<b>Path unknown attribute</b>	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

---

**Release History**

Release 6.1.5; command was introduced.

**Related Commands**

[show ipv6 bgp routes](#) Displays the known IPv6 BGP routes.

## show ipv6 bgp routes

Displays the known IPv6 BGP routes.

**show ipv6 bgp routes**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

-> show ipv6 bgp routes

Legends: ECL = EBGP change list, ICC = IBGP client change list  
 ICL = IBGP change list, LCL = local change list  
 AGG = Aggregation, AGC = Aggregation contribution  
 AGL = Aggregation list, GDL = Deletion list  
 AGW = Aggregation waiting, AGH = Aggregation hidden  
 DMP = Dampening, ACT = Active route

Prefix	ECL	ICC	ICL	LCL	AGG	AGC	AGL	AGW	AGH	GDL	DMP	ACT
2020:100:200:1::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:2::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:3::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:4::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:5::/64	No	No	No	No	No	No	No	No	No	No	No	Yes

2525:2525:5::/48	No	No	No	No	No	No	No	No	No	No	No	Yes

### *output definitions*

---

<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>ECL</b>	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
<b>ICC</b>	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

*output definitions (continued)*

---

<b>ICL</b>	Internal BGP change list. When Yes, this route has changes that need to be advertised.
<b>LCL</b>	Local change list. When Yes, this route is local.
<b>AGG</b>	Aggregation. When Yes, this route is an aggregate route.
<b>AGC</b>	Aggregation contribution. When Yes, this route is part of an aggregate route.
<b>AGL</b>	Aggregation list. When Yes, this route is placed on an aggregate list.
<b>AGW</b>	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
<b>AGH</b>	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
<b>GDL</b>	Deletion list. When Yes, this route will be deleted.
<b>DMP</b>	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
<b>ACT</b>	Active route. When Yes, the route is active.

---

**Release History**

Release 6.1.5; command was introduced.

**Related Commands**

**show ipv6 bgp path** Displays the known IPv6 BGP paths for all the routes or a specific route.

```

---

## ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

**ipv6 bgp network** *ipv6\_address/prefix\_length*

**no ipv6 bgp network** *ipv6\_address/prefix\_length*

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

### Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<a href="#">ipv6 bgp network status</a>	Enables or disables a BGP network.
<a href="#">show ipv6 bgp network</a>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

### MIB Objects

```
alaBgpNetwork6Table
  alaBgpNetwork6Addr
  alaBgpNetwork6MaskLen
```

---

## ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

```
ipv6 bgp network ipv6_address/prefix_length [community {none | num | num:num}]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<b>none</b>	Removes a prefix from a community.
<i>num</i>	The community attribute number.
<i>num:num</i>	Community attribute in the AA : NN format. AA indicates the autonomous system and NN indicates the community number.

### Defaults

By default, a route is not assigned to a community.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.

### Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

## **MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6Community
```

---

## ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**local-preference** *num*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The local preference attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>num</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

### Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

## **MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6LocalPref
```

---

## ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**metric num**]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The MED attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>num</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

### Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as a IPv6 BGP network to other BGP peers.
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

## **MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6Metric
```

---

---

## ipv6 bgp network status

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [status {enable | disable}]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<b>enable</b>	Enables the BGP network.
<b>disable</b>	Disables the BGP network.

### Defaults

By default, the BGP network is disabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

### Examples

```
-> ipv6 bgp network 2001::1/64 status enable
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

**show ipv6 bgp network** Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

### MIB Objects

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6RowStatus
```

---

## show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

**show ipv6 bgp network** [*ipv6\_address/prefix\_length*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, all IPv6 BGP networks and their status will be displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *ipv6\_address/prefix\_length* parameter to display the status of a specific IPv6 BGP network.

### Examples

```
show ipv6 bgp network
  Network                               Admin state Oper state
-----+-----+-----
2525:500:600::/64                       enabled      active
```

```
show ipv6 bgp network 2525:500:600::/64
Network address           = 2525:500:600::/64,
Network admin state       = enabled,
Network oper state        = active,
Network metric             = 0,
Network local preference = 0,
Network community string = <none>
```

#### *output definitions*

<b>Network</b> or <b>Network address</b>	The IPv6 address configured for this local BGP network. This value is configured through the <b>ipv6 bgp network</b> command.
<b>Admin state</b> or <b>Network admin state</b>	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <b>ipv6 bgp network status</b> command.
<b>Oper state</b> or <b>Network oper state</b>	Indicates whether this BGP local network is operationally active or inactive.

---

*output definitions (continued)*

---

<b>Network metric</b>	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <b>ipv6 bgp network metric</b> command.
<b>Network local preference</b>	The local preference value for this local BGP network. This value is configured through the <b>ipv6 bgp network local-preference</b> command.
<b>Network community string</b>	The community string value for this local BGP network. This value is configured through the <b>ipv6 bgp network community</b> command.

---

## Release History

Release 6.1.5; command was introduced.

## Related Commands

**ipv6 bgp network** .Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

## MIB Objects

```
alaBgpNetwork6Table
  alaBgpNetwork6Addr
  alaBgpNetwork6MaskLen
  alaBgpNetwork6State
  alaBgpNetwork6Metric
  alaBgpNetwork6LocalPref
  alaBgpNetwork6Community
  alaBgpNetwork6RowStatus
```

---

## ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address*

**no ipv6 bgp neighbor** *ipv6\_address*

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the new BGP peer.

### Defaults

By default, no BGP peers are configured in the BGP network.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor status** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

### Examples

```
-> ipv6 bgp neighbor 2001::1  
-> no ipv6 bgp neighbor 2001::1
```

### Release History

Release 6.1.5; command was introduced.

## Related Commands

- ipv6 bgp neighbor status** Enables or disables the BGP peer status.
- ipv6 bgp neighbor remote-as** Assigns an AS number to the BGP peer.

## MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6Addr

---

## ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

```
ipv6 bgp neighbor peer6_address clear soft {in | out}
```

---

### Syntax Definitions

<i>peer6_address</i>	The 128-bit IPv6 address of the BGP peer.
<b>in</b>	Restarts inbound policy evaluation of the peer.
<b>out</b>	Restarts outbound policy evaluation of the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the IPv6 peer session.
- This command is useful if policies have been changed.
- BGP neighbour must be configured.

### Examples

```
-> ipv6 bgp neighbor 2001::1 clear soft in  
-> ipv6 bgp neighbor 2001::1 clear soft out
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[ipv6 bgp neighbor soft-reconfiguration](#) Enables or disables IPv6 BGP peer soft reconfiguration.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeer6ddr  
  alaBgpPeer6ReconfigureInBound  
  alaBgpPeer6ReconfigureOutound
```

---

---

## ipv6 bgp neighbor soft-reconfiguration

Enables or disables IPv6 BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

**ipv6 bgp neighbor *peer6\_address* soft-reconfiguration**

**no ipv6 bgp neighbor *peer6\_address* soft-reconfiguration**

---

### Syntax Definitions

*peer6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Default

This command is enabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- BGP neighbor must be configured.
- BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2021::10 soft-reconfiguration
-> no ipv6 bgp neighbor 2021::10 soft-reconfiguration
```

### Release History

Release 6.3.4; command was introduced

## Related Commands

**ipv6 bgp neighbor clear soft** Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeer6Addr  
  alaBgpPeer6SoftReconfig

---

---

## ipv6 bgp neighbor in-prefix6list

Configures an inbound BGP prefix6-list policy for an IPv6 BGP peer.

```
ipv6 bgp neighbor peer6_address in-prefix6list pfx_list_name
```

---

### Syntax Definitions

<i>peer6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>pfx_list_name</i>	An Output prefix list name (1 - 70 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The prefix list name (**uniqLocal** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- BGP neighbor must be configured.

### Examples

```
-> ipv6 bgp neighbor 2021::10 in-prefix6list uniqLocal
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeer6Addr  
  alaBgpPeer6Prefix6ListIn
```

---

## ipv6 bgp neighbor out-prefix6list

Configures an outgoing BGP prefix6-list policy for an IPv6 BGP peer.

```
ipv6 bgp neighbor peer6_address out-prefix6list pxf_list_name
```

---

### Syntax Definitions

<i>peer6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>pxf_list_name</i>	An Output prefix list name ( 1 - 70 characters). .

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The prefix list name (**uniqLocal** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- BGP neighbor must be configured.

### Examples

```
-> ipv6 bgp neighbor 2021::10 out-prefix6list uniqLocal
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">ip bgp policy prefix6-list</a>	Creates or deletes a BGP prefix6-list policy for filtering IPv6 prefixes.
--------------------------------------------	---------------------------------------------------------------------------

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeer6Addr  
  alaBgpPeer6Prefix6ListOut
```

---

---

## ipv6 bgp neighbor activate-ipv6

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv6**]

**no ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv6**]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

### Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)              Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6ActivateIpv6
```

---

## ipv6 bgp neighbor ipv6-next-hop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv6-next-hop ipv6_address]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the next hop router.

### Defaults

By default, the IPv6 next hop address is set to all zeros.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

### Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-next-hop fe80::/24  
-> no ipv6 bgp neighbor 2001::1 ipv6-next-hop fe80::/24
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeerIpv6NextHop
```

---

## ipv6 bgp neighbor status

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address* [status {enable | disable}]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the new BGP peer.
<b>enable</b>	Enables the BGP peer.
<b>disable</b>	Disables the BGP peer.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the [ipv6 bgp neighbor](#) command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ipv6 bgp neighbor 2001::1 status enable
-> ipv6 bgp neighbor 2001::1 status disable
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6RowStatus
```

---

## ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

```
ipv6 bgp neighbor ipv6_address [remote-as num]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

*num*                                      Autonomous system number in the range 1–65535.

### Defaults

---

parameter	default
<i>num</i>	1

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

**ip bgp autonomous-system**       Sets the AS for the local BGP speaker.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6AS
```

---

## ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

**ipv6 bgp neighbor** *ipv6\_address* [**timers** *num num*]

---

### Syntax Definitions

<i>ipv6_address</i>	A 128-bit IPv6 address for the BGP peer.
<i>num</i>	The KEEPALIVE message interval in seconds.
<i>num</i>	The hold time interval in seconds.

### Defaults

parameter	default
<i>num</i> (keepalive)	30 seconds
<i>num</i> (holdtime)	90 seconds

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

### Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

## Release History

Release 6.1.5; command was introduced.

## Related Commands

**ipv6 bgp neighbor conn-retry-interval** The interval, in seconds, between BGP retries to set up a connection with another peer via the transport protocol.

## MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6HoldTime  
  alaBgpPeer6KeepAlive

---

## ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

**ipv6 bgp neighbor** *ipv6\_address* [**maximum-prefix** *num* [**warning-only**]]

**no ipv6 bgp neighbor** *ipv6\_address* [**maximum-prefix** *num* [**warning-only**]]

---

### Syntax Definitions

*ipv6\_address* A 128-bit IPv6 address for the BGP peer.

*num* The number of prefixes. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>num</i>	5000

By default, **warning-only** is enabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

### Release History

Release 6.1.5; command was introduced.

---

## ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

```
ipv6 bgp neighbor ipv6_address [next-hop-self]
```

```
no ipv6 bgp neighbor ipv6_address [next-hop-self]
```

---

### Syntax Definitions

*ipv6\_address*                      A 128-bit IPv6 address for the BGP peer.

### Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (via other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self  
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6NextHopSelf
```

---

## ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer via the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

**ipv6 bgp neighbor** *ipv6\_address* [**conn-retry-interval** *num*]

---

### Syntax Definitions

<i>ipv6_address</i>	A 128-bit IPv6 address for the BGP neighbor.
<i>num</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>num</i>	120

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

### Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ConnRetryInterval
```

---

## ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

```
ipv6 bgp neighbor ipv6_address [default-originate]
```

```
no ipv6 bgp neighbor ipv6_address [default-originate]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the neighbor.

### Defaults

This **default-originate** parameter is disabled by default.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

### Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate  
-> no ipv6 bgp neighbor 2001::1 default-originate
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)    Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6DefaultOriginate
```

---

## ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

**ipv6 bgp neighbor** *ipv6\_address* [**update-source** *interface\_name*]

**no ipv6 bgp neighbor** *ipv6\_address* [**update-source** *interface\_name*]

---

### Syntax Definitions

*ipv6\_address*

The 128-bit IPv6 address for the BGP peer.

*interface\_name*

The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

### Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6  
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

### Release History

Release 6.1.5; command was introduced.

---

---

## ipv6 bgp neighbor ipv4-nexthop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv4-nexthop ip_address]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>ip_address</i>	The 32-bit IP address of the next hop.

### Defaults

By default, the IPv4 next hop value is set to all zeros.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

### Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 172.22.2.115
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 0.0.0.0
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) .Displays the configured IPv6 BGP peers.

## show ipv6 bgp neighbors

Displays the configured IPv6 BGP peers.

**show ipv6 bgp neighbors** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP neighbor.

### Defaults

By default, all the configured IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *ipv6\_address* parameter to display the details of a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors
Legends: Nbr = Neighbor
         As  = Autonomous System
Nbr address                As  Admin state Oper state  BGP Id      Up/Down

Neighbor default originate = disabled,
Neighbor maximum prefixes = 5000,
Neighbor max prefixes warning = enabled,
# of prefixes received    = 10,
```

```

Neighbor MD5 key           = <none>,
Neighbor local port       = 49154,
Neighbor TCP window size  = 32768,
Graceful Restart State    = None,
Advertised Restart Interval = 0s,
Forwarding State during restart = NotPreserved,
Activate IPv6 unicast     = enabled,
Configured IPv4 NextHop Address = 0.0.0.0,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast     = advertised

```

### *output definitions*

<b>Nbr address</b> or <b>Neighbor address</b>	The IPv6 address for this BGP peer. Assign this address through the <b>ipv6 bgp neighbor</b> command.
<b>As</b> or <b>Neighbor autonomous system</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ipv6 bgp neighbor remote-as</b> command.
<b>Admin state</b> or <b>Neighbor Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ipv6 bgp neighbor status</b> command.
<b>Oper state</b> or <b>Neighbor Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>BGP Id</b>	The unique BGP identifier of the peer.
<b>Up/Down</b>	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
<b>Neighbor passive status</b>	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session).
<b>Neighbor name</b>	The name assigned to this peer.
<b>Neighbor local address</b>	The interface assigned to this peer. This value is configured through the <b>ipv6 bgp neighbor update-source</b> command.
<b>Neighbor EBGp multiHop</b>	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.
<b>Neighbor next hop self</b>	Indicates whether this peer is using next hop processing. This value is configured through the <b>ipv6 bgp neighbor next-hop-self</b> command.
<b>Neighbor Route Refresh</b>	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
<b>Neighbor Ipv4 unicast</b>	Indicates whether this peer is multiprotocol IPv4 unicast capable.
<b>Neighbor Ipv4 multicast</b>	Indicates whether this peer is multiprotocol IPv4 multicast capable.
<b>Neighbor type</b>	Indicates whether this peer is internal or external to the AS.
<b>Neighbor auto-restart</b>	Indicates whether peer auto-restart is enabled or disabled.

*output definitions (continued)*

---

<b>Neighbor route-reflector-client</b>	Indicates whether this peer is a client to the local route reflector, if configured.
<b>Neighbor confederation status</b>	Indicates whether this peer is a member of a BGP confederation.
<b>Neighbor remove private AS</b>	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.
<b>Neighbor default originate</b>	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the <b>ipv6 bgp neighbor default-originate</b> command.
<b>Neighbor maximum prefixes</b>	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the <b>ipv6 bgp neighbor maximum-prefix</b> command.
<b>Neighbor max prefixes warning</b>	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the <b>ipv6 bgp neighbor update-source</b> command.
<b># of prefixes received</b>	Displays the total number of prefixes received by this neighbor.
<b>Neighbor MD5 key</b>	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.
<b>Neighbor local port</b>	The TCP port used for the session with this peer.
<b>Neighbor TCP window size</b>	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
<b>Graceful Restart State</b>	Indicates the graceful restart state. This feature does not support IPv6 prefixes.
<b>Advertised Restart Interval</b>	Indicates the restart interval in seconds.
<b>Forwarding State during restart</b>	Indicates whether the peer has preserved the forwarding state during the graceful restart.
<b>Activate IPv6 unicast</b>	Indicates whether or not IPv6 unicast advertisements are enabled. Options include <b>enabled</b> or <b>disabled</b> .
<b>Configured IPv4 NextHop Address</b>	Specifies the IPv4 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv4-nexthop</b> command.
<b>Configured IPv6 NextHop Address</b>	Specifies the IPv6 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv6-nexthop</b> command.
<b>Neighbor Ipv6 unicast</b>	Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include enabled or disabled.

## show ipv6 bgp neighbors statistics

Displays the neighbor statistics of the configured IPv6 BGP peers.

**show ipv6 bgp neighbors statistics** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *ipv6\_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors statistics
```

```
Legends: Nbr    = Neighbor
          As     = Autonomous System
          RMSGS  = # of received messages
          SMSGS  = # of sent messages
          RUPDS  = # of Update messages received
          SUPDS  = # of Update messages sent
          RNOFY  = # of Notify messages received
          SNOFY  = # of Notify messages sent
          RPFXS  = # of prefixes received
          UPTNS  = # of UP transitions
          DNTNS  = # of DOWN transitions
```

```
Nbr address           As     RMSGS SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1      30    225   260    2     3     0     0     10    1     1
```

### output definitions

---

<b>Nbr address</b>	The IPv6 address for this peer. This value is configured using the <b>ipv6 bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. This value is configured using the <b>ipv6 bgp neighbor remote-as</b> command.
<b>RMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b>SMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

*output definitions (continued)*

---

<b>RUPDS</b>	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>SUPDS</b>	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>RNOFY</b>	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>SNOFY</b>	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>RPFXS</b>	Number of unique route prefixes received by this peer.
<b>UPTNS</b>	Number of times this peer has come up, operationally.
<b>DNTNS</b>	Number of times this peer has gone down, operationally.

---

```
-> show ipv6 bgp neighbors statistics 2001:100:3:4::1
Neighbor address           = 2001:100:3:4::1,
# of UP transitions        = 1,
Time of last UP transition = 01h:50m:36s,
# of DOWN transitions      = 1,
Time of last DOWN transition = 00h:00m:00s,
Last DOWN reason          = none,

# of Notification msgs sent = 0,
Last sent Notification reason = none [none]
Time last msg was sent     = 00h:00m:18s,
```

*output definitions*

---

<b>Neighbor address</b>	The IPv6 address for this peer. This value is configured using the <b>ipv6 bgp neighbor</b> command.
<b># of UP transitions</b>	Number of times this peer has come up, operationally.
<b>Time of last UP transition</b>	The duration that this peer has been up.
<b># of DOWN transitions</b>	Number of times this peer has gone down, operationally.
<b>Time of last DOWN transition</b>	The duration since this peer last went down.

---

*output definitions (continued)*

---

<b>Last DOWN reason</b>	Provides a message as the last reason why a peer went down. The possible reasons for going down are:  user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
<b># of msgs rcvd</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b># of Update msgs rcvd</b>	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of prefixes rcvd</b>	Number of unique route prefixes received by this peer.
<b># of Route Refresh msgs rcvd</b>	Number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
<b># of Notification msgs rcvd</b>	Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last rcvd Notification reason</b>	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> <li>message header error - synchronization loss</li> <li>message header error - bad length</li> <li>message header error - bad type</li> <li>open message error - unsupported version</li> <li>open message error - bad peer autonomous system</li> <li>open message error - bad peer bgp id</li> <li>open message error - unsupported option</li> <li>open message error - authentication failure</li> <li>open message error - unacceptable hold time</li> <li>open message error - unsupported capability</li> <li>update message error - malformed attribute</li> <li>update message error - unknown attribute</li> <li>update message error - missing wellknown attribute</li> <li>update message error - attribute flags error</li> <li>update message error - attribute length error</li> <li>update message error - invalid origin</li> <li>update message error - as loop</li> <li>update message error - invalid nexthop</li> <li>update message error - optional attribute error</li> <li>update message error - invalid network</li> <li>update message error - malformed aspath</li> <li>cease - maximum number of prefixes reached</li> <li>cease - administrative shutdown</li> <li>cease - peer de-configured</li> <li>cease- administrative reset</li> <li>cease- connection rejected</li> <li>cease - other configuration change</li> <li>cease - connection collision resolution</li> <li>cease - out of resources</li> <li>hold time out - none</li> <li>fsm error - none</li> <li>none - none</li> </ul>
<b>Time last msg was rcvd</b>	The duration since a message was received from this peer.
<b># of msgsd sent</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
<b># of Update msgsd sent</b>	Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of Route Refresh msgsd sent</b>	Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
<b># of Notification msgsd sent</b>	Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last sent Notification reason</b>	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the <b>Peer last received notification reason</b> field above.
<b>Time last msg was sent</b>	The duration since a message was sent to this peer.

---

**Release History**

Release 6.1.5; command was introduced.

## show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

**show ipv6 bgp neighbors timers** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the *ipv6\_address* parameter to display the timer value for a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors timers
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive

Nbr address                As    Hold  Hold(C) RtAdv  Retry  Kalive  Ka(C)
-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1           30   90   90     30   120   30     30
```

### output definitions

---

<b>Nbr address</b>	The IPv6 address for this BGP peer. Assign this address using the <a href="#">ipv6 bgp neighbor</a> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned using the <a href="#">ipv6 bgp neighbor remote-as</a> command.
<b>Hold</b>	The actual negotiated hold time value.
<b>Hold (C)</b>	The hold time value. This value is configured using the <a href="#">ipv6 bgp neighbor timers</a> command.
<b>RtAdv</b>	The route advertisement interval, in seconds, for updates between external BGP peers.
<b>Retry</b>	The interval, in seconds, between retries by this peer to set up a connection via TCP with another peer. This value is configured using the <a href="#">ipv6 bgp neighbor timers</a> command.

---

*output definitions (continued)*

---

<b>Kalive</b>	The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
<b>Ka (C)</b>	The KEEPALIVE interval as configured using the <a href="#">ipv6 bgp neighbor timers</a> command.

---

## Release History

Release 6.1.5; command was introduced.

## Related Commands

[show ip bgp statistics](#) Displays BGP global statistics.

  alaBgpPeer6HoldTime

---

## show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

```
show ipv6 bgp neighbors policy ipv6_address
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv6 peer.

### Examples

```
OS6850::> show ipv6 bgp neighbors policy
Neighbor address = 2001::1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

#### *output definitions*

---

<b>Neighbor autonomous system</b>	The AS to which the peer is assigned. This can be assigned by using the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor output policy map name</b>	The outbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor input policy map name</b>	The inbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor output aspath-list name</b>	The outbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefix6list</b> command.
<b>Neighbor input aspath-list name</b>	The inbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-aspathlist</b> command.

*output definitions (continued)*

---

<b>Neighbor output prefix-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.
<b>Neighbor input prefix-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefixlist</b> command.
<b>Neighbor output community-list name</b>	The outbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-communitylist</b> command.
<b>Neighbor input community-list name</b>	The inbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-communitylist</b> command.
<b>Neighbor soft reconfiguration</b>	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the <b>ip bgp neighbor soft-reconfiguration</b> command.
<b>Neighbor output prefix6-list name</b>	The outbound prefix6-list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor out-prefix6list</b> command.
<b>Neighbor input prefix6-list name</b>	The inbound prefix6-list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor in-prefix6list</b> command.

---

# 26 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (e.g., web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

*Filename* AlcatellIND1Slb.mib  
*Module:* ALCATEL-IND1-SLB-MIB

A summary of available commands is listed here:

<b>Global SLB Commands</b>	<b>ip slb admin</b> <b>ip slb reset statistics</b> <b>show ip slb</b>
<b>SLB Cluster Commands</b>	<b>ip slb cluster</b> <b>ip slb cluster admin status</b> <b>ip slb cluster ping period</b> <b>ip slb cluster ping timeout</b> <b>ip slb cluster ping retries</b> <b>ip slb cluster probe</b> <b>show ip slb clusters</b> <b>show ip slb cluster</b>
<b>SLB Server Commands</b>	<b>ip slb server ip cluster</b> <b>ip slb server ip cluster probe</b> <b>show ip slb cluster server</b> <b>show ip slb servers</b>
<b>SLB Probe Commands</b>	<b>ip slb probe</b> <b>ip slb probe timeout</b> <b>ip slb probe period</b> <b>ip slb probe port</b> <b>ip slb probe retries</b> <b>ip slb probe username</b> <b>ip slb probe password</b> <b>ip slb probe url</b> <b>ip slb probe status</b> <b>ip slb probe send</b> <b>ip slb probe expect</b> <b>show ip slb probes</b>

## ip slb admin

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

**ip slb admin {enable | disable}**

---

### Syntax Definitions

**enable** Enables Server Load Balancing on a switch.

**disable** Disables Server Load Balancing on a switch.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration will go active.

### Examples

```
-> ip slb admin enable
-> ip slb admin disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ip slb</a>	Displays the status of Server Load Balancing on a switch.
<a href="#">ip slb cluster</a>	Configures a Server Load Balancing cluster on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

```
slbFeature
  slbAdminStatus
```

---

## ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

**ip slb reset statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

### Examples

```
-> ip slb reset statistics
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

- |                                      |                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">show ip slb clusters</a> | Displays the status and configuration of all Server Load Balancing clusters on a switch.                       |
| <a href="#">show ip slb cluster</a>  | Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch. |

### MIB Objects

```
slbFeature  
  slbResetStatistics
```

---

## ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

**ip slb cluster** *name* {**vip** *ip\_address* | **condition** *string*} [**I3** | **I2**]

**no ip slb cluster** *name*

---

### Syntax Definitions

<i>name</i>	The name of the Server Load Balancing (SLB) cluster. The name can consist of a maximum of 23 characters. Spaces must be enclosed within quotation marks (e.g., “mail server”).
<i>ip_address</i>	The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.
<i>string</i>	The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.
<b>I3</b>	Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.
<b>I2</b>	Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the <b>condition</b> parameter.

### Defaults

parameter	default
<b>I3</b>   <b>I2</b>	<b>I3</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers.
- Specifying the **I3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.
- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin** command to enable this feature. Note, however, that it is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

- A maximum of 16 Server Load Balancing clusters may be configured on an OmniSwitch 6850/6850E switch. Each cluster may contain up to 16 servers for a total of 256 servers per switch.

## Examples

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond 12
-> ip slb cluster cluster_2 condition slb_cond 13
-> no ip slb cluster hr_servers
```

## Release History

Release 6.1; command was introduced.

Release 6.1.3; **condition**, **I2**, **I3**, and **arp** parameters added.

Release 6.1.5; **I2** and **I3** parameters not used with the **vip** parameter; **arp** parameter deprecated.

## Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb admin</a>	Enables or disables Server Load Balancing on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

## MIB Objects

```
slbClusterTable
  slbClusterName
  slbClusterVIP
  slbClusterRowStatus
  slbClusterPackets
  slbClusterCondition
  slbClusterType
```

---

## ip slb cluster admin status

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

**ip slb cluster** *cluster\_name* **admin status** {enable | disable}

---

### Syntax Definitions

<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
<b>enable</b>	Administratively enables a Server Load Balancing cluster on a switch.
<b>disable</b>	Administratively disables a Server Load Balancing cluster on a switch.

### Defaults

By default, a cluster is administratively enabled when the cluster is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

### Examples

```
-> ip slb cluster hr_servers admin status enable
-> ip slb cluster "mail servers" admin status disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb cluster</a>	Configures Server Load Balancing clusters.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

```
slbClusterTable
    slbClusterAdminStatus
```

---

## ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing cluster.

**ip slb cluster** *cluster\_name* **ping period** *seconds*

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>seconds</i>	The number of seconds for the ping period. Specifying 0 (zero) will disable the ping. The valid range for the ping period is 0–600 seconds.

### Defaults

---

parameter	default
<i>seconds</i>	60

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the [ip slb cluster ping timeout](#) command to modify the ping timeout value.

### Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

### Release History

Release 6.1; command was introduced.

**Related Commands**

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb cluster ping timeout</b>	Modifies the ping timeout value.
<b>ip slb cluster ping retries</b>	Modifies the number of ping retries.

**MIB Objects**

```
slbClusterTable  
    slbClusterPingPeriod
```

---

## ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

**ip slb cluster** *cluster\_name* **ping timeout** *milliseconds*

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>milliseconds</i>	The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>milliseconds</i>	3000

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

Use the [ip slb cluster ping period](#) command to modify the ping period value.

### Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

### Release History

Release 6.1; command was introduced.

**Related Commands**

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb cluster ping period</b>	Modifies the ping period value.
<b>ip slb cluster ping retries</b>	Modifies the number of ping retries.

**MIB Objects**

```
slbClusterTable  
    slbClusterPingTimeout
```

---

## ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

**ip slb cluster** *cluster\_name* **ping retries** *count*

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>count</i>	The number of ping retries. The valid range for the ping retry value is 0–255.

### Defaults

---

parameter	default
<i>count</i>	3

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb cluster ping period</a>	Modifies the ping period value.
<a href="#">ip slb cluster ping timeout</a>	Modifies the ping timeout value.

### MIB Objects

slbClusterTable  
    slbClusterPingRetries

---

## ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name probe probe_name
```

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>probe_name</i>	The name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

### Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">ip slb probe</a>	Configures and deletes SLB probes.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

slbClusterTable  
    slbClusterProbeName

---

## ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

**ip slb server ip** *ip\_address* **cluster** *cluster\_name* [**admin status** {**enable** | **disable**}] [**weight** *weight*]

**no ip slb server ip** *ip\_address* **cluster** *cluster\_name*

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the physical server.
<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
<b>enable</b>	Enables a server.
<b>disable</b>	Disables a server.
<i>weight</i>	Specifies the weight of the server. The valid range of weight value is 0 - 32

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>
<b>weight</b>	<b>1</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a physical server from a Server Load Balancing cluster.
- Up to 16 clusters per switch are allowed. Each cluster may contain up to 16 servers to provide a maximum of 256 physical servers per switch.
- Use the **weight** parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server will prevent this server from being assigned any new connections. This server will be a backup server.
- A higher weight value indicates that the server can accept more network traffic.

### Examples

```
-> ip slb cluster corporate_servers vip 15.2.2.50
-> ip slb server ip 15.2.2.2 cluster corporate_servers weight 7
-> no ip slb server ip 15.2.2.3 cluster corporate_servers
```

## Release History

Release 6.1; command was introduced.

Release 6.4.2; **weight** parameter added.

## Related Commands

<b>ip slb admin</b>	Enables or disables Server Load Balancing on a switch.
<b>ip slb cluster</b>	Configures Server Load Balancing clusters.
<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>show ip slb cluster server</b>	Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing cluster.

## MIB Objects

```

---

## ip slb server ip cluster probe

Configures a probe for a Server Load Balancing (SLB) server.

**ip slb server ip** *ip\_address* **cluster** *cluster\_name* **probe** *probe\_name*

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>probe_name</i>	The name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

### Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers probe p_http
```

### Release History

Release 6.1; command was introduced.

<a href="#">ip slb admin</a>	Enables or disables Server Load Balancing on a switch.
<a href="#">ip slb cluster</a>	Configures Server Load Balancing clusters.

### MIB Objects

slbServerTable  
    slbServerProbeName

---

## ip slb probe

Configures a Server Load Balancing (SLB) probe used to check the health of servers or clusters.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
```

```
no ip slb probe probe_name
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete an SLB probe.
- It is possible to configure up to 20 probes per switch.

### Examples

```
-> ip slb probe mail_server_probe smtp  
-> no ip slb probe mail_server_probe
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[show ip slb probes](#) Displays the configuration of SLB probes.

## MIB Objects

```
slbProbeTable  
    slbProbeName  
    slbProbeMethod
```

---

## ip slb probe timeout

Configures the amount of time to wait for Server Load Balancing (SLB) probe answers.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
timeout seconds
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>seconds</i>	Specifies the timeout in seconds, which can be 1–3600000.

### Defaults

parameter	default
<i>seconds</i>	3000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mail_server smtp timeout 12000
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[ip slb probe](#)

Configures and deletes SLB probes.

[show ip slb probes](#)

## MIB Objects

slbProbeTable

slbProbeName

slbProbeMethod

slbProbeTimeout

---

## ip slb probe period

Configures the length of time between each SLB probe to check the health of the servers.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
period seconds
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>seconds</i>	Specifies the length of time for the SLB probe period (0–3600 seconds).

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http period 120
```

## Release History

Release 6.1; command was introduced.

## Related Commands

## MIB Objects

slbProbeTable

slbProbeName

slbProbeMethod

slbProbePeriod

---

## ip slb probe port

Configures the TCP/UDP port on which the Server Load Balancing (SLB) probe is sent.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
port port_number
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>port_number</i>	Specifies the TDP/UDP port number (0–65535).

### Defaults

parameter	default
<i>port_number</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mis_server udp port 200
```

## Release History

Release 6.1; command was introduced.

## Related Commands

## MIB Objects

slbProbeTable

    slbProbeName

    slbProbeMethod

    slbProbePort

---

## ip slb probe retries

Configures the number of Server Load Balancing (SLB) probe retries that are performed before deciding that a server is out of service.

**ip slb probe** *probe\_name* {**ftp** | **http** | **https** | **imap** | **imaps** | **nntp** | **ping** | **pop** | **pops** | **smtp** | **tcp** | **udp**}  
**retries** *retries*

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>retries</i>	Specifies the number of retries (0–255).

### Defaults

parameter	default
<i>retries</i>	3

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mail_server smtp retries 5
```

## Release History

Release 6.1; command was introduced.

## Related Commands

Displays the configuration of SLB probes.

## MIB Objects

slbProbeTable

    slbProbeName

    slbProbeMethod

    slbProbeRetries

---

## ip slb probe username

Configures a user name that is sent to a server as credentials for an HTTP GET operation to verify the health of the server.

```
ip slb probe probe_name {http | https} username user_name
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>user_name</i>	Specifies user name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http username subnet1
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip slb probe</a>	Configures and deletes SLB probes.
<a href="#">show ip slb probes</a>	Displays the configuration of SLB probes.

### MIB Objects

```
slbProbeTable  
  slbProbeName  
  slbProbeMethod  
  slbProbeHttpUsername
```

---

## ip slb probe password

Configures a password that is sent to a server as credentials for an HTTP GET to verify the health of the server.

```
ip slb probe probe_name {http | https} password password
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>password</i>	Specifies the password.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

The password is encrypted in the configuration file so it is not readable.

### Examples

```
-> ip slb probe web_server http password h1f45xc
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip slb probe</a>	Configures and deletes SLB probes.

```

---

## ip slb probe url

Configures a URL that is sent to a server for an HTTP GET to verify the health of the server.

```
ip slb probe probe_name {http | https} url url
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>url</i>	Specifies the URL of the server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
->ip slb probe web_server http url pub/index.html
```

### Release History

Release 6.1; command was introduced.

### Related Commands

  slbProbeName  
  slbProbeMethod  
  slbProbeHttpUrl
```

---

## ip slb probe status

Configures the expected status returned from an HTTP GET to verify the health of a server.

```
ip slb probe probe_name {http | https} status status_value
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>status_value</i>	Specifies the expected status returned, which can be 0–4294967295.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>status_value</i>	200

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http status 404
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip slb probe</a>	Configures and deletes SLB probes.

```

---

## ip slb probe send

Configures an ASCII string that is sent to a server to invoke a server response and verify the health of the server.

```
ip slb probe probe_name {tcp | udp} send send_string
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>send_string</i>	Specifies the ASCII string sent to a server to invoke a response.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server tcp send test
```

### Release History

Release 6.1; command was introduced.

Release 6.1.3; **http** and **https** parameters removed.

### Related Commands

<a href="#">ip slb probe</a>	Configures and deletes SLB probes.

  slbProbeSend
```

---

## ip slb probe expect

Configures an ASCII string used to compare a response from a server to verify the health of the server.

```
ip slb probe probe_name {http | https | tcp | udp} expect expect_string
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>expect_string</i>	Specifies the ASCII string used to compare a response from a server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http expect test
```

### Release History

Release 6.1; command was introduced.

### Related Commands

## show ip slb

Displays the status of Server Load Balancing on a switch.

**show ip slb**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip slb
Admin status           : Enabled,
Operational status    : In Service,
Number of clusters    : 3
```

Output fields are described here:

#### *output definitions*

---

<b>Admin status</b>	The current administrative status of Server Load Balancing (SLB) on this switch ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational status</b>	The current operational status of Server Load Balancing (SLB) on this switch, which is either <b>In service</b> (at least one SLB cluster is in service) or <b>Out of service</b> (all SLB clusters are out of service).
<b>Number of clusters</b>	The total number of Server Load Balancing (SLB) clusters on this switch. A maximum of 16 SLB clusters per switch is allowed.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>show ip slb servers</b>	Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.
<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>show ip slb cluster server</b>	Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster.

## MIB Objects

```
slbFeature  
  slbAdminStatus  
  slbOperStatus  
  slbClustersCount
```

---

```
-> show ip slb clusters statistics
Cluster Name                                     Count

    Dst IP 101.113.113.1/255.255.255.255      4503911
Cluster6           Enabled  In Service           2 Servers
    Src IP 202.202.1.0/255.255.255.0          6527831
    Src Port 2/49
```

### *output definitions*

---

<b>Cluster Name</b>	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
<b>Count</b>	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.

---

## Release History

Release 6.1; command was introduced.

Release 6.1.5; **statistics** parameter added; **Count** field added.

## Related Commands

<a href="#">ip slb reset statistics</a>	Resets SLB statistics for all clusters.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single SLB cluster.
<a href="#">show ip slb servers</a>	Displays the status of all physical servers belonging to each SLB cluster on a switch.
<a href="#">show ip slb cluster server</a>	Displays detailed status and configuration information for a single physical server in an SLB cluster.

## MIB Objects

```
slbClusterTable
  slbClusterName
  slbClusterVIP
  slbClusterCondition
  slbClusterAdminStatus
  slbClusterOperStatus
  slbClusterNumberOfServers

slbStatsTable
  slbStatsClusterName
  slbStatsIndex
  slbStatsCounter
slbStatsQualTable
  slbStatsQualType
  slbStatsQualData
```

---

## show ip slb cluster

Displays detailed statistics and configuration information for a single Server Load Balancing (SLB) cluster. This command also displays traffic statistics for single QoS policy condition cluster.

**show ip slb cluster** *name* [**statistics**]

---

### Syntax Definitions

**name** Specifies the name of the SLB cluster.

**statistics** Displays SLB statistics for the specified cluster.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to the cluster because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below:

### Examples

```
-> show ip slb cluster Intranet
Cluster Intranet
  VIP                : 128.241.130.205,
  Type               : L3
  Admin status       : Enabled,
  Operational status : In Service,
  Ping period (seconds) : 60,
  Ping timeout (milliseconds) : 3000,
  Ping retries       : 3,
  Probe              : None,
  Number of packets  : 45768,
  Number of servers  : 2
  Server 128.241.130.4
    Admin status = Enabled, Operational Status = In Service,
    Availability (%) = 98
  Server 128.241.130.5
    Admin status = Enabled, Operational Status = Discovery,
    Availability (%) = 0
```

### output definitions

---

<b>Cluster</b>	The name of this Server Load Balancing (SLB) cluster.
<b>VIP</b>	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
<b>Type</b>	The classifier for the hypothetical packet, which can be <b>L2</b> or <b>L3</b> .

*output definitions (continued)*

---

<b>Admin status</b>	The current administrative status of this Server Load Balancing (SLB) cluster ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational status</b>	The current operational status of this Server Load Balancing (SLB) cluster, which is <b>In Service</b> (i.e., at least one physical server is operational in the cluster) or <b>Out of Service</b> .
<b>Ping period (seconds)</b>	The ping period (in seconds) used by this Server Load Balancing (SLB) cluster to check the health of physical servers.
<b>Ping timeout (milliseconds)</b>	The timeout (in milliseconds) used by this Server Load Balancing (SLB) cluster to wait for ping answers from physical servers.
<b>Ping retries</b>	The number of ping retries that this Server Load Balancing (SLB) cluster will execute before switching the status to <b>No answer</b> .
<b>Probe</b>	The probe configured for this cluster.
<b>Number of packets</b>	The number of packets balanced for this Server Load Balancing (SLB) cluster.
<b>Number of servers</b>	The total number of physical servers that belong to this Server Load Balancing (SLB) cluster.
<b>Server</b>	The IP address for this physical server.
<b>Admin Status</b>	The administrative state of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational Status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Availability (%)</b>	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.

---

```
-> show ip slb cluster Cluster6 statistics
Cluster Name                               Count
-----+-----
Cluster6      Enabled  In Service      2 Servers
  Src IP 202.202.1.0/255.255.255.0         6527831
  Src Port 2/49
```

*output definitions*

---

<b>Cluster Name</b>	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
<b>Count</b>	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.

---

## Release History

Release 6.1; command was introduced.

Release 6.1.3; **Type** field added; **Routed flows success ratio (%)** field removed.

Release 6.1.5; **statistics** parameter added; **Count** field added.

## show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

**show ip slb cluster** *cluster\_name* **server** *ip\_address*

---

### Syntax Definitions

*cluster\_name* Specifies the name of the Server Load Balancing (SLB) cluster.

*ip\_address* Specifies the IP address for the physical server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

Specifying a value for the *cluster\_name* and *ip\_address* parameters is required.

### Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster c11
  VIP 128.220.40.205
  Server 128.220.40.4
    Admin weight           : 3,
    MAC addr               : 00:00:1f:40:53:6a,
    Slot number            : 1,
    Port number             : 4,
    Admin status           : Enabled,
    Oper status            : In Service,
    Probe                   : None,
    Availability time (%)  : 95,
    Ping failures          : 0,
    Last ping round trip time (milliseconds) : 20,
    Probe status           : OK,
```

Output fields are described here:

#### *output definitions*

---

<b>Cluster</b>	The name of the Server Load Balancing (SLB) cluster.
<b>VIP</b>	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
<b>Server</b>	The IP address for this physical server.

*output definitions (continued)*

---

<b>Admin weight</b>	The weight assigned to this physical server.. A weight of 0 (zero) indicates that no new connections will be assigned to the server. A higher weight value indicates that the server can accept more network traffic.
<b>MAC addr</b>	The MAC address of this physical server.
<b>Slot number</b>	The slot number of the network interface (NI) module to which this physical server is attached.
<b>Port number</b>	The port number to which this physical server is attached.
<b>Admin status</b>	The current administrative status of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Oper status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Probe</b>	The name of the probe configured for this server.
<b>Availability time (%)</b>	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.
<b>Ping failures</b>	The total number of pings that have failed on this physical server.
<b>Last ping round trip time (milliseconds)</b>	The total amount of time (in milliseconds) measured for the last valid ping to this physical server to make a round trip.
<b>Probe status</b>	The status of the probe configured for this server.

---

**Release History**

Release 6.1; command was introduced.

Release 6.4.2; **Admin weight** field added.

## Related Commands

128.220.40.6	FileTransfer	Enabled	No answer	50
128.220.40.7	FileTransfer	Disabled	Disabled	---
128.220.40.1	WorldWideWeb	Enabled	In Service	100
128.220.40.2	WorldWideWeb	Enabled	Discovery	50
128.220.40.3	WorldWideWeb	Enabled	Link Down	75

Output fields are described here:

#### *output definitions*

---

<b>IP addr</b>	The IP address for this physical server.
<b>Cluster Name</b>	The name of the Server Load Balancing (SLB) cluster to which this physical server belongs.
<b>Admin Status</b>	The current administrative status of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).

*output definitions (continued)*

---

<b>Operational Status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"><li>• <b>Disabled</b> (this server is administratively disabled).</li><li>• <b>No Answer</b> (this server has not responded to ping requests).</li><li>• <b>Link Down</b> (there is a bad connection to this server).</li><li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li><li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li><li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li></ul>
<b>% Avail</b>	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>show ip slb cluster server</b>	Displays the detailed status and configuration of a single physical server in a Server Load Balancing cluster.
<b>show ip slb clusters</b>	Displays detailed status and configuration information for all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster.

**MIB Objects**

```
slbServers
  slbServerIpAddress
  slbServerClusterName
  slbServerAdminStatus
  slbServerOperStatus
  slbServerFlows
```

---

## show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

**show ip slb probes** [*probe\_name*]

---

### Syntax Definitions

*probe\_name* Specifies the name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes will be displayed.

### Examples

No probe name is specified:

```
-> show ip slb probes
Probe Name          Period  Retries  Timeout  Method
-----+-----+-----+-----+-----
web_server          60000    3    12000   HTTP
mail_server         60000    3     3000   SMTP
mis_servers         3600000  5    24000   Ping
```

Output fields are described here:

#### *output definitions*

---

<b>Probe Name</b>	The user-specified name of the probe.
<b>Period</b>	The period (in seconds) to check the health of servers.
<b>Retries</b>	The number of probe retries before deciding that a server is out of service.
<b>Timeout</b>	The timeout (in seconds) used to wait for probe answers.
<b>Method</b>	The type of probe.

---

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server
Probe mail_server
Type                : SMTP,
Period (seconds)    : 60,
Timeout (milliseconds) : 3000,
Retries              : 3,
Port                : 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp
Probe phttp
  Type           : HTTP,
  Period (seconds) : 60,
  Timeout (milliseconds) : 3000,
  Retries        : 3,
  Port           : 0,
  Username       : ,
  Password       : ,
  Expect         : ,
  Status         : 200,
  URL            : /,
```

Output fields are described here:

### *output definitions*

---

<b>Probe</b>	The user-specified name of the probe.
<b>Type</b>	The type of probe.
<b>Period</b>	The period (in seconds) to check the health of servers.
<b>Timeout</b>	The timeout (in seconds) used to wait for probe answers.
<b>Retries</b>	The number of probe retries before deciding that a server is out of service.
<b>Port</b>	The TCP/UDP port on which the probe is sent.
<b>Username</b>	The configured user name sent to a server as credentials for an HTTP GET operation for the probe.
<b>Password</b>	The configured password for the probe.
<b>Expect</b>	The configured ASCII string used to compare a response from a server to verify the health of the server.
<b>Status</b>	The expected status returned from an HTTP GET to verify the health of a server.
<b>URL</b>	The configured URL sent to a server for an HTTP GET to verify the health of the server.

---

### **Release History**

Release 6.1; command was introduced.

## Related Commands

<b>ip slb probe</b>	Configures and deletes SLB probes.
<b>ip slb probe period</b>	Configures the probe period to check the health of servers.
<b>ip slb probe timeout</b>	Configures the timeout used to wait for probe answers.
<b>ip slb probe retries</b>	Configures the number of probe retries before deciding that a server is out of service.
<b>ip slb probe port</b>	Configures the TCP/UDP port that the probe should be sent on.
<b>ip slb probe username</b>	Configures a user name sent to a server as credentials for an HTTP GET operation
<b>ip slb probe password</b>	Configures a password sent to a server as credentials for an HTTP GET to verify the health of the server
<b>ip slb probe expect</b>	Configures an ASCII string used to compare a response from a server to verify the health of the server.
<b>ip slb probe status</b>	Configures the expected status returned from an HTTP GET to verify the health of a server.
<b>ip slb probe url</b>	Configures a URL sent to a server for an HTTP GET to verify the health of the server.

# 27 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

Alcatel-Lucent's IPMS software is compatible with the following RFCs:

- RFC 1112 — Host Extensions for IP Multicasting
- RFC 2236 — Internet Group Management Protocol, Version 2
- RFC 2933 — Internet Group Management Protocol MIB
- RFC 3376 — Internet Group Management Protocol, Version 3

Alcatel-Lucent's IPv6MS software is compatible with the following RFCs:

- RFC 2710 — Multicast Listener Discovery for IPv6
- RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
- RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS commands is as follows:

*Filename:* AlcatelIND1Igmplib  
*Module:* ALCATEL-IGMP-IND1-MIB

MIB information for the IPv6MS commands is as follows:

*Filename:* AlcatelIND1Mld.mib  
*Module:* ALCATEL-MLD-IND1-MIB

The following table summarizes the available IP and IPv6 multicast commands:

---

**ip multicast status**  
**ip multicast router-timeout**  
**ip multicast querier-forwarding**  
**ip multicast version**  
**ip multicast max-group**  
**ip multicast vlan max-group**  
**ip multicast port max-group**  
**ip multicast static-neighbor**  
**ip multicast static-querier**  
**ip multicast static-group**  
**ip multicast query-interval**  
**ip multicast last-member-query-interval**  
**ip multicast query-response-interval**  
**ip multicast unsolicited-report-interval**  
**ip multicast router-timeout**  
**ip multicast source-timeout**  
**ip multicast querying**  
**ip multicast robustness**  
**ip multicast spoofing**  
**ip multicast zapping**  
**ip multicast proxying**  
**ip multicast helper-address**  
**ip multicast helper-address**  
**ipv6 multicast querier-forwarding**  
**ipv6 multicast version**  
**ipv6 multicast max-group**  
**ipv6 multicast vlan max-group**  
**ipv6 multicast port max-group**  
**ipv6 multicast static-neighbor**  
**ipv6 multicast static-querier**  
**ipv6 multicast static-group**  
**ipv6 multicast query-interval**  
**ipv6 multicast last-member-query-interval**  
**ipv6 multicast query-response-interval**  
**ipv6 multicast unsolicited-report-interval**  
**ipv6 multicast router-timeout**  
**ipv6 multicast source-timeout**  
**ipv6 multicast querying**  
**ipv6 multicast robustness**  
**ipv6 multicast spoofing**  
**ipv6 multicast zapping**  
**ipv6 multicast proxying**  
**show ip multicast**  
**show ip multicast port**

**show ip multicast group**  
**show ip multicast source**  
**show ip multicast tunnel**  
**show ipv6 multicast**  
**show ipv6 multicast port**  
**show ipv6 multicast forward**  
**show ipv6 multicast neighbor**  
**show ipv6 multicast querier**  
**show ipv6 multicast group**  
**show ipv6 multicast source**  
**show ipv6 multicast tunnel**

---

## ip multicast status

Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

**ip multicast** [*vlan vid*] **status** [{*enable* | *disable*}]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IP Multicast Switching and Routing.
<b>disable</b>	Disable IP Multicast Switching and Routing.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If an IP Multicast Routing protocol is already running on the system, the **ip multicast status** command will override the existing configuration and always enable IP Multicast Switching and Routing.
- If the IP Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the system if no VLAN is specified, by using only **ip multicast status** (e.g., ip multicast status).
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the specified VLAN, by using only **ip multicast vlan vid status** (e.g., ip multicast vlan 2 status).

### Examples

```
-> ip multicast status enable
-> ip multicast status disable
-> ip multicast status
-> ip multicast vlan 2 status enable
-> ip multicast vlan 2 status disable
-> ip multicast vlan 2 status
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpStatus

alaIcmpVlan

    alaIcmpVlanStatus

---

## ip multicast flood-unknown

Enables or disables the flooding of new multicast packets until the multicast group membership table is updated.

**ip multicast flood-unknown {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enable the flooding of multicast packets until membership table updated.
<b>disable</b>	Disable the flooding of multicast packets.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When flood-unknown is enabled and IP multicast switching is enabled, multicast packets are flooded on the VLAN until the multicast group membership table is updated. They are then forwarded based on the multicast group membership table.
- When flood-unknown is enabled and IP multicast switching is disabled, all multicast traffic will be flooded on the VLAN.
- When flood-unknown is disabled and IP multicast switching is enabled, multicast packets are not flooded on the VLAN but will be forwarded once the multicast group membership table is updated.
- If IP multicast switching is disabled and flood-unknown is disabled, all multicast packets are flooded on the VLAN.

### Examples

```
-> ip multicast flood-unknown enable  
-> ip multicast flood-unknown disable
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### **ip multicast status**

Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpStatus

alaIcmpVlan

    alaIcmpVlanStatus

---

## ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] querier-forwarding [{enable | disable}]**

**no ip multicast [vlan *vid*] querier-forwarding**

---

### Syntax Definitions

<i>vid</i>	The VLAN on which configuration is applied.
<b>enable</b>	Enable IGMP querier forwarding.
<b>disable</b>	Disable IGMP querier forwarding.

### Defaults

---

parameter	default
<b>enable / disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.

### Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 2 querier-forwarding disable
-> ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 2 querier-forwarding
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpQuerierForwarding
alaIcmpVlan
  alaIcmpVlanQuerierForwarding
```

---

## ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **version** [*version*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*version* Default IGMP protocol version to run. Valid range is 1 to 3.

### Defaults

parameter	default
<i>version</i>	2

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs.
- If the default IGMP protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- To restore the IGMP multicast version to the default (i.e., 2) version on the system if no VLAN is specified, use **ip multicast version** followed by the value 0 (e.g., ip multicast version 0) or use only **ip multicast version** (e.g., ip multicast version).
- To restore the IGMP multicast version to the default (i.e., 2) version on the specified VLAN, use **ip multicast vlan** *vid* **version**, followed by the value 0 (e.g., ip multicast vlan 2 version 0) or use only **ip multicast vlan** *vid* **version** (e.g., ip multicast vlan 2 version).

### Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 2 version 0
-> ip multicast vlan 2 version
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpVersion
alaIcmpVlan
  alaIcmpVlanVersion
```

---

## ip multicast max-group

Configures the global maximum group limit that can be learned per port/VLAN instance. The limit is applied to each port/VLAN instance and an action is taken when it exceeds the limit.

**ip multicast max-group** [*num*] [action {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>num</i>	Specifies the maximum IGMP group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

---

parameter	defaults
<b>action</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring a max-group value will have no effect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a specific VLAN or port will override the global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmpMaxGroupLimit  
alaIcmpMaxGroupExceedAction

---

## ip multicast vlan max-group

Configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.

**ip multicast vlan *vid* max-group [*num*] [action {none | drop | replace}]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>num</i>	The maximum IGMP group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

---

parameter	defaults
<b>Action</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a VLAN will override the global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 10 max-group
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmpVlanTable

    alaIcmpVlanMaxGroupLimit

    alaIcmpVlanMaxGroupExceedAction

---

## ip multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

**ip multicast port *slot / port* max-group [*num*] [action {none | drop | replace}]**

---

### Syntax Definitions

<i>slot / port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>num</i>	The maximum IGMP group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

---

parameter	defaults
<b>Action</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a port will override the VLAN or global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ip multicast port 1/1 max-group 10 action drop
-> ip multicast port 6/14 max-group 20 action replace
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmpPortTable

  alaIcmpPortMaxGroupLimit

  alaIcmpPortMaxGroupExceedAction

---

## ip multicast static-neighbor

Creates a static IGMP neighbor entry on a specified port on a specified VLAN.

**ip multicast static-neighbor** *vlan vid port slot/port*

**no ip multicast static-neighbor** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static IGMP neighbor.

*slot/port* The slot/port number you want to configure as a static IGMP neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on a specified port on a specified VLAN.
- The **ip multicast static-neighbor** command allows you to create an IGMP static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static neighbor entry on a link aggregate port by entering **ip multicast static-neighbor** *vlan vid port*, followed by the link aggregation group number (e.g., `ip multicast static-neighbor vlan 2 port 7`).

### Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1
-> no ip multicast static-neighbor vlan 4 port 1/1
-> ip multicast static-neighbor vlan 4 port 7
-> no ip multicast static-neighbor vlan 4 port 7
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**show ip multicast neighbor** Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

## MIB Objects

```
alaIcmpStaticNeighborTable  
  alaIcmpStaticNeighborVlan  
  alaIcmpStaticNeighborIfIndex  
  alaIcmpStaticNeighborRowStatus
```

---

## ip multicast static-querier

Creates a static IGMP querier entry on a specified port on a specified VLAN.

**ip multicast static-querier** *vlan vid port slot/port*

**no ip multicast static-querier** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static IGMP querier.

*slot/port* The slot/port number you want to configure as a static IGMP querier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on a specified port on a specified VLAN.
- The **ip multicast static-querier** command allows you to create an IGMP static querier entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static querier entry on a link aggregate port by entering **ip multicast static-querier** *vlan vid port*, followed by the link aggregation group number (e.g., `ip multicast static-querier vlan 2 port 7`).

### Examples

```
-> ip multicast static-querier vlan 4 port 1/1
-> no ip multicast static-querier vlan 4 port 1/1
-> ip multicast static-querier vlan 4 port 7
-> no ip multicast static-querier vlan 4 port 7
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**show ip multicast querier**      Displays the IGMP querier table entries of IP Multicast Switching and Routing.

## MIB Objects

```
alaIcmpStaticQuerierTable  
  alaIcmpStaticQuerierVlan  
  alaIcmpStaticQuerierIfIndex  
  alaIcmpStaticQuerierRowStatus
```

---

## ip multicast static-group

Creates a static IGMP group entry on a specified port on a specified VLAN.

**ip multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

**no ip multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the multicast group.
<i>vid</i>	VLAN to include as a static IGMP group.
<i>slot/port</i>	The slot/port number you want to configure as a static IGMP group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on a specified port on a specified VLAN.
- The **ip multicast static-group** command allows you to create an IGMP static group entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- You can also create an IGMP static group entry on a link aggregate port by entering **ip multicast static-group** *ip\_address* **vlan** *vid* **port**, followed by the link aggregation group number (e.g., ip multicast static-group 11.0.0.1 vlan 2 port 7).

### Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1
-> no ip multicast static-group 229.10.10.10.10 vlan 4 port 1/1
-> ip multicast static-group 225.11.11.11 vlan 4 port 7
-> no ip multicast static-group 225.11.11.11 vlan 4 port 7
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ip multicast group**

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

## MIB Objects

```
alaIcmpStaticMemberTable  
  alaIcmpStaticMemberVlan  
  alaIcmpStaticMemberIfIndex  
  alaIcmpStaticMemberGroupAddress  
  alaIcmpStaticMemberRowStatus
```

---

## ip multicast query-interval

Sets the IGMP query interval on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **query-interval** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.  
*seconds* IGMP query interval in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	125

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs.
- If the IGMP query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- To restore the IGMP query interval to its default (i.e., 125 seconds) value on the system if no VLAN is specified, use **ip multicast query-interval** followed by the value 0 (e.g., ip multicast query-interval 0) or use only **ip multicast query-interval** (e.g., ip multicast query-interval).
- To restore the IGMP query interval to its default (i.e., 125 seconds) value on the specified VLAN, use **ip multicast vlan vid query-interval**, followed by the value 0 (e.g., ip multicast vlan 2 query-interval 0) or use only **ip multicast vlan vid query-interval** (e.g., ip multicast vlan 2 query-interval).

### Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
-> ip multicast vlan 2 query-interval 0
-> ip multicast vlan 2 query-interval
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

  alaIcmpVlanQueryInterval
```

---

## ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **last-member-query-interval** [*tenths-of-seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>tenths-of-seconds</i>	IGMP last member query interval in tenths of seconds. Valid range is 1 to 65535.

### Defaults

---

parameter	default
<i>tenths-of-seconds</i>	10

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs.
- If the IGMP last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- To restore the IGMP last member query interval to its default (i.e., 10 tenths-of-seconds) value on the system if no VLAN is specified, use **ip multicast last-member-query-interval** followed by the value 0 (e.g., **ip multicast last-member-query-interval 0**) or use only **ip multicast last-member-query-interval** (e.g., **ip multicast last-member-query-interval**).
- To restore the IGMP last member query interval to its default (i.e., 10 tenths-of-seconds) value on the specified VLAN, use **ip multicast vlan vid last-member-query-interval** followed by the value 0 (e.g., **ip multicast vlan 2 last-member-query-interval 0**) or use only **ip multicast vlan vid last-member-query-interval** (e.g., **ip multicast vlan 2 last-member-query-interval**).

### Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> ip multicast vlan 2 last-member-query-interval
```

## Release History

## ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **query-response-interval** [*tenths-of-seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>tenths-of-seconds</i>	IGMP query response interval in tenths of seconds. Valid range is 1 to 65535.

### Defaults

---

parameter	default
<i>tenths-of-seconds</i>	100

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- To restore the IGMP query response interval to its default (i.e., 100 tenths-of-seconds) value on the system if no VLAN is specified, use **ip multicast query-response-interval** followed by the value 0 (e.g., **ip multicast query-response-interval 0**) or use only **ip multicast query-response-interval** (e.g., **ip multicast query-response-interval**).
- To restore the IGMP last member query interval to its default (i.e., 100 tenths-of-seconds) value on the specified VLAN, use **ip multicast vlan** *vid* **query-response-interval** followed by the value 0 (e.g., **ip multicast vlan 2 query-response-interval 0**) or use only **ip multicast vlan** *vid* **query-response-interval** (e.g., **ip multicast vlan 2 query-response-interval**).

### Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
-> ip multicast vlan 2 query-response-interval
```

## Release History

## ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **unsolicited-report-interval** [*seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>seconds</i>	IGMP query response interval in seconds. Valid range is 1 to 65535, where 0 represents the default setting.

### Defaults

---

parameter	default
<i>seconds</i>	1

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- To restore the IGMP unsolicited report interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ip multicast unsolicited-report-interval** followed by the value 0 (e.g., ip multicast unsolicited-report-interval 0) or use only **ip multicast unsolicited-report-interval** (e.g., ip multicast unsolicited-report-interval).
- To restore the IGMP unsolicited report interval to its default (i.e., 1 second) value on the specified VLAN, use **ip multicast vlan vid unsolicited-report-interval** followed by the value 0 (e.g., ip multicast vlan 2 unsolicited-report-interval 0) or use only **ip multicast vlan vid unsolicited-report-interval** (e.g., ip multicast vlan 2 unsolicited-report-interval).

### Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
-> ip multicast vlan 2 unsolicited-report-interval
```

## ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [*vlan vid*] **router-timeout** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* IGMP router timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ip multicast router-timeout** followed by the value 0 (e.g., ip multicast router-timeout 0) or use only **ip multicast router-timeout** (e.g., ip multicast router-timeout).
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ip multicast vlan vid router-timeout** followed by the value 0 (e.g., ip multicast vlan 2 router-timeout 0) or use only **ip multicast vlan vid router-timeout** (e.g., ip multicast vlan 2 router-timeout).

### Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> ip multicast vlan 2 router-timeout
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

  alaIcmpVlanRouterTimeout
```

---

## ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **source-timeout** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* IGMP source timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ip multicast source-timeout** followed by the value 0 (e.g., ip multicast source-timeout 0) or use only **ip multicast source-timeout** (e.g., ip multicast source-timeout).
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ip multicast vlan vid source-timeout** followed by the value 0 (e.g., ip multicast vlan 2 source-timeout 0) or use only **ip multicast vlan vid source-timeout** (e.g., ip multicast vlan 2 source-timeout).

### Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> ip multicast vlan 2 source-timeout
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

alaIcmp
  alaIcmpSourceTimeout
alaIcmpVlan
  alaIcmpVlanSourceTimeout
```

---

## ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] querying [{enable | disable}]**

**no ip multicast [vlan *vid*] querying**

---

### Syntax Definitions

<i>vid</i>	VLAN on which configuration is applied.
<b>enable</b>	Enable IGMP querying.
<b>disable</b>	Disable IGMP querying.

### Defaults

---

parameter	default
<b>enable / disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP querying entry on the specified VLAN or on the system and return to its default behavior.
- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast querying** (e.g., ip multicast querying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* querying** (e.g., ip multicast vlan 2 querying).

### Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 2 querying disable
-> ip multicast vlan 2 querying
-> no ip multicast vlan 2 querying
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **no** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpQuerying

alaIcmpVlan

    alaIcmpVlanQuerying

---

## ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **robustness** [*robustness*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.  
*robustness* IGMP robustness variable. Valid range is 1 to 7.

### Defaults

---

parameter	default
<i>robustness</i>	2

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs.
- If the IGMP robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the IGMP robustness variable to its default (i.e., 2) value on the system if no VLAN is specified, use **ip multicast robustness** followed by the value 0 (e.g., ip multicast robustness 0) or use only **ip multicast robustness** (e.g., ip multicast robustness).
- To restore the IGMP robustness variable to its default (i.e., 2) value on the specified VLAN, use **ip multicast vlan vid robustness** followed by the value 0 (e.g., ip multicast vlan 2 robustness 0) or use only **ip multicast vlan vid robustness** (e.g., ip multicast vlan 2 robustness).

### Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> ip multicast robustness
-> ip multicast vlan 2 robustness 3
-> ip multicast vlan 2 robustness 0
-> ip multicast vlan 2 robustness
```

### Release History

Release 6.1.1; command was introduced.

## MIB Objects

```
alaIcmp
  alaIcmpRobustness
alaIcmpVlan
  alaIcmpVlanRobustness
```

---

## ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] spoofing [{enable | disable}]**

**no ip multicast [vlan *vid*] spoofing**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IGMP spoofing.
<b>disable</b>	Disable IGMP spoofing.

### Defaults

---

parameter	default
<b>enable / disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated IGMP group membership information.
- You can also restore the IGMP spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast spoofing** (e.g., ip multicast spoofing).
- You can also restore the IGMP spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* spoofing** (e.g., ip multicast vlan 2 spoofing).

### Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
-> ip multicast vlan 2 spoofing disable
-> ip multicast vlan 2 spoofing
-> no ip multicast vlan 2 spoofing
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **no** parameter added.

## Related Commands

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpSpoofing

alaIcmpVlan

    alaIcmpVlanSpoofing

---

## ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] zapping [{enable | disable}]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IGMP zapping.
<b>disable</b>	Disable IGMP zapping.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast zapping** (e.g., ip multicast zapping).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* zapping** (e.g., ip multicast vlan 2 zapping).

### Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 2 zapping disable
-> ip multicast vlan 2 zapping
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpZapping
alaIcmpVlan
  alaIcmpVlanZapping
```

---

## ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] proxying [enable | disable]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IGMP proxying.
<b>disable</b>	Disable IGMP proxying.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast proxying** (e.g., ip multicast proxying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* proxying** (e.g., ip multicast vlan 2 proxying).

### Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 2 proxying disable
-> ip multicast vlan 2 proxying
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpProxying
alaIcmpVlan
  alaIcmpVlanProxying
```

---

## ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host reports and Leave messages are to be sent.

**ip multicast helper-address** [*ip-address*]

---

### Syntax Definitions

*ip-address*                                      The IP address of the relay host

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- To disable the IPMS reporting feature, 0.0.0.0 is used as the IP address. It can also be disabled by omitting the IP address from the command.

### Examples

```
-> ip multicast helper-address 10.1.1.198  
-> ip multicast helper-address 0.0.0.0
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**show ip multicast**                              Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

### MIB Objects

```
alaIgmP  
  alaIgmPHelperAddress  
  alaIgmPHelperAddressType
```

---

## ipv6 multicast status

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **status** [{**enable** | **disable**}]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IPv6 Multicast Switching and Routing.
<b>disable</b>	Disable IPv6 Multicast Switching and Routing.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If an IPv6 multicast routing protocol is already running on the system, the **ipv6 multicast status** command will override this configuration and always enable IPv6 Multicast Switching and Routing.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the MLD querying to its default (i.e., disabled) status on the system if no VLAN is specified, by using only **ipv6 multicast status** (e.g., `ipv6 multicast status`).
- You can also restore the MLD querying to its default (i.e., disabled) status on the specified VLAN, by using only **ipv6 multicast vlan vid status** (e.g., `ipv6 multicast vlan 2 status`).

### Examples

```
-> ipv6 multicast status enable
-> ipv6 multicast status disable
-> ipv6 multicast status
-> ipv6 multicast vlan 2 status enable
-> ipv6 multicast vlan 2 status disable
-> ipv6 multicast vlan 2 status
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldStatus
alaMldVlan
  alaMldVlanStatus
```

---

## ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] querier-forwarding [{enable | disable}]**

**no ipv6 multicast [vlan *vid*] querier-forwarding**

---

### Syntax Definitions

<i>vid</i>	The VLAN on which configuration is applied.
<b>enable</b>	Enable MLD querier forwarding.
<b>disable</b>	Disable MLD querier forwarding.

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an MLD querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.

### Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 2 querier-forwarding disable
-> ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 2 querier-forwarding
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldQuerierForwarding
alaMldVlan
  alaMldVlanQuerierForwarding
```

---

## ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [**vlan** *vid*] **version** [*version*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*version* Default MLD protocol version to run. Valid range is 1 to 2.

### Defaults

parameter	default
<i>version</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs.
- If the default MLD protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- To restore the MLD multicast version to the default (i.e., 1) version on the system if no VLAN is specified, use **ipv6 multicast version** followed by the value 0 (e.g., `ipv6 multicast version 0`) or use only **ipv6 multicast version** (e.g., `ipv6 multicast version`).
- To restore the MLD multicast version to the default (i.e., 1) version on the specified VLAN, use **ipv6 multicast vlan** *vid* **version** followed by the value 0 (e.g., `ipv6 multicast vlan 2 version 0`) or use only **ipv6 multicast vlan** *vid* **version** (e.g., `ipv6 multicast vlan 2 version`).

### Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 2 version 0
-> ipv6 multicast vlan 2 version
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldVersion
alaMldVlan
  alaMldVlanVersion
```

---

## ipv6 multicast max-group

Configures the global maximum group limit that can be learned per port/VLAN instance. The limit is applied to each port/VLAN instance and an action is taken when it exceeds the limit.

**ipv6 multicast max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>num</i>	Specifies the maximum MLD group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	none

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a specific VLAN or port will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmpMaxGroupLimit  
alaIcmpMaxGroupExceedAction

---

## ipv6 multicast vlan max-group

Configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.

**ipv6 multicast vlan** *vid* **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>num</i>	The maximum MLD group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

---

parameter	defaults
<b>Action</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a VLAN will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 10 max-group 20 action replace
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

    alaIcmpVlanMaxGroupExceedAction

---

## ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

**ipv6 multicast port** *slot / port* **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>slot / port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>num</i>	The maximum MLD group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
<b>Action</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a port will override the VLAN or global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ipv6 multicast port 1/1 max-group 10 action drop
-> ipv6 multicast port 1/1 max-group action replace
```

### Release History

Release 6.3.4; command was introduced.

## ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on a specified port on a specified VLAN.

**ipv6 multicast static-neighbor** *vlan vid port slot/port*

**no ipv6 multicast static-neighbor** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static MLD neighbor.

*slot/port* The slot/port number you want to configure as a static MLD neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-neighbor** command allows you to create an MLD static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static neighbor entry on a link aggregate port by entering **ipv6 multicast static-neighbor** *vlan vid port*, followed by the link aggregation group number (e.g., `ipv6 multicast static-neighbor vlan 2 port 7`).

### Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1
-> ipv6 multicast static-neighbor vlan 4 port 7
-> no ipv6 multicast static-neighbor vlan 4 port 7
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**show ipv6 multicast neighbor** Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

## MIB Objects

```
alaMldStaticNeighborTable  
  alaMldStaticNeighborVlan  
  alaMldStaticNeighborIfIndex  
  alaMldStaticNeighborRowStatus
```

---

## ipv6 multicast static-querier

Creates a static MLD querier entry on a specified port on a specified VLAN.

**ipv6 multicast static-querier** *vlan vid port slot/port*

**no ipv6 multicast static-querier** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static MLD querier.

*slot/port* The slot/port number you want to configure as a static MLD querier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-querier** command allows you to create an MLD static querier entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static querier entry on a link aggregate port by entering **ipv6 multicast static-querier** *vlan vid port*, followed by the link aggregation group number (e.g., `ipv6 multicast static-querier vlan 2 port 7`).

### Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1
-> ipv6 multicast static-querier vlan 4 port 7
-> no ipv6 multicast static-querier vlan 4 port 7
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**show ipv6 multicast querier** Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

## MIB Objects

```
alaMldStaticQuerierTable

```

---

## ipv6 multicast static-group

Creates a static MLD group entry on a specified port on a specified VLAN.

**ipv6 multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

**no ipv6 multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

### Syntax Definitions

<i>ip_address</i>	IPv6 multicast group address.
<i>vid</i>	VLAN to include as a static MLD group.
<i>slot/port</i>	The slot/port number you want to configure as a static MLD group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on a specified port on the specified VLAN.
- The **ipv6 multicast static-group** command allows you to create an MLD static group entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive MLD traffic addressed to the specified IPv6 multicast group address.
- You can also create an MLD static group entry on a link aggregate port by entering **ipv6 multicast static-group** *ip\_address* **vlan** *vid* **port**, followed by the link aggregation group number (e.g., `ipv6 multicast static-group ff05::5 vlan 2 port 7`).

### Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 port 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 7
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

```

---

## ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **query-interval** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* MLD query interval in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	125

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs.
- If the MLD query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- To restore the MLD query interval to its default (i.e., 125 seconds) value on the system if no VLAN is specified, use **ipv6 multicast query-interval** followed by the value 0 (e.g., `ipv6 multicast query-interval 0`) or use only **ipv6 multicast query-interval** (e.g., `ipv6 multicast query-interval`).
- To restore the MLD query interval to its default (i.e., 125 seconds) value on the specified VLAN, use **ipv6 multicast vlan vid query-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 query-interval 0`) or use only **ipv6 multicast vlan vid query-interval** (e.g., `ipv6 multicast vlan 2 query-interval`).

### Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
-> ipv6 multicast vlan 2 query-interval
```

### Release History

## ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **last-member-query-interval** [*milliseconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>milliseconds</i>	MLD last member query interval in milliseconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>milliseconds</i>	1000

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs. apply this configuration.
- If the MLD last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- To restore the MLD last member query interval to its default (i.e., 1000 milliseconds) value on the system if no VLAN is specified, use **ipv6 multicast last-member-query-interval** followed by the value 0 (e.g., `ipv6 multicast last-member-query-interval 0`) or use only **ipv6 multicast last-member-query-interval** (e.g., `ipv6 multicast last-member-query-interval`).
- To restore the MLD last member query interval to its default (i.e., 1000 milliseconds) value on the specified VLAN, use **ipv6 multicast vlan vid last-member-query interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 last-member-query-interval 0`) or use only **ipv6 multicast vlan vid last-member-query-interval** (e.g., `ipv6 multicast vlan 2 last-member-query-interval`).

### Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> ipv6 multicast last-member-query-interval
-> ipv6 multicast vlan 4 last-member-query-interval 2200
-> ipv6 multicast vlan 4 last-member-query-interval 0
-> ipv6 multicast vlan 4 last-member-query-interval
```

## ipv6 multicast query-response-interval

Sets the MLD query response interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **query-response-interval** [*milliseconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*milliseconds* MLD query response interval in milliseconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>milliseconds</i>	10000

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query response interval to use on the system and/or the specified VLANs.
- If the MLD query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query response interval refers to the time period to reply to an MLD query message.
- To restore the MLD query response interval to its default (i.e., 10000 milliseconds) value on the system if no VLAN is specified, use **ipv6 multicast query-response-interval** followed by the value 0 (e.g., `ipv6 multicast query-response-interval 0`) or use only **ipv6 multicast query-response-interval** (e.g., `ipv6 multicast query-response-interval`).
- To restore the MLD last member query interval to its default (i.e., 10000 milliseconds) value on the specified VLAN, use **ipv6 multicast vlan vid query-response-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 query-response-interval 0`) or use only **ipv6 multicast vlan vid query-response-interval** (e.g., `ipv6 multicast vlan 2 query-response-interval`).

### Examples

```
-> ipv6 multicast query-response-interval 20000
-> ipv6 multicast query-response-interval 0
-> ipv6 multicast query-response-interval

## ipv6 multicast unsolicited-report-interval

Sets the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **unsolicited-report-interval** [*seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>seconds</i>	MLD unsolicited report interval in seconds. Valid range is 1 to 65535, where 0 represents the default setting.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- To restore the MLD unsolicited interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ipv6 multicast unsolicited-report-interval** followed by the value 0 (e.g., `ipv6 multicast unsolicited-report-interval 0`) or use only **ipv6 multicast unsolicited-report-interval** (e.g., `ipv6 multicast unsolicited-report-interval`).
- To restore the MLD unsolicited report interval to its default (i.e., 1 second) value on the specified VLAN, use **ipv6 multicast vlan vid unsolicited-report-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 unsolicited-report-interval 0`) or use only **ipv6 multicast vlan vid unsolicited-report-interval** (e.g., `ipv6 multicast vlan 2 unsolicited-report-interval`).

### Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
-> ipv6 multicast vlan 2 unsolicited-report-interval
```

## ipv6 multicast router-timeout

Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **router-timeout** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* MLD router timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD router timeout on the system and/or the specified VLANs. apply this configuration.
- If the MLD router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ipv6 multicast router-timeout** followed by the value 0 (e.g., `ipv6 multicast router-timeout 0`) or use only **ipv6 multicast router-timeout** (e.g., `ipv6 multicast router-timeout`).
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ipv6 multicast vlan vid router-timeout** followed by the value 0 (e.g., `ipv6 multicast vlan 2 router-timeout 0`) or use only **ipv6 multicast vlan vid router-timeout** (e.g., `ipv6 multicast vlan 2 router-timeout`).

### Examples

```
-> ipv6 multicast router-timeout 100
-> ipv6 multicast router-timeout 0
-> ipv6 multicast router-timeout
-> ipv6 multicast vlan 2 router-timeout 100
-> ipv6 multicast vlan 2 router-timeout 0
-> ipv6 multicast vlan 2 router-timeout
```

## ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **source-timeout** [*seconds*]

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* MLD source timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ipv6 multicast source-timeout** followed by the value 0 (e.g., `ipv6 multicast source-timeout 0`) or use only **ipv6 multicast source-timeout** (e.g., `ipv6 multicast source-timeout`).
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ipv6 multicast vlan vid source-timeout** followed by the value 0 (e.g., `ipv6 multicast vlan 2 source-timeout 0`) or use only **ipv6 multicast vlan vid source-timeout** (e.g., `ipv6 multicast vlan 2 source-timeout`).

### Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> ipv6 multicast vlan 2 source-timeout
```

### Release History

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldSourceTimeout
alaMldVlan
  alaMldVlanSourceTimeout
```

---

## ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] querying [{enable | disable}]**

**no ipv6 multicast [vlan *vid*] querying**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD querying.
<b>disable</b>	Disable MLD querying.

### Defaults

parameter	default
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an MLD querying entry on the specified VLAN or on the system and return to its default behavior.
- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- You can also restore the MLD querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast querying** (e.g., `ipv6 multicast querying`).
- You can also restore the MLD querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* querying** (e.g., `ipv6 multicast vlan 2 querying`).

### Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 2 querying disable
-> ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 2 querying
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **no** parameter added.

## Related Commands

    alaMldVlanQuerying

---

## ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **robustness** [*robustness*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*robustness* MLD robustness variable. Valid range is 1 to 7.

### Defaults

parameter	default
<i>robustness</i>	2

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs.
- If the MLD robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the MLD robustness variable to its default (i.e., 2) value on the system if no VLAN is specified, use **ipv6 multicast robustness** followed by the value 0 (e.g., `ipv6 multicast robustness 0`) or use only **ipv6 multicast robustness** (e.g., `ipv6 multicast robustness`).
- To restore the MLD robustness variable to its default (i.e., 2) value on the specified VLAN, use **ipv6 multicast vlan vid robustness** followed by the value 0 (e.g., `ipv6 multicast vlan 2 robustness 0`) or use only **ipv6 multicast vlan vid robustness** (e.g., `ipv6 multicast vlan 2 robustness`).

### Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
-> ipv6 multicast vlan 2 robustness 0
-> ipv6 multicast vlan 2 robustness
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldRobustness
alaMldVlan
  alaMldVlanRobustness
```

---

## ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] spoofing [{enable | disable}]**

**no ipv6 multicast [vlan *vid*] spoofing**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD spoofing.
<b>disable</b>	Disable MLD spoofing.

### Defaults

parameter	defaults
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an MLD spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated MLD group membership information.
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast spoofing** (i.e., ipv6 multicast spoofing).
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* spoofing** (i.e., ipv6 multicast vlan 2 spoofing).

### Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
-> ipv6 multicast vlan 2 spoofing disable
-> ipv6 multicast vlan 2 spoofing
-> no ipv6 multicast vlan 2 spoofing
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **no** parameter added.

## Related Commands

### **show ipv6 multicast**

## MIB Objects

alaMld

    alaMldSpoofing

alaMldVlan

    alaMldVlanSpoofing

---

## ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **zapping** [{*enable* | *disable*}]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD zapping.
<b>disable</b>	Disable MLD zapping.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast zapping** (e.g., `ipv6 multicast zapping`).
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan vid zapping** (e.g., `ipv6 multicast vlan 2 zapping`).

### Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 2 zapping disable
-> ipv6 multicast vlan 2 zapping
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldZapping
alaMldVlan
  alaMldVlanZapping
```

---

## ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] proxying [enable | disable]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD proxying.
<b>disable</b>	Disable MLD proxying.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast proxying** (e.g., ipv6 multicast proxying).
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* proxying** (e.g., ipv6 multicast vlan 2 proxying).

### Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 2 proxying disable
-> ipv6 multicast vlan 2 proxying
```

### Release History

Release 6.1.3; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldProxying
alaMldVlan
  alaMldVlanProxying
```

---

## show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

**show ip multicast** [*vlan vid*]

---

### Syntax Definitions

*vid* VLAN ID number (1–4094).

### Defaults

By default the status and general configuration parameters for the system.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

### Examples

```
-> show ip multicast
```

```
Status: Enabled
Querying: Disabled
Proxying: Disabled
Spoofing: Disabled
Zapping: Disabled
Querier Forwarding: Disabled
Version: 2
Robustness: 2
Query Interval (seconds): 125
Query Response Interval (tenths of seconds): 100
Last Member Query Interval(tenths of seconds):10
Unsolicited Report Interval(seconds): 1
Router Timeout (seconds): 90
Source Timeout (seconds): 30
Max-group: 10,
Max-group action: replace
Helper-address 10.1.1.198
```

```
-> show ip multicast vlan 10
```

```
Status: Enabled
Querying: Disabled
Proxying: Disabled
Spoofing: Disabled
Zapping: Disabled
Querier Forwarding: Disabled
Version: 2
Robustness: 2
Query Interval (seconds): 125
Query Response Interval (tenths of seconds): 100
Last Member Query Interval(tenths of seconds):10
Unsolicited Report Interval(seconds): 1
Router Timeout (seconds): 90
Source Timeout (seconds): 30
Max-group: 0,
Max-group action: none
```

Output fields are described here:

#### *output definitions*

<b>Status</b>	Whether the IP Multicast Switching and Routing is <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IP Multicast Switching and Routing with the <b>ip multicast status</b> command, which is described on <a href="#">page 27-3</a> .
<b>Querying</b>	The current state of IGMP querying, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP querying with the <b>ip multicast querying</b> command, which is described on <a href="#">page 27-35</a> .
<b>Proxying</b>	The current state of IGMP proxying on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP spoofing with the <b>ip multicast proxying</b> command, which is described on <a href="#">page 27-43</a> .
<b>Spoofing</b>	The current state of IGMP spoofing on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP spoofing with the <b>ip multicast spoofing</b> command, which is described on <a href="#">page 27-39</a> .
<b>Zapping</b>	The current state of IGMP zapping on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP zapping with the <b>ip multicast zapping</b> command, which is described on <a href="#">page 27-41</a> .
<b>Querier Forwarding</b>	The current state of IGMP querier forwarding on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP Querier forwarding with the <b>ip multicast querier-forwarding</b> command, which is described on <a href="#">page 27-7</a> .
<b>Version</b>	Displays the default IGMP version, which can be <b>1</b> , <b>2</b> or <b>3</b> . Use the <b>ip multicast version</b> command to modify this parameter.
<b>Robustness</b>	Displays the IGMP robustness value, ranging from <b>1</b> to <b>7</b> . (The default value is <b>2</b> ). Use the <b>ip multicast robustness</b> command to modify this parameter.

*output definitions*

---

<b>Query Interval (seconds)</b>	Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). You can modify this parameter with the <a href="#">ip multicast query-interval</a> command, which is described on <a href="#">page 27-23</a> .
<b>Query Response Interval (tenths of seconds)</b>	Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). You can modify this parameter with the <a href="#">ip multicast query-response-interval</a> command, which is described on <a href="#">page 27-27</a> .
<b>Last Member Query Interval (tenths of seconds)</b>	Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) You can modify this parameter with the <a href="#">ip multicast last-member-query-interval</a> command, which is described on <a href="#">page 27-25</a> .
<b>Unsolicited Report Interval (seconds)</b>	Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). You can modify this parameter with the <a href="#">ip multicast unsolicited-report-interval</a> command, which is described on <a href="#">page 27-29</a> .
<b>Router Timeout (seconds)</b>	Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) You can modify this parameter with the <a href="#">ip multicast router-timeout</a> command, which is described on <a href="#">page 27-31</a> .
<b>Source Timeout (seconds)</b>	Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) You can modify this parameter with the <a href="#">ip multicast source-timeout</a> command, which is described on <a href="#">page 27-33</a> .
<b>Max-group</b>	The global or VLAN specific maximum group count allowed.
<b>Max-group action</b>	The action to be taken when the group membership limit is exceeded.
<b>Helper-address</b>	Displays the configured helper address. Use the <a href="#">ip multicast helper-address</a> command to modify this parameter, which is described on <a href="#">page 27-45</a> .

---

**Release History**

Release 6.1.1; command was introduced.

Release 6.3.1; **Querier Forwarding** field added.

Release 6.3.4; **Max-group and Max-group action** field added.

Release 6.4.2; **Helper-address** field added.

.

## Related Commands

<b>ip multicast status</b>	Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.
<b>ip multicast helper-address</b>	Sets the ip address of relay host on the system.
<b>ip multicast version</b>	Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast querying</b>	Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast robustness</b>	Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast spoofing</b>	Enables or disables IGMP spoofing on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast zapping</b>	Enables or disables IGMP zapping on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast proxying</b>	Enables or disables IGMP proxying on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast query-interval</b>	Sets the IGMP query interval on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast last-member-query-interval</b>	Sets the IGMP last member query interval value on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast query-response-interval</b>	Sets the IGMP query response interval on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast unsolicited-report-interval</b>	Sets the value of the IGMP unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast router-timeout</b>	Configures the expiry time of IP multicast routers on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast source-timeout</b>	Configures the expiry time of IP multicast sources on the specified VLAN or on the system if no VLAN is specified.

## show ip multicast port

Displays the max-group configuration applicable for all port or vlan instances of a given port or all ports. The current number of groups learnt on a given port or vlan instance will also be displayed.

**show ip multicast port** [*slot/port*]

---

### Syntax Definitions

*slot / port*

The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3)).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Specify a slot and port number to display the configuration information for a specific switch port.

### Examples

```
-> show ip multicast port
```

```
Total 5 Port-Vlan Pairs
```

Port	VLAN	Current Igmp Groups	Max-group	Action
1/1	10	1	1	drop
1/1	20	1	1	drop
1/3	15	2	5	replace
1/4	20	3	10	drop
1/6	15	5	0	none

```
-> show ip multicast port 1/1
```

```
Max-group 0 Action none
```

```
Total 2 Port-Vlan Pairs
```

Port	vlan	current IGMP group	max-group	action
1/1	10	1	1	drop
1/1	20	2	5	replace

#### *output definitions*

---

<b>Port</b>	The slot and port number of the IP multicast port.
<b>VLAN</b>	The VLAN associated with the IP multicast port.
<b>Current Groups</b>	The current group associated with the IP Current groups.

*output definitions*

<b>IGMP</b>	The IGMP associated with the IP multicast port.
<b>Max-group</b>	The maximum group count allowed on the port.
<b>Action</b>	The action to be taken when the group membership limit is exceeded.

**Release History**

Release 6.3.4; command was introduced.

**Related Commands**

<b>ip multicast status</b>	Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.
<b>ip multicast version</b>	Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast querying</b>	Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast robustness</b>	Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.

## show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

**show ip multicast forward** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip multicast forward
```

```
Total 1 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
228.0.0.1	1.0.0.2	0.0.0.0	1	2/1	1	2/23

```
-> show ip multicast forward 228.0.0.1
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
228.0.0.1	1.0.0.2	0.0.0.0	1	2/1	1	2/23

Output fields are described here:

#### *output definitions*

---

<b>Group Address</b>	IP group address of the IP multicast forward.
<b>Host Address</b>	IP host address of the IP multicast forward.
<b>Tunnel Address</b>	IP source tunnel address of the IP multicast forward.
<b>VLAN</b>	VLAN associated with the IP multicast forward.
<b>Port</b>	The slot and port number of the IP multicast forward.

---

## show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

**show ip multicast group** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

-> show ip multicast group

```
Total 3 Groups
Group Address   Source Address  VLAN  Port  Mode      Static  Count  Life
-----+-----+-----+-----+-----+-----+-----+-----
231.0.0.3      1.0.0.5        1     2/1   exclude  no      1      257
234.0.0.4      0.0.0.0        1     2/1   exclude  no      1      218
229.0.0.1      0.0.0.0        1     2/13  exclude  yes     0       0
```

-> show ip multicast group 234.0.0.4

```
Group Address   Source Address  VLAN  Port  Mode      Static  Count  Life
-----+-----+-----+-----+-----+-----+-----+-----
234.0.0.4      0.0.0.0        1     2/1   exclude  no      1      218
```

Output fields are described here:

#### *output definitions*

---

<b>Group Address</b>	IP address of the IP multicast group.
<b>Source Address</b>	IP address of the IP multicast source.
<b>VLAN</b>	The VLAN associated with the IP multicast group.
<b>Port</b>	The slot and port number of the IP multicast group.
<b>Mode</b>	IGMP source filter mode.
<b>Static</b>	Whether it is a static multicast group or not.
<b>Count</b>	Number of IGMP membership requests made.
<b>Life</b>	Life time of the IGMP group membership.

---

## Release History

Release 6.1.1; command was introduced

## Related Commands.

**ip multicast static-group** Creates a static IGMP group entry on a specified port on a specified VLAN.

```

---

## show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

**show ip multicast source** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip multicast source
```

```
Total 1 Sources
Group Address  Host Address  Tunnel Address  VLAN  Port
-----+-----+-----+-----+-----
228.0.0.1     1.0.0.2      0.0.0.0        1     2/1
```

```
-> show ip multicast source 228.0.0.1
```

```
Total 1 Sources
Group Address  Host Address  Tunnel Address  VLAN  Port
-----+-----+-----+-----+-----
228.0.0.1     1.0.0.2      0.0.0.0        1     2/1
```

### output definitions

---

<b>Group Address</b>	IP group address of the IP multicast source.
<b>Host Address</b>	IP host address of the IP multicast source.
<b>Tunnel Address</b>	IP destination tunnel address of the IP multicast source.
<b>VLAN</b>	VLAN associated with the IP multicast source.
<b>Port</b>	The slot and port number of the IP multicast source.

---

### Release History

Release 6.1.1; command was introduced.

## Related Commands

### **show ip multicast tunnel**

Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

```

---

## show ip multicast tunnel

Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

**show ip multicast tunnel [address]**

---

### Syntax Definitions

**address** IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip multicast tunnel
Total 1 Tunnels
```

Group Address	Host Address	Tunnel Address	Ingress	
			VLAN	Port
228.0.0.1	1.0.0.2	2.1.2.3	1	2/1

#### *output definitions*

---

<b>Group Address</b>	IP group address of the IP multicast tunnel.
<b>Host Address</b>	IP host address of the IP multicast tunnel.
<b>Tunnel Address</b>	IP source tunnel address of the IP multicast tunnel.
<b>VLAN</b>	VLAN associated with the IP multicast tunnel.
<b>Port</b>	The slot and port number of the IP multicast tunnel.

---

### Release History

Release 6.1.1; command was introduced.

