper dhcp-snooping binding 00:2a:95:51:6c:10 port 1/15 address 17.15.3.10
lease-time 3 vlan 200
-> no ip helper dhcp-snooping binding 00:2a:95:51:6c:10 port 1/15 address
17.15.3.10 lease-time 3 vlan 200
```

## Release History

Release 6.1.2; command was introduced.  
Release 6.3.4; **lease-time** parameter was removed.

## Related Commands

### [ip helper dhcp-snooping binding timeout](#)

Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

### [ip helper dhcp-snooping binding action](#)

Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

## MIB Objects

iphelperDhcpSnoopingBindingStatus
iphelperDhcpSnoopingBindingTable
  iphelperDhcpSnoopingBindingMacAddress
  iphelperDhcpSnoopingBindingIfIndex
  iphelperDhcpSnoopingBindingIpAddress
  iphelperDhcpSnoopingBindingVlan
  iphelperDhcpSnoopingBindingType
```

---

## ip helper dhcp-snooping ip-source-filter

Enables or disables the IP source filtering capability at a port, link aggregation, or VLAN level. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

**ip helper dhcp-snooping ip-source-filter** {vlan *num* | port *slot/port[-port2]* | linkagg *num*} {enable | disable}

---

### Syntax Definitions

<b>vlan</b>	The VLAN identification number (1–4094).
<b>linkagg <i>num</i></b>	Specifies the link aggregate identification number.
<b><i>slot1/port1[-port2]</i></b>	Specifies the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-16).
<b>enable</b>	Enables IP source filtering for the specified port, link aggregation, or VLAN.
<b>disable</b>	Disables IP source filtering for the specified port, link aggregation, or VLAN level.

### Defaults

By default, IP source filtering is disabled for a port or link aggregate, or VLAN.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering can be enabled
  - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
  - on all the ports when DHCP Snooping is globally enabled for the switch.

### Examples

```
-> ip helper dhcp-snooping ip-source-filter port 1/1 enable
-> ip helper dhcp-snooping ip-source-filter linkagg 2 enable
-> ip helper dhcp-snooping ip-source-filter vlan 10 enable
-> ip helper dhcp-snooping ip-source-filter vlan 20 disable
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

**show ip helper dhcp-snooping ip-source-filter** Displays the ports or VLANs on which IP source filtering is enabled.

---

## ip helper dhcp-snooping binding action

Triggers a purge or renew action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the **dhcpBinding.db** file.

**ip helper dhcp-snooping port binding action {purge | renew}**

---

### Syntax Definitions

<b>purge</b>	Clears all binding table entries that are maintained in switch memory.
<b>renew</b>	Populates the binding table with entries saved in the <b>dhcpBinding.db</b> file located in the <b>/flash/switch</b> directory on the switch.

### Defaults

By default, the timeout value is set to 300 seconds.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpBinding.db** file on the switch. Use the **purge** and **renew** options available with this command to sync the binding table contents with the contents of the **dhcpBinding.db** file.

### Examples

```
-> ip helper dhcp-snooping binding action purge
-> ip helper dhcp-snooping binding action renew
```

### Release History

Release 6.1.2; command was introduced.

### Related Commands

<a href="#">ip helper dhcp-snooping ip-source-filter</a>	.Enables or disables the DHCP Snooping binding table functionality.
<a href="#">ip helper dhcp-snooping binding timeout</a>	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

### MIB Objects

iphelperDhcpSnoopingBindingDatabaseAction

---

## ip helper dhcp-snooping binding persistency

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

**ip helper dhcp-snooping binding persistency {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables DHCP Snooping binding persistency.
<b>disable</b>	Disables DHCP Snooping binding persistency.

### Defaults

By default, DHCP Snooping binding persistency is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- With this option disabled, the entry will be removed if the MAC address is missing from the MAC address table when the database is synchronized.
- Use the [show ip helper](#) command to display the current status.

### Examples

```
-> ip helper dhcp-snooping binding persistency enable
-> ip helper dhcp-snooping binding persistency disable
```

### Release History

Release 6.3.3; command was introduced.

### Related Commands

<a href="#">ip helper dhcp-snooping ip-source-filter</a>	Enables or disables the DHCP Snooping binding table functionality.
<a href="#">ip helper dhcp-snooping binding timeout</a>	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

## ip helper boot-up

Enables or disables automatic IP address configuration for default VLAN 1 when an unconfigured switch boots up. If enabled, the switch broadcasts a BootP or a DHCP request packet at boot time. When the switch receives an IP address from a BootP/DHCP server, the address is assigned to default VLAN 1.

---

**Note.** Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

---

**ip helper boot-up {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables automatic IP address configuration for default VLAN 1.
<b>disable</b>	Disables automatic IP address configuration for default VLAN 1.

### Defaults

By default, this feature is disabled on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **ip helper boot-up enable** command to specify BootP or DHCP for the request packet type.
- If an IP router port already exists for VLAN 1, a request packet is not broadcast even if automatic IP address configuration is enabled for the switch.

### Examples

```
-> ip helper boot-up enable
-> ip helper boot-up disable
```

### Release History

Release 6.1; command was introduced.

Release 6.4.3; command deprecated; use **ip interface dhcp-client**.

**Related Commands****ip helper boot-up enable**

Specifies BootP or DHCP as the type of request packet the switch will broadcast at boot time.

**MIB Objects**

iphelperStatTable

iphelperBootupOption

---

## ip helper boot-up enable

Specifies the type of packet to broadcast (BootP or DHCP) when automatic IP address configuration is enabled for the switch.

---

**Note.** Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

---

**ip helper boot-up enable {BOOTP | DHCP}**

---

### Syntax Definitions

**BOOTP** Broadcasts a BOOTP formatted request packet.  
**DHCP** Broadcasts a DHCP formatted request packet.

### Defaults

---

parameter	default
BOOTP   DHCP	BOOTP

---

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

This command is only valid if automatic IP address configuration is already enabled for the switch.

### Examples

```
-> ip helper boot-up enable DHCP  
-> ip helper boot-up enable BOOTP
```

### Release History

Release 6.1; command was introduced.  
Release 6.4.3; command deprecated; use [ip interface dhcp-client](#).

### Related Commands

[ip helper boot-up](#) Enables or disables automatic IP configuration for the switch.

### MIB Objects

iphelperStatTable  
iphelperBootupPacketOption

---

## ip udp relay

Enables or disables UDP port relay for BOOTP/DHCP and generic UDP service ports (i.e., NBNS/NBDD, other well-known UDP ports, and user-defined service ports that are not well-known).

**ip udp relay** {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port* [*name*]}

**no ip udp relay** {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port*}

---

### Syntax Definitions

<b>BOOTP</b>	BOOTP/DHCP well-known ports 67/68.
<b>NBDD</b>	NBDD well-known port 138.
<b>NBNSNBDD</b>	NBNS/NBDD well-known ports 137/138.
<b>DNS</b>	DNS well-known port 53.
<b>TACACS</b>	TACACS well-known port 65.
<b>TFTP</b>	TFTP well-known port 69.
<b>NTP</b>	NTP well-known port 123.
<i>port</i>	Any number that is not a well-known port number.
<i>name</i>	Text string description up to 30 characters.

### Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

parameter	default
<i>name</i>	User Service Other#

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- Only use the *port* parameter to specify service port numbers that are not well known. For example, do not specify port 53 as it is the well-known port number for DNS. Instead, use the **DNS** parameter to enable relay for port 53.
- The *name* parameter is only used with the *port* parameter and provides a user-defined description to identify the not well-known port service.
- When entering a *name* for a user-defined service, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *name* "A UDP Protocol" requires quotes because of the spaces between the words.

- When UDP Relay is disabled for BOOTP/DHCP, the **ip helper** configuration is *not* retained and all dependant functionality (i.e., automatic IP configuration for VLAN 1, Telnet and HTTP client authentication, etc.) is disrupted.
- Up to three types of UDP Relay services are supported at any one time and in any combination.

---

**Note.** If the relay service for BOOTP/DHCP is disabled when the switch reboots, the service is automatically enabled when the switch comes back up. If there were three non-BOOTP/DHCP relay services already enabled before the reboot, the most recent service enabled is disabled and replaced with the BOOTP/DHCP relay service.

---

- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default. Specify **NBNS/NBDD** to enable relay for both well-known ports.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

## Examples

```
-> ip udp relay DNS
-> ip udp 3047 "Generic Service"
-> no ip udp relay BOOTP
-> no ip udp relay 3047
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**ip udp relay vlan** Specifies the VLAN to which traffic from the specified UDP service port is forwarded.

## MIB Objects

```
iphelperxServicePortAssociationTable
  iphelperxServicePortAssociationService
  iphelperxServicePortAssociationPort
  iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
  iphelperxPortServiceAssociationService
  iphelperxPortServiceAssociationPort
  iphelperxPortServiceAssociationName
```

---

## ip udp relay vlan

Specifies a VLAN on which traffic destined for a UDP port is forwarded.

**ip udp relay** {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port*} **vlan** *vlan\_id*

**no ip udp relay** {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port*} **vlan** *vlan\_id*

---

### Syntax Definitions

<b>BOOTP</b>	BOOTP/DHCP well-known ports 67/68.
<b>NBDD</b>	NBDD well-known port 138.
<b>NBNSNBDD</b>	NBNS/NBDD well-known ports 137/138.
<b>DNS</b>	DNS well-known port 53.
<b>TACACS</b>	TACACS well-known port 65.
<b>TFTP</b>	TFTP well-known port 69.
<b>NTP</b>	NTP well-known port 123.
<i>port</i>	A user-specified port that is not a well-known port.
<i>vlan_id</i>	A numeric value (1–4094) that uniquely identifies an individual VLAN. Use a hyphen to specify a range of VLANs (e.g., 1-5).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The maximum number of VLANs that can receive forwarded UDP service port traffic is 256.
- Only specify service port numbers that are *not* well known when using the *port* parameter with this command. For example, do not specify port 53 as it is the well-known port number for the DNS UDP service. Instead, use the **DNS** parameter to enable relay for port 53.
- Specifying a VLAN for the BOOTP/DHCP service is not supported.

### Examples

```
-> ip udp relay DNS vlan 10
-> ip udp 3047 vlan 500
-> no ip udp relay DNS vlan 10
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[ip udp relay](#) Enables or disables relay for UDP service ports.

## MIB Objects

```
iphelperxPortServiceAssociationTable  
  iphelperxPortServiceAssociationService
```

---

## show ip helper

Displays the current DHCP Relay, Relay Agent Information, and DHCP Snooping configuration.

**show ip helper**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Displays information for all IP addresses configured.

### Examples

The following example shows what the display output looks like when the DHCP Snooping feature is enabled and the DHCP relay agent information (Option 82) feature is disabled:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds) = 3,
  Max number of hops     = 4,
  Relay Agent Information           = Disabled,
  DHCP Snooping Status           = Switch-Level Enabled,
    Option 82 Data Insertion Per Switch = Enabled,
    MAC Address Verification Per Switch = Enabled,
  DHCP Snooping Bypass Opt82-Check = Disabled,
  DHCP Snooping Opt82 Format       = Base MAC,
  DHCP Snooping Opt82 String      = 00:d0:95:ae:3b:f6,
  DHCP Snooping Binding DB Status = Enabled,
    Database Sync Timeout         = 300,
    Database Last Sync Time       = Mar 19 2007 14:32,
    Binding Persistency Status    = Enabled
  PXE Support                    = Disabled,
  Forward option                  = standard
  Vlan Number NA
  Bootup Option Disable
    Forwarding Address :
      1.1.1.1
      21.2.2.10
      172.19.4.1
  UDP Relay on Default VRF = Enabled
```

The following example shows what the display output looks like when the DHCP Snooping feature is enabled and the Option-82 format is set to ASCII:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds) = 3,
  Max number of hops      = 4,
  Relay Agent Information      = Disabled,
  DHCP Snooping Status       = Switch-Level Enabled,
    Option 82 Data Insertion Per Switch = Enabled,
    MAC Address Verification Per Switch = Enabled,
  DHCP Snooping Opt82 ASCII Circuit ID Field1 = Base MAC,
  DHCP Snooping Opt82 ASCII Circuit ID Field1 String = 00:e0:b1:91:45:d0,
  DHCP Snooping Opt82 ASCII Circuit ID Field2 = Cvlan,
  DHCP Snooping Opt82 ASCII Circuit ID Field2 String = - ,
  DHCP Snooping Opt82 ASCII Circuit ID Delimiter = "/",
  DHCP Snooping Opt82 ASCII Remote ID Field1 = Vlan,
  DHCP Snooping Opt82 ASCII Remote ID Field1 String = - ,
  DHCP Snooping Opt82 ASCII Remote ID Field2 = Cvlan,
  DHCP Snooping Opt82 ASCII Remote ID Field2 String = - ,
  DHCP Snooping Opt82 ASCII Remote ID Delimiter = " ",

  DHCP Snooping Binding DB Status = Enabled,
    Database Sync Timeout = 300,
    Database Last Sync Time = Mar 19 2007 14:32,
    Binding Persistency Status = Enabled
  PXE Support = Disabled,
  Forward option = standard
    Vlan Number NA
  Bootup Option Disable
    Forwarding Address :
      1.1.1.1
      21.2.2.10
      172.19.4.1
  UDP Relay on Default VRF = Enabled
```

### *output definitions*

<b>Forward Delay</b>	The current forward delay time (default is three seconds). Use the <a href="#">ip helper forward delay</a> command to change this value.
<b>Max number of hops</b>	The current maximum number of hops allowed (default is four hops). Use the <a href="#">ip helper maximum hops</a> command to change this value.
<b>Forward option</b>	The current forwarding option setting: <b>standard</b> or <b>avlan only</b> . Use the <a href="#">ip helper standard</a> and <a href="#">ip helper avlan only</a> commands to change this value.
<b>Relay Agent Information</b>	Indicates the status ( <b>Enabled</b> or <b>Disabled</b> ) of the DHCP relay agent information option (Option 82) feature. Configured through the <a href="#">ip helper agent-information</a> command. This feature is disabled if the DHCP snooping feature is enabled.

*output definitions*

<b>Relay Agent Information Policy</b>	The current policy action ( <b>Drop, Keep, Replace</b> ) applied to DHCP packets that contain an Option-82 field. Configured through the <b>ip helper agent-information policy</b> command. Note that this field only appears when the DHCP relay agent information Option-82 feature is enabled.
<b>DHCP Snooping Status</b>	Indicates the status ( <b>Disabled, Switch-Level Enabled, or VLAN-Level Enabled</b> ) of the DHCP snooping feature. Configured through the <b>ip helper dhcp-snooping</b> or <b>ip helper dhcp-snooping vlan</b> command. This feature is disabled if the DHCP relay agent information option is enabled.
<b>Option 82 Data Insertion Per Switch</b>	Indicates whether or not the DHCP Option 82 field is added to DHCP packets ( <b>Enabled or Disabled</b> ). Configured through the <b>ip helper dhcp-snooping option-82 data-insertion</b> command. Note that this field only appears when DHCP snooping is enabled at the switch level.
<b>MAC Address Verification Per Switch</b>	Indicates whether or not MAC address verification is performed on the DHCP packets ( <b>Enabled or Disabled</b> ). Configured through the <b>ip helper dhcp-snooping mac-address verification</b> command. Note that this field only appears when DHCP snooping is enabled at the switch level.
<b>DHCP Snooping Bypass Opt82-Check</b>	Indicates whether or not an Option-82 check is performed for DHCP packets ingressing on untrusted ports ( <b>Enabled or Disabled</b> ). Configured through the <b>ip helper dhcp-snooping option-82 format ascii circuit-id</b> command.
<b>DHCP Snooping Opt82 Format</b>	The type of information (base MAC address for the switch, system name for the switch, user-defined text, or interface alias) that the switch will insert into the Option-82 suboption when Option-82 data insertion is enabled for the switch. Configured through the <b>ip helper dhcp-snooping option-82 format</b> command.
<b>DHCP Snooping Opt 82 String</b>	The user-defined text inserted into the Option-82 field when data insertion is enabled and a string format for the data is specified. Configure through the <b>ip helper dhcp-snooping option-82 format</b> command.
<b>DHCP Snooping Opt82 Format = ASCII</b>	Indicates that the switch will insert Option-82 information into the Circuit ID suboption as an ASCII text string. Configured through the <b>ip helper dhcp-snooping option-82 format ascii circuit-id</b> command.
<b>DHCP Snooping Opt82 ASCII Field1</b>	If the Option-82 format is set to ASCII, this field contains the type of information that the switch will insert into the Option-82 Circuit ID suboption. This field only displays when the Option-82 format is set to ASCII. The Circuit ID suboption may contain up to five ASCII text strings; a separate field is displayed for each type of string that is configured. Configured through the <b>ip helper dhcp-snooping option-82 format ascii circuit-id</b> command.

*output definitions*

<b>DHCP Snooping Opt82 ASCII Field1 String</b>	The value of the ASCII text string that is inserted into the Option-82 Circuit ID suboption field. This field only displays when the Option-82 format is set to ASCII. The Circuit ID suboption may contain up to five ASCII text strings; a separate field is displayed for each string that is configured. Configured through the <b>ip helper dhcp-snooping option-82 format ascii circuit-id</b> command.
<b>DHCP Snooping Opt82 ASCII Delimiter</b>	The character that is used to separate multiple ASCII text strings inserted into the Option-82 Circuit ID suboption. This field only displays when more than one ASCII text string is configured for the Circuit ID suboption. Configured through the <b>ip helper dhcp-snooping option-82 format ascii circuit-id</b> command.
<b>DHCP Binding DB Status</b>	Indicates if the DHCP snooping binding table (database) functionality is <b>Enabled</b> or <b>Disabled</b> .
<b>Database Sync Timeout</b>	The amount of time, in seconds, that the switch waits between each synchronization of the DHCP snooping binding table with the <b>dhcpBinding.db</b> file (default is 300 seconds). Configured through the <b>ip helper dhcp-snooping binding timeout</b> command. Note that this field does not appear if the binding table functionality is disabled.
<b>Database Last Sync Time</b>	The last time and day the DHCP snooping binding table was synchronized with the <b>dhcpBinding.db</b> file. Note that this field does not appear if the binding table functionality is disabled.
<b>Binding Persistency Status</b>	Indicates whether or not the DHCP snooping binding table retains entries with MAC addresses that were cleared from the MAC address table ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>ip helper dhcp-snooping binding persistency</b> command.
<b>Bootup Option</b>	Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>ip helper boot-up</b> command.
<b>Bootup Packet Option</b>	Indicates if the Bootup Option broadcasts a <b>DHCP</b> or <b>BOOTP</b> packet to obtain an IP address for default VLAN 1. Configured through the <b>ip helper boot-up enable</b> command. Note that this field does not appear if the Bootup Option is disabled.
<b>Forwarding Addresses</b>	IP addresses for DHCP servers that will receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the <b>ip helper address</b> command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.2; new fields added for DHCP Option 82 and DHCP Snooping features.

Release 6.1.3; new field added for global DHCP traffic suppression feature.

Release 6.1.5; **Traffic Suppression** field deprecated; new **DHCP Snooping Bypass Opt82-Check** field added.

Release 6.3.1; **DHCP Snooping Opt82 Format** and **DHCP Snooping Opt82 String** fields added.

Release 6.3.3; **Binding Persistency Status** field added.

Release 6.4.3; **DHCP Snooping Opt82 Format ASCII** fields added.

---

## show ip helper stats

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations, and the number of packets processed since the last time these statistics were displayed. Also includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

**show ip helper stats**

**ip helper no stats**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to clear all DHCP Relay statistics.

### Examples

```
-> show ip helper stats
```

```
Global Statistics :
  Reception From Client :
    Total Count =      12, Delta =      12,
  Forw Delay Violation :
    Total Count =       3, Delta =       3,
  Max Hops Violation :
    Total Count =       0, Delta =       0,
  Agent Info Violation :
    Total Count =       0, Delta =       0,
  Invalid Gateway IP :
    Total Count =       0, Delta =       0,
  Invalid Agent Info From Server :
    Total Count =       0, Delta =       0,
Server Specific Statistics :
  Server 5.5.5.5
    Tx Server :
      Total Count =       9, Delta =       9
```

*output definitions*

---

<b>Reception From Client</b>	Number of packets DHCP Relay has received from the DHCP client.
<b>Forw Delay Violation</b>	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.
<b>Max Hops Violation</b>	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
<b>Agent Info Violation</b>	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to <b>Drop</b> or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
<b>Invalid Gateway IP</b>	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
<b>Invalid Agent Info From Server</b>	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
<b>Delta</b>	Total number of packets processed since the last time the <b>ip helper</b> statistics were checked during any user session.
<b>Server</b>	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the <b>ip helper address</b> command to add or remove DHCP server IP addresses from DHCP Relay configuration.
<b>Tx Server</b>	Number of packets DHCP Relay has transmitted to the DHCP server.
<b>Delta</b>	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

---

**Release History**

## show ip helper dhcp-snooping vlan

Displays a list of VLANs that have DHCP Snooping enabled and whether or not MAC address verification and Option-82 data insertion is enabled for each VLAN.

**show ip helper dhcp-snooping vlan**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the **show ip helper** command to determine the status of DHCP Snooping at the switch level.

### Examples

```
-> show ip helper dhcp-snooping vlan
VLAN   Opt82      MAC Addr
ID     Insertion  Verification
-----+-----
50      Enabled    Enabled
60      Enabled    Enabled
100     Disabled   Enabled
200     Enabled    Disabled
1500    Disabled   Disabled
```

#### *output definitions*

---

<b>VLAN ID</b>	The VLAN identification number for the DHCP Snooping VLAN.
<b>MAC Address Verification</b>	Indicates whether or not MAC address verification is enabled for the VLAN ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>ip helper dhcp-snooping vlan</b> command.
<b>Opt-82 Data Insertion</b>	Indicates whether or not Option-82 data insertion is enabled for the VLAN ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>ip helper dhcp-snooping vlan</b> command.

---

### Release History

Release 6.1.2; command was introduced.

## Related Commands

## show ip helper dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports that are filtered by DHCP Snooping.

**show ip helper dhcp-snooping port**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports is displayed.
- If DHCP Snooping is operating at the VLAN level, then information for only those ports that are associated with a DHCP Snooping VLAN is displayed.
- The violation statistics displayed only apply to ports that are in the client only trust mode. When the trust mode for a port is changed from **client-only** to **trusted** or **blocked**, the violation counters are set to zero (0).

### Examples

```
-> show ip helper dhcp-snooping port
Slot      Trust      IP Src   Opt82      MAC      Server      Relay      Binding
Port      Mode       Filtering Violation  Violation Violation  Violation  Violation
-----+-----+-----+-----+-----+-----+-----+-----
1/1       Blocked   Disabled    0          0         0         0         0
1/2       Client-Only Enabled    0          0         0         0         0
1/3       Client-Only Enabled    0          0         0         0         0
1/4       Client-Only Enabled    0          0         0         0         0
1/5       Client-Only Enabled    0          0         0         0         0
1/6       Blocked   Disabled    0          0         0         0         0
1/7       Client-Only Enabled    0          0         0         0         0
1/8       Client-Only Enabled    0          0         0         0         0
1/9       Client-Only Enabled    0          0         0         0         0
1/10      Trusted   Disabled    0          0         0         0         0
1/11      Trusted   Disabled    0          0         0         0         0
1/12      Trusted   Disabled    0          0         0         0         0
```

*output definitions*

---

<b>Slot/Port</b>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<b>Trust Mode</b>	The DHCP Snooping trust mode for the port ( <b>Blocked</b> , <b>Client-Only</b> , or <b>Trusted</b> ). Configured through the <b>ip helper dhcp-snooping port</b> command.
<b>IP Src Filtering</b>	Indicates whether or not IP source filtering is enabled for the port ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>ip helper dhcp-snooping port ip-source-filtering</b> command.
<b>Opt82 Violation</b>	The number of DHCP packets dropped due to a DHCP Snooping Option-82 violation.
<b>MAC Violation</b>	The number of DHCP packets dropped due to a mismatch between the packet source MAC address and the client hardware address contained within the packet.
<b>Server Violation</b>	The number of DHCP server packets dropped because they originated from outside the network or firewall.
<b>Relay Violation</b>	The number of DHCP packets dropped because the packet included a relay agent IP address that was not 0.0.0.0.
<b>Binding Violation</b>	The number of DHCP packets dropped due to a mismatch between packets received and binding table information.

---

**Release History**

Release 6.1.2; command was introduced.

**Related Commands**

<b>show ip helper</b>	Displays current DHCP Relay configuration information.
<b>show ip helper dhcp-snooping vlan</b>	Displays a list of DHCP Snooping VLANs.

**MIB Objects**

```

```

---

## show ip helper dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

**show ip helper dhcp-snooping binding**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the [ip helper dhcp-snooping ip-source-filter](#) command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

### Examples

```
-> show ip helper dhcp-snooping binding
      MAC          Slot      IP          Lease   VLAN   Binding
      Address      Port      Address     Time    ID     Type
-----+-----+-----+-----+-----+-----
00:ae:22:e4:00:08  1/4     10.255.11.23  2000    5     Dynamic
10:fe:a2:e4:32:08  2/15    10.255.91.53  2000    2     Dynamic
```

### output definitions

---

<b>MAC Address</b>	The MAC address of the client.
<b>Slot/Port</b>	The slot/port designation for the switch port that received the DHCP request
<b>IP Address</b>	The IP address offered by the DHCP server.
<b>Lease Time</b>	The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry.
<b>VLAN ID</b>	The VLAN ID of the VLAN to which the client belongs.
<b>Binding Type</b>	Indicates whether the binding table entry is <b>dynamic</b> or <b>static</b> . Static entries are created using the <a href="#">ip helper dhcp-snooping ip-source-filter</a> command.

---

### Release History

Release 6.1.2; command was introduced.

## Related Commands

- show ip helper** Displays current DHCP Relay configuration information.
- show ip helper dhcp-snooping vlan** Displays a list of DHCP Snooping VLANs.
- show ip helper dhcp-snooping port** Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

## show ip udp relay service

Displays current configuration for UDP services by service name or by service port number.

**show ip udp relay service** [**BOOTP** | **NBDD** | **NBNSNBDD** | **DNS** | **TACACS** | **TFTP** | **NTP** | *port*]

---

### Syntax Definitions

<b>BOOTP</b>	BOOTP/DHCP well-known ports 67/68.
<b>NBDD</b>	NBDD well-known port 138.
<b>NBNSNBDD</b>	NBNS/NBDD well-known ports 137/138.
<b>DNS</b>	DNS well-known port 53.
<b>TACACS</b>	TACACS well-known port 65.
<b>TFTP</b>	TFTP well-known port 69.
<b>NTP</b>	NTP well-known port 123.
<i>port</i>	A user-specified port that is not a well-known port.

### Defaults

By default, the configuration for all UDP services is shown.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Enter a service name or port number with this command to display information about an individual service.
- When specifying a port number, do not specify a well-known port number. Instead, use the service name for the well-known port (i.e., NBNS/NBDD, DNS, etc.).

### Examples

```
-> show ip udp relay service
```

```
Service      Port(s)  Description
-----+-----+-----
  1           67 68    BOOTP/DHCP
  4           53      DNS
  5           65      TACACS
```

```
-> show ip udp relay service dns
```

```
Service      Port(s)  Description
-----+-----+-----
  4           53      DNS
```

```
-> show ip udp relay service 1776
```

```
Service      Port(s)  Description
-----+-----+-----
     9         1776      A UDP protocol
```

### *output definitions*

---

<b>Service</b>	The UDP service number. ( <b>1</b> through <b>7</b> for well-known service ports and <b>8</b> and above for user-defined service ports).
<b>Port(s)</b>	The UDP service port number.
<b>Description</b>	A description of the UDP service.

---

### **Release History**

Release 6.1; command was introduced.

### **Related Commands**

- show ip udp relay statistics** Displays the current statistics for each UDP port relay service.
- show ip udp relay destination** Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

### **MIB Objects**

```
iphelperxPropertiesTable
  iphelperxPropertiesService
  iphelperxPropertiesPort
  iphelperxPropertiesName
```

---

## show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLAN(s) configured for that service, and the number of packets the service has sent and received.

**show ip udp relay** [**BOOTP** | **NBDD** | **NBNSNBDD** | **DNS** | **TACACS** | **TFTP** | **NTP** | *port*]

---

### Syntax Definitions

<b>BOOTP</b>	BOOTP/DHCP well-known ports 67/68.
<b>NBDD</b>	NBDD well-known port 138.
<b>NBNSNBDD</b>	NBNS/NBDD well-known ports 137/138.
<b>DNS</b>	DNS well-known port 53.
<b>TACACS</b>	TACACS well-known port 65.
<b>TFTP</b>	TFTP well-known port 69.
<b>NTP</b>	NTP well-known port 123.
<i>port</i>	A user-specified port that is not a well-known port.

### Defaults

By default, the statistics for all UDP services is shown.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9800, 9000E

### Usage Guidelines

- Enter a service name or port number with this command to display information about an individual service.
- When specifying a port number, do not specify a well-known port number. Instead, use the service name for the well-known port (i.e., NBNS/NBDD, DNS, etc.).

### Examples

```
-> show ip udp relay statistics
```

Service	Vlan	Pkts Sent	Pkts Recvd
BOOTP		0	0
DNS	2	10	10
	4	15	15
TACACS	3	0	0

```
-> show ip udp relay statistics tacacs
```

```
Service          Vlan    Pkts Sent  Pkts Recvd
-----+-----+-----+-----
TACACS           3        0          0
```

```
-> show ip udp relay statistics 1776
```

```
Service          Vlan    Pkts Sent  Pkts Recvd
-----+-----+-----+-----
A UDP Protocol   18        2          2
```

### output definitions

<b>Service</b>	The active UDP service name.
<b>VLAN</b>	The VLAN assigned to the UDP service port that will forward traffic destined for that port. Use the <b>ip udp relay vlan</b> command to configure this value.
<b>Pkts Sent</b>	The number of packets sent from this service port to the server.
<b>Pkts Recvd</b>	The number of packets received by this service port from a client.

### Release History

Release 6.1; command was introduced.

### Related Commands

- show ip udp relay service** Displays current configuration for UDP services by service name or by service port number.
- show ip udp relay destination** Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

### MIB Objects

```
iphelperxStatTable
  iphelperxStatService
  iphelperxStatVlan
  iphelperxStatTxToServer
  iphelperxStatRxFromClient
```

## show ip udp relay destination

Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

**show ip udp relay destination** [**BOOTP** | **NBDD** | **NBNSNBDD** | **DNS** | **TACACS** | **TFTP** | **NTP** | *port*]

---

### Syntax Definitions

<b>BOOTP</b>	BOOTP/DHCP well-known ports 67/68.
<b>NBDD</b>	NBDD well-known port 138.
<b>NBNSNBDD</b>	NBNS/NBDD well-known ports 137/138.
<b>DNS</b>	DNS well-known port 53.
<b>TACACS</b>	TACACS well-known port 65.
<b>TFTP</b>	TFTP well-known port 69.
<b>NTP</b>	NTP well-known port 123.
<i>port</i>	A user-specified port that is not a well-known port.

### Defaults

By default, the forwarding VLAN assignments for all UDP services is shown.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9800, 9000E

### Usage Guidelines

- Enter a service name or port number with this command to display information about an individual service.
- When specifying a port number, do not specify a well-known port number. Instead, use the service name for the well-known port (i.e., NBNS/NBDD, DNS, etc.).

### Examples

```
-> show ip udp relay destination
```

Service	Port	VLANs
-----+-----+-----		
BOOTP	67	
DNS	53	2 4
TACACS	65	3

```
-> show ip udp relay destination dns
```

Service	Port	VLANs
-----+-----+-----		
DNS	53	2 4

```
-> show ip udp relay destination 1776
```

```
Service          Port      VLANs
-----+-----+-----
A UDP Protocol  1776     18
```

### *output definitions*

---

<b>Service</b>	The active UDP service name.
<b>Port</b>	The UDP service port number.
<b>VLANs</b>	The VLAN assigned to the UDP service port that will forward traffic destined for that port. Use the <b>ip udp relay vlan</b> command to configure this value.

---

### **Release History**

Release 6.1; command was introduced.

### **Related Commands**

- show ip udp relay service** Displays current configuration for UDP services by service name or by service port number.
- show ip udp relay statistics** Displays the current statistics for each UDP port relay service.

### **MIB Objects**

## dhcp-server

Enables, disables, or restarts the DHCP server operation.

**dhcp-server {enable | disable | restart}**

---

### Syntax Definitions

<b>enable</b>	Enables operation status of the DHCP server.
<b>disable</b>	Disables operation status of the DHCP server.
<b>restart</b>	Restarts the DHCP Server.

### Defaults

The DHCP server is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Restart the DHCP server after making changes to the *dhcpd.conf* file.

### Examples

```
-> dhcp-server enable
-> dhcp-server disable
-> dhcp-server restart
```

### Release History

Release 6.4.3; command introduced.

### Related Commands

[show dhcp-server statistics](#) Displays the DHCP Server lease statistics.

### MIB Objects

```
alaDhcpSrvGlobalConfigStatus
alaDhcpSrvGlobalRestart
```

---

## clear dhcp-server statistics

Clears the packet counters of dhcp-server statistics.

```
clear dhcp-server statistics
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to clear the packet counters of dhcp-server statistics.

### Examples

```
-> clear dhcp-server statistics
```

### Release History

Release 6.4.3; command introduced.

### Related Commands

[show dhcp-server statistics](#) Displays the DHCP Server lease statistics.

### MIB Objects

NA

---

## show dhcp-server leases

Displays the leases offered by the DHCP server.

**show dhcp-server leases** [*ip\_address* | *mac\_address*] [**type** {**static** | **dynamic**}]

---

### Syntax Definitions

<i>ip_address</i>	Specifies IP address of the interface configured with DHCP server.
<i>mac_address</i>	Specifies MAC address of the interface configured with DHCP server.
<b>static</b>	Displays only static leases.
<b>dynamic</b>	Displays only dynamic leases.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- DHCP server should be enabled first before using this command.

### Examples

```
-> show dhcp-server leases
```

IP address	MAC address	Lease Granted	Lease Expiry	Type
10.255.91.53	10:fe:a2:e4:32:08	2010-01-16 11:38:47	2010-01-17 11:38:47	Dynamic
10.255.91.55	20:fe:a2:e4:32:08	2010-01-16 10:30:00	2010-01-18 10:30:00	Static
10.255.91.58	20:fe:a2:e4:34:08	2010-01-16 10:30:00	2010-01-18 10:30:00	Dynamic

```
-> show dhcp-server leases ipaddr 10.255.91.53
```

IP address	MAC address	Lease Granted	Lease Expiry	Type
10.255.91.53	10:fe:a2:e4:32:08	2010-01-16 11:38:47	2010-01-17 11:38:47	Dynamic

```
-> show dhcp-server leases type static
```

IP address	MAC address	Lease Granted	Lease Expiry	Type
10.255.91.55	20:fe:a2:e4:32:08	2010-01-16 10:30:00	2010-01-18 10:30:00	Static

### output definitions

---

<b>IP address</b>	The IP address allocated to the client.
<b>MAC address</b>	The MAC address of the client for which the lease is allocated.

*output definitions (continued)*

---

<b>Lease Granted</b>	The date and time at which lease is granted.
<b>Lease Expiry</b>	The date and time at which lease expires.
<b>Type</b>	The type of lease offered.

---

**Release History**

Release 6.4.3; command introduced.

**Related Commands**

[clear dhcp-server statistics](#) Clears the DHCP Server lease statistics.

**MIB Objects**

```

## show dhcp-server statistics

Displays the statistics of the DHCP server.

**show dhcp-server statistics** [**packets** | **hosts** | **subnets** | **all**]

---

### Syntax Definitions

<b>packets</b>	Displays general statistical information along with specific information about data packets received, dropped and transmitted.
<b>hosts</b>	Displays general statistical information along with specific information about hosts related to all the subnets.
<b>subnets</b>	Displays general statistical information along with specific information about all the subnets.
<b>all</b>	Displays all statistical information related to the DHCP server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- DHCP server should be enabled first before using this command.

### Examples

```
-> Show dhcp-server stats all
```

```
General stats:

*output definitions*

---

<b>General stats</b>	Denotes General DHCP Server statistics.
<b>Name</b>	Specifies the name assigned to the DHCP Server.
<b>Status</b>	Specifies up or down status of the DHCP Server.
<b>Total subnets used</b>	Specifies the total number of subnets being used.
<b>Total subnets managed</b>	Specifies the total number of subnets being managed by the DHCP server.
<b>Total subnets unused</b>	Specifies the total number of subnets being unused
<b>Total subnets full</b>	Specifies the total number of subnets wherein all of the IP addresses are used.
<b>DHCP Server System Up Time</b>	Shows the DHCP Server System Up Time Performance Monitor counter.
<b>Sync time</b>	Specifies the time for DHCP server to contact and synchronize with the designated time server
<b>Last sync time</b>	Specifies the last time the synchronization occurred.
<b>Next sync time</b>	Specifies the next time the synchronization should be scheduled.
<b>Packet stats</b>	Denotes statistical information about the data packet transmission
<b>Total DHCP Discovers</b>	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server.
<b>Total DHCP Offers</b>	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
<b>Total DHCP Requests</b>	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
<b>Total DHCP Request Grants</b>	Specifies the total number of DHCP request grants provided by the server to the clients.

*output definitions (continued)*

---

<b>Total DHCP Request Renews</b>	Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server.
<b>Total DHCP Declines</b>	Specifies the total number of DHCP requests declined by the DHCP server.
<b>Total DHCP Acks</b>	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients.
<b>Total DHCP Nacks</b>	Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
<b>Total DHCP Releases</b>	Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients.
<b>Total DHCP Informs</b>	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server.
<b>Total Bootp requests</b>	Specifies the total number of BOOTP requests sent by the clients to the DHCP server.
<b>Total Bootp response</b>	Specifies the total number of BOOTP response packets sent by the DHCP server to the clients.
<b>Total Unknown packets</b>	Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server.
<b>Leases stats</b>	Denotes statistical information about leases provided by the DHCP server.
<b>Hosts Managed</b>	Specifies the total number of clients managed by the DHCP server.
<b>Hosts used</b>	Specifies the total number of clients using the IP addresses provided by the DHCP server.
<b>Hosts unused</b>	Specifies the total number of clients managed by the DHCP server which are not being used.
<b>Hosts Pending</b>	Specifies the total number of DHCP IP address requests which are pending by the DHCP server.
<b>Hosts unavailable</b>	Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired.
<b>Static DHCP</b>	Denotes statistical information about the hosts configured with Static DHCP.
<b>Automatic DHCP</b>	Denotes statistical information about the hosts configured with Automatic DHCP.
<b>Static BootP</b>	Denotes statistical information about the hosts configured under Static BootP. <b>Note:</b> BootP Relay is disabled when DHCP server is enabled on the switch.
<b>Automatic BootP</b>	Denotes statistical information about the hosts configured with Automatic BootP.
<b>Subnet statistics</b>	Denotes all DHCP related statistical information for individual subnets.
<b>Range</b>	Specifies the range of IP addresses in the individual subnet

*output definitions (continued)*

---

<b>Mask</b>	Specifies the subnet mask
<b>Type</b>	Specifies whether the type of IP address allocation is dynamic or Static.

---

**Release History**

Release 6.4.3; command introduced.

**Related Commands**

[clear dhcp-server statistics](#) Clears the DHCP Server lease statistics.

**MIB Objects**

NA

## show ip helper dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

**show ip helper dhcp-snooping ip-source-filter {vlan | port}**

---

### Syntax Definitions

**vlan** Displays the VLANs on which IP source filtering is enabled.

**port** Displays the ports on which IP source filtering is enabled.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

### Examples

```
-> show ip helper dhcp-snooping ip-source-filter port
Slot  IP Src
Port  Filtering
-----+-----
1/7   Enabled
1/12  Enabled
```

#### *output definitions*

---

<b>Slot/Port</b>	Specifies the slot and port number.
<b>IP Src Filtering</b>	Specifies if IP source filtering status. <b>Enabled</b> or <b>Disabled</b> .

---

```
-> show ip helper dhcp-snooping ip-source-filter vlan
Vlan  IP Src Filtering
-----+-----
10    Enabled
11    Enabled
12    Enabled
13    Enabled
```

#### *output definitions*

---

<b>Vlan</b>	VLAN number.
<b>IP Src Filtering</b>	Specifies if IP source filtering status. <b>Enabled</b> or <b>Disabled</b> .

---

## Release History

Release 6.4.4; command was introduced.

## Related Commands

**ip helper dhcp-snooping ip-source-filter** Enables or disables the IP source filtering at a port, link aggregation, or VLAN level.

## MIB Objects

```

# 21 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP/VRRP3 routers on the LAN. The VRRP/VRRP3 router, which controls the IP/IPv6 address associated with a virtual router is called the master router, and forwards packets to that IP/IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The Alcatel-Lucent implementation of VRRP also supports the collective management of virtual routers on a switch.

---

**Note.** VRRP3 does not support the collective management functionality.

---

The VRRP and VRRP3 commands comply with RFC 2787 and RFC 3768, respectively.

MIB information is as follows:

*Filename:* IETF-VRRP.MIB  
*Module:* VRRP-MIB

*Filename:* AlcatelIND1VRRP.MIB  
*Module:* ALCATEL-IND1-VRRP-MIB

*Filename:* AlcatelIND1VRRP3.MIB  
*Module:* ALCATEL-IND1-VRRP3-MIB

The VRRP CLI commands are listed here:

---

- vrrp**
- vrrp address**
- vrrp track**
- vrrp track-association**
- vrrp trap**
- vrrp delay**
- vrrp interval**
- vrrp priority**
- vrrp preempt**
- vrrp all**
- vrrp set**
- vrrp group**
- vrrp group all**
- vrrp group set**

- show vrrp3 track-association**

---

## vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

**vrrp** *vrid* *vlan\_id* [**enable** | **disable** | **on** | **off**] [**priority** *priority*] [**preempt** | **no preempt**] [[**advertising**]  
**interval** *seconds*]

**no vrrp** *vrid* *vlan\_id*

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<b>enable</b>	Enables the virtual router. A virtual router may only be enabled if an IP address is configured for the virtual router.
<b>disable</b>	Disables the virtual router. Cannot be combined on the same line with other parameters.
<b>on</b>	Alternate syntax for enabling the virtual router.
<b>off</b>	Alternate syntax for disabling the virtual router.
<i>priority</i>	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router.
<i>seconds</i>	The interval in seconds after which the master router will send VRRP advertisements. The advertising interval must be same for all VRRP routers configured with the same VRID. The valid range is 1–255 seconds.

## Defaults

parameter	default
<b>enable   disable   on   off</b>	<b>disable (off)</b>
<i>priority</i>	100
<b>preempt   no preempt</b>	<b>preempt</b>
<i>seconds</i>	1

## Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp address** command to configure an IP address for the virtual router. This must be done before the virtual router can be enabled.
- To disable the virtual router, rather than to remove it, use the **disable** or **off** option. Note that **disable** or **off** cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.

Important information about configuring priority:

- A value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 254. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.

## Examples

```
-> vrrp 23 1 priority 75
-> vrrp 23 1 enable
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[vrrp address](#)

Configures an IP address for a virtual router.

[show vrrp](#)

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrp3OperTable

alaVrrp3OperAdminState

alaVrrp3OperPriority

alaVrrp3OperPreemptMode

alaVrrp3OperAdvertisementInterval

alaVrrp3OperRowStatus

---

## vrrp address

Configures an IP address for a virtual router.

```
vrrp vrid vlan_id address ip_address
```

```
vrrp vrid vlan_id no address ip_address
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured.
<i>ip_address</i>	The virtual IP address associated with the specified virtual router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

A virtual router IP address must be configured before the virtual router can be enabled.

### Examples

```
-> vrrp 1 3 address 10.10.3.2
-> vrrp 1 3 no address 10.10.3.2
```

### Release History

Release 6.1; command was introduced.

Release 6.1.3; command modified; *ip* parameter is replaced by *address* parameter.

### Related Commands

<a href="#">vrrp</a>	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
<a href="#">show vrrp statistics</a>	Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

### MIB Objects

```
alaVrrp3AssoIpAddrTable
  alaVrrp3AssoIpAddrRowStatus
```

---

## vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

```
vrrp track track_id [enable | disable] [priority value] [ipv4-interface name / ipv6-interface name |  
port slot/port | address address]
```

```
no vrrp track track_id
```

---

### Syntax Definitions

<i>track_id</i>	The ID of the tracking policy; the range is 1 to 255.
<b>enable</b>	Enables the tracking policy.
<b>disable</b>	Disables the tracking policy.
<i>value</i>	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down. The valid range is 0–255.
<i>name</i>	The name of the IPv4 or IPv6 interface that this policy will track.
<i>slot/port</i>	The slot/port number that this policy will track.
<i>address</i>	The remote IP or IPv6 address that this policy will track.

### Defaults

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>value</i>	25

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **disable** option to disable the tracking policy, rather than removing it from the switch.

## Examples

```
-> vrrp track 2 enable priority 50 ipv4-interface Marketing
-> vrrp track 3 enable priority 60 ipv6-interface Sales
-> vrrp track 3 disable
```

## Release History

Release 6.1; command was introduced.

Release 6.1.3; *ip* parameter is replaced by *address* parameter.

## Related Commands

[vrrp track-association](#)

Associates a VRRP tracking policy with a virtual router.

[show vrrp track](#)

Displays information about tracking policies on the switch.

## MIB Objects

```
alaVRRPTrackTable
  alaVrrpTrackState
  alaVrrpTrackAdminState
  alaVrrpTrackPriority
  alaVrrpTrackEntityType
  alaVrrpTrackEntityVlan
  alaVrrpTrackEntityPort
  alaVrrpTrackEntityIpAddress
  alaVrrpTrackEntityIpv6Interface
  alaVrrpTrackEntityInterface
  alaVrrpTrackRowStatus
```

---

## vrrp track-association

Associates a VRRP tracking policy with a virtual router.

```
vrrp vrid vlan_id track-association track_id
```

```
vrrp vrid vlan_id no track-association track_id
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN ID of the virtual router.
<i>track_id</i>	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to remove a tracking policy from a virtual router.

### Examples

```
-> vrrp 2 4 track-association 1  
-> vrrp 2 4 no track-association 1
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">vrrp</a>	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
<a href="#">show vrrp track-association</a>	Displays the tracking policies associated with virtual routers.

### MIB Objects

```
alaVrrpAssoTrackTable  
  alaVrrpAssoTrackId  
  alaVrrpTrackRowStatus
```

---

## vrrp trap

Enables or disables SNMP traps for VRRP.

**vrrp trap**

**no vrrp trap**

---

### Syntax Definitions

N/A

### Defaults

By default, SNMP traps for VRRP are enabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP traps to actually be sent.

### Examples

```
-> vrrp trap  
-> no vrrp trap
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[snmp trap filter](#) Enables or disables SNMP trap filtering.

### MIB Objects

```
vrrpOperGroup  
vrrpNotificationCntl
```

---

## vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

**vrrp delay** *seconds*

---

### Syntax Definitions

*seconds*

The amount of time after a reboot that virtual routers will wait before they go active; the range is 0 to 180 seconds.

### Defaults

parameter	default
<i>seconds</i>	45 seconds

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

### Examples

```
-> vrrp delay 50
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[vrrp](#)

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

[show vrrp](#)

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

### MIB Objects

alaVRRPStartDelay

---

## vrrp interval

Modifies the default advertising interval value assigned to the virtual routers on the switch.

**vrrp interval** *seconds*

---

### Syntax Definitions

*seconds*                                      The default advertising interval for the virtual routers. The valid range is 1–255 seconds.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp interval 50
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
alaVrrpDefaultInterval

---

## vrrp priority

Modifies the default priority value assigned to the virtual routers on the switch.

**vrrp priority** *priority*

---

### Syntax Definitions

*priority*                                      The default priority value for the virtual routers. The valid range is 1–254.

### Defaults

parameter	default
<i>priority</i>	100

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp priority 50
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
alaVrrpDefaultPriority

---

## vrrp preempt

Modifies the default preempt mode assigned to the virtual routers on the switch.

vrrp [preempt | no preempt]

---

### Syntax Definitions

<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router by default.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router by default.

### Defaults

parameter	default
preempt   no preempt	preempt

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp preempt
-> vrrp no preempt
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
alaVrrpDefaultPreemptMode

---

## vrrp all

Changes the administrative status of all the virtual routers on the switch.

**vrrp** [**disable** | **enable** | **enable all**]

---

### Syntax Definitions

<b>disable</b>	Disables all the virtual routers on the switch.
<b>enable</b>	Enables the virtual routers that have not previously been disabled individually or collectively via the <b>vrrp group all</b> command.
<b>enable all</b>	Enables all the virtual routers on the switch including those virtual routers that have been disabled individually or collectively via the <b>vrrp group all</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command changes the administrative status of all the virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

### Examples

```
-> vrrp disable  
-> vrrp enable  
-> vrrp enable all
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>vrrp interval</b>	Modifies the default advertising interval value assigned to the virtual routers on the switch.
<b>vrrp priority</b>	Modifies the default priority value assigned to the virtual routers on the switch.
<b>vrrp preempt</b>	Modifies the default preempt mode assigned to the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
alaVrrpAdminState

---

## vrrp set

Sets the new default parameter values to existing virtual routers on the switch.

```
vrrp set [interval | priority | preempt | all ] [ override]
```

---

### Syntax Definitions

<b>interval</b>	Sets the VRRP advertisement interval value to the new default value.
<b>priority</b>	Sets the priority value to the new default value.
<b>preempt</b>	Sets the preempt mode to the new default mode.
<b>all</b>	Sets all the parameters value to the new default value.
<b>override</b>	Overrides the specified parameters configured value with the new default value.

### Defaults

parameter	default
interval   priority   preempt   all	all

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp set priority
-> vrrp set priority override
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>vrrp interval</b>	Modifies the default advertising interval value assigned to the virtual routers on the switch.
<b>vrrp priority</b>	Modifies the default priority value assigned to the virtual routers on the switch.
<b>vrrp preempt</b>	Modifies the default preempt mode assigned to the virtual routers on the switch.
<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

```
alaVrrpv2Config  
  alaVrrpSetParam  
  alaVrrpOverride
```

---

## vrrp group

Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

**vrrp group** *vrgid* [*interval seconds*] [*priority priority*] [**preempt** | **no preempt**]

**no vrrp group** *vrgid*

---

### Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<i>seconds</i>	The default advertising interval for the virtual router group. The valid range is 1–255 seconds.
<i>priority</i>	The default priority value for the virtual router group. The valid range is 1–254.
<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router by default.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router by default.

### Defaults

parameter	default
<i>seconds</i>	1
<i>priority</i>	100
<b>preempt</b>   <b>no preempt</b>	<b>preempt</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default value to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

## Examples

```
-> vrrp group 25 interval 50 priority 50 no preempt  
-> no vrrp group 25
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

<a href="#">vrrp group all</a>	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
<a href="#">vrrp group set</a>	Sets the new modified default value to all the virtual routers in a virtual router group.
<a href="#">vrrp group-association</a>	Adds a virtual router to a virtual router group.
<a href="#">show vrrp group</a>	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

## MIB Objects

```
alaVrrpGroupTable  
  alaVrrpGroupInterval  
  alaVrrpGroupPriority  
  alaVrrpGroupPreemptMode  
  alaVrrpGroupRowStatus
```

---

## vrrp group all

Changes the administrative status of all the virtual routers in a virtual router group using a single command.

**vrrp group *vrgid* [disable | enable | enable all]**

---

### Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<b>disable</b>	Disables all the virtual routers in the group.
<b>enable</b>	Enables those virtual routers that have not previously been disabled individually in the group.
<b>enable all</b>	Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If a virtual router in a group is disabled on an individual basis, it can only be reenabled by using the **enable all** option in this command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

### Examples

```
-> vrrp group 25 disable
-> vrrp group 25 enable
-> vrrp group 25 enable all
```

### Release History

Release 6.3.1; command was introduced.

**Related Commands**

<b>vrrp group</b>	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

alaVrrpGroupTable  
  alaVrrpGroupAdminState

---

## vrrp group set

Sets the new modified default value to all the virtual routers in a virtual router group.

**vrrp group *vrgid* set [interval | priority | preempt | all] [override]**

---

### Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<b>interval</b>	Sets the VRRP advertisement interval value to the new default value.
<b>priority</b>	Sets the priority value to the new default value.
<b>preempt</b>	Sets the preempt mode to the new default mode.
<b>all</b>	Sets all the parameters' value to the new default value.
<b>override</b>	Overrides the parameter's configured value with the group default value.

### Defaults

parameter	default
<b>interval   priority   preempt   all</b>	<b>all</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, you must disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.

### Examples

```
->vrrp group 10 set priority
->vrrp group 10 set priority override
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>vrrp group</b>	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
<b>vrrp group all</b>	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
<b>show vrrp group</b>	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

## MIB Objects

```
alaVrrpGroupTable  
  alaVrrpGroupSetParam  
  alaVrrpGroupOverride
```

---

## vrrp group-association

Adds a virtual router to a virtual router group.

```
vrrp vrid vlan_id group-association vrgid
```

```
vrrp vrid vlan_id no group-association vrgid
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<i>vrgid</i>	The virtual router group ID, in the range from 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the virtual router from the virtual router group.
- A virtual router need not be disabled in order to be added to a virtual router group. However, the virtual router will not adopt the group's default parameter values until it is reenabled.
- A virtual router need not be disabled to be removed from a group.

### Examples

```
-> vrrp 25 1 group-association 10  
-> vrrp 25 1 no group-association 10
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

**show vrrp group-association** Displays the virtual routers that are associated with a group.

## **MIB Objects**

alaVrrpAssoGroupTable

    alaVrrpAssoGroupRowStatus

---

## vrrp3

Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.

**vrrp3** *vrid* *vlan\_id* [**enable** | **disable** | **on** | **off**] [**priority** *priority*] [**preempt** | **no preempt**][**accept** | **no accept**] [[**advertising**] **interval** *centiseconds*]

**no vrrp3** *vrid* *vlan\_id*

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<b>enable</b>	Enables the virtual router.
<b>disable</b>	Disables the virtual router. Cannot be combined on the same line with other parameters.
<b>on</b>	Alternate syntax for enabling the virtual router.
<b>off</b>	Alternate syntax for disabling the virtual router.
<i>priority</i>	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router.
<b>accept</b>	Specifies that the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
<b>no accept</b>	Specifies that the master router, which is not the IPv6 address owner will not accept the packets addressed to the IPv6 address owner as its own.
<i>centiseconds</i>	The interval in centiseconds after which the master router will send VRRP3 advertisements. The advertising interval must be the same for all VRRP3 routers configured with the same VRID. The valid range is 1–4096 centiseconds.

## Defaults

parameter	default
<b>enable   disable   on   off</b>	<b>disable (off)</b>
<i>priority</i>	100
<b>preempt   no preempt</b>	<b>preempt</b>
<b>accept / no accept</b>	<b>accept</b>
<i>centiseconds</i>	100

## Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp3 address** command to configure an IPv6 address for the virtual router.
- To disable the virtual router, rather than to remove it, use the **disable** or **off** option. Note that the **disable** or **off** options cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- The maximum number of virtual routers supported is based on the 100 centisecond interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval cannot be less than 10 centiseconds.

## Examples

```
-> vrrp3 23 1 priority 75  
-> vrrp3 23 1 enable
```

## Release History

Release 6.1.3; command was introduced.

## Related Commands

[vrrp3 address](#)

Configures an IPv6 address for a virtual router.

---

## vrrp3 address

Configures an IPv6 address for a virtual router.

```
vrrp3 vrid vlan_id address ipv6_address
```

```
vrrp3 vrid vlan_id no address ipv6_address
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured.
<i>address</i>	The virtual IPv6 address associated with the specified virtual router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> vrrp3 1 3 address 213:100:1::56  
-> vrrp3 1 3 no address 213:100:1::56
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

---

## **vrrp3 trap**

Enables or disables SNMP traps for VRRP3.

**vrrp3 trap**

**no vrrp3 trap**

---

### **Syntax Definitions**

N/A

### **Defaults**

By default, SNMP traps for VRRP3 are enabled.

### **Platforms Supported**

OmniSwitch 6850, 6855, 6850E, 9000E

### **Usage Guidelines**

SNMP traps must be enabled globally on the switch for VRRP3 traps to actually be sent.

### **Examples**

```
-> vrrp3 trap  
-> no vrrp3 trap
```

### **Release History**

Release 6.1.3; command was introduced.

### **Related Commands**

[snmp trap filter](#)                      SNMP traps must be enabled with this command.

### **MIB Objects**

```
alaVrrp3OperGroup  
  alaVrrp3NotificationCntl
```

---

## vrrp3 track-association

Associates a VRRP3 tracking policy with a virtual router.

```
vrrp3 vrid vlan_id track-association track_id
```

```
vrrp3 vrid vlan_id no track-association track_id
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN ID of the virtual router.
<i>track_id</i>	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- Use the **vrrp track** command to create a tracking policy for an IPv6 interface.

### Examples

```
-> vrrp3 2 4 track-association 1  
-> vrrp3 2 4 no track-association 1
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

<b>vrrp3</b>	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
<b>show vrrp3 track-association</b>	Displays the tracking policies associated with VRRP3 virtual routers.

### MIB Objects

  alaVrrp3TrackRowStatus
```

---

*output definitions*

---

<b>VRRP default advertisement interval</b>	The default advertising interval for all virtual routers on the switch.
<b>VRRP default priority</b>	The default priority value for all virtual routers on the switch.
<b>VRRP default preempt</b>	The default preempt mode for all virtual routers on the switch.
<b>VRRP trap generation</b>	Indicates whether or not the VRRP trap generation is enabled or disabled; configured through the <b>vrrp track</b> command.
<b>VRRP startup delay</b>	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the <b>vrrp delay</b> command.
<b>VRID</b>	Virtual router identifier. Configured through the <b>vrrp</b> command.
<b>VLAN</b>	The VLAN associated with the VRRP instance. Configured through the <b>vrrp</b> command.
<b>IP Address(es)</b>	The assigned IP addresses. Configured through the <b>vrrp address</b> command.
<b>Admin Status</b>	The administrative status of this virtual router instance; <b>enabled</b> allows the virtual router instance to operate; <b>disabled</b> disables the virtual router instance without deleting it.
<b>Priority</b>	Indicates the VRRP router's priority for the virtual router. For more information about priority, see the <b>vrrp</b> command description on <a href="#">page 21-3</a> .
<b>Preempt</b>	Controls whether a higher priority virtual router will preempt a lower priority master router: <b>preempt</b> indicates that a higher priority virtual router will preempt a lower priority master; <b>no preempt</b> indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.
<b>Virtual MAC</b>	Displays the virtual MAC address for the virtual router. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the <b>backup</b> or <b>initialize</b> state.
<b>Adv. Interval</b>	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

---

**Release History**

Release 6.1; command was introduced.

Release 6.3.1; **VRRP default advertisement interval**, **VRRP default priority**, and **VRRP default preempt** fields added.

## Related Commands

<b>vrrp</b>	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
<b>vrrp address</b>	Configures an IP address for a virtual router.
<b>vrrp interval</b>	Modifies the default advertising interval value assigned to the virtual routers on the switch.
<b>vrrp priority</b>	Modifies the default priority value assigned to the virtual routers on the switch.
<b>vrrp preempt</b>	Modifies the default preempt mode assigned to the virtual routers on the switch.
<b>show vrrp statistics</b>	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

## show vrrp track

Displays information about tracking policies on the switch.

```
show vrrp track [track_id]
```

---

### Syntax Definitions

*track\_id*                                      The ID of the tracking policy for which you want to display information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

### Examples

```
-> show vrrp track
Track
ID          Policy          Admin   Oper
           State          State   Pri
-----+-----+-----+-----+-----
   1    PORT 1/1      Enabled   Up     25
   2    192.10.150.42 Enabled   Down   25
```

### *output definitions*

---

<b>Track ID</b>	The ID of the tracking policy.
<b>Policy</b>	The slot/port, IP address, or VLAN tracked by the policy.
<b>Admin State</b>	Whether the tracking policy is administratively enabled or disabled.
<b>Oper State</b>	Indicates whether the operating state of the tracking policy is Up or Down.
<b>Pri</b>	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### **vrrp track**

Creates a new tracking policy or modifies an existing tracking policy.

## MIB Objects

```
alaVRRPTrackTable  
  alaVrrpTrackState  
  alaVrrpTrackAdminState  
  alaVrrpTrackPriority  
  alaVrrpTrackEntityType  
  alaVrrpTrackEntityVlan  
  alaVrrpTrackEntityPort  
  alaVrrpTrackEntityIpAddress  
  alaVrrpTrackEntityIpv6Interface  
  alaVrrpTrackEntityInterface
```

---

## show vrrp track-association

Displays the tracking policies associated with virtual routers.

**show vrrp** [*vrid*] **track-association** [*track\_id*]

---

### Syntax Definitions

*vrid* The virtual router ID, in the range from 1–255.

*track\_id* The ID of the tracking policy for which you want to display information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

### Examples

```
-> show vrrp 2 track-association
      Conf  Cur  Track
VRID VLAN Pri  Pri  ID      Policy      Admin  Oper  Track
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
      2    1  100  100  1  VLAN    1      Enabled Up    25
      2    1  100  100  2  10.255.11.101  Enabled Up    25
```

### output definitions

---

<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN ID associated with the virtual router.
<b>Conf Pri</b>	The priority configured for the virtual router through the <b>vrrp</b> command.
<b>Cur Pri</b>	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
<b>Track ID</b>	The ID of the tracking policy.
<b>Policy</b>	The VLAN, IP address, or slot/port being tracked by this policy.
<b>Admin State</b>	The administrative state of the tracking policy configured through the <b>vrrp track</b> command.