### Related Commands

```

---

## show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

**show ipv6 multicast** [**vlan** *vid*]

---

### Syntax Definitions

*vid* VLAN for which to display the configuration.

### Defaults

By default the status and general configuration parameters for the system.

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

### Examples

```
-> show ipv6 multicast vlan 100
```

```
Status: = Enabled
Querying: = Disabled
Proxying: = Disabled
Spoofing: = Disabled
Zapping: = Disabled
Querier Forwarding: = Disabled
Version: = 1
Robustness: = 2
Query Interval (seconds): = 125
Query Response Interval (milliseconds): = 10000
Last Member Query Interval (milliseconds): = 1000
Unsolicited Report Interval (seconds) = 1,
Router Timeout (seconds): = 90
Source Timeout (seconds): = 30
Max-group = 5,
Max-group action = drop
```

```
-> show ipv6 multicast vlan 100
```

```
Status: = Enabled
Querying: = Disabled
Proxying: = Disabled
Spoofing: = Disabled
Zapping: = Disabled
Querier Forwarding: = Disabled
Version: = 1
Robustness: = 2
Query Interval (seconds): = 125
Query Response Interval (milliseconds): = 10000
Last Member Query Interval (milliseconds): = 1000
Unsolicited Report Interval (seconds) = 1,
Router Timeout (seconds): = 90
Source Timeout (seconds): = 30:
Max-group = 23,
Max-group action = none
```

### *output definitions*

<b>Status</b>	Whether the IPv6 Multicast Switching and Routing is <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IPv6 Multicast Switching and Routing with the <b>ip multicast helper-address</b> command, which is described on <a href="#">page 27-45</a>
<b>Querying</b>	The current state of MLD querying, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD querying with the <b>ipv6 multicast querying</b> command, which is described on <a href="#">page 27-76</a>
<b>Proxying</b>	The current state of MLD proxying on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD spoofing with the <b>ipv6 multicast proxying</b> command, which is described on <a href="#">page 27-84</a>
<b>Spoofing</b>	The current state of MLD spoofing on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD spoofing with the <b>ipv6 multicast spoofing</b> command, which is described on <a href="#">page 27-39</a>
<b>Zapping</b>	The current state of MLD zapping on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD zapping with the <b>ipv6 multicast zapping</b> command, which is described on <a href="#">page 27-82</a>
<b>Querier Forwarding</b>	The current state of MLD querier forwarding on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD Querier forwarding with the <b>ipv6 multicast querier-forwarding</b> command, which is described on <a href="#">page 27-48</a> .
<b>Version</b>	Displays the default MLD version, which can be <b>1</b> , <b>2</b> or <b>3</b> . Use the <b>ipv6 multicast version</b> command to modify this parameter.
<b>Robustness</b>	Displays the MLD robustness value, ranging from <b>1</b> to <b>7</b> . Use the <b>ipv6 multicast robustness</b> command to modify this parameter.
<b>Query Interval (seconds)</b>	Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). You can modify this parameter with the <b>ipv6 multicast query-interval</b> command, which is described on <a href="#">page 27-64</a> .

*output definitions*

---

<b>Query Response Interval (milliseconds)</b>	Displays the time (in milliseconds) to reply to an MLD query message. (The default value is 10000 milliseconds.) You can modify this parameter with the <b>ipv6 multicast query-response-interval</b> command, which is described on <a href="#">page 27-68</a> .
<b>Last Member Query Interval (milliseconds)</b>	Displays the time (in milliseconds) to reply to an MLD query message sent in response to a leave group message. (The default value is 1000 milliseconds.) You can modify this parameter with the <b>ipv6 multicast last-member-query-interval</b> command, which is described on <a href="#">page 27-66</a> .
<b>Unsolicited Report Interval (seconds)</b>	Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). You can modify this parameter with the <b>ipv6 multicast unsolicited-report-interval</b> command, which is described on <a href="#">page 27-70</a> .
<b>Router Timeout (seconds)</b>	Displays the MLD router timeout in seconds (The default value is 90 seconds.) You can modify this parameter with the <b>ipv6 multicast router-timeout</b> command, which is described on <a href="#">page 27-72</a>
<b>Source Timeout (seconds)</b>	Displays the IGMP source timeout in seconds (The default is 30 seconds.) You can modify this parameter with the <b>ipv6 multicast source-timeout</b> command, which is described on <a href="#">page 27-74</a>
<b>Max-group</b>	The global or VLAN specific maximum group count allowed.
<b>Max-group action</b>	The action to be taken when the group membership limit is exceeded.

---

**Release History**

Release 6.1.1; command was introduced.

Release 6.3.1; **Querier Forwarding** field added.

Release 6.3.4; **Max-group** and **Max-group action** field added.

## Related Commands

<b>ipv6 multicast status</b>	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast version</b>	Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast query-interval</b>	Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast last-member-query-interval</b>	Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast query-response-interval</b>	Sets the MLD query response interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast unsolicited-report-interval</b>	Sets the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast router-timeout</b>	Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast source-timeout</b>	Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast querying</b>	Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast robustness</b>	Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast spoofing</b>	Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast zapping</b>	Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast proxying</b>	Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

## show ipv6 multicast port

Display the max-group configuration applicable for all port or vlan instances of a given port or all ports. The current number of groups learnt on a given port or vlan instance will also be displayed in this show output..

**show ipv6 multicast port** [*slot/port*]

---

### Syntax Definitions

*slot / port*

The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3)).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

### Examples

```
-> show ipv6 multicast port 1/6
Max-group 9 Action replace
```

```
Total 1 Port-Vlan Pairs
  Port   VLAN   Current Mld   Max-group   Action
          Groups
-----+-----+-----+-----+-----
      1/6   15             5           0         none
```

Output fields are described here:

#### *output definitions*

---

<b>Port</b>	The slot and port number of the IP multicast port.
<b>VLAN</b>	The VLAN associated with the IP multicast port.
<b>Current Groups</b>	The current group associated with the IP Current groups.
<b>IGMP</b>	The IGMP associated with the IP multicast port.
<b>Max-group</b>	The maximum group count allowed on the port.
<b>Action</b>	The action to be taken when the group membership limit is exceeded.

---

### Release History

Release 6.3.4; command was introduced.

-----+-----+-----+-----+-----
ff05::6        4444::2       ::             1     2/1
```

### output definitions

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast source.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast source.
<b>Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast source.
<b>VLAN</b>	VLAN associated with the IPv6 multicast source.
<b>Port</b>	The slot and port number of the IPv6 multicast source.

---

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**ipv6 multicast static-group** Creates a static MLD group entry on a specified port on a specified VLAN.

## MIB Objects

```
alaMldSourceTable

  alaMldSourceIfIndex
  alaMldSourceGroupAddress
  alaMldSourceHostAddress
  alaMldSourceDestAddress
  alaMldSourceOrigAddress
  alaMldSourceType
  alaMldSourceUpTime
```

---

## show ipv6 multicast tunnel

Displays the IPv6 Multicast Switching and Routing tunneling table entries matching the specified IPv6 multicast group address, or all entries if no IPv6 multicast address is specified.

**show ipv6 multicast tunnel** [*address*]

---

### Syntax Definitions

*address* IPv6 multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 multicast tunnel
Total 1 Tunnels
```

Group Address	Host Address	Tunnel Address	Ingress	
			VLAN	Port
ff05::6	4444::2	3333::2	1	2/1

#### *output definitions*

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast tunnel.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast tunnel.
<b>Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast tunnel.
<b>VLAN</b>	VLAN associated with the IPv6 multicast tunnel.
<b>Port</b>	The slot and port number of the IPv6 multicast tunnel.

---

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**show ipv6 multicast source** Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified

# 28 IP Multicast VLAN Commands

The IP Multicast VLAN (IPMV) is a distribution Multicast VLAN that flows into the customer ports. These distribution VLANs connect to the nearest multicast router and support multicast traffic only. Multicast traffic flows from the distribution VLAN to the customer VLAN and not vice-versa. Customer-generated multicast traffic should flow via the customer VLANs so that the Multicast router can control distribution of this traffic. IPMV feature is invisible to the customer. The customer VLANs can be tagged or untagged.

IPMV works in both the Enterprise environment as well as the VLAN Stacking environment. The ports are separately classified as VLAN Stacking ports or as legacy ports (fixed ports/tagged ports). VLAN Stacking VLAN contains only VLAN Stacking ports as its members, while Normal data VLAN contains normal legacy ports. This ensures that data flow is confined to a single broadcast domain.

MIB information for the IP Multicast VLAN commands is as follows:

*Filename:* AlcatelIND1IPMV.MIB  
*Module:* Alcatel-IND1-IPM-VLAN-MIB

*Filename:* AlcatelIND1VlanStacking.MIB  
*Module:* Alcatel-IND1-VLAN-STACKING-MIB

*Filename:* AlcatelIND1VlanManager.MIB  
*Module:* Alcatel-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

---

<b>VLAN Manager Commands</b>	<b><a href="#">vlan ipmvlan</a></b>
<b>VLAN Stacking Commands</b>	<b><a href="#">vlan ipmvlan ctag</a> <a href="#">vlan ipmvlan address</a> <a href="#">vlan ipmvlan sender-port</a> <a href="#">vlan ipmvlan receiver-port</a> <a href="#">show vlan ipmvlan c-tag</a> <a href="#">show vlan ipmvlan address</a> <a href="#">show vlan ipmvlan port-config</a> <a href="#">show ipmvlan port-config</a></b>

---

## vlan ipmvlan

Creates an IP Multicast VLAN.

```
vlan ipmvlan ipmvlan-id [{enable | disable} | [{1x1 | flat} stp {enable | disable}]] [name name-string]
```

```
no vlan ipmvlan ipmvlan-id [-ipmvlan-id2]
```

---

### Syntax Definitions

<i>ipmvlan-id</i>	Specifies the IP Multicast VLAN number. The valid range is 2–4094.
<b>enable</b>	Enables IPMVLAN.
<b>disable</b>	Disables IPMVLAN.
<b>1x1</b>	Specifies that the switch is running in the 1x1 Spanning Tree mode.
<b>flat</b>	Specifies that the switch is running in the Flat Spanning Tree mode.
<b>stp enable</b>	Enables Spanning Tree for the specified IPMVLAN.
<b>stp disable</b>	Disables Spanning Tree for the specified IPMVLAN.
<i>name-string</i>	Alphanumeric string up to 32 characters. Use quotes around the string if the name contains multiple words with spaces between them (for example, “Alcatel-Lucent VLAN”).
<i>ipmvlan-id2</i>	The last IPMVLAN number in a range of IPMVLANs that you want to configure.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a single or multiple IPMVLANs. If the specified IPMVLAN(s) does not exist, an error message will be displayed.
- If *ipmvlan-id* does not exist or if *ipmvlan-id* exists as VLAN Stacking VLAN or Standard VLAN, an error message will be displayed.
- The default mode of the IPMVLAN is the Enterprise mode.
- If an IPMVLAN is disabled, all the ports bound to an IPMVLAN will be blocked for that VLAN instance.
- A maximum of 256 IPMVLANs can be configured.

## Examples

```
-> vlan ipmvlan 1003 name "multicast vlan"  
-> vlan ipmvlan 1333 1x1 stp enable name "multicast vlan"  
-> no vlan ipmvlan 1003
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; support added for entering a range and/or multiple entries of IPMVLANs; **1x1**, **flat**, **stp enable**, and **stp disable** parameters added.

## Related Commands

### [show vlan ipmvlan](#)

Displays IPMVLAN information for a specific IPMVLAN or all IPMVLANs.

### [show vlan](#)

Displays a list of VLANs and their types configured on the switch.

## MIB Objects

vlanTable

```
  vlanNumber  
  vlanDescription  
  vlanTrafficType  
  vlanAdmStatus  
  alavlanOperStatus  
  alavlanStpStatus  
  alavlan1x1StpStatus  
  alavlanflatStpStatus  
  vlanStatus
```

---

## vlan ipmvlan ctag

Defines the mapping between an IPMVLAN and a customer VLAN ID (c-tag) to be used in the c-tag translation rule.

```
vlan ipmvlan ipmvlan-id ctag {ctag | ctag1-ctag2}
```

```
no vlan ipmvlan ipmvlan-id ctag {ctag | ctag1-ctag2}
```

---

### Syntax Definitions

<i>ipmvlan-id</i>	Specifies the IP Multicast VLAN number for which the c-tag is to be assigned. The valid range is 2–4094.
<i>ctag</i>	The customer VLAN ID number is used in the translation rule. The valid range is 1–4094.
<i>ctag1-ctag2</i>	Specifies the range of the customer VLAN ID numbers.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the mapping between the IPMVLAN and the customer VLAN ID.
- If the c-tag is already assigned to another IPMVLAN, the configuration request will fail.
- If you assign a range of c-tags to an IPMVLAN, an error message will be displayed for the c-tags already assigned to the IPMVLAN.
- The command will not work in Enterprise Mode.

### Examples

```
-> vlan ipmvlan 1003 ctag 10  
-> no vlan ipmvlan 1003 ctag 10
```

### Release History

Release 6.2.1; command was introduced.

## Related Commands

### [show vlan ipmvlan c-tag](#)

Displays the customer VLAN IDs associated with a single IP Multicast VLAN or all the configured IP Multicast VLANs.

## MIB Objects

```
alaipmvVlanCtagTable  
  alaipmvVlanNumber  
  alaipmvVlanCtag  
  alaipmvVlanCtagRowStatus
```

---

## vlan ipmvlan address

Assigns an IPv4 address, IPv6 address, or a range of addresses to an existing IPMVLAN.

**vlan ipmvlan** *ipmvlan-id* **address** {*ip\_address* [{*/prefixlen* / **mask** *mask*}] | *ipv6\_address* | *ipaddress1-ipaddress2* | *ipv6address1-ipv6address2*}

**no vlan ipmvlan** *ipmvlan-id* **address** {*ip\_address* [{*/prefixlen* / **mask** *mask*}] | *ipv6\_address* | *ipaddress1-ipaddress2* | *ipv6address1-ipv6address2*}

---

### Syntax Definitions

<i>ipmvlan-id</i>	Specifies the IP Multicast VLAN number to which the IP address will be assigned. The valid range is 2–4094.
<i>ip_address</i>	Specifies a 32-bit IP Multicast address that will be assigned to the IPMVLAN.
<i>/prefixlen</i>	Specifies the Prefix Length of mask.
<i>mask</i>	Specifies the IPv4 address mask.
<i>ipv6_address</i>	Specifies a 128-bit IPv6 Multicast address that will be assigned to the IPMVLAN.
<i>ipaddress1-ipaddress2</i>	Specifies the IP Multicast address range.
<i>ipv6address1-ipv6address2</i>	Specifies the IPv6 Multicast address range.

### Defaults

parameter	default
<i>prefixlen</i>	32
<i>mask</i>	255.255.255.255

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to disassociate the already assigned IPv4 or IPv6 address from the IPMVLAN.
- Use optional parameters **mask** or *prefixlen* with this command to assign subnet mask to IPv4 Multicast Group Address.
- IPMVLAN overlapping is allowed. The same address can be assigned to different IPMVLANs as long as the IPMVLANs do not share a common receiver port. (Not supported on OS9000E)
- If you assign a range of addresses containing duplicate addresses already assigned to the IPMVLAN, an error message will be displayed and no addresses will be added from that range.

- The recommended maximum number of addresses to be specified in a range is 256. Larger ranges should be broken up into separate commands. Contiguous address ranges entered with separate commands are treated as a single range and should be broken up using the *prefixlen* or *mask* parameters.
- IPv4 multicast group address with longest Prefix Length association takes preference over other IPv4 multicast group address.
- Non-zero host bits are not allowed for the creation of IPv4 addresses with mask/prefix-length. E.g. 225.1.3.4/24 is not allowed; the correct group/mask should be 225.1.3.0/24.
- Optional parameters *Prefixlen* and **mask** are not supported in OS9000E.

## Examples

```
-> vlan ipmvlan 1003 address 225.0.0.1
-> vlan ipmvlan 1033 address ff08::3
-> vlan ipmvlan 1033 address 226.0.1.0/24
-> vlan ipmvlan 1033 address 226.0.1.0 mask 255.255.255.0
-> vlan ipmvlan 1033 address 224.1.1.7-224.1.1.9
-> vlan ipmvlan 1033 address ffae::7-ffae::9
-> no vlan ipmvlan 1003 address 225.0.0.1
-> no vlan ipmvlan 1033 address ff08::3
-> no vlan ipmvlan 1033 address 226.0.1.0/24
-> no vlan ipmvlan 1033 address 226.0.1.0 mask 255.255.255.0
-> no vlan ipmvlan 1033 address 224.1.1.7-224.1.1.9
-> no vlan ipmvlan 1033 address ffae::7-ffae::9
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.4; ability to assign the same multicast address to different IPMVLANs was added.

Release 6.4.2; *Prefixlen* and **mask** parameters added.

## Related Commands

**show vlan ipmvlan address** Displays the IPv4 and IPv6 addresses assigned to single IP Multicast VLAN or all the configured IP Multicast VLANs.

## MIB Objects

```
alaipmvVlanIpAddrMaskTable
  alaipmvVlanIpAddrVlanNumber
  alaipmvVlanIpAddrType
  alaipmvVlanIpAddress
  alaipmvVlanIpAddrMaskEntry
  alaipmvVlanIpAddrRowStatus
```

---

## vlan ipmvlan sender-port

Configures a port, a range of ports, an aggregate of ports, or a range of aggregates as sender port for the IP Multicast VLAN. This sender port can receive multicast data for the configured multicast groups.

```
vlan ipmvlan ipmvlan-id sender-port {port slot/port[-port2] / linkagg agg_num [-agg_num2]}
```

```
no vlan ipmvlan ipmvlan-id sender-port {port slot/port[-port2] / linkagg agg_num [-agg_num2]}
```

---

### Syntax Definitions

<i>ipmvlan-id</i>	Specifies the IP Multicast VLAN number to which the port will be attached as a sender port. The valid range is 2–4094.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>agg_num</i>	The link aggregate ID number (0–31) to be assigned as a sender port to the IPMVLAN.
<i>agg_num2</i>	The last link aggregate ID number in a range of aggregates that you want to configure.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a single port, a range of ports, an aggregate of ports, or a range of aggregates assigned as the sender port(s) for the IPMVLAN.
- Multiple sender ports can be assigned to an IPMVLAN and a port can be configured as a sender port for multiple IPMVLANs.
- In the Enterprise mode, the configuration fails if the port configured as a sender port is not a tagged port, or if the port is an aggregated port ( member port of a logical aggregate) or a VLAN Stacking port.
- In the VLAN Stacking mode, the configuration fails if the port configured as a sender port is not a VLAN Stacking port (network port).

### Examples

The following command configures the sender port in an Enterprise mode:

```
-> vlan ipmvlan 1003 sender-port port 1/45-50
```

The following commands configure the sender port in the VLAN Stacking mode:

```
-> ethernet-service svlan 1001
-> ethernet-service svlan 1001 nni 1/49
-> ethernet-service ipmvlan 1033
-> vlan ipmvlan 1033 sender-port port 1/49
```

Note that in the above example, port 1/49 was first configured as a VLAN Stacking network (NNI) port before it was configured as a sender port for the IPMVLAN. See the “VLAN Stacking Commands” chapter for more information.

The following command removes the port configured as sender port:

```
-> no vlan ipmvlan 1003 sender-port port 1/50
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; support added for entering a range and/or multiple entries of ports and aggregates.

## Related Commands

**show vlan ipmvlan port-config** Displays the sender and receiver ports for a specific IP Multicast VLAN or all the IP Multicast VLANs.

## MIB Objects

```
alaipmvVlanPortTable
  alaipmvVlanPortIPMVlanNumber
  alaipmvVlanPortPortNumber
  alaipmvVlanPortPortType
  alaipmvVlanPortRowStatus
```

---

## vlan ipmvlan receiver-port

Configures a port, a range of ports, or an aggregate of ports as receiver ports for the IP Multicast VLAN.

**vlan ipmvlan** *ipmvlan-id* **receiver-port** {**port** *slot/port*[-*port2*] / **linkagg** *agg\_num* [-*agg\_num2*]}

**no vlan ipmvlan** *ipmvlan-id* **receiver-port** {**port** *slot/port*[-*port2*] / **linkagg** *agg\_num* [-*agg\_num2*]}

---

### Syntax Definitions

<i>ipmvlan-id</i>	Specifies the IP Multicast VLAN number to which the port will be attached as a receiver port. The valid range is 2–4094.
<i>slot/port</i>	The slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	Last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<i>agg_num</i>	The link aggregate ID number to be assigned as a receiver port to the specified IPMVLAN. The valid range is 0–31.
<i>agg_num2</i>	Last link aggregate ID number in a range of aggregates you want to configure.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the port assigned as a receiver port for the IPMVLAN.
- A single port can be configured as a receiver port for multiple IPMVLANs as long as the IPMVLANs are not associated with the same address. An IPMVLAN can contain multiple receiver ports.
- In the Enterprise mode, the configuration fails if the port configured as a receiver port is an aggregated port (member port of a logical aggregate) or a VLAN Stacking port.
- In the VLAN Stacking mode, the configuration fails if the port configured as a receiver port is not a VLAN Stacking user port.

### Examples

The following commands configure the receiver port in the Enterprise mode:

```
-> vlan ipmvlan 1003 receiver-port port 1/51-60
-> vlan ipmvlan 1033 receiver-port port 1/62
```

The following commands configure the receiver port in the VLAN Stacking mode:

```
-> ethernet-service ipmvlan 1002
-> vlan ipmvlan 1002 receiver-port port 1/1
```

Note that in the above example, port 1/1 was previously configured as a VLAN Stacking user port. See the “VLAN Stacking Commands” chapter for more information.

The following command removes the port configured as a sender port:

```
-> no vlan ipmvlan 1002 receiver-port port 1/1
```

## Release History

Release 6.2.1; command was introduced.

## Related Commands

**show vlan ipmvlan port-config** Displays the sender and receiver ports for a specific IP Multicast VLAN or all the configured IP Multicast VLANs.

## MIB Objects

```
alaipmvVlanPortTable
  alaipmvVlanPortIPMVlanNumber
  alaipmvVlanPortPortNumber
  alaipmvVlanPortPortType
  alaipmvVlanPortRowStatus
```

---

## show vlan ipmvlan c-tag

Displays the customer VLAN IDs associated with a single IP Multicast VLAN or all the configured IP Multicast VLANs.

**show vlan ipmvlan** [*ipmvlan-id*] **c-tag**

---

### Syntax Definitions

*ipmvlan-id* Specifies the IP Multicast VLAN number. The valid range is 2–4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show vlan ipmvlan c-tag
```

```

ipmvlan      ctag
+-----+-----+
  100         10
  100         20
  200         30

```

### output definitions

---

<b>ipmvlan</b>	The numerical IPMVLAN ID.
<b>ctag</b>	The customer VLAN-ID associated with the IPMVLAN.

---

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[vlan ipmvlan ctag](#) Defines the mapping between a IPMVLAN and a customer VLAN ID (c-tag) to be used in the c-tag translation rule.

### MIB Objects

```

alaipmvVlanCtagTable
  alaipmvVlanNumber
  alaipmvVlanCtag

```

---

## show vlan ipmvlan address

Displays the IPv4 and IPv6 addresses assigned to a single IP Multicast VLAN or all the configured IP Multicast VLANs.

**show vlan ipmvlan** [*ipmvlan-id*] **address** [ipv4 | ipv6]

---

### Syntax Definitions

*ipmvlan-id* Specifies the IP Multicast VLAN number. The valid range is 2–4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show vlan ipmvlan 10 address
IpAddress          ipAddressType
-----+-----
224.1.1.1          Ipv4
224.1.1.2          Ipv4
224.1.1.3          Ipv4
224.1.1.7-224.1.1.9  Ipv4
ffae::1            Ipv6
ffae::2            Ipv6
ffae::3            Ipv6
ffae::7-ffae::9    Ipv6
```

```
-> show vlan ipmvlan 10 address ipv4
IpAddress          ipAddressType
-----+-----
224.1.1.1          Ipv4
224.1.1.2          Ipv4
224.1.1.3          Ipv4
224.1.1.7-224.1.1.9  Ipv4
```

```
-> show vlan ipmvlan 10 address ipv6
IpAddress          ipAddressType
-----+-----
ffae::1            Ipv6
ffae::2            Ipv6
ffae::3            Ipv6
ffae::7-ffae::9    Ipv6
```

```
-> show vlan ipmvlan address
```

ipmvlan	ipAddress	ipAddressType
100	224.1.2.3	Ipv4
100	225.1.1.1	Ipv4
100	ff08::3	Ipv6
200	224.1.1.2	Ipv4
200	ff09::1	Ipv6

### output definitions

<b>ipmvlan</b>	The numerical IPMVLAN ID.
<b>ipAddress</b>	The IPv4 or IPv6 address.
<b>ipAddressType</b>	The IP address type ( <b>IPv4</b> or <b>IPv6</b> ).

## Release History

Release 6.2.1; command was introduced.

## Related Commands

**vlan ipmvlan address** Assigns an IPv4 address, IPv6 address, or a range of addresses to an existing IPMVLAN.

## MIB Objects

```
alaipmvVlanIpAddrMaskTable
  alaipmvVlanIpAddrVlanNumber
  alaipmvVlanIpAddrType
  alaipmvVlanIpAddress
```

## show vlan ipmvlan port-config

Displays the sender and receiver ports for a specific IP Multicast VLAN or all the IP Multicast VLANs.

**show vlan ipmvlan** [*ipmvlan-id*] **port-config**

---

### Syntax Definitions

*ipmvlan-id* Specifies the IP Multicast VLAN number for which the sender and receiver ports will be displayed. The valid range is 2–4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show vlan ipmvlan port-config
ipmvlan    port    type
+-----+-----+-----+
   50       2/1    receiver
   50       2/10   sender
   51       2/2    receiver
   51       0/2    receiver
  100       2/2    receiver
  101       0/1    sender
```

```
-> show vlan ipmvlan 50 port-config
port      type
+-----+-----+
   2/1     receiver
   2/10    sender
```

```
-> show vlan ipmvlan 51 port-config
port      type
+-----+-----+
   2/2     receiver
   0/2     receiver
```

```

-> show vlan ipmvlan 100 port-config
  port      type
+-----+-----+
  2/2      receiver

-> show vlan ipmvlan 101 port-config
  port      type
+-----+-----+
  0/1      sender

```

### *output definitions*

---

<b>ipmvlan</b>	The numerical IPMVLAN ID.
<b>port</b>	Displays the slot number of the module and the physical port number on that module for which the IPMVLAN is configured.
<b>type</b>	The type ( <b>sender</b> or <b>receiver</b> ) of the IPMVLAN port.

---

### **Release History**

Release 6.2.1; command was introduced.

Release 6.3.1; command was modified.

### **Related Commands**

<b>vlan ipmvlan sender-port</b>	Configures a port or an aggregate of ports as the sender port for the IP Multicast VLAN.
<b>vlan ipmvlan receiver-port</b>	Configures a port (or a range of ports) or an aggregate of ports as the receiver port for the IP Multicast VLAN.

### **MIB Objects**

```

alaipmvVlanPortTable
  alaipmvVlanPortIPMvlanNumber
  alaipmvVlanPortPortNumber
  alaipmvVlanPortPortType

```

---

## show ipmvlan port-config

Displays the sender and receiver IPMVLANs for a specific slot or port.

**show vlan ipmvlan port-config** [*slot/port* / *agg\_num*]

---

### Syntax Definitions

*slot/port*                      The slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num*                        The Link aggregate ID number. The valid range is 0–31.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show vlan ipmvlan port-config 2/1
ipmvlan      type
+-----+-----+
   50         receiver
```

```
-> show vlan ipmvlan port-config 2/2
ipmvlan      type
+-----+-----+
   51         receiver
  100         receiver
```

```
-> show vlan ipmvlan port-config 1
ipmvlan      type
+-----+-----+
  101         sender
```

### output definitions

---

<b>ipmvlan</b>	The numerical IPMVLAN ID.
<b>type</b>	The type ( <b>sender</b> or <b>receiver</b> ) of the IPMVLAN port.

---

### Release History

Release 6.2.1; command was introduced.  
 Release 6.3.1; command was modified.

## Related Commands

### **vlan ipmvlan sender-port**

Configures a port or an aggregate of ports as the sender port for the IP Multicast VLAN.

### **vlan ipmvlan receiver-port**

Configures a port (or a range of ports) or an aggregate of ports as the receiver port for the IP Multicast VLAN.

# 29 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide Advanced*.

MIB information for the DVMRP commands is as follows:

*Filename:* AlcatelIND1Dvmrp.MIB  
*Module:* ALCATEL-IND1-DVMRP-MIB

*Filename:* IETF\_DVMRP\_STD\_DRAFT.MIB  
*Module:* DVMRP-STD-MIB

A summary of the available commands is listed here:

---

**ip load dvmrp**  
**ip dvmrp status**  
**ip dvmrp flash-interval**  
**ip dvmrp graft-timeout**  
**ip dvmrp interface**  
**ip dvmrp interface metric**  
**ip dvmrp neighbor-interval**  
**ip dvmrp neighbor-timeout**  
**ip dvmrp prune-lifetime**  
**ip dvmrp prune-timeout**  
**ip dvmrp report-interval**  
**ip dvmrp route-holddown**  
**ip dvmrp route-timeout**  
**ip dvmrp subord-default**  
**ip dvmrp tunnel**  
**ip dvmrp tunnel ttl**  
**ip dvmrp debug-level**  
**ip dvmrp debug-type**  
**show ip dvmrp**  
**show ip dvmrp interface**  
**show ip dvmrp neighbor**  
**show ip dvmrp nexthop**  
**show ip dvmrp prune**  
**show ip dvmrp route**  
**show ip dvmrp tunnel**  
**show ip dvmrp debug**

---

## ip load dvmrp

Dynamically loads DVMRP to memory.

**ip load dvmrp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the [ip dvmrp status command on page 29-3](#).
- The advanced routing image must be loaded before the DVMRP feature starts working on the switch.

### Examples

```
-> ip load dvmrp
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip dvmrp status](#) Globally enables or disables DVMRP protocol on the switch.

### MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPDvmrpStatus
```

---

## ip dvmrp status

Globally enables or disables DVMRP protocol on the switch.

**ip dvmrp status** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Administratively enables DVMRP on the switch.
<b>disable</b>	Administratively disables DVMRP on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the [ip load dvmrp command on page 29-2](#).
- The advanced routing image must be loaded before the DVMRP feature starts working on the switch.
- To enable or disable DVMRP for a particular interface, refer to the [ip dvmrp interface command on page 29-7](#).

### Examples

```
-> ip dvmrp status enable
-> ip dvmrp status disable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">ip dvmrp interface</a>	Enables or disables the DVMRP protocol on a specified interface.
<a href="#">ip load dvmrp</a>	Dynamically loads DVMRP to memory.
<a href="#">show ip dvmrp</a>	Displays global DVMRP parameters, including current status.

## MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpAdminStatus
```

---

## ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

**ip dvmrp flash-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the interval value, in seconds (5–86400).

### Defaults

---

parameter	default
<i>seconds</i>	5

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

### Examples

```
-> ip dvmrp flash-interval 5
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpFlashUpdateInterval

---

---

## ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

**ip dvmrp graft-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the graft message retransmission value, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp graft-timeout 5
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpGraftRetransmission

---

## ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

**ip dvmrp interface** {*interface\_name*}

**no ip dvmrp interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

Use the **no** form of this command to delete an interface.

### Examples

```
-> ip dvmrp interface vlan-10  
-> no ip dvmrp interface vlan-10
```

### Release History

Release 6.1; command was introduced.

Release 6.1.1; *ip\_address* parameter deprecated.

### Related Commands

- |                                           |                                                                                               |
|-------------------------------------------|-----------------------------------------------------------------------------------------------|
| <a href="#">ip dvmrp status</a>           | Globally enables or disables the DVMRP protocol on the switch.                                |
| <a href="#">ip dvmrp interface metric</a> | Configures the distance metric for an interface, which is used to calculate distance vectors. |
| <a href="#">show ip dvmrp interface</a>   | Displays information for all multicast-capable interfaces.                                    |

### MIB Objects

dvmrpInterfaceTable  
    dvmrpInterfaceLocalAddress  
    dvmrpInterfaceStatus

---

## ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

**ip dvmrp interface** *{interface\_name}* **metric** *value*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>value</i>	Specifies the metric value (1–31).

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

### Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

### Release History

Release 6.1; command was introduced.  
Release 6.1.1; *ip\_address* parameter deprecated.

### Related Commands

<a href="#">ip dvmrp interface</a>	Enables or disables the DVMRP protocol on a specified interface.
<a href="#">show ip dvmrp interface</a>	Displays the DVMRP interface table.

### MIB Objects

```
dvmrpInterfaceTable
  dvmrpInterfaceLocalAddress
  dvmrpInterfaceMetric
```

---

## ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

**ip dvmrp neighbor-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the probe interval time, in seconds (5–30).

### Defaults

parameter	default
<i>seconds</i>	10

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp neighbor-interval 10
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- [ip dvmrp neighbor-timeout](#) Configures the neighbor timeout.
- [show ip dvmrp neighbor](#) Displays the DVMRP neighbor table.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpNeighborProbeInterval

---

## ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

**ip dvmrp neighbor-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the neighbor timeout, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	35

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp neighbor-timeout 35
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- [ip dvmrp neighbor-interval](#) Configures the neighbor probe interval time.
- [show ip dvmrp neighbor](#) Displays the DVMRP neighbor table.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpNeighborTimeout

---

## ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

**ip dvmrp prune-lifetime** *seconds*

---

### Syntax Definitions

*seconds* Specifies the prune lifetime, in seconds (180–86400).

### Defaults

parameter	default
<i>seconds</i>	7200

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp prune-lifetime 7200
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- |                                        |                                                                            |
|----------------------------------------|----------------------------------------------------------------------------|
| <a href="#">ip dvmrp prune-timeout</a> | Configures the prune packet retransmission value.                          |
| <a href="#">show ip dvmrp prune</a>    | Displays DVMRP prune entries, including the router's upstream prune state. |
| <a href="#">show ip dvmrp</a>          | Displays the global DVMRP parameters.                                      |

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpPruneLifetime

---

## ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

**ip dvmrp prune-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies retransmission time, in seconds (30–86400).

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp prune-timeout 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp prune-lifetime</a>	Indicates the length of time a prune will be in effect.
<a href="#">show ip dvmrp prune</a>	Displays DVMRP prune entries, including the router's upstream prune state.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpPruneRetransmission

---

## ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

**ip dvmrp report-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the report interval, in seconds (10–2000).

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp report-interval 60
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- [show ip dvmrp route](#) Displays the DVMRP routes that are being advertised to other routers.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
  alaDvmrpRouteReportInterval

---

---

## ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

**ip dvmrp route-holddown** *seconds*

---

### Syntax Definitions

*seconds* Specifies the holddown time, in seconds (1–86400).

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp route-holddown 120
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp route-timeout</a>	Configures the route expiration timeout value.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.
<a href="#">show ip dvmrp route</a>	Displays the DVMRP routes that are being advertised to other routers.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteHoldDown

---

## ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

**ip dvmrp route-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the timeout value, in seconds (20–4000).

### Defaults

parameter	default
<i>seconds</i>	140

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp route-timeout 140
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip dvmrp route-holddown](#) Configures the time during which DVMRP routes are kept in a hold down state.

[show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteExpirationTimeout

---

## ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

**ip dvmrp subord-default {true | false}**

---

### Syntax Definitions

<b>true</b>	DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery.
<b>false</b>	DVMRP neighbors are <i>not</i> assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency.

### Defaults

parameter	default
true   false	true

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a subordinate be changed to false.
- To view the current subordinate neighbor status, use the [show ip dvmrp](#) command. For more information, refer to [page 29-25](#).

### Examples

```
-> ip dvmrp subord-default false
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show ip dvmrp](#)

Displays the global DVMRP parameters.

## MIB Objects

alaDvmrpGlobalConfig

alaDvmrpInitNbrASSubord

---

## ip dvmrp tunnel

Adds or deletes a DVMRP tunnel.

```
ip dvmrp tunnel {local_name} {remote_address}
```

```
no ip dvmrp tunnel {local_name} {remote_address}
```

---

### Syntax Definitions

<i>local_name</i>	The name of the local router interface.
<i>remote_address</i>	The 32-bit IP address of the remote router interface. The remote router interface IP address serves as an identifier for the remote end of the DVMRP tunnel.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a tunnel.
- The local IP address of the tunnel must match the IP address of an existing DVMRP interface.
- Routing (via RIP, OSPF, etc.) must first be set up in order for the remote tunnel endpoint to be accessible.

### Examples

```
-> ip dvmrp tunnel vlan-2 168.22.2.120  
-> no ip dvmrp tunnel vlan-2 168.22.2.120
```

### -Release History

Release 6.1; command was introduced.

Release 6.1.1; *local\_address* and *remote\_name* parameters deprecated.

## Related Commands

<b>ip dvmrp tunnel ttl</b>	Configures the TTL value for the tunnel defined for the specified local address and remote address.
<b>show ip dvmrp interface</b>	Displays the DVMRP interface table.
<b>show ip dvmrp tunnel</b>	Displays the DVMRP tunnel entries.

## MIB Objects

```
tunnelConfigTable
  tunnelConfigLocalAddress
  tunnelConfigRemoteAddress
  tunnelConfigStatus
```

---

## ip dvmrp tunnel ttl

Configures the TTL value for the tunnel defined for the specified local address and remote address. The TTL value is added to the TTL field of the IP header for outgoing packets destined for the remote tunnel endpoint.

**ip dvmrp tunnel** {*interface\_name* *remote\_address*} **ttl** *value*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>remote_address</i>	Remote IP address of the tunnel.
<i>value</i>	The Time to Live (TTL) value (0–255).

### Defaults

parameter	default
<i>value</i>	255

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The local IP address for the tunnel must match the IP address of an existing DVMRP tunnel.
- A value of 0 indicates that the value is copied from the payload's header.

### Examples

```
-> ip dvmrp tunnel vlan-2 172.22.2.120 ttl 0
```

### Release History

Release 6.1; command was introduced.  
Release 6.1.1; *local\_address* deprecated.

### Related Commands

<a href="#">ip dvmrp tunnel</a>	Adds or deletes a DVMRP tunnel for the specified local and remote addresses.
<a href="#">show ip dvmrp tunnel</a>	Displays the DVMRP tunnel entries.

## **MIB Objects**

tunnelIfTable

    tunnelIfLocalAddress

    tunnelIfRemoteAddress

    tunnelIfHopLimit

---

## ip dvmrp debug-level

Defines the level of debugging for DVMRP protocol on the switch.

**ip dvmrp debug-level** *level*

---

### Syntax Definitions

*level*

Specifies the DVMRP debug level (0–255). Higher debug-levels will include all messages that correspond to a lower value. For example, a debug level of 2 will display all messages for level 1 and level 2. As a rule of thumb, higher levels will display more detailed messages; lower levels will display more basic messages.

### Defaults

parameter	default
<i>level</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

When the debug level is set to 0, DVMRP debug logging is turned off.

### Examples

```
-> ip dvmrp debug-level 2
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ip dvmrp debug-type](#)

Enables or disables DVMRP debugging for a specified message type, or for all message types.

[show ip dvmrp debug](#)

Displays the current level of debugging for DVMRP protocol on the switch, as well as the current status for all debugging types.

### MIB Objects

N/A

---

## ip dvmrp debug-type

Enables or disables DVMRP debugging for a specified message type, or for all message types.

---

**Note.** Debugging for a specified message type will only be enabled if its debug level is a value greater than zero (i.e., 1–255). For information on specifying the debug level, refer to the [ip dvmrp debug-level command on page 29-22](#).

---

**ip dvmrp debug-type** *message\_type*

**no ip dvmrp debug-type** *message\_type*

---

### Syntax Definitions

*message\_type* Enables or disables DVMRP debugging for the specified item. Select from the list below. You may enter multiple message types in any order. For example, **ip dvmrp debug-type time flash init**.

---

supported message types	descriptions
<b>all</b>	Enables or disables DVMRP debugging for all items listed below. The syntax <b>all</b> can be used to easily turn debugging for all message types on or off.
<b>error</b>	Enables or disables debugging for DVMRP Error messages.
<b>flash</b>	Enables or disables debugging for DVMRP Flash processing.
<b>graft</b>	Enables or disables debugging for DVMRP Graft processing.
<b>igmp</b>	Enables or disables debugging for DVMRP Internet Group Management Protocol (IGMP) packet processing.
<b>ipmrm</b>	Enables or disables debugging for DVMRP IP Multicast Routing Manager (IPMRM) interaction.
<b>init</b>	Enables or disables debugging related to DVMRP initialization code.
<b>mip</b>	Enables or disables debugging for MIP (Management Internal Protocol) processing. Includes CLI and SNMP.
<b>misc</b>	Enables or disables miscellaneous debugging of DVMRP.
<b>nbr</b>	Enables or disables debugging for DVMRP Neighbor processing.
<b>probes</b>	Enables or disables debugging for DVMRP Probe processing.
<b>prunes</b>	Enables or disables debugging for DVMRP Prune processing.
<b>routes</b>	Enables or disables debugging for DVMRP Route processing.
<b>time</b>	Enables or disables debugging for DVMRP Timer processing.
<b>tm</b>	Enables or disables debugging for DVMRP Task Manager interaction.

---

---

## Defaults

parameter	default
<i>message_type</i>	error

## Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to disable debugging for the specified item.
- Reminder: Debugging for a specified message type will only be enabled if its debug level is a value greater than zero (i.e., 1–255). For information on specifying the debug level, refer to the [ip dvmrp debug-level](#) command on page 29-22.
- The syntax **all** can be used to easily turn debugging for all message types on or off (e.g., **ip dvmrp debug-type all** or **no ip dvmrp debug-type all**).

## Examples

```
-> ip dvmrp debug-type all
-> ip dvmrp debug-type tm igmp flash
-> no ip dvmrp debug-type misc
-> no ip dvmrp debug-type all
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[ip dvmrp debug-level](#)

Defines the level of debugging for DVMRP protocol on the switch.

[show ip dvmrp debug](#)

Displays the current level of debugging for DVMRP protocol on the switch, as well as the current status for all debugging types.

## MIB Objects

N/A

---

## show ip dvmrp

Displays the global DVMRP parameters.

**show ip dvmrp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip dvmrp
```

```
DVMRP Admin Status = enabled,  
Flash Interval      = 5,  
Graft Timeout      = 5,  
Neighbor Interval  = 10,  
Neighbor Timeout   = 35,  
Prune Lifetime     = 7200,  
Prune Timeout      = 30,  
Report Interval    = 60,  
Route Holddown     = 120,  
Route Timeout      = 140,  
Subord Default     = true,
```

```
Number of Routes          = 2,  
Number of Reachable Routes = 2
```

### *output definitions*

---

**DVMRP Admin Status**

The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, refer to the [ip dvmrp status command on page 29-3](#).

**Flash Interval**

The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

---

*output definitions (continued)*

---

<b>Graft Timeout</b>	The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Values may range from 5–86400. The default value is 5.
<b>Neighbor Interval</b>	The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Values may range from 5–30. The default value is 10.
<b>Neighbor Timeout</b>	The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Values may range from 5–86400. The default value is 35.
<b>Prune Lifetime</b>	The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Values may range from 180–86400. The default value is 7200.
<b>Prune Timeout</b>	The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Values range from 30–86400. The default value is 30.
<b>Report Interval</b>	The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Values may range from 10–2000. The default value is 60.
<b>Route Holddown</b>	The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Values may range from 1–120. The default value is 120.
<b>Route Timeout</b>	The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Values may range from 20–4000. The default value is 140.
<b>Subord Default</b>	Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, refer to the <a href="#">ip dvmrp subord-default command on page 29-16</a> . Options include true and false. The default value is true.

*output definitions (continued)*

---

<b>Number of Routes</b>	The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes.
<b>Number of Reachable Routes</b>	The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>ip dvmrp status</b>	Globally enables or disables DVMRP protocol on the switch.
<b>ip dvmrp flash-interval</b>	Configures the minimum flash update interval value.
<b>ip dvmrp graft-timeout</b>	Configures the graft message retransmission value.
<b>ip dvmrp neighbor-timeout</b>	Configures the neighbor timeout.
<b>ip dvmrp prune-lifetime</b>	Indicates the length of time a prune will be in effect.
<b>ip dvmrp prune-timeout</b>	Configures the prune packet retransmission value.
<b>ip dvmrp report-interval</b>	Configures the route report interval.
<b>ip dvmrp route-holddown</b>	Configures the time during which DVMRP routes are kept in a hold down state.
<b>ip dvmrp route-timeout</b>	Configures the route expiration timeout value.
<b>ip dvmrp subord-default</b>	Configures the neighbor probe interval time.

## show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

**show ip dvmrp interface** [*ip\_address* | *interface\_name* | **enabled** | **disabled**]

---

### Syntax Definitions

<i>ip_address</i>	Specifies a particular interface IP address.
<i>interface_name</i>	The name of the interface.
<b>enabled</b>	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>enabled</i> .
<b>disabled</b>	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>disabled</i> .

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as *enabled* in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

### Examples

```
-> show ip dvmrp interface
Interface Name      Vlan  Metric  Admin-Status  Oper-Status
-----+-----+-----+-----+-----
vlan-1              1      1      Disabled      Disabled
vlan-2              2      1      Enabled       Enabled

-> show ip dvmrp interface enabled
Interface Name      Vlan  Metric  Admin-Status  Oper-Status
-----+-----+-----+-----+-----
vlan-2              2      1      Enabled       Enabled
```

*output definitions*

---

<b>Interface Name</b>	The name of the interface.
<b>Vlan</b>	The associated VLAN ID.
<b>Tunnel</b>	Indicates whether there is a DVMRP tunnel currently configured on the interface. This field is not relevant for Release 5.3.1 and later.
<b>Metric</b>	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
<b>Admin-Status</b>	The current administrative status of the corresponding interface. Options include <b>Enabled</b> or <b>Disabled</b> . An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the <a href="#">ip dvmrp interface command on page 29-7</a> .
<b>Oper-Status</b>	The current operational status of the corresponding multicast-capable interface. Options include <b>Enabled</b> or <b>Disabled</b> . For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the <a href="#">ip dvmrp status command on page 29-3</a> .

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.

  dvmrpInterfaceMetric
  dvmrpInterfaceStatus
```

---

## show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

```
show ip dvmrp neighbor [ip_address]
```

---

### Syntax Definitions

*ip\_address* Specifies a particular IP address for a neighboring DVMRP router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

### Examples

```
-> show ip dvmrp neighbor
```

```
Neighbor Address   Intf Name      Uptime        Expires        GenID        Vers  State
-----+-----+-----+-----+-----+-----+-----
143.209.92.214    vlan-2        00h:09m:12s  00h:00m:06s  546947509   3.255  active
```

#### *output definitions*

---

<b>Neighbor Address</b>	The 32-bit IP address of the DVMRP neighbor's router interface.
<b>Intf Name</b>	The interface name of the neighbor's router.
<b>Uptime</b>	The amount of time the neighbor has been running, displayed in hours, minutes, and seconds.
<b>Expires</b>	The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds.
<b>GenID</b>	The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent.
<b>Version</b>	The DVMRP version number for the neighbor.
<b>State</b>	The current state of the DVMRP neighbor. Options include <b>active</b> and <b>down</b> .

---

### Release History

Release 6.1; command was introduced.

## Related Commands

- ip dvmrp neighbor-interval** Configures the neighbor probe interval time.
- ip dvmrp neighbor-timeout** Configures the neighbor timeout.

  dvmrpNeighborMinorVersion  
  dvmrpNeighborState
```

---

## show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

**show ip dvmrp nexthop** [*ip\_address ip\_mask*]

---

### Syntax Definitions

<i>ip_address</i>	Specifies a source IP address for which DVMRP next hop entries will be displayed.
<i>ip_mask</i>	Specifies a source IP mask for which DVMRP next hop entries will be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

### Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0
```

Src Address/Mask	Interface Name	Vlan	Hop Type
-----+-----+-----			
172.22.2.115/24	vlan-22	22	branch

#### *output definitions*

---

<b>Src Address/Mask</b>	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
<b>Interface Name</b>	The name of the interface.
<b>Vlan</b>	The associated VLAN ID.
<b>Hop Type</b>	The hop type of the associated entry. Options include <b>leaf</b> or <b>branch</b> . If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as <b>branch</b> .

## show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

**show ip dvmrp prune** [*group\_address source\_address source\_mask*]

---

### Syntax Definitions

<i>group_address</i>	Specifies a pruned group address.
<i>source_address</i>	Specifies a source IP address.
<i>source_mask</i>	Specifies a source IP mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

### Examples

```
-> show ip dvmrp prune
```

Group Address	Source Address/Mask	Expires
-----+-----+-----		
224.0.0.4	143.209.92.14/24	00h:00m:30s

#### output definitions

---

<b>Group Address</b>	The 32-bit multicast group address.
<b>Source Address/Mask</b>	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
<b>Expires</b>	The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

Indicates the length of time a prune will be in effect.

[ip dvmrp prune-timeout](#)

Configures the prune packet retransmission value.

## MIB Objects

dvmrpPruneTable

    dvmrpPruneGroup

    dvmrpPruneSource

    dvmrpPruneSourceMask

    dvmrpPruneExpiryTime

---

## show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

**show ip dvmrp route** [*ip\_address ip\_mask*]

---

### Syntax Definitions

*ip\_address*                      The 32-bit source IP address representing route(s).

*ip\_mask*                            A 32-bit number that determines the subnet mask for the IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

### Examples

-> show ip dvmrp route

Legends:    Flags:    L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid

Address/Mask	Gateway	Metric	Age	Expires	Flags
11.0.0.0/8	55.0.0.5	2	00h:13m:14s	02m:07s	R
22.0.0.0/8	44.0.0.4	2	00h:33m:14s	02m:15s	R
44.0.0.0/8	-	1	05h:24m:59s	-	L
55.0.0.0/8	-	1	05h:24m:59s	-	L
66.0.0.0/8	44.0.0.4	2	00h:03m:11s	02m:15s	R

### output definitions

---

<b>Address/Mask</b>	The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24, etc.
<b>Gateway</b>	The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes.
<b>Metric</b>	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
<b>Age</b>	The current age of the DVMRP route, displayed in hours, minutes, and seconds.

*output definitions (continued)*

---

<b>Expires</b>	The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes.
<b>Flags</b>	The flag type of a particular DVMRP route. Options include <b>L</b> (Local), <b>R</b> (Remote), <b>F</b> (Flash), <b>H</b> (Holddown), and <b>I</b> (Invalid).

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">ip dvmrp report-interval</a>	Configures the route report interval.
<a href="#">ip dvmrp route-holddown</a>	Configures the time during which DVMRP routes are kept in a hold down state.
<a href="#">ip dvmrp route-timeout</a>	Configures the route expiration timeout value.

**MIB Objects**

```
dvmrpRouteTable
  dvmrpRouteSource
  dvmrpRouteSourceMask
  dvmrpRouteMetric
  dvmrpRouteExpiryTime
  dvmrpRouteUpTime
```

---

## show ip dvmrp tunnel

Displays DVMRP tunnel entries.

**show ip dvmrp tunnel** [*local\_address remote\_address*]

---

### Syntax Definitions

*local\_address*

The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.

*remote\_mask*

The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

### Examples

-> show ip dvmrp tunnel

Interface Name	Local Address	Remote Address	TTL	Status
vlan-2	143.209.92.203	12.0.0.1	255	Enabled

#### *output definitions*

---

<b>Interface Name</b>	The interface name. This field is only displayed on OmniSwitch 6850E switch.
<b>Local Address</b>	The 32-bit local IP address for the DVMRP tunnel.
<b>Remote Address</b>	The 32-bit remote IP address for the DVMRP tunnel.

*output definitions (continued)*

---

<b>TTL</b>	The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Values may range from 0–255.
<b>Status</b>	The corresponding interface status. Options include <b>Enabled</b> or <b>Disabled</b> . If the interface specified by the local address has been configured and is operationally enabled, the status is <b>Enabled</b> . If the interface is down, the value displayed is <b>Disabled</b> .

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">ip dvmrp tunnel</a>	Adds or deletes a DVMRP tunnel.
<a href="#">ip dvmrp tunnel ttl</a>	Configures the TTL value for the tunnel defined for the specified local address and remote address.

**MIB Objects**

```
tunnelIfTable
  tunnelIfLocalAddress
  tunnelIfRemoteAddress
  tunnelIfHopLimit
dvmrpInterfaceGroup
  dvmrpInterfaceStatus
```

---

## show ip dvmrp debug

Displays the current level of debugging for DVMRP protocol on the switch, as well as the current status for all debugging types.

**show ip dvmrp debug**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The administrative debugging status for message types displayed in the table are determined by the [ip dvmrp debug-type](#) command on page 29-23.
- To configure debug levels, refer to the [ip dvmrp debug-level](#) command on page 29-22.

### Examples

```
-> show ip dvmrp debug
```

```
Debug Level = 1,
Error       = on,
Flash      = off,
Grafts     = off,
IGMP       = off,
IPMRM      = off,
Init       = off,
MIP        = off,
Misc       = off
Nbr        = on,
Probes     = off,
Prunes     = off,
Routes     = on,
Time       = off,
TM         = off,
```

#### *output definitions*

---

<b>Debug Level</b>	The current debug level value. For information on setting this parameter, see the <a href="#">ip dvmrp debug-level</a> command on page 29-22.
<b>error</b>	The current debugging status for DVMRP Error messages. Options include <b>on</b> or <b>off</b> .
<b>Flash</b>	The current debugging status for DVMRP Flash processing. Options include <b>on</b> or <b>off</b> .

*output definitions (continued)*

---

<b>Grafts</b>	The current debugging status for DVMRP Graft processing. Options include <b>on</b> or <b>off</b> .
<b>IGMP</b>	The current debugging status for DVMRP Internet Group Management Protocol (IGMP) packet processing. Options include <b>on</b> or <b>off</b> .
<b>IPMRM</b>	The current debugging status for DVMRP IP Multicast Routing Manager (IPMRM) interaction. Options include <b>on</b> or <b>off</b> .
<b>Init</b>	The current debugging status for DVMRP Initialization. Options include <b>on</b> or <b>off</b> .
<b>MIP</b>	The current debugging status for DVMRP MIP (Management Internal Protocol) processing. Includes CLI and SNMP. Options include <b>on</b> or <b>off</b> .
<b>Misc</b>	The current status of miscellaneous DVMRP debugging. Options include <b>on</b> or <b>off</b> .
<b>Nbr</b>	The current debugging status for DVMRP Neighbor processing. Options include <b>on</b> or <b>off</b> .
<b>Probes</b>	The current debugging status for DVMRP Probe processing. Options include <b>on</b> or <b>off</b> .
<b>Prunes</b>	The current debugging status for DVMRP Prune processing. Options include <b>on</b> or <b>off</b> .
<b>Routes</b>	The current debugging status for DVMRP Route processing. Options include <b>on</b> or <b>off</b> .
<b>Time</b>	The current debugging status for DVMRP Timer processing. Options include <b>on</b> or <b>off</b> .
<b>TM</b>	The current debugging status for DVMRP Task Manager interaction. Options include <b>on</b> or <b>off</b> .

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[ip dvmrp debug-level](#)

Defines the level of debugging for DVMRP protocol on the switch.

[ip dvmrp debug-type](#)

# 30 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only via specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs). PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

Alcatel-Lucent implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

*Filename:* AlcatelIND1Pim\_mib.htm  
*Module:* ALCATEL-IND1-PIM-MIB

*Filename:* IETF\_PIM\_BSR.mib  
*Module:* PIM-BSR-MIB

*Filename:* IETF\_PIM\_STD.mib  
*Module:* PIM-STD-MIB

---

## ip load pim

Dynamically loads PIM to memory.

**ip load pim**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip load pim
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

<b>ip pim sparse status</b>	Globally enables or disables the PIM-SM protocol on the switch.
<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>ip pim dense status</b>	Globally enables or disables PIM-DM protocol on the switch.
<b>show ip pim dense</b>	Displays the status of the various global parameters for the PIM Dense mode.
<b>ipv6 pim sparse status</b>	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
<b>ipv6 pim dense status</b>	Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.
<b>show ipv6 pim dense</b>	Displays the status of the various global parameters for the IPv6 PIM dense mode.

## MIB Objects

alaDrcTmConfig  
alaDrcTmIPpimStatus

---

## ip pim sparse status

Globally enables or disables PIM-SM protocol on the switch.

`ip pim sparse status {enable | disable}`

---

### Syntax Definitions

<b>enable</b>	Globally enables PIM-SM on the switch.
<b>disable</b>	Globally disables PIM-SM on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 30-3](#) for more information.
- The advanced routing image must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip pim sparse status enable
-> ip pim sparse status disable
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ip pim sparse</a>	Displays the status of the various global parameters for the PIM sparse mode.

alaPimsmGlobalConfig
  alaPimsmAdminStatus
```

---

## ip pim dense status

Globally enables or disables PIM-DM protocol on the switch.

**ip pim dense status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Globally enables PIM-DM on the switch.
<b>disable</b>	Globally disables PIM-DM on the switch.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 30-3](#) for more information.
- The advanced routing image must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip pim dense status enable
-> ip pim dense status disable
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

## ip pim ssm group

Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).

**ip pim ssm group** *group\_address/prefix\_length* [[**no**] **override**] [**priority** *priority*]

**no ip pim ssm group** *group\_address/prefix\_length*

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>override</b>	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority

### Examples

```
-> ip pim ssm group 224.0.0.0/4 priority 50
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ip pim ssm group</b>	Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPRowStatus
```

---

## ip pim dense group

Statically maps the specified IP multicast group(s) to the PIM Dense mode (DM).

**ip pim dense group** *group\_address/prefix\_length* [[**no**] **override**] [**priority** *priority*]

**no ip pim dense group** *group\_address/prefix\_length*

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>override</b>	Specifies this static Dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

### Examples

```
-> ip pim dense group 224.0.0.0/4 priority 50
```

### Release History

Release 6.3.1; command was introduced.

## ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

**ip pim cbsr** *ip\_address* [**priority** *priority*] [**mask-length** *bits*]

**no ip pim cbsr** *ip\_address*

---

### Syntax Definitions

<i>ip_address</i>	Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<i>priority</i>	Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0 to 255.
<i>bits</i>	Specifies a 32-bit mask length that is advertised in the Bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 32.

### Defaults

---

parameter	default
<i>priority</i>	64
<i>bits</i>	30

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

### Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### `show ip pim cbsr`

Displays the Candidate-BSR information that is used in the Bootstrap messages.

## MIB Objects

```

  alaPimBsrCandidateBSRAddress  
  alaPimBsrCandidateBSRPriority  
  alaPimBsrCandidateBSRHashMaskLength  
  alaPimBsrCandidateBSRRowStatus
```

---

## ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

```
ip pim static-rp group_address/prefix_length rp_address [[no] override] [priority priority]
```

```
no ip pim static-rp group_address/prefix_length rp_address
```

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<i>rp_address</i>	Specifies a 32-bit Rendezvous Point (RP) address.
<b>override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority
- To view current static RP configuration settings, use the [show ip pim static-rp](#) command.

### Examples

```
-> ip pim static-rp 224.0.0.0/4 10.1.1.1 priority 10
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **override** and **priority** options added.

## Related Commands

<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ip pim static-rp</b>	Displays the PIM static RP table for ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of static RP configuration (i.e., enabled or disabled).
<b>show ip pim group-map</b>	Displays the PIM group mapping table.

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPRPAddress  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPRowStatus
```

---

## ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

**ip pim candidate-rp** *rp\_address* *group-address/prefix\_length* [**priority** *priority*] [**interval** *seconds*]

**no ip pim candidate-rp** *rp\_address* *group-address/prefix\_length*

---

### Syntax Definitions

<i>rp_address</i>	Specifies a 32-bit address that will be advertised as a Candidate-RP.
<i>group_address</i>	Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the Bootstrap router, in seconds. Values may range from 1 to 300.

### Defaults

parameter	default
<i>priority</i>	192
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp\_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the candidate-rp entries.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim candidate-rp 50.1.1.1 224.0.0.0/4 priority 100 interval 100
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

**show ip pim candidate-rp**      Displays the IP multicast groups for which the local router will advertise itself as a Candidate-RP.

## MIB Objects

  alaPimBsrCandidateRPGroupPrefixLength
  alaPimBsrCandidateRPPriority
  alaPimBsrCandidateRPAdvInterval
  alaPimBsrCandidateRPRowStatus
```

---

## ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

**ip pim rp-threshold** *bps*

---

### Syntax Definitions

*bps* The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

### Defaults

parameter	default
<i>bps</i>	1

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the [show ip pim sparse](#) command.

### Examples

```
-> ip pim rp-threshold 131072
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the global parameters for PIM sparse mode.

### MIB Objects

alaPimsmGlobalConfig  
  alaPimsmRPThreshold

---

## ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

**ip pim keepalive-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the timeout value, in seconds (0-65535).

### Defaults

parameter	default
<i>seconds</i>	210

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

### Examples

```
-> ip pim keepalive-period 500
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ip pim dense</b>	Displays the status of the various global parameters for the PIM dense mode.
<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
<b>show ipv6 pim dense</b>	Displays the status of the various global parameters for the IPv6 PIM dense mode.

## MIB Objects

alaPim  
alaPimKeepalivePeriod

---

## ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

**ip pim max-rps** *number*

---

### Syntax Definitions

*number* The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

### Defaults

parameter	default
<i>number</i>	32

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the [ip pim sparse status command on page 30-5](#).

### Examples

```
-> ip pim max-rps 32
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

<b>ip pim sparse status</b>	Globally enables or disables the PIM-SM protocol on the switch.
<b>ipv6 pim sparse status</b>	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

## MIB Objects

alaPimsmGlobalConfig  
alaPimsmMaxRPs

---

## ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

**ip pim register checksum {header | full}**

---

### Syntax Definitions

<b>header</b>	Specifies that the checksum for registers is done only on the PIM header.
<b>full</b>	Specifies that the checksum is done over the entire PIM register message.

### Defaults

---

parameter	default
header   full	header

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmOldRegisterMessageSupport
```

---

## ip pim spt status

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

**ip pim spt status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables last hop DR switching to the SPT.
<b>disable</b>	Disables last hop DR switching to the SPT.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the [show ip pim sparse](#) command.

### Examples

```
-> ip pim spt status enable
-> ip pim spt status disable
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmAdminSPTConfig
```

---

## ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

**ip pim state-refresh-interval** *seconds*

---

### Syntax Definitions

*seconds*                      The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

### Examples

```
-> ip pim state-refresh-interval 80
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.

<a href="#">show ip pim dense</a>	Displays the status of the various global parameters for the PIM dense mode.
<a href="#">show ipv6 pim dense</a>	Displays the status of the various global parameters for the IPv6 PIM dense mode.

### MIB Objects

alaPim  
alaPimRefreshInterval

---

## ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

**ip pim state-refresh- limit** *ticks*

---

### Syntax Definitions

*ticks*

The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

### Defaults

parameter	default
<i>ticks</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

### Examples

```
-> ip pim state-refresh-limit 2
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.

### MIB Objects

```
alaPimdmGlobalConfig  
alaPimdmStateRefreshLimitInterval
```

---

## ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

**ip pim interface** *if\_name* [**hello-interval** *seconds*] [**triggered-hello** *seconds*] [**joinprune-interval** *seconds*] [**hello-holdtime** *seconds*] [**joinprune-holdtime** *seconds*] [**prune-delay** *milliseconds*] [**override-interval** *milliseconds*] [**dr-priority** *priority*] [[**no**] **stub**] [**prune-limit-interval** *seconds*] [**graft-retry-interval** *seconds*]

**no ip pim interface** *if\_name*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which PIM is being enabled or disabled.
<b>hello-interval</b> <i>seconds</i>	The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values may range from 0 to 18000.
<b>triggered-hello</b> <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values may range from 0 to 60.
<b>joinprune-interval</b> <i>seconds</i>	The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
<b>hello-holdtime</b> <i>seconds</i>	Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>joinprune-holdtime</b> <i>seconds</i>	Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>prune-delay</b> <i>milliseconds</i>	Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
<b>override-interval</b> <i>milliseconds</i>	Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in <i>milliseconds</i> . Values may range from 0 to 65535.
<b>dr-priority</b> <i>priority</i>	Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority.
<b>prune-limit-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>graft-retry-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>stub</b>	Specifies the interface not to send any PIM packets via this interface, and to ignore received PIM packets.

## Defaults

parameter	default
<b>hello-interval</b> <i>seconds</i>	30
<b>triggered-hello</b> <i>seconds</i>	5
<b>joinprune-interval</b> <i>seconds</i>	60
<b>hello-holdtime</b> <i>seconds</i>	105
<b>joinprune-holdtime</b> <i>seconds</i>	210
<b>prune-delay</b> <i>milliseconds</i>	500
<b>override-interval</b> <i>milliseconds</i>	2500
<b>dr-priority</b> <i>priority</i>	1
<b>prune-limit-interval</b> <i>seconds</i>	60
<b>graft-retry-interval</b> <i>seconds</i>	3
<b>stub</b>	Disabled.

## Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the [ip pim sparse status command on page 30-5](#). To enable or disable PIM-DM on the switch, refer to the [ip pim dense status command on page 30-6](#).
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/Prune messages are not sent.
- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinite time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite hold-time for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets via that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.

## Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-inter-  
val 100 hello-holdtime 350 joinprune-holdtime 400  
-> no ip pim interface vlan-2
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **mode**, **cbsr-preference**, **genid**, **max-graft-retries**, and **sr-ttl-threshold** options removed.

## Related Command

### [show ip pim interface](#)

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

## MIB Objects

```
alaPimInterfaceTable  
  alaPimInterfaceIfIndex  
  alaPimInterfaceStatus  
  alaPimInterfaceHelloInterval  
  alaPimInterfaceTrigHelloInterval  
  alaPimInterfaceJoinPruneInterval  
  alaPimInterfaceHelloHoldtime  
  alaPimInterfaceJoinPruneHoldtime  
  alaPimInterfacePropagationDelay  
  alaPimInterfaceOverrideInterval  
  alaPimInterfaceDRPriority  
  alaPimInterfaceStubInterface  
  alaPimInterfacePruneLimitInterval  
  alaPimInterfaceGraftRetryInterval
```

---

## ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

**ip pim neighbor-loss-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

### Examples

```
-> ip pim neighbor-loss-notification-period 100
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

### MIB Objects

alaPim  
alaPimNeighborLossNotificationPeriod

---

## ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

**ip pim invalid-register-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim invalid-register-notification-period 100
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

### MIB Objects

alaPim  
alaPimInvalidRegisterNotificationPeriod

---

## ip pim invalid-joinprune-notification-period

Specifies the minimum time that must elapse between the PIM invalid joinprune notifications originated by the router.

**ip pim invalid-joinprune-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between invalid joinprune notifications, in seconds (10–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid joinprune notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the control plane to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.

### Examples

```
-> ip pim invalid-joinprune-notification-period 100
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

**show ip pim notifications** Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

alaPimInvalidJoinPruneNotificationPeriod

---

## ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

**ip pim rp-mapping-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim rp-mapping-notification-period 100
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

---

## ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

**ip pim interface-election-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim interface-election-notification-period 100
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

alaPimInterfaceElectionNotificationPeriod

---

## show ip pim sparse

Displays the status of the various global parameters for the PIM sparse mode.

**show ip pim sparse**

---

### Syntax Definitions

N/A.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip pim sparse
Status                = enabled,
Keepalive Period      = 210,
Max RPs                = 32,
Probe Time            = 5,
Register Checksum     = header,
Register Suppress Timeout = 60,
RP Threshold          = 1,
SPT Status            = enabled,
```

*output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of PIM-SM. Options include <b>enabled</b> and <b>disabled</b> .
<b>Keepalive Period</b>	The duration of the Keepalive timer. The default value is 210.
<b>Max RPs</b>	The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32.
<b>Probe Time</b>	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
<b>Register Checksum</b>	The current application of the checksum function on register messages in the domain. Options include <b>header</b> and <b>full</b> . The default setting is <b>header</b> .
<b>Register Suppress Timeout</b>	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.
<b>RP Threshold</b>	Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled.
<b>SPT Status</b>	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .

---

**Release History**

Release 6.1.1; command was introduced.

Release 6.3.1; Keepalive Period field added; BSR Address, BSR Expiry Time, CBSR Address, CBSR Priority, CBSR Mask Length, CRP Address, CRP Hold Time, CRP Expiry Time, CRP Interval, CRP Priority, Data Timeout, and Join/Prune Interval fields removed.

## Related Commands

<b>ip pim sparse status</b>	Globally enables or disables PIM-SM protocol on the switch.
<b>ip pim interface</b>	Enables or disables the PIM protocol on a specific interface.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<b>ip pim max-rps</b>	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
<b>ip pim probe-time</b>	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
<b>ip pim register checksum</b>	Configures the application of the checksum function on sent and received register messages in the domain.
<b>ip pim register-suppress-timeout</b>	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
<b>ip pim rp-threshold</b>	Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.
<b>ip pim spt status</b>	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

## MIB Objects

```
alaPimsmGlobalConfig

```

---

---

## show ip pim dense

Displays the status of the various global parameters for the PIM dense mode.

`show ip pim dense`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip pim dense
Status                = enabled,
Source Lifetime       = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL     = 16
```

*output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of PIM-DM. Options include <b>enabled</b> and <b>disabled</b> .
<b>Source Lifetime</b>	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
<b>State Refresh Interval</b>	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
<b>State Refresh Limit Interval</b>	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval.
<b>State Refresh TTL</b>	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.

---

**Release History**

Release 6.1.1; command was introduced.

Release 6.3.1; **join/prune** field was removed.

**Related Commands**

<b>ip pim dense status</b>	Globally enables or disables PIM-DM protocol on the switch.
<b>ip pim interface</b>	Enables or disables the PIM protocol on a specific interface.
<b>ip pim state-refresh-interval</b>	Sets the interval between successive State Refresh messages originated by a router.
<b>ip pim state-refresh-limit</b>	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
<b>ip pim state-refresh-ttl</b>	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

**MIB Objects**

```

alaPimdmGlobalConfig
  alaPimdmAdminStatus
  alaPimKeepalivePeriod
  alaPimRefreshInterval
  alaPimdmStateRefreshLimitInterval
  alaPimdmStateRefreshTimeToLive

```

---

## show ip pim ssm group

Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

```
show ip pim ssm group
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

### Examples

```
-> show ip pim ssm group
Group Address/Pref Length  Mode  Override  Precedence  Status
-----+-----+-----+-----+-----
224.0.0.0/4                ssm    false     none        enabled
```

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

- ip pim ssm group**                      Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).
- show ip pim group-map**                Displays the PIM group mapping table.

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPPimMode  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPRowStatus
```

---

## show ip pim dense group

Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).

**show ip pim dense group**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only on PIM dense mode.

### Examples

```
-> show ip pim dense group
```

```
Group Address/Pref Length  Mode  Override  Precedence  Status
-----+-----+-----+-----+-----
224.0.0.0/4                dm    false    none        enabled
```

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

- ip pim dense group** Creates and manages the static configuration of dense mode (DM) group mappings.
- show ip pim group-map** Displays the PIM group mapping table.

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPRowStatus  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPPimMode
```

---

*output definitions*

---

<b>Neighbor (IP) Address</b>	The 32-bit IP address of the active PIM neighbor.
<b>Interface Name</b>	The name of the interface used to reach this PIM neighbor.
<b>Uptime</b>	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
<b>Expiry time</b>	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
<b>Lan Prune Delay Present</b>	Evaluates to TRUE if this neighbor is using the Lan Prune Delay option.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on this network.
<b>DR Priority Present</b>	Evaluates to TRUE if the neighbor is using the DR Priority option.
<b>DR Priority</b>	The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE.
<b>TBit field</b>	The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
<b>Generation ID Present</b>	Evaluates to TRUE if this neighbor is using the Generation ID option.
<b>Generation ID Value</b>	The value of the Generation ID from the last PIM Hello message received from the neighbor.
<b>BiDir Capable</b>	Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option.
<b>State Refresh Capable</b>	Displays whether the neighbor is capable of receiving State Refresh messages. Options include <b>true</b> or <b>false</b> .
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.

---

**Release History**

Release 6.1.1; command was introduced.

Release 6.3.1; sparse, dense options removed; vlan (ID), mode, LAN prune delay fields removed; Interface name, LAN delay present, Propagation Delay, Generation ID present, Generation ID Value, BiDir Capable, DR Priority, Override Interval fields added.

**Related Commands**

N/A

## show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

**show ip pim candidate-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip pim candidate-rp
RP Address          Group Address      Priority  Interval  Status
-----+-----+-----+-----+-----
172.21.63.11       224.0.0.0/4       192      60        enabled
```

#### *output definitions*

---

<b>RP Address</b>	A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP).
<b>Group Address</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). This is the group for which the local router advertises itself as a C-RP.
<b>Priority</b>	The C-RP router's priority. The lower the value, the higher the priority.
<b>Interval</b>	The time interval at which the C-RP advertisements are sent to the BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### **ip pim candidate-rp**

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

## MIB Objects

```
alaPimBsrCandidateRPTable  
  alaPimBsrCandidateRPAddress  
  alaPimBsrCandidateRPGroupAddress  
  alaBsrCandidateRPGroupPrefixLength  
  alaPimBsrCandidateRPPriority  
  alaPimBsrCandidateRPInterval  
  alaPimBsrCandidateRPStatus
```

---

## show ip pim group-map

Displays the PIM group mapping table.

```
show ip pim group-map [bsr | static-rp | ssm | dense]
```

---

### Syntax Definitions

N/A

### Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined via the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the Bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received Bootstrap messages).

### Examples

```
-> show ip pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	224.0.0.0/4	172.21.63.11	asm	192
BSR	224.0.0.0/4	214.0.0.7	asm	192
Static	232.0.0.0/8		ssm	

```
-> show ip pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	224.0.0.0/4	172.21.63.11	asm	192
BSR	224.0.0.0/4	214.0.0.7	asm	192

```
-> show ip pim group-map static
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
Static	232.0.0.0/8		ssm	

*output definitions*

---

<b>Origin</b>	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
<b>Group Address/Prefix Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>RP Address</b>	The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM.
<b>Mode</b>	The PIM mode to be used for groups in this prefix.
<b>Mapping Precedence</b>	The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

---

**Release History**

Release 6.3.1; command was introduced.

**Related Commands**

<b>ip pim ssm group</b>	Creates and manages the static configuration of a Source Specific Multicast mode group mappings.
<b>ip pim dense group</b>	Creates and manages the static configuration of dense mode (DM) group mappings.
<b>ip pim static-rp</b>	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

**MIB Objects**

```

alaPimGroupMappingTable
  alaPimGroupMappingOrigin
  alaPimGroupMappingGrpAddress
  alaPimGroupMappingPrecedence
  alaPimGroupMappingRPAddress
  alaPimGroupMappingPimMode
  alaPimGroupMappingGrpPrefixLength

```

---

## show ip pim interface

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

**show ip pim interface** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                      The interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

### Examples

```
-> show ip pim interface
Total 1 Interfaces
```

Interface Name	IP Address	Designated Router	Hello Interval	J/P Interval	Oper Status
tesvl	50.1.1.1	50.1.1.1	100	10	disabled

```
-> show ip pim interface tesvl
Interface Name           = tesvl,
IP Address               = 50.1.1.1,
Designated Router       = 50.1.1.1,
Hello Interval          = 30,
Triggered Hello Interval = 5,
Hello HoldTime          = 105,
Join/Prune Interval     = 60,
Join/Prune HoldTime     = 210,
Propagation (Prune) Delay = 500,
Override Interval      = 2500,
Generation ID           = 0x46e68b13,
DR Priority              = 1,
DR Priority Enabled     = true,
Lan Delay Enabled       = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled     = true,
```

---

```

Stub Interface           = false,
Prune Limit Interval    = 60,
Graft Retry Interval    = 3,
State Refresh Enabled   = true,
Operational Status     = disabled

```

*output definitions*

---

<b>Interface Name</b>	The name of the interface on which PIM is enabled.
<b>IP address</b>	Specifies the IP address of the specified interface.
<b>Designated Router</b>	The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
<b>Hello Interval</b>	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
<b>Join/Prune Interval</b>	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 1 to 18000.
<b>Triggered Hello Interval</b>	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 1 to 60. The default value is 5.
<b>Hello Holdtime</b>	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
<b>Join/Prune Holdtime</b>	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on this network.
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
<b>Generation ID Option</b>	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
<b>DR Priority</b>	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
<b>Lan Delay Enabled</b>	Options include <b>true</b> and <b>false</b> . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
<b>Effective Propagation Delay</b>	The Effective Propagation Delay on this interface.

*output definitions (continued)*

---

<b>Effective Override Interval</b>	The Effective Override Interval on this interface.
<b>Suppression Enabled</b>	Specifies whether the Join suppression is enabled on this interface.
<b>DR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
<b>Stub Interface</b>	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
<b>Prune Limit Interval</b>	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM.
<b>Graft Retry Interval</b>	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values may range from 1 to 65535. The default value is 3.
<b>SR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
<b>Operational Status</b>	The current operational status of the corresponding interface. Options include <b>enabled</b> and <b>disabled</b> . This value indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. The default setting is <b>disabled</b> . To globally enable or disable PIM on the switch, refer to the <a href="#">ip pim sparse status command</a> on page 30-5 and <a href="#">ip pim dense status command</a> on page 30-6.

---

**Release History**

Release 6.1.1; command was introduced.

Release 6.3.1; **sparse** and **dense** options removed; Mode, Prune Delay Value, Prune Delay Option, CBSR Preference fields removed; Propagation Delay, Effective Propagation Delay, Effective Override Interval, Suppression Enabled, DR Priority Enabled, and Stub Interface fields added.

**Related Commands**

[ip pim interface](#) Enables or disables the PIM protocol on a specific interface.

## show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

```
show ip pim static-rp
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range

### Examples

```
-> show ip pim static-rp
Group Address/Pref Length  RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
224.0.0.0/4                172.21.63.11  asm   false    none     enabled
```

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the <a href="#">ip pim static-rp command on page 30-13</a> .
<b>RP Address</b>	A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the <a href="#">ip pim static-rp command on page 30-13</a> .
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether static RP configuration is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> . To change the current status, refer to the <a href="#">ip pim static-rp command on page 30-13</a> .

---

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **Mode**, **Override**, and **Precedence** fields added.

## Related Commands

### [ip pim static-rp](#)

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

## show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

**show ip pim cbsr**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip pim cbsr
CBSR Address           = 214.0.0.7,
Status                 = enabled,
CBSR Priority           = 0,
Hash Mask Length      = 30,
Elected BSR           = False,
Timer                  = 00h:00m:00s
```

### *output definitions*

---

<b>CBSR Address</b>	The 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.
<b>CBSR Priority</b>	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The 32-bit mask length that is advertised in the Bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
<b>Elected BSR</b>	Specifies whether the local router is the elected BSR.
<b>Timer</b>	The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

## show ip pim groute

Displays all (\*,G) state that the IPv4 PIM has.

**show ip pim groute** [*group\_address*]

---

### Syntax Definitions

*group\_address* A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

### Defaults

By default, entire (\*,G) routing table is displayed. To view more detailed (\*,G) state information about a particular group, specify the group address in the command line.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

When the *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

### Examples

```
-> show ip pim groute
```

```
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	Upstream Neighbor	UpTime

```

### *output definitions*

---

<b>Group-address</b>	The IPv4 Multicast Group Address.
<b>RP Address</b>	The address of the Rendezvous Point (RP) for the group.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Pim Mode Origin</b>	The mechanism by which the PIM mode and RP for the group were learned.
<b>Upstream Join State</b>	Whether the local router should join the RP tree for the group.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the RP.

*output definitions (continued)*

---

<b>RPF Route Protocol</b>	The routing mechanism via which the route used to find the RPF interface towards the RP was learned.
<b>RPF Route Address/Prefix Length</b>	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
<b>Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the RP.
<b>Route Metric</b>	The routing metric of the route used to find the RPF interface towards the RP.
<b>Interface Name</b>	The interface name that corresponds to the ifIndex.
<b>Local Membership</b>	Whether the local router has (*,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (*,G) Join/Prune messages received on this interface.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (*,G) Join state for this interface expires.
<b>Assert State</b>	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
<b>Assert Timer</b>	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
<b>Assert Winner Address</b>	If the Assert State is 'Loser', this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
<b>Assert Winner Metric</b>	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

## show ip pim sgroute

Displays all (S,G) state that the IPv4 PIM has.

**show ip pim sgroute** [*source\_address group\_address*]

---

### Syntax Definitions

*source\_address*                      The 32-bit IP address for a specific multicast source.

*group\_address*                        A 32-bit multicast address.

### Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source\_address* and *group\_address* associated with that entry.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When the *source\_address* and *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

### Examples

```
-> show ip pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
          L = Local, R = RPT, T = SPT, F = Register,
          P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

```

***output definitions***

---

<b>Source-address</b>	The IPv4 Source address.
<b>Group-address</b>	The IPv4 Multicast Group Address.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.

*output definitions (continued)*

<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Flags</b>	Flags indicating SPTBit, Prune State, Join State, etc.
<b>Pim Mode</b>	Whether the Group Address is SSM, ASM or DM.
<b>Upstream Join State</b>	Whether the local router should join the SPT for the source and group represented by this entry.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (S,G) Join message.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the source.
<b>RPF Route Protocol</b>	The routing mechanism via which the route used to find the RPF Interface towards the source was learned.
<b>RPF Route Address/Prefix Length</b>	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
<b>RPF Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>RPF Route Metric</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>DR Register State</b>	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
<b>DR Register Stop Timer</b>	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
<b>Upstream Prune State</b>	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
<b>Upstream Prune Limit Timer</b>	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
<b>Originator State</b>	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
<b>Source Active Timer</b>	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
<b>State Refresh Timer</b>	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
<b>Interface Name</b>	The interface name corresponding to the ifIndex that corresponds to this entry.
<b>Uptime</b>	The time since this entry was created.
<b>Local Membership</b>	Whether the local router has (S,G) local membership on this interface.

*output definitions (continued)*

---

<b>Join Prune State</b>	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (S,G) Join state for this interface expires.
<b>Assert State</b>	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
<b>Assert Winner</b>	If the Assert State is Loser, this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
<b>Assert Winner Metric Metric</b>	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

## ipv6 pim sparse status

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

**ipv6 pim sparse status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PIM-SM globally for IPv6.
<b>disable</b>	Disables PIM-SM globally for IPv6.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 30-3](#) for more information.

### Examples

```
-> ipv6 pim sparse status enable
-> ipv6 pim sparse status disable
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<a href="#">ipv6 pim interface</a>	Enables or disables the PIM protocol on a specific interface.

---

## ipv6 pim dense status

Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.

**ipv6 pim dense status {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PIM-DM globally for IPv6.
<b>disable</b>	Disables PIM-DM globally for IPv6.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 30-3](#) for more information.

### Examples

```
-> ipv6 pim dense-status enable
-> ipv6 pim dense-status disable
```

## ipv6 pim ssm group

Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

**ipv6 pim ssm group** *group\_address/prefix\_length* [[no] **override**] [**priority** *priority*]

**no ipv6 pim ssm group** *group\_address/prefix\_length*

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128.
<b>override</b>	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

### Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

---

## ipv6 pim dense group

Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

**ipv6 pim dense group** *group\_address/prefix\_length* [[**no**] **override**] [**priority** *priority*]

**no ipv6 pim dense group** *group\_address/prefix\_length*

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<b>override</b>	Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

### Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50
-> no ipv6 pim dense group ff0e::1234/128
```

### Release History

Release 6.3.1; command was introduced.

## ipv6 pim cbsr

Configures the local router as the candidate Bootstrap router (C-BSR) for the PIM IPv6 domain of the specified scope zone.

**ipv6 pim cbsr** *bsr\_address* [**priority** *bsr\_priority*] [**mask-length** *masklen*] [**scope** *scope\_value*]

**no ipv6 pim cbsr** *bsr\_address* [**priority** *bsr\_priority*] [**mask-length** *masklen*] [**scope** *scope\_value*]

---

### Syntax Definitions

<i>bsr_address</i>	The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR for PIM IPv6. The specified address must be a domain-wide reachable address.
<i>bsr_priority</i>	The priority value of the local router as a Candidate-BSR. Values may range from 0 to 255. A numerically higher value indicates higher priority.
<i>masklen</i>	The hash mask length that is advertised in the Bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128.
<i>scope_value</i>	The scope value to which this entry applies. The values 3-15 are used to indicate the particular scope to which this BSR applies. If scope value is not used then the C-BSR will be a global (non-scoped) BSR.

### Defaults

parameter	default
<i>bsr-priority</i>	64
<i>masklen</i>	126

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only if PIM is loaded in the system.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

## Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4 scope 6
-> no ipv6 pim cbsr 2000::1 scope 6
-> no ipv6 pim cbsr 2000::1
```

## Release History

Release 6.3.1; command was introduced.  
Release 6.3.4; **scope** parameter was added.

## Related Commands

### **show ipv6 pim cbsr**

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

## MIB Objects

## ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

**ipv6 pim static-rp** *group\_address/prefix\_length rp\_address* [[**no**] **override**] [**priority** *priority*]

**no ipv6 pim static-rp** *group\_address/prefix\_length rp\_address*

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<i>rp_address</i>	Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address.
<b>override</b>	Specifies the static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

**show ipv6 pim group-map**

Displays the IPv6 PIM group mapping table.

**show ipv6 pim static-rp**

Displays the IPv6 PIM Static RP table, which includes IPv6 multi-cast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

## MIB Objects

alaPimStaticRPTable

```
alaPimStaticRPGrpAddress  
alaPimStaticRPGrpPrefixLength  
alaPimStaticRPRPAddress  
alaPimStaticRPOverrideDynamic  
alaPimStaticRPPrecedence

```

---

## ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

**ipv6 pim candidate-rp** *rp\_address group\_address/prefix\_length* [**priority** *priority*] [**interval** *seconds*]

**no ipv6 pim candidate-rp** *rp\_address group\_address/prefix\_length*

---

### Syntax Definitions

<i>rp_address</i>	Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address.
<i>group_address</i>	Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the specified IPv6 multicast group address.
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the Bootstrap router, in seconds. Values may range from 1 to 300.

### Defaults

parameter	default
<i>priority</i>	192
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

**show ipv6 pim candidate-rp** Displays the IPv6 multicast groups for which the local router will advertise itself as a Candidate-RP.

## MIB Objects

```

  alaPimBsrCandidateRPPriority  
  alaPimBsrCandidateRPAdvInterval  
  alaPimBsrCandidateRPRowStatus
```

---

## ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

**ipv6 pim rp-switchover {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the RP to switch to native forwarding.
<b>disable</b>	Disables the RP from switching to native forwarding.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim rp-switchover enable
-> ipv6 pim rp-switchover disable
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

**show ipv6 pim sparse** Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

```
alaPismGlobalConfig
  alaPismV6RPSwitchover
```

---

## ipv6 pim spt status

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

```
ipv6 pim spt status {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables last hop DR switching to the SPT.
<b>disable</b>	Disables last hop DR switching to the SPT.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

### Examples

```
-> ipv6 pim spt status enable
-> ipv6 pim spt status disable
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

## ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, join-prune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

**ipv6 pim interface** *if\_name* [**hello-interval** *seconds*] [**triggered-hello** *seconds*] [**joinprune-interval** *seconds*] [**hello-holdtime** *seconds*] [**joinprune-holdtime** *seconds*] [**prune-delay** *milliseconds*] [**override-interval** *milliseconds*] [**dr-priority** *priority*] [[**no**] **stub**] [**prune-limit-interval** *seconds*] [**graft-retry-interval** *seconds*]

**no ipv6 pim interface** *if\_name*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the IPv6 PIM is being enabled or disabled.
<b>hello-interval</b> <i>seconds</i>	The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000.
<b>triggered-hello</b> <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60.
<b>joinprune-interval</b> <i>seconds</i>	The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
<b>hello-holdtime</b> <i>seconds</i>	Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>joinprune-holdtime</b> <i>seconds</i>	Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>prune-delay</b> <i>milliseconds</i>	Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
<b>override-interval</b> <i>milliseconds</i>	Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in <i>milliseconds</i> . Values may range from 0 to 65535.
<b>dr-priority</b> <i>priority</i>	Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority.
<b>prune-limit-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>graft-retry-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535.

**stub** Specifies the interface not to send any IPv6 PIM packets via this interface, and to ignore received IPv6 PIM packets.

## Defaults

parameter	default
<b>hello-interval</b> <i>seconds</i>	30
<b>triggered-hello</b> <i>seconds</i>	5
<b>joinprune-interval</b> <i>seconds</i>	60
<b>hello-holdtime</b> <i>seconds</i>	105
<b>joinprune-holdtime</b> <i>seconds</i>	210
<b>prune-delay</b> <i>milliseconds</i>	500
<b>override-interval</b> <i>milliseconds</i>	2500
<b>dr-priority</b> <i>priority</i>	1
<b>prune-limit-interval</b> <i>seconds</i>	60
<b>graft-retry-interval</b> <i>seconds</i>	3
<b>stub</b>	Disabled

## Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.
- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the [ipv6 pim sparse status command on page 30-75](#). To enable or disable IPv6 PIM-DM on the switch, refer to the [ipv6 pim dense status command on page 30-76](#).
- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.
- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinite time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a join-prune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.

- The interface configured as a **stub** will not send any IPv6 PIM packets via that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub one.
- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.

## Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-interval 100 hello-holdtime 350 joinprune-holdtime 400
-> no ipv6 pim interface vlan-2
```

## Release History

## show ipv6 pim sparse

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

**show ipv6 pim sparse**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim sparse
Status                = enabled,
Keepalive Period      = 210,
Max RPs                = 32,
Probe Time            = 5,
Register Suppress Timeout = 60,
RP Switchover         = enabled,
SPT Status            = enabled,
```

### *output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include <b>enabled</b> and <b>disabled</b> .
<b>Keepalive Period</b>	The duration of the Keepalive timer. The default value is 210.
<b>Max RPs</b>	The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32.
<b>Probe Time</b>	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
<b>Register Suppress Timeout</b>	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.

*output definitions*

---

<b>RP switchover</b>	The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .
<b>SPT Status</b>	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .

---

**Release History**

Release 6.3.1; command was introduced.

**Related Commands**

<b>ipv6 pim rp-switchover</b>	Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.
<b>ipv6 pim spt status</b>	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received.
<b>ipv6 pim sparse status</b>	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>ipv6 pim interface</b>	Enables IPv6 PIM and configures statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.
<b>ip pim max-rps</b>	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
<b>ip pim probe-time</b>	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
<b>ip pim register-suppress-timeout</b>	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

## show ipv6 pim dense

Displays the status of the various global parameters for the IPv6 PIM dense mode.

```
show ipv6 pim dense
```

---

### Syntax Definitions

N/A.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim dense
Status                = enabled,
Source Lifetime       = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL     = 16
```

*output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include <b>enabled</b> and <b>disabled</b> .
<b>Source Lifetime</b>	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
<b>State Refresh Interval</b>	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
<b>State Refresh Limit Interval</b>	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0.
<b>State Refresh TTL</b>	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.

---

**Release History**

Release 6.3.1; command was introduced.

**Related Commands**

<a href="#">ip6 pim dense status</a>	Enables or disables IPv6 PIM-DM (dense mode) globally on the switch.
<a href="#">ip pim keepalive-period</a>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<a href="#">ip pim state-refresh-interval</a>	Sets the interval between successive State Refresh messages originated by a router.
<a href="#">ip pim state-refresh-limit</a>	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
<a href="#">ip pim state-refresh-ttl</a>	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

**MIB Objects**

---

## show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

```
show ipv6 pim ssm group
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ipv6 pim ssm group
```

```
Group Address/Pref Length  Mode  Override Precedence Status
-----+-----+-----+-----+-----
ff00::/8                   ssm   false   none    enabled
ff34::/32                   ssm   false   none    enabled
```

#### *output definitions*

---

<b>Group Address/Pref Length</b>	The IPv6 multicast group address along with the prefix length.
<b>Mode</b>	The IPv6 PIM mode that is used for the groups in this prefix.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that can be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

### Release History

## show ipv6 pim interface

Displays detailed IPv6 PIM settings for a specific interface. In general, it displays IPv6 PIM settings for all the interfaces if no argument is specified.

**show ipv6 pim interface** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

### Examples

```
-> show ipv6 pim interface
```

Interface Name	Designated Router	Hello Interval	Join/Prune Interval	Oper Status
vlan-5	fe80::2d0:95ff:feac:a537	30	60	enabled
vlan-30	fe80::2d0:95ff:feac:a537	30	60	disabled
vlan-40	fe80::2d0:95ff:fee2:6eec	30	60	enabled

```
-> show ipv6 pim interface vlan-5
```

```
Interface Name          = vlan-5,
IP Address              = fe80::2d0:95ff:fee2:6eec,
Designated Router      = fe80::2d0:95ff:fee2:a537,
Hello Interval         = 30,
Triggered Hello Interval = 5,
Hello HoldTime        = 105,
Join/Prune Interval    = 60,
Join/Prune HoldTime    = 210,
Propagation (Prune) Delay = 500,
Override Interval      = 2500,
Generation ID          = 0x4717be4d,
DR Priority             = 1,
DR Priority Enabled     = true,
Lan Delay Enabled      = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled    = true,
Stub Interface         = false,
```

```

Prune Limit Interval      = 60,
Graft Retry Interval     = 3,
State Refresh Enabled    = true,
Operational Status      = enabled

```

*output definitions*

---

<b>Interface Name</b>	The name of the IPv6 PIM interface.
<b>IPv6 address</b>	Specifies the IPv6 address of the specified interface.
<b>Designated Router</b>	The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
<b>Hello Interval</b>	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
<b>Join/Prune Interval</b>	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60.
<b>Triggered Hello Interval</b>	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5.
<b>Hello Holdtime</b>	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
<b>Join/Prune Holdtime</b>	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500.
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
<b>Generation ID Option</b>	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
<b>DR Priority</b>	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
<b>Lan Delay Enabled</b>	Options include <b>true</b> and <b>false</b> . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
<b>Effective Propagation Delay</b>	The Effective Propagation Delay on this interface.

*output definitions (continued)*

---

<b>Effective Override Interval</b>	The Effective Override Interval on this interface.
<b>Suppression Enabled</b>	Specifies whether the Join suppression is enabled on this interface.
<b>DR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
<b>Stub Interface</b>	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
<b>Prune Limit Interval</b>	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60.
<b>Graft Retry Interval</b>	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3.
<b>SR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
<b>Operational Status</b>	The current operational status of the corresponding interface. Options include <b>enabled</b> and <b>disabled</b> . This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is <b>disabled</b> . To enable or disable PIM on an interface, refer to the <a href="#">ipv6 pim interface command on page 30-89</a> . To globally enable or disable PIM on the switch, refer to the <a href="#">ipv6 pim sparse status command on page 30-75</a> and <a href="#">ipv6 pim dense status command on page 30-76</a> .

---

**Release History**

Release 6.3.1; command was introduced.

**Related Commands**

[ipv6 pim interface](#) Enables IPv6 PIM and configures statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

## show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

```
show ipv6 pim neighbor [ipv6_address] [if_name]
```

---

### Syntax Definitions

*ipv6\_address*                      The IPv6 address for the PIM neighbor.

*if\_name*                              The name of the interface.

### Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

### Examples

```
-> show ipv6 pim neighbor
Neighbor Address                      Interface Name                      Uptime                      Expires                      DR Pri
-----+-----+-----+-----+-----
fe80::2d0:95ff:feac:a537              vlan-30                              02h:56m:51s                      00h:01m:28s                      1
```

If a specific neighbor address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ipv6 pim neighbor fe80::2d0:95ff:feac:a537
vlan-30
Neighbor IPv6 Address                      = fe80::2d0:95ff:feac:a537,
Uptime                                      = 02h:57m:09s,
Expires                                      = 00h:01m:40s,
Lan Prune Delay Present                      = True,
Propagation Delay                              = 500,
Override Interval                              = 2500,
TBit Field                                      = True,
Gen ID Present                                      = True,
Gen ID Value                                      = 0x7720c123,
BiDir Capable                                      = False,
DR Priority Present                              = True,
DR Priority                                      = 1,
State Refresh Capable                              = True,
```

```

Secondary Addresses:
  3000::11

vlan-40
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 03h:57m:03s,
Expires                   = 00h:01m:20s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit Field                 = True,
Gen ID Present            = True,
Gen ID Value               = 0x7720c123,
BiDir Capable             = False,

DR Priority                 = 1,
State Refresh Capable     = True,
Secondary Addresses:
  4000::11

```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```

-> show IPv6 pim neighbor vlan-30
vlan-30
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 02h:57m:09s,
Expires                   = 00h:01m:40s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit Field                 = True,
Gen ID Present            = True,
Gen ID Value               = 0x7720c123,
BiDir Capable             = False,
DR Priority Present        = True,
DR Priority                 = 1,
State Refresh Capable     = True,
Secondary Addresses:
  3000::11

```

### *output definitions*

<b>Neighbor IPv6 Address</b>	The IPv6 address of the active PIM neighbor.
<b>Interface Name</b>	The name of the IPv6 PIM interface that is used to reach the neighbor.
<b>Uptime</b>	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
<b>Expires</b>	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
<b>LAN Prune Delay present</b>	Specifies whether this neighbor is using the LAN Prune Delay option. Options include <b>true</b> or <b>false</b> .
<b>Propagation Delay</b>	The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.

*output definitions (continued)*

---

<b>Override Interval</b>	The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.
<b>TBit field</b>	The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
<b>Gen ID present</b>	Specifies whether this neighbor is using Generation ID option. Options include <b>true</b> or <b>false</b> .
<b>Gen ID Value</b>	The value of the Generation ID in the last PIM Hello message received from this neighbor.
<b>BiDir Capable</b>	Specifies whether this neighbor is using the Bidirectional-PIM Capable option.
<b>DR Priority Present</b>	Displays whether the neighbor is using the Designated Router option. Options include <b>true</b> or <b>false</b> .
<b>DR priority</b>	The value of the Designated Router Priority in the last PIM Hello message received from this neighbor.
<b>State Refresh Capable</b>	Displays whether the neighbor is capable of receiving State Refresh messages. Options include <b>true</b> or <b>false</b> .
<b>Secondary Addresses</b>	The secondary IPv6 address of this PIM neighbor.

## show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

```
show ipv6 pim static-rp
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ipv6 pim static-rp
```

Group Address/Pref Length	RP Address	Mode	Override	Precedence	Status
ff00::/8	3000::11	asm	false	none	enabled
ff34::/32	3000::11	asm	false	none	enabled

#### *output definitions*

<b>Group Address/Pref Length</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM.
<b>Mode</b>	The IPv6 PIM mode that is used for the groups in this prefix. The possible values include ASM, SSM, or DM.
<b>Override</b>	Specifies that this static RP configuration can override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that is used for this static RP configuration.
<b>Status</b>	Displays whether the static RP configuration is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### **ipv6 pim static-rp**

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPAddress  
  alaPimStaticRPPimMode  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPRowStatus  
  alaPimStaticRPPrecedence
```

---

## show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

**show ipv6 pim group-map** [**bsr** | **static-rp** | **ssm** | **dense**]

---

### Syntax Definitions

N/A

### Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined via the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the Bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received Bootstrap messages).