*output definitions (continued)*

---

<b>Oper State</b>	Whether the tracking policy is operational (Up) or not (Down).
<b>Track Pri</b>	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

*output definitions*

---

<b>VRRP trap generation</b>	Whether or not VRRP trap generation is enabled or disabled.
<b>VRRP startup delay</b>	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize.
<b>VRID</b>	Virtual router identifier. Configured through the <b>vrrp3</b> command.
<b>VLAN</b>	The VLAN associated with the VRRP3 instance. Configured through the <b>vrrp3</b> command.
<b>IPv6 Address(es)</b>	The assigned IPv6 addresses. Configured through the <b>vrrp3 address</b> command.
<b>Admin Status</b>	The administrative status of this virtual router instance; <b>enabled</b> allows the virtual router instance to operate; <b>disabled</b> disables the virtual router instance without deleting it.
<b>Priority</b>	Indicates the VRRP3 router's priority for the virtual router. For more information about priority, see the <b>vrrp3</b> command description on <a href="#">page 21-30</a> .
<b>Preempt</b>	Controls whether a higher priority virtual router will preempt a lower priority master: <b>preempt</b> indicates that a higher priority virtual router will preempt a lower priority master; <b>no preempt</b> indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case the IP address owner will always take over it if is available.
<b>Accept</b>	Displays whether the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
<b>Virtual MAC</b>	Displays the virtual MAC address for the virtual router when the router is in the <b>master</b> state. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the <b>backup</b> or <b>initialize</b> state.
<b>Adv. Interval</b>	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

## show vrrp3 track-association

Displays the tracking policies associated with VRRP3 virtual routers.

**show vrrp3** [*vrid*] **track-association** [*track\_id*]

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>track_id</i>	The ID of the tracking policy for which you want to display information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

### Examples

```
-> show vrrp3 track-association
      Conf  Cur  Track
VRID VLAN  Pri  Pri  ID          Policy      Admin  Oper  Track
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
   1  101  200  200  1  PORT 1/37      Enabled  Up    25
```

### output definitions

---

<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN ID associated with the virtual router.
<b>Conf Pri</b>	The priority configured for the virtual router through the <b>vrrp3</b> command.
<b>Cur Pri</b>	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
<b>Track ID</b>	The ID of the tracking policy.
<b>Policy</b>	The VLAN, IPv6 address, or slot/port being tracked by this policy.
<b>Admin State</b>	The administrative state of the tracking policy.

*output definitions (continued)*

---

<b>Oper State</b>	Indicates whether the tracking policy is operational (Up) or not (Down).
<b>Track Pri</b>	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

---

**Release History**

# 22 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

*Filename:* AlcatelIND1DrcTm.mib  
*Module:* ALCATEL-IND1-DRCTM-MIB

*Filename:* AlcatelIND1Ospf.mib  
*Module:* ALCATEL-IND1-OSPF-MIB

*Filename:* IETF\_OSPF.MIB  
*Module:* OSPF-MIB

---

The following is a list of the commands for configuring OSPF:

---

<b>Global OSPF Commands</b>	<code>ip ospf status</code> <code>ip load ospf</code> <code>ip ospf exit-overflow-interval</code> <code>ip ospf extlsdb-limit</code> <code>ip ospf host</code> <code>ip ospf mtu-checking</code> <code>ip ospf default-originate</code> <code>ip ospf route-tag</code> <code>ip ospf spf-timer</code> <code>ip ospf virtual-link</code> <code>ip ospf neighbor</code> <code>show ip ospf</code> <code>show ip ospf border-routers</code> <code>show ip ospf ext-lsdb</code> <code>show ip ospf host</code> <code>show ip ospf lsdb</code> <code>show ip ospf neighbor</code> <code>show ip ospf routes</code> <code>show ip ospf virtual-link</code> <code>show ip ospf virtual-neighbor</code>
<b>OSPF Area Commands</b>	<code>ip ospf area</code> <code>ip ospf area default-metric</code> <code>ip ospf area range</code> <code>show ip ospf area</code> <code>show ip ospf area range</code> <code>show ip ospf area stub</code>
<b>OSPF Interface Commands</b>	<code>ip ospf interface</code> <code>ip ospf interface area</code> <code>ip ospf interface auth-key</code> <code>ip ospf interface auth-type</code> <code>ip ospf interface dead-interval</code> <code>ip ospf interface hello-interval</code> <code>ip ospf interface md5</code> <code>ip ospf interface md5 key</code> <code>ip ospf interface type</code> <code>ip ospf interface cost</code> <code>ip ospf interface poll-interval</code> <code>ip ospf interface priority</code> <code>ip ospf interface retrans-interval</code> <code>ip ospf interface transit-delay</code> <code>show ip ospf interface</code>
<b>OSPF Graceful Restart Commands</b>	<code>ip ospf restart-support</code> <code>ip ospf restart-interval</code> <code>ip ospf restart-helper status</code> <code>ip ospf restart-helper strict-lsa-checking status</code> <code>ip ospf restart initiate</code> <code>show ip ospf restart</code>

---

## ip ospf status

Enables or disables the administration status of OSPF on the router.

**ip ospf status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables OSPF.
<b>disable</b>	Disables OSPF.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

### Examples

```
-> ip ospf status enable
-> ip ospf status disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

### MIB Objects

```
ospfGeneralGroup
  ospfAdminStat
```

---

## ip load ospf

Loads the OSPF software on the router.

`ip load ospf`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Example

```
-> ip load ospf
```

### Release History

Release 6.1; command was introduced.

### Related Commands

N/A

### MIB Objects

ALADRCTMCONFIG

alaDrcTmIPOspfStatus

---

## ip ospf exit-overflow-interval

This command sets the overflow interval value.

**ip ospf exit-overflow-interval** *seconds*

---

### Syntax Definitions

*seconds*                                      The number of seconds the router waits before attempting to leave the overflow state.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The overflow interval is the time the router will wait before attempting to leave the database overflow state; the interval begins upon the router's arrival into this state.
- When the router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

### Example

```
-> ip ospf exit-overflow-interval 10
```

### Release History

Release 6.1; command was introduced.

Release 6.4.2; The number of seconds cannot be changed and will always be zero.

### Related Commands

[show ip ospf](#)                                      Displays the OSPF status and general configuration parameters.

### MIB Objects

ospfGeneralGroup  
  ospfExitOverflowInterval

---

## ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

**ip ospf extlsdb-limit** *limit*

---

### Syntax Definitions

*limit* The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

### Defaults

parameter	default
<i>limit</i>	-1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

### Example

```
-> ip ospf extlsdb-limit 25
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

### MIB Objects

ospfGeneralGroup  
ospfExtLsdbLimit

---

## ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

**ip ospf host** *ip\_address* **tos** *tos* [**metric** *metric*]

**no ip ospf host** *ip\_address* **tos** *tos*

---

### Syntax Definitions

<i>ip_address</i>	The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.
<i>tos</i>	The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0 and up.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>metric</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path

### Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10  
-> no ip ospf host 172.22.2.115 tos 1
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**show ip ospf host**

Displays information on configured OSPF hosts.

## MIB Objects

ospfHostTable

ospfHostStatus

ospfHostIpAddress

ospfHostTOS

ospfHostMetric

---

## ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

**ip ospf mtu-checking**

**no ip ospf mtu-checking**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, OS6855-U24X, 6850E, 9000E

### Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

### Examples

```
-> ip ospf mtu-checking  
-> no ip ospf mtu-checking
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show ip ospf** Displays the OSPF status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf  
  alaOspfMTUCheck
```

---

## ip ospf default-originate

Configures a default external route into the OSPF routing domain.

**ip ospf default-originate** {only | always} [metric-type {type1 | type2}] [metric *value*]

**no ip ospf default-originate**

---

### Syntax Definitions

<b>only</b>	Advertises only when there is a default route in the routing table.
<b>always</b>	Advertises the default route regardless of whether the routing table has a default route.
<b>type1</b>	Sets the external route as type1.
<b>type2</b>	Sets the external route as type2.
<i>value</i>	The metric value. The valid range is 1-65535.

### Defaults

parameter	default
type1   type2	type2
<i>value</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

### Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

**show ip ospf**

Displays OSPF status and general configuration parameters.

## MIB Objects

```
alaProtocolOspf  
  alaOspfDefaultOriginate  
  alaOspfDefaultOriginateMetricType  
  alaOspfDefaultOriginateMetric
```

---

## ip ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

**ip ospf route-tag** *tag*

---

### Syntax Definitions

*tag* The set tag value. The valid range is 0–2,147,483,647.

### Defaults

parameter	default
<i>tag</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

### Example

```
-> ip ospf route-tag 2
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

### MIB Objects

alaProtocolOspf  
alaOspfRedistRouteTag

---

## ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

**ip ospf spf-timer** [**delay** *delay\_seconds*] [**hold** *hold\_seconds*]

---

### Syntax Definitions

*delay\_seconds* Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.

*hold\_seconds* Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

### Defaults

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

### Example

```
-> ip ospf spf-timer delay 20 hold 35
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**show ip ospf**

Displays the OSPF status and general configuration parameters.

## MIB Objects

alaProtocolOspf

    alaOspfTimerSpfDelay

    alaOspfTimerSpfHold

---

## ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

```
ip ospf virtual-link area_id router_id [auth-type {none | simple | md5}] [auth-key key_string]  
[dead-interval seconds] [hello-interval seconds] [retrans-interval seconds] [transit-delay seconds]
```

```
no ip ospf virtual-link area_id router_id
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>none</b>	Sets the virtual link authorization type to no authentication.
<b>simple</b>	Sets the virtual link authorization type to simple authentication. If <b>simple</b> is selected, a key must be specified as well.
<b>md5</b>	Sets the virtual link authorization type to MD5 authentication.
<i>key_string</i>	Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
<b>dead-interval</b> <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
<b>hello-interval</b> <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
<b>retrans-interval</b> <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
<b>transit-delay</b> <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

## Defaults

parameter	default
<b>none</b>   <b>simple</b>   <b>md5</b>	<b>none</b>
<i>key_string</i>	null string
<b>dead-interval</b> <i>seconds</i>	40
<b>hello-interval</b> <i>seconds</i>	10
<b>retrans-interval</b> <i>seconds</i>	5
<b>transit-delay</b> <i>seconds</i>	1

## Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

## Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**show ip ospf virtual-link**      Displays the virtual link information.

## MIB Objects

```
ospfVirtIfTable  
  ospfVirtIfAreaId  
  ospfVirtIfNeighbor  
  ospfVirtIfAuthKey  
  ospfVirtIfStatus  
  ospfVirtIfAuthType  
  ospfVirtIfRtrDeadInterval  
  ospfVirtIfHelloInterval  
  ospfVirtIfRetransInterval  
  ospfVirtIfTransitDelay
```

---

## ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

**ip ospf neighbor** *neighbor\_id* {**eligible** | **non-eligible**}

**no ip ospf neighbor** *neighbor\_id*

---

### Syntax Definitions

*neighbor\_id* A unique 32-bit IP address identical to the neighbor's interface address.

**eligible** Sets this router as eligible to be the DR.

**non-eligible** Sets this router as not eligible to be the DR.

### Defaults

parameter	default
<b>eligible</b>   <b>non-eligible</b>	<b>eligible</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

### Examples

```
-> ip ospf neighbor 1.1.1.1 non-eligible
-> no ip ospf neighbor 1.1.1.1
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[ip ospf interface type](#)

Configures the OSPF interface type.

[show ip ospf neighbor](#)

Displays information on OSPF non-virtual neighbor routers.

## MIB Objects

ospfNbrTable

ospfNbrPriority

ospfNbmaNbrStatus

---

## ip ospf area

Assigns an OSPF interface to a specified area.

**ip ospf area** *area\_id* [summary {enable | disable}] | [type {normal | stub | nssa}]

**no ip ospf area** *area\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>enable</b>	Enables summarization.
<b>disable</b>	Disables summarization.
<b>normal</b>	Sets the area as a regular OSPF area.
<b>stub</b>	Configures an OSPF area as a stub area.
<b>nssa</b>	Configures an OSPF area as a Not So Stubby Area (NSSA)

### Defaults

parameter	default
enable   disable	enable
normal   stub   nssa	normal

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.

### Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip ospf area default-metric</b>	Creates or deletes an OSPF default metric.
<b>ip ospf area range</b>	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
<b>show ip ospf area</b>	Displays either all OSPF areas, or a specified OSPF area.

## MIB Objects

```
ospfAreaTable  
  ospfImportAsExtern  
  ospfAreaSummary  
  ospfAreaId
```

---

## ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

**ip ospf area *area\_id* default-metric *tos* [[cost *cost*] | [type {ospf | type 1 | type 2}]]**

**no ip ospf area *area\_id* default-metric *tos***

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>tos</i>	Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>cost</i>	The numerical cost of this area and ToS. Only 0 is supported in the current release.
<b>ospf</b>	Advertises external routes as OSPF autonomous system external (ASE) routes.
<b>type1</b>	Advertises external routes as a Type 1 (non-OSPF) metric.
<b>type2</b>	Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

### Defaults

parameter	default
<i>tos</i>	0
<b>ospf   type 1   type 2</b>	<b>ospf</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS. To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

### Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">ip ospf area</a>	Creates or deletes an OSPF area.
<a href="#">ip ospf area range</a>	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
<a href="#">show ip ospf area</a>	Displays either all OSPF areas, or a specified OSPF area.

## MIB Objects

```
ospfStubAreaTable  
  ospfStubAreaId  
  ospfStubTOS  
  ospfStubStatus  
  ospfStubMetric  
  ospfStubMetricType
```

---

## ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

```
ip ospf area area_id range {summary | nssa} ip_address subnet_mask
[effect {admatching | noMatching}]
```

```
no ip ospf area area_id range {summary | nssa} ip_address subnet_mask
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>summary</b>	Advertises the address range as a summary link state advertisement (LSA).
<b>nssa</b>	Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement.
<i>ip_address</i>	A 32-bit IP address for the range's area.
<i>subnet_mask</i>	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
<b>admatching</b>	Determines that routes specified falling within the specified range will be advertised.
<b>noMatching</b>	Determines that any route falling within the specified range will not be advertised.

### Defaults

parameter	default
summary   nssa	summary
admatching   noMatching	admatching

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.

- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.
- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

## Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0  
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">ip ospf area</a>	Creates or deletes an OSPF area.
<a href="#">ip ospf area default-metric</a>	Creates or deletes an OSPF default metric.
<a href="#">show ip ospf area range</a>	Displays all or specified route summaries in a given area.

## MIB Objects

```
ospfAreaAggregateTable  
  ospfAreaAggregateAreaId  
  ospfAreaAggregateLsdbType  
  ospfAreaAggregateNet  
  ospfAreaAggregateMask  
  ospfAreaAggregateEffect  
  ospfAreaAggregateStatus
```

---

## ip ospf interface

Creates and deletes an OSPF interface.

**ip ospf interface** {*interface\_name*}

**no ip ospf interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

### Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

**show ip ospf interface**                      Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfTable
  ospfIfIpAddress
alaOspfIfAugTable
  alaOspfIfIntfName
```

---

## ip ospf interface status

Enables or disables the administrative status on an OSPF interface.

**ip ospf interface** {*interface\_name*} **status** {**enable** | **disable**}

**no ip ospf interface** {*interface\_name*} **status** {**enable** | **disable**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>enable</b>	Enables the OSPF interface.
<b>disable</b>	Disables the OSPF interface.

### Defaults

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

### Examples

```
-> ip ospf interface vlan-101 status enable
-> ip ospf interface vlan-101 status disable
-> no ip ospf interface vlan-101 status enable
-> no ip ospf interface vlan-101 status disable
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

**show ip ospf interface** Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfAdminStat

---

---

## ip ospf interface area

Configures an OSPF area identifier for this interface.

```
ip ospf interface {interface_name} area area_id
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>area_id</i>	A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

An interface must be assigned to an area to become operational.

### Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

<a href="#">show ip ospf area</a>	Displays either all the OSPF areas, or a specified OSPF area.
<a href="#">show ip ospf interface</a>	Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfAreaId

---

## ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

```
ip ospf interface {interface_name} auth-key key_string
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_string</i>	An authentication key (8 characters maximum).

### Defaults

The default for the authentication key string is a null string.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on [page 22-30](#), set to **simple**.

### Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

<a href="#">ip ospf interface auth-type</a>	Sets the authentication type.
<a href="#">show ip ospf interface</a>	Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfTable  
  ospfIfAuthKey
```

---

## ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

**ip ospf interface** {*interface\_name*} **auth-type** [**none** | **simple** | **md5**]

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>none</b>	No authentication.
<b>simple</b>	Simple, clear text authentication.
<b>md5</b>	MD5 encrypted authentication.

### Defaults

parameter	default
<b>none</b>   <b>simple</b>   <b>md5</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on [page 22-29](#).
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conjunction with the commands described on [page 22-34](#) and [page 22-36](#). One command enables MD5 and the other sets the key identification number.

### Examples

```
-> ip ospf interface vlan-101 auth-type simple
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

**ip ospf interface auth-key**  
**show ip ospf interface**

ospfIfAuthType

---

## ip ospf interface dead-interval

Configures the OSPF interface dead interval.

**ip ospf interface** {*interface\_name*} **dead-interval** *seconds*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                                The dead interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multi-point)	120

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

### Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[ip ospf interface hello-interval](#)    Configures the OSPF interface hello interval.

[show ip ospf interface](#)                Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfTable
  ospfIfRtrDeadInterval
```

---

## ip ospf interface hello-interval

Configures the OSPF interface hello interval.

```
ip ospf interface {interface_name} hello-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The hello interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multi-point)	30

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

### Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfHelloInterval

---

## ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

**ip ospf interface** {*interface\_name*} **md5** *key\_id* [**enable** | **disable**]

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_id</i>	A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
<b>enable</b>	Enables the interface key.
<b>disable</b>	Disables the interface key.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on [page 22-30](#) and [page 22-36](#).
- The **no** variant deletes the key ID number.

### Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

<a href="#">ip ospf interface auth-type</a>	Sets the OSPF interface authentication type.
<a href="#">ip ospf interface md5 key</a>	Configures the OSPF key ID and key.

## MIB Objects

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId
```

---

## ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

```
ip ospf interface {interface_name} md5 key_id key key_string
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_id</i>	The key ID. The valid range is 1–255.
<i>key_string</i>	A key string.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used in conjunction with the commands described above on [page 22-30](#) and [page 22-34](#).
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

### Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

<a href="#">ip ospf interface auth-type</a>	Sets the OSPF interface authentication type.
<a href="#">ip ospf interface md5</a>	Creates and deletes the OSPF interface MD5 key identification number.

  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId  
  alaOspfIfMd5Key
```

---

## ip ospf interface type

Configures the OSPF interface type.

**ip ospf interface** {*interface\_name*} **type** {**point-to-point** | **point-to-multipoint** | **broadcast** | **non-broadcast**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>point-to-point</b>	Sets the interface to be a point-to-point OSPF interface.
<b>point-to-multipoint</b>	Sets the interface to be a point-to-multipoint OSPF interface.
<b>broadcast</b>	Sets the interface to be a broadcast OSPF interface.
<b>non-broadcast</b>	Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

### Defaults

parameter	default
<b>broadcast</b>   <b>non-broadcast</b>   <b>point-to-point</b>   <b>point-to-multipoint</b>	<b>broadcast</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

### Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

## Related Commands

## MIB Objects

ospfIfTable  
ospfIfType

---

## ip ospf interface cost

Configures the OSPF interface cost.

```
ip ospf interface {interface_name} cost cost
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*cost* The interface cost. The valid range is 0 to 65535.

### Defaults

parameter	default
<i>cost</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

### Examples

```
-> ip ospf interface vlan-101 cost 10
```

### Release History

Release 6.1; command was introduced.  
Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfMetricTable  
  ospfIfMetricIpAddress  
  ospfIfMetricValue
```

---

## ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

**ip ospf interface** {*interface\_name*} **poll-interval** *seconds*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The poll interval, in seconds. The valid range is 1–2147483647.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

### Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[show ip ospf interface](#)                      Displays the status and statistics of an OSPF interface.

### MIB Objects

  ospfIfPollInterval

---

## ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

```
ip ospf interface {interface_name} priority priority
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*priority*                              The interface priority. The valid range is 0–255.

### Defaults

parameter	default
<i>priority</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

### Examples

```
-> ip ospf interface vlan-101 priority 100
```

### Release History

Release 6.1; command was introduced.  
Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

## ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

**ip ospf interface** {*interface\_name*} **retrans-interval** *seconds*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The retransmit interval, in seconds. The valid range 0–3600.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

### Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[show ip ospf interface](#)                      Displays the status and statistics of an OSPF interface.

### MIB Objects

## ip ospf interface transit-delay

Configures the OSPF interface transit delay.

```
ip ospf interface {interface_name} transit-delay seconds
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The transit delay, in seconds. The valid range is 0–3600.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

### Release History

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

### Related Commands

[show ip ospf interface](#)                      Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfTransitDelay

---

## ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

**ip ospf restart-support {planned-unplanned | planned-only}**

**no ip ospf restart-support**

---

### Syntax Definitions

**planned-unplanned** Specifies support for planned and unplanned restarts.

**planned-only** This parameter is currently not supported.

### Defaults

Graceful restart is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch 6850 Series switches, a graceful restart is supported only on active ports (i.e., interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

### Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show ip ospf restart** Displays the OSPF graceful restart related configuration and status.

### MIB Objects

```
alaProtocolOspf
  alaOspfRestartSupport
```

---

## ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

**ip ospf restart-interval** [*seconds*]

---

### Syntax Definitions

*seconds*                                      The hitless restart timeout interval, in seconds. The valid range is 0–1800.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch 6850 switches, a graceful restart is supported only on active ports (i.e., interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

### Example

```
-> ip ospf restart-interval 600
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- [ip ospf restart-support](#)                      Administratively enables and disables support for the graceful restart feature on an OSPF router.
- [show ip ospf restart](#)                         Displays the OSPF graceful restart related configuration and status.

### MIB Objects

```

---

## ip ospf restart-helper status

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

**ip ospf restart-helper [status {enable | disable}]**

---

### Syntax Definitions

<b>enable</b>	Enables the capability of an OSPF router to operate in helper mode.
<b>disable</b>	Disables the capability of an OSPF router to operate in helper mode.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch 6850 switches, a graceful restart is supported only on active ports (i.e., interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

### Examples

```
-> ip ospf restart-helper status disable
-> ip ospf restart-helper status enable
```

### Release History

Release 6.1; command was introduced.

## ip ospf restart-helper strict-lsa-checking status

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

**ip ospf restart-helper strict-lsa-checking status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.
<b>disable</b>	Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch 6850 switches, a graceful restart is supported only on active ports (i.e., interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display the general configuration parameters of the OSPF router.
- See the Related Commands section below to modify the displayed parameters.

### Examples

-> show ip ospf

```

Router Id                = 10.255.11.242,
OSPF Version Number     = 2,
Admin Status            = Enabled,
Area Border Router?    = No,
AS Border Router Status = Disabled,
Route Tag               = 0,
SPF Hold Time (in seconds) = 10,
SPF Delay Time (in seconds) = 5,
MTU Checking           = Disabled,
# of Routes            = 0,
# of AS-External LSAs  = 0,
# of self-originated LSAs = 0,
# of LSAs received     = 0,
External LSDB Limit    = -1,
Exit Overflow Interval = 0,
# of SPF calculations done = 0,
# of Incr SPF calculations done = 0,
# of Init State Nbrs   = 0,
# of 2-Way State Nbrs  = 0,
# of Exchange State Nbrs = 0,
# of Full State Nbrs   = 0,
# of attached areas    = 1,
# of Active areas      = 0,
# of Transit areas     = 0,
# of attached NSSAs    = 0

```

*output definitions*

---

<b>Router Id</b>	The unique identification for the router.
<b>OSPF Version Number</b>	The version of OSPF the router is running.
<b>Admin Status</b>	Whether OSPF is currently enabled or disabled on the router.
<b>Area Border Router?</b>	Whether the router status is an area router or not.
<b>AS Border Router Status</b>	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
<b>Route Tag</b>	Shows the route tag for this router.
<b>SPF Hold Time</b>	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
<b>SPF Delay Time</b>	Shows the time in seconds between consecutive SPF calculations.
<b>MTU Checking</b>	Shows whether Maximum Transfer Unit checking is enabled or disabled. This is set using the <b>ip ospf mtu-checking</b> command.
<b># of routes</b>	The total number of OSPF routes known to this router.
<b># of AS-External LSAs</b>	The number of external routes learned from outside the router's Autonomous System (AS).
<b># of self-originated LSAs</b>	The number of times a new Link State Advertisement has been sent from this router.
<b># of LSAs received</b>	The number of times a new Link State Advertisement has been received by this router.
<b>External LSDB Limit</b>	The maximum number of entries allowed in the external Link State Database.
<b>Exit Overflow Interval</b>	The number of seconds the router remains in the overflow state before attempting to leave it. This is set using the <b>ip ospf exit-overflow-interval</b> command.
<b># of SPF calculations done</b>	The number of SPF calculations that have occurred.
<b># of Incr SPF calculations done</b>	The number of incremental SPF calculations done.
<b># of Init State Nbrs</b>	The number of neighbors in the initialization state.
<b># of 2-Way State Nbrs</b>	The number of OSPF 2-way state neighbors on this router.
<b># of Exchange State Nbrs</b>	The number of neighbors in the exchange state.
<b># of Full State Nbrs</b>	The number of neighbors in the full state.
<b># of attached areas</b>	The number of areas that are configured on the router.
<b># of Active areas</b>	The number of areas that are active.
<b># of Transit areas</b>	The number of transit areas that are configured on the router.
<b># of attached NSSAs</b>	The number of Not So Stubby Areas that are configured on the router.

---

**Release History**

Release 6.1; command was introduced.

---

## Related Commands

<b>ip ospf status</b>	Enables or disables the administration of OSPF on the router.
<b>ip ospf mtu-checking</b>	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
<b>ip ospf spf-timer</b>	Configures timers for SPF calculation.
<b>ip ospf extlsdb-limit</b>	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
<b>ip ospf exit-overflow-interval</b>	This command sets the overflow interval value.
<b>ip ospf route-tag</b>	Configures a tag value for Autonomous System External (ASE) routes created.
<b>ip router router-id</b>	Configures the router ID for the router.

## show ip ospf border-routers

Displays information regarding all or specified border routers.

**show ip ospf border-routers** [*area\_id*] [*router\_id*] [*tos*] [*gateway*]

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<i>tos</i>	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>gateway</i>	The 32-bit IP address of the gateway for the border router being displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

### Examples

```
-> show ip ospf border-routers 10.0.0.0
```

Router Id	Area Id	Gateway	TOS	Metric
10.0.0.0	1.0.0.1	143.209.92.71	1	1

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area ID</b>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>Gateway</b>	The next hop interface on which the border router has been learned.
<b>ToS</b>	The Type of Service. Only ToS value 0 is supported at this time.
<b>Metric</b>	The cost to the border router.

---

## show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

```
show ip ospf ext-lsdb [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

*ls\_id*

The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.

*router\_id*

The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf ext-lsdb
```

LS Id	Orig Router-Id	SeqNo	Age	Protocol
198.168.100.100	198.168.100.100	10	100	STATIC

#### output definitions

---

<b>LS Id</b>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<b>Orig Router-Id</b>	The router ID of the router that originated the external LSDB.
<b>SeqNo</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
<b>Protocol</b>	The type of protocol, if any.

---

## Release History

Release 6.1; command was introduced.

## show ip ospf host

Displays information on the configured OSPF hosts.

```
show ip ospf host [ip_address]
```

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf host 172.22.2.115
```

Host Address	TOS	Metric	Status	AreaId
143.209.92.12	1	0	Up	0.0.0.0

#### *output definitions*

---

<b>Host Address</b>	A 32-bit IP address for a directly attached host. This can be set using the <b>ip ospf host</b> command.
<b>ToS</b>	The Type of Service traffic from the host is labeled as. ToS is set using the <b>ip ospf host</b> command.
<b>Metric</b>	The metric assigned to the host. Metric is set using the <b>ip ospf host</b> command.
<b>Status</b>	Whether the host is enabled or disabled.
<b>AreaId</b>	The area identification for the host's area.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip ospf host**

Creates and deletes an OSPF entry for directly attached hosts.

---

## show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

```
show ip ospf lsdb [area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>rtr</b>	Specifies router LSAs.
<b>net</b>	Specifies network LSAs.
<b>netsum</b>	Specifies network summary LSAs.
<b>asbrsum</b>	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

### Examples

```
-> show ip ospf lsdb
  Area Id      Type      LS Id      Orig Router-Id  SeqNo      Age
-----+-----+-----+-----+-----+-----
0.0.0.1      OSPF      198.168.100.100  198.168.100.100  1          100
```

#### *output definitions*

---

<b>Area Id</b>	The area identification for the area to which the record belongs.
<b>Type</b>	The protocol type from where the route was learned.
<b>LS Id</b>	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.

---

*output definitions (continued)*

---

<b>Orig Router-Id</b>	The router ID of the router that originated the external LSDB.
<b>SeqNo</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

---

Last Restart Helper Exit Reason = None

```

### *output definitions*

---

<b>Neighbor's IP Address</b>	The IP address of the neighbor.
<b>Neighbor's Router Id</b>	The identification number for the selected host's record. It is most often the router's IP address.
<b>Neighbor's Area Id</b>	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
<b>Neighbor's DR Address</b>	The address of the neighbors Designated Router.
<b>Neighbor's BDR Address</b>	The address of the neighbors Backup Designated Router.
<b>Neighbor's Priority</b>	The priority value for this neighbor becoming the DR.
<b>Neighbor's State</b>	The condition of the OSPF neighbor's state machine.
<b>Hello Suppressed</b>	Whether sending hello messages to this neighbor is suppressed.
<b>Neighbor's type</b>	What type of neighbor this is, either dynamic or static.
<b>DR Eligible</b>	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as <b>No</b> . Otherwise, if configured as Eligible (the default), it shows up as <b>Yes</b> .
<b># of State Events</b>	The number of state events restricted for this neighbor and the local router.
<b>Mode</b>	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>MD5 Sequence Number</b>	The sequence number of the MD5 authorization key.
<b>Time since Last Hello</b>	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
<b># of Outstanding LS Requests</b>	The number of Link State requests to this neighbor that have not received a response from this neighbor.
<b># of Outstanding LS Acknowledgements</b>	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.

*output definitions (continued)*

---

<b># of Outstanding LS Retransmissions</b>	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a hitless restart helper for the neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[ip ospf neighbor](#) Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

```

---

## show ip ospf routes

Displays the OSPF routes known to the router.

**show ip ospf routes** [*ip\_addr mask tos gateway*]

---

### Syntax Definitions

<i>ip_addr</i>	The 32-bit IP address of the route destination in dotted decimal format.
<i>mask</i>	The IP subnet mask of the route destination.
<i>tos</i>	The Type of Service of the route.
<i>gateway</i>	The next hop IP address for this router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

-> show ip ospf routes

Destination/Mask	Gateway	Metric	Vlan	Type
-----+-----+-----+-----+-----				
198.168.100.100	195.5.2.8	0	5	AS-Ext

#### output definitions

---

<b>Destination/Mask</b>	The destination address of the route. This can also display the destination IP address mask if it is known.
<b>Gateway</b>	The gateway address of the route.
<b>Metric</b>	The cost of the route.
<b>Vlan</b>	The VLAN number on which the gateway can be routed.
<b>Type</b>	The type of OSPF route.

---

### Release History

Release 6.1; command was introduced.

---

## show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router via a virtual link rather than a physical one.

```
show ip ospf virtual-neighbor area_id router_id
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies the configured OSPF area in the AS.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1
```

AreaId	RouterId	Priority	Events	RxmtQlen	LastHello	State
0.0.0.0	10.0.0.1	1	10	100	323	INIT

### output definitions

---

<b>AreaId</b>	The area identification for the area of which the virtual neighbor is a part.
<b>RouterId</b>	The router identification of the virtual neighbor.
<b>Priority</b>	The number used to determine whether the virtual neighbor will become the designated router for its area.
<b>Events</b>	The number of OSPF control message sent by the neighbor to the router.
<b>RxmtQlen</b>	The length (in number of packets) of the retransmit queue.
<b>LastHello</b>	The last Hello message sent by the neighbor
<b>State</b>	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

---

```

-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254

Last Restart Helper Exit Reason = None

```

### *output definitions*

---

<b>Neighbor's IP Address</b>	The IP address of the virtual neighbor.
<b>Neighbor's Router Id</b>	The identification number for the selected host's record. It is most often the router's IP address.
<b>Neighbor's Area Id</b>	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
<b>Neighbor's DR Address</b>	The address of the virtual neighbor's Designated Router.
<b>Neighbor's BDR Address</b>	The address of the virtual neighbor's Backup Designated Router.
<b>Neighbor's Priority</b>	The priority value for this virtual neighbor becoming the DR.
<b>Neighbor's State</b>	The condition of the OSPF virtual neighbor's state machine.
<b>Hello Suppressed</b>	Whether sending hello messages to this virtual neighbor is suppressed.
<b>Neighbor's type</b>	What type of virtual neighbor this is, either dynamic or static.
<b>DR Eligible</b>	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as <b>No</b> . Otherwise, if configured as Eligible (the default), it shows up as <b>Yes</b> .
<b># of State Events</b>	The number of state events restricted for this virtual neighbor and the local router.
<b>Mode</b>	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>MD5 Sequence Number</b>	The sequence number of the MD5 authorization key.
<b>Time since Last Hello</b>	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
<b>Last DD I_M_MS</b>	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

*output definitions (continued)*

---

<b># of Outstanding LS Requests</b>	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
<b># of Outstanding LS Acknowledgements</b>	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
<b># of Outstanding LS Retransmissions</b>	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

## show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

**show ip ospf area** [*area\_id*]

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ip ospf area
```

Area Id	AdminStatus	Type	OperStatus
1.1.1.1	disabled	normal	down
0.0.0.1	disabled	normal	down

```
-> show ip ospf area 0.0.0.0
```

```
Area Identifier          = 1.1.1.1,
Admin Status            = Disabled,
Operational Status     = Down,
Area Type               = normal,
Area Summary            = Enabled,
Time since last SPF Run = 00h:00m:27s,
# of Area Border Routers known = 0,
# of AS Border Routers known = 0,
# of LSAs in area      = 0,
# of SPF Calculations done = 0,
# of Incremental SPF Calculations done = 0,
# of Neighbors in Init State = 0,
# of Neighbors in 2-Way State = 0,
# of Neighbors in Exchange State = 0,
# of Neighbors in Full State = 0,
# of Interfaces attached = 0
Attached Interfaces     = vlan-213
```

*output definitions*

---

<b>Area Identifier</b>	The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS.
<b>Admin Status</b>	Whether the area is enabled or disabled.
<b>Operational Status</b>	Whether the area is active.
<b>Area Type</b>	The area type. This field will be <b>normal</b> , <b>stub</b> , or <b>NSSA</b> .
<b>Area Summary</b>	Whether Area Summary is enabled or disabled.
<b>Time since last SPF Run</b>	The last time the Shortest Path First calculation was performed.
<b># of Area Border Routers known</b>	The number of Area Border Routers in the area.
<b># of AS Border Routers known</b>	The number of Autonomous System Border Routers in the area.
<b># of LSAs</b>	The total number of Link State Advertisements for the Area.
<b># of SPF Calculations</b>	The number of times the area has calculated the Shortest Path.
<b># of Incremental SPF Calculations</b>	The number of incremental Shortest Path First calculations that have been performed in the area.
<b># of Neighbors in Init State</b>	The number of OSPF neighbors that are in initialization.
<b># of Neighbors in 2-Way State</b>	The number of OSPF 2-way state neighbors in this area.
<b># of Neighbors in Exchange State</b>	The number of OSPF neighbors that are currently establishing their status.
<b># of Neighbors in Full State</b>	The number of OSPF neighbors.
<b># of Interfaces attached</b>	The number of OSPF interfaces.
<b>Attached Interfaces</b>	The names of the OSPF interfaces attached to this area.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>ip ospf area</b>	Creates or deletes an OSPF area, assigning default metric, cost, and type.
<b>ip ospf area range</b>	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
<b>show ip ospf interface</b>	Displays OSPF interface information.

---

## show ip ospf area range

Displays all or specified route summaries in a given area.

```
show ip ospf area area_id range [{summary | nssa} ip_address ip_mask]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>summary</b>	Specifies that routes are summarized.
<b>nssa</b>	Specifies the Not So Stubby Area (NSSA) routers are summarized.
<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ip ospf area 0.0.0.0 range
```

AreaId	Type	Destination	Advertise
0.0.0.0	Summary	192.168.12.1/24	Matching
0.0.0.0	NSSA	143.209.92.71/24	noMatching

#### *output definitions*

---

<b>AreaId</b>	The area identification for the area range.
<b>Type</b>	The type of area the range is associated with.
<b>Destination</b>	The destination address of the range.
<b>Advertise</b>	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### **ip ospf area range**

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

## MIB Objects

```

---

## show ip ospf area stub

Displays stub default area metrics, if configured.

**show ip ospf area *area\_id* stub**

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip ospf area 0.0.0.1 stub
```

```

      Area Id      TOS      Metric      MetricType
-----+-----+-----+-----
0.0.0.1          1          1          ospf

```

#### *output definitions*

---

<b>Area Id</b>	The identification number of the stub area.
<b>TOS</b>	The Type of Service assignment.
<b>Metric</b>	The metric assignment of the default router in the stub area.
<b>MetricType</b>	The metric type of the stub area. It will be either <b>ospf</b> , <b>type1</b> , or <b>type2</b> .

---

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip ospf area** Creates or deletes an OSPF area.

## **MIB Objects**

  ospfStubMetricType
```

---

## show ip ospf interface

Displays OSPF interface information.

**show ip ospf interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

### Examples

No interface name is specified:

```
-> show ip ospf interface
```

Interface Name	DR Address	Backup DR Address	Admin Status	Oper Status	State
vlan-213	213.10.10.1	213.10.10.254	enabled	up	DR
vlan-215	215.10.10.254	215.10.10.1	enabled	up	BDR

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface.
<b>DR Address</b>	The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See <a href="#">Chapter 5, “VLAN Management Commands,”</a> for more information.)
<b>Backup DR Address</b>	The IP address of the backup designated router.
<b>Vlan</b>	The VLAN to which the interface is assigned.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Oper Status</b>	Whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .

---

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                     = 3,
Interface IP Address        = 100.10.10.2,
Interface IP Mask           = 255.255.255.0,
Admin Status                = Enabled,
Operational Status         = Up,
OSPF Interface State       = BDR,
Interface Type              = Broadcast,
Area Id                     = 0.0.0.2,
Designated Router IP Address = 100.10.10.88,
Designated Router RouterId  = 100.10.10.88,
Backup Designated Router IP Address = 100.10.10.2,
Backup Designated Router RouterId = 192.169.1.2,
MTU (bytes)                 = 1500,
Metric Cost                 = 1,
Priority                     = 1,
Hello Interval (seconds)    = 10,
Transit Delay (seconds)     = 1,
Retrans Interval (seconds)  = 5,
Dead Interval (seconds)     = 40,
Poll Interval (seconds)     = 120,
Link Type                   = Broadcast,
Authentication Type         = md5,
#  Id  Key  Status  StartAccept  StopAccept  StartGen  StopGen
---+---+---+-----+-----+-----+-----+
1  1    Set  Enabled    0           0           0           0
# of Events                  = 2,
# of Init State Neighbors   = 0,
# of 2-Way State Neighbors  = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors   = 1
```

---

**Note.** See the table of the following page for output definitions.

---

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                     = 3,
Interface IP Address        = 100.10.10.2,
Interface IP Mask           = 255.255.255.0,
Admin Status                = Enabled,
Operational Status         = Up,
OSPF Interface State       = DR,
Interface Type              = Broadcast,
Area Id                     = 0.0.0.2,
Designated Router IP Address = 100.10.10.2,
Designated Router RouterId  = 192.169.1.2,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes)                 = 1500,
Metric Cost                 = 1,
Priority                     = 1,
Hello Interval (seconds)    = 10,
Transit Delay (seconds)     = 1,
Retrans Interval (seconds)  = 5,
Dead Interval (seconds)     = 40,
Poll Interval (seconds)     = 120,
Link Type                   = Broadcast,
Authentication Type         = simple,
Authentication Key          = Set,
# of Events                 = 3,
# of Init State Neighbors   = 0,
# of Exchange State Neighbors = 0,
# of 2-Way State Neighbors  = 0,
# of Full State Neighbors   = 0
```

Output fields when an interface name is specified are described below:

#### *output definitions*

<b>Interface IP Name</b>	The name of the IP interface to which the OSPF interface is assigned.
<b>VLAN Id</b>	The VLAN to which the interface is assigned.
<b>Interface IP Address</b>	The IP address assigned to the interface.
<b>Interface IP Mask</b>	The IP mask associated with the IP address assigned to the interface.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Operational Status</b>	Whether the interface is an active OSPF interface.
<b>OSPF Interface State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .
<b>Interface Type</b>	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
<b>Area Id</b>	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
<b>Designated Router IP Address</b>	The designated router IP address.
<b>Designated Router RouterId</b>	The identification number of the designated router.

*output definitions (continued)*

---

<b>Backup Designated Router IP Address</b>	The IP address of the backup designated router.
<b>Backup Designated Router RouterId</b>	The identification number of the backup designated router.
<b>MTU</b>	The Maximum Transfer Unit (in bytes) for the interface.
<b>Metric Cost</b>	The cost added to routes learned on this interface.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Hello Interval</b>	The number of seconds between hello messages sent out on the interface.
<b>Transit Delay</b>	The estimated number of seconds required to transmit a link state update over this interface.
<b>Retrans Interval</b>	The number of seconds the interface waits before resending hello messages.
<b>Dead Interval</b>	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
<b>Poll Interval</b>	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
<b>Link Type</b>	The IP interface type, either <b>broadcast</b> or <b>non broadcast</b> .
<b>Authentication Type</b>	The type of authentication used by this interface, either <b>none</b> , <b>simple</b> , or <b>md5</b> .
<b>#</b>	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)
<b>Id</b>	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
<b>Key</b>	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
<b>Status</b>	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
<b>StartAccept</b>	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
<b>StopAccept</b>	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
<b>StartGen</b>	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
<b>StopGen</b>	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
<b>Authentication Key</b>	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
<b># of Events</b>	The number of interface state machine events.
<b># of Init State Neighbors</b>	The number of OSPF neighbors in the initialization state.

*output definitions (continued)*

---

<b># of 2-Way State Neighbors</b>	The number of OSPF 2-way state neighbors on this interface.
<b># of Exchange State Neighbors</b>	The number of OSPF neighbors in the exchange state.
<b># of Full State Neighbors</b>	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.

---

**Release History**

Release 6.1; command was introduced.

Release 6.2.1; *ip\_address* parameter deprecated.

**Related Commands**

<b>ip ospf interface</b>	Creates and deletes an OSPF interface.
<b>ip ospf interface auth-key</b>	Configures an OSPF authentication key for simple authentication on an interface.
<b>ip ospf interface dead-interval</b>	Configures the OSPF interface dead interval.
<b>ip ospf interface hello-interval</b>	Configures the OSPF interface hello interval.
<b>ip ospf interface md5</b>	Creates and deletes the OSPF interface MD5 key identification number.
<b>ip ospf interface md5 key</b>	Configures the OSPF key string.
<b>ip ospf interface cost</b>	Configures the OSPF interface cost.
<b>ip ospf interface poll-interval</b>	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
<b>ip ospf interface priority</b>	Configures the OSPF interface priority.
<b>ip ospf interface retrans-interval</b>	Configures the OSPF interface retransmit interval.
<b>ip ospf interface transit-delay</b>	Configures the OSPF interface transit delay.
<b>ip ospf interface auth-type</b>	Sets the OSPF interface authentication type.
<b>ip ospf interface area</b>	Configures an OSPF interface area.
<b>ip ospf interface type</b>	Configures the OSPF interface type.
<b>ip ospf interface status</b>	Enables or disables the administration status on an OSPF interface.

---

## show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

```
show ip ospf restart
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch stackable switches, a graceful restart is supported only on active ports (i.e., interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

### Examples

```
-> show ip ospf restart
Restart Support                = Enabled,
Restart Interval (in seconds)  = 120,
Restart Status                 = Not Restarting,
Restart Age (in seconds)       = 0,
Last Restart Exit Reason       = None,
Restart Helper Support         = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Mode            = NotHelping
```

### *output definitions*

---

<b>Restart Support</b>	The administrative status of OSPF graceful restart, which can be <b>Enabled</b> or <b>Disabled</b> .
<b>Restart Interval</b>	The configured OSPF hitless restart timeout interval, in seconds. Use the <b>ip ospf restart-interval</b> command to modify this parameter.
<b>Restart Status</b>	The current status of OSPF graceful restart, which can be <b>Not Restarting</b> , <b>Unplanned Restart</b> (after a CMM takeover), or <b>Planned Restart</b> (before CMM takeover).
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF graceful restart interval.

*output definitions (continued)*

---

<b>Last Restart Exit Reason</b>	The outcome of the last attempt at a graceful restart. If the value is <b>None</b> , then no restart has yet been attempted. If the value is <b>In Progress</b> , then a restart attempt is currently underway. Other possible values include <b>Completed</b> (successfully completed), <b>Timed Out</b> (timed out), and <b>Topology Changed</b> (aborted due to topology change).
<b>Restart Helper Support</b>	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be <b>Enabled</b> or <b>Disabled</b> . Use the <a href="#">ip ospf restart-helper status</a> command to modify this parameter.
<b>Restart Helper Strict Checking</b>	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be <b>Enabled</b> or <b>Disabled</b> . Use the <a href="#">ip ospf restart-helper strict-lsa-checking status</a> command to modify this parameter.
<b>Restart Helper Mode</b>	Whether this OSPF router is operating as a helper to a restarting router.

---

# 23 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

---

**Note.** OSPFv3 is supported only on OmniSwitch 6850 Series, OmniSwitch 6855, OmniSwitch 6850E Series, and 9000E switches.

---

Alcatel-Lucent's version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

*Filename:* AlcatelIND1DrcTm.mib  
*Module:* ALCATEL-IND1-DRCTM-MIB

*Filename:* AlcatelIND1Ospf3.mib  
*Module:* ALCATEL-IND1-OSPF3-MIB

*Filename:* IETF-OSPF-OSPFv3.MIB  
*Module:* OSPF-OSPFv3-MIB

---

The following is a list of the commands for configuring OSPFv3:

---

<b>Global OSPFv3 Commands</b>	<code>ipv6 ospf status</code> <code>ipv6 load ospf</code> <code>ipv6 ospf host</code> <code>ipv6 ospf mtu-checking</code> <code>ipv6 ospf route-tag</code> <code>ipv6 ospf spf-timer</code> <code>ipv6 ospf virtual-link</code> <code>show ipv6 ospf</code> <code>show ipv6 ospf border-routers</code> <code>show ipv6 ospf host</code> <code>show ipv6 ospf lsdb</code> <code>show ipv6 ospf neighbor</code> <code>show ipv6 ospf routes</code> <code>show ipv6 ospf virtual-link</code>
<b>OSPFv3 Area Commands</b>	<code>ipv6 ospf area</code> <code>show ipv6 ospf area</code>
<b>OSPFv3 Interface Commands</b>	<code>ipv6 ospf interface</code> <code>ipv6 ospf interface status</code> <code>ipv6 ospf interface area</code> <code>ipv6 ospf interface dead-interval</code> <code>ipv6 ospf interface hello-interval</code> <code>ipv6 ospf interface cost</code> <code>ipv6 ospf interface priority</code> <code>ipv6 ospf interface retrans-interval</code> <code>ipv6 ospf interface transit-delay</code> <code>show ipv6 ospf interface</code>

---

## ipv6 ospf status

Enables or disables the OSPFv3 administrative status for the router.

`ipv6 ospf status {enable | disable}`

---

### Syntax Definitions

<code>enable</code>	Enables OSPFv3.
<code>disable</code>	Disables OSPFv3.

### Defaults

parameter	default
<code>enable   disable</code>	<code>enable</code>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

### Examples

```
-> ipv6 ospf status enable
-> ipv6 ospf status disable
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf](#) Displays OSPFv3 status and general configuration parameters.

### MIB Objects

```
ospfv3GeneralGroup
  ospfv3AdminStat
```

---

## ipv6 load ospf

Loads the OSPFv3 software on the router.

**ipv6 load ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Example

```
-> ipv6 load ospf
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

N/A

### MIB Objects

ALADRCTMCONFIG

alaDrcTmIPOspf3Status

---

## ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

**ipv6 ospf host** *ipv6\_address* [**area** *area\_id*] [**metric** *metric*]

**no ipv6 ospf host** *ipv6\_address* **area** *area\_id*

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IP address of the OSPF host.
<i>area_id</i>	Area to which the host route belongs.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0–65535.

### Defaults

<b>parameter</b>	<b>default</b>
<i>metric</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

### Examples

```
-> ipv6 ospf host 2001::1/64 metric 10
-> no ipv6 ospf host 2001::1/64 metric 10
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf host](#) Displays information on the configured OSPFv3 hosts.

**MIB Objects**

ospfv3HostTable

ospfv3HostStatus

ospfv3HostAreaID

ospfv3HostAddress

ospfv3HostMetric

---

## ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

**ipv6 ospf mtu-checking**

**no ipv6 ospf mtu-checking**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

### Examples

```
-> ipv6 ospf mtu-checking  
-> no ipv6 ospf mtu-checking
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf](#) Displays the OSPFv3 status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf3  
  alaOspf3MTUCheck
```

---

## ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

**ipv6 ospf route-tag** *tag*

---

### Syntax Definitions

*tag* The set tag value. The valid range is 0–2, 147, 483, 647.

### Defaults

parameter	default
<i>tag</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

### Examples

```
-> ipv6 ospf route-tag 2
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf](#) Displays OSPFv3 status and general configuration parameters.

### MIB Objects

alaProtocolOspf3  
alaOspf3RedistRouteTag

---

## ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ipv6 ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

---

### Syntax Definitions

*delay\_seconds*

Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.

*hold\_seconds*

Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

### Defaults

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

### Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

### Release History

Release 6.1.3; command was introduced.

**Related Commands****show ipv6 ospf**

Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**

  alaOspf3TimerSpfDelay  
  alaOspf3TimerSpfHold
```

---

## ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

```
ipv6 ospf virtual-link area area_id router router_id
[dead-interval seconds] [hello-interval seconds] [retrans-interval seconds] [transit-delay seconds]
```

```
no ipv6 ospf virtual-link area area_id router router_id
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>dead-interval</b> <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
<b>hello-interval</b> <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
<b>retrans-interval</b> <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
<b>transit-delay</b> <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

### Defaults

parameter	default
<b>dead-interval</b> <i>seconds</i>	40
<b>hello-interval</b> <i>seconds</i>	10
<b>retrans-interval</b> <i>seconds</i>	5
<b>transit-delay</b> <i>seconds</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

## Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

## Release History

---

## ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

**ipv6 ospf area** *area\_id* [**type** {**normal** | **stub** [**default-metric** *metric*]}]

**no ipv6 ospf area** *area\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IPv4 address format.
<b>normal</b>	Sets the area as a regular OSPFv3 area.
<b>stub</b>	Configures an OSPFv3 area as a stub area.
<i>metric</i>	Defines the metric to be used for default routes injected into the stub.

### Defaults

---

parameter	default
<b>normal</b>   <b>stub</b>	<b>normal</b>

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub area.

### Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub
-> ipv6 ospf area 0.0.0.1 type normal
-> no ipv6 ospf area 0.0.0.1
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf area](#) Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

**MIB Objects**

```
ospfv3AreaTable

  ospfv3AreaId
```

---

## ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

**ipv6 ospf interface** *interface\_name*

**no ipv6 ospf interface** *interface\_name*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

### Examples

```
-> ipv6 ospf interface vlan-101  
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

**show ipv6 ospf interface**              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

ospfv3IfTable  
ospfv3IfIndex

---

## ipv6 ospf interface status

Enables or disables the administration status on an OSPFv3 interface.

**ipv6 ospf interface** *interface\_name* **status** {**enable** | **disable**}

**no ipv6 ospf interface** *interface\_name*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>enable</b>	Enables the OSPFv3 interface.
<b>disable</b>	Disables the OSPFv3 interface.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

### Examples

```
-> ipv6 ospf interface vlan-101 status enable
-> ipv6 ospf interface vlan-101 status disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

**show ipv6 ospf interface** Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfAdminStat
```

---

## ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

```
ipv6 ospf interface interface_name area area_id
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*area\_id*                              A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

An interface must be assigned to an area to become operational.

### Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf area](#)                      Displays either all the OSPFv3 areas, or a specified OSPFv3 area.

[show ipv6 ospf interface](#)                Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfAreaId
```

---

## ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

**ipv6 ospf interface** *interface\_name* **dead-interval** *seconds*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The dead interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multi-point)	120

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

### Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

[ipv6 ospf interface hello-interval](#)

Configures the OSPFv3 interface hello interval.

[show ipv6 ospf interface](#)

ospfv3IfIndex

ospfv3IfRtrDeadInterval

---

## ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

**ipv6 ospf interface** *interface\_name* **hello-interval** *seconds*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The hello interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multi-point)	30

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

### Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[ipv6 ospf interface dead-interval](#)                      Configures the OSPFv3 interface dead interval.

[show ipv6 ospf interface](#)                      Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfHelloInterval
```

---

## ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

```
ipv6 ospf interface interface_name cost cost
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*cost* The interface cost. The valid range is 0–65535.

### Defaults

parameter	default
<i>cost</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

### Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfMetricValue
```

---

## ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

**ip ospf interface** *interface\_name* **priority** *priority*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*priority*                              The interface priority. The valid range is 0–255.

### Defaults

parameter	default
<i>priority</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

### Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

ospfv3IfTable  
    ospfv3IfIndex  
    ospfv3IfRtrPriority

---

## ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

**ipv6 ospf interface** *interface\_name* **retrans-interval** *interval*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*interval*                              The retransmit interval, in seconds. The valid range 0–3600.

### Defaults

parameter	default
<i>interval</i>	5

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

### Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

**show ipv6 ospf interface**              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfRetransInterval
```

---

## ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

```
ipv6 ospf interface interface_name transit-delay delay
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*delay*                                The transit delay, in seconds. The valid range is 0–3600.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)            Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex

```

---

## show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

**show ipv6 ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display the general configuration parameters of the OSPFv3 router.
- See the Related Commands section below to modify the displayed parameters.

### Examples

```
-> show ipv6 ospf
```

```
Status = Enabled,
Router ID = 5.5.5.5,
# Areas = 2,
# Interfaces = 4,
Area Border Router = Yes,
AS Border Router = No,
External Route Tag = 0,
SPF Hold (seconds) = 10,
SPF Delay (seconds) = 5,
MTU checking = Enabled,
# SPF calculations performed = 3,
Last SPF run (seconds ago) = N/A,
# of neighbors that are in:
  Full state = 3,
  Loading state = 0,
  Exchange state = 0,
  Exstart state = 0,
  2way state = 0,
  Init state = 0,
  Attempt state = 0,
  Down state = 0,
```

*output definitions*

---

<b>Status</b>	Displays whether OSPFv3 is currently enabled or disabled on the router.
<b>Router Id</b>	The unique identification for the router.
<b># Areas</b>	Number of areas to which the router belongs.
<b># Interface</b>	Number of interfaces participating in OSPF
<b>Area Border Router</b>	Displays whether the router status is an area router or not.
<b>AS Border Router</b>	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
<b>External Route Tag</b>	Displays the route tag for this router.
<b>SPF Hold (seconds)</b>	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
<b>SPF Delay (seconds)</b>	Displays the time in seconds between consecutive SPF calculations.
<b>MTU Checking</b>	Displays whether Maximum Transfer Unit checking is enabled or disabled. This is set using the <b>ipv6 ospf mtu-checking</b> command.
<b># SPF calculations performed</b>	Displays the number of SPF calculation performed.
<b>Last SPF run (seconds ago)</b>	N/A
<b>Full state</b>	Displays the number of neighbor routers that are in Full state.
<b>Loading state</b>	Displays the number of neighbor routers that are in Loading state.
<b>Exchange state</b>	Displays the number of neighbor routers that are in Exchange state.
<b>Exstart state</b>	Displays the number of neighbor routers that are in Exstart state.
<b>2way state</b>	Displays the number of neighbor routers that are in 2way state.
<b>Init state</b>	Displays the number of neighbor routers that are in Init state.
<b>Attempt state</b>	Displays the number of neighbor routers that are in Attempt state.
<b>Down state</b>	Displays the number of neighbor routers that are in Down state.

---

**Release History**

Release 6.1.3; command was introduced.

## Related Commands

<b>ipv6 ospf status</b>	Enables or disables the administration of OSPFv3 on the router.
<b>ipv6 ospf mtu-checking</b>	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
<b>ipv6 ospf spf-timer</b>	Configures timers for SPF calculation.
<b>ipv6 ospf route-tag</b>	Configures a tag value for Autonomous System External (ASE) routes created.
<b>ip router router-id</b>	Configures the router ID for the router.

## MIB Objects

```

---

## show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

**show ipv6 ospf border-routers** [**area** *area\_id*] [**router** *router\_id*]

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

### Examples

```
-> show ipv6 ospf border-routers
```

```
Router ID          Area          Metric  Type
-----+-----+-----+-----
6.6.6.6            0.0.0.0        2      INTRA
6.6.6.6            0.0.0.1        2      INTRA
    fe80::2d0:95ff:fee2:6bda -> pseudo1
    fe80::2d0:95ff:fee2:6bda -> pseudo2
```

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area</b>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>Metric</b>	The metric used by the routes.
<b>Type</b>	The type of routes specified (intra or inter).

---

---

## show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

**show ipv6 ospf host** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      A 128-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

-> show ipv6 ospf host

```
Area           Metric   Address
-----+-----+-----
0.0.0.1        1       2001::1/64
```

#### *output definitions*

---

<b>Area</b>	A 32-bit IP address for a directly attached host. This can be set using the <b>ipv6 ospf host</b> command.
<b>Metric</b>	The metric assigned to the host. Metric is set using the <b>ipv6 ospf host</b> command.
<b>Address</b>	IPV6 address of the host.

---

### Release History

Release 6.1.3; command was introduced.

## Related Commands

[ipv6 ospf host](#)

Creates or deletes an OSPFv3 entry for directly attached hosts.

## MIB Objects

```
ospfv3HostTable  
  ospfv3HostIpAddress  
  ospfv3HostMetric  
  ospfHostStatus  
  ospfv3HostAreaID
```

---

## show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

```
show ipv6 ospf lsdb [area area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>rtr</b>	Specifies router LSAs.
<b>net</b>	Specifies network LSAs.
<b>netsum</b>	Specifies network summary LSAs.
<b>asbrsum</b>	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display the LSDB of the OSPF router. It can be used for OSPF debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

## Examples

```
-> show ipv6 ospf lsdb
```

Area	Type	Link ID	Advertising Rtr	Sequence #	Age
0.0.0.0	Router	0	1.1.1.1	8000020f	1117
0.0.0.0	Router	0	3.3.3.3	80000208	1121
0.0.0.0	Router	0	5.5.5.5	800001f1	1117
0.0.0.0	Router	0	30.30.30.30	800000da	1115

### *output definitions*

---

<b>Area</b>	The identification of the area to which the router belongs.
<b>Type</b>	The protocol type from where the route was learned.
<b>Link ID</b>	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
<b>Advertising Rtr</b>	The ID of the router that advertises the routes.
<b>Sequence #</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

---

## Release History

Release 6.1.3; command was introduced.

## Related Commands

[ipv6 ospf status](#) Displays the OSPFv3 status and general configuration parameters.

  ospfv3AsLsdbSequence  
  ospfv3AsLsdbAge
```

---

## show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

**show ipv6 ospf neighbor** [**router** *ipv4\_address*][**interface** *interface\_name*]

---

### Syntax Definitions

*ipv4\_address*                      A 32-bit router ID of the neighboring router.  
*interface\_name*                    The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ipv6 ospf neighbor
```

Router ID	Area/Transit Area	State	Interface
1.1.1.1	0.0.0.0	FULL	vlan-2071
3.3.3.3	0.0.0.0	FULL	vlan-2071
5.5.5.5	0.0.0.0	FULL	vlan-2071
23.23.23.23	0.0.0.1	FULL	vlan-2055
23.23.23.23	0.0.0.1	FULL	vlan-2056
24.24.24.24	0.0.0.1	FULL	vlan-2065
24.24.24.24	0.0.0.1	FULL	vlan-2066

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area/Transit Area</b>	The area identifier.
<b>State</b>	The state of the OSPF neighbor adjacency.
<b>Interface</b>	The name of the interface.

---

```
-> show ipv6 ospf neighbor router 24.24.24.24
```

Router ID	Area/Transit Area	State	Interface
24.24.24.24	0.0.0.1	FULL	vlan-2070
24.24.24.24	0.0.0.1	FULL	vlan-2073

*output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area/Transit Area</b>	The area identifier.
<b>State</b>	The state of the OSPF neighbor adjacency.
<b>Interface</b>	The name of the interface.

---

**Release History**

Release 6.1.3; command was introduced.

## show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

**show ipv6 ospf routes** [**prefix** *ipv6\_address\_prefix*][**gateway** *gateway*]

---

### Syntax Definitions

*ipv6\_address\_prefix*                    The 128-bit IPv6 address of the route destination in hexadecimal format.

*gateway*                                The next hop IPv6 address for this router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

```
-> show ipv6 ospf routes
```

Prefix	Gateway Address -> Interface	Path Type	Path Metric Metric 1 : 2
::30.30.31.0/120	:: -> v6-intf1001	INTRA	1 : -
::30.30.32.0/120	:: -> v6-intf1002	INTRA	1 : -
::30.30.33.0/120	:: -> v6-intf1003	INTRA	1 : -

#### *output definitions*

---

<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>Gateway Address</b>	The address of the gateway.
<b>Interface</b>	The outgoing interface on the switch.
<b>Path Type</b>	The type of routes specified (intra or inter).
<b>Path Metric</b>	The cost of the route.

---

### **Release History**

Release 6.1.3; command was introduced.

### **Related Commands**

[ipv6 ospf status](#)

Displays the OSPFv3 status and general configuration parameters.

### **MIB Objects**

N/A

---

## Related Commands

[ipv6 ospf virtual-link](#)

Creates or deletes a virtual link.