### Examples

```
-> show ipv6 pim group-map
Origin      Group Address/Pref Length  RP Address  Mode  Precedence
-----+-----+-----+-----+-----
BSR         ff00::/8                    3000::11   asm   192
BSR         ff00::/8                    4000::7    asm   192
SSM         ff33::/32                    -          ssm

```

```
-> show ipv6 pim group-map bsr
Origin      Group Address/Pref Length  RP Address  Mode  Precedence
-----+-----+-----+-----+-----
BSR         ff00::/8                    3000::11   asm   192
BSR         ff00::/8                    4000::7    asm   192

```

```
-> show ipv6 pim group-map ssm
Origin      Group Address/Pref Length  RP Address  Mode  Precedence
-----+-----+-----+-----+-----

```

SSM ff33::/32

ssm

*output definitions*

---

<b>Origin</b>	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
<b>Group Address/Prefix Length</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the Rendezvous Point to be used for groups within the group prefix.
<b>Mode</b>	The IPv6 PIM mode to be used for groups in this prefix.
<b>Mapping Precedence</b>	The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

---

**Release History**

Release 6.3.1; command was introduced.

**Related Commands**

<a href="#">ipv6 pim static-rp</a>	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).
<a href="#">ipv6 pim ssm group</a>	Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).
<a href="#">ipv6 pim dense group</a>	Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

**MIB Objects**

  alaPimGroupMappingOrigin
  alaPimGroupMappingGrpAddress
  alaPimGroupMappingGrpPrefixLength
  alaPimGroupMappingRPAddress
  alaPimGroupMappingPimMode
  alaPimGroupMappingPrecedence

```

---

## show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

**show ipv6 pim candidate-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim candidate-rp
RP Address          Group Address      Priority  Interval  Status
-----+-----+-----+-----+-----
3000::11           FF00::/8           192      60        enabled
```

#### *output definitions*

---

<b>RP Address</b>	An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP).
<b>Group Address</b>	The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP.
<b>Priority</b>	The C-RP router's priority. The lower the value, the higher the priority.
<b>Interval</b>	The time interval at which the C-RP advertisements are sent to the BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### **ipv6 pim candidate-rp**

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

## MIB Objects

```
alaPimBsrCandidateRPTable  
  alaPimBsrCandidateRPAddress  
  alaPimBsrCandidateRPGroupAddress  
  alaPimBsrCandidateRPGroupPrefixLength  
  alaPimBsrCandidateRPPriority  
  alaPimBsrCandidateRPInterval  
  alaPimBsrCandidateRPStatus
```

---

## show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages. If the scope argument is not included in the command line, then this command will display C-BSR information for all known scope zones.

**show ipv6 pim cbsr** [*scope scope\_value*]

---

### Syntax Definitions

*scope\_value* This is an optional argument used to display the C-BSR information associated with a particular scope zone.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim cbsr
```

```
CBSR Global Scope
  CBSR Address      = 8000::7,
  Status            = enabled,
  CBSR Priority      = 0,
  Hash Mask Length  = 126,
  Elected BSR      = False,
  Timer             = 00h:00m:00s
```

```
CBSR Scope Zone:6
  CBSR Address      = 3000::7,
  Status            = enabled,
  CBSR Priority      = 0,
  Hash Mask Length  = 126,
  Elected BSR      = False,
  Timer             = 00h:00m:00s
```

```
-> show ipv6 pim cbsr scope 6
```

```
CBSR Scope Zone:6
  CBSR Address      = 3000::7,
  Status            = enabled,
  CBSR Priority      = 0,
  Hash Mask Length  = 126,
```

Elected BSR = False,  
 Timer = 00h:00m:00s

### *output definitions*

---

<b>Scope</b>	IPv6 scope value that ranges from 3-15. It is used to define Candidate BSR information associated with a particular scope zone.
<b>CBSR Address</b>	An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR for PIM IPv6.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.
<b>CBSR Priority</b>	The priority value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The hash mask length that is advertised in the Bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group).
<b>Elected BSR</b>	Specifies whether the local router is the elected BSR for PIM IPv6.
<b>Timer</b>	The time that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

---

### **Release History**

Release 6.3.1; command was introduced.  
 Release 6.3.4; **scope** parameter was added.

### **Related Commands**

[ipv6 pim cbsr](#) Configures the Candidate-BSR information that is used in the Bootstrap messages.

### **MIB Objects**

  pimBsrCandidateBSRBootstrapTimer
  pimBsrCandidateBSRStatus
```

---

## show ipv6 pim bsr

Displays information about the elected BSR for PIM IPv6. If the scope argument is included in the command line, then this command will display BSR information of the specified scope zone. If the scope argument is not included in the command line then BSR information for all the known scope zones will be displayed.

**show ipv6 pim bsr** [*scope scope\_value*]

---

### Syntax Definitions

*scope\_value* This is an optional argument used to display BSR information of a particular scope zone.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim bsr
```

```
BSR Global Scope
  BSR Address           = 8000::7,
  BSR Priority           = 192,
  Hash Mask Length      = 126,
  Expiry Time           = 00h:01m:35s
```

```
BSR Scope Zone:6
  BSR Address           = 3000::7,
  BSR Priority           = 192,
  Hash Mask Length      = 126,
  Expiry Time           = 00h:01m:32s
```

```
->show ipv6 pim bsr scope 6
```

```
BSR Scope Zone:3
  BSR Address           = 3000::7,
  BSR Priority           = 192,
  Hash Mask Length      = 126,
  Expiry Time           = 00h:01m:32s
```

*output definitions*

---

<b>Scope</b>	IPv6 scope value that ranges from 3-15. It is used to define BSR information associated with a particular scope zone.
<b>BSR Address</b>	The IPv6 unicast address of the elected BSR.
<b>BSR Priority</b>	The priority value of the elected BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The hash mask length that is advertised in the Bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
<b>Expiry Time</b>	The minimum time remaining before the elected BSR for PIM IPv6 will be declared down.

---

**Release History**

Release 6.3.1; command was introduced.  
Release 6.3.4; **scope** parameter was added.

**Related Commands**

---

## show ipv6 pim groute

Displays all (\*,G) state that the IPv6 PIM has.

```
show ipv6 pim groute [group_address]
```

---

### Syntax Definitions

*group\_address*                      The IPv6 address of the Multicast Group.

### Defaults

By default, entire (\*,G) routing table is displayed. To view more detailed (\*,G) state information about a particular group, specify the group address in the command line.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

When the *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

### Examples

```
-> show ipv6 pim groute
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	UpTime
ff0e::7	5ffe::3	vlan-4	00h:01m:23s

```
-> show ipv6 pim groute ff0e::7

*output definitions*

---

<b>Group-address</b>	The IPv6 Multicast Group Address.
<b>RP Address</b>	The address of the Rendezvous Point (RP) for the group.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Pim Mode Origin</b>	The mechanism by which the PIM mode and RP for the group were learned.
<b>Upstream Join State</b>	Whether the local router should join the RP tree for the group.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the RP.
<b>RPF Route Protocol</b>	The routing mechanism via which the route used to find the RPF interface towards the RP was learned.
<b>RPF Route Address/Prefix Length</b>	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
<b>Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the RP.
<b>Route Metric</b>	The routing metric of the route used to find the RPF interface towards the RP.
<b>Interface Name</b>	The interface name that corresponds to the ifIndex.
<b>Local Membership</b>	Whether the local router has (*,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (*,G) Join/Prune messages received on this interface.

*output definitions (continued)*

---

<b>Prune Pending Timer</b>	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (*,G) Join state for this interface expires.
<b>Assert State</b>	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
<b>Assert Timer</b>	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
<b>Assert Winner Address</b>	If the Assert State is 'Loser', this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
<b>Assert Winner Metric</b>	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

## show ipv6 pim sgroute

Displays all (S,G) state that the IPv6 PIM has.

**show ipv6 pim sgroute** [*source\_address* *group\_address*]

---

### Syntax Definitions

*source\_address*                    The IPv6 address for a specific multicast source.

*group\_address*                    A IPv6 multicast address.

### Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source\_address* and *group\_address* associated with that entry.

### Platforms Supported

OmniSwitch 6850, 6855, 6850E, 9000E

### Usage Guidelines

- When the *source\_address* and *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

### Examples

```
-> show ipv6 pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
           L = Local, R = RPT, T = SPT, F = Register,
           P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

Source Address	Group Address	RPF Interface	UpTime	Flags
8ffe::3	ff0e::7		00h:01m:34s	SR

```
-> show ipv6 pim sgroute 8ffe::3 ff0e::7
(8ffe::3,ff0e::7)
```

```

**output definitions**

---

<b>Source-address</b>	The IPv6 Source address.
<b>Group-address</b>	The IPv6 Multicast Group Address.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Flags</b>	Flags indicating SPTBit, Prune State, Join State, etc.
<b>Pim Mode</b>	Whether the Group Address is SSM, ASM or DM.
<b>Upstream Join State</b>	Whether the local router should join the SPT for the source and group represented by this entry.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (S,G) Join message.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the source.
<b>RPF Route Protocol</b>	The routing mechanism via which the route used to find the RPF Interface towards the source was learned.
<b>RPF Route Address/Prefix Length</b>	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
<b>RPF Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the source.

*output definitions (continued)*

---

<b>RPF Route Metric</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>DR Register State</b>	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
<b>DR Register Stop Timer</b>	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
<b>Upstream Prune State</b>	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
<b>Upstream Prune Limit Timer</b>	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFIfIndex. This is only used by PIM-DM.
<b>Originator State</b>	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
<b>Source Active Timer</b>	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
<b>State Refresh Timer</b>	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
<b>Interface Name</b>	The interface name corresponding to the ifIndex that corresponds to this entry.
<b>Uptime</b>	The time since this entry was created.
<b>Local Membership</b>	Whether the local router has (S,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (S,G) Join state for this interface expires.
<b>Assert State</b>	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
<b>Assert Winner</b>	If the Assert State is Loser, this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
<b>Assert Winner Metric Metric</b>	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

# 31 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for Multicast Routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

*Filename:* AlcatelIND1Iprrm.mib  
*Module:* ALCATEL-IND1-IPRRM-MIB

*Filename:* IETF\_IPMCAST.mib  
*Module:* IPMCAST-MIB

A summary of the available commands is listed here:

---

- ip mroute-boundary**
- ip mroute interface ttl**
- ipv6 mroute-boundary**
- ipv6 mroute interface ttl**
- show ip mroute-boundary**
- show ipv6 mroute-boundary**
- show ip mroute**
- show ipv6 mroute**
- show ip mroute interface**
- show ipv6 mroute interface**
- show ip mroute-nexthop**
- show ipv6 mroute-nexthop**

---

## ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide* for detailed information.

**ip mroute-boundary** *if\_name scoped\_address mask*

**no ip mroute-boundary** *if\_name scoped\_address mask*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the boundary is being assigned.
<i>scoped_address</i>	A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255.
<i>mask</i>	A corresponding Class A, B, or C mask address (e.g. 255.0.0.0).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.
- IPMRM must be configured on the switch

### Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show ip mroute-boundary** Displays scoped multicast address boundaries for the switch’s router interfaces.

**MIB Objects**

IpMRouteBoundaryTable

ipMRouteBoundaryIfIndex

ipMRouteBoundaryAddress

ipMRouteBoundaryAddressMask

ipMRouteBoundaryStatus

---

## ipv6 mroute-boundary

Configures or deletes an IPv6 multicast boundary on the interface for a specified scope zone. Packets with a destination address in the associated address/mask range will not be forwarded over the boundary interface.

**ipv6 mroute-boundary** *if\_name* **scope** *scope\_value*

**no ipv6 mroute-boundary** *if\_name* **scope** *scope\_value*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the boundary is being assigned.
<i>scope_value</i>	The scope value indicates the scope of the IPv6 internetwork for which the multicast traffic is intended. Range of scope value is 3-15.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the configured IPv6 scoped multicast address boundaries for a router interface.
- IPMRM must be configured on the switch.

### Examples

```
-> ipv6 mroute-boundary vlan-2 scope 6
```

### Release History

Release 6.3.4; command was introduced.

### Related commands

**show ipv6 mroute-boundary** Displays information about the IPv6 scoped multicast boundaries that have been defined on the system.

### MIB Objects

```
ipMcastBoundaryTable  
  ipMcastBoundaryIfIndex  
  ipMcastBoundaryAddressType  
  ipMcastBoundaryAddress  
  ipMcastBoundaryAddressPrefixLength
```

---

## ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

**ip mroute interface** *if\_name* **ttl** *threshold*

---

### Syntax Definitions

<i>if_name</i>	The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM).
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

### Defaults

parameter	default
<i>threshold</i>	0

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ip mroute interface vlan-1 ttl 255
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show ip mroute interface](#) Displays IP multicast interface information.

### MIB Objects

```
alaIpMcastInterfaceTable
  alaIpMcastInterfaceIfIndex
  alaIpMcastInterfaceTtl
```

---

## ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

**ipv6 mroute interface** *if\_name* **ttl** *threshold*

---

### Syntax Definitions

<i>if_name</i>	The name of the IPv6 interface.
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

### Defaults

---

parameter	default
<i>threshold</i>	0

---

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show ipv6 mroute interface](#) Displays IPv6 multicast interface information.

### MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

---

## show ip mroute-boundary

Displays scoped multicast address boundaries for the switch's router interfaces.

```
show ip mroute-boundary
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip mroute-boundary
```

```
Interface Name  Interface Address  Boundary Address
-----+-----+-----
vlan-4         214.0.0.7         239.1.1.1/32
```

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
<b>Interface Address</b>	The IP address of this interface where the boundary is assigned.
<b>Boundary Address</b>	The scoped multicast address that, when combined with the boundary mask, identifies the scoped boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

**ip mroute-boundary** Adds or deletes a router's scoped multicast address boundaries.

## MIB Objects

IpMRouteBoundaryTable  
    ipMRouteBoundaryIfIndex  
    ipMRouteBoundaryAddress  
    ipMRouteBoundaryAddressMask  
    ipMRouteBoundaryStatus

---

## show ipv6 mroute-boundary

Displays IPv6 scoped multicast boundaries which are configured on the system.

**show ipv6 mroute-boundary**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

-> show ipv6 mroute-boundary

```
Interface Name                Boundary Address/Prefix Length
-----+-----
vlan-5                        ff06::/16
vlan-8                        ff08::/16
```

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
<b>Boundary Address</b>	The IPv6 group address which when combined with the prefix length identifies the group range for which the scoped boundary exists.

---

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### [ipv6 mroute-boundary](#)

Configures or deletes an IPv6 multicast boundary on the interface for a specified scope zone.

## MIB Objects

```
ipMcastBoundaryTable  
  ipMcastBoundaryIfIndex  
  ipMcastBoundaryAddressType  
  ipMcastBoundaryAddress  
  ipMcastBoundaryAddressPrefixLength
```

---

## show ip mroute

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

`show ip mroute`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

-> `show ip mroute`

```
Total 2 Mroutes
Group Address      Src Address      Upstream Nbr      Route Address      Proto
-----+-----+-----+-----+-----
225.0.0.0          214.0.0.2/32    0.0.0.0           214.0.0.0/24      PIM-SM
225.0.0.1          214.0.0.2/32    0.0.0.0           214.0.0.0/24      PIM-DM
```

### *output definitions*

---

<b>Group Address</b>	The IP multicast group address for this entry.
<b>Src Address</b>	The network address which identifies the source for this entry.
<b>Upstream Nbr</b>	The address of the upstream neighbor from which IP datagrams from these sources to this multicast address are received.
<b>Route Address</b>	The address portion of the route used to find the upstream or parent interface for this multicast forwarding entry.
<b>Proto</b>	The multicast routing protocol through which this multicast forwarding entry was learned (i.e., DVMRP, PIM-SM or PIM-DM).

---

### Release History

Release 6.1; command was introduced.

### Related Commands

N/A

## **MIB Objects**

```
alaIpMcastRouteTable
  alaIpMcastRouteGroup
  alaIpMcastRouteSource
  alaIpMcastRouteInIfIndex
  alaIpMcastRouteUpstreamNeighbor
  alaIpMcastRouteRtAddress
  alaIpMcastRouteRtPrefixLength
  alaIpMcastRouteProtocol
```

---

## show ipv6 mroute

Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.

**show ipv6 mroute**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 mroute
Total 2 Mroutes
Group Address Source Address Interface Upstream Neighbor Route Addr/Prefix Len
Proto
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
+-----+
ff06:7777::1 2600::7      vlan-30  fe80::2d0:95ff:feac:a537 2600::/64
PIM-SM
ff06:7777::2 2600::7      vlan-30  fe80::2d0:95ff:feac:a537 2600::/64
PIM-SM
```

#### *output definitions*

---

<b>Group Address</b>	The IPv6 multicast group address for this entry.
<b>Source Address</b>	The IPv6 multicast address, which identifies the source for this entry.
<b>Interface</b>	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
<b>Upstream Neighbor</b>	The IPv6 address of the upstream neighbor from which the datagrams from these sources to this multicast address are received.
<b>Route Addr/Prefix len</b>	The IPv6 address portion of the route used to find the upstream or parent interface for this IPv6 multicast forwarding entry.
<b>Proto</b>	The IPv6 multicast routing protocol through which this IPv6 multicast forwarding entry was learned.

---

### Release History

Release 6.3.1; command was introduced.

## **Related Commands**

N/A

## **MIB Objects**

```
alaIpMcastRouteTable
  alaIpMcastRouteGroup
  alaIpMcastRouteSource
  alaIpMcastRouteInIfIndex
  alaIpMcastRouteUpstreamNeighbor
  alaIpMcastRouteRtAddress
  alaIpMcastRouteRtPrefixLength
  alaIpMcastRouteProtocol
```

---

## show ip mroute interface

Displays IP multicast interface information.

**show ip mroute interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

### Examples

-> show ip mroute interface

Interface Name	IP Address	TTL	Multicast Protocol
vlan-4	214.0.0.7	0	PIM
vlan-26	172.21.63.7	0	PIM
vlan-11	212.61.11.7	0	PIM

### output definitions

---

<b>Interface Name</b>	The name configured for the interface.
<b>IP Address</b>	The IP address of this interface entry.
<b>TTL</b>	The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface.
<b>Multicast Protocol</b>	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

N/A

## **MIB Objects**

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl  
  alaIpMcastInterfaceProtocol
```

---

## show ipv6 mroute interface

Displays IPv6 multicast interface information.

**show ipv6 mroute interface** *{interface\_name}*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

Not specifying an interface name displays all known IPv6 multicast interfaces information.

### Examples

-> show ipv6 mroute interface

Interface Name	IP Address	TTL	Multicast Protocol
vlan-4	2000::1	0	PIM
vlan-26	2000::2	0	PIM
vlan-11	2000::3	0	PIM

#### *output definitions*

---

<b>Interface Name</b>	The name configured for the IPv6 interface.
<b>IP Address</b>	The IPv6 address of this interface entry.
<b>TTL</b>	The datagram TTL threshold for the interface. Any IPv6 multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface.
<b>Multicast Protocol</b>	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

---

### Release History

Release 6.3.1; command was introduced.

### Related Commands

N/A

## **MIB Objects**

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl  
  alaIpMcastInterfaceProtocol
```

---

## show ip mroute-nexthop

Displays next-hop information on outgoing interfaces for routing IP multicast datagrams.

**show ip mroute-nexthop**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ip mroute-nexthop
```

Total 10 Nexthops

Group Address	Src Address	Interface Name	Next Hop Address	Protocol
225.0.0.0	214.0.0.2/32	vlan-26	225.0.0.0	PIM-SM
225.0.0.1	214.0.0.2/32	vlan-26	225.0.0.1	PIM-SM
225.0.0.2	214.0.0.2/32	vlan-26	225.0.0.2	PIM-SM
225.0.0.3	214.0.0.2/32	vlan-26	225.0.0.3	PIM-SM
225.0.0.4	214.0.0.2/32	vlan-26	225.0.0.4	PIM-SM
225.0.0.5	214.0.0.2/32	vlan-26	225.0.0.5	PIM-SM
225.0.0.6	214.0.0.2/32	vlan-26	225.0.0.6	PIM-SM
225.0.0.7	214.0.0.2/32	vlan-26	225.0.0.7	PIM-SM
225.0.0.8	214.0.0.2/32	vlan-26	225.0.0.8	PIM-SM
225.0.0.9	214.0.0.2/32	vlan-26	225.0.0.9	PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IP multicast group address for this entry.
<b>Src Address</b>	The network address, which identifies the source for this entry.
<b>Interface Name</b>	Generally, this is the name configured for the interface.
<b>Next Hop Address</b>	The address of the next-hop that is specific to this entry.
<b>Protocol</b>	The routing protocol by which this next-hop was learned (i.e., DVMRP or PIM-SM).

---

## Release History

Release 6.1; command was introduced.

## Related Commands

**show ipv6 mroute-boundary** Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

## MIB Objects

```
alaIpMcastRouteNextHopTable
  alaIpMcastRouteNextHopGroup
  alaIpMcastRouteNextHopSource
  alaIpMcastRouteNextHopIfIndex
  alaIpMcastRouteNextHopAddress
  alaIpMcastRouteNextHopProtocol
```

---

## show ipv6 mroute-nexthop

Displays IPv6 next-hop information on outgoing interfaces for routing IP multicast datagrams.

**show ipv6 mroute-nexthop**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 mroute-nexthop
```

```
Total 2 Nexthops
```

Group Address	Source Address	Interface	Next Hop Address	Protocol
ff06:7777::1	2600::7	vlan-40	ff06:7777::1	PIM-SM
ff06:7777::2	2600::7	vlan-40	ff06:7777::2	PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IPv6 multicast group address for this entry.
<b>Src Address</b>	The IPv6 multicast address, which identifies the source for this entry.
<b>Interface Name</b>	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
<b>Next Hop Address</b>	The IPv6 address of the next-hop that is specific to this entry.
<b>Protocol</b>	The IPv6 multicast routing protocol by which this IPv6 multicast forwarding entry was learned.

---

# 32 QoS Commands

Alcatel-Lucent's QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to [Chapter 33, "QoS Policy Commands,"](#) for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

*Filename:* alcatelIND1Qos.mib  
*Module* ALCATEL-IND1-QoS-MIB

---

**Important Note.** Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

---

---

The QoS commands are listed here:

---

<b>Global commands</b>	<code>qos</code> <code>qos trust ports</code> <code>qos default servicing mode</code> <code>qos forward log</code> <code>qos log console</code> <code>qos log lines</code> <code>qos log level</code> <code>qos default bridged disposition</code> <code>qos default routed disposition</code> <code>qos default multicast disposition</code> <code>qos user-port</code> <code>qos dei</code> <code>qos stats interval</code> <code>qos nms priority</code> <code>qos phones</code> <code>qos quarantine mac-group</code> <code>qos quarantine path</code> <code>qos quarantine page</code> <code>debug qos</code> <code>debug qos internal</code> <code>qos clear log</code> <code>qos apply</code> <code>qos revert</code> <code>qos flush</code> <code>qos reset</code> <code>qos stats reset</code> <code>show qos queue</code> <code>show qos slice</code> <code>show qos log</code> <code>show qos config</code> <code>show qos statistics</code>
<b>Port and Slice commands</b>	<code>qos port</code> <code>qos port reset</code> <code>qos port trusted</code> <code>qos port servicing mode</code> <code>qos port q minbw maxbw</code> <code>qos port maximum egress-bandwidth</code> <code>qos port maximum ingress-bandwidth</code> <code>qos port default 802.1p</code> <code>qos port default dscp</code> <code>qos port default classification</code> <code>qos port dei</code> <code>qos port monitor</code> <code>show qos port</code> <code>show qos port monitor</code>

---

## qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of these options, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos {enable | disable}
    [trust ports]
    [default servicing mode]
    [forward log]
    [log console]
    [log lines lines]
    [log level level]
    [clear log]
    [default bridged disposition {accept | deny | drop}]
    [default routed disposition {accept | deny | drop}]
    [default multicast disposition {accept | deny | drop}]
    [user-port {filter | shutdown} {spoof | bgp | bpdud | rip | ospf}]
    [stats interval seconds]
    [nms priority]
    [phones [priority priority_value | trusted]]
    [quarantine mac-group mac_group]
    [quarantine path url]
    [qos quarantine page]
    [dei {ingress | egress}]
```

---

### Syntax Definitions

<b>enable</b>	Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The <b>enable</b> setting may be used alone or in conjunction with optional command keywords.
<b>disable</b>	Disables QoS. Flows coming into the switch are not matched to policies. The <b>disable</b> setting cannot be used with any other command keyword.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

## Examples

```
-> qos enable default disposition deny
-> qos disable
-> qos enable
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy rule</a>	Configures a policy rule on the switch.
<a href="#">show policy rule</a>	Displays information for policy rules configured on the switch.

```

## qos trust ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See [page 32-44](#) for more information about this command.

**qos trust ports**

**qos no trust ports**

---

### Syntax Definitions

N/A

### Defaults

By default, 802.1Q-tagged ports and mobile ports are trusted; any other port is untrusted by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **qos port trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Any port configured for 802.1Q tagging is always trusted regardless of the global setting.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

### Examples

```
-> qos trust ports
-> qos no trust ports
```

### Release History

Release 6.1; command was introduced.

**Related Commands**

<b>qos port</b>	Configures a physical port for QoS.
<b>qos port trusted</b>	Configures whether or not a particular port is trusted or untrusted.
<b>show qos port</b>	Displays information about QoS ports.

**MIB Objects**

alaQoSConfigTable  
  alaQoSConfigTrustedPorts

---

## qos default servicing mode

Configures the default queuing scheme for destination (egress) ports.

```
qos default servicing mode {strict-priority | wrr [w0 w1 w2 w3 w4 w5 w6 w7] | priority-wrr [w0 w1 w2 w3 w4 w5 w6 w7] | drr [w0 w1 w2 w3 w4 w5 w6 w7]}
```

---

### Syntax Definitions

<b>strict-priority</b>	Selects the strict priority queuing scheme as the default servicing mode. All eight available queues on a port are serviced strictly by priority.
<b>wrr</b>	Selects the weighted round robin (WRR) queuing scheme as the default servicing mode. Traffic is serviced based on the weight of each queue.
<b>priority-wrr</b>	Parameter not supported.
<b>drr</b>	Selects the deficit round robin (DRR) queuing scheme as the default servicing mode. Traffic is serviced based on the weight of each queue.
<i>w0 w1 w2 w3 w4 w5 w6 w7</i>	The value of the desired weight for each of the queues when WRR or DRR is the active queuing scheme. The range is 0 to 15.

### Defaults

parameter	default
<b>strict-priority   wrr   drr</b>	<b>strict-priority</b>
<i>w0 w1 w2 w3 w4 w5 w6 w7</i>	1 (best effort)

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Each queue can have a different weight value and configuring these values in ascending or descending order is not required. When a queue is given a weight of 0, it is configured as a Strict-Priority queue.
- Use the **wrr** parameter to configure a Priority-WRR queuing scheme, which consists of a combination of Strict-Priority queues (zero weight) and WRR queues (non-zero weight).
- Using the **qos default servicing mode** command does not override configuration values that were set on a per port basis with the **qos port servicing mode** command.
- The servicing mode only applies to destination (egress) ports because this is where traffic shaping occurs. Even though the **qos port servicing mode** and **qos default servicing mode** commands are allowed on source (ingress) ports, they do not affect traffic on these ports.

### Examples

```
-> qos default servicing mode strict-priority
-> qos default servicing mode wrr 1 2 3 4 5 6 7 8
-> qos default servicing mode drr 10 0 12 14 0 0 8 1
```

## Release History

Release 6.1; command was introduced.

Release 6.1.1; **wrr** and **drp** parameters added.

Release 6.3.1; **priority-wrr** parameter deprecated.

## Related Commands

---

## qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

**qos forward log**

**qos no forward log**

---

### Syntax Definitions

N/A

### Defaults

By default, logged events are not sent to the policy server software in the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

### Examples

```
-> qos forward log
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigForwardLog
```

---

---

## qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

**qos log console**

**qos no log console**

---

### Syntax Definitions

N/A

### Defaults

QoS log messages are not sent to the switch logging utility by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

### Examples

```
-> qos log console
-> qos no log console
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[qos log lines](#)

Configures the number of lines in the QoS log.

[swlog output](#)

Enables or disables switch logging output to the console, file, or data socket (remote session).

[show qos log](#)

Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable
  alaQoSConfigLogConsole
```

---

## qos log lines

Configures the number of lines in the QoS log.

**qos log lines** *lines*

---

### Syntax Definitions

*lines* The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–512.

### Defaults

---

parameter	default
<i>lines</i>	256

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **boot.cfg** file. The log length will be changed at the next reboot.

### Examples

```
-> qos log lines 5  
-> qos log lines 0
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show qos log](#) Displays the log of QoS events.

### MIB Objects

alaQoSConfigTable  
  alaQoSConfigLogLines

---

## qos log level

Configures the level of log detail.

**qos log level** *level*

**qos no log level**

---

### Syntax Definitions

*level* The level of log detail, in the range from 2 (least detail) to 9 (most detail).

### Defaults

parameter	default
<i>level</i>	6

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **qos debug** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **qos debug** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- To log fatal errors only, set the log level to 0.
- Note that a high log level value will impact the performance of the switch.

### Examples

```
-> qos log level 4  
-> qos log level 0
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[qos log lines](#)

Configures the number of lines in the QoS log.

---

## qos default bridged disposition

Configures the default disposition for bridged traffic (Layer 2) that comes into the switch and does not match any policies.

**qos default bridged disposition {accept | deny | drop}**

---

### Syntax Definitions

<b>accept</b>	Specifies that the switch should accept the flow.
<b>drop</b>	Specifies that the switch should silently drop the flow.
<b>deny</b>	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as <b>drop</b> ; that is, the flow is silently dropped.

### Defaults

By default, the disposition for flows that do match any policies is **accept**.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The disposition for particular flows may be configured through the **policy action disposition** command. The disposition for a particular flow will override the global setting.
- Typically, when configuring IP filtering rules, the global default disposition should be set to **deny**. Filtering rules may then be configured to allow particular types of traffic through the switch.
- If you set the bridged disposition to deny or drop, and you configure rules to allow bridged traffic, each type of allowed traffic must have two rules, one for source and one for destination.

### Examples

```
-> qos default bridged disposition deny
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**policy action disposition**      Configures a disposition for a policy action.

```

---

---

## qos default routed disposition

Configures the default disposition for routed traffic (Layer 3) that comes into the switch and does not match any policies.

**qos default routed disposition {accept | deny | drop}**

---

### Syntax Definitions

<b>accept</b>	Specifies that the switch should accept the flow.
<b>drop</b>	Specifies that the switch should silently drop the flow.
<b>deny</b>	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as <b>drop</b> ; that is, the flow is silently dropped.

### Defaults

By default, the disposition for flows that do match any policies is **accept**.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The disposition for particular flows may be configured through the **policy action disposition** command. The disposition for a particular flow will override the global setting.
- Typically, when configuring IP filtering rules, the global default disposition should be set to **deny**. Filtering rules may then be configured to allow particular types of traffic through the switch.

### Examples

```
-> qos default routed disposition deny
```

### Release History

Release 6.1; command was introduced.

### Related Commands

```

---

## qos default multicast disposition

Configures the default disposition for multicast flows coming into the switch that do not match any policies.

**qos default multicast disposition {accept | deny | drop}**

---

### Syntax Definitions

<b>accept</b>	Specifies that the switch should accept the flow.
<b>drop</b>	Specifies that the switch should silently drop the flow.
<b>deny</b>	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as <b>drop</b> ; that is, the flow is silently dropped.

### Defaults

By default, multicast flows that do not match policies are accepted on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **policy action multicast** command to specify the disposition for a particular action associated with a multicast condition. The disposition for a particular action will override the global setting.
- This command applies only to IGMP messages. It does not apply to other types of multicast traffic.

### Examples

```
-> qos default multicast disposition deny
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[policy action disposition](#) Configures a disposition for a policy action.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigDefaultMulticastDisposition  
  alaQoSConfigAppliedDefaultMulticastDisposition
```

---

## qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

**qos user-port** {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcp-server | dns-reply}

**qos no user-port** {filter | shutdown}

---

### Syntax Definitions

<b>filter</b>	Filters the specified type of traffic when it is received on UserPort ports.
<b>shutdown</b>	Administratively disables UserPort ports that receive the specified type of traffic.
<b>spoof</b>	Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets.
<b>bgp</b>	Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured.
<b>bpdu</b>	Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets.
<b>rip</b>	Filters RIP protocol packets.
<b>ospf</b>	Filters OSPF protocol packets.
<b>vrrp</b>	Filters VRRP protocol packets.
<b>dvmrp</b>	Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options.
<b>pim</b>	Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options.
<b>isis</b>	Filters IS-IS protocol packets.
<b>dhcp-server</b>	Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67.
<b>dns-reply</b>	Filters all packets (both TCP and UDP) that originate from the known DNS port 53.

## Defaults

parameter	default
<b>filter</b>	spooof
<b>shutdown</b>	none

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spooof bgp ospf**).
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spooof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.

## Examples

```
-> qos user-port filter spooof bpdu
-> qos user-port shutdown spooof bgp ospf
-> qos no user-port shutdown
```

## Release History

Release 6.1.1; command was introduced.

Release 6.3.1; **dvmrp**, **pim**, **isis**, and **dns-reply** parameters added.

alaQoSConfigAppliedUserportFilter

alaQoSConfigUserportShutdown

alaQoSConfigAppliedUserportShutdown

---

## qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

**qos dei {ingress | egress}**

**qos no dei {ingress | egress}**

---

### Syntax Definitions

<b>ingress</b>	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic.
<b>egress</b>	Marks the DEI/CFI bit for egress packets if TCM marked the packets yellow.

### Defaults

By default, no DEI/CFI bit marking or mapping is done.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

### Examples

```
-> qos dei ingress
-> qos dei egress
-> qos no dei ingress
-> qos no dei egress
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<b>qos port</b>	Configures a physical port for QoS.
<b>qos port dei</b>	Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port.
<b>policy action cir</b>	Configures a Tri-Color Marking policy action.
<b>show qos config</b>	Displays global information about the QoS configuration.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigDEIMapping  
  alaQoSConfigDEIMarking
```

---

## qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

**qos stats interval** *seconds*

---

### Syntax Definitions

*seconds*

The number of seconds before the switch polls network interfaces for statistics. The range is 10–3600.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

### Examples

```
-> qos stats interval 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show qos statistics](#)

Displays statistics about the QoS configuration.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigStatsInterval
```

---

---

## qos nms priority

Enables or disables the automatic prioritization of NMS traffic—SSH (TCP Port 22), Telnet (TCP Port 23), WebView (HTTP Port 80) and SNMP (UDP port 161)—that is destined for the switch. Prioritization maximizes access for NMS traffic and helps to reduce the potential for DoS attacks.

**qos nms priority**

**qos no nms priority**

---

### Syntax Definitions

N/A

### Defaults

By default, NMS traffic prioritization is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of NMS traffic.
- The NMS traffic from the first eight *active* IP interfaces is prioritized; any such traffic from additional interfaces is not prioritized.
- The precedence of an active IP interface is determined by the value of the SNMP interface index (ifindex), which was assigned to the interface when it was created. The lower the ifindex value the higher the precedence; the higher the ifindex value the lower the precedence. Note that the precedence is only determined for active IP interfaces.
- To change the precedence of an IP interface, use the **ip interface ifindex** command and specify a higher (lower precedence) or lower (higher precedence) ifindex value.
- When automatic NMS prioritization is enabled, QoS policies that specify priority are not applied to the NMS traffic. Other QoS policies, however, are applied to this type of traffic as usual. If a policy specifies rate limiting, then the policy with the lowest rate limiting value is applied.

### Examples

```
-> qos nms priority
-> qos no nms priority
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

**show qos config**

Displays the QoS configuration for the switch.

## MIB Objects

alaQoSConfigTable

alaQoSConfigAutoNms

---

## qos phones

Enables or disables the automatic prioritization of IP phone traffic.

**qos phones** [*priority priority\_value* | **trusted**]

**qos no phones**

---

### Syntax Definitions

*priority\_value*                      The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

**trusted**                                Trusts IP phone traffic; priority value of the IP phone packet is used.

### Defaults

parameter	default
<i>priority_value</i>   <b>trusted</b>	trusted

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC:  
 00-80-9F-54-xx-xx to 00-80-9F-64-xx-xx  
 00-80-9F-66-xx-xx to 00-80-9F-6F-xx-xx.
- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.

### Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

### Release History

Release 6.3.1; command was introduced.

## **Related Commands**

**show qos config**

Displays the QoS configuration for the switch.

## **MIB Objects**

alaQoSConfigTable

alaQoSConfigAutoPhones

---

## qos quarantine mac-group

Configures the name of the Quarantine MAC address group. The OmniVista Quarantine Manager application identifies source MAC addresses to quarantine and adds these addresses to the Quarantine MAC group.

**qos quarantine mac-group** *mac\_group*

**qos no quarantine mac-group**

---

### Syntax Definitions

*mac\_group*                      The name of the Quarantine MAC group (up to 31 alphanumeric characters).

### Defaults

parameter	default
<i>mac-group</i>	Quarantined

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Use the **no** form of the command to reset the default MAC group name back to “Quarantined”.
- The *mac-group* name specified with this command must match the group name specified with the OmniVista Quarantine Manager application.
- Each switch can have a different Quarantine MAC group name as long as each switch matches the OmniVista Quarantine Manager MAC group name for that switch. Note that there is only one such MAC group per switch.
- Do not use the Quarantine MAC group name in regular QoS policies.
- This group is also used by the switch Quarantine Manager and Remediation (QMR) application to restrict or restore network access to quarantined MACs.
- Note that QMR is not available if VLAN Stacking services or QoS VLAN Stacking inner VLAN and 802.1p policies are configured on the switch.
- QMR is considered active when there are MAC addresses in the Quarantine MAC address group. Use the **show policy mac group** command to display the contents of this group. In addition, the **show mac-address-table** command output display identifies quarantined MAC addresses.

### Examples

```
-> qos quarantine mac-group mac_group1
-> no quarantine mac-group
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

<a href="#">qos quarantine path</a>	Specifies the URL for a remediation server.
<a href="#">qos quarantine page</a>	Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured.
<a href="#">show policy mac group</a>	Displays information about policy MAC groups.
<a href="#">show qos config</a>	Displays QoS configuration information.

## MIB Objects

alaQoSConfigTable  
  alaQoSConfigQuarantineMacGroupName

---

## qos quarantine path

Specifies the URL for a remediation server. This information is used by the Quarantine Manager and Remediation (QMR) application.

**qos quarantine path** *url*

**qos no quarantine path**

---

### Syntax Definitions

*url* The URL for the QMR remediation server.

### Defaults

By default, no URL is configured.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Use the **no** form of the command to remove the remediation server URL from the configuration.
- Add the corresponding IP address for the remediation server to the “alaExceptionSubnet” network group. Specifying both the URL and IP address is required to redirect quarantined MACs to the remediation server.

### Examples

```
-> qos quarantine path www.remediate.com  
-> no quarantine path
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<a href="#">qos quarantine mac-group</a>	Configures the name of the Quarantine MAC address group.
<a href="#">qos quarantine page</a>	Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured.
<a href="#">policy network group</a>	Configures a network group name and its associated IP addresses.
<a href="#">show qos config</a>	Displays QoS configuration information.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigQMPath
```

---

## qos quarantine page

Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured. This page is used to notify the client that QMR has quarantined the client.

**qos quarantine page**

**qos no quarantine page**

---

### Syntax Definitions

N/A

### Defaults

By default, no Quarantined page is sent to the client.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Use the **no** form of the command to disable the Quarantined page notification.
- A Quarantined page is only sent if a remediation server path was not configured. Note that even if the remediation server is not active, a page is not sent as long as the server is configured for QMR.

### Examples

```
-> qos quarantine page  
-> no quarantine page
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<a href="#">qos quarantine mac-group</a>	Configures the name of the Quarantine MAC address group.
<a href="#">qos quarantine path</a>	Specifies the URL for a remediation server.
<a href="#">show qos config</a>	Displays QoS configuration information.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigQMPage
```

---

## debug qos

Configures the type of QoS events that will be displayed in the QoS log.

```
debug qos [info] [config] [rule] [main] [route] [hre] [port] [msg] [sl] [ioctl] [mem] [cam] [mapper]
[flows] [queue] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress] [rsvp] [balance] [nimg]
```

```
debug no qos
```

```
debug no qos [info] [config] [rule] [main] [route] [hre] [port] [msg] [sl] [ioctl] [mem] [cam] [mapper]
[flows] [queue] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress] [rsvp] [balance] [nimg]
```

---

### Syntax Definitions

<b>flows</b>	Logs events for flows on the switch.
<b>queue</b>	Logs events for queues created and destroyed on the switch.
<b>rule</b>	Logs events for rules configured on the switch.
<b>l2</b>	Logs Layer 2 QoS events on the switch.
<b>l3</b>	Logs Layer 3 QoS events on the switch.
<b>nat</b>	Logs events for Network Address Translation policies. <i>Not supported for the OmniSwitch 6624/6648.</i>
<b>port</b>	Logs events related to QoS ports.
<b>msg</b>	Logs QoS messages.
<b>classifier</b>	Logs information whenever the switch classifies a flow; more details are provided if the log level is higher.
<b>info</b>	Logs basic information about the switch
<b>config</b>	Logs information about the global configuration.
<b>main</b>	Logs information about basic program interfaces.
<b>route</b>	Logs information about routing.
<b>hre</b>	Logs information about hardware route programming.
<b>sl</b>	Logs information about source learning.
<b>mem</b>	Logs information about memory.
<b>cam</b>	Logs information about CAM operations.
<b>mapper</b>	Logs information about mapping queues.
<b>slot</b>	Logs events related to slots.
<b>sem</b>	Logs information about semaphore, process locking.
<b>pm</b>	Logs events related to the Policy Manager.
<b>ingress</b>	Logs information about packets arriving on the switch.

<b>egress</b>	Logs information about packets leaving the switch.
<b>rsvp</b>	Logs information about RSVP flows. <i>Currently not supported.</i>
<b>balance</b>	Logs information about flows that are part of a load balancing cluster. <i>Not supported for the OmniSwitch 6624/6648.</i>
<b>nimsg</b>	Logs information about QoS interfaces.

## Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.
- Use this command to troubleshoot QoS events on the switch.

## Examples

```
-> debug qos flows queue  
-> qos debug no flows no queue  
-> debug no qos
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">qos forward log</a>	Enables the switch to send events to the PolicyView application in real time.
<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

## MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigDebug
```

---

## debug qos internal

Displays debugging information for QoS internal to the switch.

**debug qos internal** [*slice slot/slice*] [**flow**] [**queue**] [**port**] [**l2tree**] [**l3tree**] [**vector**] [**pending**] [**verbose**] [**mapper**] [**pool**] [**log**] [**pingonly** | **nopingonly**]

---

### Syntax Definitions

<i>slot/slice</i>	The slot number and slice for which you want to view debugging information. A <i>slice</i> is a logical section of hardware that corresponds to particular ports on a network interface module.
<b>flow</b>	Displays information about QoS flows.
<b>queue</b>	Displays information about QoS queues.
<b>port</b>	Displays information about QoS ports.
<b>l2tree</b>	Displays information about Layer 2 flows.
<b>l3tree</b>	Displays information about Layer 3 flows.
<b>vector</b>	Displays information about vectors.
<b>pending</b>	Displays information about pending QoS objects.
<b>verbose</b>	Sets the output to verbose mode for more detailed information.
<b>mapper</b>	Displays information about QoS mapping flows to queues.
<b>pool</b>	Displays information about the buffer pool.
<b>log</b>	Displays information about QoS information that is logged.
<b>pingonly</b>	Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies.
<b>nopingonly</b>	Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets.

### Defaults

Debugging is disabled by default.

parameter	default
<b>pingonly</b>   <b>nopingonly</b>	<b>nopingonly</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

Use the **debug qos** command to set the level of log detail in the QoS log.

## Examples

```
-> debug qos internal "verbose log"
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">debug qos</a>	Configures the type of QoS events that will be displayed in the QoS log.
<a href="#">policy condition ip protocol</a>	Configures an IP protocol for a policy condition.

## MIB Objects

N/A

---

## qos clear log

Clears messages in the current QoS log.

```
qos clear log
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

### Examples

```
-> qos clear log
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">debug qos</a>	Configures the type of QoS events that will be displayed in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigClearLog
```

---

## qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

**qos apply**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

### Examples

```
-> qos apply
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos revert</a>	Removes any policies configured through policy rule but not applied to the current configuration through the <b>qos apply</b> command.
<a href="#">qos reset</a>	Resets the QoS configuration to its default values.
<a href="#">qos flush</a>	Deletes all pending policy information.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigApply
```

---

## qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

**qos revert**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

### Examples

```
-> qos revert
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">policy rule</a>	Configures a policy rule and saves it to the current configuration but does not make it active on the switch.
<a href="#">qos apply</a>	Applies all QoS settings configured on the switch to the current configuration.
<a href="#">qos reset</a>	Resets the QoS configuration to its defaults.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigRevert
```

---

## qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

**qos flush**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration*.

---

**Note.** Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

---

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

---

#### base commands

---

<b>policy rule</b>	<b>policy mac group</b>
<b>policy network group</b>	<b>policy port group</b>
<b>policy service</b>	<b>policy condition</b>
<b>policy service group</b>	<b>policy action</b>

---

### Examples

```
-> qos flush
```

### Release History

Release 6.1; command was introduced.

**Related Commands****qos revert**

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

**qos apply**

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

**policy server flush**

Removes all cached LDAP policy data from the switch.

**MIB Objects**

alaQoSConfigTable  
  alaQoSConfigFlush

---

## qos reset

Resets the QoS configuration to its defaults.

```
qos reset
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

### Examples

```
-> qos reset
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies all QoS settings configured on the switch to the current configuration.
<a href="#">qos revert</a>	Deletes any QoS configuration that has not been applied to the configuration through the <b>qos apply</b> command.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigReset
```

---

## qos stats reset

Resets QoS statistic counters to zero.

```
qos stats reset [egress]
```

---

### Syntax Definitions

N/A

### Defaults

All QoS statistic counters are reset to zero.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.
- Use the **egress** parameter to reset only the egress CoS queue statistics to zero. Statistics may be displayed with the **show qos queue** command.

### Examples

```
-> qos stats reset  
-> qos stats reset egress
```

### Release History

Release 6.1; command was introduced.

Release 6.4.3; **egress** parameter added.

### Related Commands

<a href="#">show qos statistics</a>	Displays statistics about the QoS configuration.
<a href="#">show qos queue</a>	Displays QoS egress CoS queue statistics.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigStatsReset
```

---

## qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

**qos port** *slot/port*

[**trusted**]

[**servicing mode**]

[**qn** {**minbw** | **maxbw**} *kbps*]

[**maximum egress-bandwidth**]

[**maximum ingress-bandwidth**]

[**default 802.1p** *value*]

[**default dscp** *value*]

[**default classification** {**802.1p** | **tos** | **dscp**}]

[**dei** {**ingress** | **egress**}]

---

### Syntax Definitions

*slot/port*

The physical slot and port number. For example: 4/1.

### Defaults

- Mobile ports and ports enabled for 802.1Q are always trusted; by default, any other ports are not trusted.
- By default, QoS ports do not preempt queues of lower priority.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

### Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures whether the default mode for QoS ports is trusted or untrusted.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">qos port</a>	Configures a physical port for QoS.
<a href="#">qos trust ports</a>	Configures the global trust mode for QoS ports.
<a href="#">show qos port</a>	Displays information about QoS ports.

## MIB Objects

alaQoSPortTable  
    alaQoSPortTrusted

---

## qos port servicing mode

Configures a queuing scheme for an individual destination (egress) port.

```
qos port slot/port servicing mode {strict-priority | wrr [w0 w1 w2 w3 w4 w5 w6 w7] | priority-wrr [w0 w1 w2 w3 w4 w5 w6 w7] | drr [w0 w1 w2 w3 w4 w5 w6 w7] | default}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number to which this servicing mode applies.
<b>strict-priority</b>	Selects the strict priority queuing scheme as the servicing mode for the specified port. All eight available queues on a port are serviced strictly by priority.
<b>wrr</b>	Selects the weighted round robin (WRR) queuing scheme as the servicing mode for the specified port. Traffic is serviced based on the weight of each queue.
<b>priority-wrr</b>	Parameter not supported.
<b>drr</b>	Selects the deficit round robin (DRR) queuing scheme as the servicing mode for the specified port. Traffic is serviced based on the weight of each queue.
<i>w0 w1 w2 w3 w4 w5 w6 w7</i>	The value of the desired weight for each of the queues when WRR or DRR is the active queuing scheme. The range is 0 to 15.
<b>default</b>	Selects the switch default servicing mode for the port. The default mode is configured using the <a href="#">qos default servicing mode</a> command.

### Defaults

parameter	default
<b>strict-priority   wrr   drr</b>	<b>strict-priority</b>
<i>w0 w1 w2 w3 w4 w5 w6 w7</i>	1 (best effort)

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Each queue can have a different weight value and configuring these values in ascending or descending order is *not* required. When a queue is given a weight of 0, it is configured as a Strict-Priority queue.
- Use the **wrr** parameter to configure a Priority-WRR queuing scheme, which consists of a combination of Strict-Priority queues (zero weight) and WRR queues (non-zero weight).
- The **qos port servicing mode** command overrides the servicing mode configured with the **qos default servicing mode** command.

- The servicing mode only applies to destination (egress) ports because this is where traffic shaping occurs. Even though the **qos port servicing mode** and **qos default servicing mode** commands are allowed on source (ingress) ports, they do not affect traffic on these ports.
- Once the **qos port servicing mode** command is used on a port, this same command is required to make any additional mode changes for that port. If the port is changed back to the default servicing mode, however, this restriction is removed and the **qos default servicing mode** command is also allowed on the port.

## Examples

```
-> qos port 3/1 servicing mode strict-priority
-> qos port 3/3 servicing mode wrr 1 2 3 4 5 6 7 8
-> qos port 3/4 servicing mode drr 10 11 12 13 14 15 16 17
-> qos port 3/2 servicing mode default
```

## Release History

Release 6.1; command was introduced.

Release 6.1.1; **wrr** and **drr** parameters added.

Release 6.3.1; priority-wrr parameter deprecated.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">qos default servicing mode</a>	Configures the default servicing mode for all switch ports.
<a href="#">show qos queue</a>	Displays information for all QoS queues.

  alaQoSPortQ6PriorityWeight
  alaQoSPortQ7PriorityWeight
```

---

## qos port q minbw maxbw

Configures a minimum and maximum bandwidth for each of the 8 COS egress queues on the specified port.

```
qos port slot/port qn {minbw | maxbw} kbps
```

```
qos port slot/port no qn {minbw | maxbw} kbps
```

---

### Syntax Definitions

<i>slot/port</i>	The slot/port on which the COS min/max bandwidth is configured.
<i>n</i>	The number of the queue for the specified port. Range is 1 to 8.
<i>kbps</i>	The minimum or maximum bandwidth value (in Kbits per second). The value may be entered as an integer (for example, <b>10000</b> ) or with abbreviated units (for example, <b>10k</b> , <b>10m</b> , <b>10g</b> , or <b>10t</b> ). If the value is entered in bits per second, the switch rounds the value up to the nearest thousand.

### Defaults

By default the minimum bandwidth value for each queue is set to zero (best effort), and the maximum bandwidth value for each queue is set to zero (port speed).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to return the minimum or maximum bandwidth value for the specified queue to the default value (zero).
- Note that configuring the minimum and maximum bandwidth for the same queue is allowed on the same command line (see the “Examples” section).
- Configuring the bandwidth values for different queues requires a separate command for each queue.

### Examples

```
-> qos port 1/3 q0 minbw 10 q0 maxbw 100
-> qos port 1/3 q1 minbw 100
-> qos port 1/3 q1 maxbw 10g
-> qos port 2/1 q7 minbw 5k q7 maxbw 50k
-> qos port 1/3 no q1 minbw
-> qos port 1/3 no q1 maxbw
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos default servicing mode</b>	Configures the default servicing mode for all switch ports.
<b>show qos queue</b>	Displays information for all QoS queues.

---

## qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

**qos port** *slot/port* **maximum egress-bandwidth** *bps*

**qos port** *slot/port* **no maximum egress-bandwidth**

---

### Syntax Definitions

<i>slot/port</i>	The slot number and port number of the physical port.
<i>bps</i>	The maximum amount of bandwidth that may be used for all traffic egressing on the QoS port.

### Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum egress-bandwidth 1000  
-> qos port 3/1 no maximum egress-bandwidth
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; **bandwidth** parameter changed to **egress-bandwidth**.

### Related Commands

<b>qos port maximum ingress-bandwidth</b>	Configures the rate at which traffic is received on a QoS port.
<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures a physical port for QoS.
<b>show qos port</b>	Displays information about QoS ports.

  alaQoSPortMaximumBandwidthStatus
```

---

## qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

**qos port** *slot/port* **maximum ingress-bandwidth** *bps*

**qos port** *slot/port* **no maximum ingress-bandwidth**

---

### Syntax Definitions

<i>slot/port</i>	The slot number and port number of the physical port.
<i>bps</i>	The maximum amount of bandwidth that may be used for all traffic ingressing on the QoS port.

### Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum ingress-bandwidth 1000  
-> qos port 3/1 no maximum ingress-bandwidth
```

### Release History

Release 6.3.1; command introduced.

### Related Commands

<b>qos port maximum egress-bandwidth</b>	Configures the rate at which traffic is sent on a QoS port.
<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures a physical port for QoS.
<b>show qos port</b>	Displays information about QoS ports.

## **MIB Objects**

alaQoSPortTable

    alaQoSPortSlot

    alaQoSPortPort

    alaQoSPortMaximumIngBandwidth

    alaQoSPortMaximumIngBandwidthStatus

---

## qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

**qos port** *slot/port* **default 802.1p** *value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number and port number of the physical port.
<i>value</i>	The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

### Examples

```
-> qos port 3/1 default 802.1p 5
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures a physical port for QoS.
<b>show qos port</b>	Displays information about QoS ports.

## **MIB Objects**

```
alaQoSPortTable  
  alaQoSPortDefault8021p  
  alaQoSAppliedPortDefault8021p
```

---

## qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

**qos port** *slot/port* **default dscp** *value*

---

### Syntax Definitions

*slot/port*                      The slot number and port number of the physical port.

*value*                              The ToS/DSCP value. The range is 0–63.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

### Examples

```
-> qos port 3/1 default dscp 63
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<code>qos apply</code>	Applies configured QoS and policy settings to the current configuration.
<code>qos port</code>	Configures a physical port for QoS.
<code>show qos port</code>	Displays information about QoS ports.

## MIB Objects

  alaQoSPortDefaultDSCP  
  alaQoSAppliedPortDefaultDSCP
```

---

## qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

**qos port *slot/port* default classification {802.1p | dscp}**

---

### Syntax Definitions

<i>slot/port</i>	The slot number and port number of the physical port.
<b>802.1p</b>	Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port.
<b>dscp</b>	Specifies that DSCP of the flow will be used to prioritize flows coming in on the port.

### Defaults

parameter	default
<b>802.1p   dscp</b>	DSCP

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified as the default priority value.
- Note that when the default priority value is set to DSCP (using the default DSCP value of 0), the DSCP value of a tagged IP packet is mapped to the 802.1p value for that same packet. In other words, the 802.1p priority is overwritten with the DSCP value. This does not apply to Layer 2 packets.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

### Examples

```
-> qos port 3/1 default classification tos
-> qos port 8/24 default classification dscp
-> qos port 7/1 default classification 802.1p
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

<a href="#">show qos port</a>	Displays information about QoS ports.

## MIB Objects

alaQoSPortTable  
alaQoSPortDefaultClassification

---

## qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

```
qos port slot/port dei {ingress | egress}
```

```
qos port slot/port no dei {ingress | egress}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number and port number of the physical port.
<b>ingress</b>	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress packets.
<b>egress</b>	Sets the DEI/CFI bit for egress packets if TCM marked the packets yellow.

### Defaults

By default, no DEI/CFI bit mapping or marking is done.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

### Examples

```
-> qos port 1/10 dei ingress
-> qos port 1/20 dei egress
-> qos port 1/10 no dei ingress
-> qos port 1/20 no dei egress
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<b>qos port</b>	Configures a physical port for QoS.
<b>qos dei</b>	Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports.
<b>policy action cir</b>	Configures a Tri-Color Marking policy action.
<b>show qos config</b>	Displays global information about the QoS configuration.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSPortTable  
  alaQoSPortDEIMapping  
  alaQoSPortDEIMarking
```

---

## Related Commands

<b>qos port</b>	Configures a physical port for QoS.
<b>show qos port monitor</b>	Displays ports that QoS is monitoring to gather egress CoS statistics.
<b>show qos queue</b>	Displays information and statistics for QoS priority queues.

## MIB Objects

alaQoSPortTable  
alaQoSPortMonitor

---

## show qos port

Displays information about all QoS ports or a particular port.

**show qos port** [*slot/port*] [*statistics*]

---

### Syntax Definitions

**slot/port** The physical slot and port number. For example: 3/1.

**statistics** Displays statistics for high-density gigabit modules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

character	definition
+	Indicates that the port is manually configured as trusted through the <b>qos port trusted</b> command; the port setting takes precedence over the global trust setting configured through the <b>qos trust ports</b> command.
*	Indicates that the port is automatically trusted regardless of the global setting set through the <b>qos trust ports</b> command. (Applies to mobile ports and ports configured for 802.1Q.)

### Examples

```
-> show qos port
```

Slot/ Port	Active	Trust	Default P/DSCP	Default Classification	Queues Deftl Total	Bandwidth Physical	Ingress	Egress	DEI Map/Mark	Type

```

### output definitions

<b>Slot/Port</b>	The slot and physical port number.
<b>Active</b>	Whether or not the port is sending/receiving QoS traffic.
<b>Trust</b>	Whether the port is trusted or not trusted.
<b>Default P</b>	The default 802.1p setting for the port.
<b>Default DSCP</b>	The default ToS/DSCP setting for the port.
<b>Default Classification</b>	The default classification setting for the port ( <b>802.1p</b> or <b>DSCP</b> ).
<b>Default Queues</b>	The number of default queues.
<b>Total Queues</b>	The total number of queues.
<b>Physical Bandwidth</b>	The amount of physical bandwidth available on the port.
<b>Ingress</b>	The amount of ingress bandwidth for the port.
<b>Egress</b>	The amount of egress bandwidth for the port.
<b>DEI Map</b>	Whether or not the port maps the DEI bit for yellow (non-conforming) ingress packets.
<b>DEI Mark</b>	Whether or not the port sets the DEI bit for yellow (non-conforming) egress packets.
<b>Type</b>	The interface type, <b>ethernet</b> or <b>wan</b> .

### Release History

Release 6.1; command was introduced.  
 Release 6.4.3; **DEI Map** and **Mark** fields added.

### Related Commands

**qos port** Configures a physical port for QoS.

```

## show qos port monitor

Displays ports that are enabled to monitor egress CoS transmit and drop statistics.

**show qos port monitor**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- This command displays ports that were configured to enable statistics monitoring using the **qos port monitor** command.
- Note that this command is not required on the OmniSwitch 9000E, as QoS monitoring is automatically active on all ports for these switches.

### Examples

```
-> show qos port monitor
```

```

  NI      Port
-----+-----
  1       1/10
  2       2/5
  3       3/16
  4       4/26
  5       5/25

```

#### *output definitions*

---

<b>NI</b>	The slot number.
<b>Port</b>	The slot/port number for the switch port.

---

### Release History

Release 6.4.3; command was introduced.

## **Related Commands**

**qos port monitor**

Enables or disables statistics monitoring for a specific port.

## **MIB Objects**

*output definitions*

---

<b>Slot/Port</b>	The physical slot/port numbers associated with the queue.
<b>VPN</b>	The virtual port number associated with the queue.
<b>Q No</b>	The queue number ( <b>0</b> through <b>7</b> ).
<b>Pri</b>	The priority associated with the queue ( <b>0</b> through <b>7</b> ), configured through the <b>policy action priority</b> command.
<b>Wt</b>	The weight value assigned to each queue. Configured through the <b>qos default servicing mode</b> and <b>qos port servicing mode</b> commands.
<b>Bandwidth Min</b>	The minimum bandwidth requirement for the queue.
<b>Bandwidth Max</b>	The maximum bandwidth requirement for the queue (the bandwidth allowed by the maximum configured for all actions associated with the queue). Configured through the <b>policy action maximum bandwidth</b> command.
<b>Max Bufs</b>	The number of buffers associated with the queue.
<b>Max Depth</b>	The maximum queue depth, in bytes. Configured through the <b>policy action maximum depth</b> command.
<b>Packets Xmit/Drop</b>	The number of packets transmitted/dropped from this queue.
<b>Type</b>	The type of queuing performed on this queue ( <b>pri</b> , <b>wrr</b> , <b>drp</b> ).

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.1; **Q No** field was added.

Release 6.4.3; *slot/port* parameter added, **Action** field deprecated.

**Related Commands**

<b>policy rule</b>	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
<b>qos port monitor</b>	Enables QoS statistics monitoring for a specific port.

**MIB Objects**

---

## show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

```
show qos slice {ingress | egress} [slot/slice]
```

---

### Syntax Definitions

<b>ingress</b>	Displays information for ingress rules.
<b>egress</b>	Displays information for egress rules.
<i>slot/slice</i>	The slot number and slice for which you want to view information. The number of slices per module varies depending on the type of module.

### Defaults

By default, information is displayed for all slots/slices.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E  
 OmniSwitch 6400, 6855-U24X, 9000E; **egress** parameter supported.

### Usage Guidelines

- Use the **ingress** parameter to display information for rules applied to ingress traffic.
- Use the **egress** parameter to display information for rules applied to egress traffic.
- Use the *slot/slice* parameter to display information for a specific slot or slice on the switch.
- This command is useful for monitoring switch resources required for policy rules.

### Examples

```
-> show qos slice
Slot/
Slice   Type  Ranges      Rules      Counters      Meters
        Total/Free  CAM Total/Free  Total/Free  Total/Free

*output definitions*

<b>QoS Configuration</b>	Whether or not QoS is enabled or disabled. Configured through the <b>qos</b> command.
<b>Mapping</b>	Whether or not DEI mapping for ingress packets is enabled or disabled. Configured through the <b>qos dei</b> command.
<b>Marking</b>	Whether or not DEI marking for egress packets is enabled or disabled. Configured through the <b>qos dei</b> command.
<b>Default queues</b>	The number of default queues for QoS ports. There are eight queues for each QoS port; this value is not configurable.
<b>Default queue service</b>	The default servicing mode for the switch ( <b>strict-priority</b> , <b>WRR</b> , or <b>DRR</b> ). Configured through the <b>qos default servicing mode</b> command.
<b>Trusted Ports</b>	The default trusted mode for switch ports. Configured through the <b>qos trust ports</b> command.
<b>NMS Priority</b>	Whether or not the automatic prioritization of NMS traffic is enabled or disabled. Configured through the <b>qos nms priority</b> command.
<b>Phones</b>	Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the <b>qos phones</b> command.
<b>Default bridged disposition</b>	Whether or not bridged traffic that does not match any policy will be accepted or denied on the switch. Configured through the <b>qos default bridged disposition</b> command.
<b>Default routed disposition</b>	Whether or not routed traffic that does not match any policy will be accepted or denied on the switch. Configured through the <b>qos default routed disposition</b> command.
<b>Default IGMP/MLD disposition</b>	Whether or not multicast flows that do not match any policy will be accepted or denied on the switch. Configured through the <b>qos default multicast disposition</b> command.
<b>Log lines</b>	The number of lines included in the QoS log. Configured through the <b>qos log lines</b> command.
<b>Log level</b>	The level of log detail. Configured through the <b>qos log level</b> command.
<b>Log to console</b>	Whether or not log messages are sent to the console. Configured through the <b>qos log console</b> command.
<b>Forward log</b>	Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the <b>qos forward log</b> command.
<b>Stats interval</b>	How often the switch polls network interfaces for statistics about QoS events. Configured through the <b>qos stats interval</b> command.
<b>Filter</b>	The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the <b>qos user-port</b> command.
<b>Shutdown</b>	The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the <b>qos user-port</b> command.
<b>Quarantine MAC Group</b>	The name of the Quarantine Manager and Remediation (QMR) MAC address group. Configured through the <b>qos quarantine mac-group</b> command. Note that this field only displays on an OmniSwitch 6850 and 6855.

*output definitions (continued)*

---

<b>Quarantined Page</b>	Indicates whether or not QMR sends a Quarantined page to a client. Configured through the <b>qos quarantine page</b> command. Note that this field only displays on an OmniSwitch 6850 and 6855.
<b>Remediation URL</b>	The URL for the QMR remediation server. Configured through the <b>qos quarantine path</b> command. Note that this field only displays on an OmniSwitch 6850 and 6855.
<b>Debug</b>	The type of information that will be displayed in the QoS log. Configured through the <b>debug qos</b> command. A value of <b>info</b> indicates the default debugging type.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.1; **Filter** and **Shutdown** fields added.

Release 6.3.1; **NMS Priority**, **Phones**, and **Quarantine Manager** fields added.

Release 6.4.3; **DEI Mapping** and **Marking** fields added.

**Related Commands**

<b>qos</b>	Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch.
<b>show qos statistics</b>	Displays statistics about the QoS configuration.

### *output definitions*

---

<b>Events</b>	The number of Layer 2 or Layer 3 flows transmitted on the switch.
<b>Matches</b>	The number of Layer 2 or Layer 3 flows that match policies.
<b>Drops</b>	The number of Layer 2 or Layer 3 flows that were dropped.
<b>L2</b>	The number of Layer 2 events, matches, and drops.
<b>L3 Ingress</b>	The number of Layer 3 ingress events, matches, and drops.
<b>L3 Egress</b>	The number of Layer 3 egress events, matches, and drops.
<b>IGMP join</b>	The number of multicast events, matches, and drops.
<b>Fragments</b>	The number of fragments dropped.
<b>Bad Fragments</b>	The number of fragments received with an offset of 1.
<b>Unknown Fragments</b>	The number of out-of-order fragments received.
<b>Sent NI messages</b>	The number of messages sent to network interfaces.
<b>Received NI messages</b>	The number of messages received by network interfaces.
<b>Failed NI messages</b>	The number of failed message attempts to network interfaces.
<b>Load balanced flows</b>	The number of Server Load Balance flow entries.
<b>Reflexive flows</b>	The number of reflexive flows.
<b>Reflexive correction</b>	The number of reflexive flow corrections.
<b>Flow lookups</b>	The number of flow table lookups.
<b>Flow hits</b>	The number of flow table lookup hits.
<b>Max PTree nodes</b>	The highest number of nodes in the classifier tree.
<b>Max Ptree depth</b>	The length of the longest path in the classifier tree.
<b>Spoofed Events</b>	The number of spoofed events.
<b>Nonspoofed Events</b>	The number of nonspoofed events.
<b>DropServices</b>	The number of TCP/UDP flows dropped.
<b>Software Resources</b>	The current usage and availability of software resources for the QoS configuration.
<b>Hardware Resources</b>	The current usage and availability of hardware resources for the QoS configuration.

---

## Release History

Release 6.1; command was introduced.

Release 6.1.1; **Spoofed Events**, **Nonspoofed Events**, and **DropServices** fields added.

Release 6.3.4: **vlan groups** field added to Software Resources display.

## Related Commands

**qos stats reset**                      Resets QoS statistic counters to zero.

---

# 33 QoS Policy Commands

This chapter describes CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

---

**Note.** Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

---

Refer to [Chapter 43, “QoS Commands,”](#) for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

*Filename:* alcatelIND1Qos.mib  
*Module* ALCATEL-IND1-QoS-MIB

---

**Important Note.** Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

---

The QoS Policy commands are listed here:

---

<b>Policy commands</b>	<b>policy rule</b> <b>policy validity period</b> <b>policy condition</b> <b>policy action</b> <b>policy list</b> <b>show policy action</b> <b>show policy condition</b> <b>show active policy rule</b> <b>show active policy rule meter-statistics</b> <b>show policy rule</b> <b>show policy validity period</b> <b>show active policy list</b> <b>show policy list</b>
------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

---

**Group commands**

**policy network group**  
**policy service group**  
**policy mac group**  
**policy port group**  
**policy vlan group**  
**policy map group**  
**show policy network group**  
**show policy mac group**  
**show policy port group**  
**show policy vlan group**  
**show policy map group**  
**show policy service group**

**Service commands**

**policy service**  
**policy service protocol**  
**policy service source tcp port**  
**policy service destination tcp port**  
**policy service source udp port**  
**policy service destination udp port**  
**show policy service**

---

**Condition commands**

**policy condition**  
**policy condition source ip**  
**policy condition source ipv6**  
**policy condition destination ipv6**  
**policy condition multicast ip**  
**policy condition source network group**  
**policy condition destination network group**  
**policy condition multicast network group**  
**policy condition source ip port**  
**policy condition destination ip port**  
**policy condition source tcp port**  
**policy condition destination tcp port**  
**policy condition source udp port**  
**policy condition destination udp port**  
**policy condition ethertype**  
**policy condition established**  
**policy condition tcpflags**  
**policy condition service**  
**policy condition service group**  
**policy condition icmptype**  
**policy condition icmpcode**  
**policy condition ip protocol**  
**policy condition ipv6**  
**policy condition nh**  
**policy condition flow-label**  
**policy condition tos**  
**policy condition dscp**  
**policy condition source mac**  
**policy condition source mac group**  
**policy condition destination mac**  
**policy condition destination mac group**  
**policy condition source vlan**  
**policy condition source vlan group**  
**policy condition inner source vlan**  
**policy condition inner source vlan group**  
**policy condition destination vlan**  
**policy condition 802.1p**  
**policy condition inner 802.1p**  
**policy condition source port**  
**policy condition destination port**  
**policy condition source port group**  
**policy condition destination port group**  
**policy condition vrf**

---

**Command for testing conditions**

**show policy classify**

---

**Action commands**

**policy action**  
**policy action disposition**  
**policy action shared**  
**policy action priority**  
**policy action maximum bandwidth**  
**policy action maximum depth**  
**policy action cir**  
**policy action tos**  
**policy action 802.1p**  
**policy action dscp**  
**policy action map**  
**policy action permanent gateway ip**  
**policy action port-disable**  
**policy action redirect port**  
**policy action redirect linkagg**  
**policy action no-cache**  
**policy action mirror**

---

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

---

<b>Access Control Lists</b>	<b>policy condition</b> <b>policy action disposition</b> <b>policy rule</b>
<b>ACLMAN interactive shell</b>	<b>aclman</b>
<b>Traffic prioritization/shaping</b>	<b>policy action shared</b> <b>policy action priority</b> <b>policy action maximum bandwidth</b> <b>policy action maximum depth</b> <b>policy action cir</b> <b>policy rule</b>
<b>802.1p/ToS/DSCP tagging or mapping</b>	<b>policy condition tos</b> <b>policy condition dscp</b> <b>policy condition 802.1p</b> <b>policy action tos</b> <b>policy action 802.1p</b> <b>policy action dscp</b> <b>policy action map</b> <b>policy rule</b>
<b>Policy based port mirroring</b>	<b>policy action mirror</b>
<b>VLAN Stacking (Ethernet Services)</b>	<b>policy condition inner source vlan</b> <b>policy condition inner 802.1p</b>

---

## aclman

Invokes the Access Control List Manager (ACLMAN) interactive shell for using common industry syntax to create ACLs.

**aclman**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Invoking multiple, concurrent ACLMAN shells is supported.
- Once the shell is active, Alcatel-Lucent CLI commands are no longer accepted. Refer to the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about ACLMAN commands and usage.
- Commands entered using the ACLMAN shell are interpreted and converted to Alcatel-Lucent CLI syntax that is used for creating QoS filtering policies.
- Note that a user with read-only access to the Alcatel-Lucent CLI policy domain is restricted to using only the ACLMAN **clear**, **exit**, and **show** commands when the shell is active.

### Examples

```
-> aclman
```

### Release History

Release 6.1.2; command was introduced.

### Related Commands

N/A

---

## policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

**policy rule** *rule\_name* [**enable** | **disable**] [**precedence** *precedence*] [**condition** *condition*] [**action** *action*] [**validity period** *name* | **no validity period**] [**save**] [**log** [**log-interval** *seconds*]] [**count** {**packets** | **bytes**}] [**trap** | **no trap**] [**default-list** | **no default-list**]

**no policy rule** *rule\_name*

**policy rule** *rule\_name* [**no reflexive**] [**no save**] [**no log**]

---

### Syntax Definitions

<i>rule_name</i>	The name of the policy rule, any alphanumeric string.
<b>enable</b>	Enables the policy rule.
<b>disable</b>	Disables the policy rule.
<i>precedence</i>	The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView.
<i>condition</i>	The condition name that is associated with this rule. Conditions are configured through the <b>policy condition</b> command.
<i>action</i>	The name of the action that is associated with this rule. Actions are configured through the <b>policy action</b> command.
<i>name</i>	The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the <b>policy validity period</b> command.
<b>save</b>	Marks the policy rule so that it may be captured as part of the switch configuration.
<b>log</b>	Configures the switch to log messages about specific flows coming into the switch that match this policy rule.
<i>seconds</i>	Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible.
<b>packets</b>	Counts the number of packets that match the rule.
<b>bytes</b>	Counts the number of bytes that match the rule.
<b>trap</b>	Enables or disables traps for the rule.
<b>default-list</b>	Adds or removes the policy rule from the default policy list.

## Defaults

By default, rules are not reflexive, but they are saved to the configuration.

parameter	default
<b>enable   disable</b>	enable
<i>precedence</i>	0
<b>log</b>	no
<b>log-interval</b>	30 seconds
<b>packets   bytes</b>	packets
<b>trap</b>	enable
<b>default-list</b>	add to default list

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration. The change will not take effect, however, until the **qos apply** command is issued.
- When a flow comes into the switch, the switch examines Layer 2 source policies first; if no match is found, it examines Layer 2 destination policies; if no match is found it then examines Layer 3 policies. The precedence value only applies within the group of the same type of rules.
- If multiple rules (of the same type; that is, Layer 2 source, Layer 2 destination, or Layer 3) are configured with the same precedence, the switch evaluates the rules in the order they were created.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **reload issu** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.

- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

**from {cli | ldap | blt}**

This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.

- The **log** option is useful for determining the source of attacks on the switch firewall.
- Logging of ARP packets is not supported.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.

## Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity period vp01
-> no policy rule rule2
-> policy rule rule2 no precedence
-> policy rule rule2 no validity period
-> policy rule rule2 no default-list
```

## Release History

Release 6.1; command was introduced.

Release 6.1.1; **count** parameter added.

Release 6.3.4; **default-list** parameter added.

## Related Commands

<a href="#">policy validity period</a>	Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.
<a href="#">policy condition</a>	Configures condition parameters.
<a href="#">policy action</a>	Configures action parameters.
<a href="#">policy list</a>	Adds or removes a policy rule from a policy list.
<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">show active policy rule</a>	Displays only those policy rules that are currently being enforced on the switch.
<a href="#">show policy rule</a>	Displays information for policy rules configured on the switch.

---

- alaQoSAppliedExcessByteCount
- alaQoSDefaultList

---

## policy validity period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

**policy validity period** *name* [[**no**] **days** *days*] [[**no**] **months** *months*] [[**no**] **hours** *hh:mm* **to** *hh:mm* | **no hours**] [**interval** *mm:dd:yyyy hh:mm* **to** *mm:dd:yyyy hh:mm* | **no interval**]

**no policy validity period** *name*

---

### Syntax Definitions

<i>name</i>	The name of the validity period (up to 31 alphanumeric characters).
<i>days</i>	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., monday, tuesday, wednesday, etc.).
months	The month(s) in which the validity period is active. Enter the actual month (e.g., january, february, march, etc.).
<i>hh:mm</i>	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
<i>mm:dd:yyyy hh:mm</i>	An interval of time in which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:2005 12:01 to 11:02:2005 12:01).

### Defaults

By default, no validity period is in effect for a policy rule.

parameter	default
<i>days</i>	no restriction
<i>months</i>	no restriction
<i>hh:mm</i>	no specific time
<i>mm:dd:yyyy hh:mm</i>	no interval

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **policy rule** command to associate a validity period with a rule.

- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **snapshot** command is entered after the **policy validity period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity period** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy validity period vp01 days tuesday thursday months january february
-> policy validity period vp01 hours 13:00 to 19:00
-> policy validity period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity period vp01 no days thursday
-> no policy validity period vp02
```

## Release History

Release 6.1; command was introduced.

---

## policy list

Configures a list of policy rules. There are two types of lists supported: User Network Profile (UNP) and egress. Rules assigned to a UNP list are applied to traffic classified into a specific profile. Rules assigned to an egress list are applied to traffic egressing on QoS ports.

**policy list** *list\_name* **type** [**unp** | **egress**] **rules** *rule\_name* [*rule\_name2...*] [**enable** | **disable**]

**no policy list** *list\_name*

**policy list** *list\_name* **no rules** *rule\_name* [*rule\_name2...*]

---

### Syntax Definitions

<i>list_name</i>	The name to assign to the policy list. Note that the list name is case sensitive.
<b>unp</b>	Applies the list of policy rules to the User Network Profile to which the list is assigned.
<b>egress</b>	Applies the list of policy rules to traffic egressing on QoS ports.
<i>rule_name</i>	The name of an existing QoS policy rule to include in the policy list.
<i>rule_name2</i>	Optional. The name of another QoS policy rule to include in the policy list. Separate each rule name specified with a space.
<b>enable</b>	Enables the policy list.
<b>disable</b>	Disables the policy list.

### Defaults

A default policy list is available when the switch boots up. This list has no name and is not configurable. All QoS policy rules are assigned to this default list unless the **no default-list** option of the [policy rule](#) command is used.

parameter	default
<b>unp</b>   <b>egress</b>	<b>unp</b>
<b>enable</b>   <b>disable</b>	enabled

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E  
 OmniSwitch 6400, 6855-U24X, 9000E **egress** parameter supported.

### Usage Guidelines

- Use the **no** form of the command to remove a policy list from the configuration or to remove a policy rule from an existing list.
- The QoS policy rule name specified with this command must already exist in the switch configuration.

- Only those rules that are assigned to an egress policy list are applied to egress traffic. However, certain policy conditions and actions are not supported within an egress policy list. For example, IPv6 conditions are not allowed. See the “Configuring QoS” chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information.
- QoS changes DSCP and 802.1p values for traffic ingressing on an *untrusted* port. As a result, the new values may not match any egress policy list rules as expected. To avoid this scenario, trust the ingress port or configure a default ToS/DSCP/802.1p value as required.
- If an egress policy list rule contains an 802.1p condition and the ingress port is *trusted*, set the default classification of the ingress port to 802.1p. If the default classification of the ingress port is set to DSCP, the 802.1p value of the traffic is changed per the DSCP classification and will not match the egress 802.1p condition.
- Egress rate limiting configured through an Ethernet Service SAP profile takes precedence over egress rate limiting specified within a QoS egress policy list rule.
- A rule may belong to a UNP list, the default list, and an egress policy list at the same time. By default, a rule is assigned to a default policy list when the rule is created. If the rule is subsequently assigned to another policy list, it still remains associated with the default list.
- If a rule is a member of multiple policy lists but one or more of these lists are disabled, the rule is still active in those lists that are enabled.
- If the QoS status of a rule is disabled, then the rule is disabled for all lists even if a list to which the policy belongs is enabled.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.
- If the **snapshot** command is entered after the **policy list** command is configured, the resulting ASCII file will include the following additional syntax for the **policy list** command:

**from {cli | ldap | blt}**

This syntax indicates how the list was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy list unpl type rules r1 r2 r3
-> policy list unpl disable
-> policy list unpl no rules r2
-> policy list unpl enable
-> no policy list unpl
-> policy list egr1 type egress rules r1 r2 r3
-> policy list egr1 disable
-> policy list egr1 no rules r3
-> policy list egr1 enable
-> no policy list egr1
```

## Release History

Release 6.3.4; command was introduced.

Release 6.4.3; **egress** parameter added.

## Related Commands

<b>policy rule</b>	Configures a policy rule on the switch and optionally associates that rule with a validity period.
<b>show policy rule</b>	Displays information for policy rules configured on the switch.
<b>show active policy list</b>	Displays only those policy lists that are currently being enforced on the switch.
<b>show policy list</b>	Displays information for policy lists configured on the switch.

```

---

## policy network group

Configures a network group name and its associated IP addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the network group.

**policy network group** *net\_group ip\_address [mask net\_mask] [ip\_address2 [mask net\_mask2]...]*

**no policy network group** *net\_group*

**policy network group** *net\_group no ip\_address [mask netmask] [ip\_address2 [mask net\_mask2]...]*

---

### Syntax Definitions

<i>net_group</i>	The name of the network group (up to 31 alphanumeric characters).
<i>ip_address</i>	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
<i>net_mask</i>	The mask for the IPv4 address. If no mask is entered, the IPv4 address is assumed to be a host address.
<i>ip_address2</i>	Optional. Another IPv4 address to be included in the network group. Multiple IP addresses may be configured for a network group. Separate each address/mask combination with a space.
<i>net_mask2</i>	Optional mask for the IPv4 address. If no mask is entered, the natural mask for the address will be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to configure a group of IPv4 addresses to which you want to apply QoS rules. Rather than create a condition for each IPv4 address, group the addresses together. Use the **policy condition** command to associate a condition with the network group.
- Use the **no** form of the command to remove a network group from the configuration or to remove an IP address from a network group.
- If the **snapshot** command is entered after the **policy network group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy network group** command:

**from {cli | ldap | blt}**

This syntax indicates how the network group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in network group, this setting is not configurable.

## Examples

```
-> policy network group webgroup1 10.10.12.5 10.50.3.1
-> policy network group webgroup1 no 10.10.12.5
-> no policy network group webgroup1
```

## Release History

Release 6.1; command was introduced.

---

## policy service group

Configures a service group and its associated services. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the service group.

**policy service group** *service\_group service\_name1 [service\_name2...]*

**no policy service group** *service\_group*

**policy service group** *service\_group no service\_name1 [service\_name2...]*

---

### Syntax Definitions

<i>service_group</i>	The name of the service group (up to 31 alphanumeric characters).
<i>service_name1</i>	The service name is configured through the <b>policy service</b> command and includes information about protocol, source port, and destination port.
<i>service_name2...</i>	Optional. Additional service names may be configured for a service group. Separate each service name with a space.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to configure a group of services to which you want to apply QoS rules. Rather than create a condition for each service, group services together. Use the **policy condition** command to associate a condition with the service group.
- Use the **no** form of the command to remove a service group from the configuration, or to remove a service from a service group.
- To drop packets destined to specific TCP and UDP ports, create port services for the traffic that you want dropped and add these services to a service group called DropServices. Then create a condition for this service group and a source port group, which can then be used in a deny rule. Refer to the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about ACL security enhancements.
- If the **snapshot** command is entered after the **policy service group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service group** command:

**from {cli | ldap | blt}**

This syntax indicates how the service group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in service group, this setting is not configurable.

## Examples

```
-> policy service group servgroup2 telnet ftp
-> policy service group servgroup2 no telnet
-> no policy service group servgroup2
```

## Release History

Release 6.1; command was introduced.

## policy mac group

Configures a MAC group and its associated MAC addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the MAC group.

**policy mac group** *mac\_group mac\_address* [**mask** *mac\_mask*] [*mac\_address2* [**mask** *mac\_mask2*]...]

**no policy mac group** *mac\_group*

**policy mac group** *mac\_group no mac\_address* [**mask** *mac\_mask*] [*mac\_address2* [**mask** *mac\_mask2*]...]

---

### Syntax Definitions

<i>mac_group</i>	The name of the MAC group (up to 31 alphanumeric characters).
<i>mac_address</i>	The MAC address associated with the group (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	The mask of the MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.
<i>mac_address2</i>	Optional. Additional MAC addresses may be configured for a MAC group. Separate each address with a space.
<i>mac_mask2</i>	The mask of an additional MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to configure a group of source or destination MAC addresses to which you want to apply QoS rules. Rather than create a condition for each MAC address, group MAC addresses together. Use the **policy condition** command to associate a condition with the MAC group.
- Use the **no** form of the command to remove a MAC group from the configuration, or to remove a MAC address from a MAC group.
- The MAC group name “alaPhones” is a reserved group name used to identify the MAC addresses of IP phones. See the [qos phones](#) command for more information.
- The MAC group name “Quarantined” is a reserved group name used to identify MAC address that are restricted through the Quarantine Manager and Remediation (QMR) switch application. This name is

configurable by the user, but “Quarantined” is used by default if a different name is not specified. See the [qos quarantine mac-group](#) command for more information.

- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

**from {cli | ldap | blt}**

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy mac group mac_group1 00:20:da:05:f6:23 00:20:da:05:f6:24
-> no policy mac group mac_group1
```

## Release History

Release 6.1; command was introduced.

```

## policy port group

Configures a port group and its associated slot and port numbers. A port group may be attached to a policy condition. The action associated with that policy will be applied to all members of the port group.

**policy port group** *group\_name slot/port[-port] [slot/port[-port]...]*

**no policy port group** *group\_name*

**policy port group** *group\_name no slot/port[-port] [slot/port[-port]...]*

---

### Syntax Definitions

<i>group_name</i>	The name of the port group (up to 31 alphanumeric characters).
<i>slot/port[-port]</i>	The slot and port (or port range) to be included in the group. At least one slot/port combination must be specified. Additional combinations may be included in the group; each combination should be separated by a space.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to configure a group of ports to which you want to apply QoS rules. Rather than create a condition for each port, group ports together. Use the **policy condition** command to associate a condition with the port group.
- Use the **no** form of the command to remove a port group from the configuration, or to remove a slot/port from a port group.
- If a range of ports is specified using the syntax *slot/port-port* (i.e., 2/1-8), a single port within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- When a port group is used as part of a policy rule and a policy action specifies a maximum bandwidth, each interface in the port group will be allowed the maximum bandwidth.
- To prevent IP source address spoofing, add ports to the port group called **UserPorts**. This port group does not need to be used in a condition or rule to be effected on flows and only applies to routed traffic. Ports added to the UserPorts group will block spoofed traffic while still allowing normal traffic on the port. Refer to the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about ACL security enhancements.
- Use the **qos user-port** command to configure the option to filter or administratively disable a port when a specific type of traffic (Spoof, RIP, BPDU, OSPF, and/or BGP) is received on a port that is a member of the pre-defined UserPorts group.

- If the **snapshot** command is entered after the **policy port group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

**from {cli | ldap | blt}**

This syntax indicates how the port group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy port group port_group4 3/1-2 4/3 5/4
-> policy port group port_group4 no 3/1-2
-> policy port group UserPorts 4/1-8 5/1-8
```

## Release History

Release 6.1; command was introduced.

```

## policy vlan group

Configures a VLAN group and its associated VLAN ID numbers. A VLAN group may be attached to a policy condition. The action associated with that policy will be applied to all members of the VLAN group.

**policy vlan group** *group\_name* *vlan\_id[-vlan\_id]* [*vlan\_id[-vlan\_id]*...]

**no policy vlan group** *group\_name*

**policy vlan group** *group\_name no* *vlan\_id[-vlan\_id]* [*vlan\_id[-vlan\_id]*...]

---

### Syntax Definitions

<i>group_name</i>	The name of the VLAN group (up to 31 alphanumeric characters).
<i>vlan_id[-vlan_id]</i>	The VLAN ID to include in the group. At least one VLAN ID combination is required. To specify a contiguous range of VLAN IDs, use a hyphen. To specify multiple ID entries, use a space (for example, 10-15 50 100 250-252).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to configure a group of VLAN IDs to which you want to apply QoS rules. Rather than create a condition for each VLAN, group VLANs together. Use the **policy condition** command to associate a condition with the VLAN group.
- Use the **no** form of the command to remove a VLAN group from the configuration, or to remove a VLAN from a VLAN group.
- If a range of VLANs is specified using the syntax *vlan\_id-vlan\_id* (i.e., 1-8), a single VLAN within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- If the **snapshot** command is entered after the **policy vlan group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

**from {cli | ldap | blt}**

This syntax indicates how the VLAN group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy vlan group vlan_group1 100-200 205 240-245 1000
-> policy vlan group vlan_group2 1000-2000
-> policy vlan group vlan_group3 3000
```

```
-> policy vlan group vlan_group3 3000 3100-3105
-> no policy vlan group vlan_group2
-> policy vlan group vlan_group1 no 100-200
```

## Release History

Release 6.3.4; command was introduced.

## policy map group

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values. A map group may be referenced in a policy action with the **map** keyword.

**policy map group** *map\_group* {*value1:value2...*}

**no policy map group** *map\_group*

**policy map group no** {*value1:value2...*}

---

### Syntax Definitions

<i>map_group</i>	The name of the map group (up to 31 alphanumeric characters).
<i>value1</i>	The 802.1p, ToS, or DSCP value to be mapped to another value. May be a value or a range of values (for example, <b>1-2</b> ).
<i>value2...</i>	The 802.1p, ToS, or DSCP value to be used in place of <i>value1</i> . Additional mapping pairs may be included.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a mapping pair or to remove the map group entirely.
- The map group may contain more than one mapping pair.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

**from** {**cli** | **ldap** | **blt**}

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy map group tosGroup 1-4:3 5-6:5 7:6
-> policy map group tosGroup no 7:6
-> no policy map group tosGroup
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### [policy action map](#)

Configures a mapping group for a policy action.

```

---

## policy service

Configures a service that may be used as part of a policy service group or included as part of a policy condition. A service is a source and/or destination TCP or UDP port or port range.

This overview section describes the base command. *At least one option must be configured with the base command.* Some options may be used in combination; some options are shortcuts for keyword combinations (see the Usage Guidelines). Options are described as separate commands. See the command descriptions and usage guidelines for valid combinations.

Use the **no** form for keywords to remove a parameter from a service.

```
policy service service_name
  [protocol protocol]
  [source ip port port[-port]]
  [destination ip port port[-port]]
  [source tcp port port[-port]]
  [destination tcp port port[-port]]
  [source udp port port[-port]]
  [destination udp port port[-port]]
```

```
no policy service service_name
```

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported. This value must be specified for <b>source ip port</b> or <b>destination ip port</b> ; it cannot be specified for <b>source tcp port</b> , <b>destination tcp port</b> , <b>source udp port</b> , or <b>destination udp port</b> .
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. Specify a range of ports using a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.

- The command options offer alternate ways of configuring TCP or UDP ports for a service. Note that port types (TCP or UDP) cannot be mixed in the same service. The following table shows how the keywords are used:

To configure:	Use keywords:	Notes
TCP or UDP ports for a service	<b>protocol</b> <b>source ip port</b> <b>destination ip port</b>	<i>The protocol must be specified with at least one source or destination port.</i>
TCP ports for a service	<b>source tcp port</b> <b>destination tcp port</b>	<i>Keywords may be used in combination.</i>
UDP ports for a service	<b>source udp port</b> <b>destination udp port</b>	<i>Keywords may be used in combination.</i>

- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

The following two commands show two different ways of configuring the same service:

```
-> policy service telnet2 protocol 6 destination ip port 23
-> policy service telnet3 destination tcp port 23
```

## Release History

Release 6.1; command was introduced.

---

## policy service protocol

Configures a service with a protocol and IP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **protocol** *protocol* {[**source ip port** *port*[-*port*]]  
[**destination ip port** *port*[-*port*]]}

**no policy service** *service\_name*

**policy service** *service\_name* [**no source ip port**] [**no destination ip port**]

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported.
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. (A protocol value cannot be removed from a service.)
- Shortcut commands for the **policy service protocol** command include the following: **policy service source tcp port**, **policy service destination tcp port**, **policy service source udp port**, and **policy service destination udp port**.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service telnet2 protocol 6 destination ip port 23 source ip port 22
-> policy service telnet2 no source ip port
```

## Release History

Release 6.1; command was introduced.

```

---

## policy service source tcp port

Configures a service with a source TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **source tcp port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no source tcp port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service serv_5 source tcp port 21-22
```

### Release History

Release 6.1; command was introduced.