## MIB Objects

```
ospfv3VirtIfTable  
  ospfv3VirtIfAreaId  
  ospfv3VirtIfNeighbor  
  ospfv3VirtIfState
```

---

## show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

```
show ipv6 ospf area [area_id]
```

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPF area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ipv6 ospf area
```

Area ID	Type	Stub Metric	Number of Interfaces
0.0.0.0	Normal	NA	2
0.0.0.1	Normal	NA	2

```
-> show ipv6 ospf area 0.0.0.0
```

```
Area Type = Normal,
Area Stub Metric = 0,
# of SPF calculations = 52,
# Interfaces = 3,
# Router LSAs = 2,
# Network LSAs = 3,
# Intra-area-prefix LSAs = 4,
# Inter-area-prefix LSAs = 15,
# Inter-area-router LSAs = 0,
# hosts = 0,
```

### output definitions

---

<b>Area Type</b>	The area type. This field will be <b>normal</b> or <b>stub</b> .
<b>Area Stub Metric</b>	Indicates whether the area is enabled or disabled.
<b># Router LSAs</b>	The total number of Link State Advertisements for the Area.

*output definitions (continued)*

---

<b># Network LSAs</b>	The total number of inter-area Link State Advertisements.
<b># of SPF calculations</b>	The number of times the area has calculated the Shortest Path.
<b># Interfaces</b>	The number of OSPF interfaces.
<b># Intra-area-prefix LSAs</b>	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
<b># Inter-area-prefix LSAs</b>	The number of inter-area-prefix LSAs. Corresponds to Type 3 summary-LSA of OSPF.
<b># Inter-area-router LSAs</b>	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPF.
<b># hosts</b>	The number of directly attached hosts.

---

**Release History**

Release 6.1.3; command was introduced.

**Related Commands**

<a href="#">ipv6 ospf area</a>	Creates or deletes an OSPFv3 area, assigning default metric, cost, and type.
<a href="#">show ipv6 ospf interface</a>	Displays OSPFv3 interface information.

**MIB Objects**

```
ospfv3AreaTable
  ospfv3AreaId
  ospfv3ImportAsExtern
  ospfv3SpfRuns
  ospfv3AreaBdrRtrCount
  ospfv3AreaSummary
  ospfv3AreaStatus
```

---

## show ipv6 ospf interface

Displays OSPFv3 interface information.

**show ipv6 ospf interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

### Examples

```
-> show ipv6 ospf interface
```

Name	DR Router ID	BDR Router ID	Admin Status	Oper Status	State
vlan-2071	5.5.5.5	0.0.0.0	Enabled	Up	DR
vlan-2055	7.7.7.7	5.5.5.5	Enabled	Up	BDR
vlan-2056	7.7.7.7	5.5.5.5	Enabled	Up	BDR

### output definitions

---

<b>Name</b>	The name of the interface.
<b>DR Router ID</b>	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See <a href="#">Chapter 5, “VLAN Management Commands,”</a> for more information.)
<b>BDR Router ID</b>	The IP address of the backup designated router.
<b>Vlan</b>	The VLAN to which the interface is assigned.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Oper Status</b>	Indicates whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>DR</b> , <b>BDR</b> , <b>other</b> .

---

```

-> show ipv6 ospf interface vlan-2071
Type                               = BROADCAST,
Admin Status                       = Enabled,
IPv6 Interface Status              = Up,
Oper Status                         = Up,
State                               = DR,
Area                               = 0.0.0.0,
Priority                            = 100,
Cost                               = 1,
Designated Router                  = 3.3.3.3,
Backup Designated Router           = 0.0.0.0,
Hello Interval                     = 1,
Router Dead Interval               = 4,
Retransmit Interval                = 5,
Transit Delay                      = 1,
Ifindex                            = 17,
IPv6 'ifindex'                    = 2071,
MTU                                 = 1500,
# of attached neighbors            = 0,
Globally reachable prefix #0       = 2071::2/64

```

Output fields when an IP address or interface name is specified are described below:

#### *output definitions*

<b>Type</b>	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
<b>Admin Status</b>	The current administrative status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>IPv6 Interface Status</b>	The current administrative status of the IPv6 interface, either <b>up</b> or <b>down</b> .
<b>Oper Status</b>	Indicates whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .
<b>Area</b>	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Cost</b>	The cost added to routes learned on this interface.
<b>Designated Router</b>	The identification number of the designated router.
<b>Backup Designated Router</b>	The identification number of the backup designated router.
<b>Hello Interval</b>	The number of seconds between hello messages sent out on the interface.
<b>Router Dead Interval</b>	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
<b>Retransmit Interval</b>	The number of seconds the interface waits before resending hello messages.
<b>Transit Delay</b>	The estimated number of seconds required to transmit a link state update over this interface.

*output definitions (continued)*

---

<b>Ifindex</b>	The unique value assigned to an interface.
<b>IPv6 'ifindex'</b>	The unique value assigned to an IPv6 interface.
<b>MTU</b>	The Maximum Transfer Unit (in bytes) for the interface.
<b># of attached neighbors</b>	The number of OSPFv3 neighbors in the initialization state.
<b>Globally reachable prefix #0</b>	A globally unique IPv6 address.

---

**Release History**

Release 6.1.3; command was introduced.

**Related Commands**

<b>ipv6 ospf interface</b>	Creates and deletes an OSPFv3 interface.
<b>ipv6 ospf interface dead-interval</b>	Configures the OSPFv3 interface dead interval.
<b>ipv6 ospf interface hello-interval</b>	Configures the OSPFv3 interface hello interval.
<b>ipv6 ospf interface cost</b>	Configures the OSPFv3 interface cost.
<b>ipv6 ospf interface priority</b>	Configures the OSPFv3 interface priority.
<b>ipv6 ospf interface retrans-interval</b>	Configures the OSPFv3 interface retransmit interval.
<b>ipv6 ospf interface transit-delay</b>	Configures the OSPFv3 interface transit delay.
<b>ipv6 ospf interface area</b>	Configures an OSPFv3 interface area.
<b>ipv6 ospf interface status</b>	Enables or disables the administration status on an OSPFv3 interface.

# 24 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

---

**Note.** IS-IS is currently supported only on the OmniSwitch 6850 and 6850E Series

---

Alcatel-Lucent's version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

*Filename:* AlcatelIND1Iisis.mib  
*Module:* ALCATEL-IND1-ISIS-MIB

*Filename:* IETF\_ISIS.MIB  
*Module:* ISIS-MIB

A summary of the available commands is listed here:

---

**Global IS-IS Commands**

**ip load isis**  
**ip isis status**  
**ip isis area-id**  
**ip isis level-capability**  
**ip isis auth-check**  
**ip isis auth-type**  
**ip isis csnp-auth**  
**ip isis hello-auth**  
**ip isis psnp-auth**  
**ip isis lsp-lifetime**  
**ip isis lsp-wait**  
**ip isis spf-wait**  
**ip isis summary-address**  
**ip isis overload**  
**ip isis overload-on-boot**  
**ip isis graceful-restart**  
**ip isis graceful-restart helper**  
**ip isis strict-adjacency-check**  
**ip isis level auth-type**  
**ip isis level hello-auth**  
**ip isis level csnp-auth**  
**ip isis level psnp-auth**  
**ip isis level wide-metrics-only**  
**show ip isis adjacency**  
**show ip isis database**  
**show ip isis hostname**  
**show ip isis routes**  
**show ip isis spf**  
**show ip isis spf-log**  
**show ip isis statistics**  
**show ip isis status**  
**show ip isis summary-address**

---

**Interface Commands**

---

```
ip isis interface
ip isis interface status
ip isis interface interface-type
ip isis interface csnp-interval
ip isis interface hello-auth-type
ip isis interface level-capability
ip isis interface lsp-pacing-interval
ip isis interface passive
ip isis interface retransmit-interval
ip isis interface default-type
ip isis interface level hello-auth-type
ip isis interface level hello-interval
ip isis interface level hello-multiplier
ip isis interface level metric
ip isis interface level passive
ip isis interface level priority
show ip isis interface
```

---

**Clear Commands**

```
clear ip isis adjacency
clear ip isis lsp-database
clear ip isis spf-log
clear ip isis statistics
```

---

## ip load isis

Loads the IS-IS software on the router.

**ip load isis**

---

### Syntax Definitions

N/A

### Defaults

By default, IS-IS is not loaded on the switch.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

### Examples

```
-> ip load isis
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip protocols](#) Displays switch routing protocol information and status.

### MIB Objects

alaDrcTmIPISISStatus

---

## ip isis status

Enables or disables the administrative status of IS-IS on the switch.

**ip isis status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables IS-IS.
<b>disable</b>	Disables IS-IS.

### Defaults

---

parameter	default
enable / disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

### Examples

```
-> ip isis status enable
-> ip isis status disable
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```
isisSysTable
  isisSysAdminState
```

---

## ip isis level-capability

Configures the router level of the IS-IS protocol globally.

**ip isis level-capability {level-1 | level-2 | level-1/2}**

---

### Syntax Definitions

<b>level-1</b>	Specifies that the router can operate at Level-1 only.
<b>level-2</b>	Specifies that the router can operate at Level-2 only.
<b>level-1/2</b>	Specifies that the router can operate at both Level-1 and Level-2.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>level-1 / level-2 / level-1/2</b>	<b>level-1/2</b>

---

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- You can also configure the level capability at per interface level.

### Examples

```
-> ip isis level-capability level-1  
-> ip isis level-capability level-2
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

**ip isis interface level-capability** Configures the IS-IS level on the specified interface.  
**show ip isis status** Displays the IS-IS status.

### MIB Objects

isisSysTable  
isisSysType

---

## ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

**ip isis auth-check {enable | disable}**

---

### Syntax Definitions

enable	Enables authentication check for IS-IS PDUs.
disable	Disables authentication check for IS-IS PDUs.

### Defaults

By default, authentication check is enabled.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

### Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

### Release History

Release 6.3.1; command was introduced;

### Related Commands

<a href="#">ip isis auth-type</a>	Enables authentication and configures the authentication type of IS-IS protocol globally.
<a href="#">ip isis level auth-type</a>	Enables authentication and configures the authentication types for specific IS-IS levels.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

### MIB Objects

```
vRtrIisisTable
  vRtrIisisAuthCheck
```

---

## ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

```
ip isis auth-type {simple {key key | encrypt-key encrypt-key} | md5 {key key | encrypt-key encrypt-key} | none}
```

---

### Syntax Definitions

<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt-key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
simple / md5 / none	none

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt-key*. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt-key*.
- This command configures the authentication type of ISIS protocol globally. These settings can be overridden at each level.

- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis auth-type simple key rachel  
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **key** and **encrypt-key** parameters were added.

## Related Commands

<a href="#">ip isis level auth-type</a>	Enables authentication and configures the authentication types for specific IS-IS levels.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

## MIB Objects

```
vRtrIsisTable  
  vRtrIsisAuthType  
  vRtrIsisAuthKey
```

---

## ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

**ip isis csnp-auth**

**no ip isis csnp-auth**

---

### Syntax Definitions

N/A

### Defaults

CSNP authentication check is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

### Examples

```
-> ip isis csnp-auth  
-> no ip isis csnp-auth
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

---

<a href="#">ip isis level csnp-auth</a>	Configures CSNP authentication for specific IS-IS levels.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

---

### MIB Objects

```
vRtrIisTable  
    vRtrIisCsnpAuthentication
```

---

## ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

**ip isis hello-auth**

**no ip isis hello-auth**

---

### Syntax Definitions

N/A

### Defaults

Authentication check of Hello PDUs is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

### Examples

```
-> ip isis hello-auth  
-> no ip isis hello-auth
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

**ip isis level hello-auth** Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

**show ip isis status** Displays the IS-IS status.

### MIB Objects

```
vRtrIsisTable  
    vRtrIsisHelloAuthentication
```

---

## ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

**ip isis psnp-auth**

**no ip isis psnp-auth**

---

### Syntax Definitions

N/A

### Defaults

PSNP authentication check is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

### Examples

```
-> ip isis psnp-auth  
-> no ip isis psnp-auth
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[ip isis level psnp-auth](#)

Configures the PSNP authentication for specific IS-IS levels.

[show ip isis status](#)

Displays the IS-IS status.

### MIB Objects

vRtrIisisTable

vRtrIisisPsnpAuthentication

---

## ip isis lsp-lifetime

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

**ip isis lsp-lifetime** *seconds*

**no ip isis lsp-lifetime**

---

### Syntax Definitions

*seconds* Validity interval in seconds. The valid range is 350–65535.

### Defaults

parameter	default
<i>seconds</i>	1200

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to restore the default value.

### Examples

```
-> ip isis lsp-lifetime 760
-> no ip isis lsp-lifetime
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

<a href="#">ip isis interface lsp-pacing-interval</a>	Configures the time interval between IS-IS LSP PDUs sent from the specified interface.
<a href="#">show ip isis status</a>	Displays the IS-IS status.
<a href="#">show ip isis database</a>	Displays IS-IS LSP database information of the adjacent routers.

### MIB Objects

```
vRtrIisisTable
vRtrIisisLspLifetime
```

---

## ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

**ip isis lsp-wait** {**max-wait** | **initial-wait** | **second-wait**} *seconds*

**no ip isis lsp-wait** {**max-wait** | **initial-wait** | **second-wait**}

---

### Syntax Definitions

<b>max-wait</b>	Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.
<b>initial-wait</b>	Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.
<b>second-wait</b>	Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.
<i>seconds</i>	Specifies the time interval.

### Defaults

<b>parameter</b>	<b>default</b>
<i>seconds</i> ( <b>max-wait</b> )	5
<i>seconds</i> ( <b>initial-wait</b> )	0
<i>seconds</i> ( <b>second-wait</b> )	1

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

### Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**ip isis interface lsp-pacing-interval**

Configures the time interval between IS-IS LSP PDUs sent from the specified interface.

**show ip isis status**

Displays the IS-IS status.

## MIB Objects

## ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

**ip isis spf-wait** {**max-wait** *seconds* | **initial-wait** *milliseconds*| **second-wait** *milliseconds*}

**no ip isis spf-wait** {**max-wait** | **initial-wait** | **second-wait**}

---

### Syntax Definitions

<b>max-wait</b> <i>seconds</i>	Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds.
<b>initial-wait</b> <i>milliseconds</i>	Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.
<b>second-wait</b> <i>milliseconds</i>	Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

### Defaults

parameter	default
<b>max-wait</b> <i>seconds</i>	10
<b>initial-wait</b> <i>milliseconds</i>	1000
<b>second-wait</b> <i>milliseconds</i>	1000

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

### Examples

```
-> ip isis spf-wait max-wait 25
-> no ip isis spf-wait initial-wait
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

**show ip isis status** Displays the IS-IS status.

---

## ip isis summary-address

Adds or deletes the summary address.

**ip isis summary-address** {*ip-prefix/mask* | *ip-prefix* [*/netmask*]} {**level-1** | **level-2** | **level-1/2**}

**no ip isis summary-address** {*ip-prefix/mask* | *ip-prefix* [*/netmask*]}

---

### Syntax Definitions

<i>ip-prefix/mask</i>	Specifies the IP prefix in dotted decimal notation and the mask length.
<i>ip-prefix</i>	Specifies the IP prefix in dotted decimal notation.
<i>/netmask</i>	Specifies the subnet mask in dotted decimal notation.
<b>level-1</b>	Specifies the IS-IS level as Level-1.
<b>level-2</b>	Specifies the IS-IS level as Level-2.
<b>level-1/2</b>	Specifies the IS-IS level as Level-1/2.

### Defaults

parameter	default
<b>level-1</b>   <b>level-2</b>   <b>level-1/2</b>	<b>level-1/2</b>

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarised by default.

### Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

### Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **level-1/2** parameter was added, *netmask* parameter is optional.

## Related Commands

**show ip isis summary-address** Displays the IS-IS summary address database.

## MIB Objects

vRtrIsisSummRowStatus

---

## ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

**ip isis overload** [*timeout seconds*]

**no ip isis overload** [*timeout*]

---

### Syntax Definitions

**timeout** *seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

### Defaults

By default, the IS-IS overload state is disabled.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

### Examples

```
-> ip isis overload timeout 70  
-> no ip isis overload timeout
```

### Release History

Release 6.2.1; command was introduced..

## Related Commands

- ip isis overload-on-boot** Configures the IS-IS router to be in the overload state during bootup for a specified time period.
- show ip isis status** Displays the IS-IS status.

## MIB Objects

```

  vRtrIisisOverloadTimeout
```

---

## ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

**ip isis overload-on-boot** [*timeout seconds*]

**no ip isis overload-on-boot** [*timeout seconds*]

---

### Syntax Definitions

**timeout** *seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

### Defaults

By default, the IS-IS router will not be in the overload state.

parameter	default
<b>timeout</b> <i>seconds</i>	60

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

### Examples

```
-> ip isis overload-on-boot timeout 80  
-> no ip isis overload-on-boot timeout
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

<code>ip isis overload</code>	Sets the IS-IS router to operate in the overload state.
<code>show ip isis status</code>	Displays the IS-IS status.

## MIB Objects

```

  vRtrIisOverloadOnBoot  
  vRtrIisOverloadOnBootTimeout
```

---

## ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

**ip isis graceful-restart**

**no ip isis graceful-restart**

---

### Syntax Definitions

N/A

### Defaults

Graceful restart is disabled on the router by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

### Examples

```
-> ip isis graceful-restart  
-> no ip isis graceful-restart
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

**ip isis graceful-restart helper** Configures the helper mode of routers for graceful restart.  
**show ip isis status** Displays the IS-IS status.

### MIB Objects

```
vRtrIisisTable  
    vRtrIisisGracefulRestart
```

---

## ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

```
ip isis graceful-restart helper {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables the helper mode on the router.
<b>disable</b>	Disables the helper mode on the router.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

### Examples

```
-> ip isis graceful-restart helper disable
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

<a href="#">ip isis graceful-restart</a>	Configures graceful restart on the router.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

### MIB Objects

```
vRtrIisisTable  
vRtrIisisGRHelperMode
```

---

## ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

**ip isis strict-adjacency-check {enable | disable}**

---

### Syntax Definitions

**enable** Enables the adjacency check configuration on the router.

**disable** Disables the adjacency check configuration on the router.

### Defaults

By default, the adjacency check configuration is disabled.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

### Examples

```
-> ip isis strict-adjacency-check enable
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```
vRtrIsisTable  
  vRtrIsisStrictAdjacencyCheck
```

---

## ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

**ip isis level {1 | 2} auth-type {simple {key *key* | encrypt-key *encrypt-key*} | md5 {key *key* | encrypt-key *encrypt-key*} | none}**

---

### Syntax Definitions

<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt-key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
simple / md5 / none	none

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt-key*. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt-key*.
- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis level 2 auth-type simple key rachel  
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **key** and **encrypt-key** parameters were added.

## Related Commands

## ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

**ip isis level {1 | 2} hello-auth**

**no ip isis level {1 | 2} hello-auth**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

Authentication check of Level Hello PDUs is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

### Examples

```
-> ip isis level 1 hello-auth  
-> no ip isis level 1 hello-auth
```

### Release History

Release 6.2.1; command was introduced.

## ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

**ip isis level {1 | 2} csnp-auth**

**no ip isis level {1 | 2} csnp-auth**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

### Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

## ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

**ip isis level {1 | 2} psnp-auth**

**no ip isis level {1 | 2} psnp-auth**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

### Examples

```
-> ip isis level 1 psnp-auth  
-> no ip isis level 1 psnp-auth
```

```

---

## ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

**ip isis level {1 | 2} wide-metrics-only**

**no ip isis level {1 | 2} wide-metrics-only**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

By default, wide metrics is disabled.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

### Examples

```
-> ip isis level 1 wide-metrics-only  
-> no ip isis level 1 wide-metrics-only
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

---

## show ip isis adjacency

Displays information about IS-IS adjacent routers.

**show ip isis adjacency** [{system-id *nbr\_sys\_id* | interface *interface\_name*}] [**detail**]

---

### Syntax Definitions

<i>nbr_sys_id</i>	The system ID of the neighbor router.
<i>interface_name</i>	The name of the IS-IS interface.
<b>detail</b>	Indicates that the output is displayed in a detailed manner.

### Defaults

By default adjacency information for all the neighbor routers are displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use *the nbr\_sys\_id* or *interface\_name* parameter with this command to view the adjacency information for a specific neighbor.

### Examples

```
-> show ip isis adjacency
=====
ISIS Adjacency
=====
System ID          Type      State    Hold    Interface  Host-name
-----

## show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

```
show ip isis database [{system_id system_id | lsp_id lsp_id}] [detail] [level {1 | 2}]
```

---

### Syntax Definitions

<i>system_id</i>	The system ID of the router.
<i>lsp_id</i>	The LSP ID.
<b>detail</b>	Indicates that the output is displayed in a detailed manner.
<b>level</b>	Indicates the IS-IS level, either <b>1</b> or <b>2</b> .

### Defaults

By default the entire LSP database is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use *system-id* or *lsp-id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

### Examples

```
-> show ip isis database
Legends : P           = The Partition repair bit is set
OV      = The overload bit is set
ATT     = The Attach bit is set
L1      = Specifies a Level 1 IS type
L2      = Specifies a Level 2 IS type
=====

```

*output definitions*

---

<b>LSP ID</b>	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
<b>Sequence</b>	The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs.
<b>Checksum</b>	The checksum value of the LSP.
<b>Lifetime</b>	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
<b>Attributes</b>	The level capability of the router.
<b>LSP Count</b>	The number of LSPs in the Link State Database.

---

```

---

<b>LSP ID</b>	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
<b>Sequence</b>	The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs.
<b>Checksum</b>	The checksum value of the LSP.
<b>Lifetime</b>	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
<b>Version</b>	The version of the IS-IS protocol that has generated the LSP.
<b>Pkt Type</b>	The IS-IS PDU type number derived from the PDU header, which can be <b>18</b> or <b>20</b> . The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type.
<b>Pkt Ver</b>	The version of the IS-IS protocol that has generated the packet.
<b>Attributes</b>	The level capability of the router.
<b>Max Area</b>	The Maximum number of areas supported by the originating router of the LSP.
<b>SysID Len</b>	The length of the system-id as used by the originating router.
<b>Used Len</b>	The length used by the LSP.
<b>Alloc Len</b>	The length allocated for the LSP to be stored.
<b>Area Address</b>	The area ID of the router.
<b>Supp protocols</b>	The network layer protocols that are supported.
<b>IS-Host Name</b>	The host name of the router.
<b>System ID</b>	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
<b>IS Neighbors</b>	The list of reachable IS-IS neighbors.
<b>IPv4 Internal Reach</b>	The list of IS-IS internal routes.
<b>IP Prefix</b>	The IP address and subnet mask of the destination.
<b>Metrics</b>	The metric value to reach the destination.
<b>IPv4 External Reach</b>	The list of external IS-IS routes.
<b>level-1 LSP Count</b>	The number of Level-1 LSPs.
<b>level-2 LSP Count</b>	The number of Level-2 LSPs.

### *output definitions*

<b>System Id</b>	The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
<b>Admin State</b>	The state of the router ( <b>Up</b> or <b>Down</b> ).
<b>Last Enabled</b>	The date and time when the router is enabled.
<b>Level Capability</b>	The level capability of the router ( <b>L1</b> , <b>L2</b> , or <b>L1L2</b> ).
<b>Authentication Check</b>	Indicates the status of the authentication ( <b>true</b> or <b>false</b> ).
<b>Authentication Type</b>	The type of authentication ( <b>password</b> or <b>md5</b> ).
<b>Graceful Restart</b>	Indicates if graceful restart is <b>Enabled</b> or <b>Disabled</b> .
<b>GR helper-mode</b>	Indicates if the helper mode of graceful restart is <b>Enabled</b> or <b>Disabled</b> .
<b>LSP Lifetime</b>	The Lifetime of the LSP (in seconds).
<b>LSP Wait</b>	The Wait time of the LSP (in seconds).
<b>Adjacency Check</b>	The adjacency check configuration on the router
<b>L1 Auth Type</b>	The authentication type ( <b>password</b> or <b>md5</b> ) for Level-1 adjacency.
<b>L2 Auth Type</b>	The authentication type ( <b>password</b> or <b>md5</b> ) for Level-2 adjacency.
<b>L1 Wide Metrics-only</b>	Indicates whether wide metrics is <b>Enabled</b> or <b>Disabled</b> for Level-1 adjacency.
<b>L2 Wide Metrics-only</b>	Indicates whether wide metrics is <b>Enabled</b> or <b>Disabled</b> for Level-2 adjacency.
<b>L1 LSDB Overload</b>	Indicates whether LSDB Overload is <b>Enabled</b> or <b>Disabled</b> for Level-1 adjacency.
<b>L2 LSDB Overload</b>	Indicates whether LSDB Overload is <b>Enabled</b> or <b>Disabled</b> for Level-2 adjacency.
<b>L1 LSPs</b>	The number of LSPs for Level-1 adjacency.
<b>L2 LSPs</b>	The number of LSPs for Level-2 adjacency.
<b>Last SPF</b>	The date and duration of the last SPF calculation.
<b>SPF Wait</b>	The Wait time for the SPF calculation.
<b>Hello-Auth Check</b>	Indicates the status of global Hello authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Csnp-Auth Check</b>	Indicates the status of global CSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Psnp-Auth Check</b>	Indicates the status of global PSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L1 Hello-Auth Check</b>	Indicates the status of L1 Hello authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L1 Csnp-Auth Check</b>	Indicates the status of L1 CSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).

*output definitions (continued)*

<b>L1 Psnp-Auth Check</b>	Indicates the status of L1 PSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L2 Hello-Auth Check</b>	Indicates the status of L2 Hello authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L2 Csnp-Auth Check</b>	Indicates the status of L2 CSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L2 Psnp-Auth Check</b>	Indicates the status of L2 PSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Area Address</b>	The area address of the router.

**Release History**

Release 6.2.1; command was introduced.

Release 6.3.1; Adjacency Check field was added.

**Related Commands**

<b>ip isis status</b>	Enables or disables the administration status of IS-IS on the router.
<b>ip isis level-capability</b>	Configures the router level of the IS-IS protocol globally.
<b>ip isis auth-type</b>	Configures authentication type of IS-IS protocol globally.
<b>ip isis csnp-auth</b>	Enables or disables the authentication of CSNPs.
<b>ip isis hello-auth</b>	Enables or disables the authentication of Hello PDUs globally.
<b>ip isis psnp-auth</b>	Enables or disables the authentication of PSNPs.
<b>ip isis graceful-restart</b>	Configures graceful restart on the router.
<b>ip isis overload</b>	Sets the IS-IS router to operate in the overload state for a specified time period.
<b>ip isis overload-on-boot</b>	Configures the IS-IS router to be in the overload state after bootup for a specified time period.
<b>ip isis lsp-wait</b>	Configures the time interval between successively generated LSPs.
<b>ip isis spf-wait</b>	Configures the time interval between successive Shortest Path First (SPF) calculations.
<b>ip isis level auth-type</b>	Enables the authentication and configures the authentication types for specific IS-IS levels.
<b>ip isis level hello-auth</b>	Enables or disables the authentication of Hello PDUs for specific IS-IS levels.
<b>ip isis level csnp-auth</b>	Enables or disables the authentication of CSNPs for specific IS-IS levels.
<b>ip isis level psnp-auth</b>	Enables or disables the authentication of PSNP PDUs for specific IS-IS levels.
<b>ip isis level wide-metrics-only</b>	Configures wide metrics in LSPs for specific IS-IS levels.
<b>ip isis area-id</b>	Configures the area ID for the switch.
<b>ip isis auth-check</b>	Enables or disables authentication check for IS-IS PDUs.

- ip isis graceful-restart helper** Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.
- ip isis lsp-lifetime** Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.
- ip isis strict-adjacency-check** Enables or disables the adjacency check configuration on the router.

## show ip isis summary-address

Displays the IS-IS summary address database.

**show ip isis summary-address** [*ip-addr* [/i>mask]]

---

### Syntax Definitions

*ip-addr*                                    The 32-bit IP address.

*/mask*                                     The netmask value. The valid range is 1–32.

### Defaults

By default summary address information for all the IP addresses is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the *ip-addr* parameter with this command to view the summary address information for a specific IP address.

### Examples

```
-> show ip isis summary-address
=====
ISIS Summary Address
=====
Address                                    Level
-----
1.0.0.0/8                                 L1
2.1.0.0/24                                L1L2
3.1.2.3/32                                L2
-----

Summary Address : 3
```

#### *output definitions*

---

<b>Address</b>	The summary address for a range of IPv4 addresses.
<b>Level</b>	The capability level of the router.
<b>Summary Address</b>	The number of summarized addresses.

---

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**ip isis summary-address** Adds or deletes the summary address.

## MIB Objects

vRtrIsissummaryTable

    vRtrIsisSummPefix

    vRtrIsisSummMask

    vRtrIsisSummLevel

---

## ip isis interface

Creates an IS-IS interface.

**ip isis interface** *interface\_name*

**no ip isis interface** *interface\_name*

---

### Syntax Definitions

*interface\_name*                      The name of the IS-IS interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the IS-IS interface.
- The interface name cannot contain spaces.

### Examples

```
-> ip isis interface vlan-101
-> no ip isis interface vlan-101
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis interface](#)                      Displays the IS-IS interface information.

### MIB Objects

```
vRtrIisisIfTable
  vRtrIisisIfRowStatus
```

---

## ip isis interface status

Enables or disables IS-IS on an interface.

**ip isis interface** *interface\_name* **status {enable / disable}**

---

### Syntax Definitions

<i>interface_name</i>	Name of the interface.
<b>enable</b>	Administratively enables IS-IS on the interface.
<b>disable</b>	Administratively disables IS-IS on the interface.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

### Examples

```
-> ip isis interface vlan-101 status enable
-> ip isis interface vlan-101 status disable
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis interface](#) Displays the IS-IS interface information.

### MIB Objects

```
isisCircTable
  isisCircAdminState
```

---

## ip isis interface interface-type

Configures the IS-IS interface as broadcast or point-to-point.

**ip isis interface** *interface\_name* **interface-type** {**broadcast** | **point-to-point**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>broadcast</b>	Sets the interface as a broadcast IS-IS interface.
<b>point-to-point</b>	Sets the interface as a point-to-point IS-IS interface.

### Defaults

parameter	default
<b>broadcast</b>   <b>point-to-point</b>	<b>broadcast</b>

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

N/A.

### Examples

```
-> ip isis interface vlan-101 interface-type broadcast
-> ip isis interface vlan-101 interface-type point-to-point
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

```

---

## ip isis interface csnp-interval

Configures the time interval to send CSNPs from the specified interface.

**ip isis interface** *interface\_name* **csnp-interval** *seconds*

**no ip isis interface** *interface\_name* **csnp-interval**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The time interval (1–65535) in seconds between successive CSNP PDUs sent on this interface.

### Defaults

parameter	default
<i>seconds (broadcast)</i>	10
<i>seconds (point-to-point)</i>	5

---

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to restore the settings to the default value.

### Examples

```
-> ip isis interface vlan-101 csnp-interval 50
-> no ip isis interface vlan-101 csnp-interval
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis interface](#)                      Displays the IS-IS interface information.

### MIB Objects

vRtrisisIftable  
vRtrIsisIfCsnpInterval

---

## ip isis interface hello-auth-type

Configures the authentication of Hello PDUs on a specific interface.

```
ip isis interface interface_name hello-auth-type {simple {key key | encrypt-key encrypt-key} | md5 {key key | encrypt-key encrypt-key} | none}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt-key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
simple / md5 / none	none

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt-key*. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt-key*.

- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis interface vlan-101 hello-auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis interface vlan-101 hello-auth-type none
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **key** and **encrypt-key** parameters were added.

## Related Commands

<a href="#">ip isis interface level hello-auth-type</a>	Configures the authentication of Hello PDUs for the specified IS-IS level of an interface.
<a href="#">show ip isis interface</a>	Displays the IS-IS interface information.