---

## policy service destination tcp port

Configures a service with a destination TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **destination tcp port** *port*[-*port*]

**no policy service** *service\_name*

**policy service** *service\_name* **no destination tcp port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a service from the configuration, or to remove parameters from a particular service.
- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service service4 destination tcp port 23
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">policy service group</a>	Configures a policy service group, which is made up of policy services.

---

## policy service source udp port

Configures a service with a source UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **source udp port** *port*[-*port*]

**no policy service** *service\_name*

**policy service** *service\_name* **no source udp port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service serv_a source udp port 1000
-> no policy service serv_a
```

### Release History

Release 6.1; command was introduced.

```

---

## policy service destination udp port

Configures a service with a destination UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **destination udp port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no destination udp port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. For example, a port number for NETBIOS is 137. A port range should be separated by a hyphen (for example, <b>137-138</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service service4 destination udp port 137
```

### Release History

---

## policy condition

Creates a QoS policy condition. The condition determines what parameters the switch uses to classify incoming flows. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

Some condition parameters may not be supported depending on the platform you are using. Also some condition parameters may not be supported with some action parameters. See the condition/action tables in the *OmniSwitch AOS Release 6 Network Configuration Guide*.

**policy condition** *condition\_name*

```
[source ip ip_address [mask netmask]]
[source ipv6 {any | ipv6_address [mask netmask]}]
[destination ip ip_address [mask netmask]]
[destination ipv6 {any | ipv6_address [mask netmask]}]
[multicast ip ip_address [mask netmask]]
[source network group network_group]
[destination network group network_group]
[multicast network group multicast_group]
[source ip port port[-port]]
[destination ip port port[-port]]
[source tcp port port[-port]]
[destination tcp port port[-port]]
[source udp port port[-port]]
[destination udp port port[-port]]
[ethertype etype]
[established]
[tcpflags {any | all} flag [mask flag]]
[service service]
[service group service_group]
[icmptype type]
[icmpcode code]
[ip protocol protocol]
[ipv6]
[nh next_header_value]
[flow-label flow_label_value]
[tos tos_value tos_mask]
[dscp {dscp_value[-value] [dscp_mask]}]
[source mac mac_address [mask mac_mask]]
[destination mac mac_address [mask mac_mask]]
[source mac group group_name]
[destination mac group mac_group]
[source vlan vlan_id]
[source vlan group group_name]
[inner source vlan vlan_id ]
```

```
[inner source vlan group mac_group]
[destination vlan vlan_id]
[802.1p 802.1p_value]
[source port slot/port[-port]]
[source port group group_name]
[destination port slot/port[-port]]
[destination port group group_name]
[vrf { vrf_name | default}]
```

**no policy condition** *condition\_name*

---

## Syntax Definitions

*condition\_name*                      The name of the condition. Any alphanumeric string.

## Defaults

N/A

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the [policy rule](#) command for more information.
- Use the [qos apply](#) command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from a policy rule.
- At least one parameter must be associated with a condition.
- If the **snapshot** command is entered after the **policy condition** command is configured, the resulting ASCII file will include the following additional syntax for the **policy condition** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the condition was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in condition, this option is not configurable.

## Examples

```
-> policy condition cond4 source port 3/1
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>policy action</b>	Configures a policy action.
<b>policy rule</b>	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
<b>show policy condition</b>	Shows information about policy conditions configured on the switch.

## policy condition source ip

Configures a source IP address for a policy condition.

**policy condition** *condition\_name* **source ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no source ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The source IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the source IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A source IP address and a source IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a source IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond3 source ip 173.201.18.3
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

## policy condition source ipv6

Configures a source IPv6 address for a policy condition.

**policy condition** *condition\_name* **source ipv6** {**any** | *ipv6\_address* [**mask** *netmask*]}

**policy condition** *condition\_name* **no source ipv6**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Any source IPv6 address.
<i>ipv6_address</i>	A specific source IPv6 address.
<i>netmask</i>	The mask for the source IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

### Examples

```
-> policy condition cond3 source ipv6 ::1234:531F:BCD2:F34A
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

## policy condition destination ip

Configures a destination IP address for a policy condition.

**policy condition** *condition\_name* **destination ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no destination ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The destination IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the destination IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a destination IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 destination ip 208.192.21.0 mask 255.255.255.0
```

### Release History

Release 6.1; command was introduced.

## policy condition destination ipv6

Configures a destination IPv6 address for a policy condition.

**policy condition** *condition\_name* **destination ipv6** {**any** | *ipv6\_address* [**mask** *netmask*]}

**policy condition** *condition\_name* **no destination ipv6**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Any destination IPv6 address.
<i>ipv6_address</i>	A specific destination IPv6 address.
<i>netmask</i>	The mask for the source IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a destination IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

### Examples

```

## policy condition multicast ip

Configures a multicast IP address for a policy condition.

**policy condition** *condition\_name* **multicast ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no multicast ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The multicast IP address.
<i>netmask</i>	Optional. The mask for the multicast IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A multicast IP address and a multicast network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a multicast IP address from a condition; however, at least one classification parameter must be associated with a condition.
- An IP multicast condition is used in IGMP ACLs. The multicast IP is the multicast group address used in the IGMP report packet.

### Examples

```
-> policy condition cond4 multicast ip 224.1.1.1
```

### Release History

Release 6.1; command was introduced.

## policy condition source network group

Associates a source network group with a policy condition.

**policy condition** *condition\_name* **source network group** *network\_group*

**policy condition** *condition\_name* **no source network group**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*network\_group* The name of the source network group. Network groups are configured through the **policy network group** command. See [page 33-17](#) for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source network group from a condition; however, at least one classification parameter must be associated with a condition.
- A source IP address and a source IP network group cannot be specified in the same condition.

### Examples

```
-> policy condition cond5 source network group webgroup1
```

## policy condition destination network group

Associates a destination network group with a policy condition.

**policy condition** *condition\_name* **destination network group** *network\_group*

**policy condition** *condition\_name* **no destination network group**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*network\_group*                      The name of the destination network group. Network groups are configured through the **policy network group** command. See [page 33-17](#) for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a destination network group from a condition; however, at least one classification parameter must be associated with a condition.
- A destination IP address and a destination IP network group cannot be specified in the same condition.

### Examples

```

## policy condition multicast network group

Associates a multicast group with a policy condition.

**policy condition** *condition\_name* **multicast network group** *multicast\_group*

**policy condition** *condition\_name* **no multicast network group**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*multicast\_group* The multicast group name. Multicast groups are configured through the **policy network group** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a multicast group from a condition; however, at least one classification parameter must be associated with a condition.
- A multicast address and a multicast network group cannot be specified in the same condition.

## policy condition source ip port

Configures a source IP port number for a policy condition.

**policy condition** *condition\_name* **source ip port** *port*[-*port*]

**policy condition** *condition\_name* **no source ip port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the [policy condition ip protocol](#) for more information.
- The same condition cannot specify a source IP port with a source TCP port, source UDP port, service, or service group.

### Examples

```
-> policy condition cond1 ip protocol 6 source ip port 137
```

### Release History

Release 6.1; command was introduced.

---

## policy condition destination ip port

Configures a destination IP port number for a policy condition.

**policy condition** *condition\_name* **destination ip port** *port[-port]*

**policy condition** *condition\_name* **no destination ip port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a destination IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the same condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the [policy condition ip protocol](#) command for more information.
- The same condition cannot specify a destination IP port with a service or service group.

### Examples

```
-> policy condition cond2 ip protocol 6 destination ip port 137-138
```

### Release History

Release 6.1; command was introduced.

## policy condition source tcp port

Configures a source TCP port number for a policy condition.

**policy condition** *condition\_name* **source tcp port** *port*[-*port*]

**policy condition** *condition\_name* **no source tcp port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip port** command, which requires that the protocol also be specified. Rather than specifying **source ip port** and **ip protocol**, use **source tcp port**.
- The same condition cannot specify a source TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond3 source tcp port 137
-> policy condition cond4 ipv6 source tcp port 21
-> policy condition cond3 no source tcp port
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; support for IPv6 policies added.

## policy condition destination tcp port

Configures a destination TCP port number for a policy condition.

**policy condition** *condition\_name* **destination tcp port** *port[-port]*

**policy condition** *condition\_name* **no destination tcp port**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*port*                                      The TCP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a destination TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip port** command, which requires that the protocol also be specified. Rather than specifying **destination ip port** and **ip protocol**, use **destination tcp port**.
- The same condition cannot specify a destination TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond4 destination tcp port 137-138
-> policy condition cond5 ipv6 destination tcp port 140
-> policy condition cond4 no destination tcp port
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; support for IPv6 policies added.

---

## policy condition source udp port

Configures a source UDP port number for a policy condition.

**policy condition** *condition\_name* **source udp port** *port[-port]*

**policy condition** *condition\_name* **no source udp port**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*port*                                      The UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip port** command, which requires that the protocol also be specified. Rather than specifying **source ip port** and **ip protocol**, use **source udp port**.
- The same condition cannot specify a source UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond5 source udp port 1200-1400
-> policy condition cond6 ipv6 source udp port 1000
-> policy condition cond5 no source udp port
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; support for IPv6 policies added.

## policy condition destination udp port

Configures a destination UDP port number for a policy condition.

**policy condition** *condition\_name* **destination udp port** *port*[-*port*]

**policy condition** *condition\_name* **no destination udp port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a destination UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip port** command, which requires that the protocol also be specified. Rather than specifying **destination ip port** and **ip protocol**, use **destination tcp port**.
- The same condition cannot specify a destination UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond4 destination udp port 137-138
-> policy condition cond5 ipv6 destination udp port 140
-> policy condition cond4 no destination udp port
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; support for IPv6 policies added.

---

## policy condition ethertype

Configures an ethertype value to use for traffic classification.

**policy condition** *condition\_name* **ethertype** *etype*

**policy condition** *condition\_name* **no ethertype**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*etype*                                      The ethertype value, in the range 1536–65535 or 0x600–0xffff hex.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an ethertype value from a condition; however, at least one classification parameter must be associated with a condition.
- Enter a numeric or equivalent hex value for the *etype*.

### Examples

```
-> policy condition cond12 ethertype 8137
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

## policy condition established

Configures an established TCP connection as a policy condition. A connection is considered established if the **ack** or **rst** flags in the TCP header of the packet are set.

**policy condition** *condition\_name* **established**

**policy condition** *condition\_name* **no established**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove **established** from a condition; however, at least one classification parameter must be associated with a condition.
- When an initial TCP connection packet is received only the **syn** flag is set. As a result, TCP packets are only examined if they are not the starting packet.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- The **source mac**, **destination mac**, and **ethertype conditions** cannot be combined with the **established** condition parameter.
- Note that even though **established** can be used with most action parameters, it is mainly intended for ACL use.

### Examples

```
-> policy condition cond2 source ip 192.168.5.10 established
-> policy condition cond3 destination ip 10.255.11.40
```

### Release History

Release 6.1; command was introduced.

  alaQoSAppliedConditionTcpEstablished
```

---

## policy condition tcpflags

Configures a specific TCP flag value or combination of flag values as a policy condition.

**policy condition** *condition\_name* **tcpflags** [**any** | **all**] {**F** | **S** | **R** | **P** | **A** | **U** | **E** | **W**} **mask** {**F** | **S** | **R** | **P** | **A** | **U** | **E** | **W**}

**policy condition** *condition\_name* **no tcpflags**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Match on any of the specified TCP flags.
<b>all</b>	Match all specified TCP flags.
<b>F</b>   <b>S</b>   <b>R</b>   <b>P</b>   <b>A</b>   <b>U</b>   <b>E</b>   <b>W</b>	TCP flag value to match ( <b>F</b> =fin, <b>S</b> =syn, <b>R</b> =rst, <b>P</b> =psh, <b>A</b> =ack, <b>U</b> =urg, <b>E</b> =ecn, and <b>W</b> =cwr). <i>The E and W flags are currently not supported.</i>

### Defaults

parameter	default
<b>any</b>   <b>all</b>	all

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove **tcpflags** from a condition; however, at least one classification parameter must be associated with a condition.
- Use the **any** option to indicate that a match on any one of the specified TCP flags qualifies as a match for the condition. Use the **all** option to indicate that a match on all specified TCP flags is required to qualify as a match for the condition.
- Enter one or more TCP flags after the **any** or **all** keyword to indicate that the value of the flag bit must be set to one to qualify as a match.
- Enter one or more TCP flags after the **mask** keyword to indicate which TCP flags to match.
- If a TCP flag is specified as part of the **mask** but does not have a corresponding match value specified with the **any** or **all** options, then zero is assumed as the match value. For example, **tcpflags all f s mask f s a** looks for the following bit values to determine a match: **f**=1, **s**=1, **a**=0.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- The **source mac**, **destination mac**, and **ethertype conditions** cannot be combined with the **established** condition parameter.

- Note that even though **tcpflags** can be used with most action parameters, it is mainly intended for ACL use.

## Examples

```
-> policy condition c1 tcpflags all f s mask f s a
-> policy condition c2 tcpflags any a r mask a r
```

## Release History

Release 6.1; command was introduced.

---

## policy condition service

Configures a service for a policy condition.

**policy condition** *condition\_name* **service** *service\_name*

**policy condition** *condition\_name* **no service**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*service\_name*                        The service name, configured through the **policy service** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service cannot also specify a service group, IP protocol, source IP port, or destination IP port.

### Examples

```
-> policy condition cond12 service serv2
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">policy service</a>	Configures a service that may be used as part of a policy service group.

## policy condition service group

Associates a policy service group with a policy condition.

**policy condition** *condition\_name* **service group** *service\_group*

**policy condition** *condition\_name* **no service group**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*service\_group* The service group name. Service groups are configured through the **policy service group** command. See [page 33-19](#) for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service group cannot also specify a service, IP protocol, source IP port, or destination IP port.

### Examples

```
-> policy condition cond12 service group servgroup2
```

### Release History

Release 6.1; command was introduced.

## policy condition icmp type

Configures an ICMP type value to use for traffic classification.

**policy condition** *condition\_name* **icmp type** *type*

**policy condition** *condition\_name* **no icmp type**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>type</i>	The ICMP type value, in the range 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove an ICMP type value from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond12 icmp type 100
```

### Release History

Release 6.1; command was introduced.

---

## policy condition icmpcode

Configures an ICMP code value to use for traffic classification.

**policy condition** *condition\_name* **icmpcode** *code*

**policy condition** *condition\_name* **no icmpcode**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*code* The ICMP code value, in the range 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove an ICMP code value from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond12 icmpcode 150
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**policy condition** Creates a policy condition.

```

---

## policy condition ip protocol

Configures an IP protocol for a policy condition.

**policy condition** *condition\_name* **ip protocol** *protocol*

**policy condition** *condition\_name* **no ip protocol**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*protocol* The protocol associated with the flow. The range is 0–255.

### Defaults

parameter	default
<i>protocol</i>	6

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a protocol from a condition; however, at least one classification parameter must be associated with a condition.
- If a source or destination port is specified (through the **policy condition source ip port** or **policy condition destination ip port** commands), the protocol must be specified.
- The same condition cannot specify an IP protocol with a service or service group.

### Examples

```
-> policy condition cond4 ip protocol 6
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- policy condition source ip port** Configures a source IP port number for a policy condition.
- policy condition destination ip port** Configures a destination IP port number for a policy condition.
- qos apply** Applies configured QoS and policy settings to the current configuration.
- show policy condition** Shows information about policy conditions configured on the switch.

---

## policy condition ipv6

Configures a policy condition to classify IPv6 traffic.

**policy condition** *condition\_name* **ipv6**

**policy condition** *condition\_name* **no ipv6**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove IPv6 traffic as a condition; however, at least one classification parameter must be associated with a condition.
- When the **ipv6** keyword is used in a condition, a policy that uses the condition is considered an IPv6 policy. IPv6 policies are effected only on IPv6 traffic. All other IP policies are considered IPv4 policies and are effected only on IPv4 traffic.
- IPv6 Layer 4 policies are supported and are configured using the **ipv6** keyword in a condition that specifies Layer 4 information, services, or service groups. Note that IPv6 Layer 4 policies only work with packets that contain a single header.
- The **icmptype** and **icmpcode** keywords in an IPv6 policy imply the ICMPv6 protocol, not the ICMPv4 protocol.

### Examples

```
-> policy condition cond4 ipv6
-> policy condition cond5 ipv6 tos 7
-> policy condition cond6 ipv6 source port 1/1
-> policy condition cond7 ipv6 source tcp port 21
-> policy condition cond8 ipv6 source tcp port 0-1024
-> policy condition cond6 no ipv6
```

### Release History

Release 6.1.3; command was introduced.

Release 6.3.1; support for IPv6 Layer 4 policies added.

---

## policy condition nh

Configures an IPv6 next header value as a policy condition. This value is compared to the next header value in the IPv6 header.

**policy condition** *condition\_name* **nh** *next\_header\_value*

**policy condition** *condition\_name* **no nh**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*next\_header\_value*                  The next header value (0–255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove the next header value as a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 nh 100
-> policy condition cond4 no nh
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

[qos apply](#)                              Applies configured QoS and policy settings to the current configuration.

[show policy condition](#)                Shows information about policy conditions configured on the switch.

## **MIB Objects**

  alaQoSAppliedConditionIpv6NHStatus
```

---

## policy condition flow-label

Configures an IPv6 flow label value as a policy condition. This value is compared to the flow label value in the IPv6 header.

**policy condition** *condition\_name* **flow-label** *flow\_label\_value*

**policy condition** *condition\_name* **no flow-label**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>flow_label_value</i>	The flow-label value (0–1048575).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove the flow label value as a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 flow-label 1500
-> policy condition cond4 no flow-label
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

---

## policy condition tos

Configures the precedence bits in the Type of Service (ToS) byte value for a policy condition.

**policy condition** *condition\_name* **tos** *tos\_value* [**mask** *tos\_mask*]

**policy condition** *conditioning* **no tos**

---

### Syntax Definitions

<i>conditioning</i>	The name of the condition. May be an existing condition name or a new condition.
<i>tos_value</i>	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).
<i>tos_mask</i>	The mask for the ToS bits, in the range 0–7.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a condition; however, at least one classification parameter must be associated with a condition.
- If a ToS value is specified, a DSCP value may not be specified.

### Examples

```
-> policy condition cond2 tos 7
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">policy condition</a>	Creates a policy condition.

---

## policy condition dscp

Configures the Differentiated Services Code Point (DSCP) for a policy condition. The DSCP value defines the six most significant bits of the DS byte in the IP header.

**policy condition** *condition\_name* **dscp** {*dscp\_value*[-*value*]} [**mask** *dscp\_mask*]

**policy condition** *condition\_name* **no dscp**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
{ <i>dscp_value</i> [- <i>value</i> ]}	The DiffServ Code Point value, in the range 0–63. Use a hyphen to specify a range of DSCP values for the condition (for example, 10-20).
<i>dscp_mask</i>	The mask for the DiffServ Code Point, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a condition; however, at least one classification parameter must be associated with a condition.
- If a DSCP value is specified, a ToS value may not be specified.

### Examples

```
-> policy condition cond4 dscp 10
-> policy condition cond5 dscp 20-30
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; support for specifying a DSCP range of values without a mask added for OS6850.

## policy condition source mac

Configures a source MAC address for a policy condition.

**policy condition** *condition\_name* **source mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **no source mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The source MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23)
<i>mac_mask</i>	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond2 source mac 00:20:da:05:f6:23
```

### Release History

Release 6.1; command was introduced.

### Related Commands

## policy condition destination mac

Configures a destination MAC address for a policy condition.

---

**Note.** Specifying a destination MAC address and mask of all zeros (00:00:00:00:00:00) as a policy condition can result in the switch dropping all traffic. Only use this type of condition in combination with other policies that will allow desired traffic and/or if a source or destination slot/port is also part of the destination MAC condition.

---

**policy condition** *condition\_name* **destination mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **no destination mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The destination MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	Optional. The mask for the destination MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a destination MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond3 destination mac 00:20:da:05:f6:23
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

```

---

## policy condition source mac group

Associates a source MAC group with a policy condition.

**policy condition** *condition\_name* **source mac group** *group\_name*

**policy condition** *condition\_name* **no source mac group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source MAC group, configured through the <b>policy mac group</b> command. See <a href="#">page 33-21</a> for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source MAC group from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond4 source mac group mac_group1
```

### Release History

Release 6.1; command was introduced.

## policy condition source vlan

Configures a source VLAN for a policy condition.

**policy condition** *condition\_name* **source vlan** *vlan\_id*

**policy condition** *condition\_name* **no source vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The source VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- The **source vlan** policy condition classifies double-tagged traffic (for example, VLAN Stacking packets) based on the value of the *outer* VLAN tag of the packet. Use the **inner source vlan** policy condition to classify double-tagged traffic based on the value of the *inner* VLAN tag of the packet.
- A source VLAN ID and a source VLAN group cannot be specified in the same condition. However, a source VLAN ID or group and an inner source VLAN ID or group can be specified in the same condition.

### Examples

```
-> policy condition cond5 source vlan 3
-> policy condition cond6 source vlan 150 inner source vlan 500
-> policy condition cond7 source vlan 300 inner source vlan group invlan1
```

### Release History

Release 6.1; command was introduced.

## Related Commands

---

## policy condition source vlan group

Associates a source VLAN group with a policy condition.

**policy condition** *condition\_name* **source vlan group** *vlan\_group*

**policy condition** *condition\_name* **no source vlan group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_group</i>	The name of an existing VLAN group, configured through the <b>policy vlan group</b> command. See <a href="#">page 33-25</a> for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source VLAN group from a policy condition; however, at least one classification parameter must be associated with a condition.
- The **source vlan group** condition classifies double-tagged traffic (for example, VLAN Stacking packets) based on the value of the *outer* VLAN tag of the packet. Use the **inner source vlan group** condition to classify double-tagged traffic based on the value of the *inner* VLAN tag of the packet.
- A source VLAN ID and a source VLAN group cannot be specified in the same condition. However, a source VLAN ID or group and an inner source VLAN ID or group can be specified in the same condition.

### Examples

```
-> policy condition cond1 source vlan group vlan_group1
-> policy condition cond2 source vlan group vstack1 inner source vlan 150
-> policy condition cond3 source vlan group vstack1 inner source vlan group invlan1
-> policy condition cond1 no source vlan group
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>policy vlan group</b>	Configures a VLAN group and its associated VLAN IDs.
<b>policy condition</b>	Creates a policy condition.
<b>policy condition inner source vlan group</b>	Associates an inner source VLAN group with a policy condition.

## MIB Objects

```
alaQoSConditionTable
  alaQoSConditionName
  alaQoSConditionSourceVlanGroup
alaQoSAppliedConditionTable
  alaQoSAppliedConditionName
  alaQoSAppliedConditionSourceVlanGroup
```

---

## policy condition inner source vlan

Configures an inner source VLAN ID as a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner VLAN ID tag, also known as the customer VLAN ID.

**policy condition** *condition\_name* **inner source vlan** *vlan\_id*

**policy condition** *condition\_name* **no inner source vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The inner source VLAN ID (customer VLAN ID) to match on double-tagged packets.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove an inner source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner source VLAN condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.
- Use the **source vlan** policy condition to classify double-tagged traffic based on the value of the *outer* VLAN tag of the packet.
- Note that if the Quarantine Manager Remediation (QMR) feature is active on the switch, configuring VLAN Stacking services and inner VLAN or 802.1p policies is not available. QMR is considered active when there are MAC addresses present in the Quarantine MAC group.
- An inner source VLAN ID and an inner source VLAN group cannot be specified in the same condition. However, a source VLAN ID or group and an inner source VLAN ID or group can be specified in the same condition.

### Examples

```
-> policy condition cond5 inner source vlan 3
-> policy condition cond6 source vlan 500 inner source vlan 150
-> policy condition cond7 source vlan 250 inner source vlan group invlan1
-> policy condition cond5 no inner source vlan
```

## Release History

Release 6.3.1; command was introduced.

```

---

## policy condition inner source vlan group

Associates an inner source VLAN group with a policy condition.

**policy condition** *condition\_name* **inner source vlan group** *vlan\_group*

**policy condition** *condition\_name* **no inner source vlan group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_group</i>	The name of an existing VLAN group, configured through the <b>policy vlan group</b> command. See <a href="#">page 33-25</a> for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a source VLAN group from a policy condition; however, at least one classification parameter must be associated with a condition.
- The **inner source vlan group** condition classifies double-tagged traffic (for example, VLAN Stacking packets) based on the value of the *inner* VLAN tag of the packet. Use the **source vlan group** condition to classify double-tagged traffic based on the value of the *outer* VLAN tag of the packet.
- An inner source VLAN ID and an inner source VLAN group cannot be specified in the same condition. However, a source VLAN ID or group and an inner source VLAN ID or group can be specified in the same condition.

### Examples

```
-> policy condition cond2 inner source vlan group vstack1
-> policy condition cond3 inner source vlan group invlan1 source vlan group vstack1
-> policy condition cond4 inner source vlan group invlan2 source vlan 250
-> policy condition cond2 no inner source vlan group
```

## policy condition destination vlan

Configures a destination VLAN (multicast only) for a policy condition. Use the **no** form of the command to remove a destination VLAN from a condition.

**policy condition** *condition\_name* **destination vlan** *vlan\_id*

**policy condition** *condition\_name* **no destination vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The destination VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a destination VLAN from a condition; however, at least one classification parameter must be associated with a condition.
- Note that this condition is supported for multicast only policies.

### Examples

```
-> policy condition cond4 destination vlan 3
```

### Release History

Release 6.1; command was introduced.

alaQoSAppliedConditionTable

    alaQoSAppliedConditionName

    alaQoSAppliedConditionDestinationVlan

---

## policy condition 802.1p

Configures the 802.1p value for a policy condition.

**policy condition** *condition\_name* **802.1p** *802.1p\_value*[-*802.1p\_value*]

**policy condition** *condition\_name* **no 802.1p**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. Specify an existing condition name or a new condition.
<i>802.1p_value</i> [- <i>802.1p_value</i> ]	The 802.1p value, or a range of 802.1p values, in the 802.1Q VLAN tag for the flow. Use a hyphen to specify a range of values (e.g., 2-5). Only one entry is allowed per command line (a single 802.1p value or a range of values, not both). Valid 802.1p values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Rather than creating several policy conditions for contiguous 802.1p values, it is possible to specify a range of values with this command to apply multiple 802.1p values with one condition.
- Use the **no** form of the command to remove an 802.1p value or range of values for a condition; however, at least one classification parameter must be associated with a condition.
- When a range of values is configured for a single condition, removing a single value from within that range is not allowed. All 802.1p values are removed from a condition when the **no** form of this command is used.
- The **802.1p** policy condition classifies double-tagged traffic (for example, VLAN Stacking packets) based on the 802.1p value of the *outer* VLAN tag of the packet. Use the **inner 802.1p** condition to classify double-tagged traffic based on the 802.1p value of the *inner* VLAN tag of the packet.

### Examples

```
-> policy condition cond1 802.1p 0-7
-> policy condition cond2 802.1p 5
-> policy condition cond3 802.1p 2-5
-> policy condition cond3 no 802.1p
```

### Release History

Release 6.1; command was introduced.

Release 6.4.3; ability to specify a range of 802.1p values was added.

```

---

## policy condition inner 802.1p

Configures an inner (customer) source 802.1p value for a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner 802.1p bit value.

**policy condition** *condition\_name* **inner 802.1p** *802.1p\_value*[-*802.1p\_value*]

**policy condition** *condition\_name* **no inner 802.1p**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>802.1p_value</i> [- <i>802.1p_value</i> ]	The 802.1p value, or range of values, to match on the inner 802.1Q VLAN tag of double-tagged packets. Use a hyphen to specify a range of values (e.g., 2-5). Only one entry is allowed per command line (a single 802.1p value or a range of values, not both). Valid 802.1p values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Rather than creating several policy conditions for contiguous inner 802.1p values, it is possible to specify a range of values with this command to apply multiple 802.1p values with one condition.
- Use the **no** form of the command to remove an inner 802.1p value, or range of values, for a condition; however, at least one classification parameter must be associated with a condition.
- When a range of values is configured for a single condition, removing a single value from within that range is not allowed. All 802.1p values are removed from a condition when the **no** form of this command is used.
- Policies that use the inner 802.1p condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.
- Use the **source 802.1p** policy condition to classify double-tagged traffic based on the 802.1p value of the *outer* VLAN tag of the packet.
- Note that if the Quarantine Manager Remediation (QMR) feature is active on the switch, configuring VLAN Stacking services and inner VLAN or 802.1p policies is not available. QMR is considered active when there are MAC addresses present in the Quarantine MAC group.

### Examples

```
-> policy condition cond1 inner 802.1p 0-7
-> policy condition cond2 inner 802.1p 5
```

```
-> policy condition cond3 inner 802.1p 2-5
-> policy condition cond3 no inner 802.1p
-> policy condition cond2 no inner 802.1p
```

## Release History

Release 6.3.1; command was introduced.

Release 6.4.3; ability to specify a range of 802.1p values was added.

## policy condition source port

Configures a source port number for a policy condition. Use the **no** form of the command to remove a source port number from a condition.

**policy condition** *condition\_name* **source port** *slot/port[-port]*

**policy condition** *condition\_name* **no source port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>slot/port</i>	The slot and port number (or range of ports) on which the frame is received.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove a source port from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond2 source port 3/1
-> policy condition cond3 source port 3/2-4
```

### Release History

Release 6.1; command was introduced.

### Related Commands

  alaQoSAppliedConditionSourcePort
  alaQoSAppliedConditionSourcePortEnd
```

---

## policy condition destination port

Configures a destination port number for a policy condition.

**policy condition** *condition\_name* **destination port** *slot/port*[-*port*]

**policy condition** *condition\_name* **no destination port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>slot/port</i>	The slot and port number (or range of ports) on which the frame is received.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a destination port from a condition; however, at least one classification parameter must be associated with a condition.
- The destination port condition is only applied to bridged traffic, it is not applied to routed traffic.

### Examples

```
-> policy condition cond3 destination port 4/2
-> policy condition cond4 destination port 4/3-4
```

### Release History

Release 6.1; command was introduced.

## policy condition source port group

Associates a source port group with a policy condition. Use the **no** form of the command to remove a source port group from a condition.

**policy condition** *condition\_name* **source port group** *group\_name*

**policy condition** *condition\_name* **no source port group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source port group. Port groups are configured through the <b>policy port group</b> command. See <a href="#">page 33-23</a> for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove a source port group from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond6 source port group portgr4
```

### Release History

Release 6.1; command was introduced.

---

## policy condition vrf

Associates a Virtual Routing and Forwarding (VRF) instance with a policy condition.

**policy condition** *condition\_name* **vrf** {*vrf\_name* / **default**}

**policy condition** *condition\_name* **no vrf**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vrf_name</i>	The name of the VRF instance to which the QoS policy condition applies.
<b>default</b>	Specifies the default VRF instance.

### Defaults

By default, QoS policy conditions are not associated with any VRF instance. The policy applies across all instances.

### Platforms Supported

OmniSwitch 6855-U24X, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a VRF instance from a condition; however, at least one classification parameter must be associated with a condition.
- VRF policies are configured in the default VRF, similar to how all other QoS policies are configured. If the VRF name specified does not exist, the policy is not allocated any system resources.
- Policies that do not specify a VRF name are considered global policies and are applied across all VRF instances and VLANs.
- Policies that specify the default VRF apply only to traffic in the default VRF instance.
- Policies that specify a VRF name apply only to traffic in the VRF instance associated with that name.
- The **switch** network group is supported only in VRF policies that specify the default VRF instance. If this group is specified in a global policy (no VRF specified) then the policy is applied across all VRF instances.

### Examples

```
-> policy condition cond6 vrf engr-vrf
-> policy condition cond7 vrf default
-> policy condition cond6 no vrf
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy condition</a>	Creates a policy condition.
<a href="#">show policy condition</a>	Shows information about policy conditions configured on the switch.

  alaQoSConditionVrfNameStatus

alaQoSAppliedConditionTable
  alaQoSAppliedConditionName
  alaQoSAppliedConditionVrfName
  alaQoSAppliedConditionVrfNameStatus
```

---

## Usage Guidelines

- Any condition parameters that the hardware supports will be used to classify the traffic; any condition parameters that are not supported by the hardware will not be used to classify traffic, and the event will be logged in the QoS log.
- Bandwidth and queue parameters may be specified when the action is created or may be specified as separate commands.
- Use the **qos apply** command to activate configuration changes.
- Use the **no** form of the command to remove a QoS action from the configuration.
- If the **snapshot** command is entered after the **policy action** command is configured, the resulting ASCII file will include the following additional syntax for the **policy action** command:

**from {cli | ldap | blt}**

This syntax indicates how the action was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in action, this setting is not configurable.

## Examples

```
-> policy action action1 accept
```

## Release History

Release 6.1; command was introduced.

---

## policy action disposition

Configures a disposition for a policy action.

**policy action** *action\_name* **disposition** {**accept** | **drop** | **deny**}

**policy action** *action\_name* **no disposition**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>accept</b>	Specifies that the switch should accept the flow.
<b>drop</b>	Specifies that the switch should silently drop the flow.
<b>deny</b>	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as <b>drop</b> ; that is, the flow is silently dropped.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>accept   drop   deny</b>	accept

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a disposition from an action.
- This command does not support Layer 2 conditions such as destination VLAN or destination MAC address.

### Examples

```
-> policy action a3 disposition deny
-> policy action a3 no disposition
```

### Release History

Release 6.1; command was introduced.

### Related Commands

  alaQoSActionDisposition
alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionDisposition
```

---

## policy action shared

Enables queues created by a particular action to be shared.

**policy action** *action\_name* **shared**

**policy action** *action\_name* **no shared**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

By default, queues created by an action are *not* shared.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If multiple rules have the same action, more than one flow may be scheduled on the same queue if the queue is defined as shared; otherwise, a separate queue is created for each flow.
- Note that flows must be sent over the same virtual port for the flows to share a queue. For example, flows with the same 802.1Q tag may share the same queue.
- Use the **no** form of the command to disable sharing.

### Example

```
-> policy action action5 shared  
-> policy action action5 no shared
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

---

## policy action priority

Configures the priority for queuing a flow to which the QoS action applies.

**policy action** *action\_name* **priority** *priority\_value*

**policy action** *action\_name* **no priority**

---

### Syntax Definitions

*action\_name*                      The name of the action.

*priority\_value*                      The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a priority value from an action.
- This priority value is independent of 802.1Q, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.
- Note that the value displayed on the **show qos queue** screen may be different from the value entered here.

### Examples

```
-> policy action action1 priority 1
-> policy action action1 no priority
```

### Release History

Release 6.1; command was introduced.

### Related Commands

---

## policy action maximum bandwidth

Configures a maximum bandwidth value for a policy action.

**policy action** *action\_name* **maximum bandwidth** *bps*

**policy action** *action\_name* **no maximum bandwidth**

---

### Syntax Definitions

*action\_name*

The name of the action.

*bps*

The desired value for maximum bandwidth, in bits per second. The value may be entered as an integer (for example, **10000**) or with abbreviated units (for example, **10k**). If the value is entered in bits per second, the switch rounds the value up to the nearest thousand.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a maximum bandwidth value from an action.
- Note that the bandwidth may be entered in bits per second. Alternatively, the bandwidth may be entered in abbreviated units (**1k**, **2k**, etc). If the bandwidth value is entered in bytes, the switch rounds the value to the nearest thousand bytes. For example, if you enter 1 to 1024, the result is 1K. If you enter 1025 to 2048, the result is 2K.

### Examples

```
-> policy action action4 maximum bandwidth 10000
-> policy action action4 maximum bandwidth 10k
-> policy action action4 no maximum bandwidth
```

### Release History

Release 6.1; command was introduced.

## Related Commands

alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionMaximumBandwidth
```

---

## policy action maximum depth

Configures the maximum queue depth assigned to this action, in bytes. The queue depth determines the amount of buffer allocated to each queue. When the queue depth is reached, the switch starts dropping packets.

**policy action** *action\_name* **maximum depth** *bytes*

**policy action** *action\_name* **no maximum depth**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bytes</i>	The maximum queue depth, in bytes. The value may be entered as an integer (for example, <b>10000</b> ) or with abbreviated units (for example, <b>10k</b> ). If the value is entered in bytes, the switch rounds the value up to the nearest thousand.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a maximum depth value from a policy action.
- Note that the bandwidth may be entered in bytes. Alternatively, the bandwidth may be entered in abbreviated units (**1k**, **2k**, etc). If the bandwidth value is entered in bytes, the switch rounds the value to the nearest thousand bytes. For example, if you enter 1 to 1024, the result is 1K. If you enter 1025 to 2048, the result is 2K.

### Examples

```
-> policy action action2 maximum depth 100  
-> policy action action2 no maximum depth
```

### Release History

Release 6.1; command was introduced.

```

---

## policy action cir

Configures a Tri-Color Marking (TCM) policy action. This type of action consists of parameters for Committed Information Rate (CIR), Committed Burst Size (CBS), Peak Information Rate (PIR), Peak Burst Size (PBS), and the counter color mode. TCM marks packets red, green, or yellow based on the parameter values of this policy action. The counter color mode determines which packets marked by this policy action are counted based on the resulting color of the packet.

**policy action** *action\_name* **cir** *bps* [**cbs** *byte*] [**pir** *bps*] [**pbs** *byte*] [**counter-color** [**red-nonred** | **green-nongreen** | **green-red** | **green-yellow** | **red-yellow**]]

**policy action** *action\_name* **no cir** *bps*

**policy action** *action\_name* **no pir** *bps*

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i>	The burst size value, in bits per second.
<i>byte</i>	The desired value for maximum bucket size, in bytes.
<b>green-red</b>	Count the number of packets marked green (low drop precedence) and the number of packets marked red (packet is dropped). Packets marked yellow (high drop precedence) are not counted.
<b>green-yellow</b>	Count the number of green and yellow packets. Red packets are not counted.
<b>red-yellow</b>	Count the number red and yellow packets. Green packets are not counted.
<b>red-nonred</b>	Count the number of red and non-red (yellow and green) packets.
<b>green-nongreen</b>	Count the number of green and non-green (yellow and red) packets.

### Defaults

<b>parameter</b>	<b>default</b>
<i>bps</i>	0
<i>byte</i>	10K (50K on 9000E)
<b>counter-color</b>	<b>red-yellow</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the TCM parameter values.

- The **cir** and **pir** *bits* and the **cbs** and **pbs** *bytes* parameter values may be entered as an integer (for example, **10000**) or with abbreviated units (for example, **10m**).
- The **cbs** and **pbs** parameters are optional. If not specified, the switch uses 10K for these values by default.
- This implementation of TCM supports two rate limiting modes: Single-Rate (srTCM) and Two-Rate (trTCM). The srTCM mode marks packets based only on the CIR and the two burst sizes: CBS and PBS. The trTCM mode marks packets based on both the CIR and PIR and their associated CBS and PBS values.
- There is no explicit CLI command to configure the mode (srTCM or trTCM) in which the TCM meter operates. Instead, the mode is determined by the CIR and PIR values configured for the policy action. If the PIR value is greater than the CIR value, trTCM is used. If the PIR value is less than the CIR value, srTCM is used.
- Configuring CIR and CBS is similar to configuring a maximum bandwidth. Configuring CIR and PIR is similar to configuring maximum depth.
- The number of packets counted as a result of the counter color mode setting is displayed using the **show active policy rule meter-statistics** command. These statistics are only shown for those rules that are configured with a TCM policy action.

## Examples

The following command examples configure srTCM (the default):

```
-> policy action A3 cir 10M
-> policy action A4 cir 10M cbs 4k
-> policy action A5 cir 10M cbs 4k pir 10M
-> policy action A6 cir 10M cbs 4k pir 10M pbs 4k
-> policy action a7 cir 5M cbs 2k counter-color green-nongreen
-> policy action A3 no cir
-> policy action A5 no pir
```

The following command examples configure trTCM (note that PIR is greater than CIR):

```
-> policy action A7 cir 10M cbs 4k pir 20M
-> policy action A8 cir 10M cbs 4k pir 20M pbs 40M
-> policy action a9 cir 5M cbs 1M pbs 10M pbs 2M counter-color green-yellow
-> policy action A7 no cir
```

## Release History

Release 6.4.3; command was introduced.

## policy action tos

Configures a Type of Service (ToS) bits value to be applied to packets in outgoing flows to which the specified policy applies.

**policy action** *action\_name* **tos** *tos\_value*

**policy action** *action\_name* **no tos**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>tos_value</i>	The three-bit priority value in the IP header that should be set on outgoing frames in flows that match the specified policy. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

### Examples

```
-> policy action action3 tos 4
-> policy action action3 no tos
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy action</a>	Creates a policy action.

  alaQoSAppliedActionTos
```

---

## policy action 802.1p

Configures a value to be set in the 802.1p bits of the 802.1Q byte of an outgoing frame for traffic that matches a policy with this action.

**policy action** *action\_name* **802.1p** *802.1p\_value*

**policy action** *action\_name* **no 802.1p**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>802.1p_value</i>	The priority value to be set in 802.1Q frames. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value from a policy action.
- Note that specifying both ToS and DSCP in the same action is not allowed.

### Examples

```
-> policy action action4 802.1p 7
-> policy action action4 no 802.1p
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

    alaQoSAppliedAction8021p

---

## policy action dscp

Configures a Differentiated Services Code Point (DSCP) value to be set in an outgoing flow for traffic that matches rules with this action.

**policy action** *action\_name* **dscp** *dscp\_value*

**policy action** *action\_name* **no dscp**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>dscp_value</i>	The DSCP value to be set, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

### Examples

```
-> policy action action2 dscp 61
-> policy action action2 no dscp
```

### Release History

Release 6.1; command was introduced.

    alaQoSAppliedActionName

    alaQoSAppliedActionDscp

---

## policy action map

Configures a mapping group for a policy action.

**policy action map {802.1p | tos | dscp} to {802.1p | tos| dscp} using *map\_group***

**policy action no map**

---

### Syntax Definitions

<b>802.1p</b>	Indicates that an 802.1p value should be mapped.
<b>tos</b>	Indicates that a ToS value should be mapped.
<b>dscp</b>	Indicates that a DSCP value should be mapped.
<i>map_group</i>	The name of the map group, configured through the <a href="#">policy map group</a> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When remapping is configured with this command and a flow matches a policy with this remapping action, and the 802.1p, ToS, or DSCP setting in the incoming flow is specified by the map group, the value will be remapped in the outgoing flow according to the map group.
- If the 802.1p, ToS, or DSCP setting in the incoming flow is not a value specified in the map group, the switch will do one of two things:

If the *remap from* and *remap to* types are the same (802.1p to 802.1p, ToS to ToS, or DSCP to DSCP), the values in the outgoing flow will be unchanged. If the *remap from* and *remap to* types are not the same (for example: 802.1p to ToS), the switch will set the *remap to* value to zero (in this case, the ToS bit would be set to zero). The *remap to* value remains the same (in this case, the 802.1p bit would remain unchanged).

- Use the **no** form of the command to delete the map group from the configuration.

### Examples

```
-> policy action a1 map 802.1p to 802.1p using mapGroup2
-> policy action a2 map 802.1p to tos using mapGroup3
```

### Release History

Release 6.1; command was introduced.

## Related Commands

```

---

## policy action permanent gateway ip

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IP address specified in the action regardless of whether or not a route already exists in the switch routing table.

**policy action** *action\_name* **permanent gateway ip** *ip\_address*

**policy action** *action\_name* **no permanent gateway ip**

---

### Syntax Definitions

*action\_name* The name of the action.

*ip\_address* The destination IP address to which packets will be routed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a gateway IP address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

### Examples

```
-> policy action pbr2 permanent gateway ip 10.10.2.1  
-> policy action pbr2 no permanent gateway ip
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

---

## policy action port-disable

Administratively disables the source port of the traffic to which this action is applied.

**policy action** *action\_name* **port-disable**

**policy action** *action\_name* **no port-disable**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove **port-disable** from the policy action.
- An SNMP trap is sent when a port is administratively disabled through a port disable action or a User-Ports shutdown function.
- To enable a port disabled by this action, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.

### Examples

```
-> policy action pd01 port-disable  
-> policy action pb02 no port-disable
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

---

## policy action redirect port

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified port instead of the port to which the traffic was destined.

**policy action** *action\_name* **redirect port** *slot/port*

**policy action** *action\_name* **no redirect port**

---

### Syntax Definitions

*action\_name*                      The name of the action.

*slot/port*                         The slot and port number (or range of ports) that will receive the redirected traffic.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove **redirect port** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect port must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect port is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified port or link aggregate and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port must belong to VLAN A (tagged or default VLAN).

### Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

## Release History

## policy action redirect linkagg

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified link aggregate ID instead of the link aggregate to which the traffic was destined.

**policy action** *action\_name* **redirect linkagg** *link\_agg*

**policy action** *action\_name* **no redirect linkagg**

---

### Syntax Definitions

*action\_name* The name of the action.

*link\_agg* The link aggregate ID number (0–32) to assign to the specified VLAN. See [Chapter 8, “Link Aggregation Commands.”](#)

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove **redirect linkagg** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect link aggregate ID must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect link aggregate ID is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified link aggregate ID and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port or link aggregate ID to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port or link aggregate ID must belong to VLAN A (tagged or default VLAN).

### Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

## Release History

---

## policy action no-cache

Prevents entries from being added to the hardware cache or TCAM and treats the policy as a software policy by sending all packets to the CPU to be processed.

**policy action** *action\_name* **no-cache**

**policy action** *action\_name* **no no-cache**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove **no cache** from the policy action.
- Recommended for use on traffic destined for the switch.
- This command is useful to reduce hardware ACL entries by moving switch access ACLs to the CPU.

### Examples

```
-> policy action nc01 no-cache
-> policy action nc01 no no-cache
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

[qos apply](#)                      Applies configured QoS and policy settings to the current configuration.

[show policy action](#)            Displays information about policy actions.

---

## policy action mirror

Mirrors ingress, egress, or both ingress and egress packets that match a mirroring policy to the specified port.

**policy action** *action\_name* [**ingress** | **egress** | **ingress egress**] **mirror** *slot/port*

**policy action** *action\_name* **no mirror** *slot/port*

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>ingress</b>	Mirrors ingress packets.
<b>egress</b>	Mirrors egress packets.
<b>ingress egress</b>	Mirrors ingress and egress packets.
<i>slot/port</i>	The slot and port number that will receive the mirrored traffic.

### Defaults

---

parameter	default
<b>ingress   egress   ingress egress</b>	<b>ingress</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove **mirror** from the policy action.
- Use this command to configure a mirror-to-port (MTP) action that is used for policy based mirroring.
- Only one MTP session is supported at any given time. As a result, all mirroring policies should specify the same MTP port.
- Policy based mirroring and the port based mirroring feature can run simultaneously on the same switch.

### Examples

```
-> policy action a1 mirror 1/7 (default ingress)
-> policy action a1 ingress mirror 1/7
-> policy action a1 egress mirror 1/7
-> policy action a1 ingress egress mirror 1/7
-> policy action a1 no mirror
```

### Release History

## show policy classify

Sends hypothetical information to the Layer 2, Layer 3, or multicast classifier to see how the switch will handle the packet. Used to verify that a policy rule works a particular way.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Note that options may be used in combination but are described separately for ease in explanation.)

### show policy classify {l2 | l3 | multicast} [applied]

[source port *slot/port*]

[destination port *slot/port*]

[source mac *mac\_address*]

[destination mac *mac\_address*]

[source vlan *vlan\_id*]

[destination vlan *vlan\_id*]

[source interface type {ethernet | wan | ethernet-10 | ethernet-100 | ethernet-1G | ethernet-10G}]

[destination interface type {ethernet | wan | ethernet-10 | ethernet-100 | ethernet-1G | ethernet-10G}]

[802.1p *value*]

[source ip *ip\_address*]

[destination ip *ip\_address*]

[multicast ip *ip\_address*]

[tos *tos\_value*]

[dscp *dscp\_value*]

[ip protocol *protocol*]

[source ip port *port*]

[destination ip port *port*]

---

### Syntax Definitions

<b>l2</b>	Uses the Layer 2 classifier for the hypothetical packet. Typically specified for port, MAC address, VLAN, interface type, or 802.1p.
<b>l3</b>	Uses the Layer 3 classifier for the hypothetical packet. Typically specified for interface type, IP address, ToS or DSCP, IP protocol, or TCP/UDP port.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet. Typically specified for multicast IP address (which is the multicast stream) and destination parameters (for the client issuing an IGMP request).
<b>applied</b>	Indicates that only applied policies should be examined.

### Defaults

By default, only pending policies are examined.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- If you specify multicast traffic, any destination parameters specified indicate the client(s) attempting to join a multicast group.
- Use the **qos apply** command to activate saved policies.
- See command descriptions in the next sections for more information about the individual options.

## Examples

```
-> show policy classify l3 source ip 1.2.3.4 destination ip 198.60.22.2
destination ip port 80 ip protocol 6
```

Packet headers:

L3:

```
*Port          :                0/0  -> 0/0
*MAC           :                000000:000000  -> 000000:000000
*VLAN          :                0  -> 0
*802.1p        : 0
```

L3/L4:

```
*IP            :                1.2.3.4  -> 198.60.22.2
TCP            :                0  -> 80
*TOS/DSCP      : 0/0
```

Using pending l3 policies

Classify L3:

```
*Matches rule 'filter1': action pri3 (accept)
```

- Source and destination are indicated to the left and right of the arrow (->) respectively. A zero displays for values not requested in the hypothetical packet.
- Note that some fields only display for particular traffic types.

### output definitions

<b>L2/L3/L4</b>	Indicates the type of traffic (Layer 2 or Layer 3/4).
<b>Port</b>	The physical slot/port of the theoretical traffic.
<b>IfType</b>	Displays for hypothetical Layer 2 packets only. The interface type of the packet.
<b>MAC</b>	The MAC address of the hypothetical packet.
<b>VLAN</b>	The VLAN ID of the hypothetical packet.
<b>802.1p</b>	The 802.1p value of the hypothetical packet.
<b>Mcast</b>	Displays for hypothetical multicast packets only. The multicast address of the hypothetical packet.
<b>IP</b>	The IP address of the hypothetical packet.
<b>TCP</b>	The TCP/UDP port of the hypothetical packet.
<b>TOS/DSCP</b>	The ToS or DSCP value of the hypothetical packet.

## Release History

## show policy classify source port

Specifies a source port for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {l2 | l3 | multicast} [applied] source port slot/port
```

---

### Syntax Definitions

<b>l2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>l3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>slot/port</i>	The slot and port number of the source address of the flow.

### Defaults

By default, only pending policies are examined.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify l2 source port 3/1
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify destination port

Specifies a destination port for a hypothetical packet to show how the QoS software in the switch will handle the packet.

**show policy classify** {**I2** | **I3** | **multicast**} [**applied**] **destination port** *slot/port*

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>slot/port</i>	The slot and port number of the destination address of the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify I2 destination port 2/1
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify source mac

Specifies a source MAC address for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] source mac mac_address
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>mac_address</i>	The source MAC address of the Layer 2 flow (for example, 00:20:da:05:f6:23) .

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify I2 source mac 00:20:da:05:f6:23
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify destination mac

Specifies a destination MAC address for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 multicast} [applied] destination mac mac_address
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>mac_address</i>	The destination MAC address of the Layer 2 flow (for example, 00:20:da:05:f6:23).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify I2 destination mac 00:20:da:05:f6:23
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

### Release History

Release 6.1; command was introduced.

## Related Commands

[qos apply](#)

Applies configured QoS and policy settings to the current configuration.

[show policy classify](#)

Describes the base command.

---

## show policy classify source vlan

Specifies a source VLAN for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] source vlan vlan_id
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>vlan_id</i>	The destination VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify I2 source vlan 2
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

### Release History

Release 6.1; command was introduced.

## show policy classify destination vlan

Specifies a destination VLAN for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] destination vlan vlan_id
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>vlan_id</i>	The destination VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify I2 destination vlan 3
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

### Release History

Release 6.1; command was introduced.

## show policy classify source interface type

Specifies a source interface type for a hypothetical packet to show how the QoS software in the switch will handle the packet.

**show policy classify** {**l2** | **l3** | **multicast**} [**applied**] **source interface type** {**ethernet** | **wan** | **ethernet-10** | **ethernet-100** | **ethernet-1G** | **ethernet-10G**}

---

### Syntax Definitions

<b>l2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>l3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<b>ethernet</b>	Indicates that the flow's source port is an Ethernet interface.
<b>wan</b>	Indicates that the flow's source port is a WAN interface. <i>Not supported currently.</i>
<b>ethernet-10</b>	Indicates that the flow's source port is 10 Mb Ethernet.
<b>ethernet-100</b>	Indicates that the flow's source port is 100 Mb Ethernet.
<b>ethernet-1G</b>	Indicates that the flow's source port is 1 gigabit Ethernet.
<b>ethernet-10G</b>	Indicates that the flow's source port is 10 gigabit Ethernet.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> policy classify l2 source interface type ethernet
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify 802.1p

Specifies a destination interface type for a hypothetical packet to show how the QoS software in the switch will handle the packet.

**show policy classify** {**l2** | **l3** | **multicast**} [**applied**] **802.1p** *value*

---

### Syntax Definitions

<b>l2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>l3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>value</i>	The 802.1p value for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate saved policies.

### Examples

```
-> show policy classify l2 802.1p 4
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify source ip

Specifies a source IP address for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] source ip ip_address
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>ip_address</i>	The source IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.

### Examples

```
-> show policy classify I3 source ip 1.2.3.4
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify destination ip

Specifies a destination IP address for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] destination ip ip_address
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>ip_address</i>	The destination IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.

### Examples

```
-> show policy classify I3 destination ip 198.60.22.2
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify multicast ip

Specifies a multicast address for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] multicast ip ip_address
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>ip_address</i>	The multicast IP address (the address of the multicast stream).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.

### Examples

```
-> show policy classify multicast multicast ip 224.22.22.1
```

```
Packet headers:
```

```
L2:
```

```
*Port          :                               0/0 (any)  -> 0/0 (any)
*MAC           :                               000000:000000  -> 080020:D1E51
*VLAN          :                               0           -> 0
*802.1p        : 0
```

```
L3/L4:
```

```
*Mcast         :                               224.22.22.1
*IP            :                               0.0.0.0   -> 0.0.0.0
*TOS/DSCP      : 0/0
```

```
Using pending multicast policies
```

```
Classify Multicast:
```

```
*No rule matched: (accept)
```

See the output example given on [page 33-167](#) for information about the displayed fields.

## Release History

---

## show policy classify tos

Specifies a ToS value for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] tos tos_value
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>tos_value</i>	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.
- If a ToS value is specified, a DSCP value may not be specified.

### Examples

```
-> show policy classify I3 tos 7
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

### Release History

Release 6.1; command was introduced.

## show policy classify dscp

Specifies a DiffServ Code Point (DSCP) value for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] dscp dscp_value
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>dscp_value</i>	The DiffServ Code Point value, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.
- If a DSCP value is specified, a ToS value may not be specified.

### Examples

```
-> show policy classify I3 dscp 63
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy classify ip protocol

Specifies an IP protocol for a hypothetical packet to show how the QoS software in the switch will handle the packet.

```
show policy classify {I2 | I3 | multicast} [applied] ip protocol protocol
```

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>protocol</i>	The IP protocol number, for example, 6.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.

### Examples

```
-> show policy classify I3 ip protocol 6
```

## show policy classify source ip port

Specifies a source IP port for a hypothetical packet to show how the QoS software in the switch will handle the packet.

**show policy classify** {**I2** | **I3** | **multicast**} [**applied**] **source ip port** *port*

---

### Syntax Definitions

<b>I2</b>	Uses the Layer 2 classifier for the hypothetical packet.
<b>I3</b>	Uses the Layer 3 classifier for the hypothetical packet.
<b>multicast</b>	Uses the multicast IGMP classifier for the hypothetical packet.
<b>applied</b>	Indicates that only applied policies should be examined.
<i>port</i>	The well-known port number for the desired service. For example, the port number for Telnet is 23.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to determine if the switch will classify the traffic condition specified and match it to a policy. By default the classifier only tests pending policies (policies that have not yet been applied). Use the **applied** keyword to test only those policies that have been applied.
- Use the **qos apply** command to activate policies.

### Examples

```
-> show policy classify I3 source ip port 80
```

See the output example given on [page 33-167](#) for more information about the potential screen display.

## show policy network group

Displays information about pending and applied policy network groups.

**show [applied] policy network group** [*network\_group*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only network groups that have been applied should be displayed.
<i>network_group</i>	The name of the policy network group for which you want to display information; or a wildcard sequence of characters for displaying information about network groups with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy network groups displays unless *network\_group* is specified.
- The display may include any of the following characters:

character	definition
+	Indicates a new policy network group.
-	Indicates the policy network group is pending deletion.
#	Indicates that the policy network group differs between the pending/applied network groups.

### Examples

```
-> show policy network group
Group Name:          From  Entries
Switch               blt  4.0.1.166
                    10.0.1.166
                    143.209.92.166
                    192.85.3.1

+netgroup1          cli  143.209.92.0/255.255.255.0
                    172.28.5.0/255/255/255.0
```

*output definitions*

---

<b>Group Name</b>	The name of the port group, configured through the <b>policy network group</b> command.
<b>From</b>	The way the group was configured: <b>blt</b> indicates a built-in entry; <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through PolicyView
<b>Entries</b>	The IP addresses associated with the network group.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[policy network group](#) Configures policy network groups.

```

---

## show policy service

Displays information about pending and applied policy services.

**show** [**applied**] **policy service** [*service\_name*]

---

### Syntax Definitions

**applied** Indicates that only services that have been applied should be displayed.

*service\_name* The name of the service for which you want to display information; or a wildcard sequence of characters for displaying information about services with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information about all policy services is displayed unless *service\_name* is specified.
- The display may include any of the following characters:

character	definition
+	Indicates a new policy service.
-	Indicates the policy service is pending deletion.
#	Indicates that the policy service differs between the pending/applied services.

### Examples

```
-> show policy service
  Service Name      From      IPProto  ScrPort  DstPort
telnet_service     cli       6 (TCP)  23
+ftp_service       cli       6 (TCP)  21
test_service       cli       6 (TCP)  21

-> show policy service telnet_service
  Service Name      From      IPProto  ScrPort  DstPort
telnet_service     cli       6 (TCP)  23

-> show applied policy service
  Service Name      From      IPProto  ScrPort  DstPort
telnet_service     cli       6 (TCP)  23
test_service       cli       6 (TCP)  21
```

*output definitions*

---

<b>Service Name</b>	The name of the port group, configured through the <b>policy service</b> command.
<b>From</b>	The way the service was configured: <b>blt</b> indicates a built-in entry; <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through PolicyView.
<b>IPProto</b>	The IP protocol associated with the service.
<b>SrcPort</b>	A source port associated with the service.
<b>DstPort</b>	A destination port associated with the service.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[policy service](#) Configures a service that may be used as part of a policy service group.

## show policy service group

Displays information about pending and applied policy service groups.

**show [applied] policy service group** [*service\_group*]

---

### Syntax Definitions

**applied**

Indicates that only service groups that have been applied should be displayed.

*service\_group*

The name of the service group for which you want to display information; or a wildcard sequence of characters for displaying information about service groups with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy service groups displays unless *service\_group* is specified.
- The display may include any of the following characters:

<b>character</b>	<b>definition</b>
+	Indicates a new policy service group.
-	Indicates the policy service group is pending deletion.
#	Indicates that the policy service group differs between the pending/applied service groups.

### Examples

```
-> show policy service group
Group Name:           From  Entries
serv_group1          cli   telnet
                       ftp
serv_group2          cli   telnet
```

*output definitions*

---

<b>Group Name</b>	The name of the port group, configured through the <b>policy service group</b> command.
<b>From</b>	The origin of the service group: <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through PolicyView.
<b>Entries</b>	The services associated with the group. Services are configured through the <b>policy service</b> command.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**policy service group** Configures a service group and its associated services. A service group may be attached to a policy condition.

**MIB Objects**

```

    alaQoSServiceGroupsName
    alaQoSServiceGroupsSource
alaQoSAppliedServiceGroupsTable
    alaQoSAppliedServiceGroupsName
    alaQoSAppliedServiceGroupsSource
alaQoSServiceGroupTable
    alaQoSServiceGroupServiceName
alaQoSAppliedServiceGroupTable
    alaQoSAppliedServiceGroupServiceName

```

---

## show policy mac group

Displays information about pending and applied MAC groups.

**show** [**applied**] **policy mac group** [*mac\_group*]

---

### Syntax Definitions

**applied**

Indicates that only MAC groups that have been applied should be displayed.

*mac\_group*

The name of the MAC group for which you want to display information; or a wildcard sequence of characters for displaying information about MAC groups with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy MAC groups displays unless *mac\_group* is specified.
- The display may include any of the following characters:

<b>character</b>	<b>definition</b>
+	Indicates a new policy MAC group.
-	Indicates the policy MAC group is pending deletion.
#	Indicates that the policy MAC group differs between the pending/applied MAC groups.

### Examples

```
-> show policy mac group
Group Name:                From  Entries
pubsl                       cli   0020da:05f623
                              0020da:05f624
                              143.209.92.166
                              192.85.3.1

+yuba                       cli   080020:D16E51
                              172.28.5.0/255/255/255.0
```

*output definitions*

---

<b>Group Name</b>	The name of the port group, configured through the <b>policy mac group</b> command.
<b>From</b>	The origin of the MAC group: <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through PolicyView.
<b>Entries</b>	The MAC addresses associated with the group.

## show policy port group

Displays information about pending and applied policy port groups.

**show** [**applied**] **policy port group** [*group\_name*]

---

### Syntax Definitions

**applied** Indicates that only policy port groups that have been applied should be displayed.

*group\_name* The name of the policy port group for which you want to display information; or a wildcard sequence of characters for displaying information about port groups with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy port groups displays unless *group\_name* is specified.
- The display may include any of the following characters:

<b>character</b>	<b>definition</b>
+	Indicates a new policy port group.
-	Indicates the policy port group is pending deletion.
#	Indicates that the policy port group differs between the pending/applied port groups.

### Examples

```
-> show policy port group
Group Name:           From  Entries
Slot01                b1t
Slot02                b1t
Slot03                b1t
Slot04                b1t
Slot05                b1t
Slot06                b1t
Slot07                b1t
```

Slot08	blt
pgroup1	cli 2/1 3/1 3/2
pgroup2	cli 2/2 2/3

**output definitions**

---

<b>Group Name</b>	The name of the port group, configured through the <b>policy port group</b> command or built-in port groups automatically set up by the switch ( <b>Slot01, Slot02, Slot03</b> , etc.).
<b>From</b>	The origin of the port group: <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through Policy-View; <b>blt</b> indicates the entry was set up automatically by the switch based on the current hardware.
<b>Entries</b>	The slot/port combinations associated with the port group.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**policy port group** Configures a port group and its associated slot and port numbers.

## show policy vlan group

Displays information about pending and applied policy VLAN groups.

**show** [**applied**] **policy vlan group** [*group\_name*]

---

### Syntax Definitions

#### **applied**

Displays only those policy VLAN groups that have been applied.

#### *group\_name*

The name of the policy VLAN group for which you want to display information; or a wildcard sequence of characters for displaying information about VLAN groups with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

By default, all VLAN groups are displayed with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the *group\_name* parameter to display information for a specific VLAN group.
- The display may include any of the following characters:

<b>character</b>	<b>definition</b>
+	Indicates a new policy port group.
-	Indicates the policy port group is pending deletion.
#	Indicates that the policy port group differs between the pending/applied port groups.

### Examples

```
-> show policy vlan group
Group Name      vlan                From
-----+-----+-----
Vlan_grp1      100                 cli
Vlan_grp1      101                 cli
Vlan_grp1      200                 cli
Vlan_grp2      1234                cli
Vlan_grp3      2000                cli
Vlan_grp3      2001                cli
Vlan_grp3      2003-2005           cli
Vlan_grp3      2500                cli
Vlan_grp3      3000                cli
```

```

-> show policy vlan group
Group Name      vlan      From
-----+-----+-----
Vlan_grp2      1234      cli

```

### *output definitions*

---

<b>Group Name</b>	The name of the VLAN group.
<b>VLAN</b>	The VLAN IDs associated with the VLAN group.
<b>From</b>	The origin of the VLAN group: <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through PolicyView; <b>blt</b> indicates the entry was set up automatically by the switch based on the current hardware.

## show policy map group

Displays information about pending and applied policy map groups.

**show** [**applied**] **policy map group** [*group\_name*]

---

### Syntax Definitions

**applied** Indicates that only map groups that have been applied should be displayed.

*group\_name* The name of the policy map group for which you want to display information; or a wildcard sequence of characters for displaying information about map groups with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy map groups displays unless *group\_name* is specified.
- The display may include any of the following characters:

character	definition
+	Indicates a new policy port group.
-	Indicates the policy port group is pending deletion.
#	Indicates that the policy port group differs between the pending/applied port groups.

### Examples

```
-> show policy map group
Group Name          From  Entries
+tosGroup           cli   1-2:4
                   4:5
```

#### output definitions

---

<b>Group Name</b>	The name of the map group, configured through the <b>policy map group</b> command.
<b>From</b>	The origin of the port group: <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through Policy-View.
<b>Entries</b>	The slot/port combinations associated with the port group.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

## show policy action

Displays information about pending and applied policy actions configured on the switch.

**show** [**applied**] **policy action** [*action\_name*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only actions that have been applied should be displayed.
<i>action_name</i>	The name of the action for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy actions displays unless *action\_name* is specified.
- The display may include any of the following characters:

character	definition
+	Indicates a new policy action.
-	Indicates the policy action is pending deletion.
#	Indicates that the policy action differs between the pending/applied actions.

### Examples

```
-> show policy action
```

```

Action Name From  Disp  Pri Share Bandwidth          Burst size
           Min Max CIR PIR Max-Depth Bufs CBS  PBS To
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
A3          cli  accept  No          10M
+A4          cli  accept  No          10M
A5          cli  accept  No          10M 10M
A6          cli  accept  No
+A7          cli  accept  No
+A8          cli  accept  Yes
action1     cli  accept  No          10M 20M
action2     cli  accept  No          10M 20M

```

```
-> show policy action a5
```

Action Name	From	Disp	Pri	Share	Bandwidth				Burst size				
					Min	Max	CIR	PIR	Max-Depth	Bufs	CBS	PBS	To
A5	cli	accept	No				10M	10M				4K	

```
-> show applied policy action
```

Action Name	From	Disp	Pri	Share	Bandwidth				Burst size				
					Min	Max	CIR	PIR	Max-Depth	Bufs	CBS	PBS	To
A3	cli	accept	No				10M						
A5	cli	accept	No				10M	10M				4K	
A6	cli	accept	No										
action1	cli	accept	No				10M	20M				4K	
action2	cli	accept	No				10M	20M				4K	40M

```
-> show policy action action*
```

Action Name	From	Disp	Pri	Share	Bandwidth				Burst size				
					Min	Max	CIR	PIR	Max-Depth	Bufs	CBS	PBS	To
action1	cli	accept	No				10M	20M				4K	
action2	cli	accept	No				10M	20M				4K	40M

### output definitions

<b>Action Name</b>	The name of the action, configured through the <b>policy action</b> command.
<b>From</b>	Where the policy rule originated: <b>cli</b> indicates that the entry was configured on the switch; <b>ldap</b> indicates the entry was configured through PolicyView.
<b>Disp</b>	The disposition of the rule, either <b>accept</b> or <b>deny</b> .
<b>Pri</b>	The priority configured for the rule.
<b>Share</b>	Whether or not the rule specifies that the queue should be shared.
<b>Min Bandwidth</b>	The minimum bandwidth required by the rule.
<b>Max Bandwidth</b>	The maximum bandwidth required by the rule.
<b>Max Depth Bufs</b>	Maximum depth (in Kbytes) of queues for traffic.

### Release History

Release 6.1; command was introduced.

### Related Commands

#### **policy action**

Creates a policy action. A QoS action is a particular set of bandwidth and queue parameters that may be applied to a flow matching particular QoS conditions.

## show policy condition

Displays information about pending and applied policy conditions.

**show [applied] policy condition** [*condition\_name*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only conditions that have been applied should be displayed.
<i>condition_name</i>	The name of the condition for which you want to display information; or a wildcard sequence of characters for displaying information about conditions with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all policy conditions displays unless *condition\_name* is specified.
- The display may include any of the following characters:

character	definition
+	Indicates a new policy condition.
-	Indicates the policy condition is pending deletion.
#	Indicates that the policy condition differs between the pending/applied conditions.

### Examples

```
-> show policy condition
Condition Name:          From  Src  ->  Dest
pcond1                  cli
*IP      :                Any  ->  198.60.82.0/255.255.255.0

+c4                      cli

## show active policy rule

Displays information about applied policy rules that are active (enabled) on the switch.

**show active** [**bridged** | **routed** | **multicast**] **policy rule** [*rule\_name*]

---

### Syntax Definitions

<b>bridged</b>	Displays active rules that apply to bridged traffic.
<b>routed</b>	Displays active rules that apply to routed traffic.
<b>multicast</b>	Displays active rules that apply to multicast traffic.
<i>rule_name</i>	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all rules is displayed unless *rule\_name* is specified.
- Use the **show policy rule** command to display inactive as well as active policy rules.
- Information for all rule types is displayed unless a keyword (**bridged**, **routed**, **multicast**) is specified.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option in the **policy rule** command.
- The display may include any of the following characters:

---

<b>character</b>	<b>definition</b>
+	Indicates that the policy rule has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy object is pending deletion.
#	Indicates that the policy object differs between the pending/applied objects.

---

- A match may show for a rule that is not the highest precedence rule for a particular flow, but only the rule with the highest precedence is actually applied.

## Examples

```

-> show active policy rule
      Policy
R1      From  Prec  Enab  Act  Refl  Log  Trap  Save  Def  Matches
(L2/3): cli    0   Yes  Yes   No   No   Yes  Yes  Yes  Yes   2
      C1 -> QoS_Action1

R2      cli    0   Yes  Yes   No   No   Yes  Yes  Yes  Yes   0
(L2/3): C2 -> QoS_Action1

R3      cli    0   Yes  Yes   No   No   Yes  Yes  Yes  Yes   0
(L2/3): C3 -> QoS_Action1

```

### output definitions

<b>Policy</b>	The name of the policy rule, configured through the <b>policy rule</b> command. A plus sign (+) preceding a policy rule name indicates that the policy rule has been modified or has been created since the last <b>qos apply</b> .
<b>From</b>	Where the rule originated.
<b>Prec</b>	The precedence of the rule. Precedence determines the order in which the switch will apply rules.
<b>Enab</b>	Whether or not the rule is administratively enabled. (By default, rules are enabled.)
<b>Act</b>	Whether or not the rule is enforceable by the switch (e.g., qos is enabled, rule is valid and enabled, validity period is active).
<b>Refl</b>	Whether the rule is reflexive or not.
<b>Log</b>	Whether or not the switch will log messages about specific flows coming into the switch that match this policy rule. Configured through the <b>policy rule</b> command.
<b>Trap</b>	Whether or not traps are enabled for the rule. Configured through the <b>policy rule</b> command. A trap is sent when a port is administratively disabled through a port disable action or a UserPort shutdown function.
<b>Save</b>	Whether the rule will be captured in an ASCII text file (using the <b>configuration snapshot</b> command), saved to the working directory after the <b>write memory</b> command or <b>reload issu</b> command is entered, or saved after a reboot. Configured through the <b>policy rule</b> command.
<b>Def</b>	Whether or not the rule is a member of the default policy list. Configured through the <b>policy rule</b> command.
<b>Matches</b>	The number of flows matching this rule. Note that for ingress maximum bandwidth policies, the value in this field indicates the number of packets that exceed the bandwidth limit, not the packets that match the rule.
<b>{L2/3}</b>	The condition and the action associated with the rule; configured through the <b>policy condition</b> and <b>policy action</b> commands respectively.

## Release History

Release 6.1; command was introduced.

Release 6.1.1; **Trap** column added; **Inact** column changed to **Act**.

Release 6.3.4; **Def** column added.

---

## show active policy rule meter-statistics

Displays Tricolor Marking (TCM) packet color statistics for the policy rule. These statistics are kept for those rules that consist of a TCM policy action (**policy action cir**). A counter color mode is specified with the TCM policy action. The counter color mode determines which counter color statistics are displayed with this command.

**show active policy rule** [*rule\_name*] **meter-statistics**

---

### Syntax Definitions

*rule\_name*                                      The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

By default, statistics are displayed for all rules.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the optional *rule\_name* parameter to display statistics for a specific policy rule.
- This command displays statistics for applied policy rules that are active (enabled) on the switch. Use the **show policy rule** command to display inactive as well as active policy rules.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option in the **policy rule** command.
- Statistics are shown only for two out of the five available counter colors. The two counters shown are determined by the counter color mode configured for the TCM policy action. See the **policy action cir** command for more information.
- A TCM action specifies the rates and burst sizes used to determine drop precedence for packets to which the action is applied. Packets are marked a certain color based on whether or not they conform to the specified rates and burst sizes. The packet color indicates the drop precedence (Green = low drop precedence, Yellow = high drop precedence, and Red = packet is always dropped).
- Counter color statistics are shown even if there is no bandwidth management configured for the rule. In this case, the green counter will display the number of packets that matched the rule and the nongreen counter is set to zero.

### Examples

The following command examples display statistics for the Green and Red counters. These are the two counters specified by the TCM policy action that is assigned to the “R1” and “R2” policy rules.

```
-> show active policy rule meter-statistics
Policy: R1, Counter Color Mode: GREEN_RED,
  Green      :      75,      Non-Green   :      0,
  Red        :      50,      Non-Red     :      0,
  Yellow     :           0
```

```
Policy: R2, Counter Color Mode: GREEN_RED,  
Green      :      70,      Non-Green :      0,  
Red        :      50,      Non-Red   :      0,  
Yellow     :           0
```

```
-> show active policy rule r2 meter-statistics  
Policy: R2, Counter Color Mode: GREEN_RED,  
Green      :      70,      Non-Green :      0,  
Red        :      50,      Non-Red   :      0,  
Yellow     :           0
```

### *output definitions*

---

<b>Policy</b>	The name of the policy rule, configured through the <a href="#">policy rule</a> command.
<b>Counter Color Mode</b>	The counter color mode configured for the TCM policy action using the <a href="#">policy action cir</a> command.
<b>Green</b>	Packets marked green as a result of the TCM policy action; green packets have a low drop precedence.
<b>Red</b>	Packets marked red as a result of the TCM policy action; red packets are always dropped.
<b>Yellow</b>	The number of packets marked yellow as a result of the TCM policy action; yellow packets have a high drop precedence.
<b>Non-Green</b>	The number of yellow and red packets combined.
<b>Non-Red</b>	The number of green and yellow packets combined.

---

## Release History

Release 6.4.3; command was introduced.

## Related Commands

<a href="#">policy action cir</a>	Configures a TCM policy action, including the counter color mode for the action.
<a href="#">qos stats reset</a>	Resets QoS statistic counters to zero.
<a href="#">show policy action</a>	Displays information for policy actions configured on the switch.
<a href="#">show policy rule</a>	Displays information for policy rules configured on the switch.

## MIB Objects

```

```

---

## show policy rule

Displays information about pending and applied policy rules.

```
show [applied] [bridged | routed | multicast] policy rule [rule_name]
```

---

### Syntax Definitions

<b>applied</b>	Indicates that only policy rules that have been applied should be displayed.
<b>bridged</b>	Displays rules that apply to bridged traffic.
<b>routed</b>	Displays rules that apply to routed traffic.
<b>multicast</b>	Displays rules that apply to multicast traffic.
<i>rule_name</i>	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all rules is displayed unless *rule\_name* is specified.
- Information for all rule types is displayed unless a keyword (**bridged**, **routed**, **multicast**) is specified.
- Use the **show active policy rule** command to display only active rules that are currently being enforced on the switch.
- The display may include any of the following characters:

---

<b>character</b>	<b>definition</b>
+	Indicates that the policy rule has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy object is pending deletion.
#	Indicates that the policy object differs between the pending/applied objects.

---

## Examples

```

-> show policy rule
      Policy
r1      From Prec Enab  Act Refl Log Trap Save Def
(L2/3): cli    0  Yes   Yes  No  No  Yes  Yes Yes
        c1 -> a1

r2      cli    0  Yes   Yes  No  No  Yes  Yes Yes
(L2/3): c2 -> a2

+r3     cli    0  Yes   Yes  No  No  Yes  Yes No
(L2/3): c2 -> a3

+r4     cli    0  Yes   Yes  No  No  Yes  Yes No
(L2/3): c1 -> a1

-> show applied policy rule
      Policy
r1      From Prec Enab  Act Refl Log Trap Save Def
(L2/3): cli    0  Yes   Yes  No  No  Yes  Yes Yes

r2      cli    0  Yes   Yes  No  No  Yes  Yes Yes
(L2/3): c2 -> a2

```

### *output definitions*

<b>Policy</b>	The name of the policy rule, configured through the <b>policy rule</b> command. A plus sign (+) preceding a policy rule name indicates that the policy rule has been modified or has been created since the last <b>qos apply</b> .
<b>From</b>	Where the rule originated.
<b>Prec</b>	The precedence of the rule. Precedence determines the order in which the switch will apply rules. Configured through the
<b>Enab</b>	Whether or not the rule is enabled.
<b>Act</b>	Whether or not the rule is enforceable by the switch (e.g., qos is enabled, rule is valid and enabled, validity period is active).
<b>Refl</b>	Whether the rule is reflexive or not.
<b>Log</b>	Whether or not the switch will log messages about specific flows coming into the switch that match this policy rule. Configured through the <b>policy rule</b> command.
<b>Trap</b>	Whether or not traps are enabled for the rule. Configured through the <b>policy rule</b> command. A trap is sent when a port is administratively disabled through a port disable action or a UserPort shutdown function.
<b>Save</b>	Whether the rule will be captured in an ASCII text file (using the <b>configuration snapshot</b> command), saved to the working directory after the <b>write memory</b> command or <b>reload issu</b> command is entered, or saved after a reboot. Configured through the <b>policy rule</b> command.

*output definitions*

---

<b>Def</b>	Whether or not the rule is a member of the default policy list. Configured through the <b>policy rule</b> command.
<b>{L2/3}</b>	The condition and the action associated with the rule; configured through the <b>policy condition</b> and <b>policy action</b> commands respectively.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.1; **Trap** column added; **Inact** column changed to **Act**.

Release 6.3.4; **Def** column added.

**Related Commands**

**show active policy rule** Displays only those policy rules that are currently being enforced on the switch.

**show policy list** Displays information for policy lists configured on the switch.

```

---

## show active policy list

Displays information about applied policy lists that are active (enabled) on the switch.

**show active policy list** [*list\_name*]

---

### Syntax Definitions

*list\_name* The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all active rules is displayed unless a *list\_name* is specified.
- Use the [show policy list](#) command to display inactive as well as active policy lists.
- Applied lists may or may not be active on the switch. Applied lists are inactive if they have been administratively disabled with the **disable** option in the **policy list** command.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

### Examples

```
-> show active policy list
Group Name                From  Type  Enabled  Entries
-----
list1                     cli   unp   Yes      r1
                           r2
+list2                    cli   unp   Yes      r3
egress_list1             cli   egress Yes      r1
                           r2
                           r3
```

*output definitions*

---

<b>Group Name</b>	The name of the policy list. Configured through the <b>policy list</b> command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last <b>qos apply</b> .
<b>From</b>	Where the list originated.
<b>Type</b>	The type of rule ( <b>unp</b> or <b>egress</b> ). Configured through the <b>policy list</b> command. Note that the default policy list is not shown. Use the <b>show policy rule</b> command to display rules that are members of the default policy list.
<b>Enabled</b>	Whether or not the rule is enabled. Configured through the <b>policy list</b> command.
<b>Entries</b>	The QoS policy rules that are grouped together in this policy list. Configured through the <b>policy list</b> command.

---

**Release History**

Release 6.3.4; command was introduced.  
Release 6.4.3; **egress** policy list type supported.

**Related Commands**

**show policy list** Displays information about pending and applied policy lists.  
**show policy rule** Displays information about pending and applied policy rules

**MIB Objects**

## show policy list

Displays information about pending and applied policy lists.

**show [applied] policy list** [*list\_name*]

---

### Syntax Definitions

**applied** Displays only those policy lists that have been applied to the switch configuration.

*list\_name* The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Information for all rules is displayed unless a *list\_name* is specified.
- Use the [show active policy list](#) command to display only active policy lists that are currently enforced on the switch.
- The display may include any of the following characters:

character	definition

# 34 Policy Server Commands

This chapter describes CLI commands used for managing policies downloaded to the switch from an attached LDAP server. Policy rules may be created on an attached server through the PolicyView GUI application. Policy rules may also be created on the switch directly through CLI or SNMP commands. This chapter describes commands related to managing LDAP policies only. See [Chapter 32, “QoS Commands,”](#) for information about commands for creating and managing policies directly on the switch.

The policy commands are based on RFC 2251 and RFC 3060.

MIB information for policy server commands is as follows:

*Filename:* alcatelIND1policy.mib  
*Module:* ALCATEL-IND1-POLICY-MIB

The policy server commands are summarized here:

---

**[policy server load](#)**  
**[policy server flush](#)**  
**[policy server](#)**  
**[show policy server](#)**  
**[show policy server long](#)**  
**[show policy server statistics](#)**  
**[show policy server rules](#)**  
**[show policy server events](#)**

---

## policy server load

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

**policy server load**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Policies are downloaded to the switch from the directory server with the highest preference setting; this server must be enabled and operational (able to bind).

### Examples

```
-> policy server load
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[policy server flush](#) Removes all cached LDAP policy data from the switch.

### MIB Objects

```
serverPolicyDecision
```

---

## policy server flush

Removes all cached LDAP policy data from the switch.

**policy server flush**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to remove LDAP policies. Policies configured through the CLI or SNMP are not removed.

### Examples

```
-> policy server flush
```

### Release History

Release 6.1; command was introduced.

### Related Commands

#### [policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

### MIB Objects

```
serverPolicyDecision
```

---

## policy server

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

**policy server** *ip\_address* [**port** *port\_number*] [**admin** {**up** | **down**}] [**preference** *preference*] [**user** *user\_name* **password** *password*] [**searchbase** *search\_string*] [**ssl** | **no ssl**]

**no policy server** *ip\_address* [**port** *port\_number*]

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the LDAP-enabled directory server.
<i>port_number</i>	The TCP/IP port number used by the switch to connect to the directory server.
<b>up</b>	Enables the specified policy server to download rules to the switch (servers are <b>up</b> by default.)
<b>down</b>	Prevents the specified policy server from downloading rules to the switch.
<i>preference</i>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<i>user_name</i>	The user name for accessing the database entries on the directory server. When spaces are used in the user name, quotation marks must be included: “ <b>Directory Manager</b> ” is an example.
<i>password</i>	The password associated with the user name. The password must match the password defined on the directory server.
<i>search_string</i>	The root of the directory on the search that will be searched for policy information. Typically, the <i>search_string</i> includes <b>o=organization</b> and <b>c=country</b> . For example, <b>o=company</b> and <b>c=country</b> .
<b>ssl</b>	Enables a Secure Socket Layer between the switch and the policy server.
<b>no ssl</b>	Disables a Secure Socket Layer between the switch and the policy server.

## Defaults

<b>parameter</b>	<b>default</b>
<b>admin</b>	<b>up</b>
<i>port_number</i>	389 (SSL disabled) 636 (SSL enabled)
<i>preference</i>	0
<b>ssl   no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

If you change the port number, another entry is added to the policy server table; an existing port number is not changed. To remove a port number, use the **no** form of this command with the relevant policy server IP address and the port number you want to remove.

## Examples

```
-> policy server 222.22.22.2 port 345 user dirmgr password secret88 searchbase  
ou=qos,o=company,c=country
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[show policy server](#) Displays information about policies downloaded from an LDAP server.

## MIB Objects

```
DIRECTORYSERVERTABLE  
  directoryServerAddress  
  directoryServerPort  
  directoryServerAdminStatus  
  directoryServerPreference  
  directoryServerUserId  
  directoryServerAuthenticationType  
  directoryServerPassword  
  directoryServerSearchbase  
  directoryServerEnableSSL
```

---

## show policy server

Displays information about servers from which policies may be downloaded to the switch.

**show policy server**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays basic information about policy servers. Use the **show policy server long** command to display more details about the servers.

### Examples

```
-> show policy server
```

```
Server  IP Address  port  enabled  status  primary
-----+-----+-----+-----+-----+-----
   1    208.19.33.112  389    Yes     Up      X
   2    208.19.33.66   400    No      Down    -
```

### *output definitions*

---

<b>Server</b>	The index number corresponding to the LDAP server.
<b>IP Address</b>	The IP address of the LDAP server.
<b>port</b>	The TCP/IP port number used by the switch to connect to the policy server.
<b>enabled</b>	Whether or not the policy server is enabled.
<b>status</b>	The state of the policy server, <b>Unkn</b> , <b>Up</b> or <b>Down</b> .
<b>primary</b>	Indicates whether the server is the primary server; this server will be used for the next download of policies; only one server is a primary server.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### [policy server](#)

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

## MIB Objects

```
directoryServerTable
  directoryServerAddress
  directoryServerPort
  directoryServerAdminState
```

---

## show policy server long

Displays more detailed information about an LDAP policy server.

**show policy server long**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays detailed information about policy servers. Use the **show policy server** command to display basic information about policy servers.

### Examples

```
-> show policy server long
LDAP server 0
  IP address       : 155.132.44.98,
  TCP port         : 16652,
  Enabled          : Yes,
  Operational status : Unkn,
  Preference       : 99,
  Authentication   : password,
  SSL              : Disabled,
  login DN         : cn=Directory Manager,
  searchbase       : ou:4.1, cn=policyRoot, o=company.fr
  Last load time   : 09/13/01 16:38:18
LDAP server 1
  IP address       : 155.132.48.27,,
  TCP port         : 21890,
  Enabled          : Yes,
  Operational status : Unkn,
  Preference       : 50,
  Authentication   : password,
  SSL              : Disabled,
  login DN         : cn=Directory Manager,
  searchbase       : o=company.fr
  Last load time   : 00/00/00 00:00:00
```

### *output definitions*

---

<b>IP address</b>	The IP address of the policy server.
<b>TCP port</b>	The TCP/IP port number used by the switch to connect to the policy server.

*output definitions (continued)*

---

<b>Enabled</b>	Whether or not the policy server is enabled via the PolicyView application.
<b>Operational status</b>	The state of the policy server, <b>Up</b> or <b>Down</b> .
<b>Preference</b>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<b>Authentication</b>	Displays <b>password</b> if a user name and password was specified for the server through the <b>policy server</b> command. Displays <b>anonymous</b> if a user name and password are not configured.
<b>login DN</b>	The directory user name.
<b>searchbase</b>	The searchbase name, which is the root of the directory that will be searched for policy download information.
<b>Last load time</b>	The date and time that policies were last downloaded. Values of zero indicate that no policies have been downloaded.

---

**Release History**

Release 6.1; command was introduced.

**MIB Objects**

```
directoryServerTable
  directoryServerAddress
  directoryServerPort
  directoryServerPreference
  directoryServerAuthenticationType
  directoryServerSearchbase
  directoryServerUserId
  directoryServerPassword
  directoryServerCacheChange
  directoryServerLastChange
  directoryServerAdminStatus
  directoryServerOperStatus
```

---

## show policy server statistics

Displays statistics about policy directory servers.

**show policy server statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays statistics about server downloads. For information about server parameters, use the **show policy server** command.

### Examples

```
-> show policy server statistics
Server  IP Address      port  accesses  delta  successes delta  errors  delta
-----+-----+-----+-----+-----+-----+-----+-----+-----
   1    155.132.44.98 16652    793     793     295     295     0       0

### output definitions

---

<b>Server</b>	The index number corresponding to the server.
<b>IP Address</b>	The IP address of the LDAP server.
<b>port</b>	The TCP/IP port number used by the switch to connect to the policy server.
<b>accesses</b>	The number of times the server was polled by the switch to download policies.
<b>delta</b>	The change in the number of accesses since the last time the policy server was accessed.
<b>successes</b>	The number of times the server was polled by the switch to download policies and the policies were successfully downloaded.
<b>delta</b>	The change in the number of successful policy downloads since the last time the policy server was accessed.
<b>errors</b>	The number of errors returned by the server.
<b>delta</b>	The change in the number of errors returned by the server since the last time the policy server was accessed.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

### [policy server](#)

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

## MIB Objects

policyStatsTable

    policyStatsAddress

    policyStatsServerPort

    policyStatsAccessCount

    policyStatsSuccessAccessCount

    policyStatsNotFoundCount

---

## show policy server rules

Displays the names of policies originating on a directory server that have been downloaded to the switch.

**show policy server rules**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays information about policies created on directory servers only. [Chapter 32, “QoS Commands,”](#) for information about configuring and displaying policies directly on the switch.

### Examples

```
-> show policy server rules
Num      name          prio      scope      status
-----+-----+-----+-----+-----
1         QoSRule1       0         Provisioned Active
2         QoSrule2       0         Provisioned Active
```

Fields are defined here:

#### *output definitions*

---

<b>Num</b>	An index number corresponding to the policy rule.
<b>name</b>	The name of the policy rule; only rules configured through PolicyView are displayed in this table.
<b>prio</b>	The priority or preference of the rule. Indicates the order in which rules will be checked for matching to incoming traffic. If two or more rules apply to the traffic, the rule with the highest preference is applied. Preference is determined when the rule is created.
<b>scope</b>	The type of rule. <b>Provisioned</b> is the only type valid currently.
<b>status</b>	The status of the rule: <b>Active</b> indicates that the rule has been pushed to the QoS software in the switch and is available to apply to traffic; <b>notInService</b> means the rule may be pushed to the QoS software in the future but is not available yet (typically because of a variable validity period); <b>notReady</b> indicates that the rule will never be pushed to the QoS software because its validity period has expired or because it has been disabled through SNMP.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

### [policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

## show policy server events

Displays any events related to a directory server on which policies are stored.

**show policy server events**

---

### Syntax Definitions

N/A

### Defaults

The display is limited to 50 events.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The Policy Manager initialization event is always the first event logged.

### Examples

```
-> show policy server events
  Event Time                event description
-----+-----
09/13/01 16:38:15 Policy manager log init

# 35 802.1X Commands

This chapter includes information about commands used for configuring and viewing port-specific 802.1X parameters. Included in this command set are specific commands used to configure Access Guardian policies (also referred to as device classification policies) for 802.1X ports.

MIB information for the 802.1X port commands is as follows:

*Filename:* IEEE\_8021X.mib  
*Module:* IEEE8021-PAE-MIB

A summary of the available commands is listed here:

---

<b>802.1X port commands</b>	<b>802.1x</b> <b>802.1x initialize</b> <b>802.1x re-authenticate</b> <b>802.1x supp-polling retry</b> <b>show 802.1x</b> <b>show 802.1x statistics</b> <b>show 802.1x non-supplicant</b>
<b>Access Guardian commands</b>	<b>802.1x supplicant bypass</b> <b>802.1x non-supplicant allow-eap</b> <b>802.1x supplicant policy authentication</b> <b>802.1x non-supplicant policy authentication</b> <b>802.1x non-supplicant policy</b> <b>802.1x policy default</b> <b>802.1x captive-portal policy authentication</b> <b>802.1x captive-portal name</b> <b>802.1x captive-portal session-limit</b> <b>802.1x captive-portal inactivity-logout</b> <b>802.1x captive-portal retry-count</b> <b>802.1x captive-portal address</b> <b>802.1x captive-portal proxy-server-url</b> <b>802.1x captive-portal proxy-server-port</b> <b>802.1x captive-portal dns-keyword-list</b> <b>802.1x captive-portal success-redirect-url</b> <b>802.1x captive-portal fail-redirect-url</b> <b>802.1x auth-server-down</b> <b>802.1x auth-server-down policy</b> <b>802.1x auth-server-down re-authperiod</b> <b>show 802.1x device classification policies</b> <b>show 802.1x captive-portal configuration</b> <b>show 802.1x auth-server-down</b>

---

## 802.1x

Configures 802.1X parameters on a particular slot/port. Typically used for port access control on a dedicated 802.1X port.

**802.1x** *slot/port* [**direction** {**both** | **in**}] [**port-control** {**force-authorized** | **force-unauthorized** | **auto**}] [**quiet-period** *seconds*] [**tx-period** *seconds*] [**supp-timeout** *seconds*] [**server-timeout** *seconds*] [**max-req** *max\_req*] [**re-authperiod** *seconds*] [**reauthentication** | **no reauthentication**]

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>both</b>	Configures bidirectional control on the port.
<b>in</b>	Configures control over incoming traffic only.
<b>force-authorized</b>	Forces the port control to be authorized, which means that the port is open without restrictions and behaves as any other non-802.1X port. Devices do not need to authenticate to traffic through the port.
<b>force-unauthorized</b>	Forces the port control to be unauthorized, which means the port cannot accept any traffic.
<b>auto</b>	Configures the switch to dynamically control the port control status based on authentication exchanges between the 802.1X end station and the switch. Initially the port is in an unauthorized state; it becomes authorized if a device successfully completes an 802.1X authentication exchange with the switch.
<b>quiet-period</b> <i>seconds</i>	The time during which the port will not accept an 802.1X authentication attempt; the timer is activated after any authentication failure. During the time period specified, the switch will ignore and discard all Extensible Authentication Protocol over LAN (EAPOL) packets. The range is 0 to 65535 seconds.
<b>tx-period</b> <i>seconds</i>	The time before an EAP Request Identity will be re-transmitted. The range is 1 to 65535 seconds.
<b>supp-timeout</b> <i>seconds</i>	The number of seconds before the switch will time out an 802.1X user who is attempting to authenticate. The value should be modified to be a greater value if the authentication process will require additional steps by the user (for example, entering a challenge).
<b>server-timeout</b> <i>seconds</i>	The timeout for the authentication server for authentication attempts. This value is always superseded by the value configured for the RADIUS authentication server configured through the <b>aaa radius-server</b> command.
<i>max_req</i>	The maximum number of times the switch will retransmit a request for authentication information (request identity, password, challenge, etc.) to the 802.1X user before it times out the authentication session based on the <b>supp-timeout</b> . The range is 1 to 10.

<b>re-authperiod</b> <i>seconds</i>	The amount of time that must expire before the switch requires re-authentication of the Supplicant on this port. Only applicable when re-authentication is enabled.
<b>reauthentication</b>	Specifies that the port will be reauthenticated after the <b>re-authperiod</b> timer expires.
<b>no reauthentication</b>	Specifies that the port will not be reauthenticated unless the <b>802.1x re-authenticate</b> command is entered.

### Defaults

parameter	default
<b>both</b>   <b>in</b>	both
<b>force-authorized</b>   <b>force-unauthorized</b>   <b>auto</b>	auto
<b>quiet-period</b> <i>seconds</i>	60
<b>tx-period</b> <i>seconds</i>	30
<b>supp-timeout</b> <i>seconds</i>	30
<i>max_req</i>	2
<b>re-authperiod</b> <i>seconds</i>	3600
<b>reauthentication</b>   <b>no reauthentication</b>	no reauthentication

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To set the port to accept any traffic without requiring 802.1X authentication, use the **force-authorized** option.
- Use the **vlan port 802.1x** command with the **disable** option to disable 802.1X authentication on the port.
- Before any device is authenticated through an 802.1X port, the port will only process 802.1X frames (EAPoL frames) from an unknown source.
- Note that multiple devices can be authenticated on a given 802.1X port. Each device MAC address received on the port is authenticated and learned separately. Only those that authenticate successfully are allowed on the port, as described above. Those that fail authentication are blocked from accessing the 802.1X port.

### Examples

```
-> 802.1x port 3/1 quiet-period 30
```

### Release History

Release 6.1; command was introduced.

---

## 802.1x supp-polling retry

Configures the number of times to poll a device for EAP frames to determine whether or not the device is an 802.1x client.

**802.1x slot/port supp-polling retry retries**

---

### Syntax Definitions

<i>slot</i>	The slot number of the 802.1x port.
<i>port</i>	The 802.1x port number.
<i>retries</i>	The number of times a device is polled for EAP frames (0–99).

### Defaults

By default, the number of retries is set to 2.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guideline

- The polling interval is 0.5 seconds between each retry.
- If no EAP frames are received from a device connected to an 802.1x port, the device is considered a non-802.1x client (non-supPLICANT).
- Specify **0** for the number of retries to bypass polling attempts and automatically classify the device connected to the 802.1x port as a non-supPLICANT.
- Any devices previously authenticated on the port remain authenticated; however, re-authentication will not occur.
- If a guest VLAN is configured on the 802.1x port, the non-802.1x client is assigned to the guest VLAN. If a guest VLAN does not exist, the device is blocked from accessing the 802.1x port.

### Examples

```
-> 802.1x 3/1 supp-polling retry 5
-> 802.1x 3/9 supp-polling retry 10
-> 802.1x 2/1 supp-polling retry 0
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; command modified to accept **0** for the number of retries.

## Related Commands

**show 802.1x non-supplicant**

Displays a list of all non-802.1x supplicants learned on one or more 802.1x ports.

## MIB Objects

alaDot1xSuppPollingCnt

---

## 802.1x supplicant bypass

Configures whether or not MAC authentication is applied first to any client device (supplicant or non-supplicant) that is trying to connect through the specified 802.1x port.

**802.1x slot/port supplicant bypass {enable | disable}**

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>enable</b>	Enables supplicant bypass on the specified port; MAC authentication is performed first.
<b>disable</b>	Disables supplicant bypass on the specified port; 802.1x authentication is attempted first.

### Defaults

By default, supplicant bypass is disabled; 802.1x authentication is attempted first.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command together with the **802.1x non-supplicant allow-eap** command to initiate MAC authentication first on any device and then specify whether or not subsequent 802.1x authentication is also performed on that same device.
- This command is only supported on 802.1x ports configured for auto access control mode. See the **802.1x** command for more information about configuring the access control mode.
- Configuring 802.1x supplicant bypass is not allowed on ports where the 802.1x supplicant polling retry count is set to zero. Both operations are mutually exclusive on the same port.
- If supplicants are already connected to the specified port when 802.1x bypass is enabled for that port, the supplicants are automatically logged off to undergo authentication according to the enabled bypass configuration.
- When the 802.1x bypass configuration is modified or disabled, any non-supplicant devices are automatically logged off the port. This will free up those devices to undergo the authentication specified by the new bypass configuration.
- If re-authentication is configured for the 802.1x port and supplicant bypass is enabled, the MAC authentication followed by 802.1x authentication are initially performed as configured. However, only 802.1x authentication is performed during the re-authentication process, so there is no recheck to see if the MAC address of the user device is restricted.

### Examples

```
-> 802.1x 3/1 supplicant bypass enable  
-> 802.1x 3/1 supplicant bypass disable
```

## Release History

Release 6.4.4; command was introduced.

<a href="#">802.1x non-suppliant allow-eap</a>	Configures whether or not subsequent 802.1x authentication is attempted based on the MAC authentication results.
<a href="#">show 802.1x</a>	Displays the 802.1x configuration for the port.

## MIB Objects

alaDot1xAuthPolicyTable  
alaDot1xSuppliantBypass

---

## 802.1x non-supplicant allow-eap

Configures whether or not the switch attempts subsequent 802.1x authentication for a device connected to an 802.1x bypass-enabled port. When 802.1x bypass is enabled on the port, MAC authentication is performed first on any device connected to that port. This command specifies the conditions under which 802.1x authentication is performed or bypassed after the initial MAC authentication process.

**802.1x slot/port non-supplicant allow-eap {pass | fail | noauth | none}**

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>pass</b>	Allows 802.1x (EAP frame) authentication if the supplicant passes MAC authentication.
<b>fail</b>	Allows 802.1x (EAP frame) authentication if the supplicant fails MAC authentication.
<b>noauth</b>	Allows 802.1x (EAP frame) authentication if there is no MAC authentication configured on the port.
<b>none</b>	Prevents 802.1x authentication; only MAC authentication is performed on any device accessing this port.

### Defaults

By default, only MAC authentication is applied to the supplicant device (802.1x classification is not performed on the supplicant device).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The port specified with this command must also have 802.1x bypass enabled (see the [802.1x supplicant bypass](#) command). If bypass is not enabled, this command is not configurable and MAC authentication will not take precedence over 802.1x authentication.
- Using this command with the **none** parameter is similar to setting the supplicant polling retry counter to zero (see the [802.1x supp-polling retry](#) command). However, the functionality configured with each command differs as follows:
  - When the supplicant polling retry is set to zero, EAP frames are ignored. MAC authentication is only triggered when a non-EAP frame is received, which is when the supplicant times out and is in an open state.
  - When the allow EAP is set to none, EAP frames are ignored but MAC authentication is triggered when the first EAP frame is received and the supplicant is not in an open state.
- When successful MAC authentication returns a VLAN ID or User Network Profile (UNP) and the 802.1x bypass operation is configured to initiate 802.1x authentication when a device passes MAC authentication, the device is *not* moved into that VLAN or UNP. Instead, the device is moved into the

VLAN or UNP returned by 802.1x authentication. If 802.1x authentication does not provide such information, the device is moved based on the supplicant device classification policies.

### Examples

```
-> 802.1x 3/1 non-supPLICant allow-eap pass
-> 802.1x 4/1 non-supPLICant allow-eap fail
-> 802.1x 5/1 non-supPLICant allow-eap noauth
-> 802.1x 6/1 non-supPLICant allow-eap none
```

### Release History

Release 6.4.4; command was introduced.

### MIB Objects

```
alaDot1xAuthPolicyTable
  alaDot1xSBAAllowEAP
```

---

## 802.1x supplicant policy authentication

Configures a supplicant device classification policy for an 802.1x port. This type of policy uses 802.1x authentication via a remote RADIUS server. A supplicant is any device that uses the 802.1x protocol for authentication.

**802.1x slot/port supplicant policy authentication** [[pass] {group-mobility | user-network-profile profile\_name | vlan vid | default-vlan | block | captive-portal}...] [[fail] {user-network-profile profile\_name | vlan vid | block | captive-portal}...]

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>pass</b>	Indicates which policies to apply if 802.1x authentication is successful but does not return a VLAN ID.
<b>fail</b>	Indicates which policies to apply if 802.1x authentication fails or if successful authentication returns a VLAN ID that does not exist.
<b>group-mobility</b>	Use Group Mobility rules for device classification.
<i>profile_name</i>	The name of an existing User Network Profile (UNP) to use for device classification.
<i>vid</i>	Use this VLAN ID number for device classification.
<b>default-vlan</b>	Assigns supplicant to the default VLAN for the 802.1x port.
<b>block</b>	Blocks supplicant access on the 802.1x port.
<b>captive-portal</b>	Use Captive Portal for web-based device classification.

### Defaults

When 802.1x is enabled on the port, a default supplicant policy is defined for the port. This policy uses the **group-mobility** and **default-vlan** parameters for the **pass** case and the **block** parameter for the **fail** case.

When the **802.1x supplicant policy authentication** command is used without specifying any parameters, the following values for the **pass** and **fail** case are configured by default:

parameter	default
<b>pass</b>	block
<b>fail</b>	block

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Supplicant device classification policies are applied only when successful 802.1x authentication *does not* return a VLAN ID, returns a VLAN ID that does not exist, or authentication fails.

- When authentication does return a VLAN ID that exists in the switch configuration, the supplicant is assigned to that VLAN and no further classification is performed.
- If this command is used without specifying any of the optional policy keywords or a **pass/fail** parameter (e.g. **802.1x 1/10 supplicant authentication**), the resulting policy will block supplicants if successful 802.1x authentication *does not* return a VLAN ID, returns a VLAN ID that does not exist, or authentication fails.
- When multiple parameters are configured, the policy is referred to as a compound supplicant policy. Such policies use the **pass** and **fail** parameters to specify which policies to use when 802.1x authentication is successful and which to use when it fails.
- The **pass** keyword is implied and therefore an optional keyword. If the **fail** keyword is not used, the default action is to block the device when authentication fails.
- The order in which parameters are specified determines the order in which they are applied. However, this type of policy must end with either the **default-vlan**, **block**, or **captive-portal** parameters, referred to as terminal parameters (or policies). This applies to both pass and fail policies. If a terminal parameter is not specified, the **block** parameter is used by default.
- If the **captive-portal** parameter is specified with this command, then the Captive Portal authentication policy is applied to supplicant traffic. See the **802.1x captive-portal policy authentication** command page for more information.
- A User Network Profile (UNP) specifies a VLAN assignment for the device, whether or not Host Integrity Check (HIC) is required for the device, and if any QoS access control list (ACL) policies are applied to the device. See the **aaa user-network-profile** command page for information about how to create a UNP.
- Configuring supplicant classification policies is only supported on 802.1x enabled mobile ports.
- Each 802.1x port can have one supplicant policy and one non-supplicant policy for handling 802.1x and non-802.1x devices, respectively. Configuring a new supplicant or non-supplicant policy overwrites any policies that may already exist for the port.

## Examples

```
-> 802.1x 3/1 supplicant policy authentication
-> 802.1x 4/1 supplicant policy authentication vlan 27 default-vlan
-> 802.1x 5/1 supplicant policy authentication group-mobility captive-portal
-> 802.1x 5/10 supplicant policy authentication pass group-mobility default-vlan
fail vlan 43 block
-> 802.1x 6/1 supplicant policy authentication pass group-mobility default-vlan
fail captive-portal
-> 802.1x 4/10 supplicant policy authentication pass user-network-profile fail
captive-portal
```

## Release History

Release 6.1.2; command was introduced.

Release 6.3.4; **user-network-profile**, **captive-portal** parameters added.

## Related Commands

<b>show 802.1x device classification policies</b>	Displays device classification policies configured for an 802.1x port.
<b>show 802.1x non-suppliant aaa certificate-password</b>	Displays a list of all non-suplicants learned on all 802.1x ports. Displays a list of all users for one or more 802.1X ports.

## MIB Objects

alaDot1xAuthPolicyTable  
alaDot1xSuppPolicy

---

## 802.1x non-suppliant policy authentication

Configures a non-suppliant device classification policy for an 802.1x port. This type of policy uses MAC authentication via a remote RADIUS server. A non-suppliant is a device that does not support using the 802.1x protocol for authentication.

**802.1x slot/port non-suppliant policy authentication** [[**pass**] {**group-mobility** | **user-network-profile profile\_name** | **vlan vid** | **default-vlan** | **block** | **captive-portal**}] [[**fail**] {**group-mobility** | **user-network-profile profile\_name** | **vlan vid** | **default-vlan** | **block** | **captive-portal**}]

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>pass</b>	Indicates which policies to apply if MAC authentication is successful but does not return a VLAN ID or the VLAN ID returned does not exist.
<b>fail</b>	Indicates which policies to apply if MAC authentication fails.
<b>group-mobility</b>	Use Group Mobility rules for device classification.
<i>profile_name</i>	The name of an existing User Network Profile (UNP) to use for device classification.
<b>vlan vid</b>	Use this VLAN ID number for device classification.
<b>default-vlan</b>	Assigns suppliant to the default VLAN for the 802.1x port.
<b>block</b>	Blocks suppliant traffic on the 802.1x port.
<b>captive-portal</b>	Use Captive Portal for web-based device classification.

### Defaults

When 802.1x is enabled on the port, all non-suppliant traffic is blocked by default.

### Platforms Supported

OmniSwitch 6400, 6800, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Non-suppliant device classification policies are applied only when successful MAC authentication *does not* return a VLAN ID, returns a VLAN ID that does not exist, or MAC authentication fails.
- When MAC authentication does return a VLAN ID that exists in the switch configuration, the suppliant is assigned to that VLAN and no further classification is performed.
- When multiple parameters are configured, the policy is referred to as a compound non-suppliant policy. Such policies use the **pass** and **fail** parameters to specify which policies to use when MAC authentication is successful and which to use when it fails.
- The **pass** keyword is implied and therefore an optional keyword. If the **fail** keyword is not used, the default action is to block the device when authentication fails.

- The order in which the parameters are specified determines the order in which they are applied. However, this type of policy must end with either the **default-vlan** or **block**, or **captive-portal** parameters, referred to as terminal parameters (or policies). This applies to both pass and fail policies. If a terminal parameter is not specified, the **block** parameter is used by default.
- If the **captive-portal** parameter is specified with this command, then the Captive Portal authentication policy is applied to supplicant traffic. See the [802.1x captive-portal policy authentication](#) command page for more information.
- A User Network Profile (UNP) specifies a VLAN assignment for the device, whether or not Host Integrity Check (HIC) is required for the device, and if any QoS access control list (ACL) policies are applied to the device. See the [aaa user-network-profile](#) command page for information about how to create a UNP.
- Configuring non-suppliant classification policies is only supported on 802.1x enabled mobile ports.
- Each 802.1x port can have one supplicant policy and one non-suppliant policy for handling 802.1x and non-802.1x devices, respectively. Configuring a new supplicant or non-suppliant policy overwrites any policies that may already exist for the port.

## Examples

```
-> 802.1x 3/1 non-suppliant policy authentication
-> 802.1x 4/1 non-suppliant policy authentication pass group-mobility fail
default-vlan
-> 802.1x 5/1 non-suppliant policy authentication group-mobility captive-portal
-> 802.1x 5/10 non-suppliant policy authentication vlan 27 fail vlan 500 default-
vlan
-> 802.1x 2/1 non-suppliant policy authentication vlan 10 default-vlan
-> 802.1x 6/1 non-suppliant policy authentication pass group-mobility default-vlan
fail captive-portal
-> 802.1x 4/10 non-suppliant policy authentication pass user-network-profile fail
captive-portal
```

## Release History

Release 6.1.2; command was introduced.

Release 6.3.4; **user-network-profile**, **captive-portal** parameters added.

## Related Commands

<b>802.1x policy default</b>	Resets the device classification policy to the default policy value for the 802.1x port.
<b>show 802.1x device classification policies</b>	Displays device classification policies configured for an 802.1x port.
<b>show 802.1x non-suppliant</b>	Displays a list of all non-suplicants learned on all 802.1x ports.

## MIB Objects

alaDot1xAuthPolicyTable  
alaDot1xNonSuppPolicy

---

## 802.1x non-suppliant policy

Configures a non-suppliant device classification policy for an 802.1x port. This type of policy does not perform any authentication. A non-suppliant is a device that does not support using the 802.1x protocol for authentication.

**802.1x slot/port non-suppliant policy {group-mobility | user-network-profile profile\_name | vlan vid | default-vlan | block | captive-portal}**

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>group-mobility</b>	Use Group Mobility rules for device classification.
<i>profile_name</i>	The name of an existing User Network Profile (UNP) to use for device classification.
<b>vlan vid</b>	Use this VLAN ID number for device classification.
<b>default-vlan</b>	Assign suppliant to the default VLAN for the 802.1x port.
<b>block</b>	Block suppliant traffic on the 802.1x port.
<b>captive-portal</b>	Use Captive Portal for web-based device classification.

### Defaults

By default no device classification policies are configured for an 802.1x port.

### Platforms Supported

OmniSwitch 6400, 6800, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Because this policy does not use 802.1x or MAC authentication, only one classification parameter is specified and non-suplicants are only classified for assignment to non-authenticated VLANs.
- Note that if a non-suppliant policy is not configured for an 802.1x port, then non-suplicants are automatically blocked from accessing the port.
- If the **captive-portal** parameter is specified with this command, then the Captive Portal authentication policy is applied to non-suppliant traffic. See the [802.1x captive-portal policy authentication](#) command page for more information.
- A User Network Profile (UNP) specifies a VLAN assignment for the device, whether or not Host Integrity Check (HIC) is required for the device, and if any QoS access control list (ACL) policies are applied to the device. See the [aaa user-network-profile](#) command page for information about how to create a UNP.
- Configuring non-suppliant classification policies is only supported on 802.1x enabled mobile ports.
- Each 802.1x port can have one suppliant policy and one non-suppliant policy for handling 802.1x and non-802.1x devices, respectively. Configuring a new suppliant or non-suppliant policy overwrites any policies that may already exist for the port.

## Examples

```
-> 802.1x 4/1 non-suppliant policy group-mobility
-> 802.1x 5/10 non-suppliant policy vlan 500
-> 802.1x 6/1 non-suppliant policy user-network-profile
-> 802.1x 4/10 non-suppliant policy captive-portal
```

## Release History

Release 6.1.2; command was introduced.

Release 6.3.4; **user-network-profile**, **captive-portal** parameters added.

## Related Commands

## MIB Objects

```
alaDot1xAuthPolicyTable
  alaDot1xNonSuppPolicy
```

---

## 802.1x policy default

Resets the device classification policy to the default value for the 802.1x port.

**802.1x slot/port {supplicant | non-supplicant} policy default**

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>supplicant</b>	Reset the supplicant policy to the default policy value.
<b>non-supplicant</b>	Reset the non-supplicant policy to the default policy value.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The default non-supplicant policy blocks all non-supplicants from accessing the 802.1x port.
- The default supplicant policy blocks supplicants that fail authentication. If authentication is successful but does not return a VLAN ID, then Group Mobility rules are examined. If no rules exist or match supplicant traffic, then the supplicant is assigned to the default VLAN for the 802.1x port.

### Examples

```
-> 802.1x 3/1 supplicant policy default  
-> 802.1x 4/1 non-supplicant policy default
```

### Release History

Release 6.1.2; command was introduced.

## MIB Objects

alaDot1xAuthPolicyTable  
alaDot1xSuppPolicy

---

## 802.1x captive-portal policy authentication

Configures a Captive Portal device classification policy for an 802.1x port. This type of policy is applied to both supplicants and non-supplicants that were classified by a supplicant or non-supplicant policy to use Captive Portal web-based authentication.

**802.1x slot/port captive-portal policy authentication pass {group-mobility | user-network-profile profile\_name | vlan vid | default-vlan | block} [fail] {group-mobility | vlan vid | default-vlan | block}**

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>pass</b>	Indicates which policies to apply if authentication is successful but does not return a VLAN ID or the VLAN ID returned does not exist.
<b>fail</b>	Indicates which policies to apply if authentication fails.
<b>group-mobility</b>	Use Group Mobility rules for device classification.
<i>profile_name</i>	The name of a User Network Profile to use for device classification.
<b>vlan vid</b>	Use this VLAN ID number for device classification.
<b>default-vlan</b>	Assigns the device to the default VLAN for the 802.1x port.
<b>block</b>	Blocks device traffic on the 802.1x port.

### Defaults

A default Captive Portal policy is automatically configured when 802.1x is enabled on a port. This default policy uses the **default-vlan** parameter for the **pass** case and the **block** parameter for the **fail** case.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Captive Portal device classification policies are applied only when successful web-based authentication *does not* return a VLAN ID, returns a VLAN ID that does not exist, or when web-based authentication fails.
- When web-based authentication does return a VLAN ID that exists in the switch configuration, the device is assigned to that VLAN and no further classification is performed.
- When multiple parameters are configured, the policy is referred to as a compound non-supplicant policy. Such policies use the **pass** and **fail** parameters to specify which policies to use when MAC authentication is successful and which to use when it fails.
- If the **fail** keyword is not used, the default action is to block the device when authentication fails.
- The order in which the parameters are specified determines the order in which they are applied. However, this type of policy must end with either the **default-vlan** or **block** parameters, referred to as terminal parameters (or policies). This applies to both pass and fail policies.

- Captive Portal policies are applied only to 802.1x enabled mobile ports that are configured with an 802.1x supplicant or non-supplicant policy that specifies the use of Captive Portal web-based authentication.

## Examples

```
-> 802.1x 3/1 captive-portal policy authentication pass vlan 100 block fail vlan 10
-> 802.1x 4/1 captive-portal policy authentication pass group-mobility
```

## Release History

Release 6.3.4; command was introduced.

## Related Commands

<b>802.1x supplicant policy authentication</b>	Configures 802.1x authentication device classification policies for supplicants.
<b>802.1x non-supplicant policy</b>	Configures device classification policies that do not perform 802.1x or MAC authentication for non-supplicants.

## MIB Objects

```
alaDot1xAuthPolicyTable
  alaDot1xCaptivePortalPolicy
```

---

## 802.1x captive-portal session-limit

Configures the length of an active Captive Portal session.

**802.1x slot/port captive-portal session-limit time**

---

### Syntax Definitions

*slot/port*

The slot and port number of the 802.1x port.

*time*

The amount of time the Captive Portal session remains active. Valid range is from 1—999 hours.

### Defaults

parameter	default
<i>time</i>	12 hours

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The parameters configured with this command apply to the Captive Portal configuration for the specified 802.1x port.
- At the end of the Captive Portal session time limit, the user is automatically logged out of the session and is no longer allowed to access the network.

### Examples

```
-> 802.1x 3/1 captive-portal session-limit 8 retry-count 5  
-> 802.1x 4/1 captive-portal session-limit 4 retry-count 2
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

### **802.1x captive-portal retry-count**

Configures the number of login attempts allowed before the Captive Portal fail policy is applied to the device.

### **802.1x captive-portal policy authentication**

Configures a Captive Portal device classification policy for an 802.1x port.

### **show 802.1x captive-portal configuration**

Displays the global Captive Portal configuration for the switch.

## MIB Objects

```
alaDot1xAuthPolicyTable  
alaDot1xCaptivePortalSessionLimit
```

---

## 802.1x captive-portal name

Configures the name of the redirect URL that is used for accessing a public certificate.

**802.1x captive-portal name** *cp\_url\_name*

**802.1x captive-portal no name**

---

### Syntax Definitions

*cp\_url\_name*                      The name to be used for the redirect URL.

### Defaults

By default, the name of the redirect URL is set to “captive-portal”.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to change the Captive Portal redirect URL name (captive-portal) to match the common name (cn) used by the public certificate on the switch. Matching these two names prevents a certificate warning message caused when these names do not match.
- Use the **no** form of this command to remove the configured Captive Portal redirect URL name. This reverts the URL name back to the default of “captive-portal”.
- This feature is not supported on HTTPS sessions.

### Examples

```
-> 802.1x captive-portal name certname  
-> 802.1x captive-portal no name
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

<a href="#">aaa certificate-password</a>	Configures the password for accessing a public certificate on the switch.
<a href="#">show 802.1x captive-portal configuration</a>	Displays the global Captive Portal configuration for the switch.

  alaDot1xCPortalRedirectString
```

---

## 802.1x captive-portal inactivity-logout

Configures whether or not a user MAC address is flushed from the Captive Portal user table due to inactivity.

**802.1x slot/port captive-portal inactivity-logout {enable | disable}**

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the 802.1x port.
<b>enable</b>	Enables inactivity logout.
<b>disable</b>	Disables inactivity logout.

### Defaults

By default, inactivity logout is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This timer is based on the MAC address aging timer. If a user is flushed from the MAC address table due to inactivity, the user MAC address is also flushed from the Captive Portal user table.

### Examples

```
-> 802.1x 3/1 captive-portal inactivity-logout enable
-> 802.1x 3/1 captive-portal inactivity-logout disable
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

---

## 802.1x captive-portal retry-count

Configures the number of login attempts allowed before the Captive Portal fail policy is applied to the device.

**802.1x slot/port captive-portal retry-count** *retries*

---

### Syntax Definitions

*slot/port*                      The slot and port number of the 802.1x port.  
*retries*                         The number of login attempts allowed (1–99).

### Defaults

parameter	default
<i>retries</i>	3

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The parameters configured with this command apply to the Captive Portal configuration for the specified 802.1x port.
- When a device has failed the allowed number of login attempts, the **fail** case for the Captive Portal policy configured for the 802.1x port is applied. To allow an unlimited number of login attempts, specify zero for the retry count value.

### Examples

```
-> 802.1x 3/1 captive-portal session-limit 8 retry-count 5  
-> 802.1x 4/1 captive-portal session-limit 4 retry-count 2
```

### Release History

Release 6.3.4; command was introduced.

alaDot1xCaptivePortalRetryCnt

---

---

## 802.1x captive-portal address

Configures a different subnet for the Captive Portal IP address (10.123.0.1).

**802.1x captive-portal address** *ip\_address*

---

### Syntax Definitions

*address*

The IP address for the Captive Portal login page. This IP address must use the following octet values: 10.x.0.1, where “x” is used to specify a new subnet value.

### Defaults

By default, the Captive Portal IP address is set to 10.123.0.1.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the 10.123.0.1 subnet is already in use on the network, use this command to change the second octet of this IP address. Note that the second octet is the only configurable part of the Captive Portal IP address that is allowed.
- This IP address is used exclusively by the Captive Portal feature to serve various pages and to assign a temporary IP address for a client device that is attempting web-based authentication.

### Examples

```
-> 802.1x captive-portal address 10.11.0.1  
-> 802.1x captive-portal address 10.124.0.1
```

## 802.1x captive-portal proxy-server-port

Configures Captive Portal to work with a specific proxy server port.

**802.1x captive-portal proxy-server-port** *proxy\_port*

**802.1x captive-portal no proxy-server-port** *proxy\_port*

---

### Syntax Definitions

*proxy\_port*                      The configured port for the proxy server. Valid range is between 1024-49151.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is only necessary if the port required is not 80 or 8080.

### Examples

```
-> 802.1x captive-portal proxy-server-port 1200
-> 802.1x captive-portal no proxy-server-port
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

## 802.1x captive-portal dns-keyword-list

Configures a list of up to four DNS strings (keywords) that are used to identify DNS packets to which Captive Portal will accept and reply.

**802.1x captive-portal dns-keyword-list** {*keyword1* [*keyword2*] [*keyword3*] [*keyword4*]}

**802.1x captive-portal no dns-keyword-list**

---

### Syntax Definitions

*keyword* The DNS string that Captive Portal will look for in DNS packets. Up to four strings are supported. Each string may contain up to 63 characters.

### Defaults

By default, Captive Portal replies to DNS packets containing the following pre-defined DNS strings:

<b>www</b>	<b>captive-portal</b>
<b>http</b>	<b>go.microsoft</b>
<b>proxy</b>	<b>mozilla</b>
<b>wpad</b>	

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The DNS strings configured with this command are added to the list of the pre-defined DNS strings, as shown above. Note that the pre-defined strings are not configurable and will always remain on the list.
- Use the **no** form of this command to remove all the user-defined keywords from the DNS keyword list.
- Any DNS packets received that do not contain the specified DNS strings (pre-defined or user-defined) are dropped.
- Up to four keywords are configurable. Each time this command is used, the user-defined keyword strings are overwritten with the new strings. For example, if the DNS string list contains four user-defined strings, the next time this command is used and only two strings are specified, the four existing strings are removed and only the two new strings are added to the list.

### Examples

```
-> 802.1x captive-portal dns-keyword-list univ.intranet.jp  
-> 802.1x captive-portal dns-keyword-list univ.intranet1.jp univ.intranet2.jp  
-> 802.1x captive-portal dns-keyword-list univ.intranet1.jp univ.intranet2.jp  
univ.intrante3.jp univ.intranet4.jp
```

  alaDot1xCPortalDnsKeyword4
```

---

## 802.1x captive-portal success-redirect-url

Configures Captive Portal to redirect the user to a specific site upon successful authentication. This command specifies the URL of an HTTP site where a Java script is defined that specifies the actual destination URL.

**802.1x captive-portal success-redirect-url** *redirect\_url*

**802.1x captive-portal no success-redirect-url**

---

### Syntax Definitions

*redirect\_url*

The internal HTTP server URL, up to 63 characters, for the redirect Java script (for example, **http://test-cp.com/success.html**).

### Defaults

No success redirect URL is configured.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a success redirect URL configuration.
- Make sure the HTTP server URL and Java script exist and are reachable by the user during the authentication phase.
- A Java script is only needed to redirect a user to a website outside of the network; a script is not needed to redirect users to an intranet site.
- After the user attempts to authenticate through the Captive Portal login page, the Captive Portal status page displays and attempts to run the Java script that is located at the URL site specified with this command.
- If the redirect URL is not configured or is invalid, the Captive Portal status page remains open and displays an error message regarding the attempted redirection.

### Examples

The following command example configures the success URL to point to the **success.html** Java script on the **test-cp.com** HTTP server.

```
-> 802.1x captive-portal success-redirect-url http://test-cp.com/success.html
```

The following is an example Java script (**success.html**) in which the “TARGET” field specifies the actual URL to which the user is redirected.

```
<html>
<head> <meta http-equiv="expires" content="Tue, 20 Aug 1996 14:25:47 GMT">
<meta http-equiv=Pragma content=no-cache>
<meta http-equiv=cache-control content=no-cache,no-store,must-revalidate,proxy-
```

```
revalidate>  
</head>  
<body>  
<script type="text/javascript">  
    var TARGET = "http://www.google.com";  
    top.location = TARGET;  
</script>  
</body>
```

## Release History

Release 6.4.3; command was introduced.

## Related Commands

```

---

## 802.1x captive-portal fail-redirect-url

Configures Captive Portal to redirect the user to a specific site if authentication fails (user login is invalid or user bypasses authentication). This command specifies the URL of an HTTP server where a Java script is defined that specifies the actual destination URL.

**802.1x captive-portal fail-redirect-url** *redirect\_url*

**802.1x captive-portal no fail-redirect-url**

---

### Syntax Definitions

*redirect\_url*

The internal HTTP server URL, up to 63 characters, for the redirect Java script (for example, **http://test-cp.com/fail.html**).

### Defaults

No fail redirect URL is configured.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a fail redirect URL configuration.
- Make sure the HTTP server URL and Java script exist and are reachable by the user during the authentication phase.
- A Java script is only needed to redirect a user to a website outside of the network; a script is not needed to redirect users to an intranet site.
- After the user attempts to authenticate through the Captive Portal login page, the Captive Portal status page displays and attempts to run the Java script that is located at the URL site specified with this command.
- If the redirect URL is not configured or is invalid, the Captive Portal status page remains open and displays an error message regarding the attempted redirection.

### Examples

The following command example configures the fail URL to point to the **fail.html** Java script on the **test-cp.com** HTTP server.

```
-> 802.1x captive-portal fail-redirect-url http://test-cp.com/fail.html
```

The following is an example Java script (named **fail.html**) in which the "TARGET" field specifies the actual URL to which the user is redirected:

```
<html>  
<head> <meta http-equiv="expires" content="Tue, 20 Aug 1996 14:25:47 GMT">  
<meta http-equiv=Pragma content=no-cache>  
<meta http-equiv=cache-control content=no-cache,no-store,must-revalidate,proxy-revalidate>  
</head>
```

```
<body>
<script type="text/javascript">
  var TARGET = "http://www.mycompany.com";
  top.location = TARGET;
</script>
</body>
```

## Release History

Release 6.4.3; command was introduced.

## MIB Objects

```
alaDot1xCportalConfig
  alaDot1xCPortalPostAuthFailRedirectURL
```

---

## 802.1x auth-server-down

Enables or disables the authentication server down classification policy.

**802.1x auth-server-down** {enable | disable}

---

### Syntax Definitions

enable	Enables the auth-server-down policy.
disable	Disables the auth-server-down policy.

### Defaults

By default, authentication server down policy is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is global and applies to all 802.1x ports on the switch.

### Examples

```
-> 802.1x auth-server-down enable  
-> 802.1x auth-server-down disable
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**show 802.1x auth-server-down** Displays the configured authentication server down classification policy.

### MIB Objects

alaDot1xAuthSvrTimeoutStatus

---

## 802.1x auth-server-down policy

Configures the policy for classifying devices attempting to authenticate when the RADIUS servers are not reachable.

**802.1x auth-server-down policy** {**user-network-profile** *profile\_name* | **block**}

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing User Network Profile (UNP) to use for device classification.
<b>block</b>	Blocks device access on the 802.1x port.

### Defaults

By default, this policy is configured to block access to such devices and is disabled for the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **user-network-profile** parameter to classify device traffic into a specific profile when the RADIUS server is down.
- Use the **block** parameter to block device traffic on the 802.1x port when the RADIUS server is down.
- This command applies to all 802.1x-enabled ports on the switch.
- When device authentication fails due to an unreachable RADIUS server, an event message is sent to the switch logging utility (swlog). See the “Switch Logging Command” chapter for more information.

### Examples

```
-> 802.1x auth-server-down policy user-network-profile unp1
-> 802.1x auth-server-down policy block
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

- 802.1x auth-server-down** Enables or disables the authentication server down policy.
- 802.1x auth-server-down re-authperiod** Configures the amount of time to wait before re-authentication is attempted for devices classified by the server down policy.
- show 802.1x auth-server-down** Displays the configured authentication server down policy.

### MIB Objects

`alaDot1xAuthServerTimeoutPolicy`

---

## show 802.1x

Displays information about ports configured for 802.1X.

**show 802.1x** [*slot/port*]

---

### Syntax Definitions

*slot*                                      The slot of the port for which you want to display information.  
*port*                                        The port for which you want to display 802.1X information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If you do not specify a particular slot/port, information for all 802.1X ports is displayed.

### Examples

```
-> show 802.1x 1/13
```

```
802.1x configuration for slot 1 port 13:
```

```
direction                                = both,  
operational directions                 = both,  
port-control                            = auto,  
quiet-period (seconds)                 = 60,  
tx-period (seconds)                     = 30,  
supp-timeout (seconds)                 = 30,  
server-timeout (seconds)               = 30,  
max-req                                 = 2,  
re-authperiod (seconds)                = 3600,  
reauthentication                        = no  
Supplicant polling retry count         = 2  
Captive Portal Session Limit (hrs)     = 12  
Captive Portal Login Retry Count       = 3  
Supplicant Bypass                      = enable  
Supplicant Bypass allow-eap Branch     = pass,  
Captive Portal Inactivity Logout       = disable
```

*output definitions*

<b>direction</b>	Whether the port is configured for control on bidirectional traffic or incoming traffic only ( <b>both</b> or <b>in</b> ). Configured through the <b>802.1x</b> command.
<b>operational directions</b>	The operational state of controlled direction on the port, which is set automatically by the switch. If the value of <b>direction</b> is <b>both</b> , the value of operational directions is <b>both</b> . If the value of <b>direction</b> is <b>in</b> , the operational state is set to <b>in</b> on initialization and when the port's MAC address becomes operable. If the port's MAC address becomes inoperable, the operational direction is set to <b>both</b> .
<b>port-control</b>	The value of the port control parameter for the port ( <b>auto</b> , <b>force-authorized</b> , or <b>force-unauthorized</b> ). Configured through the <b>802.1x</b> command.
<b>quiet-period</b>	The time during which the port will not accept an 802.1X authentication attempt; the timer is activated after any authentication failure. The range is 0 to 65535 seconds. Configured through the <b>802.1x</b> command.
<b>tx-period</b>	The time before an EAP Request Identity will be transmitted. The range is 1 to 65535 seconds. Configured through the <b>802.1x</b> command.
<b>supp-timeout</b>	The number of seconds before the switch will time out an 802.1x user who is attempting to authenticate. Configured through the <b>802.1x</b> command.
<b>server-timeout</b>	The timeout for the authentication server for authentication attempts. Configured for the switch port through the <b>802.1x</b> command. However, this value is always superseded by the value configured for the RADIUS authentication server configured through the <b>aaa radius-server</b> command.
<b>max-req</b>	The maximum number of times the switch will retransmit a request for authentication information (request identity, password, challenge, etc.) to the 802.1X user before it times out the authentication session based on the <b>supp-timeout</b> . The range is 1 to 10. Configured through the <b>802.1x</b> command.
<b>re-authperiod</b>	The amount of time that must expire before the switch requires re-authentication of the Supplicant on this port. Only applicable when re-authentication is enabled. Configured through the <b>802.1x</b> command.
<b>reauthentication</b>	Whether or not the port will be re-authenticated after the re-authperiod expires. Configured through the <b>802.1x</b> command.
<b>Supplicant polling retry count</b>	The number of times a device is polled for EAP frames to determine whether or not the device is an 802.1x client. Configured through the <b>802.1x supp-polling retry</b> command.
<b>Captive Portal Session Limit (hrs)</b>	The amount of time, in hours, that a Captive Portal session can remain active. Configured through the <b>802.1x captive-portal session-limit</b> command.
<b>Captive Portal Login Retry Count</b>	The number of login attempts allowed before the Captive Portal fail policy is applied to the device. Configured through the <b>802.1x captive-portal retry-count</b> command.
<b>Supplicant Bypass</b>	The status of 802.1x authentication bypass ( <b>enable</b> or <b>disable</b> ). Configured through the <b>802.1x supplicant bypass</b> command.

*output definitions (continued)*

<b>Supplicant Bypass allow-eap Branch</b>	Specifies the conditions under which subsequent 802.1x authentication is attempted based on the outcome of the initial MAC authentication ( <b>pass</b> , <b>fail</b> , <b>noauth</b> , or <b>none</b> ). Configured through the <b>802.1x non-supplicant allow-eap</b> command. This value only applies when <b>Supplicant Bypass</b> is set to <b>enable</b> .
<b>Captive Portal Inactivity Logout</b>	Whether or not a user MAC address is removed from the Captive Portal user table when the same MAC ages out of the switch MAC address table due to inactivity ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>802.1x captive-portal inactivity-logout</b> command.

### Release History

Release 6.1; command was introduced.  
 Release 6.3.4; Captive Portal fields added.  
 Release 6.4.4; **Supplicant Bypass**, **Supplicant Bypass allow-eap Branch**, **Captive Portal Inactivity Logout** fields added.

### Related Commands

## show 802.1x users

Displays a list of all users for one or more 802.1X ports.

**show 802.1x users** [*slot/port*] [**unp** | **detail**]

---

### Syntax Definitions

<i>slot</i>	The slot of the port for which you want to display information.
<i>port</i>	The port for which you want to display 802.1X information.
<b>unp</b>	Lists all the users associated with user network profiles.
<b>detail</b>	Lists additional details .

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If you do not specify a particular slot/port, all users associated with 802.1X ports are displayed.

### Examples

```
->show 802.1x users
```

Slot Port	MAC Address	Port State	Classification Policy	User Name	Dynamic UNP
3/1	00:60:4f:11:22:33	Authenticated	Basic-UNP-AAA Rule	user50	Enabled
3/1	00:60:4f:44:55:66	Authenticated	Basic-UNP-AAA Rule	user51	Enabled

```
->show 802.1x users 3/1
```

Slot Port	MAC Address	Port State	Classification Policy	User Name	Dynamic UNP
3/1	00:60:4f:11:22:33	Authenticated	Basic-UNP-AAA Rule	user50	Enabled
3/1	00:60:4f:44:55:66	Authenticated	Basic-UNP-AAA Rule	user51	Enabled

### output definitions

---

<b>Slot/Port</b>	The 802.1X slot and port number that provides access to the user.
<b>MAC Address</b>	The source MAC address of the 802.1X user.

*output definitions (continued)*

---

<b>Port State</b>	The current state of the 802.1X port for a specific user: <ul style="list-style-type: none"><li>• <b>Initialize</b></li><li>• <b>Disconnected</b></li><li>• <b>Connecting</b></li><li>• <b>Authenticating</b></li><li>• <b>Authenticated</b></li><li>• <b>Authenticated-L</b></li><li>• <b>Authenticated-T</b> - Supplicant learned according to the auth-server-down policy</li><li>• <b>Aborting</b></li><li>• <b>Held</b></li><li>• <b>Force-Authenticated</b></li><li>• <b>Force-Unauthenticated</b></li></ul>
<b>Classification Policy</b>	The 802.1x device classification policy that was applied to the device.
<b>User Name</b>	The user name that is used for authentication.
<b>Dynamic UNP</b>	The status of dynamic UNP; <b>enabled</b> or <b>disabled</b> .

---

### Release History

## show 802.1x statistics

Displays statistics for all 802.1X ports or for a particular 802.1X port.

**show 802.1x statistics** [*slot/port*]

---

### Syntax Definitions

*slot*                                      The slot of the port for which you want to display 802.1X statistics.

*port*                                        The port for which you want to display 802.1X statistics.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If you do not specify a particular slot/port, information for each 802.1X port is displayed.

### Examples

```
-> show 802.1x statistic 1/13
802.1x slot/port = 1/13
  Last EAPOL frame source           = 00:0d:0c:00:00:02
  Last EAPOL frame version          = 1,
  EAPOL frames received              = 3,
  EAPOL frames transmitted          = 3,
  EAPOL start frames received       = 1,
  EAPOL logoff frames received      = 0,
  EAP Resp/Id frames received       = 1,
  EAP Response frames received     = 1,
  EAP Req/Id frames transmitted     = 1,
  EAP Req frames transmitted        = 1,
  EAP length error frames received  = 0,
  Invalid EAPOL frames received     = 0,
```

### *output definitions*

---

<b>Slot</b>	The slot number of the 802.1X port.
<b>Port</b>	The 802.1X port number.
<b>Last EAPOL frame version</b>	The protocol version number carried in the most recently received EAPOL frame.
<b>Last EAPOL frame source</b>	The source MAC address carried in the most recently received EAPOL frame.
<b>EAPOL frames received</b>	The number of valid EAPOL frames of any type that have been received by the switch.

*output definitions (continued)*

<b>EAPOL frames transmitted</b>	The number of EAPOL frames of any type that have been transmitted by the switch.
<b>EAPOL Start frames received</b>	The number of EAPOL Start frames that have been received by the switch.
<b>EAPOL Logoff frames received</b>	The number of EAPOL Logoff frames that have been received by the switch.
<b>EAP Resp/Id frames received</b>	The number of EAP Resp/Id frames that have been received by the switch.
<b>EAP Response frames received</b>	The number of valid EAP Response frames (other than Resp/Id frames) that have been received by the switch.
<b>EAP Req/Id frames transmitted</b>	The number of EAP Req/Id frames that have been transmitted by the switch.
<b>EAP Req frames transmitted</b>	The number of valid EAP Request frames (other than Req/Id frames) that have been transmitted by the switch.
<b>EAP length error frames received</b>	The number of EAPOL frames that have been received by the switch for which the Packet Body Length field is invalid.
<b>Invalid EAPOL frames received</b>	The number of EAPOL frames that have been received by the switch for which the frame type is not recognized by the switch.

## show 802.1x device classification policies

Displays device classification policies configured for 802.1x ports.

**show 802.1x device classification policies** [*slot/port*]

---

### Syntax Definitions

*slot/port*

The slot and port number of the 802.1x port for which you want to display the policy configuration.

### Defaults

All device classification policies for all 802.1x ports are displayed.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the *slot/port* parameter to display device classification policies for a specific 802.1X port.

### Examples

```
-> show 802.1x device classification policies
Device classification policies on 802.1x port 2/26
  Supplicant:
    authentication:
      pass: group-mobility, default-vlan (default)
      fail: block (default)
  Non-Supplicant:
    block (default)
  Captive Portal:
    authentication:
      pass: default-vlan (default)
      fail: block (default)
Device classification policies on 802.1x port 2/48
  Supplicant:
    authentication:
      pass: vlan 500, block
      fail: block (default)
  Non-Supplicant:
    block (default)
  Captive Portal:
    authentication:
      pass: default-vlan (default)
      fail: block (default)
```

```
-> show 802.1x device classification policies 2/48
Device classification policies on 802.1x port 2/48
  Supplicant:
    authentication:
      pass: vlan 500, block
      fail: block (default)
  Non-Supplicant:
    block (default)
  Captive Portal:
    authentication:
      pass: default-vlan (default)
      fail: block (default)
```

### *output definitions*

---

<b>Supplicant:</b>	Displays the supplicant device classification policy configured for the 802.1x port.
<b>Non-Supplicant:</b>	Displays the non-supplicant device classification policy configured for the 802.1x port.
<b>Captive Portal</b>	Displays the Captive Portal device classification policy configured for the 802.1x port.

---

### **Release History**

Release 6.1.2; command was introduced.

### **Related Commands**

- [802.1x captive-portal address](#) Displays information about ports configured for 802.1X.
- [show 802.1x non-supplicant](#) Displays a list of all non-supplicants learned on all 802.1x ports.

### **MIB Objects**

```
alaDot1xAuthPolicyTable

  alaDot1xNonSuppPolicy
```

---

## show 802.1x non-supplicant

Displays a list of all non-802.1x supplicants learned on one or more 802.1x ports.

**show 802.1x non-supplicant** [*slot/port*] [**unp** | **detail**]

---

### Syntax Definitions

<i>slot/port</i>	The slot/port number of the 802.1x port for which you want to display information.
<b>unp</b>	Lists all the users associated with user network profiles.
<b>detail</b>	Lists additional details .

### Defaults

All non-supplicants associated with all 802.1X ports are displayed.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the *slot/port* parameter to display a list of non-supplicants learned on a specific 802.1x port.

### Examples

```
->show 802.1x non-supplicant
```

Slot Port	MAC Address	MAC Authent Status	Classification Policy	Vlan Learned	Dynamic UNP
03/3	00:61:22:15:22:33	N/A	Basic-UNP-Usr	Cfg 20	Enabled
03/3	00:61:22:44:75:66	N/A	Basic-UNP-Usr	Cfg 20	Enabled
03/11	00:00:39:47:4f:0c	Failed	Vlan ID	1001	Disabled
03/11	00:00:39:c9:5a:0c	Authenticated	Group Mobility	12	Disabled
03/11	00:b0:d0:52:47:35	Authenticated	Group Mobility	12	Disabled
03/11	00:c0:4f:0e:70:68	Authenticated	MAC Authent	14	Disabled

```
->show 802.1x non-supplicant 3/3
```

Slot Port	MAC Address	MAC Authent Status	Classification Policy	Vlan Learned	Dynamic UNP
03/3	00:61:22:15:22:33	N/A	Basic-UNP-Usr	Cfg 20	Enabled
03/3	00:61:22:44:75:66	N/A	Basic-UNP-Usr	Cfg 20	Enabled

*output definitions*

<b>Slot/Port</b>	The 802.1X slot and port number that provides access to the non-802.1x device.
<b>MAC Address</b>	The source MAC address of the non-802.1x device connected to the 802.1x port.
<b>MAC Authent Status</b>	Indicates whether or not MAC authentication failed. <ul style="list-style-type: none"> <li>• <b>Success</b> - Non-supplicant learned according to the Success policy.</li> <li>• <b>Failed</b> - Non-supplicant learned according to the Failed policy</li> <li>• <b>Fail (timeout)</b> - Non-Supplicant learned according to the auth-server-down policy.</li> </ul>
<b>Classification Policy</b>	The 802.1x device classification policy that was applied to the device.
<b>VLAN Learned</b>	The VLAN ID of the VLAN in which the source MAC address of the non-802.1x device was learned.
<b>Dynamic UNP</b>	The status of dynamic UNP; enabled or disabled.

**Release History**

Release 6.1; command was introduced.

Release 6.1.2; **Authentication Status** and **Classification Policy** columns added.

Release 6.4.4; **unp** and **detail** parameters added.

**Related Commands**

## show 802.1x auth-server-down

Displays the configured authentication server down classification policy.

**show 802.1x auth-server-down**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show 802.1x auth-server-down
```

```
Status = Enabled
Re-authentication Interval = 30 seconds
Classification policy = block
```

```
-> show 802.1x auth-server-down
```

```
Status = Disabled
Re-authentication Interval = 30 seconds
Classification policy = block
```

### *output definitions*

---

<b>Status</b>	Authentication server down policy status: <b>Enabled</b> or <b>Disabled</b>
<b>Re-authentication Interval</b>	The amount of time for the device to authenticate again with the RADIUS server when the device is classified according to the Auth-server-policy.
<b>Classification Policy</b>	The 802.1x device classification policy that was applied to the device.

---

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- 802.1x auth-server-down** Enables or disables the authentication server down policy.
- 802.1x auth-server-down re-authperiod** Configures the re-authentication time for the device to authenticate again with the RADIUS server when it is classified according to the Auth-server-down policy
- 802.1x auth-server-down policy** Configures the policy for classifying the device when the authentication server is not reachable

## show 802.1x captive-portal configuration

Displays the global Captive Portal configuration for the switch.

**show 802.1x captive-portal configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

This command displays the Captive Portal IP address and the proxy server URL.

### Examples

```
-> show 802.1x captive-portal configuration
```

```
Captive Portal Global Configuration:
```

```
  Captive Portal IP address = 10.123.0.1
```

```
  Proxy Server URL = proxy
```

```
  Proxy Server Port = 8080
```

```
  Redirect URL string = captive-portal
```

```
  Post Auth Success Redirect URL = http://test-cp.com/fail.html
```

```
  Post Auth Fail Redirect URL = http://test-cp.com/success.html
```

```
  DNS Keyword 1 = univ.intranet1.jp
```

```
  DNS Keyword 2 = univ.intranet2.jp
```

```
  DNS Keyword 3 = univ.interanet3.jp
```

```
  DNS Keyword 4 = univ.intranet4.jp
```

*output definitions*

---

<b>Captive Portal IP address</b>	The Captive Portal IP address. Configured through the <b>802.1x captive-portal address</b> command.
<b>Proxy Server URL</b>	The website URL for the client proxy web server. Configured through the <b>802.1x captive-portal proxy-server-url</b> command.
<b>Proxy Server Port</b>	The port number for the configured proxy. Configured through the <b>802.1x captive-portal proxy-server-port</b> command.
<b>Post Auth Success Redirect URL</b>	The internal HTTP server URL for the intermediate Java script used to redirect the user upon successful authentication. Configured through the <b>802.1x captive-portal success-redirect-url</b> command.
<b>Redirect URL String</b>	The name of the redirect URL to be used with a public certificate. Configured through the <b>802.1x captive-portal name</b> command.
<b>Post Auth Fail Redirect URL</b>	The internal HTTP server URL for the intermediate Java script used to redirect the user when authentication fails. Configured through the <b>802.1x captive-portal fail-redirect-url</b> command.
<b>DNS Keyword</b>	A user-defined DNS string. Captive Portal replies to DNS packets that contain this string. Configured through the <b>802.1x captive-portal proxy-server-port</b> command.

---

**Release History**

Release 6.3.4; command was introduced.

Release 6.4.3; **Post Auth Success Redirect URL**, **Post Auth Fail Redirect URL**, and **DNS Keyword** fields added.

Release 6.4.4; **Proxy Server Port** and **Redirect URL String** fields added.

**Related Commands**

# 36 AAA Commands

This chapter includes descriptions for authentication, authorization, and accounting (AAA) commands. The commands are used for configuring the type of authentication as well as the AAA servers and the local user database on the switch.

- **Authenticated VLANs.** Authenticates users through the switch into particular VLANs. User information is stored on an external RADIUS, TACACS+, or LDAP server.
- **Authenticated Switch Access.** Authenticates users into the switch to manage the switch. User information is stored on a RADIUS, TACACS+, LDAP, or ACE/Server; or information may be stored locally in the switch user database.
- **Local user database.** User information may be configured for Authenticated Switch Access. For functional management access, users may be allowed to access specific command families or domains. Alternately, users may be configured with a profile that specifies access to particular ports or VLANs.

MIB information for the AAA commands is as follows:

*Filename:* alcatelIND1AAA.mib  
*Module:* ALCATEL-IND1-AAA-MIB

*Filename:* alcatelIND1Dot1x.mib  
*Module:* ALCATEL-IND1-DOT1X-MIB

A summary of the available commands is listed here:

---

## aaa radius-server

Configures or modifies a RADIUS server for Authenticated VLANs, Authenticated Switch Access, or 802.1X port access control.

```
aaa radius-server server-name [host {hostname | ip_address} [hostname2 | ip_address2]] [key secret]  
[retransmit retries] [timeout seconds] [auth-port auth_port] [acct-port acct_port]  
[vrf-name vrf_name]
```

```
no aaa radius server server-name
```

---

### Syntax Definitions

<i>server-name</i>	The name of the RADIUS server. This name is used in the related CLI commands to refer to the server.
<i>hostname</i>	The host name (DNS name) of the primary RADIUS server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary RADIUS server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup RADIUS server.
<i>ip_address2</i>	The IP address of an optional backup RADIUS server.
<i>secret</i>	The text string shared secret known to the switch and the server, but which is not sent over the network. It can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive. It is required when creating a server.
<i>retries</i>	The number of retries the switch makes to authenticate a user before trying the backup server ( <i>hostname2</i> or <i>ip_address2</i> ).
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>auth_port</i>	The UDP destination port for authentication requests.
<i>acct_port</i>	The UDP destination port for accounting requests.
<i>vrf_name</i>	Specifies the VRF instance to which the RADIUS server belongs.

## Defaults

parameter	default
<i>retries</i>	3
<i>seconds</i>	2
<i>auth_port</i>	1812
<i>acct_port</i>	1813

## Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

OmniSwitch 9000E, 6855-U24X; **vrf-name** parameter supported.

## Usage Guidelines

- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be RADIUS servers.
- Configuring multiple RADIUS servers is possible, but all RADIUS servers must belong to the same VRF instance.
- If the **vrf-name** parameter is not specified, the default VRF instance is assigned.
- Use the **no** form of the command to remove a RADIUS server from the configuration. Only one server may be removed at a time. Note that if any Authenticated Switch Access (such as telnet) is configured for the server, remove the switch access configuration first before attempting to remove the server.
- To move the RADIUS servers to a different VRF instance, first remove each server from the current VRF instance and then add each server to the new VRF instance.

## Examples

```
-> aaa radius-server pubs2 host 10.10.2.1 key wwwtoe timeout 5 vrf-name  
Management-vrf  
-> no aaa radius-server pubs2
```

## Release History

Release 6.1; command was introduced.

Release 6.4.2; **vrf-name** parameter introduced.

## Related Commands

<b>show aaa server</b>	Displays information about AAA servers.
<b>aaa authentication vlan single-mode</b>	Specifies the AAA servers to be used in single-authority mode for Authenticated VLANs.
<b>aaa authentication vlan multiple-mode</b>	Specifies the AAA servers to be used for Authenticated VLANs in multiple-authority mode.
<b>aaa authentication</b>	Specifies the AAA servers to be used for Authenticated Switch Access.
<b>aaa accounting mac</b>	Specifies the accounting servers to be used for Authenticated VLANs.
<b>aaa accounting session</b>	Specifies the accounting servers to be used for Authenticated Switch Access.

## MIB Objects

```
aaaServerTable
  aaasProtocol
  aaasHostName
  aaasIpAddress
  aaasHostName2
  aaasIpAddress2
  aaasRadKey
  aaasRetries
  aaasTimeout
  aaasRadAuthPort
  aaasRadAcctPort
  aaasVrfName
```

---

## aaa radius agent preferred

Configures the source IP address field of the Radius packet.

**aaa radius agent preferred** {**default** | **no-loopback** | *ip\_address*}

**no aaa radius agent preferred**

---

### Syntax Definitions

<b>default</b>	The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the first IP address on the switch will be used.
<b>no-loopback</b>	The Loopback0 address should not be used for the source IP address field and the first available IP address on the switch should be used for this field.
<i>ip_address</i>	The IP address to be used in the source IP field.

### Defaults

By default, the radius agent setting is set to the **default** parameter.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When configuring a specific IP address, that address must already exist on the switch.
- Use the **no** form of the command to clear a specific IP address and change the behavior back to **default**.

### Examples

```
-> aaa radius agent preferred 192.168.10.1
-> aaa radius agent preferred no-loopback
-> aaa radius agent preferred default
```

### Release History

Release 6.3.4; command was introduced.

Release 6.4.3; command was deprecated, use [ip managed-interface](#).

### Related Commands

[show aaa server](#) Displays information about AAA servers.

**MIB Objects**

radiusAgentVal  
ipedrUsrConfiguredIPaaSRetries

---

## aaa tacacs+-server

Configures or modifies a TACACS+ server for Authenticated VLANs or Authenticated Switch Access.

```
aaa tacacs+-server server-name [host {hostname | ip_address} {hostname2 | ip_address2}] [key secret][timeout seconds] [port port]
```

```
no aaa tacacs+-server server-name
```

---

### Syntax Definitions

<i>server-name</i>	The name of the TACACS+ server.
<i>hostname</i>	The host name (DNS name) of the primary TACACS+ server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary TACACS+ server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup TACACS+ server.
<i>ip_address2</i>	The IP address of an optional backup TACACS+ server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive. required when creating a server.
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>port</i>	The port number for the primary TACACS+ server.

### Defaults

<b>parameter</b>	<b>default</b>
<i>seconds</i>	2
<i>port</i>	49

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove a TACACS+ server from the configuration. Only one server may be deleted at a time. Note that if any Authenticated Switch Access (such as telnet) is configured for the server, remove the switch access configuration first before attempting to remove the server.
- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be TACACS+ servers.

---

## Examples

```
-> aaa tacacs+-server tpub host 10.10.2.2 key otna timeout 10
-> no aaa tacacs+-server tpub
```

## Release History

Release 6.1.3; command was introduced.

## Related Commands

<a href="#">show aaa server</a>	Displays information about AAA servers.
<a href="#">aaa authentication vlan single-mode</a>	Specifies the AAA servers to be used in single-authority mode for Authenticated VLANs.
<a href="#">aaa authentication vlan multiple-mode</a>	Specifies the AAA servers to be used for Authenticated VLANs in multiple-authority mode.
<a href="#">aaa authentication</a>	Specifies the AAA servers to be used for Authenticated Switch Access.
<a href="#">aaa accounting mac</a>	Specifies the accounting servers to be used for Authenticated VLANs.
<a href="#">aaa accounting session</a>	Specifies the accounting servers to be used for Authenticated Switch Access.

## MIB Objects

```
aaaServerTable
  aaasName
  aaasProtocol
  aaasHostName
  aaasIpAddress
  aaasHostName2
  aaasIpAddress2
  aaasTacacsKey
  aaasTimeout
  aaasTacacsPort
```

---

## aaa ldap-server

Configures or modifies an LDAP server for Authenticated VLANs or Authenticated Switch Access.

```
aaa ldap-server server_name [host {hostname | ip_address} [{hostname2 | ip_address2}]] [port]
[dn dn_name] [password super_password] [base search_base] [type server_type] [retransmit retries]
[timeout seconds] [ssl | no ssl] [port port]
```

```
no aaa ldap-server server-name
```

---

### Syntax Definitions

<i>server_name</i>	The name of the LDAP server.
<i>hostname</i>	The host name (DNS) of the primary LDAP server. The host name or IP address is required when creating a new server.
<i>ip_address</i>	The IP address of the primary LDAP server.
<i>hostname2</i>	The host name (DNS) of the backup LDAP server.
<i>ip_address2</i>	The IP address of a backup host for the LDAP server.
<i>dn_name</i>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers. For example: <b>cn=manager</b> . Must be different from the <i>search_base</i> name and must be in a format supported by the server. Required when creating a new server.
<i>super_password</i>	The super-user password recognized by the LDAP-enabled directory servers. The password may be clear text or hexadecimal format. Required when creating a new server.
<i>search_base</i>	The search base recognized by the LDAP-enabled directory servers. For example, <b>o=company</b> or <b>c=country</b> . Must be different from the <i>dn_name</i> . Required when creating a new server.
<i>server-type</i>	The different directory server types used in LDAP Authentication: <b>Generic</b> = Generic Schema <b>Netscape</b> = Netscape Directory Server <b>Novell</b> = Novell NDS <b>Sun</b> = Sun Directory Services <b>Microsoft</b> = Microsoft AD.
<i>retries</i>	The number of retries the switch makes to the LDAP server to authenticate a user before trying the backup server.
<i>seconds</i>	The timeout in seconds for server replies to authentication requests from the switch.

<b>ssl</b>	Enables a secure switch layer (SSL) between the switch and the LDAP server.
<b>no ssl</b>	Disables a secure switch layer (SSL) between the switch and the LDAP server.
<i>port</i>	The port number for the primary LDAP server and any backup server. Must match the port number configured on the server.

## Defaults

Defaults for optional parameters are as follows:

parameter	default
<i>port</i>	389 (SSL disabled) 636 (SSL enabled)
<i>retries</i>	3
<i>seconds</i>	2
<b>ssl   no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

## Usage Guidelines

- The *dn\_name* must be different from the *search\_base* name.
- Use the **no** form of the command to remove an LDAP server from the configuration. Only one server may be removed at a time. Note that if any Authenticated Switch Access (such as telnet) is configured for the server, remove the switch access configuration first before attempting to remove the server.
- The port number configured on the switch must match the port number configured for the server.
- When communicating with the LDAP server, the Loopback0 address is used if configured, otherwise the VLAN's IP address is used.

## Examples

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager password tpub base c=us
retransmit 4
-> no aaa ldap-server topanga5
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>show aaa server</b>	Displays information about AAA servers.
<b>aaa authentication vlan single-mode</b>	Specifies the AAA servers to be used in single-authority mode for Authenticated VLANs.
<b>aaa authentication vlan multiple-mode</b>	Configures AAA servers for Authenticated VLANs in multiple-authority mode.
<b>aaa authentication</b>	Specifies the AAA servers to be used for authenticated switch access.
<b>aaa accounting mac</b>	Specifies the accounting servers to be used for Authenticated VLANs.
<b>aaa accounting session</b>	Specifies the accounting servers to be used for Authenticated Switch Access.

  aaasLdapServType
  aaasRetries
  aaasTimeout
  aaasLdapEnableSsl
```

---

---

## aaa ace-server clear

Clears the ACE secret on the switch. An ACE/Server generates “secrets” that it sends to clients for authentication. The shared secret between the switch and the ACE/Server cannot be configured on the switch but can be cleared on the switch.

**aaa ace-server** *server-name* **clear**

---

### Syntax Definitions

*server-name* The name of the ACE Server. Usually only one ACE server is configured for a switch.

### Defaults

The default server name is provided as ACE

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Clear the ACE secret on the switch if the server and the switch get out of sync. See RSA Security’s ACE/Server documentation for more information.
- If you clear the secret on the switch, it must also be cleared on the server.

### Examples

```
-> aaa ace-server clear
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[aaa authentication](#) Specifies servers for Authenticated Switch Access.  
[show aaa server](#) Displays information about AAA servers configured for the switch.

### MIB Objects

aaaServerTable  
aaasAceClear

---

## aaa authentication vlan single-mode

Specifies the AAA servers to be used in single-authority mode for Authenticated VLANs.

**aaa authentication vlan single-mode** *server1* [*server2*] [*server3*] [*server4*]

**no aaa authentication vlan**

---

### Syntax Definitions

*server1*                      The name of the RADIUS, TACACS+, or LDAP authentication server used for authenticating users through all Authenticated VLANs on the switch. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

*server2...server4*            The names of backup servers for authenticating users through Authenticated VLANs. Up to 3 backups may be specified; include a space between each server name. These backups are only used if *server\_name1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable Authenticated VLANs in single mode.
- The servers may be RADIUS, TACACS+, or LDAP servers. Up to 4 servers (total) may be configured in single mode. Each server name should be separated by a space.
- The switch uses *only the first available server* in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

### Examples

```
-> aaa authentication vlan single-mode pubs1 pubs2 pubs3
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>aaa radius-server</b>	Configures or modifies a RADIUS server for Authenticated VLANs or Authenticated Switch Access.
<b>aaa ldap-server</b>	Configures or modifies an LDAP server for Authenticated VLANs or Authenticated Switch Access.
<b>show aaa server</b>	Displays information about a particular AAA server or AAA servers.
<b>show aaa authentication vlan</b>	Displays information about servers configured for Authenticated VLANs.

## MIB Objects

```
aaaAuthVlanTable  
  aaatvName1  
  aaatvName2  
  aaatvName3  
  aaatvName4
```

---

## aaa authentication vlan multiple-mode

Specifies the AAA servers to be used in multiple-authority mode for Authenticated VLANs.

```
aaa authentication vlan multiple-mode vlan_id server1 [server2] [server3] [server4]
```

```
no aaa authentication vlan vlan_id
```

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN associated with the server or chain of servers.
<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP authentication server used for this Authenticated VLAN in multiple mode. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands.
<i>server2...server4</i>	The names of backup servers for authenticating users through this VLAN. Up to 3 backups may be specified; include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to remove Authenticated VLANs in multiple mode.
- The servers may be RADIUS, TACACS+, or LDAP servers, or both. Up to 4 servers (total) may be configured for each VLAN in multiple mode. Each server name should be separated by a space.
- The switch uses **only the first available server** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

### Examples

```
-> aaa authentication vlan multiple-mode 2 pubs1 pubs2
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>aaa radius-server</b>	Configures or modifies a RADIUS server for Authenticated VLANs or Authenticated Switch Access.
<b>aaa ldap-server</b>	Configures or modifies an LDAP server for Authenticated VLANs or Authenticated Switch Access.
<b>show aaa server</b>	Displays information about a particular AAA server or AAA servers.
<b>show aaa authentication vlan</b>	Displays information about servers configured for Authenticated VLANs.

## MIB Objects

```
aaaAuthVlanTable  
  aaatvVlan  
  aaatvName1  
  aaatvName2  
  aaatvName3  
  aaatvName4
```

---

## aaa vlan no

Removes a user from an Authenticated VLAN. You must know the MAC address associated with the user.

**aaa avlan no** [**mac-address**] *mac\_address*

---

### Syntax Definitions

<b>mac-address</b>	Optional syntax.
<i>mac_address</i>	The MAC address of the user who should be removed from an Authenticated VLAN.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **show avlan user** command to display user MAC addresses.

### Examples

```
-> aaa avlan no 00:20:da:05:f6:23
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">aaa authentication vlan single-mode</a>	Specifies the AAA servers to be used in single-authority mode for Layer 2 Authentication.
<a href="#">aaa authentication vlan multiple-mode</a>	Specifies the AAA servers to be used in multiple-authority mode for Authenticated VLANs.
<a href="#">show avlan user</a>	Displays MAC addresses for Authenticated VLAN users on the switch.

### MIB Objects

aaaAuthenticatedUserTable  
aaaaMacAddress

---

---

## aaa avlan dns

Configures a DNS host name. When clients authenticate via a Web browser, they will be able to enter the DNS host name rather than enter the IP address.

```
aaa avlan dns [name] dns_name
```

```
no aaa avlan dns [name] dns_name
```

---

### Syntax Definitions

*dns\_name*                                      The name of the DNS host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove a host name from the configuration.

### Examples

```
-> aaa avlan dns wolfie  
-> no aaa avlan dns
```

### Release History

Release 6.1; command was introduced.

### Related Commands

    aaaAvlanDnsName
```

---

## aaa avlan default dhcp

Configures the gateway address for a DHCP server.

```
aaa avlan default dhcp [gateway] ip_address
```

```
no aaa avlan default dhcp [gateway]
```

---

### Syntax Definitions

*ip\_address*                      The IP address of the AVLAN default gateway.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove an AVLAN default gateway from the configuration.

### Examples

```
-> aaa avlan dhcp 128.23.4.1  
-> no aaa avlan dhcp
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show aaa avlan config](#)              Displays the current DNS and DHCP configuration for Authenticated VLANs.

### MIB Objects

```
aaaAvlanConfigTable  
    aaaAvlanDhcpDefGateway
```

---

## aaa authentication

Configures the interface for Authenticated Switch Access and specifies the server(s) to be used. This type of authentication gives users access to manage the switch.

**aaa authentication** {**console** | **telnet** | **ftp** | **http** | **snmp** | **ssh** | **default**} *server1* [*server2...*] [**local**]

**no aaa authentication** [**console** | **telnet** | **ftp** | **http** | **snmp** | **ssh** | **default**]

---

### Syntax Definitions

<b>console</b>	Configures Authenticated Switch Access through the console port.
<b>telnet</b>	Configures Authenticated Switch Access for any port used for Telnet.
<b>ftp</b>	Configures Authenticated Switch Access for any port used for FTP.
<b>http</b>	Configures Authenticated Switch Access for any port used for Web-based management.
<b>snmp</b>	Configures Authenticated Switch Access for any port used for SNMP.
<b>ssh</b>	Configures Authenticated Switch Access for any port used for Secure Shell.
<b>default</b>	Configures Authenticated Switch Access for any port using any service ( <b>telnet</b> , <b>ftp</b> , etc.). Note that SNMP access is enabled only if an LDAP or local server is specified with the command.
<i>server1</i>	The name of the authentication server used for Authenticated Switch Access. At least one server is required. The server may be a RADIUS, TACACS+, LDAP, ACE/Server, or the local user database. RADIUS, TACACS+, and LDAP server names are set up through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands. If an ACE/Server will be used, specify <b>ace</b> for the server name. (Only one ACE/Server may be specified.)
<i>server2...</i>	The names of backup servers for Authenticated Switch Access. Up to 3 backups may be specified (including <b>local</b> ). These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.
<b>local</b>	Specifies that the local user database will be a backup for the authentication servers. If you want to use the local user database as the only authentication server, specify <b>local</b> for <i>server1</i> .

### Defaults

- At switch startup, Authenticated Switch Access is available through console port via the local database. Authentication for other management interfaces (Telnet, FTP, etc.) is disabled.
- By default, the telnet, ftp, http, and snmp login is disabled
- The default user on the switch is **admin**, and **switch** is the password.

## Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to remove the Authenticated Switch Access configuration for the specified interface type. If the switch access configuration for an external authentication server is not removed first, attempting to remove the server configuration from the switch will fail.
- The server type may be RADIUS, TACACS+, LDAP, ACE/Server, or the local user database. Up to 4 servers may be configured for an interface type; at least one is required. Each server name should be separated by a space.
- The switch uses *only the first available server* in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.
- If the local switch database will be used as the only authentication server, specify **local** for *server1*. If **local** is specified as a backup server, it should be entered last in the list of servers. The local user database is always available if the switch is up.
- Only LDAP or the local database may be used for authenticated SNMP management.
- An ACE/Server cannot be specified for SNMP access.
- If Secure Shell (**ssh**) is enabled, Telnet and FTP should be disabled.

## Examples

```
-> aaa authentication telnet pubs1
-> no aaa authentication telnet
-> aaa authentication default pubs2 pubs3
```

## Release History

Release 6.1; command was introduced.

## Related Commands

## aaa authentication default

Sets the authenticated switch access type to the default server setting.

**aaa authentication {console | telnet | ftp | http | snmp | ssh} default**

---

### Syntax Definitions

<b>console</b>	Configures the default Authenticated Switch Access server setting for the console port.
<b>telnet</b>	Configures the default Authenticated Switch Access server setting for Telnet.
<b>ftp</b>	Configures the default Authenticated Switch Access server setting for FTP.
<b>http</b>	Configures the default Authenticated Switch Access server setting for Web-based management.
<b>snmp</b>	Configures the default Authenticated Switch Access server setting for any port used for SNMP.
<b>ssh</b>	Configures the default Authenticated Switch Access server setting for any port used for Secure Shell.

### Defaults

By default, the default Authenticated Switch Access server setting does not include any servers.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **aaa authentication** command to set the default servers.

### Examples

```
-> aaa authentication telnet default  
-> aaa authentication default default
```

### Release History

Release 6.1; command was introduced.

## Related Commands

  aaatsName2  
  aaatsName3  
  aaatsName4
```

---

## aaa authentication 802.1x

Enables/disables the switch for 802.1X authentication.

**aaa authentication 802.1x** *server1* [*server2*] [*server3*] [*server4*]

**no aaa authentication 802.1x**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS authentication server used for 802.1X authentication. ( <i>Note that only RADIUS servers are supported for 802.1X authentication.</i> ) At least one server is required. RADIUS server names are set up through the <a href="#">aaa radius-server</a> command.
<i>server2...server4</i>	The names of backup servers for authenticating 802.1X users. Up to 3 backups may be specified; include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable 802.1x authentication for the switch.
- Use the [vlan port 802.1x](#) command to enable or disable ports for 802.1X. Use the [802.1x](#) command to configure authentication parameters for a dedicated 802.1X port.
- Up to 4 RADIUS servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses *only the first available server* in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the [aaa radius-server](#) command.
- Before any device is authenticated through an 802.1X port, the port will only process 802.1X frames (EAPoL frames) from an unknown source.
- Note that multiple supplicants can be authenticated on a given 802.1X port. Each supplicant MAC address received on the port is authenticated and learned separately. Only those that authenticate successfully are allowed on the port; those that fail authentication are blocked on the 802.1X port.

## Examples

```
-> aaa authentication 802.1x rad1 rad2  
-> no aaa authentication 802.1x
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">802.1x</a>	Configures 802.1X parameters on a particular slot/port. Typically used for port access control on a dedicated 802.1X port.

aaatxOpen
```

---

## aaa authentication mac

Enables/Disables the switch for MAC authentication. This type of authentication is available in addition to 802.1x authentication and is designed to handle devices that do not support an 802.1x authentication method (non-suplicants).

**aaa authentication MAC** *server1* [*server2*] [*server3*] [*server4*]

**no aaa authentication MAC**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS authentication server used for MAC authentication. (Note that only RADIUS servers are supported for MAC authentication.) At least one server is required. RADIUS server names are set up through the <a href="#">aaa radius-server</a> command.
<i>server2...server4</i>	The names of backup servers used for MAC authentication. Up to 3 backups may be specified; include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Up to 4 RADIUS servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- Use the **no** form of this command to disable MAC authentication for the switch.
- The switch uses **only the first available server** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the [aaa radius-server](#) command.
- MAC authentication verifies the source MAC address of a non-suppliant device via a remote RADIUS server. Similar to 802.1x authentication, this method sends RADIUS frames to the server with the MAC address embedded in the username and password attributes.
- Note that the same RADIUS servers can be used for 802.1x (suppliant) and MAC (non-suppliant) authentication. Using different servers for each type of authentication is allowed but not required.
- Use the [vlan port 802.1x](#) command to enable or disable ports for 802.1X. Use the [802.1x non-suppliant policy authentication](#) command to configure a MAC authentication policy for a dedicated 802.1X port.

- Multiple supplicants and non-supplicants can be authenticated on a given 802.1X port. Each device MAC address received on the port is authenticated and learned separately. If no MAC authentication policies exist on the port, non-supplicants are blocked.

## Examples

```
-> aaa authentication mac rad1 rad2  
-> no aaa authentication mac
```

## Release History

Release 6.1.2; command was introduced.

## Related Commands

## aaa accounting 802.1x

Enables/disables accounting for 802.1X authentication sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting 802.1x** *server1* [*server2...*] [**local**]

**no aaa accounting 802.1x**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP server used for 802.1X accounting. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands.
<i>server2...</i>	The names of backup servers for 802.1X accounting. Up to 3 backups may be specified (including <b>local</b> ); include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switch Logging feature in the switch. See <a href="#">Chapter 51, “Switch Logging Commands,”</a> for information about Switch Logging commands.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable accounting for 802.1X ports.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, or LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

## Examples

```

## aaa accounting mac

Enables/disables accounting for 802.1X non-supPLICANT (MAC-based) authentication sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting mac** *server1* [*server2...*] [**local**]

**no aaa accounting mac**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP server used for accounting. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands.
<i>server2...</i>	The names of backup servers for accounting. Up to 3 backups may be specified (including <b>local</b> ); include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switch Logging feature in the switch. See <a href="#">Chapter 51, “Switch Logging Commands,”</a> for information about Switch Logging commands.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, or LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

## Examples

```
-> aaa accounting mac radl local  
-> no aaa accounting mac
```

## Release History

Release 6.4.4; command was introduced.

## Related Commands

[aaa radius-server](#)

Configures or modifies a RADIUS server for Authenticated VLANs, Authenticated Switch Access, or 802.1X port access control.

[show aaa accounting mac](#)

Displays information about accounting servers for 802.1X non-suppliant sessions.

## MIB Objects

```
aaaAcctMACTable

```

---

## aaa accounting vlan

Specifies a server or servers to be used for accounting with Authenticated VLANs. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting vlan** [*vlan\_id*] *server1* [*server2...*] [**local**]

**no accounting vlan** [*vlan\_id*]

---

### Syntax Definitions

<i>vlan_id</i>	Required only for multiple mode. The VLAN associated with the accounting server or chain of accounting servers.
<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP server used for accounting with Authenticated VLANs. At least one server is required. RADIUS and LDAP server names are set up through the <b>aaa radius-server</b> , <b>aaa tacacs+-server</b> , and <b>aaa ldap-server</b> commands. If the local accounting feature will be used as the only accounting mechanism, specify <b>local</b> for <i>server1</i> .
<i>server2...</i>	The names of backup servers. Up to 3 backups may be specified (including <b>local</b> ); include a space between each server name. Backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switch Logging feature in the switch. See <a href="#">Chapter 51, “Switch Logging Commands,”</a> for information about Switch Logging commands.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable accounting for Authenticated VLANs.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.

- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.

## Examples

```
-> aaa accounting vlan ldap1 ldap2 ldap3 radius1
-> no accounting vlan
-> aaa accounting vlan 4 radius1 ldap2 local
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>aaa radius-server</b>	Configures or modifies a RADIUS server for Authenticated VLANs or Authenticated Switch Access.
<b>aaa tacacs+-server</b>	Configures or modifies an LDAP server for Authenticated VLANs or Authenticated Switch Access.

```

---

## aaa accounting session

Configures an accounting server or servers for authenticated switch sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting session** [*server\_name1*] [*server\_name2...*] [**local**]

**no aaa accounting session**

---

### Syntax Definitions

*server\_name1*

The name of the RADIUS, TACACS+, or LDAP server used for accounting of authenticated switch sessions. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

*server\_name2...*

The names of backup servers. Up to 3 backups may be specified (including **local**); each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.

**local**

Local accounting is done through the Switching Logging feature on the switch. See [Chapter 51, “Switch Logging Commands,”](#) for information about Switch Logging commands.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable accounting for Authenticated Switch Access.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

## Examples

```
-> aaa accounting session ldap1 radius2 local  
-> no aaa accounting session
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[show aaa accounting](#)

Displays information about accounting servers configured for Authenticated Switch Access.

```

---

## aaa accounting command

Enables or disables the server for command accounting. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting command** *server1* [*server2...*] [**local**]

**no accounting command**

---

### Syntax Definitions

<i>server1</i>	The name of the TACACS+ server used for command accounting. At least one server is required. TACACS+ server names are set up through the <a href="#">aaa tacacs+-server</a> commands.
<i>server2...</i>	The names of TACACS+ backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switching Logging feature on the switch. See <a href="#">Chapter 51, “Switch Logging Commands,”</a> for information about Switch Logging commands.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to disable command accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers can be only TACACS+ servers.
- The switch uses *only the first available server* in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- TACACS+ server may each have an additional backup specified through the [aaa tacacs+-server](#) command.

### Examples

```
-> aaa accounting command tacacs1 tacacs2 tacacs3
-> no aaa accounting command
```

## Release History

Release 6.1.3; command was introduced.

## Related Commands

[show aaa accounting](#)

Displays information about accounting servers configured for Authenticated Switch Access.

## MIB Objects

```

  aaacmdSrvName2  
  aaacmdSrvName3  
  aaacmdSrvName4
```

---

## avlan default-traffic

Configures whether or not users are able to traffic in the default VLAN before they are actually authenticated.

**avlan default-traffic {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the switch to allow users authenticating through the switch to traffic in the default VLAN prior to authentication.
<b>disable</b>	Disables the switch so that users authenticating through the switch cannot traffic in the default VLAN prior to authentication.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- When this command is enabled, users are members of the default VLAN before authentication. After authenticating, users are no longer authorized for the default VLAN.
- When this command is disabled after being enabled, existing users in the default VLAN are not flushed.
- The default VLAN is configurable per port through the [vlan port default](#) command.
- The **avlan default-traffic** command allows Telnet and HTTP clients to obtain an IP address from a DHCP server in the default VLAN.

### Examples

```
-> avlan default-traffic enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[vlan port default](#)

Configures a new default VLAN for a single port or an aggregate of ports.

[show aaa avlan config](#)

Displays the current global configuration parameters for Authenticated VLANs.

## MIB Objects

aaaAvlanDefaultTraffic

---

## avlan port-bound

Configures whether or not port mobility rules apply to authenticated ports.

```
avlan port-bound {enable | disable}
```

---

### Syntax Definitions

**enable** Enables authenticated ports to use port mobility rules.

**disable** Disables authenticated ports from using port mobility rules.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

When this command is enabled, a limited number of port mobility binding rule types may be applied to authenticated ports. The types are as follows:

- port-MAC-IP address binding rule
- port-MAC binding rule

For more information about commands for configuring port binding rules, see [Chapter 37, “Port Mobility Commands.”](#)

### Examples

```
-> avlan port-bound enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### **vlan binding mac-ip-port**

Defines a binding MAC-IP-port rule for an existing VLAN. Device frames received on the specified mobile port must also contain a source MAC address and source IP address that matches the MAC and IP address specified in the rule.

### **vlan binding mac-port**

Defines a binding MAC-port rule for an existing VLAN. Device frames received on the specified mobile port must contain a source MAC address that matches the MAC address specified in the rule.

### **show aaa avlan config**

Displays the current global configuration parameters for Authenticated VLANs.

## MIB Objects

aaaAvlanConfigTable

aaaAvlanPortBound

---

## avlan auth-ip

Configures an IP address to be used for VLAN authentication.

```
avlan vlan_id auth-ip ip_address
```

---

### Syntax Definitions

<i>vlan_id</i>	The ID of the Authenticated VLAN.
<i>ip_address</i>	The IP address to be used for authentication on this VLAN. The IP address must have the same mask as the router port address for the Authenticated VLAN.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- If an IP address is not configured for an Authenticated VLAN, the switch automatically configures the address with an authentication address based on the router port address (*x.x.x.253*).
- The IP address of the Authenticated VLAN must have the same mask as the router port address. For example, if the router port address of the Authenticated VLAN is 10.10.2.4, then the IP address must be 10.10.2.*x*.
- When modifying the authentication address for a specific VLAN, make sure that the new address does not match an IP router interface address for the same VLAN. IP address resolution problems can occur if these two addresses are not unique.
- VLANs are set up for authentication through the [vlan authentication](#) command.

### Examples

```
-> avlan 3 auth-ip 10.10.2.4
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[vlan authentication](#)

Enables or disables authentication for a VLAN.

[show aaa avlan auth-ip](#)

Displays the IP addresses for Authenticated VLANs.

## MIB Objects

aaaAvlanConfigTable

aaaAvlanAddress

---

---

## aaa avlan http language

Configures the switch to display username and password prompts based on the contents of a translation file (labels.txt).

**aaa avlan http language**

---

### Syntax Definitions

N/A

### Defaults

By default, the switch displays the HTTP client login page username and password prompts in English.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- When this command is entered, the next WebView session on the switch will use the username and password strings contained in the **label.txt** file.
- The label.txt file is available on the switch in the /flash/switch directory when the **Fsecu.img**, **Esecu.img**, **Hsecu.img**, or **Jsecu.img** file is installed. The label.txt file may be modified with any text editor and may contain strings for the username and password prompts in the format:

```
Username="username_string"  
Password="password_string"
```

- If the **aaa avlan http language** command is specified, but the label.txt file does not exist on the switch or the file is empty (the default), the switch will use the English-language text defaults for the HTTP client login page.

### Examples

```
-> aaa avlan http language
```

### Release History

Release 6.1; command was introduced.

### Related Commands

N/A

### MIB Objects

```
aaaAvlanConfigTable  
aaaAvlanLanguage
```

---

## user

Configures or modifies user entries in the local user database. Use the **no** form of the command to remove the user from the local database.

```
user username [password password] [expiration {day | date}] [read-only | read-write [families... / domains...] all | none] [no snmp | no auth | sha | md5 | sha+des | md5+des] [end-user profile name] [console-only {enable | disable}]
```

```
no user username
```

---

### Syntax Definitions

<i>username</i>	The name of the user (maximum is 31 alphanumeric characters). Used for logging into the switch. Required to create a new user entry or for modifying a user.
<i>password</i>	The user's password in clear text or hexadecimal (corresponding to encrypted form). Required to create a new user entry. The default minimum length is 8 alphanumeric characters. The maximum is 47 characters.
<i>day</i>	The number of days before this user's current password expires. The range is 1 to 150 days.
<i>date</i>	The date (in the format <i>mm/dd/yyyy hh:mm</i> ) that the user's current password will expire.
<b>read-only</b>	Specifies that the user will have read-only access to the switch.
<b>read-write</b>	Specifies that the user will have read-write access to the switch.
<i>families</i>	Determines the command families available to the user on the switch. Each command family should be separated by a space. Command families are subsets of domains. See Usage Guidelines for more details.
<i>domains</i>	Determines the command domains available to the user on the switch. Each domain should be separated by a space. See the Usage Guidelines for more details.
<b>all</b>	Specifies that all command families and domains are available to the user.
<b>none</b>	Specifies that no command families or domains are available to the user.
<b>no snmp</b>	Denies the specified user SNMP access to the switch.
<b>no auth</b>	Specifies that the user has SNMP access without any required SNMP authentication and encryption protocol.
<b>sha</b>	Specifies that the SHA authentication algorithm should be used for authenticating SNMP PDU for the user.
<b>md5</b>	Specifies that the MD5 authentication algorithm should be used for authenticating SNMP PDU for the user.

<b>sha+des</b>	Specifies that the SHA authentication algorithm and DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
<b>md5+des</b>	Specifies that the MD5 authentication algorithm and the DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
<i>name</i>	The name of an end-user profile associated with this user. Configured through the <b>end-user profile</b> command. Cannot be associated with the user if command families/domains are associated with the user.
<b>console-only enable</b>	Enables console only access for the user <i>admin</i> .
<b>console-only disable</b>	Disables console only access for the user <i>admin</i> .

## Defaults

By default, if a user is created without indicating the read and write privileges and SNMP access, the user will be given privileges based on the *default user account*. The default user account may be modified, but by default it has the following privileges:

parameter	default
<b>read-only   read-write</b>	<b>read-only</b>
<b>no snmp   no auth   sha   md5   sha+des   md5+des</b>	<b>no snmp</b>
<b>console-only</b>	<b>disable</b>

For more information about the default user account, see the *OmniSwitch AOS Release 6 Switch Management Guide*.

## Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

## Usage Guidelines

- In addition to the syntax listed for the command, the syntax **authkey** *key* will display in an ASCII text file produced via the **snapshot** command if the user is allowed SNMPv3 access to the switch. The authentication key is in hexadecimal form, and is deducted from the user's password with SHA or MD5 hash and encrypted with DES encryption. The key parameter only appears in configuration files that are resulting from a snapshot. The key is computed by the switch based on the user's SNMP access and will only appear in the ASCII text file; it is not displayed through the CLI. (*This key is used for both Auth Password and Priv Password in the OmniVista NMS application.*)
- At least one user with SHA/MD5 authentication and/or DES encryption must be configured on the switch for SNMPv3 communication with OmniVista.
- Use **user** *username* and **password** *password* to reset a user's password configured through the **password** command.
- Typically the password should be a string of non-repeating characters. The CLI uses the first occurrence of the character series to uniquely identify the password. For example, the password *tpubtpub* is the same as *tpub*. A better password might be *tpub345*.

- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (\*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password \*\*123456\*\*** is allowed; **password \*\*\*\*\*** is not allowed.
- The password expiration date will display in an ASCII text file produced via the **snapshot** command.
- A password expiration for the user's current password may be configured with the **expiration** option. However, if the password is changed, or the global password expiration setting is configured with the **user password-expiration** command, the user's password expiration will be configured with the global expiration setting.
- When modifying a user's SNMP access, the user password must be re-entered (or a new one configured). This is required because the hash algorithm used to save the password in the switch depends on the SNMP authentication level.
- At initial startup, the default user on the switch is **admin** with a password of **switch**. The switch will not recreate this user at any successive startup as long as there exists at least one user defined with write access to all commands. (Note that if password expiration is configured for the **admin** user, or configured globally through the **user password-expiration** command, when the **admin** user's password expires, the **admin** user will have access only through the console port.)
- Either privileges or an end-user profile may be associated with a user; both cannot be configured for the same user.
- New users or updated user settings are saved *automatically*; that is, these settings do not require the **write memory** or **configuration snapshot** command to save user settings over a reboot.

Possible values for domains and families are listed in the table here:

Domain	Corresponding Families
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

## Examples

```
-> user techpubs password writer read-only config
-> no user techpubs
```

## Release History

Release 6.1; command was introduced.

Release 6.4.3; **Console-only** parameter was added.

---

## password

Configures the current user's password.

**password**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- If the **snapshot** command is used to capture the switch configuration, the text of the password is not displayed in the file. Instead an authentication key is included in the file.
- The **password** command does not require a password in-line; instead, after the command is entered, the system displays a prompt for the password. Enter any alphanumeric string. (The string displays on the screen as asterisks.) The system displays a prompt to verify the new password.
- A new password cannot be identical to the current password; it cannot be identical to any of the three passwords that preceded the current password.
- The password may be up to 47 characters. The default minimum password length is 8 characters.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (\*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password \*\*123456\*\*** is allowed; **password \*\*\*\*\*** is not allowed.
- Password settings are saved *automatically*; that is, the **write memory** or **configuration snapshot** command is not required to save password settings over a reboot.

### Examples

```
-> password
enter old password: *****
enter new password: *****
reenter new password: *****
->
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### **user**

Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges or profile.

## MIB Objects

```
aaaUserTable  
  aaauPassword  
  aaauOldPassword
```

---

## user password-size min

Configures the minimum number of characters required when configuring a user password.

**user password-size min** *size*

---

### Syntax Definitions

*size* The number of characters required when configuring a user password through the **password** command or when setting up a user password through the **user** command. The range is 1 to 14 characters.

### Defaults

parameter	default
<i>size</i>	8

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

N/A.

### Examples

```
-> user password-size min 9
```

### Release History

Release 6.1; command was introduced.

Release 6.3.1; minimum password size range changed to 1–14 characters.

### Related Commands

- user** Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges or profile.
- show user password-size** Displays the minimum number of characters that are required for a user password.
- show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig  
aaaAsaPasswordSizeMin

---

## user password-expiration

Configures an expiration date for all user passwords stored locally on the switch or disables password expiration.

**user password-expiration** {*day* / **disable**}

---

### Syntax Definitions

<i>day</i>	The number of days before locally configured user passwords will expire. The range is 1 to 150 days.
<b>disable</b>	Disables password expiration for users configured locally on the switch.

### Defaults

parameter	default
<i>day</i> / <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **user password-expiration** command sets a default password expiration for users configured locally on the switch.
- Password expiration may be configured on a per-user basis through the **user** command; the user setting overrides the **user password-expiration** setting until the user password is changed or the **user password-expiration** command is entered again.