## MIB Objects

```
vRtrIisisIfTable
  vRtrIisisIfHelloAuthType
  vRtrIisisIfHelloAuthKey
```

---

## ip isis interface level-capability

Configures the IS-IS level on the specified interface.

**ip isis interface** *interface\_name* **level-capability** [level-1 | level-2 | level-1/2]

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>level-1</b>	Specifies that the interface can operate at Level-1 only.
<b>level-2</b>	Specifies that the interface can operate at Level-2 only.
<b>level-1/2</b>	Specifies that the interface can operate at both Level-1 and Level-2.

### Defaults

parameter	default
level-1   level-2   level-1/2	level-1/2

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

### Examples

```
-> ip isis interface vlan-101 level-capability level-1
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

<a href="#">ip isis level-capability</a>	Configures the router level of the IS-IS protocol globally.
<a href="#">show ip isis interface</a>	Displays the IS-IS interface information.

### MIB Objects

```

---

## ip isis interface lsp-pacing-interval

Configures the time interval between IS-IS LSP PDUs sent from the specified interface.

**ip isis interface** *interface\_name* **lsp-pacing-interval** *milliseconds*

**no ip isis interface** *interface\_name* **lsp-pacing-interval**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*milliseconds*                      The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs.

### Defaults

parameter	default
<i>milliseconds</i>	100

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

### Examples

```
-> ip isis interface vlan-101 lsp-pacing-interval 120  
-> no ip isis interface vlan-101 lsp-pacing-interval
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

**ip isis lsp-lifetime**                      Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.

**ip isis lsp-wait**                      Configures the time interval between successively generated LSPs.

**show ip isis interface**                      Displays the IS-IS interface information.

### MIB Objects

vRtrIisisIfLspPacingInterval

---

---

## ip isis interface passive

Configures the interface as passive.

**ip isis interface** *interface\_name* **passive**

**no ip isis interface** *interface\_name* **passive**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

By default, the interface passive configuration is disabled.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- The passive interface will not permit ingressing and egressing IS-IS PDUs.

### Examples

```
-> ip isis interface lan-1 passive
-> no ip isis interface lan-1 passive
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

**ip isis interface level passive**      Configures the interface as passive at the specified IS-IS level.  
**show ip isis interface**              Displays the IS-IS interface information.

### MIB Objects

```

    isisCircPassiveCircuit
```

---

## ip isis interface retransmit-interval

Configures the minimum time interval between LSP retransmissions on a point-to-point interface.

**ip isis interface** *interface\_name* **retransmit-interval** *seconds*

**no ip isis interface** *interface\_name* **retransmit-interval**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to restore the default settings.

### Examples

```
-> ip isis interface lan-3 retransmit-interval 130
-> no ip isis interface lan-4 retransmit-interval
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

## ip isis interface default-type

Sets the interface type to default.

**ip isis interface** *interface\_name* **default-type**

---

### Syntax Definitions

*interface\_name*                      The IP interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

This command is used to indicate whether the circuit type is default or has been modified.

### Examples

```
-> ip isis interface lan-3 default-type
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[ip isis interface interface-type](#)    Configures the IS-IS interface as broadcast or point-to-point.

### MIB Objects

vRtrIisisIfTable  
    vRtrIisisIfTypeDefault

---

## ip isis interface level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an interface.

**ip isis interface** *interface\_name* **level** [1 | 2] **hello-auth-type** {**simple** {**key** *key* | **encrypt-key** *encrypt-key*} | **md5** {**key** *key* | **encrypt-key** *encrypt-key*} | **none**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt-key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
<b>simple / md5 / none</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt-key*.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done on the specific interface.
- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis interface wan-50 level 1 hello-auth-type md5 key xyz123
-> ip isis interface man-80 level 2 hello-auth-type none
```

## Release History

Release 6.2.1; command was introduced.

## ip isis interface level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level of an interface.

**ip isis interface** *interface\_name* **level** [1 | 2] **hello-interval** *seconds*

**no ip isis interface** *interface\_name* **level** [1 | 2] **hello-interval**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*seconds*                              The Hello interval, in seconds. The valid range is 1–20000.

### Defaults

parameter	default
<i>seconds (designated routers)</i>	3
<i>seconds (non-designated routers)</i>	9

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to restore the default settings.

### Examples

```
-> ip isis interface man-1 level 1 hello-interval 50
-> no isis interface wan-876 level 2 hello-interval
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis interface](#)                      Displays the IS-IS interface information.

### MIB Objects

vRtrIsisIfLevelTable  
vRtrIsisIfLevelHelloTimer

---

## ip isis interface level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

**ip isis interface** *interface\_name* **level** [1 | 2] **hello-multiplier** *number*

**no ip isis interface** *interface\_name* **level** [1 | 2] **hello-multiplier**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.  
*number*                                The multiplier (2–100) of the Hello interval.

### Defaults

parameter	default
<i>number</i>	3

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to restore the default settings.

### Examples

```
-> ip isis interface lan-1 level 1 hello-multiplier 10
-> no ip isis interface lan-1 level 2 hello-multiplier
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show ip isis interface](#)                      Displays the IS-IS interface information.

### MIB Objects

```
isisCircLevelTable
  isisCircLevelHelloMultiplier
```

---

## ip isis interface level metric

Configures the metric value of the specified IS-IS level of the interface.

**ip isis interface** *interface\_name* **level** [1 | 2] **metric** *number*

**no ip isis interface** *interface\_name* **level** [1 | 2] **metric**

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<i>number</i>	The metric value (1–16777215) assigned for the specified level of the interface.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	10

---

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each interface must have a cost.

### Examples

```
-> ip isis interface interface-1 level 1 metric 25  
-> no ip isis interface interface-2 level 2 metric
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**show ip isis interface**      Displays the IS-IS interface information.

## MIB Objects

vRtrIisisIfLevelTable  
vRtrisisIfLevelAdminMetric

---

## ip isis interface level passive

Configures the interface as passive at the specified IS-IS level.

**ip isis interface** *interface\_name* **level [1 | 2] passive**

**no ip isis interface** *interface\_name* **level [1 | 2] passive**

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.

### Defaults

By default, the interface level passive configuration is disabled.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- The passive interface will not permit ingressing and egressing IS-IS PDUs.

### Examples

```
-> ip isis interface lan-5 level 1 passive
-> no ip isis interface wan-10 level 1 passive
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

<a href="#">ip isis interface passive</a>	Configures the interface as passive.
<a href="#">show ip isis interface</a>	Displays the IS-IS interface information.

### MIB Objects

```
vRtrIisisIfLevelTable
  vRtrIisisIfLevelPassive
```

---

## ip isis interface level priority

Configures the IS-IS router interface priority for the designated router election on a multi-access network.

**ip isis interface** *interface\_name* **level** [1 | 2] **priority** *number*

**no ip isis interface** *interface\_name* **level** [1 | 2] **priority**

---

### Syntax Definitions

<i>interface_name</i>	The name of the given IP interface.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<i>number</i>	The priority value of this interface at this level. The valid range is 0–127.

### Defaults

parameter	default
<i>number</i>	64

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

### Examples

```
-> ip isis interface vlan-isis level 1 priority 4
-> ip isis interface vlan-isis level 2 priority 4
-> no ip isis interface vlan-isis level 1 priority
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

**show ip isis interface**                      Displays the IS-IS interface information.

## MIB Objects

vRtrIisisIfLevelTable  
    vRtrIisisIfLevelISPriority

---

## show ip isis interface

Displays the IS-IS interface information.

**show ip isis interface** [*interface\_name*] [**detail**]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

**detail**                                Indicates that the output is displayed in a detailed manner.

### Defaults

By default the interface information for all the interfaces is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Use the *interface\_name* parameter with this command to view information for a specific interface.

### Examples

```
-> show ip isis interface
=====

### output definitions

<b>Interface</b>	The name of the IS-IS interface.
<b>Level Capability</b>	The level capability of the interface.
<b>Oper State</b>	The operational state of the interface ( <b>up</b> or <b>down</b> ).
<b>Admin State</b>	The administrative state of the interface ( <b>up</b> or <b>down</b> ).
<b>Auth Type</b>	Indicates the authentication type ( <b>simple</b> , <b>MD5</b> , or <b>none</b> ) of the interface.
<b>Circuit Id</b>	The circuit ID of the interface.
<b>RetransmitInt</b>	Specifies the minimal interval of time, in seconds between retransmission of an LSP on the point-to-point interface.
<b>Type</b>	The type of interface: <b>Broadcast</b> or <b>Pt-to-Pt</b> (point to point).
<b>LSP Pacing Int</b>	The LSP Pacing interval.
<b>Mesh Group</b>	The status of the mesh group ( <b>Active</b> or <b>Inactive</b> ).
<b>CSNP Int</b>	The CSNP interval.
<b>Level</b>	Indicates the IS-IS level of the neighbor ( <b>L1</b> , <b>L2</b> , or <b>L1L2</b> ).
<b>Adjacencies</b>	The number of adjacencies formed.

*output definitions (continued)*

---

<b>Desg IS</b>	The ID of the LAN Designated Intermediate System on this circuit at this level.
<b>Auth Type</b>	Indicates the authentication type ( <b>simple</b> , <b>MD5</b> , or <b>none</b> ) for the specified level.
<b>Metric</b>	The metric value of this circuit for a specific level.
<b>Hello Timer</b>	Indicates the Hello timer value.
<b>Hello Mult</b>	Indicates the Hello multiplier value.
<b>Priority</b>	The priority value of the interface.
<b>Passive</b>	Indicates whether the interface is configured as a passive interface ( <b>Yes</b> or <b>No</b> ).

## clear ip isis lsp-database

Clears and resets the IS-IS LSP database information.

**clear ip isis lsp-database** [**system-id** *sys-id*]

---

### Syntax Definitions

*sys-id*                                      The system ID of the router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

If the *sys-id* parameter is specified, only the entries specific to that system ID are removed from the database.

### Examples

```
-> clear ip isis lsp-database system-id 000a.1234.2345
```

### Release History

Release 6.2.1; command was introduced..

### Related Commands

# 25 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The Alcatel-Lucent implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545

---

**Note.** In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

---

---

**Note.** BGP is supported on the OmniSwitch 6850 Series, and 9000E switches but not on the OmniSwitch 6855 switches.

---

MIB information for BGP is as follows:

*Filename:* AlcatelIND1Bgp.MIB  
*Module:* ALCATEL-IND1-BGP-MIB

*Filename:* IETF\_BGP4.MIB  
*Module:* BGP4-MIB

The following table summarizes the available commands:

<b>Global BGP Commands</b>	<pre> ip load bgp ip bgp status ip bgp unicast ip bgp autonomous-system ip bgp bestpath as-path ignore ip bgp cluster-id ip bgp default local-preference ip bgp fast-external-failover ip bgp always-compare-med ip bgp bestpath med missing-as-worst ip bgp client-to-client reflection ip bgp as-origin-interval ip bgp synchronization ip bgp confederation identifier ip bgp maximum-paths ip bgp log-neighbor-changes ip bgp dampening ip bgp dampening clear show ip bgp show ip bgp statistics show ip bgp dampening show ip bgp dampening-stats show ip bgp path show ip bgp routes </pre>

## ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

**ip load bgp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the [ip bgp status](#) to start the BGP protocol.

### Examples

```
-> ip load bgp
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip bgp autonomous-system</a>	Configures the Autonomous system number for this BGP router.
<a href="#">ip bgp status</a>	Administratively enables or disables BGP.

### MIB Objects

alaDrcTmIPBgpStatus

---

## ip bgp status

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

**ip bgp status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables BGP.
<b>disable</b>	Disables BGP.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- You must first load the BGP software into running memory using the [ip load bgp](#) command before initiating this command.
- Many BGP commands require that the protocol be disabled ([ip bgp status](#)) before issuing them.

### Examples

```
-> ip bgp status enable  
-> ip bgp status disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip load bgp](#) Loads the BGP software.

### MIB Objects

```
alaBgpGlobal  
  alaBgpProtoStatus
```

---

## ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

**ip bgp unicast**

**no ip bgp unicast**

---

### Syntax Definitions

N/A

### Defaults

By default, BGP IPv4 advertisements are enabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogenous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

### Examples

```
-> ip bgp unicast  
-> no ip bgp unicast
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<a href="#">ipv6 bgp unicast</a>	Enables or disables unicast IPv6 updates for the BGP routing process.
<a href="#">show ip bgp</a>	Displays the current global settings for the local BGP speaker.
<a href="#">ip router router-id</a>	Configures the router ID for the router.

### MIB Objects

```
alaBgpGlobal  
  alaBgpMultiProtocolIpv4
```

---

## ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

**ip bgp bestpath as-path ignore**

**no ip bgp bestpath as-path ignore**

---

### Syntax Definitions

N/A

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the [ip bgp status](#) command) before using this command.

### Examples

```
-> ip bgp bestpath as-path ignore  
-> no ip bgp bestpath as-path ignore
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp aggregate-address as-set** Specifies whether AS path aggregation is to be performed or not.

**ip bgp policy aspath-list** Creates or removes an AS path list.

**ip bgp default local-preference** Configures the default local preference (lpref) value to be used when advertising routes.

## MIB Objects

alaBgpGlobal

alaBgpAsPathCompare

---

## ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

**ip bgp cluster-id** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address that is the Cluster ID of the router acting as a route reflector.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the [ip bgp status](#) command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

### Examples

```
-> ip bgp cluster-id 1.2.3.4
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp status](#)                      Enables and disables BGP.

[ip bgp client-to-client reflection](#) Enables route reflection and sets this speaker as the route reflector.

### MIB Objects

alaBgpGlobal  
alaBgpClusterId

---

## ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

**ip bgp default local-preference** *value*

---

### Syntax Definitions

*value* The default local preference value for this router. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	100

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

### Examples

```
-> ip bgp default local-preference 200
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp aggregate-address local-preference** Sets the local preference for a BGP aggregate.

**ip bgp network local-preference** Sets the local preference for a BGP network.

## MIB Objects

alaBgpGlobal

alaBgpDefaultLocalPref

---

## ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

**ip bgp fast-external-failover**

**no ip bgp fast-external-failover**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

### Examples

```
-> ip bgp fast-external-failover  
-> no ip bgp fast-external-failover
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">ip bgp neighbor clear</a>	Restarts a BGP peer.
<a href="#">ip bgp neighbor auto-restart</a>	Enables or disables BGP peer automatic restart.
<a href="#">ip bgp neighbor timers</a>	Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

## MIB Objects

alaBgpFastExternalFailOver

---

## ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

**ip bgp always-compare-med**

**no ip bgp always-compare-med**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the [ip bgp status](#) command) before using this command.

### Examples

```
-> ip bgp always-compare-med  
-> no ip bgp always-compare-med
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp bestpath med missing-as-worst](#) Configures the MED parameter when it is missing in a BGP path.

### MIB Objects

```
alaBgpGlobal  
  alaBgpMedAlways
```

---

---

## ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

**ip bgp bestpath med missing-as-worst**

**no ip bgp bestpath med missing-as-worst**

---

### Syntax Definitions

N/A

### Defaults

By default this command is disabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst ( $2^{32}-1$ ) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

### Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp always-compare-med** Forces BGP to consider MED values from external routes.

### MIB Objects

alaBgpGlobal  
alaBgpMissingMed

---

## ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

**ip bgp client-to-client reflection**

**no ip bgp client-to-client reflection**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the [ip bgp neighbor route-reflector-client](#) command to configure clients.
- The BGP protocol must be disabled (using the [ip bgp status](#) command) before using this command.

### Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp status** Administratively disables BGP in this router.

**ip bgp neighbor route-reflector-client** Configures a BGP peer to be a client to the this route reflector.

## MIB Objects

alaBgpGlobal

alaBgpRouteReflection

---

## ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

**ip bgp synchronization**

**no ip bgp synchronization**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

### Examples

```
-> ip bgp synchronization
-> no ip bgp synchronization
```

### Release History

Release 6.1; command was introduced.

## Related Commands

---

## ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

**ip bgp maximum-paths**

**no ip bgp maximum-paths**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the [ip bgp status](#) command) before using this command.

### Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

### Release History

Release 6.1; command was introduced.

### Related Commands

---

## ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

**ip bgp dampening** [**half-life** *half\_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max\_suppress\_time*]

**no ip bgp dampening**

---

### Syntax Definitions

<i>half_life</i>	The half-life duration, in seconds. The valid range is 0–65535.
<i>reuse</i>	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
<i>suppress</i>	The dampening cutoff value. The valid range is 1–9999.
<i>max_suppress_time</i>	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

### Defaults

parameter	value
<i>half_life</i>	300
<i>reuse</i>	200
<i>suppress</i>	300
<i>max_suppress_time</i>	1800

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

## Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

## Release History

Release 6.1; command was introduced.

## Related Commands

---

## ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

**ip bgp dampening clear**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

### Examples

```
-> ip bgp dampening clear
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp dampening](#) Enables or disables route dampening.

### MIB Objects

```
alaBgpGlobal  
  alaBgpDampeningClear
```

---

## ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

**ip bgp aggregate-address** *ip\_address ip\_mask*

[**status** {**enable** | **disable**}]

[**as-set**]

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**summary-only**]

**no ip bgp aggregate-address** *ip\_address ip\_mask*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address to be used as the aggregate address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address status** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.

## Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0  
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[ip bgp aggregate-address  
summary-only](#)

Enables or disables aggregate summarization, which suppresses more-specific routes.

## MIB Objects

```
alaBgpAggrAddr  
alaBgpAggrSet  
alaBgpAggrCommunity  
alaBgpAggrLocalPref  
alaBgpAggrMetric  
alaBgpAggrSummarize  
alaBgpAggrMask
```

---

## ip bgp aggregate-address status

Enables or disables a BGP aggregate route.

```
ip bgp aggregate-address ip_address ip_mask status {enable | disable}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for this aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<b>enable</b>	Enables this aggregate route.
<b>disable</b>	Disables this aggregate route.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the [ip bgp aggregate-address](#) command to configure individual aggregate parameters.
- The [show ip bgp path](#) command displays every aggregate currently defined.

### Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 status enable
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 status disable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp aggregate-address**      Creates an aggregate route.  
**show ip bgp path**              Displays aggregate routes.

## MIB Objects

alaBgpAggrTable  
    alaBgpAggrAddr  
    alaBgpAggrMask

---

## ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

**ip bgp aggregate-address** *ip\_address ip\_mask as-set*

**no ip bgp aggregate-address** *ip\_address ip\_mask as-set*

---

### Syntax Definitions

*ip\_address* 32-bit IP address.

*ip\_mask* 32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp aggregate-address** Creates and deletes a BGP aggregate route.

**MIB Objects**

  alaBgpAggrAddr  
  alaBgpAggrMask  
  alaBgpAggrSet

---

## ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

**ip bgp aggregate-address** *ip\_address ip\_mask community string*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>string</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.

### Defaults

---

parameter	default
<i>string</i>	none

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

You can revert the aggregate community string to its default value by setting the community string to “**none**”. For example:

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
```

### Release History

Release 6.1; command was introduced.

### Related Commands

    alaBgpAggrMask

    alaBgpAggrCommunity

---

## ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

**ip bgp aggregate-address** *ip\_address ip\_mask local-preference value*

**no ip bgp aggregate-address** *ip\_address ip\_mask local-preference value*

---

### Syntax Definitions

<i>ip_address</i>	An IP address for the aggregate route.
<i>ip_mask</i>	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The local preference attribute. The valid range is 0–4294967295

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp default local-preference** Sets the default local preference value for this AS.

  alaBgpAggrLocalPref

---

## ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

**ip bgp aggregate-address** *ip\_address ip\_mask metric value*

**no ip bgp aggregate-address** *ip\_address ip\_mask metric value*

---

### Syntax Definitions

*ip\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask that determines how many bits of the IP address denote the network number.

*value* The MED attribute. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp bestpath med missing-as-worst** Configures the MED for paths that do not contain a MED value.

**ip bgp always-compare-med** Forces BGP to use the MED for comparison of external routes.

## ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which suppresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

**ip bgp aggregate-address** *ip\_address ip\_mask* **summary-only**

**no ip bgp aggregate-address** *ip\_address ip\_mask* **summary-only**

---

### Syntax Definitions

*ip\_address* IP address for the aggregate route.

*ip\_mask* 32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

### Release History

---

## ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

**ip bgp network** *network\_address ip\_mask*

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**status** {**enable** | **disable**}]

**no ip bgp network** *network\_address ip\_mask*

---

### Syntax Definitions

*network\_address* 32-bit IP address.

*ip\_mask* 32-bit subnet mask that determines how many bits of the network address denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network status** command.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0
-> no ip bgp network 172.22.2.115 255.255.255.0
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[ip bgp network status](#) Enables a BGP network.

## MIB Objects

```

  alaBgpNetworkAddr  
  alaBgpNetworkMetric  
  alaBgpNetworkLocalPref  
  alaBgpNetworkCommunity  
  alaBgpNetworkMask
```

---

## ip bgp network status

Enables or disables a BGP network.

**ip bgp network** *network\_address ip\_mask* **status** {**enable** | **disable**}

---

### Syntax Definitions

<i>network_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<b>enable</b>	Enables this network.
<b>disable</b>	Disables this network.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up to 200 network entries. The **show ip bgp path** command displays every network currently defined.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 status enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp network**

Create a BGP network.

---

## ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

**ip bgp network** *network\_address ip\_mask community string*

---

### Syntax Definitions

<i>network_address</i>	32-bit IP address of the network.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<i>string</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.

### Defaults

---

parameter	default
<i>string</i>	none

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

You can revert the network community string to its default value by setting the community string to “**none**”. For example:

```
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
```

### Release History

Release 6.1; command was introduced.

  alaBgpNetworkCommunity

---

## ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ip bgp network** *network\_address ip\_mask local-preference value*

**no ip bgp network** *network\_address ip\_mask local-preference value*

---

### Syntax Definitions

<i>network_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask that determines how many bits of the network address denote the network number.
<i>value</i>	The local preference attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- ip bgp network** Creates or deletes a BGP network.
- ip bgp default local-preference** Sets the default local preference for this AS.

## **MIB Objects**

---

## ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

**ip bgp network** *network\_address ip\_mask metric value*

**no ip bgp network** *network\_address ip\_mask metric value*

---

### Syntax Definitions

<i>network_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask that determines how many bits of the network address denote the network number.
<i>value</i>	A MED attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>ip bgp network</b>	Creates or deletes a BGP network.

    alaBgpNetworkMetric

---

## ip bgp neighbor status

Enables or disables a BGP peer.

**ip bgp neighbor** *ip\_address* status {enable | disable}

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the new BGP peer.

**enable** Enables this peer.

**disable** Disables this peer.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ip bgp neighbor 172.22.2.115 status enable
-> ip bgp neighbor 172.22.2.115 status disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp neighbor** Creates a BGP peer.  
**show ip bgp neighbors** Displays peer parameters.

### MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr

---

---

## ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

**ip bgp neighbor** *ip\_address* **advertisement-interval** *value*

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the neighbor.

*value* An advertisement time interval in seconds. The valid range is 0–65535.

### Defaults

parameter	default
<i>value</i>	30

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

### Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip bgp neighbors](#) Displays BGP peer main status.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerRestart

---

## ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

**ip bgp neighbor** *ip\_address* **timers** *keepalive holdtime*

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address for the BGP peer.
<i>keepalive</i>	The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
<i>holdtime</i>	The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

### Defaults

parameter	default
<i>keepalive</i>	30
<i>holdtime</i>	90

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

### Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

### Release History

Release 6.1; command was introduced.

### Related Commands

#### **ip bgp neighbor conn-retry-interval**

The interval, in seconds, between BGP retries to set up a connection via the transport protocol with another peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  bgpPeerHoldTimeConfigured
  bgpPeerKeepAliveConfigured
```

---

## ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection via the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

**ip bgp neighbor** *ip\_address* **conn-retry-interval** *seconds*

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address for the neighbor.
<i>seconds</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>seconds</i>	120

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the **ip bgp neighbor auto-restart** command).
- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

### Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

### Release History

Release 6.1; command was introduced.

## Related Commands

- ip bgp neighbor auto-restart** Enable automatic session restart after a session termination.
- ip bgp neighbor clear** Restarts the peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  bgpPeerConnectRetryInterval

---

## ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

**ip bgp neighbor *ip\_address* auto-restart**

---

### Syntax Definitions

*ip\_address*                                32-bit IP address for the neighbor.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

### Examples

```
-> ip bgp neighbor 172.22.2.115 auto-restart  
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<code>ip bgp neighbor</code>	Creates a BGP peer.
<code>ip bgp neighbor status</code>	Enables a BGP peer.

  alaBgpPeerAddr  
  alaBgpPeerAutoRestart
```

---

## ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

**ip bgp neighbor** *ip\_address* **maximum-prefix** *maximum* [**warning-only**]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address of the BGP peer.  
*maximum*                         The maximum number of prefixes. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>threshold</i>	5000

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000  
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp neighbor clear**                      Restarts the BGP peer.

**MIB Objects**

alaBgpPeerTable

  alaBgpPeerAddr

  alaBgpPeerMaxPrefixWarnOnly

  alaBgpPeerMaxPrefix

---

## ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

**ip bgp neighbor** *ip\_address* **md5 key** {*string* | **none**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	The MD5 public key. Maximum character length is 200.
<b>none</b>	Removes the MD5 public key.

### Defaults

---

parameter	default
<i>string</i>	no password

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used for snapshot files is as follows:

**ip bgp neighbor** *ip\_address* **md5 key-encrypt** *encrypted\_string*

However, you should not use this syntax to actually set an MD5 password; it will not work.

- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip bgp neighbor clear** Restarts the BGP peer.

## MIB Objects

  alaBgpPeerAddr  
  alaBgpPeerMD5Key

---

## Related Commands

- ip bgp neighbor** Creates or deletes a BGP peer.
- ip bgp neighbor next-hop-self** Sets the BGP peer to use next hop processing behavior.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerMultiHop

---

## ip bgp neighbor description

Configures the BGP peer name.

**ip bgp neighbor** *ip\_address* **description** *string*

---

### Syntax Definitions

*ip\_address*                                    32-bit IP address of the BGP peer.

*string*                                        Peer name (1 - 20 characters).

### Defaults

parameter	default
<i>string</i>	peer(ip_address)

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

### Examples

```
-> ip bgp neighbor 172.22.2.115 description "peer for building 3"
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp neighbor**                                Sets the IP address for the peer.

### MIB Objects

alaBgpPeerTable  
    alaBgpPeerAddr  
    alaBgpPeerName

---

## ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

**ip bgp neighbor *ip\_address* next-hop-self**

**no ip bgp neighbor *ip\_address* next-hop-self**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (via other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self  
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[ip bgp neighbor](#)

Creates or deletes a BGP peer.

## MIB Objects

alaBgpPeerTable

  alaBgpPeerAddr

  alaBgpPeerNextHopSelf

---

## ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

**ip bgp neighbor** *ip\_address* **passive**

**no ip bgp neighbor** *ip\_address* **passive**

---

### Syntax Definitions

*ip\_address*                                      32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 passive
-> no ip bgp neighbor 172.22.2.115 passive
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp neighbor](#)                                      Creates or deletes a BGP peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerPassive
```

---

## Related Commands

- ip bgp autonomous-system** Set the AS for the local BGP speaker.
- ip bgp neighbor** Create a BGP peer.
- ip bgp neighbor status enable** Enables a BGP peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerAS

---

## ip bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

**ip bgp neighbor *ip\_address* remove-private-as**

**no ip bgp neighbor *ip\_address* remove-private-as**

---

### Syntax Definitions

*ip\_address*                                 32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 remove-private-as  
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp neighbor remote-as](#)           Configures the AS number for this peer.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerRemovePrivateAs
```

## ip bgp neighbor soft-reconfiguration

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

**ip bgp neighbor *ip\_address* soft-reconfiguration**

**no ip bgp neighbor *ip\_address* soft-reconfiguration**

---

### Syntax Definitions

*ip\_address*                                32-bit IP address of the BGP peer.

### Default

This command is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- By default BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the inbound policy changes, the peer will have to be restarted using the [ip bgp neighbor in-prefix6list](#) command.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration  
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```

### Release History

Release 6.1; command was introduced.

## Related Commands

- `ip bgp neighbor clear` Restarts this BGP peer.
- `ip bgp neighbor in-prefix6list` Resets inbound policies to this peer.

## MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerSoftReconfig
```

---

---

## ip bgp neighbor stats-clear

Clears the statistics for a peer.

**ip bgp neighbor** *ip\_address* **stats-clear**

---

### Syntax Definitions

*ip\_address*                      32-bit IP address of the BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ip bgp neighbors statistics](#).

### Examples

```
-> ip bgp neighbor 172.22.2.115 stats-clear
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip bgp neighbors statistics](#) Displays peer statistics.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerClearCounter
```

---

## ip bgp confederation neighbor

Configures this peer as a member of the same confederation as the local BGP speaker.

**ip bgp confederation neighbor** *ip\_address*

**no ip bgp confederation neighbor** *ip\_address*

---

### Syntax Definitions

*ip\_address*                                32-bit IP address of the peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp confederation neighbor 172.22.2.115  
-> no ip bgp confederation neighbor 172.22.2.115
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp confederation identifier** Sets a confederation identification value for the local BGP speaker (this router).

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerConfedStatus
```

---

## ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

**ip bgp neighbor** *ip\_address* **update-source** [*interface\_name*]

---

### Syntax Definitions

*ip\_address*                      The 32-bit IP address for this peer.

*interface\_name*                 The name of the interface.

### Defaults

parameter	default
<i>interface_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the **ip bgp neighbor** command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted via this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

### Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117
-> ip bgp neighbor 172.22.5.115 update-source vlan-22
-> ip bgp neighbor 172.22.5.115 update-source
```

### Release History

Release 6.1; command was introduced.  
 Release 6.2.1; *interface\_address* parameter deprecated.

## Related Commands

**ip bgp neighbor**

Sets the router identification for a BGP peer.

## MIB Objects

alaBgpPeerTable

  alaBgpPeerAddr

  alaBgpPeerLocalAddr

  alaBgpPeerLocalIntfName

---

## ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

```
ip bgp neighbor ip_address in-aspathlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Inbound AS path list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAspathListIn
```

---

## ip bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ip bgp neighbor ip_address in-communitylist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Input community list (0 to 70 characters. This name is case sensitive).
<b>none</b>	Removes this community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The community filter list name (**InboundCommList** in the example below) is created using the **ip bgp policy community-list** command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- To deassign an input community filter list, use this command to assign a value of “**none**.”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-communitylist InboundCommList  
-> ip bgp neighbor 172.22.2.115 in-communitylist none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp policy community-list** Creates or deletes a community list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerCommunityListIn
```

---

---

## ip bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address in-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>string</i>	Input prefix filter list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes the prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- To deassign an input prefix filter list, use this command to assign a value of “**none.**”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefixlist InboundPrefix
-> ip bgp neighbor 172.22.2.115 in-prefixlist none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerPrefixListIn
```

---

## ip bgp neighbor in-prefix6list

Configures an inbound BGP prefix6-list policy for an IPv4 BGP peer.