### Examples

```
-> user password-expiration 2
-> user password-expiration disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>user</b>	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges or profile.
<b>show user password-expiration</b>	Displays the expiration date for passwords configured for user accounts stored on the switch.
<b>show user password-policy</b>	Displays the global password policy configuration for the switch.

## **MIB Objects**

aaaAsaConfig

aaaAsaDefaultPasswordExpirationInDays

---

## user password-policy cannot-contain-username

Specifies whether or not a user can configure a password that contains the username for the account.

**user password-policy cannot-contain-username {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Does not allow the password to contain the username.
<b>disable</b>	Allows the password to contain the username.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- The status of this function is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- When this function is enabled, a check is done at the time the password is created or modified to ensure that the username is not specified as part of the password text.

### Examples

```
-> user password-policy cannot-contain-username enable
-> user password-policy cannot-contain-username disable
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

**show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordContainUserName
```

---

## user password-policy min-digit

Configures the minimum number of base-10 digits required for a valid password.

**user password-policy min-digit** *number*

---

### Syntax Definitions

*number* The minimum number of digits. The range is 0 to 7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Specify **0** with this command to disable the minimum number of digits requirement.
- The minimum number of digits requirement is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-digit 2
-> user password-policy min-digit 0
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

**show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

```

aaaAsaPasswordMinDigit
```

---

---

## user password-policy min-nonalpha

Configures the minimum number of non-alphanumeric characters (symbols) required for a valid password.

**user password-policy min-nonalpha** *number*

---

### Syntax Definitions

*number*                                      The minimum number of non-alphanumeric characters.  
The range is 0 to 7.

### Defaults

---

parameter	default
<i>number</i>	0

---

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Specify **0** with this command to disable the minimum non-alphanumeric character requirement.
- The minimum number of non-alphanumeric characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-nonalpha 2
-> user password-policy min-nonalpha 0
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show user password-policy](#)      Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
aaaAsaPasswordMinNonAlpha
```

---

## user password-history

Configures the maximum number of old passwords to retain in the password history.

**user password-history** *number*

---

### Syntax Definitions

*number*                      The maximum number of old passwords to retain.  
The range is 0 to 24.

### Defaults

---

parameter	default
<i>number</i>	4

---

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Specify **0** with this command to disable the password history function.
- The user is prevented from specifying any passwords that are recorded in the password history and fall within the range configured through this command.
- The password history value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-history 2  
-> user password-history 0
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show user password-policy](#)      Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig  
    aaaAsaPasswordHistory
```

---

## user password-min-age

Configures the minimum number of days during which a user is prevented from changing a password.

**user password-min-age** *days*

---

### Syntax Definitions

*days* The number of days to use as the minimum age of the password. The range is 0 to 150.

### Defaults

parameter	default
<i>days</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specify **0** with this command to disable the minimum number of days requirement.
- Configure the minimum age of a password with a value that is less than the value configured for the password expiration.
- The password minimum age value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-min-age 7
-> user password-min-age 0
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinAge
```

---

## user lockout-window

Configures a moving period of time (observation window) during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts. The number of failed login attempts is decremented by the number of failed attempts that age beyond the observation window time period.

**user lockout-window** *minutes*

---

### Syntax Definitions

*minutes* The number of minutes the observation window remains active. The range is 0 to 99999.

### Defaults

parameter	default
<i>minutes</i>	0

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Specify **0** with this command to disable the observation window function. This means that failed login attempts will never age out; the number of failed attempts is never decremented.
- Do not configure an observation window time period that is greater than the lockout duration time period.
- If the number of failed login attempts exceeds the number of failed attempts allowed before the observation window time expires, then the user account is locked out of the switch.
- The observation window time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory** or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user lockout-window 500
-> user lockout-window 0
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<a href="#">user lockout-duration</a>	Configures the amount of time a user account remains locked out of the switch.
<a href="#">user lockout-threshold</a>	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
<a href="#">user lockout unlock</a>	Manually locks or unlocks a user account on the switch.
<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

## MIB Objects

```
aaaAsaConfig

<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutThreshold
```

---

## user lockout-duration

Configures the length of time a user account remains locked out of the switch. At the end of this time period, the user account is automatically unlocked.

**user lockout-duration** *minutes*

---

### Syntax Definitions

*minutes* The number of minutes the user account remains locked out. The range is 0 to 99999.

### Defaults

parameter	default
<i>minutes</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Note that if the lockout duration time period is set to zero (the default), then locked user accounts are never automatically unlocked.
- Only the **admin** user or a user with read/write AAA privileges can unlock a locked user account when the lockout duration time is set to zero. An account is unlocked by changing the user password or with the **user lockout unlock** command.
- Do not configure a lockout duration time period that is less than the amount of time configured for the observation window.
- The lockout duration time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory** or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user lockout-duration 60
-> user lockout-duration 0
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutDuration
```

---

## user lockout unlock

Manually locks or unlocks a user account on the switch.

```
user {lockout | unlock}
```

---

### Syntax Definitions

<i>username</i>	The username of the account to lock or unlock.
<b>lockout</b>	Locks the user account out of the switch.
<b>unlock</b>	Unlocks a locked user account.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- This command is only available to the **admin** user or a user with read/write AAA privileges.
- The **admin** user account is protected from any type of lockout attempt.
- User lockouts and unlocks are saved *automatically*; that is, these settings do not require the **write memory** or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user j_smith lockout
-> user j_smith unlock
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<b>show user</b>	Displays information about all users or a particular user configured in the local user database on the switch.
<b>show user lockout-setting</b>	Displays the global user lockout settings for the switch.

### MIB Objects

```
aaaUserTable
  aaauPasswordLockoutEnable
```

---

## aaa admin-logout

Administratively logs a user out of the network. This command requires administrative privileges.

```
aaa admin-logout {mac-address mac_address | port slot/port | user user_name | user-network-profile  
name profile_name}
```

---

### Syntax Definitions

<i>mac_address</i>	The source MAC address of a user device.
<i>slot/port</i>	The slot and port number designation for a specific switch port. All users learned on this port are logged out.
<i>user_name</i>	The username of the account to log out.
<i>profile_name</i>	The name of an existing User Network Profile (UNP). All users classified with this profile are logged out of the switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- This command is only available to the **admin** user.
- The **admin** user account is protected from any attempt to log out the admin user.

### Examples

```
-> aaa admin-logout mac-address 00:2a:95:00:3a:10  
-> aaa admin-logout port 1/9  
-> aaa admin-logout user j_smith  
-> aaa admin-logout user-network-profile name marketing
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[show aaa-device all-users](#) Displays the global user lockout settings for the switch.

### MIB Objects

```
alaDot1xAdminLogoutParams  
  alaDot1xAdminLogoutType  
  alaDot1xAdminLogoutMacAddress  
  alaDot1xAdminLogoutUserName
```

```
alaDot1xAdminLogoutNetworkProfileName  
alaDot1xAdminLogoutInterfaceId
```

---

## end-user profile

Configures or modifies an end user profile, which specifies access to command areas. The profile may be attached to a customer login user account.

**end-user profile** *name* [**read-only** [*area* | **all**]] [**read-write** [*area* | **all**]] [**disable** [*area* | **all**]]

**no end-user profile** *name*

---

### Syntax Definitions

<i>name</i>	The name of the end-user profile, up to 32 alphanumeric characters.
<i>area</i>	Command areas on the switch to which the user is allowed or denied access. Areas include <b>physical</b> , <b>vlan-table</b> , <b>basic-ip-routing</b> , <b>ip-routes-table</b> , <b>mac-filtering-table</b> , <b>spantree</b> .

### Defaults

Areas are disabled for end-user profiles by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of the command to delete an end-user profile.
- An end-user profile may not be attached to a user that is already configured with functional privileges.
- If a profile is deleted, but the profile name is still associated with a user, the user will not be able to log into the switch.
- Use the **end-user profile port-list** and **end-user profile vlan-range** commands to configure ports and VLANs to which this profile will have access. By default, new profiles do not allow access to any ports or VLANs.

### Examples

```
-> end-user profile bsmith read-only basic-ip-routing ip-routes-table
-> no end-user profile bsmith
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">end-user profile port-list</a>	Configures a range of ports associated with an end-user profile.
<a href="#">end-user profile vlan-range</a>	Configures a range of VLANs associated with an end-user profile.
<a href="#">user</a>	Configures or modifies user entries in the local user database.
<a href="#">show end-user profile</a>	Displays information about end-user profiles.

## MIB Objects

```
endUserProfileTable
    endUserProfileName
    endUserProfileAreaPhysical
    endUserProfileAreaVlanTable
    endUserProfileAreaBasicIPRouting
    endUserProfileAreaIpRoutesTable
    endUserProfileAreaMacFilteringTable
    endUserProfileAreaSpantree
endUserProfileSlotPortTable
    endUserProfileSlotNumber
    endUserProfilePortList
endUserProfileVlanIdTable
    endUserProfileVlanIdStart
    endUserProfileVlanIdEnd
```

---

## end-user profile port-list

Configures a range of ports associated with an end-user profile.

**end-user profile** *name* **port-list** *slot1*[*port\_range1*] [*slot2*[*port\_range2*] ...]

**end-user profile** *name* **no port-list** *slot1* [*slot2*...]

---

### Syntax Definitions

<i>name</i>	The name of an existing or a new end-user profile.
<i>slot1</i>	The slot number associated with the profile.
<i>port_range1</i>	The port or port range associated with slot1. Ports are separated by a hyphen, for example <b>2-4</b> .
<i>slot2</i>	Additional slots may be associated with the profile.
<i>port_range2</i>	Additional ports may be associated with additional slot numbers associated with the profile.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove a port list or lists from an end-user profile. Note that the **no** form removes all the ports on a given slot or slots.

### Examples

```
-> end user profile Prof1 port-list 2/1-3 3 4/1-5
-> end user profile Prof1 no port-list 4
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">end-user profile</a>	Configures or modifies an end user profile, which specifies access to command areas.
<a href="#">end-user profile vlan-range</a>	Configures a range of VLANs associated with an end-user profile.
<a href="#">show end-user profile</a>	Displays information about end-user profiles.

## MIB Objects

```
endUserProfileTable
  endUserProfileName
endUserProfileSlotPortTable
  endUserProfileSlotNumber
  endUserProfilePortList
```

---

## end-user profile vlan-range

Configures a range of VLANs associated with an end-user profile.

**end-user profile** *name* **vlan-range** *vlan\_range* [*vlan\_range2...*]

**end-user profile** *name* **no vlan-range** *vlan1* [*vlan2..*]

---

### Syntax Definitions

<i>name</i>	The name of an existing or a new end-user profile.
<i>vlan_range</i>	The VLAN range associated with the end-user profile; values are separated by a hyphen. For example: <b>3-6</b> indicates VLAN 3, VLAN 4, VLAN 5, and VLAN 6.
<i>vlan_range2...</i>	Optional additional VLAN ranges associated with the end-user profile. Up to 16 ranges total may be configured.
<i>vlan1</i>	The VLAN range to be deleted from the profile. Only the start of the range may be entered.
<i>vlan2...</i>	Additional VLAN ranges to be deleted. Only the start of the range may be entered.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of the command to remove a VLAN range or ranges from an end-user profile. Note that only the start of the VLAN range must be entered to remove the range.

### Examples

```
-> end-user profile Prof1 vlan-range 2-4 7-8
-> end-user profile Prof1 no vlan-range 7
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">end-user profile</a>	Configures or modifies an end user profile, which specifies access to command areas.
<a href="#">end-user profile port-list</a>	Configures a range of ports associated with an end-user profile.

## MIB Objects

```
endUserProfileTable
  endUserProfileName
endUserProfileVlanIdTable
  endUserProfileVlanIdStart
  endUserProfileVlanIdEnd
```

---

## aaa user-network-profile

Configures a User Network Profile (UNP) that is used to provide role-based access to the switch. The UNP determines the VLAN ID a device can join, whether or not a Host Integrity Check (HIC) is applied to the device, and if any QoS policy rules are used to control access to network resources.

**aaa user-network-profile name** *profile\_name* **vlan** *vlan-id* [**hic** [**enable** | **disable**]] [**policy-list-name** *list\_name*]

**no aaa user-network-profile name** *profile\_name*

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing or a new user profile. The name specified here must match with the Filter-ID attribute returned by the RADIUS server. The user profile name can range from 1 to 32 characters in length.
<i>vlan-id</i>	The VLAN identification number for an existing VLAN that will be assigned to a user. The valid range is 1-4094.
<b>enable</b>	Enables Host Integrity Check for the profile.
<b>disable</b>	Disables Host Integrity Check for the profile.
<i>list_name</i>	The name of an existing QoS policy list to apply to devices classified by the User Network Profile. It is possible to assign up to 13 policy lists to each user profile.

### Defaults

parameter	default
<b>hic enable</b>   <b>disable</b>	disabled
<i>list_name</i>	none

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

OmniSwitch 9000E; **hic enable**, **hic disable**, **policy-list-name** parameters not supported.

### Usage Guidelines

- Use the **no** form of this command to remove a UNP from the switch configuration.
- This command is used with RADIUS as the authentication server
- Enabling the **hic** parameter triggers the HIC verification process for any devices to which this profile is applied. The switch interacts with the InfoExpress CyberGatekeeper HIC server to determine host compliance.

### Examples

```
-> aaa user-network-profile name engineering vlan 10
-> aaa user-network-profile name marketing vlan 30 hic enable
```

```
-> aaa user-network-profile name guest_user vlan 500 hic enable policy-list name
temp_rules
```

## Release History

Release 6.3.1; command was introduced.

Release 6.3.4; **hic enable**, **hic disable**, **policy-list name** parameters added.

## Related Commands

<b>show aaa user-network-profile</b>	Displays the UNP configuration for the switch.
<b>aaa hic</b>	Globally enables or disables the HIC feature for the switch.
<b>aaa classification-rule mac-address</b>	Defines a MAC address UNP mobile rule.
<b>aaa classification-rule mac-address-range</b>	Defines a MAC address UNP mobile rule for a range of MAC addresses.
<b>aaa classification-rule ip-address</b>	Defines an IP network address UNP mobile rule.

## MIB Objects

```
aaaUserNetProfileTable
  aaaUserNetProfileName
  aaaUserNetProfileVlanID
  aaaUserNetProfileHICflag
  aaaUserNetProfileQosPolicyListName
```

---

---

## aaa classification-rule mac-address

Defines a User Network Profile (UNP) MAC address mobile rule. If the source MAC address of a device matches the MAC address defined for the rule, the specified UNP is applied to the device. UNP mobile rules are applied using an Access Guardian Group Mobility device classification policy.

**aaa classification-rule mac-address** *mac\_address* **user-network-profile name** *profile\_name*

**aaa classification-rule no mac-address** *mac\_address*

---

### Syntax Definitions

<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).
<i>profile_name</i>	The name of an existing user network profile.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the UNP mobile rule from the switch configuration.
- To change the UNP associated with a mobile rule, enter the MAC address of an existing rule but specify a different UNP name.
- When Group Mobility is configured as an Access Guardian device classification policy for an 802.1x port, both UNP mobile rules and VLAN mobile rules are applied to device traffic on that port.
- Note that UNP mobile rules take precedence over VLAN mobile rules.

### Examples

```
-> aaa classification-rule mac-address 00:00:2a:33:44:01 user-network-profile name
accounting
-> aaa classification-rule no mac-address 00:00:2a:33:44:01
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

<b>aaa classification-rule mac-address-range</b>	Configures a UNP mobile rule for a range of MAC addresses.
<b>aaa classification-rule ip-address</b>	Configures an IP address UNP mobile rule.
<b>show aaa classification-rule</b>	Displays the UNP configuration.
<b>show aaa user-network-profile</b>	Displays the UNP configuration.

## MIB Objects

```
aaaUNPMacRuleTable  
  aaaUNPMacRuleAddr  
  aaaUNPMacRuleProfileName
```

---

## aaa classification-rule mac-address-range

Defines a User Network Profile (UNP) mobile rule for a range of MAC addresses. If the source MAC address of a device matches any address within the range of MAC addresses, the specified UNP is applied to the device. UNP mobile rules are applied using an Access Guardian Group Mobility device classification policy.

```
aaa classification-rule mac-address-range low_mac_address high_mac_address user-network-profile  
name profile_name
```

```
aaa classification-rule no mac-address-range low_mac_address
```

---

### Syntax Definitions

<i>low_mac_address</i>	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).
<i>profile_name</i>	The name of an existing user network profile.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the UNP mobile rule from the switch configuration.
- To change the UNP associated with a mobile rule, enter the MAC address range of an existing rule but specify a different user network profile name.
- When Group Mobility is configured as an Access Guardian device classification policy for an 802.1x port, both UNP mobile rules and VLAN mobile rules are applied to device traffic on that port.
- Note that UNP mobile rules take precedence over VLAN mobile rules.

### Examples

```
-> aaa classification-rule mac-address-range 00:00:2a:33:44:01 00:00:2a:33:44:10  
user-network-profile name accounting  
-> aaa classification-rule no mac-address-range 00:00:2a:33:44:01
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

- aaa classification-rule mac-address** Configures a MAC address UNP mobile rule.
- aaa classification-rule ip-address** Configures an IP address UNP mobile rule.
- show aaa classification-rule** Displays the UNP mobile rule configuration.
- show aaa user-network-profile** Displays the UNP configuration.

## MIB Objects

aaaUNPMacRangeRuleTable  
aaaUNPMacRangeRuleLoAddr  
aaaUNPMacRangeRuleHiAddr  
aaaUNPMacRangeRuleProfileName

---

## aaa classification-rule ip-address

Defines a User Network Profile (UNP) IP address mobile rule. If the source IP address of a device matches the IP address defined for the rule, the specified UNP is applied to the device. UNP mobile rules are applied using an Access Guardian Group Mobility device classification policy

```
aaa classification-rule ip-address ip_address [subnet_mask] user-network-profile name profile_name
```

```
aaa classification-rule no ip-address ip_address [subnet_mask]
```

---

### Syntax Definitions

<i>ip_address</i>	IP network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0)
<i>subnet_mask</i>	Class A, B, or C subnet mask (e.g., 255.0.0.0, 255.255.0.0, or 255.255.255.0).
<i>profile_name</i>	The name of an existing user network profile.

### Defaults

By default, the subnet mask is set to the default subnet mask value for the IP address class.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the UNP mobile rule from the switch configuration.
- To change the UNP associated with a mobile rule, enter the IP address of an existing rule but specify a different UNP name.
- When Group Mobility is configured as an Access Guardian device classification policy for an 802.1x port, both UNP mobile rules and VLAN mobile rules are applied to device traffic on that port.
- Note that UNP mobile rules take precedence over VLAN mobile rules.

### Examples

```
-> aaa classification-rule ip-address 10.1.1.1 user-network-profile name accounting
-> aaa classification-rule ip-address 198.4.21.1 255.255.0.0 user-network-profile
name marketing
-> aaa classification-rule no ip-address 10.1.1.1
```

### Release History

Release 6.3.4; command was introduced.

  aaaUNPIpNetRuleMask  
  aaaUNPIpNetRuleProfileName
```

---

## aaa hic server-name

Configures the identity of the Host Integrity Check (HIC) InfoExpress CyberGatekeeper server. HIC is a User Network Profile (UNP) option that when enabled, verifies the integrity of a device connected to the switch. Both HIC and UNP are components of the Access Guardian security framework.

```
aaa hic server-name server ip-address ip_address secret secret [role {primary | backup}] [udp-port udp_port]
```

```
aaa hic no server-name server
```

---

### Syntax Definitions

<i>server</i>	The name of the HIC server.
<i>ip_address</i>	The IP address of the HIC server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive.
<b>primary   backup</b>	Configures this server as either the Primary or Backup HIC server.
<i>udp_port</i>	The UDP destination port number (1025–65536) for HIC requests.

### Defaults

parameter	default
<i>udp_port</i>	11707

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Configuring the HIC server identity and related parameters is required before globally enabling the HIC feature for the switch.
- The primary server is initially configured as the active server and the backup server as inactive.
- A keepalive message will be sent to the active server if the switch does not receive any HIC-UPDATES from the server for 16 seconds. The switch will remain the active server upon receiving the keepalive acknowledgement.
- The switch will send a total of four keepalive messages to the active server in 6 second intervals. If no response is received, the inactive server becomes the active server provided the server status is UP.
- If both servers are unavailable the switch operates in either Hold or Pass-through mode based on the HIC Server failure mode that has been configured.
- Background polling (Keepalive) packets are sent to the primary server every 16 seconds.

- If the server's role is not specified the first configured server will be the primary and the next configured server will be backup.

## Examples

```
-> aaa hic server-name hic-srv1 ip-address 2.2.2.2 secret wwwtoe mode primary
-> aaa hic server-name hic-srv1 ip-address 2.2.2.2 udp-port 12049
-> aaa hic no server-name hic-srv1
```

## Release History

Release 6.3.4; command was introduced.

Release 6.4.4; **role** parameter was introduced.

## Related Commands

<a href="#">show aaa hic server</a>	Displays the HIC server configuration for the switch.
<a href="#">aaa hic server-failure mode</a>	Configures the failure mode to be applied when both servers are unavailable.
<a href="#">show aaa server</a>	Displays information about AAA servers.
<a href="#">aaa hic redundancy background-poll-interval</a>	Configures a download server as an exception to the HIC process.
<a href="#">aaa hic</a>	Globally enables and disables the HIC feature for the switch.

## MIB Objects

```
aaaHicSvrTable
  aaaHicSvrName
  aaaHicSvrIpAddr
  aaaHicSvrRole
  aaaHicSvrConnection
  aaaHicSvrPort
  aaaHicSvrKey
  aaaHicSvrStatus
```

---

## aaa hic redundancy background-poll-interval

Configures the background polling interval that determines when the primary server is considered active after being inactive.

**aaa hic redundancy background-poll-interval** *value*

---

### Syntax Definitions

*value* The background polling interval in seconds. The valid range is from 16 to 256 in multiples of 16.

### Defaults

parameter	default
<i>value</i>	16

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- If the primary server is unavailable and placed in the inactive mode the switch begins to poll the primary server in the background.
- In order to avoid overwhelming a primary server that becomes active again the switch will generate a random reconnect value. When the switch receives continuous keepalive responses equal to the random reconnect value it assumes the primary server is ready to takeover the active role.
- When the backup server is inactive this interval determines the frequency at which the poll packets should be sent to backup server.
- Once the primary server becomes active, the backup server becomes inactive.

### Examples

```
-> aaa hic redundancy background-poll-interval 32
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

[show aaa hic](#)

Displays the global Host Integrity Check (HIC) configuration for the switch.

## MIB Objects

```
aaaHicConfigInfo  
aaaHicBgPollInterval
```

---

---

## aaa hic server-failure mode

Configures the failure mode to be applied when both servers are unavailable.

**aaa hic server-failure mode {hold | pass-through}**

---

### Syntax Definitions

<b>hold</b>	Places all new users in hold mode if the HIC servers are unavailable.
<b>pass-through</b>	Places all new users in pass-through mode if the HIC servers are unavailable.

### Defaults

parameter	default
hold   pass-through	hold

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- The server failure mode has no affect on users that have already passed HIC successfully.
- In **hold** mode new users will stay in the HIC IN PROGRESS state while the servers are unavailable.
- In **pass-through** mode new users will be moved to HIC PASSTHROUGH mode and treated same as HIC SUCCESS.

### Examples

```
-> aaa hic server-failure mode pass-through
```

### Release History

Release 6.4.4; command was introduced.

### Related Commands

[show aaa hic server](#) Displays the HIC server configuration for the switch.

### MIB Objects

aaaHicSrvFailMode

---

## aaa hic server-failure policy user-network-profile change

Configures which network profiles users will be moved to when both HIC servers are unavailable.

**aaa hic server-failure policy user-network-profile change *unp1* to *unp2***

**aaa hic server-failure policy user-network-profile no change**

---

### Syntax Definitions

*unp1* Name of the original UNP from which the user will be moved if the servers are not reachable and the failure mode is set to Hold.

*unp2* Name of the UNP that the HIC host will be moved to while the HIC servers are down.

### Defaults

parameter	default
change   no change	no change

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- If the HIC failure mode is set to Hold and the HIC servers are not available this command allows users in the HIC-in-progress state to be moved from *unp1* to *unp2*. Once the HIC servers come back up, the user shall be moved back to the original *unp1* and the HIC-check will be restarted.
- A maximum of 8 server-failure policies can be configured.
- Use the **no** parameter to prevent users from moving out of their current UNP.

### Examples

```
-> aaa hic server-failure policy user-network-profile change unp_orig to unp_temp  
-> aaa hic server-failure policy user-network-profile no change
```

### Release History

Release 6.4.4; command was introduced.

## Related Commands

**show aaa hic server**                      Displays the HIC server configuration for the switch.

## MIB Objects

```

  aaaHicSvrDownUnpMapEntry
  aaaHicSvrDownUnpName
  aaaHicSvrDownMappedUnpName
  aaaHicSvrDownUnpRowStatus
```

---

## aaa hic allowed-name

Configures a list of servers that are excluded from the Host Integrity Check (HIC) process. This list identifies servers that a host can communicate with during the verification process, when the host has limited access to the network.

**aaa hic allowed-name** *server* **ip-address** *ip\_address* [**ip-mask** *subnet\_mask*]

**aaa hic no allowed-name** *server*

---

### Syntax Definitions

<i>server</i>	The name of the server.
<i>ip_address</i>	The IP address of the primary HIC server.
<i>subnet_mask</i>	A valid IP address mask (e.g., 255.0.0.0, 255.255.0.0) to identify the IP subnet for the download server.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>subnet_mask</i>	255.255.255.255

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Use the **no** form of the command to remove a server from the HIC exception list.
- Up to four server exception entries are allowed.
- If a host device requires access to the HIC server via a Web-based agent, make sure the Web agent download server is added to this list.
- Add any additional servers required for remediation to this list..

### Examples

```
-> aaa hic allowed-name rem-srv1 ip-address 10.1.1.1
-> aaa hic allowed-name patch-srv1 ip-address 11.1.1.1
-> aaa hic allowed-name web-agent-srv1 ip-address 12.1.1.1
-> aaa hic no allowed-name rem-srv1
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

<code>show aaa server</code>	Displays information about AAA servers.
<code>aaa hic server-name</code>	Configures a HIC server for use with the switch.
<code>aaa hic</code>	Globally enables and disables the HIC feature for the switch.

## MIB Objects

```
aaaHicAllowedTable  
  aaaHicAllowedName  
  aaaHicAllowedIpAddr  
  aaaHicAllowedIpMask  
  aaaHicAllowedRowStatus
```

---

## aaa hic

Globally enables or disables the Host Integrity Check (HIC) feature for the switch.

**aaa hic {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the HIC feature for the switch.
<b>disable</b>	Disables the HIC feature for the switch.

### Defaults

HIC is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6855

### Usage Guidelines

- This command requires the configuration of the HIC server information before HIC is enabled on the switch.
- When HIC is enabled for the switch, configuring HIC server parameters is not allowed.
- Note that the VLAN Stacking feature is not available when HIC is configured for the switch. These two features are mutually exclusive in that only one of them can run on the switch at any given time.

### Examples

```
-> aaa hic enable  
-> aaa hic disable
```

### Release History

Release 6.3.4; command was introduced.

---

## aaa hic custom-proxy-port

Specifies the HTTP proxy port number used in the Web browser configuration of a host device. The HIC process uses this information when interacting with hosts using the InfoExpress Web-based compliance agent.

**aaa hic custom-proxy-port** *proxy\_port*

---

### Syntax Definitions

*proxy\_port* An HTTP proxy port number (1025–65535).

### Defaults

The HTTP proxy port is set to 8080.

### Platforms Supported

OmniSwitch 6400, 6850, 6855

### Usage Guidelines

This command overwrites the existing proxy port number.

### Examples

```
-> aaa hic custom-proxy-port 8878
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

## show aaa server

Displays information about a particular AAA server or AAA servers.

**show aaa server** [*server\_name*]

---

### Syntax Definitions

*server\_name*                      The server name, which is defined through the **aaa radius-server** or **aaa ldap-server** commands or automatically set as **ace** for ACE servers.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E  
OmniSwitch 9000E, 6855-U24X; VRF supported.

### Usage Guidelines

- If you do not include a server name in the syntax, information for all servers displays.
- To display information about an ACE server, use **ace** as the *server\_name*. Information for ACE is only available if ACE is specified for Authenticated Switch Access through the **aaa authentication** command.

### Examples

```
-> show aaa server ldap2
Server name = ldap2
  Server type= LDAP,
  Host name 1= ors40535,
  Retry number= 3,
  Timeout (in sec)= 2,
  Port= 389,
  Domain name= manager,
  Search base= c=us,

-> show aaa server rad1
Server name = rad1
  Server type           = RADIUS,
  IP Address 1         = 10.111.0.1,
  Retry number        = 3,
  Time out (sec)      = 2,
  Authentication port  = 1812,
  Accounting port     = 1813,
  VRF                  = "Management-vrf"
```

```

-> show aaa server TPub1
Server name = TPub1
  Server type           = TACACS+,
  IP Address 1         = 10.10.5.1,
  Port                 = 3,
  Timeout (in sec)     = 2,
  Encryption enabled   = no

-> show aaa server ldap2
Server name = ldap2
  Server type           = LDAP,
  Host name 1          = ors40535,
  Retry number         = 3,
  Timeout (in sec)     = 2,
  Port                 = 389,
  Domain name          = manager,
  Search base          = c=us,

```

RADIUS, TACACS+, and LDAP parameters are configured through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands. Parameters for the ACE server are automatically set by the switch.

#### *output definitions*

<b>Server name</b>	The name of the server. The switch automatically assigns “ace” to an ACE server. A RADIUS, TACACS+ or LDAP server name is defined through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands respectively.
<b>Server type</b>	The type of server (ACE, LDAP, TACACS+, or RADIUS).
<b>Host name</b>	The name of the primary LDAP, TACACS+, or RADIUS host.
<b>IP address</b>	The IP address(es) of the server.
<b>Retry number</b>	The number of retries the switch makes to authenticate a user before trying the backup server.
<b>Timeout</b>	The timeout for server replies to authentication requests.
<b>Port</b>	The port number for the primary LDAP or TACACS+ server.
<b>Encryption enabled</b>	The status of the encryption.
<b>Domain name</b>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers.
<b>Search base</b>	The search base recognized by the LDAP-enabled directory servers.
<b>Authentication port</b>	The UDP destination port for authentication requests.
<b>Accounting port</b>	The UDP destination port for accounting requests.
<b>VRF</b>	The VRF name assigned to the server.

#### **Release History**

Release 6.1; command was introduced.  
 Release 6.1.3; **Encryption enabled** field was added.  
 Release 6.4.2; added **VRF** output field.

## show aaa authentication vlan

Displays information about Authenticated VLANs and the authentication server configuration.

**show aaa authentication vlan**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **show aaa authentication vlan** command to display information about authentication servers configured in single mode or for authentication servers configured for each VLAN for authentication in multiple mode.

### Examples

```
-> show aaa authentication vlan
Authenticated vlan = 23,
  1rst authentication server = radius1,
  2nd authentication server = ldap3
Authenticated vlan = 24,
  1rst authentication server = radius1,
  2nd authentication server = ldap3.
Authenticated vlan = 25,
  1rst authentication server = radius1,
  2nd authentication server = ldap3
Authenticated vlan = 26,
  1rst authentication server = radius1,
  2nd authentication server = ldap3
Authenticated vlan = 33,
  1rst authentication server = radius1
  2nd authentication server = ldap3
```

#### *output definitions*

---

<b>Authenticated vlan</b>	The VLAN number.
<b>1st authentication server</b>	The first server to be polled for authentication information.
<b>2nd authentication server</b>	The next server to be polled for authentication information.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

- aaa authentication vlan single-mode** Specifies the AAA servers to be used in single-authority mode for Layer 2 Authentication.
- aaa authentication vlan multiple-mode** Specifies the AAA servers to be used in multiple-authority mode for Authenticated VLANs.

## MIB Objects

---

## show aaa authentication

Displays information about the current authenticated switch session.

**show aaa authentication**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use the **show aaa authentication** command to display authentication information about switch management services (Telnet, FTP, console port, Secure Shell, etc.).

### Examples

```
-> show aaa authentication
Service type = Default
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Console
  1rst authentication server = local
Service type = Telnet
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = FTP
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Http
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Snmp
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Ssh
  Authentication = Use Default,
  1rst authentication server = TacacsServer
  2nd authentication server = local
```

*output definitions*

---

<b>Authentication</b>	Displays <b>denied</b> if the management interface is disabled. Displays <b>Use Default</b> if the management interface is configured to use the default configuration.
<b>1st authentication server</b>	The first server to be polled for authentication information.
<b>2nd authentication server</b>	The next server to be polled for authentication information.

## show aaa authentication 802.1x

Displays information about the global 802.1X configuration on the switch.

**show aaa authentication 802.1x**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

This command displays information about 802.1X settings configured through the [aaa authentication 802.1x](#) command.

### Examples

```
-> show aaa authentication 802.1x
1rst authentication server = nms-avlan-30,
port usage                 = unique
```

### *output definitions*

---

<b>1st authentication server</b>	The first server to be polled for authentication information. Any backup servers are also displayed on subsequent lines.
<b>port usage</b>	Whether 802.1X ports on the switch will only accept frames from the supplicant's MAC address after successful authentication ( <b>unique</b> ); or the switch will accept any frames on 802.1X ports after successful authentication ( <b>global</b> )

---

### *output definitions*

---

<b>User name</b>	The user name for this account.
<b>Password expiration</b>	The date and time on which the password will expire. This field only displays if the password expiration is configured specifically for a user, or a default password expiration is configured globally on the switch through the <b>user password-expiration</b> command. (Note that the date/time are based on the switch's default system date/time or the system date/time configured through the <b>system date</b> and <b>system time</b> commands.)
<b>Password allow to be modified date</b>	The earliest date and time on which the user may change the password. Configured through the <b>user password-min-age</b> command.

*output definitions (continued)*

<b>Account lockout</b>	Indicates if the user account is locked out ( <b>Yes</b> or <b>No</b> ) and how many minutes remain until the user account is automatically unlocked. If no remaining time is displayed, the <b>admin</b> user or a user with admin privileges must manually unlock the account. Configured through the <b>user lockout-duration</b> and <b>user lockout unlock</b> commands.
<b>Password bad attempts</b>	The number of failed password login attempts for this user account.
<b>Read Only for domains</b>	The command domains available with the user's read-only access. See the table on the next page for a listing of valid domains. This field does not display if an end-user profile is associated with the user account.
<b>Read/Write for domains</b>	The command domains available with the user's read-write access. See the table on the next page for a listing of valid domains. This field does not display if an end-user profile is associated with the user account.
<b>Read Only for families</b>	The command families available with the user's read-only access. See the table on the next page for a listing of valid families. This field does not display if an end-user profile is associated with the user account.
<b>Read/Write for families</b>	The command families available with the user's read-write access. See the table on the next page for a listing of valid families. This field does not display if an end-user profile is associated with the user account.
<b>END user profile</b>	The name of an end-user profile associated with the user account. Configured through the <b>end-user profile</b> command. This field only displays if an end-user profile is associated with the user account.
<b>Snmp allowed</b>	Indicates whether or not the user is authorized to use SNMP ( <b>YES</b> or <b>NO</b> ). SNMP is allowed for the user account when SNMP authentication is specified for the account.
<b>Snmp authentication</b>	The level of SNMP authentication, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
<b>Snmp encryption</b>	The level of SNMP encryption, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
<b>Console-Only</b>	Displays whether the ability for the admin user to access the switch using only the console connection is enabled or disabled.

Possible values for command domains and families are listed here:

<b>Domain</b>	<b>Corresponding Families</b>
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

## show user password-expiration

Displays the expiration date for passwords configured for user accounts stored on the switch.

**show user password-expiration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

This command displays the default password expiration, which is configured through the [user password-expiration](#) command.

### Examples

```
-> show user password-expiration
User password expiration is set to 3 days.
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">user password-expiration</a>	Configures an expiration date for user passwords stored locally on the switch or disables password expiration.
<a href="#">user</a>	Configures or modifies user entries in the local user database.
<a href="#">password</a>	Configures the current user's password.
<a href="#">show user password-policy</a>	Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaDefaultPasswordExpirationInDays
```

---

## show user password-policy

Displays the global password settings configured for the switch.

**show user password-policy**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

The password policy contains parameter values that define configuration requirements for all passwords that are created on the switch. Use this command to display the current parameter values for the password policy.

### Examples

```
-> show user password-policy
Password Policy:
Contain username flag: Enable
Minimum number of English uppercase characters: 6
Minimum number of English lowercase characters: 4
Minimum number of base-10 digit: 2
Minimum number of non-alphanumeric: 3
Minimum size: 8
Password history: 4
Password minimum age: 20 (days)
Password expiration: 40 (days)
```

#### *output definitions*

<b>Contain username flag</b>	Indicates if the username is included with the password check ( <b>Enable</b> or <b>Disable</b> ). Configured through the <b>user password-policy cannot-contain-username</b> command.
<b>Minimum number of English uppercase characters</b>	The minimum number of uppercase characters required in a password. Configured through the <b>user password-policy min-uppercase</b> command.
<b>Minimum number of English lowercase characters</b>	The minimum number of lowercase characters required in a password. Configured through the <b>user password-policy min-lowercase</b> .
<b>Minimum number of base-10 digit</b>	The minimum number of digits required in a password. Configured through the <b>user password-policy min-digit</b> command.
<b>Minimum number of non-alphanumeric</b>	The minimum number of non-alphanumeric characters required in a password. Configured through the <b>user password-policy min-non-alpha</b> command.

*output definitions*

---

<b>Minimum size</b>	The minimum number of characters required for the password size. Configured through the <b>user password-size min</b> command.
<b>Password history</b>	The maximum number of old passwords retained in the password history. Configured through the <b>user password-history</b> command.
<b>Password minimum age</b>	The number of days a password is protected from any modification. Configured through the <b>user password-min-age</b> command.
<b>Password expiration</b>	The default expiration date applied to all passwords. Configured through the <b>user password-expiration</b> command.

---

**Release History**

Release 6.3.1; command was introduced.

**Related Commands**

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

The global lockout settings include parameter values that determine the length of a user observation window, the amount of time a locked user remains locked, and the number of failed password login attempts allowed.

### Examples

```
-> show user lockout-setting
Lockout Setting:
Observation window: 30 (minutes)
Duration: 200 (minutes)
Threshold: 20
```

#### *output definitions*

---

<b>Observation window</b>	The amount of time, in minutes, during which the number of failed password login attempts are counted. Configured through the <a href="#">user lockout-window</a> command.
<b>Duration</b>	The amount of time, in minutes, that a locked user account remains locked out of the switch. Configured through the <a href="#">user lockout-duration</a> command.
<b>Threshold</b>	The maximum number of failed password login attempts allowed before the user is locked out of the switch. Configured through the <a href="#">user lockout-threshold</a> command.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

[user lockout unlock](#)

Manually locks or unlocks a user account on the switch.

[show user](#)

Displays information about all users or a particular user configured in the local user database on the switch.

## MIB Objects

aaaAsaConfig

aaaAsaLockoutWindow

aaaAsaLockoutDuration

aaaAsaLockoutThreshold

---

## show avlan user

Displays MAC addresses for Authenticated VLAN users on the switch.

**show avlan user** [**vlan** *vlan\_id* | **slot** *slot*]

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN number. Information displays about users in this VLAN.
<i>slot</i>	The slot number. Information displays about users with access on this slot.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Information may be displayed for all users or for users associated with a particular VLAN or slot.

### Examples

-> show avlan user

name	Mac Address	Slot	Port	Vlan
user0	27:bc:86:90:00:00	02	02	23
user1	27:bc:86:90:00:01	02	03	12
user2	27:bc:86:90:00:02	02	05	15
user3	27:bc:86:90:00:03	04	09	10
user4	27:bc:86:90:00:04	03	02	23

-> show avlan user 23

name	Mac Address	Slot	Port	Vlan
avlan_0	27:bc:86:90:00:00	02	02	23

### output definitions

---

<b>name</b>	The name of the authenticated user.
<b>Mac Address</b>	The MAC address of the user.
<b>Slot</b>	The slot associated with the user.
<b>Port</b>	The port associated with the user.
<b>Vlan</b>	The VLAN into which the user is authenticated.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

**aaa vlan no** Deletes a particular Authenticated VLAN user from the configuration.

## MIB Objects

```
aaaAuthenticatedUserTable  
    aaaaMacAddress  
    aaaaSlot  
    aaaaPort  
    aaaaVlan
```

---

## show aaa avlan config

Displays the current global configuration parameters for Authenticated VLANs.

```
show aaa avlan config
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

Use this command to display DNS or DHCP information for Authenticated VLANs.

### Examples

```
-> show aaa avlan config
default DHCP relay address = 192.9.33.222
authentication DNS name   = authent.company.com
default traffic            = disabled
port bounding              = disabled
```

#### *output definitions*

<b>default DHCP relay address</b>	The gateway address of the DHCP server; configured through the <b>aaa avlan default dhcp</b> command.
<b>authentication DNS name</b>	The DNS host name, configured through the <b>aaa avlan dns</b> command.
<b>default traffic</b>	Whether or not the default VLAN is enabled for users to traffic in before authentication. Configured through the <b>aaa accounting command</b> command.
<b>port bounding</b>	Whether or not port mobility rules are allowed on Authenticated VLANs. Configured through the <b>avlan port-bound</b> command.

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">aaa avlan dns</a>	Configures a host name.
<a href="#">aaa avlan default dhcp</a>	Configures the gateway address for a DHCP server.
<a href="#">aaa accounting command</a>	Configures whether or not users are able to traffic in the default VLAN before they are actually authenticated.
<a href="#">avlan port-bound</a>	Configures whether or not authenticated ports may use port mobility rules.

## MIB Objects

```
aaaAvlanConfig  
  aaaAvlanDnsName  
  aaaAvlanDhcpDefGateway  
  aaaAvlanDefaultTraffic  
  aaaAvlanPortBound
```

---

## show aaa avlan auth-ip

Displays the IP addresses for Authenticated VLANs.

```
show aaa avlan auth-ip [vlan vlan_id]
```

---

### Syntax Definitions

*vlan\_id*                      The VLAN ID of the Authenticated VLAN for which you want to display the authentication IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- This command displays all Authenticated VLAN IP addresses unless a specific VLAN is requested with the **vlan** keyword and the relevant *vlan\_id*.
- The IP addresses for Authenticated VLANs is set automatically by the switch (based on the VLAN router port ID) or by the user through the **avlan auth-ip** command.

### Examples

```
-> show aaa avlan auth-ip
Vlan number      Authenticated Ip Address
-----+-----
 2                10.10.2.3
 4                12.13.14.253
```

```
-> show aaa avlan auth-ip vlan 2
Vlan number      Authenticated Ip Address
-----+-----
 2                10.10.2.3
```

### output definitions

---

<b>VLAN number</b>	The VLAN ID.
<b>Authenticated Ip Address</b>	The IP address associated with the Authenticated VLAN.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

**avlan auth-ip**

Configures an IP address to be used for VLAN authentication.

## MIB Objects

aaaAvlanConfigTable

aaaAvlanAddress

---

## debug command-info

Enables or disables the command information mode in the CLI. When this mode is enabled, any command entered on the command line will display information about the command rather than executing the command.

**debug command-info** {enable | disable}

---

### Syntax Definitions

**enable** Enables the debugging command information mode.

**disable** Disables the debugging command information mode.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- When the mode is enabled, any command entered will result in output similar to the one shown in the Examples section below. Any commands entered when the mode is enabled are not executed. To return to normal operating mode, enter **debug command-info disable**.
- The command information mode is useful when setting privileges for users.

### Examples

```
-> debug command-info enable
CLI command info mode on
-> vlan 2
PM family:  VLAN
R/W mode:   WRITE
-> ls
PM family:  SYSTEM
R/W mode:   READ
```

#### *output definitions*

<b>PM family</b>	The partitioned management (PM) command family to which the command belongs.
<b>R/W mode</b>	Whether the current command is a read-only or a write command.

### Release History

Release 6.1; command was introduced.

## Related Commands

**user**

Configures or modifies user entries in the local user database.

---

## debug end-user profile

Use this command to display detailed information about profiles or a particular profile.

**debug end-user profile** *name*

---

### Syntax Definitions

*name* The name of the end-user profile, configured through the **end-user profile** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **show end-user profile** command to display basic information about end-user profiles.
- If a particular profile is specified, information will be displayed for the profile and for all indexes following that profile. (The index value is the way the switch internally tracks profiles and reflects the order in which profiles are created.)

### Examples

```
-> debug end-user profile
End user profile : jentest, length : 7 for index : 1
  End user profile @0x5e781e8
  Read area rights : 3f
  Read and Write area rights : 0
  Physical area rights : 2
  vlan table area rights : 2
  Basic Ip routing area rights : 2
  Ip routes table area rights : 2
  Mac filtering table area rights : 2
  Spantree area rights : 2
  Slot 1, ports : 0 0 0 0
  Slot 2, ports : 0 0 0 0
  Slot 3, ports : 0 0 0 0
  Slot 4, ports : 0 0 0 0
  Slot 5, ports : 0 0 0 0
  Slot 6, ports : 0 0 0 0
  Slot 7, ports : 0 0 0 0
  Slot 8, ports : 0 0 0 0
  Slot 9, ports : 0 0 0 0
  Slot 10, ports : 0 0 0 0
  Slot 11, ports : 0 0 0 0
  Slot 12, ports : 0 0 0 0
  Slot 13, ports : 0 0 0 0
  Slot 14, ports : 0 0 0 0
  Slot 15, ports : 0 0 0 0
```

```
Slot 16, ports : 0 0 0 0
Vlan Id range number : 1
Vlan range 1, start : 1, end : 3
End user profile not created for index : 2
End user profile not created for index : 3
End user profile not created for index : 4
End user profile not created for index : 5
End user profile not created for index : 6
End user profile not created for index : 7
End user profile not created for index : 8
End user profile not created for index : 9
End user profile not created for index : 10
.
.
.
.
```

## Release History

Release 6.1; command was introduced.

## Related Commands

### [end-user profile](#)

Configures or modifies an end user profile, which specifies access to command areas on particular ports and VLANs.

### [show end-user profile](#)

Displays information about end-user profiles or a particular end-user profile.

## Related Commands

<b>end-user profile</b>	Configures or modifies an end user profile, which specifies access to command areas on particular ports and VLANs.
<b>user</b>	Configures or modifies user entries in the local user database.

## MIB Objects

```
endUserProfileTable
  endUserProfileName
  endUserProfileAreaPhysical
  endUserProfileAreaVlanTable
  endUserProfileAreaBasicIPRouting

  endUserProfileVlanIdStart
  endUserProfileVlanIdEnd
```

---

## show aaa user-network-profile

Displays the User Network Profile (UNP) configuration for the switch.

**show aaa user-network-profile**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show aaa user-network-profile
```

```
Role Name                Vlan  HIC  Policy List Name
-----+-----+-----+-----
                engineering  10 No   list1
                accounting  20 Yes list1, list2
```

#### *output definitions*

---

<b>Role Name</b>	The user profile name.
<b>Vlan</b>	The VLAN ID number the profile assigns to the user device.
<b>HIC</b>	Whether or not Host Integrity Check is required for the device to which this profile is assigned.
<b>Policy List Name</b>	The name of one or more QoS policy lists that are applied to the device to which this profile is assigned.

---

### Release History

Release 6.3.1; command was introduced.

Release 6.3.4; **HIC** and **Policy List Name** fields added.

## Related Commands

### **aaa user-network-profile**

Creates the user role in the user network profile table and maps the role to a VLAN ID.

## MIB Objects

```
aaaUserNetProfileTable  
  aaaUserNetProfileName  
  aaaUserNetProfileVlanID  
  aaaUserNetProfileHICflag  
  aaaUserNetProfileQosPolicyListName
```

---

## show aaa classification-rule

Displays the User Network Profile (UNP) mobile classification rule configuration for the switch.

**show aaa classification-rule {mac-rule | mac-range-rule | ip-net-rule}**

---

### Syntax Definitions

<b>mac-rule</b>	Displays MAC address rules.
<b>mac-range-rule</b>	Displays MAC address range rules.
<b>ip-net-rule</b>	Displays IP network address rules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855

### Usage Guidelines

- Specifying a rule type parameter (**mac-rule**, **mac-range-rule**, **ip-net-rule**) is required with this command.
- UNP mobile rules take precedence over VLAN mobile rules.

### Examples

```
-> show aaa classification-rule mac-rule
```

```
MAC Address          User Network Profile Name
-----+-----
00:1a:a0:b1:fa:e5   guest_user
00:b0:d0:2a:0e:2e   acct_user
00:b0:d0:2a:11:60   engr_user
```

#### *output definitions*

---

<b>MAC Address</b>	The source MAC address of the host device to which the UNP is applied.
<b>User Network Profile Name</b>	The name of the UNP applied to the host device.

---

```
-> show aaa classification-rule mac-range-rule
```

```
Low MAC Address      High MAC Address   User Network Profile Name
-----+-----+-----
00:1a:a0:b1:fa:10   00:1a:0a:b1:fa:20   guest_user
00:b0:d0:2a:0e:2e   00:b0:d0:2a:0e:3a   acct_user
00:b0:d0:2a:11:60   00:b0:d0:2a:11:70   engr_user
```

*output definitions*

---

<b>Low MAC Address</b>	The MAC address that identifies the low end of the range of addresses.
<b>High MAC Address</b>	The MAC address that identifies the high end of the range of addresses.
<b>User Network Profile Name</b>	The name of the UNP applied to the host device.

---

```
-> show aaa classification-rule ip-net-rule
```

IP Addr	IP Mask	User Network Profile Name
-----+-----+-----		
198.4.21.1	255.255.0.0	guest_user
10.1.1.1	255.0.0.0	acct_user
20.2.2.1	255.0.0.0	enr_user

*output definitions*

---

<b>IP Addr</b>	The source IP address of the host device to which the UNP is applied.
<b>IP Mask</b>	The subnet mask for the IP address.
<b>User Network Profile Name</b>	The name of the UNP applied to the host device.

---

## Release History

Release 6.3.4; command was introduced.

## Related Commands

<a href="#">aaa classification-rule mac-address</a>	Defines a MAC address classification rule and associates that rule with a user network profile.

## show aaa hic

Displays the global Host Integrity Check (HIC) configuration for the switch.

```
show aaa hic
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

N/A

### Examples

```
-> show aaa hic
HIC Global Status: Enabled
HIC Web Agent Download URL: http://100.100.100.100:8080/CGAgentLauncher.htm
HIC Host Custom HTTP Proxy Port: 8383
HIC Background Poll interval: 32
HIC Server-fail-mode: Hold
```

### *output definitions*

---

<b>HIC Status</b>	The HIC status for the switch ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>aaa hic</b> command.
<b>HIC Web Agent Download URL</b>	The URL for the web agent download server. Configured through the <b>aaa hic web-agent-url</b> command.
<b>HIC Host Custom HTTP Proxy Port</b>	The proxy port number used when the web-based host is redirected to the HIC server. Configured through the <b>aaa hic custom-proxy-port</b> command.
<b>HIC Background Poll Interval</b>	The URL for the web agent download server. Configured through the <b>aaa hic redundancy background-poll-interval</b> command.
<b>HIC Server-fail-mode</b>	The server background poll interval. Configured through the <b>aaa hic server-failure mode</b> command.

---

### Release History

Release 6.3.4; command was introduced.

Release 6.4.4; **Background Poll interval** and **Server-fail-mode** added.

## Related Commands

<b>show aaa hic host</b>	Displays a list of the learned host MAC addresses and the HIC status for each host.
<b>show aaa hic server</b>	Displays the HIC server configuration for the switch.
<b>show aaa hic server-failure policy</b>	Displays the list of servers allowed access to the switch and host device as part of the HIC process.

## MIB Objects

```
aaaHicConfigInfo
  aaaHicStatus

```

---

---

## show aaa hic host

Displays a list of the learned host MAC addresses and the HIC status for each host.

**show aaa hic host**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855

### Usage Guidelines

N/A

### Examples

```
-> show aaa hic host
  HIC Host MAC           Status
-----+-----
00:1a:a0:b1:fa:e5       Successful
00:b0:d0:2a:0e:2e       Failed
00:b0:d0:2a:11:60       Successful
```

#### *output definitions*

---

<b>HIC Host MAC</b>	The MAC address for each learned host device.
<b>Status</b>	The HIC status for the host device ( <b>In-Progress</b> , <b>Successful</b> , <b>Failed</b> , or <b>Timeout</b> ).

---

### Release History

Release 6.3.4; command was introduced.

## Related Commands

[show aaa hic](#)

Displays the global HIC configuration for the switch.

## show aaa hic server

Displays the HIC server configuration for the switch.

```
show aaa hic server
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

A Primary and Backup HIC server can be configured per switch.

### Examples

```
-> show aaa hic server
```

```
-> show aaa hic server
```

Server Name	IP Address	UDP Port	Server Role	Server Connection	Server Status
hic1	172.18.16.200	11707	Primary	Active	Down
hic2	172.18.16.232	11707	Backup	Inactive	Down

#### *output definitions*

---

<b>HIC Server Name</b>	The name of the HIC server. Note that only one server is supported per switch. Configured through the <a href="#">aaa hic server-name</a> command.
<b>HIC Server IP Address</b>	The IP address of the HIC server. Configured through the <a href="#">aaa hic server-name</a> command.
<b>HIC server UDP Port</b>	The UDP port number. Configured through the <a href="#">aaa hic server-name</a> command.
<b>HIC Server Role</b>	The role of this server; primary or backup. Configured through the <a href="#">aaa hic server-name</a> command.
<b>HIC Server Connection</b>	The server connection status; active or inactive.
<b>HIC Server Status:</b>	The server status; up or down.

---

## Release History

Release 6.3.4; command was introduced.

Release 6.4.4; **Role**, **Status**, and **Connection** parameters added.

## Related Commands

[show aaa hic](#)

Displays the global HIC configuration for the switch.

## show aaa hic server-failure policy

Displays the HIC server failure mode and UNP mapping.

```
show aaa hic server-failure policy
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

N/A

### Examples

```
-> show aaa hic server-failure policy
```

```
Mode: Hold
```

```
UNP Source
```

```
UNP Destination
```

```
-----+-----
```

```
unp1
```

```
unp2
```

### *output definitions*

---

<b>Mode</b>	The HIC Server Failure Mode; Hold or Pass-Through.
<b>UNP Source</b>	The current UNP of the users.
<b>UNP Destination</b>	The UNP that the users will be moved to if both HIC servers are unavailable.

---

### Release History

Release 6.4.4; command was introduced.

## Related Commands

**aaa hic server-name**                      Configures the HIC server.

```

---

## show aaa hic allowed

Displays the Host Integrity Check (HIC) server exception list. The servers included in this list are exempt from the HIC process. This allows a host device to access these servers for compliance and remediation purposes.

list of servers allowed access to the switch and host device as part of the HIC process.

**show aaa hic allowed**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6855

### Usage Guidelines

The HIC server exception list may contain up to four servers per switch.

### Examples

```
-> show aaa hic allowed
      Allowed Name          IP Address          IP Mask
-----+-----+-----
rem1_srv                   3.3.3.3             255.0.0.0
```

### *output definitions*

---

<b>Allowed Name</b>	The name of the server that is allowed access to the switch and host as part of the HIC process. Configured through the <a href="#">aaa hic redundancy background-poll-interval</a> command.
<b>IP Address</b>	The IP address of the allowed server. Configured through the <a href="#">aaa hic redundancy background-poll-interval</a> command.
<b>IP Mask</b>	The IP subnet mask for the allowed server. Configured through the <a href="#">aaa hic redundancy background-poll-interval</a> command.

---

### Release History

Release 6.3.4; command was introduced.

```

---

## show aaa priv hexa

Displays hexadecimal values for command domains/families. Useful for determining how to express command families in hexadecimal; hexadecimal values are used in configuring user privileges in attributes on an external LDAP or RADIUS authentication server.

**show aaa priv hexa** [*domain or family*]

---

### Syntax Definitions

*domain or family*

The CLI command domain or particular command family for which you want to display hexadecimal values. See table in Usage Guidelines.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Valid values for the family parameter are listed in the Corresponding Families column of the following table:

Domain	Corresponding Families
<b>domain-admin</b>	<b>file telnet dshell debug</b>
<b>domain-system</b>	<b>system aip snmp rmon webmgt config</b>
<b>domain-physical</b>	<b>chassis module interface pmm health</b>
<b>domain-network</b>	<b>ip rip ospf bgp vrrp ip-routing ipx ipmr ipms</b>
<b>domain-layer2</b>	<b>vlan bridge stp 802.1q linkagg ip-helper</b>
<b>domain-service</b>	<b>dns</b>
<b>domain-policy</b>	<b>qos policy slb</b>
<b>domain-security</b>	<b>session avlan aaa</b>

- Note that some command families may not be supported depending on the hardware platform you are running.
- If you do not specify a command family, hexadecimal values for all commands sets will display.

## Examples

```
-> show aaa priv hexa
file           = 0x00000001 0x00000000,

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[user](#)

Configures or modifies user entries in the local user database.

---

## show aaa-device all-users

Displays the Access Guardian status of all users learned on 802.1x ports.

**show aaa-device all-users** [**unp** *profile\_name* | **policy** *device\_policy* | **authentication-status** [**success** | **fail**]] [**port** *slot/port*]

---

### Syntax Definitions

<i>profile_name</i>	The name of a user network profile.
<i>device_policy</i>	The type of Access Guardian device classification policy.
<b>success</b>	Display all users that have successfully authenticated.
<b>fail</b>	Display all users that have failed authentication.
<i>slot/port</i>	The slot and port number designation for a specific switch port.

### Defaults

If none of the optional parameters are specified with this command, all users learned on all 802.1x ports are displayed by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **unp** *profile\_name* parameter to display only those users associated with a specific user network profile.
- Use the **policy** *device\_policy* parameter to display only those users authenticated with one of the device classification policy types. To specify which policy to use with this command, enter one of the following types for the *device\_policy* parameter value:

---

#### policy type

---

**vlan**  
**user-network-profile**  
**group mobility**  
**default-vlan**  
**captive-portal**  
**authentication**

---

- Use the **authentication success** or **authentication fail** parameters to display only those users that have either passed or failed authentication.
- Use the **port** *slot/port* parameter to display only those users learned on a specific port. Note that it is also possible to combine this parameter with any of the other **show aaa-device all-users** command parameters.

## Examples

-> show aaa-device all-users

*output definitions*

---

<b>Slot/Port</b>	The slot and port number to which the user device is connected.
<b>MAC Address</b>	The MAC address of the user device.
<b>User Name</b>	The user login name used to access the switch.
<b>VLAN</b>	The VLAN ID the user device is authorized to access.
<b>Addr Mode</b>	The status of the MAC address for the user device.
<b>Ip Address</b>	The IP address of the user device.
<b>Authentication Type</b>	The type of authentication used to grant the device access to the switch ( <b>1X</b> , <b>MAC</b> , or <b>none</b> ).
<b>Authentication Result</b>	The result of the authentication process ( <b>Pass</b> , <b>Fail</b> , or <b>N/A</b> ).
<b>User Network Profile Name</b>	The name of the user network profile used to classify the user device. If <b>N/A</b> appears in this field, there is no user network profile associated with this device.

## show aaa-device supplicant-users

Displays the Access Guardian status of all supplicant (802.1x) users learned on the switch.

**show aaa-device supplicant-users** [**unp** *profile\_name* | **policy** *device\_policy* | **authentication-status** [**success** | **fail**]] [**port** *slot/port*]

---

### Syntax Definitions

<i>profile_name</i>	The name of a user network profile.
<i>device_policy</i>	The type of Access Guardian device classification policy.
<b>success</b>	Display all supplicant users that have successfully authenticated.
<b>fail</b>	Display all supplicant users that have failed authentication.
<i>slot/port</i>	The slot and port number designation for a specific switch port.

### Defaults

If none of the optional parameters are specified with this command, all supplicant users are displayed by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **unp** *profile\_name* parameter to display only those users associated with a specific user network profile.
- Use the **policy** *device\_policy* parameter to display only those users authenticated with one of the device classification policy types. To specify which policy to use with this command, enter one of the following types for the *device\_policy* parameter value:

---

#### policy type

---

**vlan**  
**user-network-profile**  
**group mobility**  
**default-vlan**

## show aaa-device captive-portal-users

Displays the Access Guardian status of all users that attempted network access through the switch using Captive Portal web-based authentication.

**show aaa-device captive-portal-users** [**unp** *profile\_name* | **policy** *device\_policy* | **authentication-status** [**success** | **fail**]] [**port** *slot/port*]

---

### Syntax Definitions

<i>profile_name</i>	The name of a user network profile.
<i>device_policy</i>	The type of Access Guardian device classification policy.
<b>authentication success</b>	Display all non-supplicant users that have successfully authenticated.
<b>authentication fail</b>	Display all non-supplicant users that have failed authentication.
<i>slot/port</i>	The slot and port number designation for a specific switch port.

### Defaults

If none of the optional parameters are specified with this command, all Captive Portal users are displayed by default.

### Platforms Supported

OmniSwitch 6400, 6850,6850E, 6855, 9000E

### Usage Guidelines

- Use the **unp** *profile\_name* parameter to display only those users associated with a specific user network profile.
- Use the **policy** *device\_policy* parameter to display only those users authenticated with one of the device classification policy types. To specify which policy to use with this command, enter one of the following types for the *device\_policy* parameter value:

---

#### policy type

---

**vlan**  
**user-network-profile**  
**group mobility**  
**default-vlan**  
**captive-portal**  
**authentication**

---

- Use the **authentication success** or **authentication fail** parameters to display only those users that have either passed or failed authentication.
- Use the **port** *slot/port* parameter to display only those users learned on a specific port. Note that it is also possible to combine this parameter with any of the other **show aaa-device captive-portal-users** command parameters.

## Examples

```
-> show aaa-device captive-portal-users
```

Slot Port	MAC Address	User Name	VLAN	Addr Mode	IP Address	Authentication Type	User Result	Network Profile
1/1	00:11:50:a6:12:00	User101	100	Brdg	10.133.0.100	1X	Pass	Marketing

### output definitions

<b>Slot/Port</b>	The slot and port number to which the user device is connected.
<b>MAC Address</b>	The MAC address of the user device.

*output definitions*

---

<b>User Name</b>	The user login name used to access the switch.
<b>VLAN</b>	The VLAN ID the user device is authorized to access.
<b>Addr Mode</b>	The status of the MAC address for the user device.
<b>Ip Address</b>	The IP address of the user device.
<b>Authentication Type</b>	The type of authentication used to grant the device access to the switch ( <b>1X</b> , <b>MAC</b> , or <b>none</b> ).
<b>Authentication Result</b>	The result of the authentication process ( <b>Pass</b> , <b>Fail</b> , or <b>N/A</b> ).
<b>User Network Profile Name</b>	The name of the user network profile used to classify the user device. If <b>N/A</b> appears in this field, there is no user network profile associated with this device.

---

**Release History**

Release 6.3.4; command was introduced.

**Related Commands**

<b>show aaa-device all-users</b>	Displays a list of all users (supplicant and non-supplicant) learned on the switch.
<b>show aaa-device supplicant-users</b>	Displays a list of all supplicant (802.1X) users learned on the switch.
<b>show aaa-device non-supplicant-users</b>	Displays a list of all non-supplicant (non-802.1X) users learned on the switch.

# 37 Port Mobility Commands

Port mobility allows dynamic VLAN port assignment based on VLAN rules that are applied to port traffic. By default, all switch ports are non-mobile ports that are manually assigned to a specific VLAN and can only belong to one VLAN at a time. When a port is defined as a mobile port, switch software compares traffic coming in on the port with configured VLAN rules. If any of the mobile port traffic matches any of the VLAN rules, the port and the matching traffic become a member of that VLAN. It is also possible for mobile ports to belong to more than one VLAN, when the port carries multiple traffic types that match different rules on different VLANs.

VLANs do not have a mobile or non-mobile distinction and there is no overall switch setting to invoke the mobile port feature. Instead, mobility is enabled on individual switch ports and rules are defined for individual VLANs to capture mobile port traffic. This chapter includes descriptions of Command Line Interface (CLI) commands used to define VLAN rules, enable or disable mobile port properties, and display mobile port configuration information.

MIB information for port mobility commands is as follows:

*Filename:* AlcatelIND1GroupMobility.MIB  
*Module:* ALCATEL-IND1-GROUP-MOBILITY-MIB

A summary of the available commands is listed here:

---

- [vlan dhcp mac](#)
- [vlan dhcp mac range](#)
- [vlan dhcp port](#)
- [vlan dhcp generic](#)
- [vlan binding mac-ip-port](#)
- [vlan binding mac-port](#)
- [vlan binding port-protocol](#)
- [vlan mac](#)
- [vlan mac range](#)
- [vlan ip](#)
- [vlan ipx](#)
- [vlan protocol](#)
- [vlan port](#)
- [vlan port mobile](#)

- [vlan port default vlan](#)
- [vlan port authenticate](#)
- [vlan port 802.1x](#)
- [show vlan rules](#)
- [show vlan port mobile](#)

---

## vlan dhcp mac

Defines a DHCP MAC address rule for an existing VLAN. If a DHCP frame received on any mobile port contains a source MAC address that matches the MAC address specified in the rule, the frame's mobile port is temporarily assigned to the rule's VLAN.

**vlan vid dhcp mac mac\_address**

**vlan vid no dhcp mac mac\_address**

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>mac_address</i>	Source MAC address (e.g., 00:00:39:59:f1:0C).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a DHCP MAC address rule from the specified VLAN.
- Port mobility software checks for and processes DHCP traffic first on an active mobile port. When a mobile port receives a DHCP frame that matches a DHCP rule, the port is temporarily assigned to the VLAN long enough to forward the DHCP requests within the VLAN broadcast domain. The source MAC address of the DHCP frame, however, is not learned for that VLAN port association.
- Once a DHCP device has obtained an IP address, its non-DHCP traffic must match other VLAN rules within the same VLAN for the device to remain a member of that VLAN. If this match occurs, then the frame source is learned in the matching rule VLAN.
- DHCP rules are most often used in combination with IP network address rules. A DHCP client has an IP address of all zeros (0.0.0.0) until it receives an IP address from a DHCP server, so it would not match any IP network address rules.
- Binding rules, MAC address rules, and protocol rules also capture DHCP client traffic. The exception to this is binding rules that specify an IP address as part of the rule, similar to IP network address rule definitions.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

### Examples

```
-> vlan 10 dhcp mac 00:00:39:59:0a:0c
-> vlan 20 dhcp mac 00:00:39:4f:f1:22
-> vlan 10 no dhcp mac 00:00:39:59:0a:0c
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">vlan dhcp mac range</a>	Defines a DHCP MAC address range rule for an existing VLAN. Mobile ports that receive DHCP frames with a source MAC address that falls within the range specified by this rule are temporarily assigned to the VLAN.
<a href="#">vlan dhcp port</a>	Defines a DHCP port rule for an existing VLAN. The mobile port specified by this rule is temporarily assigned to the VLAN when it receives DHCP frames.
<a href="#">vlan dhcp generic</a>	Defines a generic DHCP rule for an existing VLAN. Mobile ports that receive DHCP frames that do not match other DHCP rules are temporarily assigned to the VLAN.
<a href="#">show vlan</a>	Displays existing VLANs.

vDhcpMacRuleTable
  vDhcpMacRuleAddr
  vDhcpMacRuleVlanId
  vDhcpMacRuleStatus
```

---

## vlan dhcp mac range

Defines a DHCP MAC range rule for an existing VLAN. If a DHCP frame contains a source MAC address that matches the low or high end MAC or falls within the range defined by the low and high end MAC, the frame's mobile port is temporarily assigned to the rule's VLAN.

**vlan vid dhcp mac range** *low\_mac\_address high\_mac\_address*

**vlan vid no dhcp mac range** *low\_mac\_address*

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>low_mac_address</i>	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a DHCP MAC range rule from the specified VLAN. It is only necessary to specify the low end MAC to identify which rule to delete; the high end MAC is not required.
- Only valid source MAC addresses are allowed for the low and high end boundary MACs. For example, multicast addresses (e.g., 01:00:00:c5:09:1a) are ignored even if they fall within a specified MAC range. To allow the use of a multicast address as either the low or high end boundary MAC would cause misleading DHCP MAC range rule results.
- Port mobility software checks for and processes DHCP traffic first on an active mobile port. When a mobile port receives a DHCP frame that matches a DHCP rule, the port is temporarily assigned to the VLAN long enough to forward the DHCP requests within the VLAN broadcast domain. The source MAC address of the DHCP frame, however, is not learned for that VLAN port association.
- Once a DHCP device has obtained an IP address, its non-DHCP traffic must match other VLAN rules within the same VLAN for the device to remain a member of that VLAN. If this match occurs, then the frame source is learned in the matching rule VLAN.
- DHCP rules are most often used in combination with IP network address rules. A DHCP client has an IP address of all zeros (0.0.0.0) until it receives an IP address from a DHCP server, so it would not match any IP network address rules.

- Binding rules, MAC address rules, and protocol rules also capture DHCP client traffic. The exception to this is binding rules that specify an IP address as part of the rule, similar to IP network address rule definitions.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 dhcp mac range 00:00:39:59:0a:0c 00:00:39:59:0a:0f
-> vlan 10 no dhcp mac range 00:00:39:59:0a:0c
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>vlan dhcp mac</b>	Defines a DHCP MAC address rule for an existing VLAN. Mobile ports that receive DHCP frames with a source MAC address that matches the address specified by this rule are temporarily assigned to the VLAN.
<b>vlan dhcp port</b>	Defines a DHCP port rule for an existing VLAN. The mobile port specified by this rule is temporarily assigned to the VLAN when it receives DHCP frames.
<b>vlan dhcp generic</b>	Defines a generic DHCP rule for an existing VLAN. Mobile ports that receive DHCP frames that do not match other DHCP rules are temporarily assigned to the VLAN.
<b>show vlan</b>	Displays existing VLANs.
<b>show vlan rules</b>	Displays rules defined for VLANs.

---

## vlan dhcp port

Defines a DHCP port rule for an existing VLAN. If a DHCP frame is received on a mobile port that matches the port specified in the rule, the mobile port is temporarily assigned to the rule's VLAN.

**vlan vid dhcp port slot/port**

**vlan vid no dhcp port slot/port**

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a DHCP port rule from the specified VLAN.
- Port mobility software checks for and processes DHCP traffic first on an active mobile port. When a mobile port receives a DHCP frame that matches a DHCP rule, the port is temporarily assigned to the VLAN long enough to forward the DHCP requests within the VLAN broadcast domain. The source MAC address of the DHCP frame, however, is not learned for that VLAN port association.
- Once a DHCP device has obtained an IP address, its non-DHCP traffic must match other VLAN rules within the same VLAN for the device to remain a member of that VLAN. If this match occurs, then the frame source is learned in the matching rule VLAN.
- DHCP rules are most often used in combination with IP network address rules. A DHCP client has an IP address of all zeros (0.0.0.0) until it receives an IP address from a DHCP server, so it would not match any IP network address rules.
- Binding rules, MAC address rules, and protocol rules also capture DHCP client traffic. The exception to this is binding rules that specify an IP address as part of the rule, similar to IP network address rule definitions.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 dhcp port 3/1
-> van 20 dhcp port 4/1-16
-> vlan 30 dhcp port 5/1-32 6/5-10 8/7-22
-> vlan 10 no dhcp port 3/1
-> vlan 20 no dhcp port 4/1-16
```

## Release History

Release 6.1; command was introduced.

## Related Commands

## MIB Objects

```
vDhcpPortRuleTable
  vDhcpPortRuleIfIndex
  vDhcpPortRuleVlanId
  vDhcpPortRuleStatus
```

---

## vlan dhcp generic

Defines a DHCP rule for an existing VLAN. If a DHCP frame does not match any other DHCP rule criteria, the frame's mobile port is temporarily assigned to the DHCP generic rule VLAN.

**vlan vid dhcp generic**

**vlan vid no dhcp generic**

---

### Syntax Definitions

*vid* VLAN ID number (1–4094).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Defaults

N/A

### Usage Guidelines

- Use the **no** form of this command to delete a DHCP generic rule from the specified VLAN.
- Only one DHCP generic rule per switch is allowed.
- Port mobility software checks for and processes DHCP traffic first on an active mobile port. When a mobile port receives a DHCP frame that matches a DHCP rule, the port is temporarily assigned to the VLAN long enough to forward the DHCP requests within the VLAN broadcast domain. The source MAC address of the DHCP frame, however, is not learned for that VLAN port association.
- Once a DHCP device has obtained an IP address, its non-DHCP traffic must match other VLAN rules within the same VLAN for the device to remain a member of that VLAN. If this match occurs, then the frame source is learned in the matching rule VLAN.
- DHCP rules are most often used in combination with IP network address rules. A DHCP client has an IP address of all zeros (0.0.0.0) until it receives an IP address from a DHCP server, so it would not match any IP network address rules.
- Binding rules, MAC address rules, and protocol rules also capture DHCP client traffic. The exception to this is binding rules that specify an IP address as part of the rule, similar to IP network address rule definitions.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

### Examples

```
-> vlan 10 dhcp generic
-> vlan 10 no dhcp generic
```

### Release History

<b>vlan dhcp mac</b>	Defines a DHCP MAC address rule for an existing VLAN. Mobile ports that receive DHCP frames with a source MAC address that matches the address specified by this rule are temporarily assigned to the VLAN.
<b>vlan dhcp mac range</b>	Defines a DHCP MAC address range rule for an existing VLAN. Mobile ports that receive DHCP frames with a source MAC address that falls within the range specified by this rule are temporarily assigned to the VLAN.
<b>show vlan</b>	Displays existing VLANs.
<b>show vlan rules</b>	Displays rules defined for VLANs.

## MIB Objects

```
vDhcpGenericRuleTable  
  vDhcpGenericRuleVlanId  
  vDhcpGenericRuleStatus
```

---

## vlan binding mac-ip-port

Defines a binding MAC-IP-port rule for an existing VLAN. This rule restricts VLAN membership to a device that matches all criteria of the rule. Device frames received on the specified mobile port must also contain a source MAC address and source IP address that matches the MAC and IP address specified in the rule.

**vlan vid binding mac-ip-port** *mac\_address ip\_address slot/port*

**vlan vid no binding mac-ip-port** *mac\_address*

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>mac_address</i>	Source MAC address (e.g., 00:00:39:59:f1:0c).
<i>ip_address</i>	IP address (e.g., 21.0.0.10, 176.23.100.2)
<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a binding MAC-IP-port rule from the specified VLAN. It is only necessary to specify a MAC address to identify which rule to delete; the IP address and slot/port are not required.
- If only the frame's source MAC address matches the MAC address specified in this rule, a binding rule violation occurs and the device frame is blocked and its port is *not* assigned to the VLAN. There is no further attempt to compare the frame to other VLAN rules.
- If only the frame's source IP address matches the MAC address specified in this rule, a binding rule violation occurs and the device frame is blocked and its port is *not* assigned to the VLAN. There is no further attempt to compare the frame to other VLAN rules.
- If only the frame's port matches the port specified in this rule, the frame is allowed but the port is still not assigned to the VLAN. The frame is then compared to other VLAN rules for possible matches.
- A binding rule applies to traffic from a specific device. Therefore, a separate binding rule is required for each device.
- Binding MAC-IP-port rules have the highest precedence of all the rules.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 binding mac-ip-port 00:00:39:59:0a:0c 21.0.0.10 5/1  
-> van 20 no binding mac-ip-port 00:00:39:4f:f1:22
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">show vlan</a>	Displays existing VLANs.

```

---

## vlan binding mac-port

Defines a binding MAC-port rule for an existing VLAN. This rule restricts VLAN membership to a device that matches all criteria of the rule. Device frames received on the specified mobile port must contain a source MAC address that matches the MAC address specified in the rule.

**vlan vid binding mac-port mac\_address slot/port**

**vlan vid no binding mac-port mac\_address**

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>mac_address</i>	Source MAC address (e.g., 00:00:39:59:f1:0c).
<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a binding MAC-port rule from the specified VLAN. It is only necessary to enter a MAC address to identify which rule to delete; the slot/port is not required.
- If only the frame's source MAC address matches the MAC address specified in this rule, a binding rule violation occurs and the device frame is blocked and its port is not assigned to the VLAN. There is no further attempt to compare the frame to other VLAN rules.
- If only the frame's port matches the port specified in this rule, the frame is allowed but the port is still not assigned to the VLAN. The frame is then compared to other VLAN rules for possible matches.
- A binding rule applies to a specific device. Therefore, a separate binding rule is required for each device.
- Binding MAC-port rules take precedence over all other rules, except binding MAC-port-protocol and binding MAC-IP-port rules.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

### Examples

```
-> vlan 10 binding mac-port 00:00:39:59:0a:0c 5/1
-> vlan 20 no binding mac-port 00:00:39:4f:f1:22
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show vlan](#)

Displays existing VLANs.

[show vlan rules](#)

Displays rules defined for VLANs.

## vlan binding port-protocol

Defines a binding port-protocol rule for an existing VLAN. This rule restricts VLAN membership to a device that matches all criteria of the rule. Device frames received on the specified mobile port must contain a protocol type that matches the protocol value specified in the rule.

**vlan** *vid* **binding port-protocol** *slot/port* {**ip-e2** | **ip-snap** | **ipv6** | **ipx-e2** | **ipx-novell** | **ipx-llc** | **ipx-snap** | **decnet** | **appletalk** | **ethertype** *type* | **dsapssap** *dsap/ssap* | **snap** *snatype*}

**vlan** *vid* **no binding port-protocol** *slot/port* {**ip-e2** | **ip-snap** | **ipx-e2** | **ipx-novell** | **ipx-llc** | **ipx-snap** | **decnet** | **appletalk** | **ethertype** *type* | **dsapssap** *dsap/ssap* | **snap** *snatype*}

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<b>ip-e2</b>	IP Ethernet-II protocol. Also captures Address Resolution Protocol (ARP).
<b>ip-snap</b>	IP SNAP protocol.
<b>ipv6</b>	IPv6 protocol.
<b>ipx-e2</b>	IPX Ethernet-II protocol.
<b>ipx-novell</b>	IPX Novell (802.3) protocol.
<b>ipx-llc</b>	IPX LLC (802.2) protocol.
<b>ipx-snap</b>	IPX SNAP protocol.
<b>decnet</b>	DECNET Phase IV (6003) protocol.
<b>appletalk</b>	AppleTalk protocol. Also captures Datagram Delivery Protocol (DDP) and AppleTalk ARP (AARP).
<i>type</i>	A two-byte hex value between 0x600 and 0xffff that defines an Ethernet type (e.g., 0600, 0806, 6002).
<i>dsap/ssap</i>	A one-byte hex value between 0x00 and 0xff that defines Destination Service Access Protocol (DSAP) and Source Service Access Protocol (SSAP) header values. Specify both a DSAP and an SSAP value for this parameter variable (e.g., F0/F0, 04/04, BC/BC).
<i>snatype</i>	A two-byte hex value between 0x600 and 0xffff that defines a Sub-network Access Protocol (SNAP) protocol.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete a binding port-protocol rule from the specified VLAN.
- If only the frame's port matches the port specified in this rule, a binding rule violation occurs and the device frame is blocked and its port is not assigned to the VLAN. There is no further attempt to compare the frame to other VLAN rules.
- If only the frame's protocol matches the protocol specified in this rule, the frame is allowed but the port is still not assigned to the VLAN. The frame is then compared to other VLAN rules for possible matches.
- Binding port-protocol rules take precedence behind all other binding rules.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 binding port-protocol 5/1 ipx-e2
-> vlan 20 binding port-protocol 7/2 dsapssap F0/F0
-> vlan 20 no binding port-protocol 7/2 dsapssap F0/F0
```

## Release History

Release 6.1; command was introduced.

```

---

## vlan mac

Defines a MAC address rule for an existing VLAN. If the source MAC address of a device matches a MAC address specified in this rule, the device and its mobile port will join the VLAN when the device starts to send traffic.

```
vlan vid mac mac_address
```

```
vlan vid no mac mac_address
```

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a MAC address rule from the specified VLAN.
- Once a device joins a MAC address rule VLAN, then it is not eligible to join multiple VLANs even if the device traffic matches other VLAN rules.
- Mac address rules take precedence behind DHCP and binding rules.
- MAC address rules also capture DHCP traffic, if no other DHCP rule exists that would classify the DHCP traffic into another VLAN. Therefore, it is not necessary to combine DHCP rules with MAC address rules for the same VLAN.
- If there are a large number of devices that must join a VLAN, try MAC range rules (see [vlan mac range command on page 37-18](#)).
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

### Examples

```
-> vlan 10 mac 00:00:39:59:0a:0c
-> vlan 20 mac 00:00:39:4f:f1:22
-> vlan 10 no mac 00:00:39:59:0a:0c
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[vlan mac range](#)

Defines a MAC range rule for an existing VLAN. Mobile ports that receive frames with a source MAC address that falls within the range specified by this rule are temporarily assigned to the VLAN.

[show vlan](#)

Displays existing VLANs.

[show vlan rules](#)

Displays rules defined for VLANs.

## MIB Objects

vMacRuleTable

  vMacRuleAddr

  vMacRuleVlanId

---

## vlan mac range

Defines a MAC range rule for an existing VLAN. If the source MAC address of a device matches the low or high end MAC or falls within the range defined by the low and high end MAC, the device and its mobile port will join the VLAN when the device starts to send traffic.

**vlan vid mac range** *low\_mac\_address high\_mac\_address*

**vlan vid no mac range** *low\_mac\_address*

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>low_mac_address</i>	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a MAC range rule from the specified VLAN. It is only necessary to enter the low end MAC address to identify which rule to delete; the high end MAC is not required.
- Only valid source MAC addresses are allowed for the low and high end boundary MACs. For example, multicast addresses (e.g., 01:00:00:c5:09:1a) are ignored even if they fall within a specified MAC range. To allow the use of a multicast address as either the low or high end boundary MAC would cause misleading MAC range rule results.
- Once a device joins a MAC range rule VLAN, then it is not eligible to join multiple VLANs even if the device traffic matches other VLAN rules.
- MAC range rules follow the same precedence as MAC address rules.
- MAC range rules also capture DHCP traffic, if no other DHCP rule exists that would classify the DHCP traffic into another VLAN. Therefore, it is not necessary to combine DHCP rules with MAC range rules for the same VLAN.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

### Examples

```
-> vlan 10 mac range 00:00:39:59:0a:0c 00:00:39:59:0a:0f
-> vlan 10 no mac range 00:00:39:59:0a:0c
```

## Release History

## vlan ip

Defines an IP network address rule for an existing VLAN. If a device sends traffic that matches the IP address specified in the rule, the device and its mobile port will join the rule's VLAN.

**vlan vid ip** *ip\_address* [*subnet\_mask*]

**vlan vid no ip** *ip\_address* [*subnet\_mask*]

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>ip_address</i>	IP network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0)
<i>subnet_mask</i>	Class A, B, or C subnet mask (e.g., 255.0.0.0, 255.255.0.0, or 255.255.255.0).

### Defaults

By default, the subnet mask is set to the default subnet mask value for the IP address class.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete an IP network address rule from the specified VLAN.
- Network address rules take precedence behind DHCP, binding, and MAC address rules.
- Use DHCP rules in combination with IP network address rules to capture and forward DHCP traffic.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

### Examples

```
-> vlan 10 ip 51.0.0.0 255.0.0.0
-> vlan 20 ip 21.0.0.0
-> vlan 10 no ip 21.0.0.0 255.0.0.0
-> vlan 10 no ip 51.0.0.0
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>vlan dhcp mac</b>	Defines a DHCP MAC address rule for an existing VLAN. Mobile ports that receive DHCP frames with a source MAC address that matches the address specified by this rule are temporarily assigned to the VLAN.
<b>vlan dhcp mac range</b>	Defines a DHCP MAC address range rule for an existing VLAN. Mobile ports that receive DHCP frames with a source MAC address that falls within the range specified by this rule are temporarily assigned to the VLAN.
<b>vlan dhcp port</b>	Defines a DHCP port rule for an existing VLAN. The mobile port specified by this rule is temporarily assigned to the VLAN when it receives DHCP frames.
<b>vlan dhcp generic</b>	Defines a generic DHCP rule for an existing VLAN. Mobile ports that receive DHCP frames that do not match other DHCP rules are temporarily assigned to the VLAN.
<b>show vlan</b>	Displays existing VLANs.
<b>show vlan rules</b>	Displays rules defined for VLANs.

## MIB Objects

```
vIpNetRuleTable  
  vIpNetRuleAddr  
  vIpNetRuleMask  
  vIpNetRuleVlanId  
  vIpNetRuleStatus
```

---

## vlan ipx

Defines an IPX network address rule for an existing VLAN. If a device sends traffic that matches the IPX network address and encapsulation specified in the rule, the device and its mobile port will join the rule's VLAN.

```
vlan vid ipx ipx_net [e2 | llc | snap | novell]
```

```
vlan vid no ipx ipx_net
```

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>ipx_net</i>	IPX network address consisting of up to eight hex characters (e.g., A010590C, B030210A). If less than eight hex digits are entered, the entry is prefixed with zeros to equal eight digits.
<b>e2</b>	Enter <b>e2</b> to specify Ethernet-II encapsulation.
<b>llc</b>	LLC (802.2) encapsulation.
<b>snap</b>	SNAP encapsulation.
<b>novell</b>	Novell Raw (802.3) encapsulation.

### Defaults

parameter	default
<b>e2   llc   snap   raw</b>	e2

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete an IPX network address rule from the specified VLAN. It is only necessary to enter the IPX network address to identify which rule to delete; the encapsulation is not required.
- Specify **e2**, **llc**, **snap**, or **novell-raw** to identify the IPX encapsulation the device is going to use. If there is a mismatch and IPX traffic is routed, connectivity with the IPX server may not occur.
- This rule only applies to those devices that already have an IPX network address configured with an encapsulation that matches the encapsulation specified for the rule.
- Network address rules take precedence behind DHCP, binding, and MAC address rules.
- To remove an IPX network address rule, it is not necessary to specify the IPX encapsulation value.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 ipx 250A llc  
-> vlan 10 no ipx 250A
```

## Release History

Release 6.1; command was introduced.

## vlan protocol

Defines a protocol rule for an existing VLAN. If a device sends traffic that matches the protocol value specified in the rule, the device and its mobile port will join the rule's VLAN.

**vlan** *vid* **protocol** {**ip-e2** | **ip-snap** | **ipx-e2** | **ipx-novell** | **ipx-llc** | **ipx-snap** | **decnet** | **appletalk** | **ethertype** *type* | **dsapssap** *dsap/ssap* | **snap** *snatype*}

**vlan** *vid* **no protocol** {**ip-e2** | **ip-snap** | **ipx-e2** | **ipx-nov** | **ipx-llc** | **ipx-snap** | **decnet** | **appletalk** | **ethertype** *type* | **dsapssap** *dsap/ssap* | **snap** *snatype*}

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<b>ip-e2</b>	IP Ethernet-II protocol. Also captures Address Resolution Protocol (ARP).
<b>ip-snap</b>	IP Sub-network Access Protocol (SNAP) protocol.
<b>ipx-e2</b>	IPX Ethernet-II protocol.
<b>ipx-novell</b>	IPX Novell (802.3) protocol.
<b>ipx-llc</b>	IPX LLC (802.2) protocol.
<b>ipx-snap</b>	IPX SNAP protocol.
<b>decnet</b>	DECNET Phase IV (6003) protocol.
<b>appletalk</b>	AppleTalk protocol. Also captures Datagram Delivery Protocol (DDP) and AppleTalk ARP (AARP).
<i>type</i>	A two-byte hex value between 0x600 and 0xffff that defines an Ethernet type (e.g., 0600, 0806, 6002).
<i>dsap/ssap</i>	A one-byte hex value between 0x00 and 0xff that defines Destination Service Access Protocol (DSAP) and Source Service Access Protocol (SSAP) header values. Specify both a DSAP and an SSAP value for this parameter variable (e.g., F0/F0, 04/04, BC/BC).
<i>snatype</i>	A two-byte hex value between 0x600 and 0xffff that defines a SNAP protocol.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete a protocol rule from the specified VLAN.
- Use the **ethertype**, **dsapssap**, or **snap** parameters if none of the generic protocol rule parameters (**ip-e2**, **ip-snap**, **ipx-e2**, **ipx-nov**, **ipx-llc**, **ipx-snap**, **decnet**, **appletalk**) provide the necessary rule definition for a specific traffic protocol.
- If an attempt is made to define an Ethertype rule with a protocol type value that is equal to the value already captured by one of the generic IP or IPX protocol rules, a message displays recommending the use of the IP or IPX generic rule.
- Protocol rules take precedence behind DHCP, binding, MAC address, and network address rules.
- IP protocol rules (ipE2 and ipSnap) also capture DHCP traffic, if no other DHCP rule exists that would classify the DHCP traffic into another VLAN. Therefore, it is not necessary to combine DHCP rules with protocol rules for the same VLAN.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 protocol ip-e2
-> vlan 20 protocol ipx-nov
-> vlan 30 protocol ethertype 0600
-> vlan 40 protocol dsapssap F0/F0
-> vlan 50 protocol snap 6004
-> vlan 10 no protocol ip-snap
-> vlan 20 no protocol ipx-e2
-> vlan 30 no protocol ethertype 0806
-> vlan 40 no protocol dsapssap 04/04
-> vlan 50 no protocol snap 80FE
```

```

---

## vlan port

Defines a port rule for an existing VLAN. An active mobile port that is specified in a port rule, dynamically joins the VLAN even if traffic on that port does not get learned or matches any VLAN rules. The specified port becomes a VLAN member only for the purpose of forwarding broadcast traffic for a VLAN on that port. The advantage to this is that traffic from multiple VLANs can flood out on a single port.

**vlan vid port slot/port**

**vlan vid no port slot/port**

---

### Syntax Definitions

<i>vid</i>	VLAN ID number (1–4094).
<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a port rule from the specified VLAN.
- Port rules are for silent devices, such as printers, that require VLAN membership to receive traffic forwarded from the VLAN. These devices usually don't send traffic, so they do not trigger dynamic assignment of their mobile ports to a VLAN.
- Port rules do not classify incoming traffic on the specified mobile port. Incoming traffic is classified for VLAN assignment in the same manner as all other mobile port traffic.
- VLAN assignments that are defined using port rules are exempt from the port's default VLAN restore status.
- An alternative to port rules is to manually assign a port to a VLAN by using the [vlan port default](#) command. This applies to both mobile and non-mobile ports.
- Rules are only assigned to existing VLANs. Use the **vlan** command to create a new VLAN.

## Examples

```
-> vlan 10 port 3/10
-> vlan 20 port 6/1-32
-> vlan 500 port 2/1-12 4/10-16 8/4-17
-> vlan 30 no port 9/11
-> vlan 40 no port 4/1-16
-> vlan 600 no port 2/14-20 7/1-9
```

## Release History

## MIB Objects

```
vPortRuleTable
  vPortRuleIfIndes
  vPortRuleVlanId
  vPortRuleStatus
```

---

## vlan port mobile

Configures Ethernet ports as mobile ports and enables or disables BPDU ignore. Mobile ports are eligible for dynamic VLAN assignment, which occurs when mobile port traffic matches a VLAN rule on one or more VLANs. Typically, mobility is applied to ports that do not send or receive BPDUs. However, enabling BPDU ignore allows BPDU ports to also participate in dynamic VLAN assignment.

---

**Note.** Enabling BPDU ignore is not recommended. In specific cases where it is required, such as connecting legacy networks to port mobility networks, make sure that ignoring BPDUs on a mobile port will not cause network loops to go undetected. Connectivity problems could also result if a mobile BPDU port dynamically moves out of its configured default VLAN where it provides traffic flow to and from another switch.

---

**vlan port mobile** *slot/port* [**bpdu ignore** {**enable** | **disable**}]

**vlan no port mobile** *slot/port*

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).

**enable** Enables BPDU ignore on a mobile port.

**disable** Disables BPDU ignore on a mobile port.

### Defaults

By default, all ports are non-mobile (fixed) ports.

parameter	default
<b>enable</b>   <b>disable</b>	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable mobility on the specified port.
- Only 10/100 and gigabit Ethernet ports are eligible for mobile port status.
- Mobile ports can join more than one VLAN. For example, if a device connected to a mobile port sends both IP and IPX traffic and VLAN 10 has an IP protocol rule and VLAN 20 has an IPX protocol rule, the mobile port and its device dynamically join both VLANs. However, certain rules, such as MAC address rules, can limit port membership to one VLAN.

- When a VLAN is administratively disabled, manual port and dynamic mobile port assignments are retained but traffic on these ports is not forwarded. However, VLAN rules remain active and continue to classify mobile port traffic for VLAN membership.
- When a BPDU is received on a mobile port and BPDU ignore is disabled, the port is changed to a fixed (non-mobile) port that is associated only with its configured default VLAN. Also, the BPDU port participates in the Spanning Tree algorithm. When BPDU ignore is enabled, a mobile port that receives a BPDU remains mobile and is not included in Spanning Tree topology calculations.
- Enabling mobility on an active port that sends or receives BPDU (e.g. ports that connect two switches and Spanning Tree is enabled on both the ports and their assigned VLANs) is not allowed. If mobility is required on this type of port, enable mobility and the BPDU ignore flag when the port is not active.

## Examples

```
-> vlan port mobile 3/1
-> vlan port mobile 3/1-16
-> vlan port mobile 3/1-16 4/17-32 8/4-12
-> vlan port mobile 5/22 authenticate enable
-> vlan port mobile 6/12-16 authenticate disable
-> vlan no port mobile 2/1
-> vlan no port mobile 3/1-16
-> vlan no port mobile 4/17-32 8/4-12
```

## Release History

Release 6.1; command was introduced.

  vMobilePortIgnoreBPDU
```

---

## vlan port default vlan restore

Enables or disables default VLAN restore for a mobile port. Use this command to specify if a mobile port should retain or drop its dynamic VLAN assignments after all MAC addresses learned on that port have aged out.

**vlan port** *slot/port* **default vlan restore** {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).
<b>enable</b>	Enable default VLAN restore for the specified mobile port. VLAN assignments are dropped when port traffic ages out.
<b>disable</b>	Disable default VLAN restore for the specified mobile port. VLAN assignments are retained when port traffic ages out.

### Defaults

By default, VLAN restore is enabled on mobile ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a hub is connected to a mobile port, enabling default VLAN restore on that port is recommended.
- If a VLAN port rule exists for a mobile port, it will remain a member of the port rule VLAN even if default VLAN restore is enabled for that port.
- When a mobile port link is disabled and then enabled, the port is always returned to its configured default VLAN. Switch ports are disabled when a device is disconnected from the port, a configuration change is made to disable the port, or switch power is turned off.

### Examples

```
-> vlan port 3/1 default vlan restore enable
-> vlan port 5/2 default vlan restore disable
-> vlan port 6/1-32 8/10-24 9/3-14 default vlan restore enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>vlan port mobile</b>	Configures Ethernet ports as mobile ports.
<b>vlan port default vlan</b>	Enables default VLAN membership for mobile port traffic that does not match any VLAN rules.
<b>vlan port authenticate</b>	Enables or disables authentication on a mobile port.
<b>show vlan port mobile</b>	Displays mobile port properties.

## MIB Objects

```
vMobilePortTable  
  vMobilePortIIIfIndex  
  vMobilePortDefVlanRestore
```

---

## vlan port default vlan

Enables or disables the forwarding of mobile port traffic on the configured default VLAN for the mobile port when the traffic does not match any VLAN rules.

**vlan port** *slot/port* **default vlan** {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).
<b>enable</b>	Enable the configured default VLAN for the specified mobile port.
<b>disable</b>	Disable the configured default VLAN for the specified mobile port.

### Defaults

Default VLAN is enabled on mobile ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- It is recommended that mobile ports with their default VLAN disabled should not share a VLAN with any other types of ports (e.g., mobile ports with default VLAN enabled or non-mobile, fixed ports).
- If the default VLAN is enabled for a mobile port, traffic that does not match any VLAN rules is forwarded on the default VLAN.
- If the default VLAN is disabled for the mobile port, traffic that does not match any VLAN rules is dropped.
- When a port (mobile or fixed) is manually assigned to a default VLAN or is still a member of default VLAN 1, then that association is referred to as the *configured* default VLAN for the port. If a mobile port is dynamically assigned to additional VLANs, these subsequent associations are referred to as secondary VLANs.

### Examples

```
-> vlan port 3/1 default vlan enable
-> vlan port 5/2 default vlan disable
-> vlan port 6/1-32 8/10-24 9/3-14 default vlan enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

  vMobilePortDefVlanEnable
```

---

## vlan port authenticate

Enables or disables authentication on a mobile port.

**vlan port** *slot/port* **authenticate** {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).
<b>enable</b>	Enable authentication on the specified mobile port.
<b>disable</b>	Disable authentication on the specified mobile port.

### Defaults

By default, authentication is disabled on mobile ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

At this time, authentication is only supported on mobile ports.

### Examples

```
-> vlan port 3/1 authenticate enable
-> vlan port 5/2 authenticate disable
-> vlan port 6/1-32 8/10-24 9/3-14 authenticate enable
```

### Release History

Release 6.1; command was introduced.

## vlan port 802.1x

Enables or disables 802.1X port-based access control on a mobile port.

**vlan port** *slot/port* **802.1x** {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical mobile port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).
<b>enable</b>	Enable 802.1x on the specified mobile port.
<b>disable</b>	Disable 802.1x on the specified mobile port.

### Defaults

By default, 802.1x is disabled on mobile ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- At this time, 802.1X is only supported on mobile ports.
- Authentication and 802.1X are mutually exclusive on a given mobile port.

### Examples

```
-> vlan port 3/1 802.1x enable
-> vlan port 5/2 802.1x disable
-> vlan port 6/1-32 8/10-24 9/3-14 802.1x enable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">vlan port mobile</a>	Configures Ethernet ports as mobile ports.
<a href="#">vlan port authenticate</a>	Enables or disables authentication on a mobile port.
<a href="#">show vlan port mobile</a>	Displays mobile port properties.

## **MIB Objects**

vMobilePortTable

    vMobilePortIIIfIndex

    vMobilePortAuthenticate

---

## show vlan rules

Displays VLAN rules for the specified VLAN.

**show vlan** [*vid*] rules

---

### Syntax Definitions

*vid* VLAN ID number (1–4094).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If a *vid* is not specified, rules defined for all VLANs are displayed.

### Examples

```
-> show vlan rules
Legend: * indicates a binding rule
```

type	vlan	rule
ip-net	7	143.113.0.0, 255.255.0.0
ipx-net	8	0x450c, llc
mac-addr	4000	00:00:00:00:10:10
mac-range	4001	00:00:00:10:00:00, 00:00:00:20:00:00
mac-port-proto*	4094	00:00:0e:00:12:34, 15/4, appletalk

```
-> show vlan 55 rules
Legend: * indicates a binding rule
```

type	vlan	rule
ip-net	55	143.113.0.0, 255.255.0.0
ipx-net	55	45, llc
mac-addr	55	00:00:00:00:10:10
mac-range	55	00:00:00:10:00:00, 00:00:00:20:00:00
mac-port-proto*	55	00:00:0e:00:12:34, 15/4, appletalk

### output definitions

---

<b>Type</b>	The type of rule defined. There are several types of VLAN rules: binding rules, MAC address rules, IP/IPX network address rules, protocol rules, port rules, custom rules, and DHCP rules.
*	Identifies a binding rule. The asterisk appears next to the rule type.

*output definitions (continued)*

---

<b>VLAN</b>	The VLAN ID number for the rule's VLAN.
<b>Rule</b>	The value for the type of rule defined. Switch software uses these rule values to determine mobile port VLAN assignment. If traffic coming in on a mobile port matches the value of a VLAN rule, then the mobile port is dynamically assigned to that VLAN.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan port</a>	Displays VLAN port assignments for all VLANs, a specific VLAN, or for a specific port (mobile and fixed).

---

## show vlan port mobile

Displays current status of mobile properties for a switch port.

**show vlan port mobile** [*slot/port*]

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (e.g., 3/1-16) and a space to specify multiple slots (e.g., 3/1-16 5/10-20 8/2-9).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a slot/port is not specified, then mobile properties for all ports are displayed.
- Note that the **show vlan port mobile** command only displays ports that are mobile or are eligible to become mobile ports. For example, ports that are part of a link aggregate or are configured for 802.1Q VLAN tagging are not included in the output of this command.

### Examples

```
-> show vlan port mobile
```

```

           cfg                               ignore
port  mobile def  authent  enabled  restore  bpdu
-----+-----+-----+-----+-----+-----+
12/12  on    1    off     on     off     off
12/13  off
12/14  off
12/15  on    10   on-avlan  off    on     off
12/16  on    10   on-8021x  on     off    on

```

#### output definitions

---

<b>port</b>	The slot number for the module and the physical mobile port number on that module.
<b>mobile</b>	The mobile status for the port ( <b>on</b> or <b>off</b> ). If set to <b>on</b> , the port is mobile and eligible for dynamic VLAN assignment. If set to <b>off</b> , the port is non-mobile and remains only a member of its configured default VLAN. Use the <b>vlan port mobile</b> to enable or disable mobility on a port.
<b>cfg def</b>	The configured default VLAN for the port, which is assigned using the <b>vlan port default</b> command.

---

*output definitions (continued)*

---

<b>authent</b>	The authentication status for the port ( <b>on-avlan</b> , <b>on-8021x</b> , or <b>off</b> ). Use the <b>vlan port authenticate</b> and <b>vlan port 802.1x</b> commands to change this status.
<b>enabled</b>	The default VLAN status for the port: <b>on</b> enables the forwarding of traffic that doesn't match any rules on the port's configured default VLAN; <b>off</b> disables the forwarding of such traffic and packets are discarded. Use the <b>vlan port default vlan</b> to change this status.
<b>restore</b>	The default VLAN restore status for the port: <b>on</b> indicates that the mobile port will not retain its VLAN assignments when qualifying traffic ages out on that port; <b>off</b> indicates that the mobile port will retain its dynamic VLAN assignments after qualifying traffic has aged out. Use the <b>vlan port default vlan restore</b> command to change this status.
<b>ignore BPDU</b>	The ignore BPDU status for the port: <b>on</b> indicates that if the mobile port receives BPDUs, they're ignored and the port remains eligible for dynamic VLAN assignment; <b>off</b> indicates that if a BPDU is seen on the port, mobility is disabled and the port is not eligible for dynamic assignment. The status of ignore BPDU is set when the <b>vlan port mobile</b> command is used to enable or disable mobility on a port.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**show vlan port** Displays VLAN port assignments for all VLANs, a specific VLAN, or for a specific port.

---

# 38 Network Security Commands

Network Security (also known as Alcatel-Lucent's Traffic Anomaly Detection feature) detects anomalies in network traffic through statistical analysis of a port's ingress and egress packets. Anomalies occur when traffic patterns of a port do not meet expectations. Network Security detects such anomalies in real time and upon detection can log and/or generate an SNMP trap and/or disable the anomalous port automatically.

Network Security provides the following capabilities:

- Real time network traffic monitoring.
- Dynamic anomaly detection.
- Dynamic anomalous port quarantining.

---

**Note.** The Network Security feature is supported only on the OmniSwitch 6850, 6855, and 9000E series.

---

MIB information for the Network Security commands is as follows:

*Filename:* AlcatelIND1Ns.mib  
*Module:* ALCATEL-IND1-NETSEC-MIB

A summary of available commands is listed here:

---

[netsec group port](#)  
[netsec group anomaly](#)  
[show netsec summary](#)  
[show netsec traffic](#)  
[show netsec statistics](#)  
[show netsec config](#)  
[show netsec operation](#)  
[show netsec group port](#)

---

Configuration procedures for Network Security are explained in the “Configuring Network Security” chapter of the *OmniSwitch AOS Release 6 Network Configuration Guide*.

## netsec group port

Creates a monitoring-group and configures port associations for that group.

**netsec group** *grp\_name* **port** *slot/port*[-*port2*]

**no netsec group** *grp\_name* **port** *slot/port*[-*port2*]

---

### Syntax Definitions

<i>grp_name</i>	The name of the monitoring-group (up to 32 characters).
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to associate on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a port or a range of ports from the monitoring-group.
- A port-range cannot be a subset of any other port-range which is already configured.
- The word 'all' cannot be used as a group name (*grp\_name*).

### Examples

```
-> netsec group ad-port port 1/1
-> netsec group ad-port port 1/3-10
-> no netsec group ad-port port 1/1
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<a href="#">netsec group anomaly</a>	Configures the monitoring period of an anomaly for a port-group, packet count configuration for triggering anomaly detection, anomaly detection algorithm's sensitivity to discrepancy in standard and observed traffic pattern.
<a href="#">show netsec summary</a>	Displays the anomaly check summary.

## **MIB Objects**

```
alaNetSecPortRangeGroupTable  
  alaNetSecPortRangeGroupStartIfId  
  alaNetSecPortRangeGroupEndIfId  
  alaNetSecPortRangeGroupName  
  alaNetSecPortRangeGroupRowStatus
```

---

## netsec group anomaly

Configures various anomaly parameters of a monitoring-group and specifies the anomaly to monitor for the monitoring-group.

```
netsec group {grp_name | all} anomaly {anomaly_name | all} {{{state | log | trap | quarantine} {enable | disable}} | {period seconds} | {count num} | {sensitivity num}
```

```
no netsec group grp_name anomaly {anomaly_name | all} {state | log | trap | quarantine | period | count | sensitivity}
```

---

### Syntax Definitions

<i>grp_name</i>	The name of the monitoring-group (up to 32 characters).
<b>group all</b>	Specifies all the monitoring-groups.
<i>anomaly_name</i>	The type of the anomaly to be enabled or disabled. (Refer to the table in the “Usage Guidelines” section below for a list of supported anomalies).
<b>anomaly all</b>	Monitors all anomalies.
<b>state</b>	Specifies the status of anomaly detection.
<b>log</b>	Logs detected anomalies.
<b>trap</b>	Sends a trap when an anomaly is detected.
<b>quarantine</b>	Quarantines the port on which an anomaly is detected.
<b>period</b> <i>seconds</i>	The time duration to observe traffic pattern, in seconds. The valid range is 5-3600
<b>count</b> <i>num</i>	The number of packets that must be seen during the period to trigger anomaly detection. The valid range is 1-100000.
<b>sensitivity</b> <i>num</i>	Sensitivity of anomaly detection to deviation from the expected traffic pattern. The valid range is 1-100.
<b>enable</b>	Enables the status of the state, log, trap, and quarantine parameters for the anomaly.
<b>disable</b>	Disables the status of the state, log, trap, and quarantine parameters for the anomaly.

## Defaults

parameter	default
state enable   disable	disable
log enable   disable	disable
trap enable   disable	disable
quarantine enable   disable	disable
period <i>seconds</i>	30
sensitivity <i>num</i>	50

## Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to reset to default value.
- Use the parameter **period** to set the time to observe traffic on a port to detect anomalies. Accuracy and latency of algorithm is proportional to the time period.
- Use the parameter **count** to configure the minimum traffic required to activate anomaly detection. Accuracy of detection is proportional to count.
- Use the parameter **sensitivity** to check anomaly sensitivity of deviation from the expected traffic pattern. Accuracy of detection is proportional to sensitivity.
- The following table lists the **netsec anomaly** command options for specifying anomalies:

anomaly name	count defaults
arp-addr-scan	50
arp-flood	90
arp-failure	6
icmp-addr-scan	30
icmp-flood	90
icmp-unreachable	20
tcp-port-scan	20
tcp-addr-scan	30
syn-flood	90
syn-failure	10
syn-ack-scan	2
fin-scan	6
fin-ack-diff	5
rst-count	50

## Examples

```
-> netsec group ad anomaly tcp-port-scan period 30
-> netsec group add anomaly arp-poisoning count 40
-> netsec group al anomaly tcp-port-scan sensitivity 90
-> netsec group ala anomaly arp-addr-scan log enable
-> netsec group a anomaly tcp-port-scan trap disable
-> no netsec group ad anomaly tcp-port-scan period
-> no netsec group al anomaly tcp-port-scan sensitivity
-> no netsec group ala anomaly arp-addr-scan quarantine
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

<a href="#">netsec group port</a>	Associates or disassociates port-range with monitoring-group.
<a href="#">show netsec config</a>	Displays the current network security configurations.

## MIB Objects

```
alaNetSecMonitoringGroupTable
  alaNetSecMonitoringGroupName
  alaNetSecMonitoringGroupAnomaly
  alaNetSecMonitoringGroupAnomalyState
  alaNetSecMonitoringGroupAnomalyLog
  alaNetSecMonitoringGroupAnomalyTrap
  alaNetSecMonitoringGroupAnomalyQuarantine
  alaNetSecMonitoringGroupAnomalyCount
  alaNetSecMonitoringGroupAnomalySensitivity
  alaNetSecMonitoringGroupAnomalyPeriod
  alaNetSecMonitoringGroupRowStatus
```

---

## show netsec summary

Displays the anomaly check summary.

**show netsec** [**group** {*grp\_name* | **all**} | **port** *slot/port*[-*port2*]] [**anomaly** {*anomaly\_name* | **all**}] **summary**

---

### Syntax Definitions

<i>grp_name</i>	The name of the monitoring-group whose member-ports statistics are required.
<b>group all</b>	Specifies all the monitoring-groups.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to display on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<i>anomaly_name</i>	The type of the anomaly.
<b>anomaly all</b>	Monitors all anomalies.

### Defaults

By default, a list of all anomalies is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **anomaly** and **group** parameters to list the summary of a particular anomaly that belongs to the specified monitoring-group.
- The following table show the list of anomalies:

<b>anomaly name</b>
<b>arp-addr-scan</b>
<b>arp-flood</b>
<b>arp-failure</b>
<b>icmp-addr-scan</b>
<b>icmp-flood</b>
<b>icmp-unreachable</b>
<b>tcp-port-scan</b>
<b>tcp-addr-scan</b>
<b>syn-flood</b>
<b>syn-failure</b>

---

**anomaly name**

---

**syn-ack-scan**

---

**fin-scan**

---

**fin-ack-diff**

---

**rst-count**

---

## Examples

```
-> show netsec anomaly all summary
```

```
Slot
Port  Anomaly          Observed  Detected
-----+-----+-----+-----
2/5   arp-addr-scan     82        0
2/5   arp-flood         82        0
2/5   arp-failure       88        6
2/5   icmp-addr-scan   82        0
2/5   icmp-flood       82        0
2/5   icmp-unreachable 82        0
2/5   tcp-port-scan    82        0
2/5   tcp-addr-scan    82        0
2/5   syn-flood        82        0
2/5   syn-failure      82        0
2/5   syn-ack-scan     82        0
2/5   fin-scan         82        0
2/5   fin-ack-diff     82        0
2/5   rst-count        82        0
```

```
-> show netsec port 2/1 anomaly arp-addr-scan summary
```

```
Slot
Port  Anomaly          Observed  Detected
-----+-----+-----+-----
2/1   arp-addr-scan    7         1
```

### *output definitions*

---

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>Anomaly</b>	The type of anomaly.
<b>Observed</b>	The number of times an anomaly was checked for this port since monitoring was enabled.
<b>Detected</b>	The number of times an anomaly was detected on this port since monitoring was enabled.

---

## Release History

Release 6.3.1; command was introduced.

## Related Commands

**netsec group port**

Associates or disassociates port-range with monitoring-group.

**netsec group anomaly**

Configures the monitoring period of an anomaly for a port-group, packet count configuration for triggering anomaly detection, anomaly detection algorithm's sensitivity to discrepancy in standard and observed traffic pattern.

## MIB Objects

```
alaNetSecPortAnomalySummaryTable  
  alaNetSecPortAnomalySummaryIfId  
  alaNetSecPortAnomalySummaryAnomaly  
  alaNetSecPortAnomalySummaryObserved  
  alaNetSecPortAnomalySummaryDetected
```

---

## show netsec traffic

Displays anomaly specific traffic statistics.

**show netsec** [**group** {*group-name* | **all**} | **port** *slot/port1*[-*port2*]] [**anomaly** {*anomaly\_name* | **all**}] **traffic**

---

### Syntax Definitions

<i>group-name</i>	The name of the monitoring-group.
<b>group all</b>	Specifies all the monitoring-groups.
<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>anomaly_name</i>	The type of the anomaly.
<b>anomaly all</b>	Monitors all anomalies.

### Defaults

By default, a list of all anomalies traffic is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

To display traffic for a particular monitoring-group, specify only the **group** parameter.

### Examples

```
-> show netsec anomaly all traffic
```

Slot	Port	Anomaly	Packet	Curr-in	Curr-out	Last-in	Last-out
2/5		arp-addr-scan	arp-rep	-	0	-	0
2/5		arp-addr-scan	arp-req	0	-	0	-
2/5		arp-flood	arp-rep	0	0	0	0
2/5		arp-flood	arp-req	0	-	0	-
2/5		arp-failure	arp-rep	-	0	-	0
2/5		arp-failure	arp-req	0	-	0	-
2/5		icmp-addr-scan	icmp-rep	-	0	-	0
2/5		icmp-addr-scan	icmp-req	0	-	0	-
2/5		icmp-flood	icmp-rep	-	0	-	0
2/5		icmp-flood	icmp-req	0	0	0	0
2/5		icmp-unreachable	icmp-dnr	0	0	0	0
2/5		tcp-port-scan	syn-only	0	0	0	0
2/5		tcp-port-scan	syn-ack	0	0	0	0
2/5		tcp-port-scan	rst	0	0	0	0
2/5		tcp-addr-scan	syn-only	0	-	0	-
2/5		tcp-addr-scan	syn-ack	-	0	-	0

2/5	tcp-addr-scan	rst	-	0	-	0
2/5	syn-flood	syn-only	0	0	0	0
2/5	syn-flood	syn-ack	0	0	0	0
2/5	syn-failure	syn-only	0	-	0	-
2/5	syn-failure	syn-ack	-	0	-	0
2/5	syn-ack-scan	syn-ack	0	0	0	0
2/5	syn-ack-scan	syn-nack	0	0	0	0
2/5	fin-scan	fin-nack	0	0	0	0
2/5	fin-ack-diff	fin-ack	0	0	0	0
2/5	rst-count	rst	0	0	0	0

```
-> show netsec group test1 anomaly arp-addr-scan traffic
```

```
Slot
```

Port	Anomaly	Packet	Curr-in	Curr-out	Last-in	Last-out
2/1	arp-addr-scan	arp-rep	-	0	-	0
2/1	arp-addr-scan	arp-req	1500	-	1746	-
2/2	arp-addr-scan	arp-rep	-	0	-	0
2/2	arp-addr-scan	arp-req	0	-	0	-

### *output definitions*

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>Anomaly</b>	The type of anomaly.
<b>Packet</b>	The packet being monitored.
<b>Curr-in</b>	The number of incoming packets during the current monitoring period.
<b>Curr-out</b>	The number of outgoing packets during the current monitoring period.
<b>Last-in</b>	The number of incoming packets during the last monitoring period.
<b>Last-out</b>	The number of outgoing packets during the last monitoring period.

## Release History

Release 6.3.1; command was introduced.

## Related Commands

```

---

## show netsec statistics

Displays the pattern counts on ports.

**show netsec** [**group** {*grp\_name* | **all**} | **port** *slot/port*[-*port2*]] **statistics**

---

### Syntax Definitions

<i>grp_name</i>	The name of the port-group (up to 16 characters).
<b>group all</b>	Specifies all the monitoring-groups.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).

### Defaults

By default, a list of all pattern counts is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

To display statistics for a particular monitoring-group, specify only the **group** parameter.

### Examples

```
-> show netsec statistics
Slot
Port      Packet      Last-In      Last-Out      Total-In      Total-Out
-----+-----+-----+-----+-----+-----
2/5      arp-rep      0             0             0             0
2/5      arp-req      0             -             0             -
2/5      icmp-rep     0             0             0             0
2/5      icmp-req     0             0             0             0
2/5      icmp-dnr     0             0             0             0
2/5      syn-only     0             0             0             0
2/5      syn-ack      0             0             0             0
2/5      syn-nack     0             0             0             0
2/5      fin-ack      0             0             0             0
2/5      fin-nack     0             0             0             0
2/5      rst          0             0             0             0
2/7      arp-rep      0             0             0             0
2/7      arp-req      0             -             0             -

### *output definitions*

---

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>Packet</b>	The packet being monitored.
<b>Last-In</b>	The number of incoming packets observed during the last 5 seconds.
<b>Last-Out</b>	The number of outgoing packets observed during the last 5 seconds.
<b>Total-In</b>	The total number of incoming packets observed since monitoring was enabled.
<b>Total-Out</b>	The total number of outgoing packets observed since monitoring was enabled.

---

### **Release History**

Release 6.3.1; command was introduced.

## Related Commands

<b>netsec group port</b>	Associates or disassociates port-range with monitoring-group.
<b>netsec group anomaly</b>	Configures the monitoring period of an anomaly for a port-group, packet count configuration for triggering anomaly detection, anomaly detection algorithm's sensitivity to discrepancy in standard and observed traffic pattern.
<b>show netsec traffic</b>	Displays anomaly specific traffic statistics.

## MIB Objects

```
alaNetSecPortStats  
  alaNetSecPortStatsIfId  
  alaNetSecPortStatsPacket  
  alaNetSecPortStatsLastIngress  
  alaNetSecPortStatsLastEgress  
  alaNetSecPortStatsTotalIngress  
  alaNetSecPortStatsTotalEgress
```

---

## show netsec config

Displays the current network security configurations.

**show netsec** [**group** {*grp\_name* | **all**}] [**anomaly** {*anomaly\_name* | **all**}] **config**

---

### Syntax Definitions

<i>group-name</i>	The name of the monitoring-group whose member-ports statistics are required.
<b>group all</b>	Specifies all the monitoring-groups.
<i>anomaly_name</i>	The type of the anomaly.
<b>anomaly all</b>	Monitors all anomalies.

### Defaults

By default, a list of all anomalies configuration is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

To display the security configuration for a particular monitoring-group, specify only the **group** parameter.

### Examples

```
-> show netsec config
```

Group	Anomaly	S	L	T	Q	Per	Cnt	Sen

## show netsec operation

Displays the network security operational conditions.

**show netsec** [**group** {*grp\_name* | **all**} | **port** *slot/port*[-*port2*]] [**anomaly** {*anomaly\_name* | **all**}] **operation**

---

### Syntax Definitions

<i>grp_name</i>	The name of the port-group (up to 16 characters).
<b>group all</b>	Specifies all the monitoring-groups.
<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<i>anomaly_name</i>	The type of the anomaly.
<b>anomaly all</b>	Monitors all anomalies.

### Defaults

By default, the network security operational condition of all the anomalies is displayed.

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

To display the network security operational condition for a particular monitoring-group, specify only the **group** parameter.

### Examples

```

# 39 Port Mapping Commands

Port Mapping is a security feature, which controls the peer users from communicating with each other. Each session comprises a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate via network ports. In a Port Mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

*Filename:* AlcatelIND1PortMapping.mib  
*Module:* ALCATEL-IND1-PORT-MAPPING

A summary of the available commands is listed here:

---

**port mapping user-port network-port**  
**port mapping** (configures port mapping status)  
**port mapping** (configures port mapping direction)  
**port mapping unknown-unicast-flooding**  
**port mapping dynamic-proxy-arp**  
**show port mapping status**  
**show port mapping**

---

## port mapping user-port network-port

Creates a port mapping session either with or without the user ports, network ports, or both. Use the **no** form of the command to delete ports or an aggregate from a session.

**port mapping** *port\_mapping\_sessionid* [**no**] [**user-port** {*slot slot* | *slot/port[-port2]*} | **linkagg** *agg\_num*] [**network-port** {*slot slot* | *slot/port[-port2]*} | **linkagg** *agg\_num*]

---

### Syntax Definitions

<i>port_mapping_sessionid</i>	The port mapping session ID. Valid range is 1 to 8.
<b>user-port</b>	Specifies a user port of the mapping session.
<b>network-port</b>	Specifies a network port of the mapping session.
<b>slot</b>	Specifies a slot to be assigned to the mapping session.
<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>linkagg</b>	Specifies a link aggregation group to be assigned to the mapping session.
<i>agg_num</i>	Link aggregation number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- User ports that are part of one session cannot communicate with each other and can communicate only via network ports of the session to the rest of the system.
- User ports can be part of one Port Mapping session only.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.
- A mobile port cannot be configured as a network port of a mapping session.

## Examples

```
-> port mapping 3 user-port 2/3 network-port 6/4
-> port mapping 4 user-port 2/5-8
-> port mapping 5 user-port 2/3 network-port slot 3
-> port mapping 5 no user-port 2/3
-> port mapping 6 no network-port linkagg 7
```

## Release History

Release 6.1.2; command was introduced.

## Related Commands

<a href="#">port mapping</a>	Enables, disables, or deletes a port mapping session.
<a href="#">port mapping</a>	Configures the direction of a port mapping session.
<a href="#">show port mapping</a>	Displays the configuration of one or more port mapping sessions.

## MIB Objects

```
PortMappingSessionTable
    pmapSessionNumber
portMappingTable
    pmapPortIfindex
    pmapPortType
```

---

## port mapping

Enables, disables, or deletes a port mapping session.

**port mapping** *port\_mapping\_sessionid* {**enable** | **disable**}

**no port mapping** *port\_mapping\_sessionid*

---

### Syntax Definitions

*port\_mapping\_sessionid*            The port mapping session ID. Valid range is 1 to 8.

**enable**                              Enables a port mapping session.

**disable**                             Disables a port mapping session.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

To be enabled, a session should have a minimum of two ports.

### Examples

```
-> port mapping 3 enable
-> port mapping 4 disable
-> no port mapping 5
```

### Release History

Release 6.1.2; command was introduced.

## Related Commands

<b>port mapping user-port network-port</b>	Creates a port mapping session with or without the user ports, network ports, or both.
<b>port mapping</b>	Configures the direction of a port mapping session.
<b>port mapping dynamic-proxy-arp</b>	Displays the status of one or more port mapping sessions.
<b>show port mapping</b>	Displays the configuration of one or more port mapping sessions.

## MIB Objects

PortMappingSessionTable  
    pmapSessionNumber  
    pmapSessionStatus

---

## port mapping

Configures the direction of a port mapping session.

**port mapping** *port\_mapping\_sessionid* {**unidirectional** | **bidirectional**}

---

### Syntax Definitions

*port\_mapping\_sessionid*            The port mapping session ID. Valid range is 1 to 8.

**unidirectional**                    Specifies unidirectional port mapping.

**bidirectional**                    Specifies bidirectional port mapping.

### Defaults

parameter	default
<b>unidirectional</b>   <b>bidirectional</b>	<b>bidirectional</b>

### Platform Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.
- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session, which is also in the unidirectional mode.
- To change the direction of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

### Examples

```
-> port mapping 5 unidirectional
-> port mapping 6 bidirectional
```

### Release History

Release 6.1.2; command was introduced.

## Related Commands

**port mapping user-port  
network-port**

Creates a port mapping session with or without the user ports, network ports or both.

**port mapping**

Enables, disables, or deletes a port mapping session.

**show port mapping**

Displays the configuration of one or more port mapping sessions.

## MIB Objects

PortMappingSessionTable

    PmapSessionNumber

    PmapSessionDirection

---

## port mapping unknown-unicast-flooding

Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.

**port mapping *session id* unknown-unicast-flooding {enable | disable}**

---

### Syntax Definitions

<i>session id</i>	The port mapping session for which the unknown unicast flooding status is to be configured.
<b>enable</b>	Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
<b>disable</b>	Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

### Defaults

parameter	default
enable   disable	enable

### Platform Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Flooding of unknown unicast traffic is enabled by default.
- Unknown unicast flooding for the user ports will be enabled if port mapping is disabled on a session.
- Configuring unknown unicast flooding will create a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration will be applied to all the member ports of the aggregate.
- Enabling this command affects unicast flooding to the user ports from all the switch ports, not just the network ports for the session.

### Examples

```
-> portmapping 1 unknown-unicast-flooding enable
-> portmapping 2 unknown-unicast-flooding disable
```

### Release History

Release 6.3.4; command was introduced.

## Related Commands

<b>port mapping user-port network-port</b>	Creates a port mapping session with or without the user ports, network ports or both.
<b>port mapping</b>	Enables, disables, or deletes a port mapping session.
<b>show port mapping</b>	Displays the configuration of one or more port mapping sessions.
<b>port mapping dynamic-proxy-arp</b>	Displays the status of one or more port mapping sessions.

## MIB Objects

portMappingSessionTable  
pmapSessionUnknownUnicastFloodStatus

---

## port mapping dynamic-proxy-arp

Enables or disables the dynamic proxy arp functionality for the port mapping session.

**port mapping *session id* dynamic-proxy-arp {enable | disable}**

---

### Syntax Definitions

<i>session id</i>	The port mapping session for which the dynamic proxy arp status is to be configured.
<b>enable</b>	Enables the dynamic proxy arp status.
<b>disable</b>	Disables the dynamic proxy arp status.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platform Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Clients must be connected to the user-ports and the head end routers connected to the network-ports of the port mapping session for dynamic proxy arp to function properly.
- DHCP snooping must be enabled for dynamic proxy arp to function.
- Using dynamic-proxy-arp in conjunction with DHCP snooping allows for the configuration of the MAC Forced Forwarding feature.

### Examples

```
-> portmapping 1 dynamic-proxy-arp enable
-> portmapping 1 dynamic-proxy-arp disable
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

<b>port mapping user-port network-port</b>	Creates a port mapping session with or without the user ports, network ports or both.
<b>port mapping</b>	Enables, disables, or deletes a port mapping session.
<b>show port mapping</b>	Displays the configuration of one or more port mapping sessions.
<b>show port mapping status</b>	Displays the status of one or more port mapping sessions.

## MIB Objects

portMappingSessionTable  
pmapSessionDynProxyARP

---

## show port mapping status

Displays the status of one or more port mapping sessions.

**show port mapping** [*port\_mapping\_sessionid*] **status**

---

### Syntax definitions

*port\_mapping\_sessionid*            The port mapping session ID. Valid range is 1 to 8.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If you do not specify the port mapping session ID, then the status of all the port mapping sessions will be displayed.

### Examples

```
-> show port mapping status
```

SessionID	Direction	Status	Unknown Unicast	DPA Status
1	uni	enable	flood	disable
2	uni	enable	drop	enable
3	bi	disable	drop	disable
4	bi	enable	flood	disable
7	bi	disable	flood	enable
8	bi	disable	flood	enable

### output definitions

---

<b>SessionID</b>	Displays the port mapping session ID.
<b>Direction</b>	Displays the direction of a port mapping session.
<b>Status</b>	Displays the status of a port mapping session.
<b>Unknown unicast</b>	Displays the status of unknown unicast flooding
<b>DPA Status</b>	Displays the status of Dynamic Proxy ARP.

---

### Release History

Release 6.1.2; command was introduced.  
 Release 6.3.4; **unknown unicast** field added.  
 Release 6.4.3; DPA Status field added

## Related Commands

**port mapping user-port  
network-port**

Creates a port mapping session with or without the user ports, network ports, or both.

**port mapping**

Enables, disables, or deletes a port mapping session.

**port mapping unknown-  
unicast-flooding**

Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.

## MIB Objects

portMappingSessionTable

    pmapSessionNumber

    pmapSessionDirection

    pmapSessionStatus

---

## show port mapping

Displays the configuration of one or more port mapping sessions.

**show port mapping** [*port\_mapping\_sessionid*]

---

### Syntax Definitions

*port\_mapping\_sessionid*            The port mapping session ID. Valid range is 1 to 8.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If you do not specify the port mapping session ID, then the configuration for all the port mapping sessions will be displayed.

### Examples

```
-> show port mapping 3
```

SessionID	USR-PORT	NETWORK-PORT
8	1/2	1/3
8	1/6	
8	1/7	

### *output definitions*

---

<b>SessionID</b>	Displays the port mapping session ID.
<b>USR-PORT</b>	Displays the set of user ports of a port mapping session.
<b>NETWORK-PORT</b>	Displays the set of network ports of a port mapping session.

---

### Release History

# 40 Learned Port Security Commands

Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

*Filename:* AlcatelInd1LearnedPortSecurity.mib  
*Module:* ALCATEL-IND1-LPS-MIB

A summary of the available commands is listed here:

---

**port-security**  
**port-security shutdown**  
**port-security maximum**  
**port-security max-filtering**  
**port-security convert-to-static**  
**port-security mac**  
**port-security mac-range**  
**port-security violation**  
**port-security release**  
**port-security learn-trap-threshold**  
**show port-security**  
**show port-security shutdown**  
**show port-security brief**

---

## port-security

Enables or disables Learned Port Security (LPS) on the switch port(s). When LPS is enabled, only devices that have a source MAC address that complies with LPS restrictions are learned on the port(s).

**port-security** *slot/port[-port2]* [**admin-status** {**enable** | **disable** | **locked**}]

**port-security chassis** {**convert-to-static** | **disable**}

**no port security** *slot/port[-port2]*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<b>enable</b>	Enables LPS on the specified port(s).
<b>disable</b>	Disables LPS on the specified port(s).
<b>locked</b>	Disables source learning on the specified LPS port(s).
<b>chassis disable</b>	Disables all LPS-eligible ports on the chassis.
<b>chassis convert-to-static</b>	Converts the learned bridge MAC address on all LPS port(s) into static MAC address. This does not apply to filtering MAC addresses.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>   <b>locked</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove LPS and clear all entries from the table. This command enables the switch port to learn new MAC addresses.
- Use the **locked** parameter to disable the learning on the port. All MAC addresses are flushed and the packets are dropped.
- The **port-security chassis disable** command disables all the LPS-eligible ports on the chassis. Disabling port security restricts a port from learning new MAC addresses.
- Use the **port-security chassis convert-to-static** command to stop the aging-out of MAC address learned on the LPS ports.
- LPS is supported on 10/100 and Gigabit Ethernet fixed, mobile, authenticated, 802.1Q tagged ports, and 802.1x ports.

- LPS is not supported on 10 Gigabit Ethernet, link aggregate, or 802.1Q tagged link aggregate (trunked) ports.
- Note that when LPS is enabled on an active port, all MAC addresses learned on that port prior to the time LPS was enabled are cleared from the source learning MAC address table.
- Configurable MAC learning restrictions consist of setting a source learning time limit window, specifying a maximum number of MACs allowed on a specific port, configuring a list of MAC addresses (individual or range of addresses) allowed on the port, and determining how a port handles traffic that is unauthorized.

## Examples

```
-> port-security 4/8 admin-status enable
-> port-security 2/1-10 admin-status enable
-> port-security 2/11-15 admin-status disable
-> port-security 4/3 admin-status locked
-> no port-security 1/1-12
-> port-security chassis disable
-> port-security chassis convert-to-static
```

## Release History

Release 6.1; command was introduced.

Release 6.1.5; **chassis** parameter was added.

Release 6.4.4; **admin-status**, **locked** and **convert-to-static** parameters added.

## Related Commands

<a href="#">port-security mac</a>	Configures a single authorized source MAC address for a port that belongs to a specified VLAN.
<a href="#">port-security mac-range</a>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<a href="#">port-security maximum</a>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<a href="#">port-security shutdown</a>	Configures the amount of time in minutes to allow source learning on all LPS ports.
<a href="#">port-security violation</a>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

## MIB Objects

```
learnedPortSecurityTable
  lpsAdminStatus
```

---

## port-security shutdown

Configures the amount of time in minutes to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of *new* MAC addresses is stopped on all LPS ports. Only configured authorized MAC addresses are still allowed on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

**port-security shutdown** *num* [**convert-to-static** {**enable** | **disable**}] [**no-aging** {**enable** | **disable**}] [**boot-up** {**enable** | **disable**}]

---

### Syntax Definitions

<i>num</i>	The number of minutes during which LPS allows source learning across all LPS ports. This amount of time defines the LPS learning window.
<b>convert-to-static enable</b>	Converts dynamically learned MAC addresses to static MAC addresses.
<b>convert-to-static disable</b>	Dynamically learned MAC addresses are not converted to static MAC addresses.
<b>no-aging enable</b>	Prevents dynamically learned MAC addresses from aging out or getting flushed during the LPS learning window time period.
<b>no-aging disable</b>	Allows dynamically learned MAC addresses to age out or get flushed during the LPS learning window time period.
<b>boot-up enable</b>	Enables the automatic start of the LPS learning window timer when the switch restarts.
<b>boot-up disable</b>	Disables the start of the LPS learning window timer when the switch restarts.

### Defaults

By default, the LPS source learning time limit is not set for the switch.

parameter	default
<b>convert-to-static</b>	<b>disable</b>
<b>no-aging</b>	<b>disable</b>
<b>boot-up</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The LPS source learning time window is started and/or reset each time the **port-security shutdown** command is issued or when the **port-security shutdown boot-up** option is enabled and the switch restarts.

- Note that even after the learning window time expires, MAC addresses are still learned as filtered addresses up to the configured maximum number of filtered MAC addresses allowed on the LPS port.
- For example, if the maximum number of MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port still allows to learn 15 MAC addresses.
- If the **convert-to-static** parameter is enabled and the LPS source learning time window expires, then all dynamic MAC addresses are converted to static MAC addresses. This stops the MAC addresses from aging out.
- The conversion of dynamic MAC addresses to static ones does not apply to LPS mobile and authenticated ports.

## Examples

```
-> port-security shutdown 25
-> port-security shutdown 60 no-aging enable
-> port-security shutdown 2 convert-to-static enable no-aging enable
-> port-security shutdown 2 convert-to-static enable no-aging enable boot-up enable
```

## Release History

Release 6.1; command was introduced.

Release 6.1.5; **convert-to-static** parameter added.

Release 6.4.4; **no-aging** and **boot-up** parameters added.

## Related Commands

<a href="#">port-security</a>	Enables or disables Learned Port Security (LPS) on the switch port(s).
<a href="#">port-security mac</a>	Configures a single authorized source MAC address for a port that belongs to a specified VLAN.
<a href="#">port-security mac-range</a>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<a href="#">port-security maximum</a>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<a href="#">port-security violation</a>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

```
learnedPortSecurityGlobalGroup
  lpsLearningWindowTime
  lpsLearningWindowTimeWithStaticConversion
  lpsLearningWindowNoAging
  lpsLearningWindowBootupStatus
```

---

## port-security maximum

Configures the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

**port-security** *slot/port[-port2] maximum num*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<b>maximum num</b>	The number of source MAC addresses (1–1000) that are allowed on this port.

### Defaults

By default, the number of MAC addresses allowed is set to 1.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the port attempts to learn a MAC address that will exceed the maximum number allowed, the port will block the unauthorized address or will shutdown. Use the **port-security violation** command to specify how the LPS port will handle violating traffic.
- If an LPS port is in a violation state and the maximum number of MAC addresses allowed is changed, the port transitions out of the violation state.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

### Examples

```
-> port-security 2/14 maximum 25
-> port-security 4/10-15 maximum 100
-> port-security 1/2 maximum 5 learn-trap-threshold 4
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>port-security</b>	Enables or disables Learned Port Security (LPS) on the switch port(s).
<b>port-security mac</b>	Configures a single authorized source MAC address for a port that belongs to a specified VLAN.
<b>port-security mac-range</b>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<b>port-security shutdown</b>	Configures the amount of time in minutes to allow source learning on all LPS ports. Also, enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.
<b>port-security violation</b>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

learnedPortSecurityTable  
lpsMaxMacNum

---

## port-security max-filtering

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

**port-security** *slot/port[-port2]* **max-filtering** *num*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<b>max-filtering</b> <i>num</i>	The maximum number of filtered MAC addresses (1–100) that are allowed on this port.

### Defaults

By default, the maximum number of filtered MAC addresses that can be learned on an LPS port is set to 5.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When the LPS learning window time expires, MAC addresses are learned in a filtering state up to the maximum filtering value set with this command. For example, if the maximum filtering value is set to five, when the learning window time expires, the switch will learn up to five filtering MAC addresses.
- If an LPS port is in a violation state and the maximum number of filtering MAC addresses allowed is changed, the port transitions out of the violation state.
- The maximum filtering value is separate from the maximum bridged MAC address value.
- When the number of filtered MAC addresses learned on the port reaches the maximum, either the port is disabled (Shutdown Violation mode) or MAC address learning is disabled (Restrict Violation mode). By default, MAC address learning is disabled on a port.

### Examples

```
-> port-security 1/10 max-filtering 6
-> port-security 1/10-13 max-filtering 18
```

### Release History

Release 6.1.5; command was introduced.

## Related Commands

### **port-security maximum**

Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

### **port-security violation**

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

learnedPortSecurityTable

lpsMaxFilteredMacNum

---

## port-security convert-to-static

Converts the dynamically learned MAC addresses on the LPS port(s) to static MAC addresses.

**port-security** {*slot/port*[-*port2*] / *chassis*} **convert-to-static**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<i>chassis</i>	Specifies all the LPS-eligible ports on the chassis.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You can stop the aging out of dynamic MAC addresses on the LPS port(s) by converting them to static MAC addresses.
- The conversion of dynamic MAC addresses to static ones does not apply to LPS mobile and authenticated ports.
- The number of converted static MAC addresses cannot exceed the maximum number of MAC addresses allowed on the port(s).

### Examples

```
-> port-security 4/8 convert-to-static
```

### Release History

Release 6.1.5; command was introduced.

## Related Commands

[port-security](#)

Enables or disables Learned Port Security (LPS) on the switch port(s).

[port-security maximum](#)

Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

## MIB Objects

learnedPortSecurityGlobalGroup

lpsConvertToStatic

---

## port-security mac

Configures a single authorized source MAC address for a port that belongs to a specified VLAN.

```
port-security slot/port mac mac_address [vlan vlan_id]
```

```
port-security slot/port no mac {all | mac_address} [vlan vlan_id]
```

---

### Syntax Definitions

<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>mac_address</i>	The source MAC address (e.g., 00:da:39:59:f1:0c) of the port.
<b>all</b>	Flushes all MAC addresses associated with the specified port.
<i>vlan_id</i>	The VLAN or the tagged VLAN to which the LPS port belongs. The range is 1–4094.

### Defaults

By default, the default VLAN ID of the port is used.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove statically configured or dynamically learned source MAC address entries from the LPS table. When a MAC address is removed from the LPS table, it is automatically cleared from the source learning table at the same time.
- LPS should be enabled on the port before configuring a MAC address. If an attempt is made to configure a MAC address on a non-LPS port, an error message is displayed.
- The additional source MAC addresses received on the LPS port which do not match the configured authorized addresses are allowed on the port based on the LPS time limit (if active) and maximum number of MAC addresses allowed..
- Each configured authorized MAC address counts towards the number of addresses allowed on the port even if the port has not learned the configured address. For example, if a port has 3 configured authorized MAC addresses and the maximum number of addresses allowed is set to 10, then only 7 additional MAC addresses are allowed on that port.

### Examples

```
-> port-security 4/20 mac 00:20:95:00:fa:5c vlan 2
-> port-security 2/11 no mac 00:20:95:00:fa:5c
-> port-security 1/2 no mac all
```

## Release History

Release 6.1; command was introduced.

Release 6.1.5; **vlan** parameter was added.

## Related Commands

<b>port-security</b>	Enables or disables Learned Port Security (LPS) on the switch port(s).
<b>port-security mac-range</b>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<b>port-security shutdown</b>	Configures the amount of time in minutes to allow source learning on all LPS ports. Also, enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.
<b>port-security maximum</b>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<b>port-security violation</b>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

```
learnedPortSecurityL2MacAddressTable  
  lpsL2MacAddress  
  lpsL2VlanId  
  lpsL2MacAddressRowStatus
```

---

## port-security mac-range

Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port. This command also enables LPS on the specified port, if LPS is not already active on the port.

**port-security** *slot/port*[-*port2*] **mac-range** [**low** *mac\_address* / **high** *mac\_address*]

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<b>low</b> <i>mac_address</i>	MAC address that defines the low end of a range of MACs (e.g., 00:20:95:00:10:2A).
<b>high</b> <i>mac_address</i>	MAC address that defines the high end of a range of MACs (e.g., 00:20:95:00:10:2F).

### Defaults

parameter	default
<b>high</b> <i>mac_address</i>	ff:ff:ff:ff:ff:ff
<b>low</b> <i>mac_address</i>	00:00:00:00:00:00

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If **low** and **high** end MAC addresses are not specified with this command, then the range is set back to the default range value (00:00:00:00:00:00– ff:ff:ff:ff:ff:ff).
- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
- Any additional source MAC addresses received that do not match configured authorized addresses are allowed on the port based on the LPS time limit (if active) and the maximum number of MAC addresses allowed.
- Each configured authorized MAC address counts towards the number of addresses allowed on the port even if the port has not learned the configured address. For example, if a port has 3 configured authorized MAC addresses and the maximum number of addresses allowed is set to 10, then only 7 additional MAC addresses are allowed on that port.

## Examples

```
-> port-security 4/20 mac-range low 00:20:95:00:fa:5c
-> port-security 5/11-15 mac-range low 00:da:95:00:00:10 high 00:da:95:00:00:1f
-> port-security 5/16-20 mac-range high 00:da:95:00:00:1f
-> port-security 5/11-15 mac-range
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">port-security</a>	Enables or disables Learned Port Security (LPS) on the switch port(s).
<a href="#">port-security mac</a>	Configures a single authorized source MAC address for a port that belongs to a specified VLAN.
<a href="#">port-security shutdown</a>	Configures the amount of time in minutes to allow source learning on all LPS ports. Also, enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.
<a href="#">port-security maximum</a>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<a href="#">port-security violation</a>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

```
learnedPortSecurityTable
  lpsLoMacRange
  lpsHiMacRange
  lpsRowStatus
```

---

## port-security violation

Configures the violation mode in which the LPS port will operate when unauthorized traffic is received on that port. This mode determines if the port is completely shut down, remains up but discards traffic, or allows LPS compliant traffic while filtering unauthorized traffic.

**port-security *slot/port*[-*port2*] violation {shutdown | restrict | discard}**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
<b>restrict</b>	Filters (blocks) unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port.
<b>discard</b>	Disables learning on the port but the port remains administratively enabled.
<b>shutdown</b>	Administratively disables the port; no traffic is allowed on the port.

### Defaults

By default, the security violation mode is set to **restrict** when LPS is enabled on the port.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When a traffic violation occurs on an LPS port, notice is sent to the Switch Logging task.
- If the violation mode is set to **restrict**, unauthorized source MAC addresses are not learned in the LPS table but are still recorded in the source learning MAC address table with a filtered operational status. This allows the user to view MAC addresses that were attempting unauthorized access to the LPS port.
- When a port is shutdown or goes into discard mode, disable and enable LPS on that port and then use the **port-security release** command to restore the port to normal operation.
- When a port goes into restrict mode, use the **port-security release** command to restore the port to normal operation.

### Examples

```
-> port-security 2/14 violation restrict
-> port-security 1/2-10 violation discard
-> port-security 4/10-15 violation shutdown
```

## Release History

Release 6.1; command was introduced.  
Release 6.4.4; **discard** parameter added.

## Related Commands

<a href="#">port-security</a>	Enables or disables Learned Port Security (LPS) on the switch port(s).

## MIB Objects

learnedPortSecurityTable  
lpsViolationOption

---

## port-security release

Releases a port that was shut down due to a Learned Port Security (LPS) violation. The specified port resumes normal operation without having to manually reset the port or the entire module.

**port-security *slot/port*[-*port2*] release**

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports on the same module (e.g. 3/1-16).

*-port2*

The last port number in a range of ports you want to configure on the same slot (e.g. 3/1-4 specifies ports 1-4 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command restores the port to the same operational state it was in before the shutdown. This includes the activation of any existing LPS configuration for the port.
- Note that when this command is used, all MAC addresses known to the specified port are flushed from the switch MAC address table.

### Examples

```
-> port-security 2/14 release  
-> port-security 4/10-15 release
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>port-security</b>	Enables or disables Learned Port Security (LPS) on the switch port(s).
<b>port-security mac</b>	Configures a single authorized source MAC address for a port that belongs to a specified VLAN.
<b>port-security mac-range</b>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<b>port-security shutdown</b>	Configures the amount of time in minutes to allow source learning on all LPS ports. Also, enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.
<b>port-security maximum</b>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

## MIB Objects

learnedPortSecurityTable

---

## port-security learn-trap-threshold

Configures the number of bridged MAC addresses to learn before sending a trap.

**port-security** *slot/port[-port2]* **learn-trap-threshold** *num*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<i>num</i>	The number of bridged MAC addresses (1–100) to learn before sending a trap.

### Defaults

By default, the number of bridged MAC addresses learned is set to 5.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.
- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.

### Examples

```
-> port-security 1/10 learn-trap-threshold 6
-> port-security 1/10-13 learn-trap-threshold 18
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show port-security](#) Displays Learned Port Security (LPS) configuration and table entries.

### MIB Objects

```
learnedPortSecurityTable
  lpsLearnTrapThreshold
```

## show port-security

Displays Learned Port Security (LPS) configuration and table entries.

**show port-security** [*slot/port1-port2* | *slot/port*]

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (e.g., 3/1-4 specifies ports 1-4 on slot 3).
<i>slot</i>	Enter the slot number for a module to specify that the command should include all ports on that module (e.g., 6 specifies all ports on the module found in slot 6 of the switch chassis).

### Defaults

By default, all ports with an LPS configuration are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the *slot/port1-port2* parameter with this command to display the LPS configuration for a specific port or a range of ports.
- Use the *slot* parameter with this command to display the LPS configuration for all the ports on a specific slot.
- In addition, MAC addresses that were learned on the LPS port because they fell within the specified MAC address range, appear as a separate entry in the LPS table with a dynamic MAC type.
- Dynamic MAC addresses become configured MAC addresses in the LPS table when the switch configuration is saved and the switch is rebooted. If the configuration is not saved before the next reboot, all dynamic MAC addresses are cleared from the LPS table.
- The MAC Type field is blank if an authorized MAC address range is configured for the LPS port.

## Examples

```
-> show port-security
Legend: Mac Address: * = Duplicate Static
        Mac Address: # = Pseudo Static
```

```
Port: 7/10
Operation Mode : ENabled,
Max MAC bridged : 1,
Trap Threshold : Disabled,
Max MAC filtered : 5,
Low MAC Range : 00:00:00:00:00:00,
High MAC Range : ff:ff:ff:ff:ff:ff,
Violation : RESTRICT
Violating MAC : NULL
```

```
MAC Address      VLAN  TYPE
-----+-----+-----
00:20:95:00:fa:5c  1    STATIC
```

### output definitions

<b>Port</b>	The module slot number and the physical port number on that module.
<b>Operation Mode</b>	The Learned Port Security operation status for the port ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>port-security</b> command.
<b>Max MAC bridged</b>	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the <b>port-security maximum</b> command.
<b>Trap Threshold</b>	The number of bridged MACs to learn before sending a trap. After this number is reached, a trap is sent out for every MAC learned thereafter. If <b>disabled</b> is displayed in this field, the trap threshold is not in force. Configured through the <b>port-security learn-trap-threshold</b> command.
<b>Max MAC filtered</b>	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the <b>port-security max-filtering</b> command.
<b>Low MAC Range</b>	MAC address that defines the lower end of a MAC address range. Configured through the <b>port-security mac-range</b> command.
<b>High MAC Range</b>	MAC address that defines the higher end of a MAC address range. Configured through the <b>port-security mac-range</b> command.
<b>Violation</b>	The security violation mode for the port ( <b>restrict</b> or <b>shutdown</b> ). Configured through the <b>port-security violation</b> command.
<b>Violating MAC</b>	The MAC Address which caused the violation on this Port.
<b>MAC Address</b>	An individual authorized MAC address. Configured through the <b>port-security mac</b> command.
<b>VLAN</b>	The VLAN to which the LPS port belongs.
<b>TYPE</b>	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port. Dynamic MAC addresses become configured MAC address entries after a configuration save and switch reboot.

## Release History

Release 6.1; command was introduced.

Release 6.1.5; **config-mac-range** parameter was removed.

Release 6.1.5; **Mac Filtered MAC allowed** field was added.

Release 6.3.1; **Trap Threshold** field was added.

Release 6.4.4; **Legend** and **Violating MAC** field added.

## Related Commands

**show port-security shutdown** Displays the amount of time during which source learning can occur on all LPS ports.

## MIB Objects

```
learnedPortSecurityTable  
  lpsMaxMacNum

```

---

## show port-security shutdown

Displays the amount of time during which source learning can occur on all LPS ports.

**show port-security shutdown**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the shutdown time is set to 0, then a source learning time limit is not active on LPS ports.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

### Examples

```
-> show port-security shutdown
LPS Shutdown Config      = 25 min,
Convert-to-static        = DISABLE,
No Aging                 = ENABLE,
Boot Up                  = ENABLE,
Remaining Learning Window = 882 sec,
```

#### *output definitions*

---

<b>LPS Shutdown Config</b>	The configured amount of time during which the LPS port can learn new MAC addresses.
<b>Convert-to-static</b>	Indicates whether or not dynamic MACs are converted to static MACs ( <b>enabled</b> or <b>disabled</b> ).
<b>No Aging</b>	Indicates whether or not learned MAC addresses can age out or get flushed during the LPS learning window time period ( <b>disabled</b> or <b>enabled</b> ).
<b>Boot Up</b>	Indicates whether or not the learning window automatically starts when the switch boots up ( <b>enabled</b> or <b>disabled</b> ).
<b>Remaining Learning Window</b>	The remaining amount of time during which the LPS port can learn MAC addresses.

---

## Release History

Release 6.1; command was introduced.

Release 6.1.5; **Convert-to-static** and **Remaining Learning Window** fields added.

Release 6.4.4; **No Aging** and **Boot Up** fields added.

## Related Commands

## show port-security brief

Displays the per port LPS parameters configured for all the ports.

**show port-security brief**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Displays the configured LPS parameters. The parameters are displayed even if the LPS is disabled on the port.

### Examples

```
-> show port-security brief
Legend: enable * = Learning Window has expired
```

Slot/ Port	Status	Max	Max-Filter	Nb Macs Bridged	Nb Macs Filtered	Nb Macs Static
1/1	ENABLED	5	100	5	10	0
1/2	ENABLED	5	100	0	10	5
1/3	RESTRICTED	5	100	5	100	0
1/4	SHUTDOWN	5	100	-	-	-
1/5	DISABLED	5	100	-	-	-
1/6	LOCKED	5	100	-	-	3

### output definitions

---

<b>Slot/Port</b>	The slot number for the module and the physical port number on that module (e.g., 1/2 specifies port 2 on slot 1)
<b>Status</b>	Displays the status of the LPS port.
<b>Max</b>	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the <b>port-security maximum</b> command.
<b>Max-Filter</b>	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the <b>port-security max-filtering</b> command.
<b>Nb Macs Bridged</b>	Number of bridge MAC address learnt on corresponding port(s).
<b>Nb Macs Filtered</b>	Number of filtered MAC address learnt on corresponding port(s).
<b>Nb Macs Static</b>	Number of static MAC address configured on corresponding port(s).

---

## Release History

Release 6.4.4; command was introduced.

## Related Commands

# 41 Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the traffic (inbound and outbound) of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or “mirrored,” port transmits and receives network traffic normally and the “mirroring” port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to examine packets to and from a specific Ethernet port.

MIB information for the Port Mirroring commands is as follows:

*Filename:* AlcatelIND1portMirMon.mib

*Module:* ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB

The following table summarizes the available commands:

<b>Port Mirroring Commands</b>	<a href="#">port mirroring source destination</a> <a href="#">port mirroring</a> <a href="#">show port mirroring status</a>
<b>Port Monitoring Commands</b>	<a href="#">port monitoring source</a> <a href="#">port monitoring</a> <a href="#">show port monitoring status</a> <a href="#">show port monitoring file</a>

## port mirroring source destination

Defines a port to mirror and the port that is to receive data from the mirrored port, and enables or disables port mirroring status. Also, enables or disables remote port mirroring.

**port mirroring** *port\_mirror\_sessionid* [**no**] **source** *slot/port[-port2]* [*slot/port[-port2]...*]  
**destination** *slot/port* [**rpmir-vlan** *vlan\_id*] [**bidirectional** | **inport** | **outport**] [**unblocked** *vlan\_id*]  
[**enable** | **disable**]

---

### Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
<b>source</b>	Adds the alphabet “a” to a port mirroring session.
<b>no source</b>	Removes a port or range of ports from a port mirroring session.
<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
[ <i>slot/port[-port2]...</i> ]	Configures multiple source ports.
<b>rpmir-vlan</b> <i>vlan_id</i>	Reserved VLAN (1–4094) to carry the mirroring traffic.
<b>bidirectional</b>	Specifies bidirectional port mirroring.
<b>inport</b>	Specifies incoming unidirectional port mirroring.
<b>outport</b>	Specifies outgoing unidirectional port mirroring.
<i>vlan_id</i>	VLAN ID is the number (1–4094) that specifies the VLAN to protect from Spanning Tree changes while port mirroring/monitoring is active. Ports in this VLAN will remain unblocked.
<b>enable</b>	Enables port mirroring status.
<b>disable</b>	Disables port mirroring status.

### Defaults

parameter	default
<b>bidirectional</b>   <b>inport</b>   <b>outport</b>	<b>bidirectional</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The maximum number of mirroring sessions is limited to two on OmniSwitch 6850 and 6855

- You cannot configure port mirroring and monitoring on the same switching ASIC on OmniSwitch 6850 Series and OmniSwitch 6855 Series switches. Each switching ASIC controls 24 ports (e.g., ports 1–24, 25–48, etc.). For example, if a port mirroring session is configured for ports 1/12 and 1/22, then configuring a port monitoring session for any of the ports between 1 and 24 is not allowed.
- If a port mirroring session is configured across two switching ASICs, then configuring a monitoring session is not allowed on any of the ports controlled by each of the ASICs involved. For example, if a port mirroring session is configured for ports 1/8 and 1/30 on a 48-port switch, then configuring a port monitoring session involving any of the ports between 1 and 48 is not allowed.
- Port mirroring is not supported on logical link aggregate ports however, it is supported on individual ports that are members of a link aggregate.
- An “N-to-1” port mirroring session is configurable, where “N” can be a number from 1 to 24 (OS6855) or 1 to 128 (OS6850). In other words, you can configure up to 24 or 128 source ports for a single destination port in a session.
- Once you execute the **port mirroring source destination** command to define the mirrored port and enable port mirroring status, the **port mirroring** command must be used to enable the port mirroring session.
- By default, the mirroring port is subject to Spanning Tree changes that could cause it to go into a blocked state. To prevent this, specify the *vlan\_id* number of the mirroring port that is to remain **unblocked** when executing the command.

### Usage Guidelines - Remote Port Mirroring

- Remote Port mirroring is supported only on OS6850 switches
- Use the **rpmir-vlan** parameter with this command to configure remote port mirroring.
- There must not be any physical loop present in the remote port mirroring VLAN.
- Spanning Tree must be disabled for the remote port mirroring VLAN.
- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.
- On OS6850 switch the QoS redirect feature can be used to override source learning.

### Examples

```
-> port mirroring 6 destination 6/4
-> port mirroring 6 source 2/3
-> port mirroring 6 destination 6/4
-> port mirroring 6 source 2/3-5 2/7 2/10
-> port mirroring 8 destination 1/12 rpmir-vlan 7
-> port mirroring 8 source 1/7 bidirectional
-> port mirroring 7 destination 6/4 unblocked 750
-> port mirroring 7 source 2/3
-> port mirroring 9 destination 1/24
-> port mirroring 9 source 1/23 inport
-> port mirroring 9 disable
-> port mirroring 8 no source 1/7
-> port mirroring 6 no source 2/10-12 2/14
```

## Release History

Release 6.1; command was introduced.

Release 6.3.1; **rpmir-vlan** parameter added.

## Related Commands

[port mirroring](#)

Enables, disables, or deletes a port mirroring session.

[show port mirroring status](#)

Displays the status of mirrored ports. This value may be enabled or disabled.

## port mirroring

Enables, disables, or deletes a port mirroring session.

**port mirroring** *port\_mirror\_sessionid* {**enable** | **disable**}

**no port mirroring** *port\_mirror\_sessionid* {**enable** | **disable**}

---

### Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
<b>enable</b>	Enables port mirroring.
<b>disable</b>	Disables port mirroring.
<b>no</b>	Optional syntax. Deletes a previously-configured port mirroring session.

### Defaults

---

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a port mirroring session.
- You must first enter the **port mirroring source destination** command to specify the mirrored and destination ports. Then use this command to enable or disable port mirroring activity on these ports.

### Examples

```
-> port mirroring 6 enable
-> port mirroring 6 disable
-> no port mirroring 6
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**port mirroring source  
destination**

Defines a port to mirror and the port that is to receive data from the mirrored port, and enables or disables port mirroring status.

**show port mirroring status**

Displays the status of mirrored ports. This value may be enabled or disabled.

## port monitoring source

Configures a port monitoring session.

```
port monitoring port_monitor_sessionid source slot/port
[no file | file filename [size filesize] | [overwrite {on | off}]]
[inport | outport | bidirectional] [timeout seconds] [enable | disable]
```

---

### Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<b>file filename</b>	Specifies a file name for the monitoring session (e.g., <b>/flash/port2</b> ).
<i>filesize</i>	Specifies the size of the file in 16K (16384) byte increments. For example, a value of 3 would specify a size of 49152 bytes. The file size can be up to 160 K (163840 bytes).
<b>no file</b>	Specifies that no file will be created for the monitoring session.
<b>on</b>	Specifies that any existing port monitoring file in flash memory will be overwritten if the total data exceeds the specified file size.
<b>off</b>	Specifies that any existing port monitoring file in flash memory will not be overwritten if the total data exceeds the specified file size.
<b>inport</b>	Specifies incoming unidirectional port monitoring.
<b>outport</b>	Specifies outgoing unidirectional port monitoring.
<i>seconds</i>	Specifies the number of seconds after which the session is disabled. The range is 0–2147483647 where 0 is forever.
<b>enable</b>	Enables the port monitoring status.
<b>disable</b>	Disables the port monitoring status.

### Defaults

parameter	default
<i>filesize</i>	1
<b>on   off</b>	<b>on</b>
<b>bidirectional   inport   outport</b>	<b>bidirectional</b>
<i>seconds</i>	0
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

## Usage Guidelines

- The maximum number of monitoring sessions is limited to one per chassis and/or stack.
- You cannot configure port mirroring and monitoring on the same switching ASIC on OmniSwitch 6850 Series and OmniSwitch 6855 Series switches. Each switching ASIC controls 24 ports (e.g., ports 1–24, 25–48, etc.). For example, if a port mirroring session is configured for ports 1/12 and 1/22, then configuring a port monitoring session for any of the ports between 1 and 24 is not allowed.
- If a port mirroring session is configured across two switching ASICs, then configuring a monitoring session is not allowed on any of the ports controlled by each of the ASICs involved. For example, if a port mirroring session is configured for ports 1/8 and 1/30 on a 48-port switch, then configuring a port monitoring session involving any of the ports between 1 and 48 is not allowed.
- By default, a file called **pmonitor.enc** is created in the **/flash** directory when you configure and enable a port monitoring session. Use the **file** option to create a user-specified file.
- By default, more-recent frames will overwrite older frames in a port monitoring file if the total data exceeds the specified file size. Use the **overwrite off** option to prevent this from occurring.
- Only the first 64 bytes of the traffic will be captured.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).

## Examples

```
-> port monitoring 6 source 2/3
-> port monitoring 6 source 2/3 file port3 size 2 enable
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">port monitoring</a>	Disables, pauses, resumes, or deletes a port monitoring session.
<a href="#">show port monitoring status</a>	Displays the port monitoring status.
<a href="#">show port monitoring file</a>	Displays the port monitoring data.

## MIB Objects

```
monitorTable
  monitorSessionNumber
  monitorIfindex
  monitorFileStatus
  monitorFileName
  monitorFileSize
  monitorScreenStatus
  monitorScreenLine
  monitorTrafficType
  monitorStatus
  monitorFileOverWrite
  monitorDirection
  monitorTimeout
```

## port monitoring

Disables, pauses, resume, or deletes an existing port monitoring session.

**port monitoring** *port\_monitor\_sessionid* {**disable** | **pause** | **resume**}

**no port monitoring** *port\_monitor\_sessionid*

---

### Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<b>disable</b>	Disables the port monitoring session.
<b>pause</b>	Pauses the port monitoring session.
<b>resumes</b>	Resumes the port monitoring session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to delete a port monitoring session.

### Examples

```
-> port monitoring 6 pause
-> port monitoring 6 disable
-> port monitoring 6 resume
-> no port monitoring 6
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">port monitoring</a>	Configures a port monitoring session.
<a href="#">show port monitoring status</a>	Displays the port monitoring status.

### MIB Objects

```
monitorTable
  monitorSessionNumber
  monitorScreenStatus
```

---

## show port mirroring status

Displays the status of mirrored ports.

**show port mirroring status** [*port\_mirror\_sessionid*]

---

### Syntax Definitions

*port\_mirror\_sessionid*                      Mirroring session identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If a port mirroring session identifier is not specified with this command, then all port mirroring sessions are displayed.

### Examples

-> show port mirroring status

Session	Mirror Destination	Mirror Direction	Unblocked Vlan	Config Status	Oper Status
6.	1/41	-	NONE	Enable	Off
	Mirror Source				
6.	1/20	bidirectional	-	Enable	Off
6.	1/21	bidirectional	-	Enable	Off
6.	1/22	bidirectional	-	Enable	Off
6.	1/23	bidirectional	-	Enable	Off
6.	1/24	bidirectional	-	Enable	Off

*output definitions*

---

<b>Session</b>	The port mirroring session identifier.
<b>Mirror Destination</b>	The location of the mirrored port.
<b>Mirror Direction</b>	The direction of the mirroring or mirrored port, which can be <b>bidirectional</b> (the default), <b>inport</b> , or <b>outport</b> .
<b>Unblocked VLAN</b>	The mirroring VLAN ID number.
<b>Config Status</b>	The configuration status of the session.
<b>Oper Status</b>	The current status of the mirroring or mirrored port.
<b>Mirror Source</b>	The location of the mirroring port.

---

**Release History**

Release 6.1; command was introduced.

## Related Commands

[port mirroring](#)

Enables, disables, or deletes a port mirroring session.

[port mirroring source destination](#)

Defines a port to mirror and a port that will receive data from the mirrored port, and enables or disables port mirroring status.

## MIB Objects

mirrorTable

mirrorMirroringIfindex

mirrorDirection

mirrorStatus

mirrorUnblockedVLAN

---

## show port monitoring status

Displays port monitoring status.

**show port monitoring status** [*port\_monitor\_sessionid*]

---

### Syntax Definitions

*port\_monitor\_sessionid*            Monitoring session identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If a port monitoring session identifier is not specified with this command, then all port monitoring sessions are displayed.

### Examples

```
-> show port monitoring status
```

Session	Monitor slot/port	Monitor Direction	Overwrite	Operating Status	Admin Status
1.	1/ 9	Bidirectional	ON	ON	ON

### *output definitions*

---

<b>Session</b>	The port monitoring session identifier.
<b>Monitor slot/port</b>	The location of the monitored port.
<b>Monitor Direction</b>	The direction of the monitoring session, which can be <b>bidirectional</b> (the default), <b>inport</b> , or <b>outport</b> .
<b>Overwrite</b>	Whether files created by a port monitoring session can be overwritten. The default is ON.
<b>Operating Status</b>	The current operating status of the port monitoring session (on/off).
<b>Admin Status</b>	The current administrative status of the port monitoring session (on/off).

---

### Release History

Release 6.1; command was introduced.

**Related Commands**

<a href="#">port monitoring source</a>	Configures a port monitoring session.
<a href="#">port monitoring</a>	Disables, pauses, resumes, or deletes a port monitoring session.

# 42 sFlow Commands

sFlow is a network monitoring technology that gives visibility in to the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn't add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

```
Filename: AlcatelIND1PortMirMon.MIB
Module:   Alcatel-IND1-PORT-MIRRORING-MONITORING-MIB

Filename: SFLOW_RFC3176.MIB
Module:   SFLOW-MIB
```

A summary of the available commands is listed here:

---

**sflow agent**  
**sflow receiver**  
**sflow sampler**  
**sflow poller**  
**show sflow agent**  
**show sflow receiver**  
**show sflow sampler**  
**show sflow poller**

---

## sflow agent

Configures a specific sflow agent IP address.

**sflow agent ip** <ip\_address>

**no sflow agent ip** <ip\_address>

---

### Syntax Definitions

*ip\_address*                      The sflow agent IP address.

### Defaults

parameter	default
<i>ip-address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete the IP address.
- If no IP address is configured 0.0.0.0 is used.
- If no IP address is configured but the Loopback0 address is configured, the Loopback0 address is used.

### Examples

```
-> sflow agent ip 192.168.1.1  
-> no sflow agent ip 192.168.1.1
```

### Release History

Release 6.3.4; command was introduced

Release 6.4.3; command was deprecated, use [ip managed-interface](#).

## sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination is associated with the receiver instance. All these destinations are attached to the sFlow manager instance and to an associated sampler/poller.

**sflow receiver** *num* **name** *string* **timeout** {*seconds* / **forever**} **address** {*ip\_address* / *ipv6address*} **udp-port** *port* **packet-size** *size* **Version** *num*

**sflow receiver** *receiver\_index* **release**

---

### Syntax Definitions

<i>num</i>	Specifies the receiver index.
<i>string</i>	Specifies the name.
<i>seconds</i> / <b>forever</b>	Specifies the timeout value.
<i>ip_address</i> / <i>ipv6address</i>	Specifies the 32/128-bit ip address.
<i>port</i>	Specifies the UDP (destination) port.
<i>size</i>	Specifies the maximum number of data bytes (size) that can be sent.
<i>num</i>	Specifies the version number.

### Defaults

parameter	default
<i>string</i>	empty
<i>seconds</i>	0
<i>ip_address</i>	0.0.0.0(ipv4)
<i>port</i>	6343
<i>size</i>	1400
<i>version num</i>	5

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **release** form at the end of the command to delete a receiver.

### Examples

```
-> sflow receiver 1 name Golden address 198.206.181.3
-> sflow receiver 1 release
```

## Release History

Release 6.1.1; command was introduced.

## Related Commands

[show sflow receiver](#)                      Displays the receiver table.

## MIB Objects

```
sFlowRcvrTable
  sFlowRcvrIndex
  sFlowRcvrOwner
  sFlowRcvrTimeout
  sFlowRcvrMaximumDatagramSize
  sFlowRcvrAddressType
  sFlowRcvrAddress
  sFlowRcvrPort
  sFlowRcvrDatagramVersion
```

---

## sflow sampler

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

**sflow sampler** *num portlist* **receiver** *receiver\_index* **rate** *value* **sample-hdr-size** *size*

**no sflow sampler** *num portlist*

---

### Syntax Definitions

<i>num</i>	Specifies the instance id.
<i>portlist</i>	Specifies the interface index range.
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the rate value for packet sampling.
<i>size</i>	Specifies the maximum number of bytes (size) that can be copied from a sampled packet.

### Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0
<i>size</i>	128

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.

### Examples

```
-> sflow sampler 1 2/1-5 receiver 1 rate 1024
-> no sflow sampler 1 2/1-5
```

### Release History

Release 6.1.1; command was introduced.

## Related Commands

**show sflow sampler**                      Displays the sampler table.

## MIB Objects

sFlowFsTable  
    sFlowFsDataSource  
    sFlowFsInstance  
    sFlowFsReceiver  
    sFlowFsPacketSamplingRate  
    sFlowFsMaximumHeaderSize

---

## sflow poller

Gets counter samples from ethernet driver and fills up the counter part of the UDP datagram.

**sflow poller** *num portlist receiver receiver\_index interval value*

**no sflow poller** *num portlist*

---

### Syntax Definitions

<i>num</i>	Specifies the instance id.
<i>portlist</i>	Specifies the interface index range.
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the maximum number of seconds between successive samples (interval value).

### Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to delete a poller.

### Examples

```
-> sflow poller 1 2/6-10 receiver 1 interval 30
-> no sflow poller 1 2/6-10
```

### Release History

Release 6.1.1; command was introduced.

### Related Commands

**show sflow poller** Displays the poller table.

## **MIB Objects**

sFlowCpTable

    sFlowCpDataSource

    sFlowCpInstance

    sFlowCpReceiver

    sFlowCpInterval

---

## show sflow agent

Displays the sflow agent table.

**show sflow agent**

---

### Syntax Definitions

**agent** Collects sample datagrams and send it to the collector across the network.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- It is necessary to execute the **ip interface** command to make a Loopback0 IP address as the fixed primary address of the switch, in order to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.
- The loopback address should be an IP interface configured on the switch.

### Examples

```
-> ip interface Loopback0 address 198.206.181.100
-> show sflow agent
Agent Version = 1.3; Alcatel-Lucent; 6.1.1
Agent IP      = 198.206.181.100
```

#### *output definitions*

<b>Agent Version</b>	Identifies the version which includes the MIB version, organization name, and the specific software build of the agent.
<b>Agent address</b>	IP address associated with the agent.

### Release History

Release 6.1.1; command was introduced.

### Related Commands

**show sflow receiver** Displays the receiver table.

## **MIB Objects**

sFlowAgent

    sFlowVersion

    sFlowAgentAddressType

    sFlowAgentAddress

---

## show sflow receiver

Displays the sflow receiver table.

**show sflow receiver** [*num*]

---

### Syntax Definitions

*num* Specifies the receiver index.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show sflow receiver
Receiver 1
Name      = Golden
Address   = IP_V4 198.206.181.3
UDP Port  = 6343
Timeout   = 65535
Packet Size= 1400
DatagramVer= 5
```

### *output definitions*

---

<b>Name</b>	Name of the entry to claim.
<b>Address</b>	IP address of the sFlow collector.
<b>UDP Port</b>	Destination port for sFlow datagrams.
<b>Timeout</b>	Time remaining before the sampler is released and stops sampling.
<b>Packet size</b>	Maximum number of data bytes that can be sent in a single sample datagram.
<b>Datagram ver</b>	Version of sFlow datagrams that should be sent.

---

### Release History

Release 6.1.1; command was introduced.

## Related Commands

[sflow agent](#)

Sets the destination hosts where the sFlow datagrams are sent out.

## MIB Objects

sFlowRcvrTable

sFlowRcvrIndex

---

## show sflow sampler

Displays the sflow sampler table.

**show sflow sampler***[num]*

---

### Syntax Definitions

*num* Specifies the instance id.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A.

### Examples

```
-> show sflow sampler
Instance  Interface  Receiver  Sample-rate  Sample-hdr-size
-----
1         2/ 1       1         2048         128
1         2/ 2       1         2048         128
1         2/ 3       1         2048         128
1         2/ 4       1         2048         128
1         2/ 5       1         2048         128
```

### *output definitions*

---

<b>Instance</b>	Instance for the flow sampler.
<b>Interface</b>	Interface used for the flow sampler.
<b>Receiver</b>	Receiver associated with the flow sampler.
<b>Sample-rate</b>	Statistical sampling rate for packet sampling from the source.
<b>Sample-hdr-size</b>	Maximum number of bytes that should be copied from a sampled packet.

---

### Release History

Release 6.1.1; command was introduced.

## Related Commands

[sflow sampler](#)

Gets hardware sampled from Q-dispatcher.

## MIB Objects

sFlowFsTable

sFlowFsInstance

---

## show sflow poller

Displays the sflow poller table.

**show sflow poller** [*num*]

---

### Syntax Definitions

*num* Specifies the instance id.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show sflow poller
Instance  Interface      Receiver  Interval
-----
          1          2/ 6         1         30
          1          2/ 7         1         30
          1          2/ 8         1         30
          1          2/ 9         1         30
          1          2/10        1         30
```

### *output definitions*

---

<b>Instance</b>	Instance for the counter poller.
<b>Interface</b>	Interface used for the counter poller.
<b>Receiver</b>	Receiver associated with the counter poller.
<b>Interval</b>	The maximum number of seconds between successive samples of the counters associated with the data source.

---

# 43 RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

*Filename:* IETF\_RMON.mib  
*Module:* RMON-MIB

The following table summarizes the available commands:

---

**rmon probes**  
**show rmon probes**  
**show rmon events**

---

## rmon probes

This command enables or disables types of RMON probes.

```
rmon probes {stats | history | alarm} [entry-number] {enable | disable}
```

---

### Syntax Definitions

<b>stats</b>	Ethernet Statistics Table probe entries.
<b>history</b>	History Control Table probe entries.
<b>alarm</b>	Alarm Table probe entries.
<i>entry-number</i>	The entry number in the list of probes ( <i>optional</i> ).
<b>enable</b>	Enables the RMON probe.
<b>disable</b>	Disables the RMON probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

### Examples

```
-> rmon probes stats 4012 enable
-> rmon probes history 10240 disable
-> rmon probes alarm 11235 enable
-> rmon probes stats enable
-> rmon probes history disable
-> rmon probes alarm enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show rmon probes](#)

Displays a list of RMON probes or a single RMON probe.

[show rmon events](#)

Displays a list of RMON logged events or a single RMON event.

## MIB Objects

ETHERSTATSTABLE

etherStatsStatus

HISTORYCONTROLTABLE

historyControlStatus

ALARMTABLE

alarmStatus

---

## show rmon probes

Displays a list of RMON probes or a single RMON probe.

**show rmon probes** [**stats** | **history** | **alarm**] [*entry-number*]

---

### Syntax Definitions

<b>stats</b>	Ethernet Statistics Table probe entries.
<b>history</b>	History Control Table probe entries.
<b>alarm</b>	Alarm Table probe entries.
<i>entry-number</i>	The entry number in the list of probes ( <i>optional</i> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe's *entry-number* in the command line.
- The **show rmon probes** command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The **show rmon probes entry-number** command displays the following information: Probe's Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

### Examples

```
-> show rmon probes stats
```

Entry	Slot/Port	Flavor	Status	Duration	System Resources
4001	4/1	Ethernet	Active	00:25:00	275 bytes
4008	4/8	Ethernet	Active	00:25:00	275 bytes
4005	4/5	Ethernet	Active	00:25:00	275 bytes

-> show rmon probes history

Entry	Slot/Port	Flavor	Status	Duration	System Resources
1	4/1	History	Active	00:25:00	9063 bytes
10240	4/5	History	Active	00:14:00	601 bytes
10325	4/8	History	Active	00:14:00	601 bytes

-> show rmon probes alarm

Entry	Slot/Port	Flavor	Status	Duration	System Resources
11235	4/8	Alarm	Active	00:07:00	835 bytes

-> show rmon probes stats 4005

Probe's Owner: Falcon Switch Auto Probe on Slot 4, Port 5  
 Entry 4005  
 Flavor = History, Status = Active  
 Time = 48 hrs 54 mins,  
 System Resources (bytes) = 275

-> show rmon probes history 10325

Probe's Owner: Analyzer-p:128.251.18.166 on Slot 4, Port 5  
 History Control Buckets Requested = 2  
 History Control Buckets Granted = 2  
 History Control Interval = 30 seconds  
 History Sample Index = 5859  
 Entry 10325  
 Flavor = History, Status = Active  
 Time = 48 hrs 53 mins,  
 System Resources (bytes) = 601

-> show rmon probes alarm 11235

Probe's Owner: Analyzer-t:128.251.18.166 on Slot 4, Port 8  
 Alarm Rising Threshold = 5  
 Alarm Falling Threshold = 0  
 Alarm Rising Event Index = 26020  
 Alarm Falling Event Index = 0  
 Alarm Interval = 10 seconds  
 Alarm Sample Type = delta value  
 Alarm Startup Alarm = rising alarm  
 Alarm Variable = 1.3.6.1.2.1.16.1.1.1.5.4008  
 Entry 11235  
 Flavor = Alarm, Status = Active  
 Time = 48 hrs 48 mins,  
 System Resources (bytes) = 1677

*output definitions*

---

<b>Probe's Owner</b>	Description and interface (location) of the probe.
<b>Slot/Port</b>	The Slot/Port number (interface) that this probe is monitoring.
<b>Entry</b>	The Entry number in the list of probes.
<b>Flavor</b>	Whether the probe type is Ethernet, History, or Alarm.
<b>Status</b>	The status of the probe— <b>Creating</b> (the probe is under creation), <b>Active</b> (the probe is Active), or <b>Inactive</b> (the probe is inactive).
<b>Duration</b>	Elapsed time (hours/minutes/seconds) since the last change in status.
<b>System Resources</b>	Amount of memory that has been allocated to this probe.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">rmon probes</a>	Enables or disables types of RMON probes.
<a href="#">show rmon events</a>	Displays RMON logged events.

**MIB Objects**

```
ETHERSTATSTABLE
    etherStatsIndex
HISTORYCONTROLTABLE
    historyControlIndex
ALARMTABLE
    alarmIndex
```

---

## show rmon events

Displays RMON events (actions that take place based on alarm conditions detected by the RMON probe).

**show rmon events** [*event-number*]

---

### Syntax Definitions

*event-number*                      The event number (*optional*) in the list of probes.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To display a list of logged events, omit the *event-number* from the command line.
- To display statistics for a particular event, include the *event-number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events *event-number*** command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

### Examples

```
-> show rmon events
```

Entry	Time	Description
1	00:08:00	etherStatsPkts.4008: [Falling trap] "Falling Event"
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

```
-> show rmon events 2
```

Entry	Time	Description
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

*output definitions*

---

<b>Entry</b>	The entry number in the list of probes.
<b>Time</b>	Time (hours, minutes, and seconds) since the last change in status.
<b>Description</b>	Description of the Alarm condition detected by the probe.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">rmon probes</a>	Enables or disables types of RMON probes.
<a href="#">show rmon probes</a>	Displays RMON probes or a single RMON probe.

# 44 VLAN Stacking Commands

The VLAN Stacking feature provides a method for tunneling multiple customer VLANs (CVLAN) through a service provider network using one or more service provider VLANs by way of 802.1Q double tagging or VLAN Translation. This feature enables service providers to provide their customers with Transparent LAN Services (TLS). This service is multipoint in nature so as to support multiple customer sites or networks distributed over the edges of a service provider network.

MIB information for the VLAN Stacking commands is as follows:

*Filename:* AlcatelIND1VlanStacking.MIB  
*Module:* Alcatel-IND1-VLAN-STACKING-MIB

*Filename:* AlcatelIND1VlanManager.MIB  
*Module:* Alcatel-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

---

<b>VLAN Stacking Service Mode</b>	<b>ethernet-service</b> <b>ethernet-service source-learning</b> <b>ethernet-service service-name</b> <b>ethernet-service svlan nni</b> <b>ethernet-service nni</b> <b>ethernet-service sap</b> <b>ethernet-service sap uni</b> <b>ethernet-service sap cvlan</b> <b>ethernet-service sap-profile</b> <b>ethernet-service sap sap-profile</b> <b>ethernet-service uni-profile</b> <b>ethernet-service uni uni-profile</b> <b>show ethernet-service mode</b> <b>show ethernet-service vlan</b> <b>show ethernet-service</b> <b>show ethernet-service sap</b> <b>show ethernet-service port</b> <b>show ethernet-service nni</b> <b>show ethernet-service uni</b> <b>show ethernet-service uni-profile</b> <b>show ethernet-service sap-profile</b>
<b>Ethernet Service Hardware</b>	<b>loopback-test</b>
<b>Loopback Test</b>	<b>show loopback-test</b>

---

## ethernet-service

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic, a management SVLAN for provider traffic, or an SVLAN that the IP Multicast VLAN (IPMV) application will use to distribute multicast traffic.

**ethernet-service** {svlan | ipmvlan | management-vlan} svid1[-svid2] [enable | disable] [[1x1 | flat] stp {enable | disable}] [name description]

**no ethernet-service** {svlan | ipmvlan | management-vlan} svid1[-svid2]

---

### Syntax Definitions

<b>svlan</b>	Creates an SVLAN for tunneling customer traffic.
<b>ipmvlan</b>	Creates an SVLAN used by IPMV to distribute multicast traffic.
<b>management-vlan</b>	Creates a management SVLAN for provider traffic.
<i>svid1</i>	The VLAN ID number identifying the SVLAN (2–4094).
<i>-svid2</i>	The last VLAN ID number in a range of SVLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).
<b>enable</b>	Enables the SVLAN administrative status.
<b>disable</b>	Disables the SVLAN administrative status, which blocks all ports bound to that SVLAN.
<b>1x1</b>	Specifies that the Spanning Tree status for the SVLAN applies when the switch is running in the 1x1 Spanning Tree mode.
<b>flat</b>	Specifies that the Spanning Tree status for the SVLAN applies when the switch is running in the flat Spanning Tree mode.
<b>stp enable</b>	Enables the SVLAN Spanning Tree status for the service provider network topology.
<b>stp disable</b>	Disables the SVLAN Spanning Tree status for the service provider network topology.
<i>description</i>	An alphanumeric string of up to 32 characters. Use quotes around the string if the VLAN name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).

### Defaults

By default, the Spanning Tree status is enabled in both the 1x1 and flat mode when the SVLAN or IPMV is created

parameter	default
<b>enable   disable</b>	<b>enable</b>
<b>stp enable   disable</b>	<b>enable</b>
<i>description</i>	VLAN ID number

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete an SVLAN or a range of SVLANs. Note that SVLAN port associations are also removed when the SVLAN is deleted.
- This command does not work if the *svlan* specified already exists as a standard VLAN.
- Use the optional **1x1** or **flat** parameter with this command to configure the Spanning Tree status only for the Spanning Tree mode specified by the parameter. For example, if the **flat** parameter is specified when disabling STP for SVLAN 10, then the Spanning Tree status for SVLAN 10 is disabled when the switch is running in the flat mode. However, the current Spanning Tree status for SVLAN 10 in the 1x1 mode remains unchanged.
- If this command is used without specifying the **1x1** or **flat** parameter, then the Spanning Tree status for the specified SVLAN is changed for both operating modes.
- Note that the Spanning Tree status for an SVLAN only applies to the Spanning Tree topology calculations for the service provider network. This status is not applied to customer VLANs (CVLANs) and does not affect the customer network topology.

## Examples

```
-> ethernet-service svlan 1001 name "Customer ABC"  
-> ethernet-service ipmvlan 255  
-> ethernet-service management-vlan 355  
-> no ethernet-service svlan 1001  
-> no ethernet-service ipmvlan 255  
-> no ethernet-service management-vlan 355
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

- |                                                  |                                                      |
|--------------------------------------------------|------------------------------------------------------|
| <a href="#">show ethernet-service vlan</a>       | Displays a list of SVLANs configured from the switch |
| <a href="#">ethernet-service source-learning</a> | Configures the source learning status for an SVLAN.  |

## MIB Objects

```
vlanTable  
  vlanNumber  
  vlanDescription  
  vlanSvlanTrafficType  
  vlanAdmStatus  
  vlan1x1StpStatus  
  vlanFlatStpStatus  
  vlanStpStatus  
  vlanStatus
```

---

## ethernet-service source-learning

Configures the status of source learning on a VLAN Stacking VLAN (SVLAN) used for tunneling customer traffic or on an SVLAN that the IP Multicast VLAN (IPMV) application uses to distribute multicast network traffic.

**ethernet-service** {svlan | ipmvlan} *svid1*[-*svid2*] **source-learning** {enable| disable}

---

### Syntax Definitions

<b>svlan</b>	Specifies an SVLAN for tunneling customer traffic.
<b>ipmvlan</b>	Specifies an SVLAN used by IP Multicast VLAN to distribute multi-cast traffic.
<i>svid1</i>	The VLAN ID number identifying the SVLAN (2–4094).
<i>-svid2</i>	The last VLAN ID number in a range of SVLANs that you want to configure (e.g. 10-12 specifies SVLANs 10, 11, and 12).
<b>enable</b>	Enables source MAC address learning.
<b>disable</b>	Disables source MAC address learning.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6400, 6855-U24X, 9000E

### Usage Guidelines

- By default, source MAC address learning is enabled on all the SVLANs.
- Disabling source learning on an SVLAN clears all the dynamically learned MAC addresses associated with the VLAN from the MAC address table.
- Static MAC addresses associated with an SVLAN are *not* cleared when source learning is disabled for the SVLAN.
- Configuring the source learning status is not supported on Management SVLANs.

### Examples

```
-> ethernet-service svlan 120-150 source-learning disable
-> ethernet-service ipmvlan 320-350 source-learning disable
```

### Release History

Release 6.4.2; command introduced.

## Related Commands

- ethernet-service**                      Creates a VLAN Stacking VLAN (SVLAN).  
**show ethernet-service vlan**        Displays a list of SVLANs configured for the switch.

## MIB Objects

```
vlanTable  
  vlanEntry  
  vlanNumber  
  vlanStatus  
  vlanMacLearningControlStatus
```

---

## ethernet-service service-name

Creates a VLAN Stacking service and associates the service with an SVLAN or an IP Multicast VLAN (IPMV). The SVLAN or IPMV specified is the VLAN that will transport traffic for the service.

**ethernet-service service-name** *service-name* {svlan | ipmvlan} *svid*

**no ethernet-service service-name** *service-name* {svlan | ipmvlan} *svid*

---

### Syntax Definitions

*service-name*                      The name of the VLAN Stacking service; an alphanumeric string of up to 32 characters. Use quotes around string if the VLAN name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).

*svid*                                      The VLAN ID number that identifies an existing SVLAN or IPMV to associate with the VLAN Stacking service (2–4094).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN Stacking service. Note that when a service is removed, the SVLAN or IPMV association with that service is also removed.
- If the VLAN Stacking service is associated with a Service Access Point (SAP) remove the SAP associations before attempting to remove the service.
- Each VLAN Stacking service is associated with one SVLAN or IPMV. Specifying an additional VLAN ID for an existing service is not allowed.

### Examples

```
-> ethernet-service service-name Marketing svlan 10
-> ethernet-service service-name Finance ipmvlan 20
-> no ethernet-service service-name Marketing
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### [ethernet-service](#)

Creates an SVLAN for customer traffic, a management VLAN for provider traffic, or an IPMV for multicast traffic.

## MIB Objects

```
alaEServiceTable  
  alaEServiceID  
  alaEServiceSVLAN  
  alaEServiceVlanType  
  alaEServiceRowStatus
```

---

## ethernet-service svlan nni

Configures the switch port as a VLAN Stacking Network Network Interface (NNI) port and associates the port with a customer SVLAN or management SVLAN. A network port connects to another provider bridge and carries both customer and provider traffic.

```
ethernet-service svlan svid1[-svid2] nni {slot/port1[-port2] / linkagg agg_num} [stp | erp]
```

```
no ethernet-service svlan svid1[-svid2] nni {slot/port1[-port2] / linkagg agg_num}
```

---

### Syntax Definitions

<i>svid1</i>	The VLAN ID number identifying the SVLAN (2–4094).
- <i>svid2</i>	The last VLAN ID number in a range of SVLANs that you want to specify (e.g. 10-12 specifies VLANs 10, 11, and 12).
<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
- <i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>agg_num</i>	The link aggregate ID number (0–31).
stp	Specifies Spanning Tree control for the SVLAN-NNI association.
erp	Specifies Ethernet Ring Protection (ERP) control for the SVLAN-NNI association.

### Defaults

parameter	default
stp   erp	stp

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an association between an NNI port and an SVLAN. Note that when the last SVLAN association is removed, the NNI port reverts to a conventional switch port.
- This SVLAN ID specified with this command must already exist in the switch configuration. Only SVLAN IDs are accepted; IPMVLAN IDs are not supported with this command.
- When this command is used, the default VLAN for the NNI port is changed to a VLAN reserved by the switch for applications such as VLAN Stacking. The reserved VLAN is not configurable using standard VLAN management commands.
- Associating a network port to an SVLAN is required.

## Examples

```
-> ethernet-service svlan 10 nni 1/3
-> ethernet-service svlan 255 nni 2/10-15
-> ethernet-service svlan 500 nni linkagg 31
-> no ethernet-service svlan 10 nni 1/3
-> no ethernet-service svlan 255 nni 2/12
```

## Release History

Release 6.3.1; command was introduced.