```
ip bgp neighbor peer_address in-prefix6list pfx_list_name
```

---

### Syntax Definitions

<i>peer_address</i>	The 32-bit IPv4 address of the BGP peer.
<i>pfx_list_name</i>	An output prefix list name ( 1 - 70 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E , 9000E

### Usage Guidelines

- The prefix list name (**uniqLocal** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to the outbound policy.
- BGP neighbor must be configured.

### Examples

```
-> ip bgp neighbor 10.0.0.1 in-prefix6list uniqLocal
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerPrefix6ListIn
```

---

---

## ip bgp neighbor out-prefix6list

Configures an outgoing BGP prefix6-list policy for an IPv4 BGP peer.

```
ip bgp neighbor peer_address out-prefix6list pfx_list_name
```

---

### Syntax Definitions

<i>peer_address</i>	The 32-bit IPv4 address of the BGP peer.
<i>pfx_list_name</i>	An Output prefix list name (1 - 70 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The prefix list name (**uniqLocal** in the example below) is created using the **ip bgp policy prefix6-list** command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- BGP neighbor must be configured.

### Examples

```
-> ip bgp neighbor 10.0.0.1 out-prefix6list uniqLocal
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

**ip bgp policy prefix6-list** Creates or deletes a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerPrefix6ListOut
```

---

## ip bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

**ip bgp neighbor** *ip\_address* **out-aspathlist** {*string* / **none**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
<b>none</b>	Removes the AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- To deassign an output AS path filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-aspathlist OutboundASpath
-> ip bgp neighbor 172.22.2.115 out-aspathlist none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp policy aspath-list** Creates or removes an AS path list.

### MIB Objects

alaBgpPeerTable  
    alaBgpPeerAspathListOut

---

---

## ip bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

```
ip bgp neighbor ip_address out-communitylist {string | none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Outbound community list (0 - 70 characters).
none	Removes the community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- To deassign an output community filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-communitylist OutboundCommlist
-> ip bgp neighbor 172.22.2.115 out-communitylist none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp policy community-list** Creates or deletes a community list.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerCommunityListOut
```

---

## ip bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address out-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Output prefix filter list (0 - 70 characters).
<b>none</b>	Removes the prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- To deassign an output prefix filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefixlist OutboundPrefix  
-> ip bgp neighbor 172.22.2.115 out-prefixlist none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefixListOut
```

---

## ip bgp neighbor route-map

Assigns an inbound policy map to a BGP peer.

```
ip bgp neighbor ip_address route-map {string | none} {in | out}
```

```
no ip bgp neighbor ip_address route-map {in | out}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the peer.
<i>string</i>	Inbound policy map name (0 to 70 characters). This name is case sensitive.
<b>none</b>	Deletes the route map if entered rather than a text string.
<b>in</b>	Designates this route map policy as an inbound policy.
<b>out</b>	Designates this route map policy as an outbound policy.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to deassign an inbound map.
- The policy route map name (**peeringPointAMap** in the example below) is created using the **ip bgp policy prefix6-list** command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

### Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[ip bgp policy prefix6-list](#)      Creates or deletes a policy route map.

## MIB Objects

alaBgpPeerTable  
    alaBgpPeerRouteMapOut  
    alaBgpPeerRouteMapIn

---

---

## ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

**ip bgp neighbor** *ip\_address* **clear soft** {**in** | **out**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for the BGP peer.
<b>in</b>	Applies reconfiguration to the inbound policies.
<b>out</b>	Applies reconfiguration to the outbound policies.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

### Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp neighbor soft-reconfiguration](#) Enables or disables BGP peer soft reconfiguration.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerReconfigureInBound
  alaBgpPeerReconfigureOutBound
```

---

## ip bgp policy aspath-list

Creates or removes an AS path list.

**ip bgp policy aspath-list** *name* “*regular\_expression*”

**no ip bgp policy aspath-list** *name* “*regular\_expression*”

---

### Syntax Definitions

*name* AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.

*regular\_expression* Regular expression, e.g., “^100 200\$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

### Defaults

No IP BGP peer policy AS path-list exists.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Valid regular expression characters (metacharacters) are shown in the table below. See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

---

Symbol	Description
^	Matches the beginning of the AS path list.
123	Matches the AS number 123.
.	Matches any single AS number.
?	Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.
+	Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
*	Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
(	Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence.

---

Symbol	Description
	Separates AS numbers in an alternation sequence.
)	Ends an alternation sequence of AS numbers
[	Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range.
-	Separates the endpoints of a range.
]	Ends a range pair.
\$	Matches the end of the AS path list.
,_	Commas, underscores and spaces are ignored.

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-aspathlist** and **ip bgp neighbor in-prefix6list** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp** command.

## Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"
-> ip bgp policy aspath-list OutboundAspath "^300 400$"
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-aspathlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor in-prefix6list</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
<b>ip bgp policy aspath-list priority</b>	Configures priority for processing regular expressions in an AS path list.

## MIB Objects

alaBgpAspathMatchListTable  
  alaBgpAspathMatchListRowStatus

---

## ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

**ip bgp policy aspath-list** *name* "*regular\_expression*" **action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
<b>permit</b>   <b>deny</b>	permit

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 25-97 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer's inbound and outbound routes configured via the [ip bgp neighbor in-aspathlist](#) and [ip bgp neighbor in-prefix6list](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp](#) command.

### Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" action permit
-> ip bgp policy aspath-list OutboundAspath "^300 400$" action deny
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-aspathlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor in-prefix6list</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list</b>	Creates or removes an AS path list.
<b>ip bgp policy aspath-list priority</b>	Configures priority for processing regular expressions in an AS path list.

## MIB Objects

```
alaBgpAspathMatchListTable  
    alaBgpAspathMatchListAction
```

---

## ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

**ip bgp policy aspath-list** *name* "*regular\_expression*" **priority** *value*

---

### Syntax Definitions

<i>name</i>	The AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	A regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<i>value</i>	A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 25-97 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer's inbound and outbound routes configured via the [ip bgp neighbor in-aspathlist](#) and [ip bgp neighbor in-prefix6list](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp](#) command.

### Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

## Release History

Release 6.1; command was introduced.

## Related Commands

- ip bgp neighbor in-prefix6list** Assigns an outbound AS path list filter to a BGP peer.
- ip bgp policy aspath-list** Creates or removes an AS path list.
- ip bgp policy aspath-list action** Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.

## MIB Objects

alaBgpAspathMatchListTable  
  alaBgpAspathMatchListPriority

---

## ip bgp policy community-list

Creates or deletes a community list.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

**no ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

No IP BGP peer policy community-list exists.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist** and **ip bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp** command.

### Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> ip bgp policy community-list none
-> no ip bgp policy community-list CommListAIn 400:20
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with a community string list.
<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListRowStatus

---

## ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
<b>permit   deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

By default, this command allows routes that match the criteria specified in the community list to pass.

### Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with a community string list.
<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListAction

---

## ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**match-type** {**exact** | **occur**}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<b>exact</b>	Checks for an exact match of the community string and the community attribute.
<b>occur</b>	Checks for an occurrence of the community string anywhere in the community attribute.

### Defaults

parameter	default
<b>exact</b>   <b>occur</b>	exact

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

### Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

### Release History

Release 6.1; command was introduced.

## Related Commands

## ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**priority** *value*

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<i>value</i>	Priority value in the range 0 - 255.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

### Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>ip bgp policy community-list</b>	Creates or deletes a community list.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.

## MIB Objects

```
alaBgpCommunityMatchListTable  
  alaBgpCommunityMatchListPriority
```

---

## ip bgp policy prefix-list

Creates or deletes a prefix match list.

**ip bgp policy prefix-list** *name ip\_address ip\_mask*

**no ip bgp policy prefix-list** *name ip\_address ip\_mask*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.

### Defaults

No IP BGP policy prefix-list exists.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefixlist** and **ip bgp neighbor out-prefixlist** commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the **show ip bgp** command.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- ip bgp policy prefix-list action** Configures action to be taken for a prefix list when a match is found.
- ip bgp policy prefix-list ge** Configures lower limit on length of prefix to be matched.
- ip bgp policy prefix-list le** Configures upper limit on length of prefix to be matched.

### MIB Objects

alaBgpPrefixMatchListTable  
  alaBgpPrefixMatchListRowStatus

---

## ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

```
ip bgp policy prefix-list name ip_address ip_mask action {permit | deny}
```

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address of the prefix list.
<i>ip_mask</i>	Mask for the prefix list.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
permit   deny	permit

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip bgp policy prefix-list</a>	Creates or deletes a prefix match list.
<a href="#">ip bgp policy prefix-list ge</a>	Configures lower limit on length of prefix to be matched.
<a href="#">ip bgp policy prefix-list le</a>	Configures upper limit on length of prefix to be matched.

### MIB Objects

```
alaBgpPrefixMatchListTable
  alaBgpPrefixMatchListAction
```

---

## ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

**ip bgp policy prefix-list** *name ip\_address ip\_mask ge value*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address of the prefix list.
<i>ip_mask</i>	Mask of the prefix list.
<i>value</i>	The lower limit value in the range 0 to 32.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the **ip bgp policy prefix-list le** command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

### Release History

Release 6.1; command was introduced.

---

## ip bgp policy prefix-list le

Configures the upper limit on the length of the prefix to be matched.

**ip bgp policy prefix-list** *name ip\_address ip\_mask le value*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	Prefix list IP address for the prefix list.
<i>ip_mask</i>	Prefix list mask for the prefix list.
<i>value</i>	The upper limit value in the range of 0 to 32.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched. This command is used in conjunction with **ip bgp policy prefix-list ge** to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

### Release History

  alaBgpPrefixMatchListLE
```

---

## ip bgp policy prefix6-list

Configures a BGP prefix6-list policy for filtering IPv6 prefixes. This policy can be applied to filter unique local IPv6 addresses.

```
ip bgp policy prefix6-list pxf_list_name prefix6/pxf_length [action{permit|deny}]  
[status{enable|disable}] [ge{masklength}] [le{masklength}]
```

```
no ip bgp policy prefix6-list pxf_list_name prefix6/pxf_length [action{permit|deny}]  
[status{enable|disable}] [ge{masklength}] [le{masklength}]
```

---

### Syntax Definitions

<i>pxf_list_name</i>	Prefix list name.
<i>prefix6</i>	Prefix list IPv6 address for the prefix list.
<i>pxf_length</i>	Prefix length. Prefix length should be in the range of 0 to 128.
<b>permit</b>   <b>deny</b>	Action to be taken which can be either permit or deny.
<b>enable</b>   <b>disable</b>	Row Status can be either enabled or disabled.
<i>masklength</i>	Minimum length of the prefix to be matched. It should be in the range of 0 - 32.
<i>masklength</i>	Maximum length of the prefix to be matched. It should be in the range of 0 - 32.

### Defaults

NA

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48  
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit  
-> ip bgp policy prefix6-list uniqLocal FC00::/48 status enable  
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

**show ip bgp policy prefix6-list** Displays configured prefix6-list policies on the system.

**show ipv6 bgp neighbors policy** Displays incoming and outgoing prefix6 list policy indentifiers configured for BGP IPv6 peer.

## MIB Objects

```
alaBgpPrefix6MatchListTable  
  alaBgpPrefix6MatchListId  
  alaBgpPrefix6MatchListAddr  
  alaBgpPrefix6MatchListAddrLength

  alaBgpPrefix6MatchListRowStatus  
  alaBgpPrefix6MatchListGE  
  alaBgpPrefix6MatchListLE
```

---

## ip bgp policy route-map

Creates or deletes a policy route map.

**ip bgp policy route-map** *name sequence\_number*

---

### Syntax Definitions

<i>name</i>	Route map name. Case-sensitive.
<i>sequence_number</i>	Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
  1. **ip bgp policy route-map aspath-list**
  2. **ip bgp policy route-map prefix-list**
  3. **ip bgp policy route-map community-list**
  4. **ip bgp policy route-map match-regexp**
  5. **ip bgp policy route-map match-prefix**
  6. **ip bgp policy route-map match-mask**
  7. **ip bgp policy route-map match-community**
- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
  - **ip bgp policy route-map community**
  - **ip bgp policy route-map community-mode**
  - **ip bgp policy route-map lpref**
  - **ip bgp policy route-map lpref-mode**
  - **ip bgp policy route-map med**
  - **ip bgp policy route-map med-mode**
  - **ip bgp policy route-map origin**

- [ip bgp policy route-map weight](#)
- Route maps can be referenced as a filtering mechanism for displaying paths using the [show ip bgp path](#) command. They are also referenced in filtering inbound and outbound routes for BGP peers using the [ip bgp neighbor route-map](#) commands.

### Examples

```
-> ip bgp policy route-map routemap1 1
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy route-map action](#) Configures action to be taken for a route when a match is found.

### MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapRowStatus
```

---

## ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

**ip bgp policy route-map** *name sequence\_number action {permit | deny}*

---

### Syntax Definitions

<i>name</i>	A route map name.
<i>sequence_number</i>	A route map sequence number. The valid range is 1–255.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined.

### Defaultst

---

parameter	default
permit   deny	permit

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

### Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapAction

---

## ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

**ip bgp policy route-map** *name sequence\_number aspath-list as\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>as_name</i>	The AS path list name or “none”.

### Defaults

parameter	default
<i>as_name</i>	none

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The **ip bgp policy aspath-list** and **ip bgp policy aspath-list action** commands are used to create and set permit/deny actions for an AS path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1
-> ip bgp policy route-map routemap1 1 aspath-list none
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ip bgp policy prefix6-list** Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapAsPathMatchListId

---

## ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

**ip bgp policy route-map** *name* *sequence\_number* **asprepend** *path*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>path</i>	The AS path to prepend or “none”. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

### Defaults

---

parameter	default
<i>path</i>	none

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none”.

### Examples

```
-> ip bgp policy route-map routemap1 1 asprepend "700 800 900"
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
  alaBgpRouteMapAsPrepend

---

## ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

**ip bgp policy route-map** *name sequence\_number* **community** [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

parameter	default
<i>string</i>	none

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to “**none**”.
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

### Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

### Release History

Release 6.1; command was introduced.

## Related Commands

alaBgpRouteMapCommunity

---

---

## ip bgp policy route-map community-list

Assigns a community matching list to the route map.

**ip bgp policy route-map** *name* *sequence\_number* **community-list** *name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>name</i>	The community list name, or “none”.

### Defaults

parameter	default
<i>name</i>	none

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.

### Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
```

### Release History

Release 6.1; command was introduced.

### Related Commands

## ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

**ip bgp policy route-map** *name sequence\_number* **community-mode** {**add** | **replace**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>add</b>	Adds the community string specified in the command <b>ip bgp policy route-map community</b> .
<b>replace</b>	Replaces the community string specified in the command <b>ip bgp policy route-map community</b> .

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>add   replace</b>	<b>add</b>

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

### Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

### Release History

Release 6.1; command was introduced.

## Related Commands

alaBgpRouteMapSetCommunityMode

---

## ip bgp policy route-map lpref

Configures the local preference value for the route map.

**ip bgp policy route-map** *name sequence\_number lpref value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The local preference value. The valid range is 0–4294967295

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used in conjunction with [ip bgp policy route-map lpref-mode](#). The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

### Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

### Release History

Release 6.1; command was introduced.

### Related Commands

## ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

**ip bgp policy route-map** *name sequence\_number* **lpref-mode** {**none** | **inc** | **dec** | **rep**}

---

### Syntax Definitions

<b>name</b>	The route map name.
<b>sequence_number</b>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Do not set the local preference attribute.
<b>inc</b>	Increment the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no local preference attribute is found in the matching route.
<b>dec</b>	Decrement the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no local preference attribute is found in the matching route.
<b>rep</b>	Replace the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command even if no local preference attribute is found in the matching route.

### Defaults

parameter	default
<b>none</b>   <b>inc</b>   <b>dec</b>   <b>rep</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

### Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

### Release History

Release 6.1; command was introduced.

## ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

**ip bgp policy route-map** *name sequence\_number match-community* [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Removes the community match from the route-map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes matching the community restricting advertisement to any peer.
<b>no-export-subconfed</b>	Routes matching the community restricting advertisement to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

parameter	default
<i>community_string</i>	none

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command allows a matching community string primitive to be placed directly in the route map. By default, no community string is specified. The default behavior can be reset by changing the value to “none”.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

### Release History

Release 6.1; command was introduced.

## Related Commands

---

## ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

**ip bgp policy route-map** *name* *sequence\_number* **match-mask** *ip\_address*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching mask or “none”.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified. The default behavior can be reset by changing the value to “none”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-prefix](#) command.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

### Release History

Release 6.1; command was introduced.

---

## ip bgp policy route-map match-prefix

Configures a matching prefix primitive in the route map.

**ip bgp policy route-map** *name* *sequence\_number* **match-prefix** *ip\_address*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching prefix.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-mask](#) command.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip bgp policy route-map match-mask](#) Configures a matching prefix primitive in the route map.

[ip bgp policy prefix6-list](#) Configures an AS path matching regular expression primitive in the route map.

### MIB Objects

 alaBgpRouteMapMatchPrefix

---

## ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

**ip bgp policy route-map** *name sequence\_number match-regexp* “*regular\_expression*”

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>regular_expression</i>	Regular expression or “none”. The regular expression must be enclosed by quotation marks.

### Defaults

parameter	default
<i>regular_expression</i>	none

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in [ip bgp policy aspath-list](#) on page 25-97.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to “**none**”.
- See the related *Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

### Release History

Release 6.1; command was introduced.

## ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

**ip bgp policy route-map** *name sequence\_number med value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The MED value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med-mode](#) command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

### Release History

Release 6.1; command was introduced.

## ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

**ip bgp policy route-map** *name sequence\_number med-mode* {**none** | **inc** | **dec** | **rep**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Do not set the MED.
<b>inc</b>	Increment the MED in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no MED is found in the matching route.
<b>dec</b>	Decrement the MED in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no MED is found in the matching route.
<b>rep</b>	Replace the MED in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command even if no MED is found in the matching route.

### Defaults

parameter	default
<b>none</b>   <b>inc</b>   <b>dec</b>   <b>rep</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map med**. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

### Release History

Release 6.1; command was introduced.

---

## ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

**ip bgp policy route-map** *name sequence\_number* **origin** {**igp** | **egp** | **incomplete** | **none**}

---

### Syntax Definitions

<i>name</i>	Route map name.
<i>sequence_number</i>	Route map sequence number. Valid range 1–255.
<b>igp</b>	Sets the origin attribute to remote internal BGP (IGP).
<b>egp</b>	Sets the origin attribute to local external BGP (EGP).
<b>incomplete</b>	Sets the origin attribute to incomplete, meaning the origin is unknown.
<b>none</b>	Sets the origin attribute to “none”.

### Defaults

---

parameter	default
<b>igp</b>   <b>egp</b>   <b>incomplete</b>   <b>none</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “**none**”.

### Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

### Release History

Release 6.1; command was introduced.

## Related Commands

  alaBgpRouteMapOrigin

---

## ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

**ip bgp policy route-map** *name* *sequence\_number* **prefix-list** *prefix\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>prefix_name</i>	The prefix list name or “none”.

### Defaults

parameter	default
<i>prefix_name</i>	none

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.
- The [ip bgp policy prefix-list](#), [ip bgp policy prefix-list action](#), [ip bgp policy prefix-list ge](#), and [ip bgp policy prefix-list le](#) commands are used to create and set permit/deny actions for a prefix path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

### Release History

Release 6.1; command was introduced.

## MIB Objects

alaBgpRouteMapTable  
  alaBgpRouteMapPrefixMatchListId

---

## ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

**ip bgp policy route-map** *name sequence\_number weight value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The weight value. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

### Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

### Release History

Release 6.1; command was introduced.

### Related Commands

---

---

## ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

**ip bgp policy route-map** *name* *sequence\_number* **community-strip** *community\_list*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>community_list</i>	The community list name.

### Defaults

No IP BGP policy route-map community list exists.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

### Examples

```
-> ip bgp policy route-map routemap1 1 community_strip communitylist
```

### Release History

Release 6.1; command was introduced.

---

## show ip bgp

Displays the current global settings for the local BGP speaker.

**show ip bgp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 9000E

### Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

### Examples

```
-> show ip bgp
Admin Status                = disabled,
Operational Status         = down,
Autonomous system Number   = 1,
BGP Router Id              = 128.0.1.4,
Confederation Id           = 0,
IGP Synchronization Status = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference   = 100,
Route Reflection           = disabled,
Cluster Id                 = 0.0.0.0,
Missing MED Status         = Best,
Aspath Comparison          = enabled,
Always Compare MED         = disabled,
Fast External Fail Over    = disabled,
Log Neighbor Changes       = disabled,
Multi path                 = disabled,
Graceful Restart           = enabled,
Graceful Restart Status    = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast               = enabled,
IPv6 Unicast               = disabled
```

### *output definitions*

---

<b>Admin Status</b>	Indicates whether the BGP protocol has been enabled or disabled through the <b>ip bgp status</b> command.
<b>Operational Status</b>	Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.

*output definitions (continued)*

---

<b>Autonomous system Number</b>	The AS assigned to the local BGP speaker through the <b>ip bgp autonomous-system</b> command.
<b>BGP Router Id</b>	The IP address for the local BGP speaker.
<b>Confederation Id</b>	Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the <b>ip bgp confederation identifier</b> command.
<b>IGP Synchronization Status</b>	Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). This value is configured through the <b>ip bgp synchronization</b> command.
<b>Minimum AS origin interval</b>	The frequency, in seconds, at which routes local to the autonomous system are advertised. This value is configured through the <b>ip bgp as-origin-interval</b> command.
<b>Default Local Preference</b>	The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the <b>ip bgp default local-preference</b> command.
<b>Route Reflection</b>	Indicates whether the local BGP speaker is acting as a route reflector for its AS. This value is configured through the <b>ip bgp client-to-client reflection</b> command.
<b>Cluster Id</b>	The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. This value is configured through the <b>ip bgp cluster-id</b> command.
<b>Missing MED Status</b>	Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value ( $2^{32}-1$ ) or the best possible value (0). This value is set using the <b>ip bgp bestpath med missing-as-worst</b> command. By default, missing MED values are treated as <b>best</b> .
<b>Aspath Comparison</b>	Indicates whether the AS path will be in used in determining the best route. This value is configured through the <b>ip bgp bestpath as-path ignore</b> command.
<b>Always Compare MED</b>	Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. This value is configured through the <b>ip bgp always-compare-med</b> command.
<b>Fast External Fail Over</b>	Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. This value is configured through the <b>ip bgp fast-external-failover</b> command.
<b>Log Neighbor Changes</b>	Indicates whether logging of peer state changes is enabled or disabled. This value is configured through the <b>ip bgp log-neighbor-changes</b> command.
<b>Multi path</b>	Indicates whether support for multiple equal cost paths is enabled or disabled. This value is configured through the <b>ip bgp maximum-paths</b> command.
<b>Graceful Restart</b>	Indicates whether graceful restart is enabled or disabled.

*output definitions (continued)*

---

<b>Graceful Restart Status</b>	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
<b>Configured Graceful Restart Interval</b>	Indicates the timer for achieving a graceful restart.
<b>IPv4 Unicast</b>	Indicates whether IPv4 unicast is enabled or disabled.
<b>IPv6 Unicast</b>	Indicates whether IPv6 unicast is enabled or disabled.

---

## show ip bgp statistics

Displays BGP global statistics.

**show ip bgp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

### Examples

```
-> show ip bgp statistics
# of Active Prefixes Known           = 0,
# of EBGP Neighbors in Established State = 0,
# of IBGP Neighbors in Established State = 0,
# of Feasible Paths                  = 0,
# of Dampened Paths                  = 0,
# of Unsynchronized Paths            = 0,
# of Policy unfeasible paths         = 0,
Total Number of Paths                = 0
```

### *output definitions*

---

<b># of Active Prefixes Known</b>	The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.
<b># of EBGP Neighbors in Established State</b>	The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.
<b># of IBGP Neighbors in Established State</b>	The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to.
<b># of Feasible Paths</b>	The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol.
<b># of Dampened Paths</b>	The number of route paths that are not active because they have violated dampening parameters.
<b># of Unsynchronized Paths</b>	The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol.

*output definitions (continued)*

---

<b># of Unfeasible Paths</b>	The number of route paths that are not active because they are not permitted based on a configured BGP policy.
<b>Total Number of Paths</b>	The total number of paths known to the speaker, active or not.

---

## show ip bgp dampening

Displays the BGP route dampening settings.

```
show ip bgp dampening
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

### Examples

```
-> show ip bgp dampening
Admin Status           = disabled,
Half life value (seconds) = 300,
Reuse value           = 200
Suppress value        = 300,
Max suppress time (seconds) = 1800,
```

#### *output definitions*

---

<b>Admin Status</b>	Indicates whether route dampening is enabled or disabled. This value is configured through the <b>ip bgp dampening</b> command.
<b>Half life value</b>	The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the <b>ip bgp dampening</b> command.
<b>Reuse value</b>	The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the <b>ip bgp dampening</b> command.
<b>Suppress value</b>	The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the <b>ip bgp dampening</b> command.
<b>Max Suppress time</b>	The maximum time (in seconds) that a route will be suppressed. This value is configured through the <b>ip bgp dampening</b> command.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### [ip bgp dampening](#)

Enables or disables BGP route dampening or the suppression of unstable routes.

## MIB Objects

```

```

---

## show ip bgp dampening-stats

Displays BGP dampening statistics.

```
show ip bgp dampening-stats [ip_address ip_mask] [peer_address]
```

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
<i>peer_address</i>	A 32-bit IP address of peer (neighbor).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

### Examples

```
-> show ip bgp dampening-stats
```

Network	Mask	From	Flaps	Duration	FOM
155.132.44.73	255.255.255.255	192.40.4.121	8	00h:00m:35s	175

#### *output definitions*

---

<b>Network</b>	The IP address for the local BGP speaker that is responsible for route dampening in this router.
<b>Mask</b>	The mask for the local BGP speaker that is responsible for route dampening in this router.
<b>From</b>	The IP address for the route that is flapping.
<b>Flaps</b>	The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.

*output definitions (continued)*

---

<b>Duration</b>	The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.
<b>FOM</b>	The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in <a href="#">ip bgp dampening</a> ), then this route will no longer be advertised.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[ip bgp dampening](#) Enables and disables route dampening.

---

## show ip bgp path

Displays BGP paths.

### show ip bgp path

```
[ip_addr ip_address ip_mask]
[peer_addr peer_address]
[aspath-list aspathlist_name]
[community-list community_list_name]
[prefix-list prefix_name]
[route-map routemap_name]
[cidr-only]
[community community_number]
[neighbor_rcv rcv_peer_address]
[neighbor_adv adv_peer_addr]
[regexp "regular_expression"]
[best]
```

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address of the path.
<i>ip_mask</i>	A 32-bit subnet mask of the path.
<i>peer_address</i>	A 32-bit IP address of the path on which to filter.
<i>aspathlist_name</i>	AS path on which to filter.
<i>community_list_name</i>	Community name on which to filter.
<i>prefix_name</i>	Prefix on which to filter.
<i>routemap_name</i>	Route map on which to filter.
<b>cidr-only</b>	Filter out everything except CIDR routes.
<i>community_number</i>	Community number on which to filter.
<i>rcv_peer_address</i>	Filter all except paths received from this path.
<i>adv_peer_addr</i>	Filter all except paths sent to this path.
<i>regular_expression</i>	Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, "\$100".
<b>best</b>	Show only the best path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.

## Examples

```
-> show ip bgp path
```

Legends: Sta = Path state

> = best, F = feasible, S = Stale

P = policy changing, U = un-synchronized

D = dampened, N = none

Nbr = Neighbor

(O) = Path Origin (? = incomplete, i = igp, e = egp)

degPref = degree of preference

Sta	Network	Mask	Nbr address	Next Hop	(O)	degPref
>	192.40.4.0	255.255.255.0	192.40.4.29	192.40.4.29	i100	
>	192.40.6.0	255.255.255.248	192.40.4.29	192.40.4.29	i100	
>	192.40.6.8	255.255.255.248	192.40.4.29	192.40.4.29	i100	
U	110.100.10.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	? 100	
U	110.100.11.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	? 100	
U	110.100.12.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	? 100	
U	110.100.13.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	? 100	
U	110.100.14.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	? 100	

### output definitions

<b>Sta</b>	Status flag. “>” Best Path: Indicates this is the best route to the destination. “F” Feasible: The alternate path available when the best path goes down. “S” Stale: Indicates the peer that advertised this route's next hop is in the process of graceful restart. “P” Policy Changing: Indicates that a policy being applied may change the route. “U” Unsyncronized: Making a path unfeasible forcefully when a nexthop is not reachable or if the local bgp network is deleted." “D” Dampened: Indicates that this route is being dampened to prevent flapping. “N” None: No path available.
<b>Network</b>	The IP address for this route path. This is the destination of the route.
<b>Mask</b>	The mask for this route path.
<b>Nbr address</b>	The IP or IPv6 address of the BGP peer that is advertising this path.
<b>Next Hop</b>	The next hop along the route path.
<b>(O)</b>	The origin attribute of this route path. A question mark (?) indicates incomplete, and <b>i</b> indicates IGP, and an <b>e</b> indicates EGP.
<b>degPref</b>	The local preference value assigned to this route path.

```
-> show ip bgp path ip-addr 192.40.6.72 255.255.255.248
BGP Path parameters
```

```

Path address = 192.40.6.72
Path mask    = 255.255.255.248
Path protocol = ebgp
Path peer    = 192.40.4.29
  Path nextHop      = 192.40.4.29,
  Path origin       = igp,
  Path local preference = -1,
  Path state        = active,
  Path weight       = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=2] : 3 2 ,
  Path MED          = -1,
  Path atomic       = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community    = <none>,
  Path unknown attribute = <none>

```

### *output definitions*

<b>Path address</b>	The IP address for route path.
<b>Path mask</b>	The mask for this route path.
<b>Path protocol</b>	The protocol from which this route path was learned. Possible values for this field are as follows: <b>local</b> , <b>static</b> , <b>directhost</b> , <b>rip</b> , <b>ospf</b> , <b>isis</b> , <b>ibgp</b> , <b>ebgp</b> , and <b>other</b> .
<b>Path peer</b>	The IP address of the peer that is advertising this route path.
<b>Path nextHop</b>	The next hop along the route path.
<b>Path origin</b>	The BGP origin attribute. Possible values will be <b>igp</b> , <b>egp</b> , <b>incomplete</b> , and <b>none</b> . The origin attribute is considered during the route decision process.
<b>Path local preference</b>	The local preference value for this route as received in an UPDATE message. A negative value (for example, the <b>-1</b> in the above display) indicates that the local preference value is missing for this route path.
<b>Path state</b>	Path state indicates the state of the path. The possible states are <b>best</b> , <b>feasible</b> , <b>policy-wait</b> , <b>un-synchronized</b> , <b>dampened</b> , or <b>none</b> . When path state is <b>none</b> , it indicates that there are no paths to this prefix and the route is being purged from the system.
<b>Path weight</b>	The path weight as assigned through inbound and outbound policies.
<b>Path preference degree</b>	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <b>ip bgp default local-preference</b> ).
<b>Path autonomous systems</b>	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
<b>Path MED</b>	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <b>-1</b> in the above display) indicates that the MED value is missing for this route path.

*output definitions (continued)*

---

<b>Path atomic</b>	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <b>yes</b> ), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
<b>Path AS aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates this is not an aggregate route.
<b>Path IPaddr aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates that this is not an aggregate route.
<b>Path community</b>	Indicates the community to which this route path belongs, if applicable. A value of <b>&lt;none&gt;</b> indicates that this route does not belong to a community.
<b>Path unknown attribute</b>	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are currently not supported by the router, but it is possible for these attributes to appear in a BGP route.

---

## show ip bgp routes

Displays BGP route details.

**show ip bgp routes** [*network\_address ip\_mask*]

---

### Syntax Definitions

*network\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays all the routes in the routing table with details.

### Examples

-> show ip bgp routes

Legends: ECL = EBGp change list, ICC = IBGP client change list

ICL = IBGP change list, LCL = local change list

AGG = Aggregation, AGC = Aggregation contribution

AGL = Aggregation list, GDL = Deletion list

AGW = Aggregation waiting, AGH = Aggregation hidden

DMP = Dampening, ACT = Active route

Address	Mask	ECL	ICC	ICL	LCL	AGG	AGC	AGL	AGW	AGH	GDL	DMP	ACT
192.40.4.0	255.255.255.0	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.0	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes

### output definitions

---

<b>Address</b>	The route destination network address.
<b>Mask</b>	The route destination network mask.
<b>ECL</b>	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
<b>ICC</b>	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

*output definitions (continued)*

---

<b>ICL</b>	Internal BGP change list. When Yes, this route has changes that need to be advertised.
<b>LCL</b>	Local change list. When Yes, this route is local.
<b>AGG</b>	Aggregation. When Yes, this route is an aggregate route.
<b>AGC</b>	Aggregation contribution. When Yes, this route is part of an aggregate route.
<b>AGL</b>	Aggregation list. When Yes, this route is placed on an aggregate list.
<b>AGW</b>	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
<b>AGH</b>	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
<b>GDL</b>	Deletion list. When Yes, this route will be deleted.
<b>DMP</b>	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
<b>ACT</b>	Active route. When Yes, the route is active.

## show ip bgp aggregate-address

Displays aggregate route status.

**show ip bgp aggregate-address** [*ip\_address ip mask*]

---

### Syntax Definitions

<i>ip_address</i>	The 32-bit IP address of the aggregate address.
<i>ip_mask</i>	The 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

### Examples

```
-> show ip bgp aggregate-address
Network          Mask                Summarize As-Set   Admin state Oper state
-----+-----+-----+-----+-----+-----+
155.132.44.73   255.255.255.255 disabled  disabled disabled  not_active
192.40.6.0       255.255.255.255 disabled  disabled disabled  not_active
```

```
-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address      = 192.40.6.0,
Aggregate mask         = 255.255.255.255,
Aggregate admin state  = disabled,
Aggregate oper state   = not_active,
Aggregate as-set       = disabled,
Aggregate summarize    = disabled,
Aggregate metric       = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

#### *output definitions*

---

<b>Network or Aggregate address</b>	The IP address for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address</a> command.
<b>Mask or Aggregate mask</b>	The mask for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address</a> command.
<b>Summarize or Aggregate summarize</b>	Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address summary-only</a> command.

*output definitions (continued)*

---

<b>As-Set or Aggregate as-set</b>	Indicates whether AS path aggregate is enabled or disabled. This value is configured through the <b>ip bgp aggregate-address as-set</b> command.
<b>Admin State or Aggregate admin state</b>	Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the <b>ip bgp aggregate-address status</b> command.
<b>Oper State or Aggregate oper state</b>	Indicates whether this aggregate route is operational and participating in BGP message exchanges.
<b>Aggregate metric</b>	The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the <b>ip bgp aggregate-address metric</b> command.
<b>Aggregate local preference</b>	The local preference value for this aggregate route. This value is configured through the <b>ip bgp aggregate-address local-preference</b> command.
<b>Aggregate community string</b>	The community string value for this aggregate route. This value is configured through the <b>ip bgp aggregate-address community</b> command.

---

## show ip bgp network

Displays currently defined network configurations.

**show ip bgp network** [*network\_address ip\_mask*]

---

### Syntax Definitions

*network\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays all the configured networks, or a single network.

### Examples

```
-> show ip bgp network
Network      Mask                Admin state Oper state
-----+-----+-----+-----
155.132.1.2  255.255.255.255 disabled  not_active
155.132.1.3  255.255.255.255 disabled  not_active
```

```
-> show ip bgp network 155.132.1.2 255.255.255.255
Network address      = 155.132.1.2,
Network mask         = 255.255.255.255,
Network admin state  = disabled,
Network oper state   = not_active,
Network metric       = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

### output definitions

---

<b>Network</b> or <b>Network address</b>	The IP address configured for this local BGP network. This value is configured through the <b>ip bgp network</b> command.
<b>Mask</b> or <b>Network mask</b>	The mask configured for this local BGP network. This value is configured through the <b>ip bgp network</b> command.
<b>Admin state</b> or <b>Network admin state</b>	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <b>ip bgp network status</b> command.

*output definitions (continued)*

---

<b>Oper state or Network oper state</b>	Indicates whether this BGP local network is operationally active or inactive.
<b>Network metric</b>	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <b>ip bgp network metric</b> command.
<b>Network local preference</b>	The local preference value for this local BGP network. This value is configured through the <b>ip bgp network local-preference</b> command.
<b>Network community string</b>	The community string value for this local BGP network. This value is configured through the <b>ip bgp network community</b> command.

---

**Release History**

## show ip bgp neighbors

Displays the configured IPv4 BGP peers.

**show ip bgp neighbors** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

There are two output options for this command. If you specify `show ip bgp peer` without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

### Examples

```
-> show ip bgp neighbors
```

```
Legends:Nbr = Neighbor
```

```
      As = Autonomous System
```

Nbr	address	As	Admin state	Oper state	BgpId	Up/Down
192.40.4.29		3	enabled	estab	192.40.4.29	00h:14m:48s
192.40.4.121		5	disabled	idle	0.0.0.0	00h:00m:00s

### output definitions

---

<b>Nbr address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ip bgp neighbor status</b> command.
<b>Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>BgpId</b>	The unique BGP identifier of the peer. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b>Up/Down</b>	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.

---

```

-> show ip bgp neighbors 0.0.0.1
Neighbor address                = 0.0.0.1,

Activate IPv6 unicast           = enabled,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast           = advertised

```

### *output definitions*

<b>Neighbor address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>Neighbor autonomous system</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ip bgp neighbor status</b> command.
<b>Neighbor Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>Neighbor passive status</b>	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). This value is configured through the <b>ip bgp neighbor passive</b> command.
<b>Neighbor name</b>	The name assigned to this peer through the <b>ip bgp neighbor description</b> command.
<b>Neighbor local address</b>	The interface assigned to this peer. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b>Neighbor EBGP multihop</b>	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the <b>ip bgp neighbor ebgp-multihop</b> command.

*output definitions (continued)*

<b>Neighbor next hop self</b>	Indicates whether this peer is using next hop processing. This value is configured through the <b>ip bgp neighbor next-hop-self</b> command.
<b>Neighbor Route Refresh</b>	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
<b>Neighbor Ipv4 unicast</b>	Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.
<b>Neighbor Ipv4 multicast</b>	Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.
<b>Neighbor type</b>	Indicates whether this peer is internal or external to the router.
<b>Neighbor auto-restart</b>	Indicates whether peer auto-restart is enabled or disabled. This value is configured through the <b>ip bgp neighbor auto-restart</b> command.
<b>Neighbor route-reflector-client</b>	Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the <b>ip bgp neighbor route-reflector-client</b> command.
<b>Neighbor confederation status</b>	Indicates whether this peer is a member of a BGP confederation. This value is configured through the <b>ip bgp confederation neighbor</b> command.
<b>Neighbor remove private AS</b>	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the <b>ip bgp neighbor remove-private-as</b> command.
<b>Neighbor default originate</b>	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the <b>ip bgp neighbor default-originate</b> command.
<b>Neighbor maximum prefixes</b>	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the <b>ip bgp neighbor maximum-prefix</b> command.
<b>Neighbor max prefixes warning</b>	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b># of prefixes received</b>	Displays the total number of prefixes received by this neighbor.
<b>Neighbor MD5 key [32- 47]</b>	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the <b>ip bgp neighbor md5 key</b> command.
<b>Neighbor local port</b>	The TCP port used for the session with this peer.
<b>Neighbor TCP window size</b>	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
<b>Graceful Restart State</b>	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
<b>Advertised Restart Interval</b>	Indicates the restart interval in seconds.

*output definitions (continued)*

---

<b>Forwarding State during restart</b>	Indicates whether the peer has preserved the forwarding state during the graceful restart.
<b>Activate IPv6 unicast</b>	Indicates if the IPv6 unicast updates are enabled or not. Options include <b>enabled</b> or <b>disabled</b> .
<b>Configured IPv6 NextHop Address</b>	Specifies the IPv6 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv6-nexthop</b> command.
<b>Neighbor Ipv6 unicast</b>	Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.

## show ip bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for the specified BGP IPv4 peer.

**show ip bgp neighbors policy *ipv4\_address***

---

### Syntax Definitions

*ipv4\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv4 peer.

### Examples

```
-> show ip bgp neighbors policy
Neighbor address = 0.0.0.0,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name  = <none>,
  Neighbor input policy map name   = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name  = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name  = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration    = enabled
  Neighbor output prefix6-list name = uniqueLocal
  Neighbor input prefix6-list name = uniqueLocal
Neighbor address = 0.0.0.1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name  = <none>,
  Neighbor input policy map name   = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name  = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name  = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration    = enabled
  Neighbor output prefix6-list name = UniqueLocal
  Neighbor input prefix6-list name = UniqueLocal
```

*output definitions*

---

<b>Neighbor autonomous system</b>	The AS to which the peer is assigned. This can be assigned by using the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor output policy map name</b>	The outbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor input policy map name</b>	The inbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor output aspath-list name</b>	The outbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefix6list</b> command.
<b>Neighbor input aspath-list name</b>	The inbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-aspathlist</b> command.
<b>Neighbor output prefix-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.
<b>Neighbor input prefix-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefixlist</b> command.
<b>Neighbor output community-list name</b>	The outbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-communitylist</b> command.
<b>Neighbor input community-list name</b>	The inbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-communitylist</b> command.
<b>Neighbor soft reconfiguration</b>	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the <b>ip bgp neighbor soft-reconfiguration</b> command.
<b>Neighbor output prefix6-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.
<b>Neighbor input prefix6-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.

## show ip bgp neighbors timer

Displays BGP peer timer statistics.

**show ip bgp neighbors timer** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

### Examples

```
-> show ip bgp neighbors timer
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
```

Nbr	address	As	Hold	Hold(C)	RtAdv	Retry	Kalive	Ka(C)
192.40.4.29		3	90	90	30	120	30	30
192.40.4.121		5	0	90	30	120	0	30

### output definitions

---

<b>Nbr address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Hold</b>	The current count for the holdtime value.
<b>Hold(C)</b>	The holdtime value configured through the <b>ip bgp neighbor timers</b> command.
<b>RtAdv</b>	The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the <b>ip bgp neighbor advertisement-interval</b> command.
<b>Retry</b>	The interval, in seconds, between retries by this peer to set up a connection via TCP with another peer. This value is configured through the <b>ip bgp neighbor timers</b> command.

*output definitions (continued)*

---

<b>Kalive</b>	The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
<b>Ka(C)</b>	The keepalive interval as configured through the <b>ip bgp neighbor timers</b> command.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**show ip bgp neighbors** Displays BGP peer main status.

---

## show ip bgp neighbors statistics

Displays BGP peer message statistics.

**show ip bgp neighbors statistics** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address of the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

### Examples

```
-> show ip bgp neighbors statistics
```

```
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
          RUPDS = number of Update messages received,
          SUPDS = number of Update messages sent,
          RNOFY = number of Notify messages received,
          SNOFY = number of Notify messages sent
          RPFXS = number of prefixes received
          UPTNS = number of UP transitions
          DNTNS = number of DOWN transitions
```

Nbr	address	As	RMSGS	SMSGS	RUPDS	SUPDS	RNOFY	SNOFY	RPFXS	UPTNS	DNTNS
192.40.4.29		3	110	123	5	0	0	1	8	2	2
192.40.4.121		5	0	0	0	0	0	0	0	0	0

### output definitions

---

<b>Nbr address</b>	The IP address for this peer. This value is configured through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. This value is configured through the <b>ip bgp neighbor remote-as</b> command.
<b>RMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b>SMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

*output definitions (continued)*

---

<b>RUPDS</b>	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>SUPDS</b>	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>RNOFY</b>	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>SNOFY</b>	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>RPFXS</b>	The number of unique route prefixes received by this peer.
<b>UPTNS</b>	The number of times this peer has come up, operationally.
<b>DNTNS</b>	Number of times this peer has gone down, operationally.

---

```

-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address                = 0.0.0.1,
# of UP transitions              = 0,
Time of last UP transition      = 00h:00m:00s,
# of DOWN transitions           = 0,
Time of last DOWN transition    = 00h:00m:00s,
Last DOWN reason                = none,
# of msgs rcvd                 = 0,
# of Update msgs rcvd          = 0,
# of prefixes rcvd             = 0,
# of Route Refresh msgs rcvd   = 0,
# of Notification msgs rcvd    = 0,
Last rcvd Notification reason   = none [none]
Time last msg was rcvd         = 00h:00m:00s,
# of msgs sent                  = 0,
# of Update msgs sent           = 0,
# of Route Refresh msgs sent   = 0,
# of Notification msgs sent     = 0,
Last sent Notification reason   = none [none]
Time last msg was sent         = 00h:00m:00s,

```

*output definitions*

---

<b>Neighbor address</b>	The IP address for this peer. This value is configured through the <b>ip bgp neighbor</b> command.
<b># of UP transitions</b>	The number of times this peer has come up, operationally.
<b>Time of last UP transition</b>	The duration that this peer has been up.
<b># of DOWN transitions</b>	Number of times this peer has gone down, operationally.
<b>Time of last DOWN transition</b>	The duration since this peer last went down.

*output definitions (continued)*

---

<b>Last DOWN reason</b>	Provides a message as the last reason why a peer went down. The possible reasons for going down are:  user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
<b># of msgs rcvd</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.
<b># of Update msgs rcvd</b>	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of prefixes rcvd</b>	The number of unique route prefixes received by this peer.
<b># of Route Refresh msgs rcvd</b>	The number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
<b># of Notification msgs rcvd</b>	The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last rcvd Notification reason</b>	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <p>message header error - synchronization loss  message header error - bad length  message header error - bad type  open message error - unsupported version  open message error - bad peer autonomous system  open message error - bad peer bgp id  open message error - unsupported option  open message error - authentication failure  open message error - unacceptable hold time  open message error - unsupported capability  update message error - malformed attribute  update message error - unknown attribute  update message error - missing wellknown attribute  update message error - attribute flags error  update message error - attribute length error  update message error - invalid origin  update message error - as loop  update message error - invalid nexthop  update message error - optional attribute error  update message error - invalid network  update message error - malformed aspath  cease - maximum number of prefixes reached  cease - administrative shutdown  cease - peer de-configured  cease- administrative reset  cease- connection rejected  cease - other configuration change  cease - connection collision resolution  cease - out of resources  hold time out - none  fsm error - none  none - none</p>
<b>Time last msg was rcvd</b>	The duration since a message was received from this peer.
<b># of msgsd sent</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
<b># of Update msgsd sent</b>	The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of Route Refresh msgsd sent</b>	The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
<b># of Notification msgsd sent</b>	The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last sent Notification reason</b>	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the <b>Peer last received notification reason</b> field above.
<b>Time last msg was sent</b>	The duration since a message was sent to this peer.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[ip bgp neighbor](#) Creates or deletes a BGP peer.

---

## show ip bgp policy aspath-list

Displays AS path list parameters.

```
show ip bgp policy aspath-list [name] ["regular_expression"]
```

---

### Syntax Definitions

<i>name</i>	An AS path name.
<i>regular_expression</i>	A regular expression. The regular expression must be enclosed by quotation marks.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the [ip bgp policy aspath-list](#) command on page 25-97.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

### Examples

```
-> show ip bgp policy aspath-list
Aspath List Name      Aspath regular expression
-----+-----
aspl1                  (500 | 400) ? 300$
aspl2                  (500 | 400)
```

```
-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp    = (500 | 400) ? 300$
  Admin state    = disabled,
  Priority        = 1,
  Action         = deny,
  Primary index  = 0,
```

#### output definitions

---

<b>Aspath List name</b>	The name of the AS path list. This is defined using the <a href="#">ip bgp policy aspath-list</a> command.
<b>Aspath regular expression</b>	The regular expression that defines the AS path list. This is defined using the <a href="#">ip bgp policy aspath-list</a> command.

*output definitions (continued)*

---

<b>Admin state</b>	The administration state of the AS path policy. It is either enable or disable.
<b>Priority</b>	The AS path list priority. This is defined using the <b>ip bgp policy aspath-list priority</b> command.
<b>Action</b>	The AS path list action, either permit or deny. This is defined using the <b>ip bgp policy aspath-list action</b> command.
<b>Primary index</b>	The instance identifier for the AS path list. This value is not configurable.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**ip bgp policy aspath-list**            Creates or removes an AS path list.

## show ip bgp policy community-list

Displays community list parameters.

```
show ip bgp policy community-list [name] [string]
```

---

### Syntax Definitions

<i>name</i>	Community name.
<i>string</i>	Community match list string

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

### Examples

```
-> show ip bgp policy community-list
Community list name      Community string
-----+-----
adfasdf                  0:0
```

```
-> show ip bgp policy community-list coml1
Community List name = coml1
Community string   = 600:1
  Admin state      = disabled,
  Match type       = exact,
  Priority          = 1,
  Action           = deny,
  Primary index    = 0
```

### output definitions

---

<b>Community List name</b>	The community list name. This is defined using the <a href="#">ip bgp policy community-list</a> command.
<b>Community string</b>	The community list definition. This is defined using the <a href="#">ip bgp policy community-list</a> command.
<b>Admin state</b>	The administration state of the community list policy, either enabled or disabled.
<b>Match type</b>	The match type of the community list. This is defined using the <a href="#">ip bgp policy community-list match-type</a> command.

*output definitions (continued)*

---

<b>Priority</b>	The community list priority. This is defined using the <b>ip bgp policy community-list priority</b> command.
<b>Action</b>	The community list action. This is defined using the <b>ip bgp policy community-list action</b> command.
<b>Primary index</b>	The instance identifier for the community list. This value is not configurable.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**ip bgp policy community-list** Creates or deletes a community list.

  alaBgpCommunityMatchListRowStatus
```

---

## show ip bgp policy prefix-list

Displays prefix list parameters.

```
show ip bgp policy prefix-list [name] [ip_address ip_mask]
```

---

### Syntax Definitions

<i>name</i>	A prefix list name.
<i>ip_address</i>	A prefix list IP address.
<i>ip_mask</i>	An IP address mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

### Examples

```
-> show ip bgp policy prefix-list
Prefix List name      Prefix address  Prefix mask
-----+-----+-----
pfxl1                 155.132.33.0   255.255.255.0
pfxl2                 155.148.32.0   255.255.255.0
```

```
-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask            = 255.255.255.0
  Admin state    = disabled,
  Match Mask >= (GE) = 0,
  Match Mask <= (LE) = 0,
  Action        = deny
```

#### *output definitions*

---

<b>Prefix List name</b>	The name of the prefix list. This is defined using the <b>ip bgp policy prefix-list</b> command.
<b>Address</b>	The IP address of the prefix list. This is defined using the <b>ip bgp policy prefix-list</b> command.
<b>Mask</b>	The mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list</b> command.
<b>Admin state</b>	The administrative state of the prefix list, either enabled or disabled.

*output definitions (continued)*

---

<b>Match Mask &gt;= (GE)</b>	The GE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list ge</b> command.
<b>Match Mask &lt;= (LE)</b>	The LE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list le</b> command.
<b>Action</b>	The action of the prefix list. This is defined using the <b>ip bgp policy prefix-list action</b> command.

```

---

## show ip bgp policy prefix6-list

Displays the configured prefix6-list policies on the system.

```
show ip bgp policy prefix6-list [pfx_list_name[{{prefix6/prefix_length}}]]
```

---

### Syntax Definitions

<i>pfx_list_name</i>	A prefix list name.
<i>prefix6</i>	A prefix list IPv6 address.
<i>prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). The valid range is 3-128.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IPv6 address and IPv6 mask.

### Examples

```
-> show ip bgp policy prefix6-list
```

```
Prefix6 List name      Prefix6 address/Prefix length
-----+-----
p11                    fc00::/7
```

```
-> show ip bgp policy prefix6-list p11
```

```
Prefix6 List name = p11
Prefix            = fc00::
Prefix Length     = 7
  Admin state     = disabled,
  Match MaskLength >= (GE) = 0,
  Match MaskLength <= (LE) = 0,
  Action          = deny
```

#### *output definitions*

---

<b>Prefix6 List name</b>	The name of the prefix6-list. This is defined using the <b>ip bgp policy prefix6-list</b> command.
<b>Prefix6 Address</b>	The IPv6 address of the prefix6-list. This is defined using the <b>ip bgp policy prefix6-list</b> command.
<b>Prefix Length</b>	The mask of the prefix6-list. This is defined using the <b>ip bgp policy prefix6-list</b> command.

*output definitions (continued)*

---

<b>Admin state</b>	The administrative state of the prefix list, either enabled or disabled.
<b>Match Mask &gt;= (GE)</b>	The GE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list ge</b> command.
<b>Match Mask &lt;= (LE)</b>	The LE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list le</b> command.
<b>Action</b>	The action of the prefix list. This is defined using the <b>ip bgp policy prefix-list action</b> command.

---

**Release History**

Release 6.3.4; command was introduced.

**Related Commands**

**ip bgp policy prefix6-list**      Creates or deletes a BGP prefix6-list policy for filtering IPv6 prefix.

**MIB Objects**

```
alaBgpPrefix6MatchListTable
  alaBgpPrefix6MatchListId
  alaBgpPrefix6MatchListAddr

  alaBgpPrefix6MatchListAction
```

---

## show ip bgp policy route-map

Displays policy route map parameters.

```
show ip bgp policy route-map [name] [sequence_number]
```

---

### Syntax Definitions

*name*                                      Route map name.

*sequence\_number*                        A sequence number. The valid range is 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

### Examples

```
-> show ip bgp policy route-map
RouteMap name                      Instance
-----+-----
rmap1                                1
rmap1                                2
rmap2                                1

-> show ip bgp policy route-map rmap1
RouteMap name                      = rmap1
RouteMap instance = 1
  Admin state                        = disabled,
  Local pref (mode/value)           = <none> / 0,
  Route map action                   = permit,
  Origin                              = <none>,
  MED (mode/value)                  = <none> / 0,
  Weight                              = 0,
  Aspath-List name                   = aspl1,
  Aspath prepend                     = <none>,
  Aspath match primitive             = 500 .* 400$,
  Prefix-List name                   = <none>,
  Prefix match primitive             = 0.0.0.0 0.0.0.0,
  Community-List name                = com12,
  Community match primitive          = <none>,
  Community string [mode]            = [Additive]
```

*output definitions*

---

<b>RouteMap name</b>	The name of the route map policy. This is determined using the <b>ip bgp policy prefix6-list</b> command.
<b>RouteMap instance</b>	The instance of the route map policy. This is determined using the <b>ip bgp policy prefix6-list</b> command.
<b>Admin state</b>	The administrative state of the route map policy, either enabled or disabled.
<b>Local pref (mode/value)</b>	The local preference of the route map policy. This is determined using the <b>ip bgp policy route-map lpref</b> command.
<b>Route map action</b>	The action of the route map policy. This is determined using the <b>ip bgp policy route-map action</b> command.
<b>Origin</b>	The origin of the route map policy. This is determined using the <b>ip bgp policy route-map origin</b> command.
<b>MED (mode/value)</b>	The MED of the route map policy. This is determined using the <b>ip bgp policy route-map med</b> command.
<b>Weight</b>	The weight of the route map policy. This is determined using the <b>ip bgp policy route-map weight</b> command.
<b>Aspath-List name</b>	The name of the AS path list attached to this route map. This is set using the <b>show ip bgp policy aspath-list</b> command.
<b>Aspath prepend</b>	The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done).
<b>Aspath match primitive</b>	The regular expression used to match AS Path for this route map.
<b>Prefix-List name</b>	The name of the prefix list attached to this route map. This is set using the <b>show ip bgp policy prefix-list</b> command.
<b>Prefix match primitive</b>	The prefix to match for this route map.
<b>Community-List name</b>	The name of the community list attached to this route map. This is set using the <b>show ip bgp policy community-list</b> command.
<b>Community match primitive</b>	The community string to match for this route map.
<b>Community string [mode]</b>	The name of the community mode attached to this route map. This is set using the <b>ip bgp policy route-map community-mode</b> command.

---

**Release History**

Release 6.1; command was introduced.

---

## ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

**ip bgp graceful-restart**

**no ip bgp graceful-restart**

---

### Syntax Definitions

N/A

### Defaults

Graceful restart is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on a chassis with a single CMM or on an in a standalone switch.
- On an OmniSwitch stackable switch graceful restart is supported only on active ports (i.e., interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary element in a stack.
- Note that graceful restart does not support IPv6 prefixes at this time.

### Examples

```
-> ip bgp graceful restart  
-> no ip bgp graceful restart
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

### MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart

```

---

## ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

**ipv6 bgp unicast**

**no ipv6 bgp unicast**

---

### Syntax Definitions

N/A

### Defaults

By default, IPv6 BGP advertisements are disabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

### Examples

```
-> ipv6 bgp unicast  
-> no ipv6 bgp unicast
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<a href="#">ipv6 bgp unicast</a>	Enables or disables unicast IPv4 updates for the BGP routing process.
<a href="#">show ip bgp</a>	Displays the current global settings for the local BGP speaker.

### MIB Objects

```
alaBgpGlobal  
  alaBgpMultiProtocolIpv6
```

---

---

## ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

**ip bgp neighbor** *ip\_address* **activate-ipv6**

**no ip bgp neighbor** *ip\_address* **activate-ipv6**

---

### Syntax Definitions

*ip\_address*                      The 32-bit IPv4 address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

### Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ip bgp neighbors](#)                      Displays BGP peer main status.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerIpv6Unicast
```

---

## ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

**ip bgp neighbor** *ip\_address* **ipv6-nexthop** *ipv6\_address*

---

### Syntax Definitions

<i>ip_address</i>	The 32-bit IPv4 address of the neighbor.
<i>ipv6_address</i>	A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

### Defaults

By default, the IPv6 next hop value is set to all zeros.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

### Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

**show ipv6 bgp neighbors** Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerIpv6NextHop
```

---

## show ipv6 bgp path

Displays the known IPv6 BGP paths for all the routes or a specific route.

**show ipv6 bgp path** [**ipv6-addr** *ipv6\_address/prefix\_length*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, IPv6 BGP paths for all the routes will be displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *ipv6\_address/prefix\_length* parameter to display the IPv6 BGP paths for a specified route.

### Examples

```
-> show ipv6 bgp path
Legends: Sta      = Path state
         >        = best, F = feasible, S = stale
         U        = un-synchronized
         Nbr      = Neighbor
         (O)      = Path Origin (? = incomplete, i = igp, e = egp)
         degPref  = degree of preference
```

Sta	Prefix	Nbr Address	(O)	degPref
>	2020:100:200:1::/64	2001:100:3:4::1	i	100
>	2020:100:200:2::/64	2001:100:3:4::1	i	100
>	2020:100:200:3::/64	2001:100:3:4::1	i	100
>	2020:100:200:4::/64	2001:100:3:4::1	i	100
>	2020:100:200:5::/64	2001:100:3:4::1	i	100
>	2525:2525:1::/48	100.3.4.1	i	100
>	2525:2525:2::/48	100.3.4.1	i	100
>	2525:2525:3::/48	100.3.4.1	i	100
>	2525:2525:4::/48	100.3.4.1	i	100
>	2525:2525:5::/48	100.3.4.1	i	100

*output definitions*

---

<b>Sta</b>	Status flag. “>” Best Path: Indicates this is the best route to the destination. “F” Feasible: The alternate path available when the best path goes down. “S” Stale: Indicates the peer that advertised this route's next hop is in the process of graceful restart. “P” Policy Changing: Indicates that a policy being applied may change the route. “U” Unsynchronized: Making a path unfeasible forcefully when a nexthop is not reachable or if the local bgp network is deleted." “D” Dampened: Indicates that this route is being dampened to prevent flapping. “N” None: No path available.
<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>Nbr Address</b>	The IP or IPv6 address of the BGP peer that advertises this path.
<b>(0)</b>	The origin attribute of this route path. A question mark (?) indicates incomplete, and <b>i</b> indicates IGP, and an <b>e</b> indicates EGP.
<b>degPref</b>	The local preference value assigned to this route path.

---

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
BGP Path parameters
Path address    = 2020:100:200:1::
Path Length    = 64
Path protocol  = ibgp
Path neighbor   = peer(2001:100:3:4::1)
  Path nextHop   = 2001:100:3:4::1,
  Path origin    = igp,
  Path local preference = 100,
  Path state     = active,
  Path weight    = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED      = <none>,
  Path atomic   = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community = <none>,
  Path Originator Id = <none>,
  Path Cluster List = <none>,
  Path unknown attribute = <none>
```

*output definitions*

---

<b>Path address</b>	The IPv6 address for route path.
<b>Path Length</b>	The prefix length of the IPv6 path.

*output definitions (continued)*

<b>Path protocol</b>	The protocol from which this route path was learned. Possible values for this field are as follows: <b>local</b> , <b>static</b> , <b>directhost</b> , <b>rip</b> , <b>ospf</b> , <b>isis</b> , <b>ibgp</b> , <b>ebgp</b> , and <b>other</b> .
<b>Path neighbor</b>	The IPv6 address of the BGP peer.
<b>Path nextHop</b>	The next hop along the route path.
<b>Path origin</b>	The BGP origin attribute. Possible values will be <b>igp</b> , <b>egp</b> , <b>incomplete</b> , and <b>none</b> . The origin attribute is considered during the route decision process.
<b>Path local preference</b>	The local preference value for this route as received in an UPDATE message. A negative value (for example, the <b>-1</b> in the above display) indicates that the local preference value is missing for this route path.
<b>Path state</b>	Indicates the state of the path. The possible states are <b>best</b> , <b>feasible</b> , <b>policy-wait</b> , <b>un-synchronized</b> , <b>dampened</b> , or <b>none</b> . When path state is <b>none</b> , it indicates that there are no paths to this prefix and the route is being purged from the system.
<b>Path weight</b>	The path weight as assigned through inbound and outbound policies.
<b>Path preference degree</b>	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <b>ip bgp default local-preference</b> ).
<b>Path autonomous systems</b>	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
<b>Path MED</b>	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <b>-1</b> in the above display) indicates that the MED value is missing for this route path.
<b>Path atomic</b>	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <b>yes</b> ), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
<b>Path AS aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates this is not an aggregate route.
<b>Path IPaddr aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates that this is not an aggregate route.
<b>Path community</b>	Indicates the community to which this route path belongs, if applicable. A value of <b>&lt;none&gt;</b> indicates that this route does not belong to a community.
<b>Path Originator Id</b>	The Router Id of the BGP4 speaker that performed route reflection

*output definitions (continued)*

---

<b>Path Cluster List</b>	Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.