Release 6.3.4; **stp** and **erp** parameters added.

## Related Commands

### [ethernet-service](#)

Creates an SVLAN for customer traffic, a management VLAN for provider traffic, or an IPMV for multicast traffic.

### [ethernet-service nni](#)

Configures the vendor TPID value, the legacy BPDU processing status, and the transparent bridging status for a VLAN Stacking Network Network Interface (NNI).

## MIB Objects

```
alaEServiceNniSvlanTable
  alaEServiceNniSvlanNni
  alaEServiceNniSvlanSvlan
  alaEServiceNniSvlanRowStatus
```

---

## ethernet-service nni

Configures the vendor TPID value, the legacy BPDU processing status, and the transparent bridging status for a VLAN Stacking Network Network Interface (NNI).

```
ethernet-service nni {slot/port1[-port2] / agg_num} [tpid value] [{stp | gvrp | mvrp} legacy-bpdu
{enable | disable}] [transparent-bridging {enable | disable}]
```

---

### Syntax Definitions

<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g., 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>agg_num</i>	The link aggregate ID number (0–31).
<i>value</i>	Specifies the TPID value of the port.
<b>stp</b>	Specifies Spanning Tree legacy BPDU support.
<b>gvrp</b>	Specifies GVRP legacy BPDU support.
<b>mvrp</b>	Specifies MVRP legacy BPDU support.
<b>legacy-bpdu enable</b>	Enables the specified legacy BPDU support.
<b>legacy-bpdu disable</b>	Disables the specified legacy BPDU support.
<b>transparent-bridging enable</b>	Enables transparent bridging.
<b>transparent-bridging disable</b>	Disables transparent bridging.

### Defaults

parameter	default
<i>value</i>	<b>0x8100</b>
<b>stp legacy-bpdu enable   disable</b>	<b>disable</b>
<b>gvrp legacy-bpdu enable   disable</b>	<b>disable</b>
<b>mvrp legacy-bpdu enable   disable</b>	<b>disable</b>
<b>transparent-bridging enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command only applies to ports configured as VLAN Stacking NNI ports.

- Enable legacy BPDU support only on VLAN Stacking network ports that are connected to legacy BPDU switches. Enabling legacy BPDU between AOS switches may cause flooding or an unstable network.
- If legacy BPDU is enabled on a network port while at same time BPDU flooding is enabled on user ports, make sure that tagged customer BPDUs are not interpreted by intermediate switches in the provider network.
- Note that if the peer switch connected to the VLAN Stacking network port supports the Provider MAC address (i.e., STP, 802.1ad/D6.0 MAC), then enabling legacy BPDU support is not required on the network port. Refer to the following table to determine the type of STP, GVRP, or MVRP MAC used:

---

### STP

Customer MAC address	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}
Provider MAC address (802.1ad/D6.0)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x08}
Provider MAC address (Legacy MAC)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}

### GVRP

Customer MAC address	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x21}
Provider MAC address	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x0D}

### MVRP

Customer MAC address	(0x01, 0x80, 0xc2, 0x00, 0x00, 0x21)
Provider MAC address	(0x01, 0x80, 0xc2, 0x00, 0x00, 0x0D)

- GVRP legacy BPDU are supported only on network ports that already have GVRP enabled for the port.
- STP legacy BPDU and transparent bridging are supported only when the flat Spanning Tree mode is active on the switch.
- When transparent bridging is enabled, the NNI forwards SVLAN traffic without processing packet contents. As a result, the NNI port can also forward traffic for SVLANs that are not configured on the local switch, thus allowing for a greater number of NNI port associations with SVLANs.
- Note that enabling transparent bridging is recommended only on NNI ports that are known to and controlled by the network administrator.
- If the Spanning Tree operating mode for the switch is changed from flat mode to 1x1 mode, transparent bridging is automatically disabled on all NNI ports.

## Examples

```
-> ethernet-service nni 2/10-15 tpid 88a8
-> ethernet-service nni 31 stp legacy-bpdu enable
-> ethernet-service nni 10 gvrp legacy-bpdu enable
-> ethernet-service nni 7/1 mvrp legacy-bpdu enable
-> ethernet-service nni 1/10 transparent bridging enable
```

## Release History

Release 6.3.1; command was introduced.

Release 6.3.4; **transparent-bridging** parameter added.

Release 6.4.3; **mvrp** parameter added.

## Related Commands

**ethernet-service svlan nni** Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN, or an IP Multicast VLAN (IPMV).

**show ethernet-service nni** Displays configuration information for NNI ports.

## MIB Objects

```
alaEServicePortTable
  alaEServicePortID
  alaEServicePortType
  alaEServicePortVendorTpid
  alaEServicePortLegacyStpBpdu
  alaEServicePortLegacyGvrpBpdu
  alaEServicePortLegacyMvrpBpdu
  alaEServicePortRowStatus
```

---

## ethernet-service sap

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

**ethernet-service sap** *sapid* **service-name** *service-name*

**no ethernet-service sap** *sapid*

---

### Syntax Definitions

*sapid* The SAP ID number identifying the service instance (1-1024).

*service-name* The name of the service to associate with this SAP.

### Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a VLAN Stacking SAP. When a SAP is deleted, all port and CVLAN associations with the SAP are also deleted.
- The service name specified with this command must already exist in the switch configuration. Use the **ethernet-service service-name** command to create a service to associate with the SAP.
- Each SAP ID is associated with only one service. However, it is possible to associate one service with multiple SAP IDs.

### Examples

```
-> ethernet-service sap 10 service-name CustomerA
```

```
-> no ethernet-service sap 11
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

**ethernet-service service-name** Creates a VLAN Stacking service and associates the service with an SVLAN or an IP Multicast VLAN (IPMV).

**ethernet-service sap-profile** Creates a VLAN Stacking SAP profile.

**ethernet-service sap sap-profile** Associates a SAP profile with a SAP ID.

## MIB Objects

```
alaEServiceSapTable
  alaEServiceSapID
  alaEServiceSapService
  alaEServiceSapRowStatus
```

---

## ethernet-service sap uni

Configures the switch port as a VLAN Stacking User Network Interface (UNI) and associates the port with a VLAN Stacking Service Access Point (SAP). A UNI port is a customer facing port on which traffic enters the SAP.

```
ethernet-service sap sapid uni {slot/port1[-port2] / linkagg agg_num}
```

```
ethernet-service sap sapid no uni {slot/port1[-port2] / linkagg agg_num}
```

---

### Syntax Definitions

<i>sapid</i>	The SAP ID number identifying the service instance (1–1024).
<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>agg_num</i>	The link aggregate ID number (0–31).

### Defaults

A switch port or a link aggregate becomes a VLAN Stacking UNI port by default when the port or link aggregate is associated with a VLAN Stacking SAP.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an association between a UNI port and a SAP. Note that when the last SAP association is removed, the UNI port converts back to a conventional switch port.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Note that if the SAP ID specified with this command is associated with an IPMVLAN, the SAP profile must specify CVLAN translation. In addition, multicast traffic is not associated with the IPMVLAN until the UNI port is associated with the IPMVLAN as a receiver port. For more information, see the “IP Multicast VLAN Commands” chapter in this guide.
- When this command is used, the default VLAN for the UNI port is changed to a reserved VLAN and all customer traffic received is dropped until the type of traffic for the port is configured using the **ethernet-service sap cvlan** command.

### Examples

```
-> ethernet-service sap 10 uni 1/3
-> ethernet-service sap 10 uni 2/10-15
-> ethernet-service sap 10 uni linkagg 31
-> ethernet-service sap 10 no uni 1/3
-> ethernet-service sap 10 no uni linkagg 31
```

## Release History

Release 6.3.1; command was introduced.

## Related Commands

- ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
- ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.

## MIB Objects

```
alaEServiceSapUniTable  
  alaEServiceSapUniSap  
  alaEServiceSapUniUni  
  alaEServiceSapUniRowStatus
```

---

## ethernet-service sap cvlan

Associates customer VLAN (CVLAN) traffic with a VLAN Stacking Service Access Point (SAP). The parameter values configured with this command are applied to frames received on all SAP UNI ports and determines the type of customer traffic that is accepted on the UNI ports and processed by the service.

**ethernet-service sap *sapid* cvlan {all / *cvid* | *cvid1-cvid2* / **untagged**}**

**ethernet-service sap *sapid* no cvlan {all / *cvid* | *cvid1-cvid2* / **untagged**}**

---

### Syntax Definitions

<i>sapid</i>	The SAP ID number (1–1024).
<b>all</b>	Applies the SAP profile to tagged and untagged frames.
<i>cvid1</i>	Applies the SAP profile to frames tagged with this CVLAN ID.
<i>cvid1-cvid2</i>	Applies the SAP profile to frames tagged with a CVLAN ID that falls within this range of CVLAN IDs (for example, 10-12 specifies frames tagged with CVLAN 10, 11, or 12).
<b>untagged</b>	Applies the SAP profile only to untagged frames.

### Defaults

By default, no CVLAN traffic is associated with the SAP ID when the SAP is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove a CVLAN ID or the designation for **all** or **untagged** frames from the SAP. Note that when the last CVLAN parameter is deleted from an SAP configuration, the SAP itself is not automatically deleted.
- The **all** and **untagged** parameters are configurable in combination with a CVLAN ID. For example, if **untagged** and a CVLAN ID are associated with the same SAP ID, then the SAP profile is applied to only untagged traffic *and* traffic tagged with the specified CVLAN ID. All other traffic is dropped.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Note that this command is not supported with SAP IDs that are associated with an IPMVLAN.
- Configuring both the **all** and **untagged** parameter for the same SAP is not allowed. Specify only one of these two parameters per SAP.
- When either the **all** or **untagged** parameter is configured for the SAP, the default VLAN for the UNI ports associated with the SAP is changed to the VLAN assigned to the service that is associated with the SAP.

- Only one SAP with the **all** or **untagged** option per UNI is allowed. For example, if UNI port 1/17 is part of SAP 10 and SAP 20 and SAP 10 is configured for **all** traffic, then only **untagged** or a CVLAN ID is allowed for SAP 20.

### Examples

```
-> ethernet-service sap 10 cvlan 200
-> ethernet-service sap 10 cvlan all
-> ethernet-service sap 11 cvlan 100-150
-> ethernet-service sap 11 cvlan untagged
-> ethernet-service sap 10 no cvlan 200
-> ethernet-service sap 10 no cvlan 100-150
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

#### [ethernet-service sap](#)

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

### MIB Objects

```

  alaEServiceSapUniUni
  alaEServiceSapUniRowStatus
```

---

## ethernet-service sap-profile

Creates a profile for a VLAN Stacking Service Access Point (SAP). Profile attributes are used to define traffic engineering policies that are applied to traffic serviced by the SAP.

**ethernet-service sap-profile** *sap-profile-name*

**[bandwidth not-assigned]**

**[egress-bandwidth** *mbps*]

**[{shared | not-shared} ingress-bandwidth** *mbps*]

**[cvlan-tag {preserve | translate}]**

**[priority [not-assigned | map-inner-to-outer-p | map-dscp-to-outer-p | fixed** *value*]]

**no ethernet-service sap-profile** *sap-profile-name*

---

### Syntax Definitions

<i>sap-profile-name</i>	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").
<b>bandwidth not-assigned</b>	Specifies that the profile will not allocate switch resources to enforce bandwidth requirements. Applies only when the profile specifies the default ingress bandwidth value (zero).
<b>egress-bandwidth</b> <i>mbps</i>	The maximum amount of egress bandwidth, in megabits per second, to be allowed for SAP ports (0-9999).
<b>shared</b>	Shares the ingress bandwidth limit across all SAP ports and CVLANs.
<b>not shared</b>	Applies the ingress bandwidth limit to individual SAP ports and CVLANs; bandwidth is not shared.
<b>ingress-bandwidth</b> <i>mbps</i>	The maximum amount of ingress bandwidth, in megabits per second, to be allowed for SAP ports.
<b>cvlan-tag preserve</b>	Retains the customer VLAN ID (inner tag) and double tags the frame with the SVLAN ID (outer tag).
<b>cvlan-tag translate</b>	Replaces the customer VLAN ID with the SVLAN ID.
<b>priority not-assigned</b>	Specifies that the SAP profile will not allocate switch resources to enforce the priority mapping. Applies only when the profile specifies the default priority value (fixed).
<b>priority map-inner-to-outer-p</b>	Maps the customer VLAN (inner tag) priority bit value to the SVLAN (outer tag) priority bit value.
<b>priority map-dscp-to-outer-p</b>	Maps the customer VLAN (inner tag) DSCP value to the SVLAN (outer tag) priority bit value.
<b>priority fixed</b> <i>value</i>	Sets the SVLAN (outer tag) priority bit to the specified value. Values range from 0 (lowest priority) to 7 (highest priority).

## Defaults

parameter	default
<b>shared   not shared</b>	<b>shared</b>
<i>mbps</i>	0
<b>preserve   translate</b>	preserve
<b>not-assigned   map-inner-to-outer-p   map-dscp-to-outer-p   fixed <i>value</i></b>	<b>fixed 0</b>

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

OmniSwitch 6400, 6855-U24X, 9000E; **egress-bandwidth** parameter supported.

## Usage Guidelines

- Use the **no** form of this command to delete a SAP profile.
- If a profile is not specified when a SAP is created, a default profile (default-sap-profile) is automatically associated with the SAP.
- Use the **ethernet-service sap sap-profile** command to associate a profile to a VLAN Stacking SAP.
- Only one SAP profile name is associated with each SAP ID; however, it is possible to associate the same SAP profile name to multiple SAP IDs.
- By default, the **bandwidth not-assigned** and **priority not-assigned** parameters are not specified when a profile is created. This means that even if no bandwidth value is specified or the priority is set to fixed (the default), QoS still allocates switch resources to enforce bandwidth and priority settings for the profile. In addition, QoS policy rules cannot override the profile bandwidth or priority settings.
- Use the **bandwidth not-assigned** and **priority not-assigned** parameters to prevent the profile from triggering QoS allocation of switch resources. When a profile is created using these parameters, QoS policy rules/ACLs are then available to define more custom bandwidth and priority settings for profile traffic. For example, mapping several inner DSCP/ToS values to the same outer 802.1p value.
- Egress bandwidth can be configured only for SVLANs and not for IPMVLANs.
- A CVLAN-UNI combination associated with a SAP having egress bandwidth configuration is unique and it cannot be configured on any other SAP with egress bandwidth configuration.

## Examples

```
-> ethernet-service sap-profile video1 egress-bandwidth 1000
-> ethernet-service sap-profile video1 ingress-bandwidth 10 cvlan translate
map-inner-to-outer-p
-> ethernet-service sap-profile voice1 not-shared ingress-bandwidth 10 cvlan
preserve fixed 1
-> ethernet-service sap-profile "QoS Mapping" bandwidth not-assigned priority
not-assigned
-> no ethernet-service sap-profile video1
```

## Release History

Release 6.3.1; command was introduced.

Release 6.3.4; **bandwidth not-assigned** parameter added.

Release 6.4.2; **egress-bandwidth** parameter added.

Release 6.4.3; **priority not-assigned** parameter added.

## Related Commands

**ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a service.

**ethernet-service sap sap-profile** Associates a SAP profile with a SAP ID.

**show ethernet-service sap-profile** Displays the profile attribute configuration for a SAP profile.

## MIB Objects

```

---

## ethernet-service sap sap-profile

Associates a VLAN Stacking Service Access Point (SAP) with a SAP profile. This command is also used to change an existing SAP profile association.

**ethernet-service sap** *sapid* **sap-profile** *sap-profile-name*

---

### Syntax Definitions

<i>sapid</i>	The SAP ID number (1–1024).
<i>sap-profile-name</i>	The name of the SAP profile to associate with this SAP ID.

### Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If a profile association already exists for the specified SAP ID, the current profile is replaced with the profile specified with this command.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- The SAP profile specified with this command must already exist. Use the **ethernet-service sap-profile** command to create a SAP profile.
- To change the profile associated with the SAP back to the default profile, enter “default-sap-profile” with this command.
- Note that if the SAP ID specified with this command is associated with an IPMVLAN, the profile associated with the SAP ID must specify CVLAN tag translation. Double tagging is not supported with IPMVLAN SAPs that are also associated with a UNI port.
- Do not specify a service name; doing so will return an error message. This command is only for associating an existing profile to a VLAN Stacking SAP.

### Examples

```
-> ethernet-service sap 10 sap-profile CustomerC  
-> ethernet-service sap 11 sap-profile CustomerD
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

- ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
- ethernet-service sap-profile** Creates a VLAN Stacking SAP profile.

  alaEServiceSapID  
  alaEServiceSapProfile  
  alaEServiceSapRowStatus

---

## ethernet-service uni-profile

Creates a User Network Interface (UNI) profile that is used to specify how to process control packets ingressing on UNI ports.

**ethernet-service uni-profile** *uni-profile-name* [**tunnel-mac** *mac-address*] [**I2-protocol** {**vtp** | **vlan** | **uplink** | **udld** | **stp** | **pvst** | **pagp** | **oam** | **mvrp** | **lacpmarker** | **gvrp** | **dtp** | **cdp** | **amap** | **802.3ad** | **802.1x** | **802.1ab** {**peer** | **discard** | **tunnel** | **mac-tunnel**}}

**no ethernet-service uni-profile** *uni-profile-name*

---

### Syntax Definitions

<i>uni-profile-name</i>	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").
<i>mac-address</i>	The mac address to be used when configuring a protocol for tunnel-mac.
<b>vtp</b>	Cisco's VTP Protocol.
<b>vlan</b>	Cisco's VLAN Protocol.
<b>uplink</b>	Cisco's Uplink Fast Protocol
<b>udld</b>	Cisco's UDLD Protocol.
<b>stp</b>	Spanning Tree BPDU.
<b>pvst</b>	Cisco's PVST Protocol.
<b>pagp</b>	Cisco's PAGP Protocol.
<b>oam</b>	OAM Protocol.
<b>mvrp</b>	MVRP Protocol.
<b>lacpmarker</b>	LACP Marker Protocol.
<b>gvrp</b>	Specifies how GARP VLAN Registration Protocol packets will be processed on the UNI port.
<b>dtp</b>	Cisco's DTP Protocol.
<b>cdp</b>	Cisco's DTP Protocol.
<b>amap</b>	Specifies how Alcatel Management Adjacency Protocol packets will be processed on the UNI port.
<b>802.3ad</b>	Specifies how 802.3ad and 802.3ah control frames will be processed on the UNI port.
<b>802.1x</b>	Specifies how 802.1x control frames will be processed on the UNI port.
<b>802.1ab</b>	Specifies how 802.1ab control frames will be processed on the UNI port.
<b>peer</b>	Allows the UNI port to participate in the specified protocol.

<b>discard</b>	Discards the specified PDU.
<b>tunnel</b>	Tunnels the specified PDU across the provider network without modifying the MAC address.
<b>mac-tunnel</b>	Changes the destination MAC address to either the configured or default tunnel MAC address before forwarding.

## Defaults

parameter	default	Protocol DA MAC Address	Default Tunnel MAC	Other	Other
<b>stp</b>	<b>tunnel</b>	0180c2000000	0100ccdcdd0	-	
<b>gvrp</b>	<b>tunnel</b>	0180c2000021	0100ccdcdd0	-	
<b>802.3ad</b>	<b>peer</b>	0180c2000002	0100ccdcdd0	-	
<b>802.1x</b>	<b>discard</b>	-	-	-	
<b>802.1ab</b>	<b>discard</b>	0180c200000e	0100ccdcdd0	-	
<b>amap</b>	<b>discard</b>	0020da007004	0100ccdcdd0	-	
<b>vtp</b>	<b>discard</b>	01000cccccc	0100ccdcdd0	-	-
<b>vlan</b>	<b>discard</b>	0100ccdcdee	0100ccdcdd0	-	-
<b>uplink</b>	<b>discard</b>	0100ccdcddcd	0100ccdcdd0	-	-
<b>udld</b>	<b>discard</b>	01000cccccc	0100ccdcdd0	-	-
<b>pvst</b>	<b>discard</b>	01000cccccd	0100ccdcdd0	-	-
<b>pagp</b>	<b>discard</b>	01000cccccc	0100ccdcdd0	-	
<b>oam</b>	<b>peer</b>	0180c2000002	0100ccdcdd0	-	
<b>mvrp</b>	<b>tunnel</b>	-	0100ccdcdd0	-	
<b>lacpmarker</b>	<b>peer</b>	0180c2000002	0100ccdcdd0	-	
<b>dtp</b>	<b>discard</b>	01000cccccc	0100ccdcdd0	-	-
<b>cdp</b>	<b>discard</b>	01000cccccc	0100ccdcdd0	-	

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **no** form of this command to delete a UNI profile.
- Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- If a protocol is configured with the **mac-tunnel** parameter and no mac address has been configured, the default Tunnel MAC address from the table above is used.

- Not all of the protocol parameters are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

	<b>peer</b>	<b>discard</b>	<b>tunnel</b>
<b>stp</b>	no	yes	yes
<b>802.1x</b>	no	yes	yes
<b>802.1ab</b>	yes	yes	yes
<b>802.3ad</b>	yes	yes	yes
<b>gvrp</b>	no	yes	yes
<b>amap</b>	yes	yes	yes
<b>vtp</b>	no	yes	yes
<b>vlan</b>	no	yes	yes
<b>uplink</b>	no	yes	yes
<b>udld</b>	yes	yes	yes
<b>pvst</b>	no	yes	yes
<b>pagp</b>	no	yes	yes
<b>oam</b>	yes	yes	yes
<b>mvrp</b>	no	yes	yes
<b>lacpmarker</b>	yes	yes	yes
<b>dtp</b>	no	yes	yes
<b>cdp</b>	no	yes	yes

- Note that 802.3ad and 802.3ah control frames are processed the same. The **802.3ad** parameter specifies how both 802.3ad and 802.3ah control frames are to be processed on the UNI port.
- Note that the VLAN Stacking provider edge (PE) switch will not tunnel GVRP frames unless the GVRP feature and/or GVRP transparent switching functionality is enabled on the PE switch. This is true even if GVRP processing is enabled for the VLAN Stacking port.
- If a user-configured UNI profile is *not* associated with a UNI port, then the default profile (default-uni-profile) is used to process control packets ingressing on the port.

## Examples

```
-> ethernet-service uni-profile uni_1 l2-protocol stp gvrp discard
-> ethernet-service uni-profile uni_1 l2-protocol vrp mac-tunnel
-> ethernet-service uni-profile uni_config_tunnel_mac tunnel-mac 00:00:00:00:00:99
-> ethernet-service uni-profile uni_config_tunnel_mac l2-protocol gvrp mac-tunnel
-> no ethernet-service uni-profile uni_1
```

## Release History

Release 6.3.1; command was introduced.

Release 6.4.3; **tunnel-mac** and **mac-tunnel** parameters were added.

## Related Commands

## ethernet-service uni uni-profile

Associates a VLAN Stacking User Network Interface (UNI) profile with a UNI port.

**ethernet-service uni** {*slot/port1*[-*port2*] | *agg\_num*} **uni-profile** *uni-profile-name*

---

### Syntax Definitions

<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g., 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>agg_num</i>	The link aggregate ID number (0–31).
<i>uni-profile-name</i>	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).

### Defaults

The default profile (default-uni-profile) is used to process control packets ingressing on a UNI port. This profile is assigned at the time a port is configured as a VLAN Stacking UNI.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This UNI specified with this command must already exist in the switch configuration.
- To change the profile associated with a UNI port, use this command and specify a different profile name than the one currently associated with the port. The last profile associated with the port, is the profile that is applied to UNI port traffic.
- To change the profile associated with a UNI port back to the default profile, enter “default-uni-profile” with this command.

### Examples

```
-> ethernet-service uni 1/3 uni-profile uni_1
-> ethernet-service uni 2/10-15 uni-profile default-uni-profile
-> no ethernet-service uni 1/3 uni-profile uni_1
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

**ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

**ethernet-service sap uni** Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).

## MIB Objects

---

---

## show ethernet-service mode

Displays the active VLAN Stacking mode for the switch.

**show ethernet-service mode**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command is available in both modes: Legacy or EServices.

### Examples

```
-> show ethernet-service mode
Vlan Stacking Mode: Legacy Mode
```

```
-> show ethernet-service mode
Vlan Stacking Mode: EServices Mode
```

### *output definitions*

---

<b>Vlan Stacking Mode</b>	Displays the current VLAN Stacking mode ( <b>Legacy Mode</b> or <b>EServices Mode</b> ).
---------------------------	------------------------------------------------------------------------------------------

---

### Release History

Release 6.3.1; command was introduced.

### Related Commands

[show ethernet-service](#) Displays configuration information for VLAN Stacking Ethernet services.

### MIB Objects

```
alaEServiceInfo
  alaEServiceMode
```

---

## show ethernet-service vlan

Displays a list of SVLANs configured from the switch.

**show ethernet-services vlan** [*svid1*-[*svid2*]]

---

### Syntax Definitions

<i>svid1</i>	The VLAN ID number identifying the SVLAN (2–4094).
- <i>svid2</i>	The last VLAN ID number in a range of SVLANs that you want to specify (e.g. 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, all SVLANs are displayed if an SVLAN or range of SVLANs is not specified with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Specify a single SVLAN ID or a range of SVLAN IDs to display configuration information for a specific SVLAN or range of SVLANs.

### Examples

```
-> show ethernet-services vlan
vlan          Type          name
+-----+-----+-----+
 4010         svlan          Customer ABC
 4011         ipmvlan       Video-Service
 4020         mgmt          Provider Management
 4021         svlan          Customer XYZ
 4030         ipmvlan       HBO
```

```
-> show ethernet-service vlan 4010
Name          : Customer ABC
Traffic Type  : svlan
```

#### output definitions

---

<b>vlan</b>	The SVLAN ID number identifying the instance.
<b>Traffic Type</b>	The type of SVLAN ( <b>svlan</b> = customer traffic, <b>mgmt</b> = management traffic, or <b>ipmvlan</b> = IP Multicast VLAN traffic).
<b>name</b>	The user-defined text description for the SVLAN. By default, the SVLAN ID is specified for the description.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### [ethernet-service](#)

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic, a management SVLAN for provider traffic, or an SVLAN that the IP Multicast VLAN (IPMV) application will use to distribute multicast traffic.

### [show ethernet-service](#)

Displays configuration information for VLAN Stacking Ethernet services.

## MIB Objects

vlanTable

    vlanNumber

    vlanDescription

    vlanSvlanTrafficType

---

## show ethernet-service

Displays configuration information for VLAN Stacking Ethernet services.

**show ethernet-service** [**service-name** *service-name* / **svlan** *svlan*]

---

### Syntax Definitions

<i>service-name</i>	The name of an existing VLAN Stacking service; an alphanumeric string of up to 32 characters. Use quotes around string if the VLAN name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).
<i>svlan</i>	The VLAN ID number that identifies an existing SVLAN (2–4094).

### Defaults

By default, all services are displayed if a service name or SVLAN ID is not specified with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Enter the name of a service to display configuration information for a specific service.
- Enter an SVLAN ID to display configuration information for all services that are associated with a specific SVLAN.

### Examples

```
-> show ethernet-service
```

```
Service Name : VideoOne
  SVLAN      : 300
  NNI(s)    : 2/1, 3/2
  SAP Id    : 20
    UNIs     : 1/1, 1/2
    CVLAN(s) : 10, 20
    sap-profile : sap-video1
  SAP Id    : 30
    UNIs     : 1/3
    CVLAN(s) : untagged, 40
    sap-profile : sap-video2

Service Name : CustomerABC
  SVLAN      : 255
  NNI(s)    : 1/22
  SAP Id    : 10
    UNIs     : 2/10, 2/11
    CVLAN(s) : 500, 600
    sap-profile : default-sap-profile
```

```

Service Name : ipmv_service
  IPMVLAN : 40
  NNI(s)   : No NNIs configured
  SAP Id   : 2
    UNIs    : 1/22
    CVLAN(s) : 100
    sap-profile : translate_profile

-> show ethernet-service service-name CustomerABC

```

```

Service Name : CustomerABC
  SVLAN     : 255
  NNI(s)    : 1/22
  SAP Id    : 10
    UNIs    : 2/10, 2/11
    CVLAN(s) : 500, 600
    sap-profile : default-sap-profile

```

```

-> show ethernet-service svlan 300

```

```

Service Name : VideoOne
  SVLAN     : 300
  NNI(s)    : 2/1, 3/2
  SAP Id    : 20
    UNIs    : 1/1, 1/2
    CVLAN(s) : 10, 20
    sap-profile : sap-video1
  SAP Id    : 30
    UNIs    : 1/3
    CVLAN(s) : 30, 40
    sap-profile : sap-video2

```

### *output definitions*

---

<b>Service Name</b>	The name of the VLAN Stacking service.
<b>SVLAN or IPMVLAN</b>	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN; IPMVLAN appears as the field name if the VLAN ID is an IP Multicast SVLAN.
<b>NNI(s)</b>	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
<b>SAP Id</b>	The ID number for the VLAN Stacking Service Access Point that is applied to the service (1-1024).
<b>UNIs</b>	VLAN Stacking User Network Interface ports that receive customer traffic.
<b>CVLAN(s)</b>	Customer VLAN IDs ingressing on UNI ports.
<b>sap-profile</b>	The name of the SAP profile associated with the SAP.

---

### **Release History**

Release 6.3.1; command was introduced.

## Related Commands

## show ethernet-service port

Displays configuration information for a VLAN Stacking service port.

**show ethernet-services port** {*slot/port* / **linkagg** *agg\_num*}

---

### Syntax Definitions

*slot/port*                      The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num*                        The link aggregate ID number (0–31).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Specifying a slot/port or link aggregate ID number is required with this command.

### Examples

```
-> show ethernet-service port 1/10
```

```
Interface : 1/10
Port Type  : UNI
  UNI Profile : default-uni-profile
  Default SVLAN : 4095
```

```
Service Name : ipmv_service
  IPMVLAN : 40
  NNI(s) : No NNIs configured
  SAP Id : 2
    UNIs : 1/10
    CVLAN(s) : 100
  sap-profile : translate_profile
```

```
Service Name : svlan_service
  SVLAN : 20
  NNI(s) : No NNIs configured
  SAP Id : 1
    UNIs : 1/10
    CVLAN(s) : 200
  sap-profile : translate_profile
```

```

-> show ethernet-service port 1/22

Interface : 1/22
Port Type : NNI

Service Name : CustomerABC
  SVLAN      : 255
  NNI(s)     : 1/22
  SAP Id     : 10
  UNIs       : 2/10, 2/11

***output definitions***

---

<b>Interface</b>	The slot and port number or link aggregate ID for the specified interface.
<b>Port Type</b>	The type of VLAN Stacking port ( <b>UNI</b> or <b>NNI</b> ).
<b>Service Name</b>	The name of the VLAN Stacking service.
<b>SVLAN or IPMVLAN</b>	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN; IPMVLAN appears as the field name if the VLAN ID is an IP Multicast SVLAN.
<b>NNI(s)</b>	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
<b>SAP Id</b>	The ID number for the VLAN Stacking Service Access Point that is applied to the service (1-1024).
<b>UNIs</b>	VLAN Stacking User Network Interface ports that receive customer traffic.
<b>CVLAN(s)</b>	Customer VLAN IDs ingressing on UNI ports.
<b>sap-profile</b>	The name of the SAP profile associated with the SAP.

---

**Release History**

Release 6.3.1; command was introduced.

## Related Commands

<b>ethernet-service svlan nni</b>	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN, or an IP Multicast VLAN (IPMV).
<b>ethernet-service sap uni</b>	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking SAP.
<b>show ethernet-service</b>	Displays configuration information for VLAN Stacking Ethernet services.

## show ethernet-service nni

Displays configuration information for VLAN Stacking Network Network Interface (NNI) ports.

**show ethernet-services nni** [*slot/port* / **linkagg** *agg\_num*]

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num* The link aggregate ID number (0–31).

### Defaults

By default, all NNI ports are displayed if a slot/port or link aggregate ID number is not specified.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *slot/port* or **linkagg** *agg\_num* parameter to display information for a specific switch port or link aggregate ID.

### Examples

```
-> show ethernet-service nni
```

```
Port  TPID  Legacy STP BPDU Legacy GVRP BPDU Legacy MVRP BPDU Transparent Bridging
-----+-----+-----+-----+-----+-----+-----+-----
1/22  0x8100  Disable          Disable          Disable          Disable
1/23  0x8100  Disable          Disable          Disable          Disable
```

```
- show ethernet-service nni 1/23
```

```
Port  TPID  Legacy STP BPDU Legacy GVRP BPDU Legacy MVRP BPDU Transparent Bridging
-----+-----+-----+-----+-----+-----+-----+-----
1/23  0x8100  Disable          Disable          Disable          Disable
```

### output definitions

---

<b>Port</b>	The slot/port number or link aggregate ID for the NNI port.
<b>TPID</b>	The vendor TPID value configured for the NNI port.
<b>Legacy STP BPDU</b>	Whether or not the NNI port will process STP legacy BPDU.
<b>Legacy GVRP BPDU</b>	Whether or not the NNI port will process GVRP legacy BPDU.
<b>Legacy MVRP BPDU</b>	Whether or not the NNI port will process MVRP legacy BPDU.
<b>Transparent Bridging</b>	Whether or not transparent bridging is enabled for the NNI port.

---

## Release History

Release 6.3.1; command was introduced.

Release 6.3.4; **Transparent Bridging** field added.

Release 6.4.3: **Legacy MVRP BPDU** field added.

## Related Commands

<a href="#">ethernet-service svlan nni</a>	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN, or an IP Multicast VLAN (IPMV).
<a href="#">ethernet-service nni</a>	Configures the vendor TPID value, the legacy BPDU processing status, and the transparent bridging status for a VLAN Stacking NNI port.
<a href="#">show ethernet-service</a>	Displays configuration information for VLAN Stacking Ethernet services.

```

---

## show ethernet-service uni

Displays a list of UNI ports configured for the switch and the profile association for each port.

**show ethernet-services uni** [*slot/port* / **linkagg** *agg\_num*]

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num* The link aggregate ID number (0–31).

### Defaults

By default, profile information for all UNI ports is displayed if a slot/port or link aggregate ID number is not specified.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Specify a slot/port or link aggregate ID number to display information for a single slot/port or link aggregate ID.

### Examples

```
-> show ethernet-service uni
```

```

  Port      UNI Profile
+-----+-----+
  1/1      uni-profile-default
  1/2      multi-site
  1/3      multi-site

```

```
- show ethernet-service uni 1/3
```

```

  Port      UNI Profile
+-----+-----+
  1/3      multi-site

```

#### *output definitions*

---

<b>Port</b>	The slot/port number or link aggregate ID for the UNI port.
<b>UNI Profile</b>	The UNI profile associated with the port.

---

### Release History

Release 6.3.1; command was introduced.

## Related Commands

**ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

**ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.

**show ethernet-service uni-profile** Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

## MIB Objects

```
alaEServiceUniProfileTable  
  alaEServicePortID  
  alaEServicePortProfileID
```

---

## show ethernet-service uni-profile

Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

**show ethernet-service uni-profile** [*uni-profile-name*]

---

### Syntax Definitions

*uni-profile-name*

Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").

### Defaults

By default, all UNI profiles are displayed if a UNI profile name is not specified with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Specify a UNI profile name to display attributes for a single UNI profile.

### Examples

```
-> show ethernet-service uni-profile
Profile Name: default-uni-profile
  Tunnel MAC : 01:00:0c:cd:cd:d0,
  STP : tunnel,      802.1x : drop,      802.3ad : peer,      802.1ab : drop,
  GVRP: tunnel,     AMAP : drop,      OAM : peer,         LACPMARKER : peer,
  UDLD: drop,       PAGP : drop,      CDP : drop,         VTP : drop,
  DTP : drop,       PVST : drop,      VLAN : drop,        UPLINK : drop,
  MVRP: tunnel
```

### output definitions

---

<b>Profile Name</b>	The name of the UNI profile.
<b>Tunnel MAC</b>	The MAC address to be used for mac tunneling.
<b>PROTOCOL: mode</b>	The protocol and configured mode: <b>peer</b> - The UNI port is participating in the specified protocol. <b>drop</b> - Discards the specified PDU <b>tunnel</b> - The PDU is being tunneled across the provider network without modifying the MAC address. <b>mac-tunnel</b> - The PDU is being tunneled across the provider network after changing the destination MAC address.

---

### Release History

Release 6.3.1; command was introduced.

Release 6.4.3; **Tunnel MAC** field and **mac-tunnel** mode were added.

## Related Commands

- ethernet-service uni-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.
- show ethernet-service uni** Displays the profile associations for VLAN Stacking User Network Interface (UNI) ports.

## show ethernet-service sap-profile

Displays the profile attribute configuration for VLAN Stacking Service Access Point (SAP) profiles.

**show ethernet-service sap-profile** *sap-profile-name*

---

### Syntax Definitions

*sap-profile-name*                      Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").

### Defaults

By default, all SAP profiles are displayed if a SAP profile name is not specified with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Specify a SAP profile name to display attributes for a single SAP profile.
- Egress bandwidth can be configured only for SVLANs and not for IPMVLANs.

### Examples

-> show ethernet-service sap-profile

Profile Name	Ingr/Egr Bw	Ingr Bw Sharing	Inner Tag Option	Priority Mapping	Priority Value
audiosap	0/10	Disable	Preserve	fixed	0
default-sap-profile	0/0	Enable	Preserve	fixed	0
sap-video1	0/0	NA	Preserve	in-out	P
sap-conf-video2	10/20	Enable	Preserve	NA	NA

-> show ethernet-service sap-profile sap-video1

Profile Name	Ingr/Egr Bw	Ingr Bw Sharing	Inner Tag Option	Priority Mapping	Priority Value
sap-video1	0/0	NA	Preserve	in-out	P

### output definitions

---

<b>Profile Name</b>	The name of the SAP profile.
<b>Ingr/Egr Bw</b>	The maximum amount of ingress-bandwidth (1=1,000,000 mbps) and egress-bandwidth (0-9999) allowed for SAP ports.

*output definitions*

---

<b>Ingr Bw Sharing</b>	The status of bandwidth sharing ( <b>enable</b> , <b>disable</b> , or <b>NA</b> ). If enabled, the ingress bandwidth value is shared across all SAP ports and CVLANs. If disabled, the bandwidth value is not shared and applied to individual SAP ports and CVLANs. If <b>NA</b> displays in this field, the bandwidth value for the profile is not assigned.
<b>Inner Tag Option</b>	Indicates how the CVLAN tag is processed ( <b>translate</b> or <b>preserve</b> ). If set to <b>preserve</b> , the CVLAN tag is retained and the SVLAN is added to the frame. If set to <b>translate</b> , the CVLAN tag is changed to the SVLAN tag.
<b>Priority Mapping</b>	Indicates how the priority value is configured for the SVLAN ( <b>in-ou</b> , <b>fixed</b> , or <b>NA</b> ). If set to <b>in-out</b> , the CVLAN priority value is mapped to the SVLAN. If set to <b>fixed</b> , a user-specified priority value is used for the SVLAN priority. If set to <b>NA</b> , the priority for the profile is not assigned.
<b>Priority Value</b>	Indicates the priority value mapped to the SVLAN (a number, <b>P</b> , <b>DSCP</b> , or <b>NA</b> ). A number indicates a fixed, user-specified value is used; <b>P</b> indicates the CVLAN 802.1p bit value is used; <b>DSCP</b> indicates the CVLAN DSCP value is used; <b>NA</b> indicates the priority value for the profile is not assigned.

---

**Release History**

Release 6.3.1; command was introduced.

Release 6.4.2; **Egr** (egress bandwidth) field added along with **Ingr** (ingress bandwidth) field.

Release 6.4.3; **NA** used to indicate bandwidth/priority values for the profile are not assigned.

**Related Commands**

<b>ethernet-service sap-profile</b>	Creates a profile for a VLAN Stacking Service Access Point (SAP).
<b>ethernet-service sap</b>	Creates a VLAN Stacking SAP and associates the SAP with a service and SAP profile.
<b>ethernet-service sap sap-profile</b>	Specifies a different SAP profile for the SAP.
<b>show ethernet-service sap</b>	Displays configuration information for VLAN Stacking SAPs.

  alaEServiceSapProfilePriorityMapMode
  alaEServiceSapProfileFixedPriority
  alaEServiceSapProfileIngressBW
  alaEServiceSapProfileEgressBW
  alaEServiceSapProfileBandwidthShare

```

---

## loopback-test

Configures a wire-speed Ethernet loopback test profile and enables or disables the activation of the profile. The loopback test profile specifies the switch attributes that are required to conduct an ingress or egress loopback operation on a switch port.

```
loopback-test profile_name source-mac src_address destination-mac dest_address vlan vlan_id  
loopback-port slot/port type {inward | outward}
```

```
loopback-test profile_name {enable | disable}
```

```
no loopback-test profile_name
```

---

### Syntax Definitions

<i>profile_name</i>	Alphanumeric string of up to 31 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).
<i>src_address</i>	A unique source MAC address for the test frame.
<i>dest_address</i>	A unique destination MAC address for the test frame.
<i>vlan_id</i>	The VLAN ID of the test frame. Always use the outer VLAN ID.
<i>slot/port</i>	The switch port number to use for the loopback test.
<b>inward</b>	Sets the type of loopback test to ingress.
<b>outward</b>	Sets the type of loopback test to egress.
<b>enable</b>	Enables the loopback test profile.
<b>disable</b>	Disables the loopback test profile.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Use the **no** form of this command to delete a loopback profile.
- Use the **loopback-test enable** command to enable the loopback test profile on the specified port. When the profile is enabled, the loopback operation is enabled for the port.
- Use the **loopback-test disable** command to disable the loopback operation for the specified port.
- Once a UNI or NNI port is designated as a loopback port, the port is no longer eligible to participate in other switch functions. In addition, an outward loopback port goes “out-of-service” and will no longer carry customer traffic but remains active for test frame traffic. However, an inward loopback port remains “in-service” and will continue to carry customer traffic as well as test frame traffic.

- Only Layer 2 loopback tests are supported, so test frames are not routed. As a result, the loopback test operation will only swap the source and destination MAC address of bridged test frames.
- In a typical ingress loopback scenario, specifying the switch base MAC address as the destination address is recommended. In a typical egress loopback scenario, a customer premises equipment (CPE) MAC address can be used, but configuring and using a static MAC address on the egress loopback port is recommended.
- The port specified for an inward loopback test is the port on which test frames are received and looped back. The port specified for an outward test is the egress destination port on which test frames are looped back. The loopback operation performed on the specified port swaps the source and destination MAC address of the test frame and then forwards the frame back to the test head.
- The switch creates a static MAC address entry for the egress port when the outward loopback profile is applied on that port. The static address created is the destination MAC address specified in the profile. If the switch receives a non-test frame that contains the same MAC address, both the test and non-test frames are filtered even if they were received on different ports.
- If the MAC addresses specified in the loopback test profile are actual network address (for example, 02:da:95:e1:22:10, not aa:aa:aa:aa:aa:aa), flush the MAC address table for the switch when the loopback test is finished.

## Examples

The following command examples create an ingress UNI and NNI test profile:

```
-> loopback-test PE1-inward-UNI source-mac 00:00:00:dd:aa:01 destination-mac
00:00:00:cc:aa:bb vlan 1001 loopback-port 1/1 type inward

-> loopback-test PE2-inward-NNI source-mac 00:00:00:dd:aa:02 destination-mac
00:00:00:cc:aa:bc vlan 1001 loopback-port 2/1 type inward
```

The following command examples create an egress UNI and NNI test profile:

```
-> loopback-test PE2-outward-UNI source-mac 00:00:00:dd:ab:01 destination-mac
00:00:00:cc:ab:bb vlan 1001 loopback-port 1/1 type outward

-> loopback-test PE1-outward-NNI source-mac 00:00:00:cc:ab:bb destination-mac
00:00:00:dd:ab:01b vlan 1001 loopback-port 2/1 type outward
```

The following command examples enable and disable a loopback test profile:

```
-> loopback-test PE1-outward-UNI enable
-> loopback-test PE1-outward-UNI disable
```

## Release History

Release 6.4.3; command was introduced.

## show loopback-test

Displays the profile configuration for a hardware loopback test profile.

```
show loopback-test [profile_name]
```

---

### Syntax Definitions

*profile\_name*                      The name of an existing hardware loopback test profile.

### Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *profile\_name* parameter to display the loopback test configuration for a specific profile.

### Examples

```
-> show loopback-test
Profile-Name      Src-Mac                Dest-Mac                Vlan   Port   Type   Status

# 45 Ethernet OAM Commands

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

*Filename:* AlcatelIND1Eoam.MIB  
*Module:* Alcatel-IND1-ETHERNET-OAM-MIB

*Filename:* IETF\_802\_1ag.MI  
*Module:* IEEE8021-CFM-MIB

A summary of the available commands is listed here:

## ethoam vlan

Creates an association between Primary VID and Non-Primary VID(s).

**ethoam vlan** {*vlanid-list*} **primary-vlan** {*vlan-id*}

**no ethoam vlan** {*vlanid-list*}

---

### Syntax Definitions

*vlanid-list* VLAN Identifier List e.g. '10 30-40' or '10'

*vlan-id* VLAN Identifier e.g. '20'

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID only.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either 'mhf' is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan <vid>) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the **no** form of this command to dissociate Primary VID from the Non-Primary VID(s).

### Examples

```
-> ethoam vlan 10 primary-vlan 20
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10
```

### Release History

Release 6.4.3; command was introduced

## Related Commands

### `show ethoam vlan`

Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

---

## ethoam domain

Creates an Ethernet domain with a specific name.

**ethoam domain** *name* **format** {**none** | **dnsname** | **mac-address-uint** | **string**}  
**level** *num*

**no ethoam domain** *name*

---

### Syntax Definitions

<i>name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	This format is supported for the inter-op with ITU-T Y.1731.
<b>string</b>	Character String.
<b>mac-address-uint</b>	MAC address + 2-octet (unsigned) integer.
<b>dnsname</b>	Domain Name like string, globally unique text string derived from a DNS name.
<i>num</i>	MD Level and it ranges from 0 to 7

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Maximum domain length is 43.
- Use format as 'none' for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs and MIPs configured in it.

### Examples

```
-> ethoam domain MD format none level 3  
-> ethoam domain MD1 format string level 4
```

### Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **carriercode**, **countrycode**, **vpnId** parameters deleted; **mac-address** parameter replaced with **mac-address-uint** parameter; **level** and *mac\_address* parameters added.

Release 6.4.3 *domain\_name / mac\_address, level\_num* parameters replaced with *name,num* parameters; **none** parameter added.

## Related Commands

### **show ethoam**

Displays the information of all the Management Domains (MD) configured on the bridge.

### **show ethoam domain**

Displays the information of a specific Management Domain configured on the bridge.

## MIB Objects

```
dotlagCfmMdTable  
  dotlagCfmMdName  
  dotlagCfmMdFormat  
  dotlagCfmMdLevel
```

---

## ethoam domain mhf

Configure the Message Handling Function (MHF) value for MD entry.

**ethoam domain** *name* **mhf** {**none** | **explicit** | **default**}

---

### Syntax Definitions

<i>name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>none</b>   <b>explicit</b>   <b>default</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Domain must be created before it is modified.

### Examples

```
-> ethoam domain MD mhf default
```

### Release History

Release 6.3.1; command was introduced.

Release 6.4.3 *domain\_name* / *mac\_address* parameters replaced with *name* parameters; **none** parameter added.

### Related Commands

[show ethoam](#) Displays the information of all the Management Domains (MD) configured on the bridge.

### MIB Objects

```
dot1agCfmMdTable  
dot1agCfmMdName  
dot1agCfmMdMhfCreation
```

---

## ethoam domain id-permission

Configures the ID-permission value for MD entry.

**ethoam domain** *name* **id-permission** {**none** | **chassisid**}

---

### Syntax Definitions

<i>name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present. System name shall be filled as Chassis ID.

### Defaults

parameter	default
<b>none</b>   <b>chassisid</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Domain must be created before it is modified.

### Examples

```
-> ethoam domain MD id-permission chassisid
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

<a href="#">show ethoam default-domain configuration</a>	Displays the values of scalar Default-MD objects.
<a href="#">show ethoam domain</a>	Displays the information of a specific Management Domain configured on the bridge.

### MIB Objects

```
dotlagCfmMdTable
  dotlagCfmMdName
  dotlagCfmMdIdPermission
```

---

## ethoam association

Creates Maintenance Association (MA) entry.

```
ethoam association ma_name format {vpnid | unsignedint | string | primaryvid | icc-based} domain  
md_name primary-vlan vlan-id
```

```
no ethoam association ma_name domain md_name
```

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<b>vpnid</b>	As specified in RFC 2685 VPN ID.
<b>unsignedint</b>	2-octet unsigned integer.
<b>string</b>	Character String.
<b>primaryvid</b>	Primary VLAN ID (12 bits represented in a 2-octet integer).
<b>icc-based</b>	This format is supported for inter-op with ITU-T.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>vlan-id</i>	Primary VLAN Identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as 'icc-based' to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.

### Examples

```
-> ethoam association MA format string domain MD primary-vlan 100
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **primaryVid** and *mac\_address* parameters added; **level** parameter deleted.

Release 6.4.3; **icc-based** parameter added.

## Related Commands

**show ethoam domain  
association**

Displays the information of a specified MA in a Management Domain configured on the bridge.

## MIB Objects

```
dotlagCfmMaNetTable
  dotlagCfmMaNetFormat

  dotlagCfmMaComponentId
  dotlagCfmMaCompPrimaryVid
  dotlagCfmMaCompRowStatus
```

---

## ethoam association mhf

Configures the MIP Half Function (MHF) value for MA Entry.

**ethoam association** *ma\_name* **domain** *md\_name* **mhf** {**none** | **default** | **explicit** | **defer**}

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.
<b>defer</b>	The creation of MHFs is determined by the corresponding MD object 'dot1agCfmMdMhfCreation'.

### Defaults

---

parameter	default
<b>none</b>   <b>explicit</b>   <b>default</b>   <b>defer</b>	<b>defer</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- MA must be created before it is modified.
- On modification of 'mhf' for any MA, Automip shall also be invoked for all VLANS associated with this primary VID.

### Examples

```
-> ethoam association MA domain MD mhf-creation defer
```

### Release History

Release 6.2.1; command was introduced.  
Release 6.3.1; *mac\_address* parameter added.  
Release 6.4.3; command was introduced.

## Related Commands

**show ethoam domain association** Displays the information of a specified MA in a Management Domain configured on the bridge.

**show ethoam default-domain** Displays the information of the default MA.

## MIB Objects

dot1agCfmMaNetTable

dot1agCfmMaNetName

dot1agCfmMaCompMhfCreation

---

## ethoam association id-permission

Configure id-permission value for MA Entry.

```
ethoam association ma_name domain md_name md_name id-permission {none | chassisid | defer}
```

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
<b>defer</b>	The contents of the Sender ID TLV are determined by the corresponding MD object 'dot1agCfmMdIdPermission'.

### Defaults

---

parameter	default
none   chassisid   defer	defer

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- MA must be created before it is modified.

### Examples

```
-> ethoam association MA domain MD id-permission defer
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**show ethoam domain  
association**

Displays the information of a specified MA in a Management Domain configured on the bridge.

**show ethoam domain**

dot1agCfmMaNetName

dot1agCfmMaCompTable

dot1agCfmMaCompMidPermission

---

## ethoam association ccm-interval

Modifies the Continuity Check Message (CCM) transmission interval of an Ethernet OAM Maintenance Association.

**ethoam association** *association\_name* **domain** {*domain\_name* | *mac\_address*}  
**ccm-interval** {**interval-invalid** | **interval100ms** | **interval1s** | **interval10s** | **interval1m** | **interval10m**}

---

### Syntax Definitions

<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 45-5</a> .
<b>interval-invalid</b>	Specifies that no CCMs are sent by a MEP
<b>interval100ms</b>	Specifies the CCMs are sent every 100 milli seconds.
<b>interval1s</b>	Specifies that CCMs are sent every 1 second.
<b>interval10s</b>	Specifies that CCMs are sent every 10 seconds.
<b>interval1m</b>	Specifies that CCMs are sent every minute.
<b>interval10m</b>	Specifies that CCMs are sent every 10 minutes.

### Defaults

parameter	default
<b>interval-invalid</b>   <b>interval100ms</b>   <b>interval1s</b>   <b>interval10s</b>   <b>interval1m</b>   <b>interval10m</b>	<b>interval10s</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The *ma\_name* should be unique amid all those used by or available to the service provider within a domain.

### Examples

```
-> ethoam association MA domain MD ccm-interval interval10s
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **intervalnone** parameter replaced with **interval-invalid** parameter; **interval1m**, **interval10m**, and *mac\_address* parameters added; **interval60s** parameter deleted.

Release 6.4.4; **interval100ms** parameter added.

## Related Commands

**show ethoam domain**

Displays the information of a specific Management Domain configured on the bridge.

## MIB Objects

---

## ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

**ethoam association** *ma\_name* **domain** {*md\_name* | *mac\_add*}  
**endpoint-list** *mep\_id*[-*mep\_id2*]

**no ethoam association** *association\_name* **domain** {*domain\_name* | *mac\_add*}  
**endpoint-list** *mep\_id*[-*mep\_id2*]

---

### Syntax Definitions

<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus domain name length) characters may be used.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 45-5</a>
<i>mac_add</i>	Specifies the CFM system MAC address.
<i>mep_id</i>	Specifies the MEP number.
<i>mep_id2</i>	Last MEP number in a range of MEPs you want to configure.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The *ma\_name* should be unique within a domain.

### Examples

```
-> ethoam association MA domain MD endpoint-list 100-200  
-> no ethoam association MA domain MD endpoint-list 100-200
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

**show ethoam domain  
association**

Displays the information of a specified MA in a Management Domain configured on the bridge.

    dotlagCfmMaMepListRowStatus
```

---

## clear ethoam statistics

Clear statistics for all MEPs or for a particular MEP.

**clear ethoam statistics** [**domain** *domain* **association** *association* **endpoint** *mep-id*]

---

### Syntax Definitions

<i>domain</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>association</i>	Association name for the created Ethernet OAM Association.
<i>mep-id</i>	MEP Identifier. Valid Range is 1-8191.

### Defaults

None

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

None

### Examples

```
-> clear ethoam statistics
-> clear ethoam statistics domain MD association MA endpoint 10
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[show ethoam statistics](#) Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

### MIB Objects

dotlagCfmMdTable
    dotlagCfmMdName
dotlagCfmMaNetTable
    dotlagCfmMaNetName
dotlagCfmMepTable
    dotlagCfmMepIdentifier
    alaCfmMepClearStats
    alaCfmGlobalClearStats
```

---

## ethoam default-domain mhf

Configure the effective MHF value for all default domain entries with MHF value set to **defer**.

**ethoam default-domain mhf {none | default | explicit}**

**no ethoam default-domain**

---

### Syntax Definitions

<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level. Defaults

### Defaults

Default value is none.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ethoam default-domain mhf default
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[show ethoam default-domain configuration](#) Displays the values of scalar Default-MD objects.

### MIB Objects

```
dot1agCfmDefaultMdDefMhfCreation
```

---

---

## ethoam default-domain id-permission

Configures the effective ID permission value for all default domain entries with the ID permission value set to **defer**.

**ethoam default-domain id-permission {none | chassisid}**

**no ethoam default-domain**

---

### Syntax Definitions

<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

### Defaults

Default value is none.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> ethoam default-domain id-permission chassisid
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

**show ethoam default-domain configuration** Displays the default domain configuration.

### MIB Objects

dot1agCfmDefaultMdDefIdPermission

---

## ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

**ethoam default-domain primary-vlan** {*vlan-id*} [level {no-level | *num*}] [mhf {none | default | explicit | defer}] [id-permission {none | chassisid | defer}]

**no ethoam default-domain**

---

### Syntax Definitions

<i>vlan-id</i>	VLAN Identifier.
<b>no-level</b>	MD level is inherited from the default domain level.
<i>num</i>	MD Level. Valid range is 0 to 7.
<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.
<b>defer</b>	MHF defers to the default domain MHF value.
<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
<b>defer</b>	ID permission defers to the default domain ID permission value.

### Defaults

parameter	default
no-level / <i>num</i>	no-level
none   explicit   default   defer	defer
none   chassisid   defer	defer

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANS associated with this primary VID.

## Examples

```
-> ethoam default-domain primary-vlan 10 id-permission chassisid level 3 mhf default.  
-> ethoam default-domain primary-vlan 10 id-permission chassisid  
-> ethoam default-domain primary-vlan 10 level 3  
-> ethoam default-domain primary-vlan 10 mhf default  
-> ethoam default-domain primary-vlan 10 level 3 mhf default
```

## Release History

Release 6.3.1; command was introduced.

Release 6.4.3; command was introduced.

## Related Commands

**show ethoam default-domain** Displays the information of all the default MD.

## MIB Objects

```
dot1agCfmDefaultMdTable  
  dot1agCfmDefaultMdComponentId  
  dot1agCfmDefaultMdPrimaryVid  
  dot1agCfmDefaultMdLevel
```

---

## ethoam endpoint

Creates a Maintenance End Point (MEP) and virtual MEP.

**ethoam endpoint** *mep-id* **domain** *md\_name* **association** *ma\_name* **direction** { **up** | **down** } {**port** {*slot/*  
*port* | **virtual** | **linkagg** *agg\_id*} [**primary-vlan** *vlan\_id*]

**no ethoam endpoint** *mep-id* **domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<b>up</b>	For UP MEP.
<b>down</b>	For DOWN MEP.
<i>slot/port</i>	Physical slot and port number on which MEP needs to be created.
<b>virtual</b>	Keyword for creating virtual MEP.
<i>agg_id</i>	Linkagg Identifier on which MEP needs to be created.
<i>vlan_id</i>	VLAN identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to delete a maintenance endpoint.
- The *mep\_id* must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.
- For creating a virtual MEP the value of port must be given the keyword “virtual”.

## Examples

```
-> ethoam endpoint 10 domain MD association MA direction up port 1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-
vlan 100
-> no ethoam endpoint 10 domain MD association MA
```

## Release History

Release 6.4.3; command was introduced.

Release 6.4.4; **virtual** parameter added.

## Related Commands

[show ethoam domain  
association end-point](#)

Displays the information of a specific MEP in a Management Domain configured on the bridge.

## MIB Objects

  dotlagCfmMepIfIndex
  dotlagCfmMepPrimaryVid
```

---

## ethoam endpoint admin-state

Configures the administrative state of MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>association_name</i>	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<b>enable</b>	Administratively enables MEP.
<b>disable</b>	Administratively disables MEP.

### Defaults

The default value is **disable**.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The *mep\_id* specified must already exist in the switch configuration.

### Examples

```
-> ethoam endpoint 100 domain MD association MA admin-state enable
```

### Release History

Release 6.2.1; command was introduced.  
Release 6.3.1; *mac\_address* parameter added.

---

## ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **rfp** {**enable** | **disable**}

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<b>enable</b>	Administratively enables RFP on MEP.
<b>disable</b>	Administratively disables RFP on MEP.

### Defaults

The default value of RFP is disable.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The *mep\_id* specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.

### Examples

```
-> ethoam endpoint 1 domain md1 association ma1 rfp enable
```

## Release History

Release 6.4.4; command was introduced.

## Related Commands

[show ethoam domain association end-point](#)

Displays the information of a specific MEP in a Management Domain configured on the bridge.

## MIB Objects

```

dotlagCfmMepTable
  dotlagCfmMepIdentifier
  dotlagCfmRfpEnabled
```

---

## ethoam endpoint ccm

Configures the MEP to generate Continuity Check Messages (CCM).

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name  
ccm {enable | disable}
```

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM association. Up to 48 (minus the domain name length) characters may be used.
<b>enable</b>	Enables MEP to generate CCMS.
<b>disable</b>	Disables MEP to generate CCMS.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain MD association MA ccm enable
```

### Release History

Release 6.2.1; command was introduced.  
Release 6.3.1; *mac\_address* parameter added.

### Related Commands

## ethoam endpoint priority

Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **priority**  
*ccm\_ltm\_priority*

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 45-5</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>ccm_ltm_priority</i>	Priority value for CCMs and LTMs transmitted by the MEP. The valid range is 0–7.

### Defaults

---

parameter	default
<i>ccm_ltm_priority</i>	7

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain MD association MA priority 6
```

### Release History

Release 6.2.1; command was introduced.  
Release 6.3.1; *mac\_address* parameter added.

## ethoam endpoint lowest-priority-defect

Configures the lowest priority fault alarm for the lowest priority defect for a MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **lowest-priority-defect** *lowest\_priority\_defect*

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 45-5</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>lowest_priority_defect</i>	The lowest priority defect that can generate a Fault alarm. Possible values are <b>xcon</b> , <b>rem-err-xcon</b> , <b>no-defect</b> , <b>mac-rem-err-xcon</b> , <b>err-xcon</b> , and <b>all-defect</b> .

### Defaults

parameter	default
<i>lowest_priority_defect</i>	mac-rem-err-xcon

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain esd.alcatel-lucent.com association alcatel-sales
lowest-priority-defect all-defect
```

### Release History

Release 6.3.1; command was introduced.

## ethoam linktrace

Enables the maintenance entity to initiate transmitting Link Trace Messages (LTM).

**ethoam linktrace** {**target-macaddress** *mac\_address* | **target-endpoint** *t-mepid*} **source-endpoint** *s-mepid* **domain** {*d-name* | *mac\_add*} **association** *a-name* [**flag** [**fdb-mpdb** | **fdbonly**]] [**hop-count** *hop\_count*]

---

### Syntax Definitions

<i>mac_add</i>	Target MAC address to be transmitted.
<i>t-mepid</i>	Specifies the MEP for which the Loopback message is targeted.
<i>s-mepid</i>	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
<i>d-name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<b>domain</b> <i>mac_address</i>	Specifies the CFM system MAC address.
<i>a-name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<b>fdbonly</b>	Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.
<i>hop_count</i>	Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2 <sup>32</sup> .

### Defaults

parameter	default
<b>flag</b>	<b>fdbonly</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.

## Examples

```
-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD associa-  
tion flag fdbonly hop-count 32  
Transaction Id: 6943
```

```
-> ethoam linktrace target-endpoint 15 source 4 domain MD association  
Transaction Id: 6934
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **target-macaddress**, **target-endpoint**, **source-endpoint**, and **domain** *mac\_address* parameters added; **end-point** parameter deleted.

## Related Commands

### [show ethoam domain](#)

---

## ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

**ethoam loopback** {**target-endpoint** *t-mepid* | **target-macaddress** *mac\_add*} **source-endpoint** *s-mepid* **domain** *d-name* **association** *a-name* [**number** *num*] [**data** *string*] [**vlan-priority** *vlan-priority*] [**drop-eligible** { **true** | **false** }]

---

### Syntax Definitions

<i>t-mepid</i>	Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.
<i>mac_add</i>	Target MAC address to be transmitted.
<i>s-mepid</i>	Specifies the MEP that transmits the Loopback message. The valid range is 1-8191.
<i>d-name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>a-name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>num</i>	Number of loopback messages. Valid range is 1-10.
<i>string</i>	Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1-255.
<i>vlan-priority</i>	VLAN Priority. Valid Range is 0-7.
<b>true</b>	Sets the drop eligibility bit in the VLAN tag to true.
<b>false</b>	Sets the drop eligibility bit in the VLAN tag to false.

### Defaults

parameter	default
<i>num</i>	1
<i>vlan-priority</i>	CCM priority
<b>drop-eligible</b> { <b>true</b>   <b>false</b> }	<b>true</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

## Examples

```
-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA
number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms
Reply form 00:0E:B1:6B:43:89: bytes=64 seq=0 time=112ms
Request timed out.
----00:E0:B1:6B:43:89 ETH-LB Statistics----
3 packets transmitted, 2 packets received, 33% packet loss
round-trip (ms)  min/avg/max = 100/106/112
```

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **target-macaddress**, **target-endpoint**, **source-endpoint**, and **domain** *mac\_address* parameters added; **end-point** parameter deleted.

```

## ethoam fault-alarm-time

Configures the timeout value for the Fault Notification Generation Alarm time that specifies the time interval during which one or more defects should be detected before the fault alarm is issued.

**ethoam fault-alarm-time** *centiseconds* **endpoint** *endpoint\_id* **domain** {*md\_name* | *mac\_address*}  
**association** *ma\_name*

**no ethoam fault-alarm-time** **endpoint** *endpoint\_id* **domain** {*md\_name* | *mac\_address*}  
**association** *ma\_name*

---

### Syntax Definitions

<i>centiseconds</i>	The Fault Notification Generation Alarm timeout value, in centiseconds. The valid range is 250–1000.
<i>endpoint_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 45-5</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>centiseconds</i>	250

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

### Examples

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.alcatel-lucent.com associa-  
tion alcatel_sales  
-> no ethoam fault-alarm-time endpoint 100 domain esd.alcatel-lucent.com associa-  
tion alcatel_sales
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

dotlagCfmMepFngAlarmTime

---

## ethoam fault-reset-time

Configures the timer value for the Fault Notification Generation Reset time that specifies the time interval during which the fault alarm is re-enabled to process faults. The fault alarm will only be re-enabled if no new faults are received during this time interval.

**ethoam fault-reset-time** *centiseconds* **endpoint** *endpoint\_id* **domain** {*mac\_add* | *d-name*} **association** *a-name*

**no ethoam fault-reset-time endpoint** *endpoint\_id* **domain** {*mac\_add* | *d-name*} **association** *a-name*

---

### Syntax Definitions

<i>centiseconds</i>	The Fault Notification Generation Reset timer value, in centi seconds. The valid range is 250–1000.
<i>mep-id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>d-name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam vlan command on page 45-3</a> .
<i>a-name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

### Defaults

parameter	default
<i>centiseconds</i>	1000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Reset timeout value to the default value.
- The Fault Notification Generation Reset timer value is configurable per MEP.

### Examples

```
-> ethoam fault-reset-time 250 end-point 100 domain esd.alcatel-lucent.com associa-
tion alcatel_sales
-> no ethoam fault-reset-time end-point 100 domain esd.alcatel-lucent.com associa-
tion alcatel_sales
```

### Release History

## ethoam one-way-delay

Initiates a one-way-delay measurement (1DM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

**ethoam one-way-delay** {**target-endpoint** *t-mepid* | **target-macaddress** *mac\_add*} **source-endpoint** *s-mepid* **domain** *domain* **association** *association* [**vlan-priority** *vlan-priority*]

---

### Syntax Definitions

<i>t-mepid</i>	Target MEP-ID. Valid Range 1-8191.
<i>mac_add</i>	Target MAC-Address.
<i>s-mepid</i>	Source MEP-ID. Valid Range 1-8191.
<i>domain</i>	The maintenance domain name.
<i>association</i>	The maintenance association name.
<i>vlan-priority</i>	VLAN Priority. Valid Range is 0-7.

### Defaults

parameter	default
<i>vlan-priority</i>	7

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating 1DM.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if its status is RMEP\_OK or RMEP\_FAILED, before initiating 1DM. So target-macaddress can be used to bypass such a restriction.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- If the 1DM is initiated with a **target-macaddress** and an egress port is found for this MAC address, then the 1DM frames are transmitted from that port. Otherwise, 1DM frames are flooded in the MEP's VLAN.
- One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

### Examples

```
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association MA vlan-priority 4
```

```
-> ethoam one-way-dealy target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
```

## Release History

Release 6.4.3; command was introduced

  alaCfmMepOWDTPriority
```

---

## ethoam two-way-delay

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

**ethoam two-way-delay** {**target-endpoint** *t-mepid* | **target-macaddress** *mac\_add*} **source-endpoint** *s-mepid* **domain** *domain* **association** *association* [**vlan-priority** *vlan-priority*]

---

### Syntax Definitions

<i>t-mepid</i>	Target MEP-ID. Valid Range 1-8191.
<i>mac_add</i>	Target MAC-Address.
<i>s-mepid</i>	Source MEP-ID. Valid Range 1-8191.
<i>domain</i>	The maintenance domain name.
<i>association</i>	The maintenance association name.
<i>vlan-priority</i>	VLAN Priority. Valid Range is 0-7.

### Defaults

---

parameter	default
<i>vlan-priority</i>	7

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if the status is RMEP\_OK or RMEP\_FAILED, before initiating two-way-delay. So **target-macaddress** can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.
- If the DMM is initiated by UP MEP with a **target-macaddress** and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP's VLAN.
- Two-way delay measurement does *not* require NTP clock synchronization on the sending and receiving MEPs.

- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure a SAA for continuous two-way frame delay measurement.

## Examples

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD association MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12 domain MD association MA vlan-priority 4
Reply from 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

## show ethoam domain association

Displays the information of a specific MA in a Management Domain configured on the bridge.

**show ethoam domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

*md\_name* Specifies the domain name.

*ma\_name* Name of the Ethernet OAM Association.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ethoam domain MD association MA
Total number of MEPs configured in this MA = 1
MA-Format : string,
Primary Vlan : 100,
Associated Vlan-list : none,
Total Number of Vlans : 1,
MA-MHFstatus : mhfDefer,
MA-IdPermission : sendIdDefer,
CCM-interval : interval10s,
MEP-List(MEP-Id) : 1-5,
```

Legend: MEP-Id: \* = Inactive Endpoint

MEP-ID	Admin State	Direction	Mac-Address	Port	Primary Vlan
1	disable	up	00:E0:B1:A0:78:A3	virtual	100

### output definitions

---

<b>Primary Vlan</b>	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
<b>MA-MHFstatus</b>	Indicates whether the maintenance entity can create MHFs for this MA. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> .
<b>CCM-interval</b>	The interval between the CCM transmissions.
<b>MEP-ID</b>	Indicates the Maintenance End Point.

*output definitions (continued)*

---

<b>Admin State</b>	Indicates the administrative state ( <b>up</b> or <b>down</b> ) of the MEP.
<b>Direction</b>	The direction of the MEP.
<b>MAC Address</b>	The MAC address of the MEP.
<b>Port</b>	The slot/port number of the Bridge port to which the MEP is attached.

---

**Release History**

Release 6.2.1; command was introduced.

Release 6.3.4; *mac\_address* parameter deleted.

## show ethoam domain association end-point

Displays the information of a specific MEP in a Management Domain configured on the bridge.

**show ethoam domain** *md\_name* **association** *ma\_name* **end-point** *mep-id*

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>mep-id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ethoam domain MD association MA endpoint 10
Admin State : disable,
Direction : up,
Slot/Port: virtual,
MacAddress: 00:E0:B1:A0:78:A3,
Fault Notification : FNG_RESET,
CCM Enabled : disabled,
RFP Status : enabled,
CCM Linktrace Priority : 7,
CCM Not Received : false,
CCM Error defect : false,
CCM Xcon defect : false,
MEP RDI defect : false,
MEP Last CCM Fault : not specified,
MEP Xcon Last CCM Fault : not specified,
MEP Error Mac Status : false,
MEP Lbm NextSeqNumber : 0,
MEP Ltm NextSeqNumber : 32157,
Fault Alarm Time : 250,
Fault Reset Time : 1000,
Lowest PrDefect Allowed : DEF_MAC_REM_ERR_XCON,
Highest PrDefect Present : DEF_NONE
```

*output definitions*

---

<b>Admin State</b>	Indicates the administrative state ( <b>up</b> or <b>down</b> ) of the MEP.
<b>Direction</b>	The direction of the MEP.
<b>Slot/Port</b>	The slot/port number of the Bridge port to which the MEP is attached.If the value is virtual, it indicates a virtual port.
<b>MAC Address</b>	The MAC address of the MEP.
<b>Fault Notification</b>	Indicates the current state of the MEP Fault Notification Generator State Machine, which can be <b>FNG_RESET</b> , <b>FNG_DEFECT</b> , <b>FNG_REPORT_DEFECT</b> , <b>FNG_DEFECT_REPORTED</b> , or <b>FNG_DEFECT_CLEARING</b> .
<b>RFP Status</b>	Indicates the status of the RFP.
<b>CCM Enabled</b>	Indicates whether the MEP generates CCMs ( <b>enabled</b> ) or not ( <b>disabled</b> ).
<b>CCM Linktrace Priority</b>	Indicates the priority value for CCMs and LTM s transmitted by the MEP.
<b>CCM Not Received</b>	Indicates if CCMs are not being received ( <b>true</b> ) or received ( <b>false</b> ) from at least one of the configured remote MEPs.
<b>CCM Error defect</b>	Indicates if a stream of erroneous CCMs is being received ( <b>true</b> ) or not ( <b>false</b> ) from a MEP in this MA.
<b>CCM Xcon defect</b>	Indicates if a stream of CCMs is being received ( <b>true</b> ) or not ( <b>false</b> ) from a MEP that belongs to another MA.
<b>MEP RDI Received</b>	Indicates that any other MEP in this MA is transmitting the RDI bit. Options include <b>true</b> or <b>false</b> .
<b>MEP Last CCM Fault</b>	The last-received CCM that triggered a MA fault.
<b>MEP Xcon Last CCM Fault</b>	The last-received CCM that triggered a cross-connect fault.
<b>MEP Error Mac Status</b>	Indicates a port status TLV. Options include <b>true</b> or <b>false</b> .
<b>MEP Lbm NextSeqNumber</b>	The next Transaction Identifier or Sequence Number to be sent in an LBM.
<b>MEP Ltm NextSeqNumber</b>	The next Transaction Identifier or Sequence Number to be sent in an LTM.
<b>Fault Alarm Time</b>	The time interval during which one or more defects should be detected before the fault alarm is issued
<b>Fault Reset Time</b>	The time interval during which the fault alarm is re-enabled to process faults
<b>Lowest PrDefect Allowed</b>	The lowest priority defect that allowed to generate fault alarm.
<b>Highest PrDefect Present</b>	The highest priority defect since the MEPs Fault Notification Generator in reset state.

---

## show ethoam default-domain configuration

Displays the level, MHF, and ID permission values for the default domain.

**show ethoam default-domain configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ethoam default-domain configuration
Level : 3,
MHF-Creation : mhfddefault,
ID-Permission : sendIdnone
```

### *output definitions*

---

<b>Level</b>	The level assigned to the default domain. Configured through the <a href="#">ethoam default-domain level</a> command.
<b>MHF-creation</b>	Indicates the MHF value for a VLAN that is part of the default MD. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> . Configured through the <a href="#">ethoam default-domain mhf</a> command.
<b>ID-Permission</b>	The ID permission of the default domain. Configured through the <a href="#">ethoam default-domain id-permission</a> command.

---

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[show ethoam default-domain](#) Displays the primary VLAN configuration for the default domain.

## show ethoam remote-endpoint domain

Displays the information of all remote MEPs learned as a part of the CCM message exchange.

**show ethoam remote-endpoint domain** *d\_name* **association** *a\_name* **end-point** *s-mepid* [**remote-mep** *r-mepid*]

---

### Syntax Definitions

<i>d_name</i>	Specifies the domain name.
<i>a_name</i>	Specifies the name of the Ethernet OAM Association.
<i>s-mepid</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>r-mepid</i>	The remote MEP. The valid range is 1–8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ethoam remote-endpoint domain MD association MA endpoint 10
Legends: PortStatusTlv: 1 = psBlocked, 2 = psUp, 0 = psNoTlv
         InterfaceStatusTlv: 1 = ifUp, 2 = ifDown, 4 = ifUnknown, 0=ifNoTlv
```

RMEP-ID	RMEP Status	OkFailed Time	Mac Address	port Tlv	I/f Tlv	RDI value	Ch-id Subtype	Ch-id
20	RMEP_OK	634600	00:E0:B1:6E:41:65	2	1	false	LCL-ASND	DUT-1
30	RMEP_OK	334600	00:E0:B1:6E:41:64	2	1	false	LCL-ASND	DUT-2

### output definitions

---

<b>MEP-ID</b>	Indicates the Maintenance End Point.
<b>RMEP Status</b>	The operational state of the remote MEP Remote State machines for this MEP, which can be <b>RMEP_IDLE</b> , <b>RMEP_START</b> , <b>RMEP_FAILED</b> , or <b>RMEP_OK</b> .
<b>OkFailed Time</b>	The time (SysUpTime) when the Remote MEP state machine last entered either the <b>RMEP_FAILED</b> or <b>RMEP_OK</b> .
<b>MacAddress</b>	The MAC address of the remote MEP.

*output definitions (continued)*

---

<b>Port Status Tlv</b>	The MAC status TLV last received.
<b>I/f Status Tlv</b>	The interface status TLV last received.

---

**Note:** - Output shown above is not accurate as it is adjusted to display it in the single row. Following are modified:

P/S Tlv - Port Status Tlv  
 I/F Tlv - I/F Status Tlv  
 Ch-id Subtype - Chassis ID Subtype  
 Ch-id - Chassis ID  
 LCL-ASND - LOCALLY\_ASSIGNED

**Release History**

Release 6.3.4; command was introduced.

**Related Commands**

## show ethoam cfmstack

Displays the contents of CFM Stack Managed Object, which determines the relationships among MEPs and MIPs on a specific bridge port.

**show ethoam cfmstack** {port *slot/port* | **virtual** | **linkagg** *agg\_num*}

---

### Syntax Definitions

<i>slot/port</i>	Slot and port number for which the contents of the configured MEP or MIP will be displayed.
<i>agg_num</i>	The aggregate ID for which the contents of the configured MEP or MIP will be displayed.
virtual	Virtual port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ethoam cfmstack port 1/3
Up MHF Configured:
  Vlan-id: 100,
  Direction: up,

## show ethoam linktrace-reply

Displays the content of the Linktrace reply (LTR) returned by a previously transmitted LTM. This command displays the LTR based on the transaction identifier or sequence number of the LTM for which the LTR is to be displayed.

**show ethoam linktrace-reply domain** *d-name* **association** *a-name* **endpoint** *s-mepid* **tran-id** *num*

---

### Syntax Definitions

<i>d-name</i>	Specifies the domain name.
<i>a-name</i>	Name of the Ethernet OAM Association.
<i>s-mepid</i>	Specifies the MEP for which LTR is to be displayed. The valid range is 1-8191.
<i>num</i>	Specifies the Transaction ID or sequence number returned from a previously transmitted LTM.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- “LTM operation successful. Target is reachable.” – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- “LTM operation unsuccessful. Target not reachable.” – This message suggests that LTM is successfully initiated but the target is not reachable.
- “LTM operation unsuccessful. Target is reachable.” – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- “LTM operation in progress.” – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- “LTM Timed out.”- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.

### Examples

```
-> show ethoam linktrace-reply domain MD association MA endpoint 10 tran-id 1256
LTM operation successful. Target is reachable.
Ttl : 63,
  LTM Forwarded : yes,
  Terminal MEP : no,
  Last Egress Identifier : 00-00:00:D0:95:EA:79:62,
  Next Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
  Relay Action : RLY_FDB,
```

```

Chassis ID Subtype : LOCALLY_ASSIGNED,
Chassis ID : DUT-2,
Ingress Action : ING_OK,
Ingress Mac : 00:D0:95:EA:9E:D4,
Ingress Port ID Subtype : LOCALLY_ASSIGNED,
Ingress Port ID : 1/1,
Egress Action : EGR_OK,
Egress Mac : 00:D0:95:EA:9E:D5,
Egress Port ID Subtype : LOCALLY_ASSIGNED,
Egress Port ID : 1/2

Ttl : 62,
LTM Forwarded : no,
Terminal MEP : yes,
Last Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
Next Egress Identifier : 00-00:00:00:00:00:00:00,
Relay Action : RLY_HIT,
Chassis ID Subtype : LOCALLY_ASSIGNED,
Chassis ID : DUT-3,
Ingress Action : ING_OK,
Ingress Mac : 00:D0:95:EA:AB:D2,
Ingress Port ID Subtype : LOCALLY_ASSIGNED,
Ingress Port ID : 1/1,
Egress Action : EGR_NONE,
Egress Mac : 00:00:00:00:00:00,
Egress Port ID Subtype : NONE,
Egress Port ID : none

```

### *output definitions*

---

<b>Ttl</b>	Time to live field for the returned LTR.
<b>LTM Forwarded</b>	Indicates whether the LTM was forwarded or not.
<b>Terminal MEP</b>	Indicates whether the MP reported in the reply Ingress/Egress TLV is a MEP.
<b>Last Egress Identifier</b>	Identifies the MEP linktrace initiator that originated, or the responder that forwarded, the LTM to which this LTR is the response.
<b>Next Egress Identifier</b>	Identifies the linktrace responder that transmitted this LTR, and can forward the LTM to the next hop.
<b>Relay Action</b>	Indicates how the dataframe targeted by the LTM would be passed to Egress bridge port. Options include <b>RLY_HIT</b> , <b>RLY_FDB</b> , or <b>RLY_MPDB</b> .
<b>Ingress Action</b>	Indicates how the dataframe targeted by the LTM would be received on the receiving MP. Options include <b>ING_NONE</b> , <b>ING_OK</b> , <b>ING_DOWN</b> , <b>ING_BLOCKED</b> , or <b>ING_VID</b> .
<b>Ingress Mac</b>	The MAC address returned in the ingress MAC address field.
<b>Egress Action</b>	Indicates how the dataframe targeted by the LTM would be passed through Egress bridge port. Options include <b>ING_NONE</b> , <b>ING_OK</b> , <b>ING_DOWN</b> , <b>ING_BLOCKED</b> , or <b>ING_VID</b> .
<b>Egress Mac</b>	The MAC address returned in the egress MAC address field.

---

## Release History

## show ethoam linktrace-tran-id

Displays the transaction identifiers returned by previously generated LTMs from a specified MEP.

**show ethoam linktrace-tran-id domain** {*domain\_name* | *mac\_address*} **association** *association\_name*  
**endpoint** *mep\_id*

---

### Syntax Definitions

<i>domain_name</i>	Specifies the domain name.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>association_name</i>	Name of the Ethernet OAM Association.
<i>mep_id</i>	Specifies the MEP for which LTR is to be displayed. The valid range is 1-8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ethoam linktrace-tran-id domain esd.alcatel-lucent.com association alcatel-
sales endpoint 3
S.No   Transaction Id
-----+-----
      1    13357,
      2    13358,
      3    13359,
```

#### output definitions

---

<b>S.No</b>	Indicates the sequence number.
<b>Transaction Id</b>	Indicates the Transaction Identifier returned from a previously transmitted LTM.

## show ethoam config-error

Displays the configuration error for a specified VLAN and port or linkagg.

**show ethoam config-error** [**vlan** *vlan\_id*] [{**port** *slot/port* | **linkagg** *agg\_id*}]

---

### Syntax Definitions

*vlan\_id* VLAN Identifier.  
*slot/port* Physical slot and port.  
*agg\_id* Logical Linkagg Identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
cli> show ethoam config-error
```

```
Vlan    Port    Error-type
-----+-----+-----
10      1/2     CFMleak
10      1/10    CFMleak
30      1/2     CFMleak
```

```
cli> show ethoam config-error vlan 10
```

```
vlan    port    error-type
-----+-----+-----
10      1/2     CFMleak
10      1/10    CFMleak
```

```
cli> show ethoam config-error port 1/2
```

```
vlan    port    error-type
-----+-----+-----
10      1/2     CFMleak
30      1/2     CFMleak
```

```
cli> show ethoam config-error vlan 10 port 1/2
```

```
vlan    port    error-type
-----+-----+-----
10      1/2     CFMleak
```

*output definitions*

---

<b>vlan</b>	VLAN identifier number.
<b>port</b>	Physical slot and port number.
<b>error-type</b>	Type of an error.

---

**Release History**

Release 6.3.4; command was introduced.

**Related Commands**

[ethoam linktrace](#) Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

**MIB Objects**

---

## show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

**show ethoam one-way-delay domain** *domain* **association** *association* **endpoint** *s-mepid* [**mac-address** *mac-add*]

---

### Syntax Definitions

<i>domain</i>	Specifies the domain name used while creating the management domain for which this management association is created.associationPhysical slot and port.
<i>association</i>	Association name for the created Ethernet OAM Association.
<i>s-mepid</i>	Source MEP-ID. Vaild Range 1-8191.
<i>mac-add</i>	MAC-Address of the remote MEP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Dash ('-') in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when 1DM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

### Examples

```
cli> show ethoam one-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value
```

Remote Mac address	Delay (us)	Jitter (us)
00:d0:95:ef:44:44	2369	1258
00:d0:95:ef:66:88	5896	282
00:d0:95:ef:88:88	2584	-
00:d0:95:ef:66:55	2698	4782

```
cli> show ethoam one-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value
```

Remote Mac address	Delay (us)	Jitter (us)
00:d0:95:ef:44:44	2369	1258

*output definitions*

---

<b>Remote Mac address</b>	Remote MAC address.
<b>Delay</b>	Physical slot and port number.
<b>eJitter</b>	Type of an error.

---

**Release History**

Release 6.4.3; command was introduced.

**Related Commands**

**ethoam one-way-delay** Initiates one-way-delay messages from a particular MEP to an RMEP.

**MIB Objects**

```

    alaCfmMepDelayVariation

```

---

## show ethoam two-way-delay

Displays the two-way ETH-DM delay and jitter parameters for a specific remote MAC-Address or for all the MAC-Addresses for which two-way-delay was initiated for a particular source MEP-ID.

**show ethoam two-way-delay domain** *domain* **association** *association* **endpoint** *s-mepid* [**mac-address** *mac-add*]

---

### Syntax Definitions

<i>domain</i>	Specifies the domain name used while creating the management domain for which this management association is created.associationPhysical slot and port.
<i>association</i>	Association name for the created Ethernet OAM Association.
<i>s-mepid</i>	Source MEP-ID. Vaild Range 1-8191.
<i>mac-add</i>	MAC-Address of the remote MEP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If '0' appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.
- If a dash ('-') appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.
- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.

### Examples

```
cli> show ethoam two-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
```

Legend: Jitter: - = undefined value

: RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address	RMEP-ID	Delay (us)	Jitter (us)

# 46 LINK OAM Commands

Ethernet in the First Mile (EFM), also known as LINK OAM, is a collection of protocols specified in IEEE 802.3ah, defining Ethernet in the access networks that connects subscribers to their immediate service provider. EFM, EFM-OAM and LINKOAM refers to IEEE 802.3ah standard.

LINK OAM (operation, administration, and maintenance) is a tool which monitors Layer-2 link status on the network by sending OAM protocol data units (OAMPDUs) between the network devices. OAMPDUs contain control and status information used to monitor, test and troubleshoot OAM-enabled links. By enabling LINK OAM on switch ports, network administrators can monitor the link-related issues on the first mile. LINK OAM provides network administrators the ability to monitor link performance, remote fault detection and remote loopback control.

---

**Note.** EFM (LINK OAM) does not include functions such as station management, bandwidth allocation or provisioning functions.

---

MIB information for the EFM (LINK OAM) commands is as

*Filename:* alcatel-ind1-dot3-oam-mib.mib  
*Module:* ALCATEL-IND1-DOT3-OAM-MIB

*Filename:* dot3-oam-mib.mib  
*Module:* DOT3-OAM-MIB

A summary of the available commands is listed here:

## efm-oam

Enables or disables the LINK OAM protocol on the switch.

**efm-oam {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the LINK OAM protocol.
<b>disable</b>	Disables the LINK OAM protocol.

### Defaults

By default, the LINK OAM protocol is disabled for the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- When LINK OAM is disabled globally, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.

### Examples

```
-> efm-oam enable
-> efm-oam disable
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<a href="#">efm-oam port status</a>	Enables or disables LINK OAM protocol on the specified port or on a range of ports.
<a href="#">efm-oam port mode</a>	Configures the LINK OAM mode on the port or on the range of ports to active or passive.
<a href="#">show efm-oam configuration</a>	Displays the global LINK OAM configuration.

### MIB Objects

alaDot3OamStatus

---

## efm-oam port status

Enables or disables LINK OAM protocol on the specified port or on a range of ports.

**efm-oam port** *slot/port* [-*port2*] **status** {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number of the module and the physical port number on that module.
<i>-port2</i>	Specifies the last port in the range of ports.
<b>enable</b>	Enables LINK OAM protocol on the specified port.
<b>disable</b>	Disables LINK OAM protocol on the specified port.

### Defaults

By default, the LINK OAM protocol is disabled on all ports for the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- If LINK OAM is disabled for the port or globally disabled for the switch, any OAMPDUs received are discarded.
- When LINK OAM is disabled for the port, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.
- LINK OAM is not supported on the mirroring ports.
- In link aggregates, LINK OAM is supported on an individual aggregable port only.

### Examples

```
-> efm-oam port 1/1 status enable
-> efm-oam port 1/1 status disable
-> efm-oam port 2/1-10 status enable
-> efm-oam port 2/1-4 status disable
```

### Release History

Release 6.4.2; command was introduced.

**Related Commands**

<b>efm-oam port mode</b>	Configure a LINK OAM mode on the port or on the range of ports to active or passive.
<b>show efm-oam configuration</b>	Displays the global LINK OAM configuration.
<b>show efm-oam port</b>	Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port.
<b>show efm-oam port detail</b>	Displays the configuration and other related parameters for a port.

**MIB Objects**

dot3OamTable  
dot3OamAdminState

---

## efm-oam port mode

Configures the LINK OAM mode on the port or on the range of ports to active or passive.

**efm-oam port *slot/port*[-*port2*] mode {active | passive}**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	Specifies the last port in the range of ports.
<b>active</b>	Configures the LINK OAM mode to active.
<b>passive</b>	Configures the LINK OAM mode to passive.

### Defaults

By default, LINK OAM mode is set to active on all ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- LINK OAM discovery process is never initiated from a port when it is in passive mode. At least one of the two peer ports should be in active mode.
- An active port will respond to Loopback-control OAMPDUs only if the peer EFM-OAM client is also in active mode.

### Examples

```
-> efm-oam port 1/1 mode active
-> efm-oam port 1/1 mode passive
-> efm-oam port 2/1-10 mode active
-> efm-oam port 2/1-4 mode passive
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">efm-oam port status</a>        | Enables or disables LINK OAM protocol on the specified port or on a range of ports.                                                                                         |
| <a href="#">show efm-oam port</a>          | Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port. |
| <a href="#">show efm-oam configuration</a> | Displays the global LINK OAM configuration.                                                                                                                                 |

## MIB Objects

dot3OamTable  
dot3OamMode

---

## efm-oam port keepalive-interval

Configures the timeout interval for the dynamically learned neighboring devices on a port or on a range of ports. Keepalive-interval is the maximum time period for which a LINK OAM port shall wait for a hello message from its peer before resetting a discovery session.

**efm-oam port** *slot/port[-port2]* **keepalive-interval** *seconds*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	Specifies the last port in the range of ports.
<i>seconds</i>	Specifies the keep-alive interval value in seconds. The range for this interval is 5 to 120 seconds.

### Defaults

By default, the keep-alive interval value is 5 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Even if unsupported OAMPDU is received on the port, keep-alive timer is reset on the port.
- To set the timer to its default value, set 5 seconds as the keepalive-interval.

### Examples

```
-> efm-oam port 1/1 keepalive-interval 10
-> efm-oam port 2/1-10 keepalive-interval 10
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<a href="#">efm-oam port hello-interval</a>	Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of a LINK OAM enabled port.
<a href="#">show efm-oam port detail</a>	Displays the configuration and other related parameters for a port.

### MIB Objects

```
alaDot3OamTable
  alaDot3OamKeepAliveInterval
```

---

## efm-oam port hello-interval

Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of an LINK OAM enabled port.

**efm-oam port** *slot/port*[-*port2*] **hello-interval** *seconds*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	Specifies the last port in the range of ports.
<i>seconds</i>	Specifies the time interval (in seconds) this port waits before sending out the next hello packet. The range for this timer is 1 to 60 seconds.

### Defaults

By default, the hello-interval value is set to 1 second.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- Use the hello-interval value of 1 second to reset the timer to its default value.
- On a given port, hello interval time period should not be more than half of keep alive timer on the peer port.

### Examples

```
-> efm-oam port 1/1 hello-interval 5
-> efm-oam port 2/1-10 hello-interval 10
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- |                                        |                                                                                                                                                                                                                                                                              |

```

---

## efm-oam port remote-loopback

Specifies whether loopback requests from peers are processed or ignored on the specified port.

**efm-oam port** *slot/port*[-*port2*] **remote-loopback** {**process** | **ignore**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	Specifies the last port in the range of ports.
<b>process</b>	Processes incoming loopback request from peer LINK OAM port.
<b>ignore</b>	Ignore (discard) incoming loopback requests.

### Defaults

By default, the incoming loopback requests are ignored.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- When the remote-loopback is in **process** mode, the session started by peer LINK OAM client will be processed by local LINK OAM port. As a result, remote port will be in remote-loopback state and the local port will be local-loopback state.
- When the remote-loopback is in **ignore** mode, the session started by peer LINK OAM will not be processed by the local port.

### Examples

```
-> efm-oam port 1/1 remote-loopback process
-> efm-oam port 1/1 remote-loopback ignore
-> efm-oam port 2/1-10 remote-loopback process
-> efm-oam port 2/1-4 remote-loopback ignore
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- efm-oam port remote-loopback start** Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.
- show efm-oam port detail** Displays the LINK OAM configuration and other related parameters for a port.
- show efm-oam port remote detail** Displays the configuration and details of the related parameters of the remote port.

## MIB Objects

dot3OamLoopbackTable  
dot3OamLoopbackIgnoreRx

---

## efm-oam port remote-loopback start

Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.

**efm-oam port *slot/port* remote-loopback {start | stop}**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<b>start</b>	Specifies whether to start the loopback request.
<b>stop</b>	Specifies whether to stop the loopback request.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- Before issuing this command, the LINK OAM port has to be in active mode and discovery of peer ports has to be completed.
- When loopback is started from a port towards a peer port which is configured to ignore the loopback request, the loopback response timer will timeout and no error is displayed. In such case, verify the loopback-state of two ports by using the command [show efm-oam port remote detail](#).
- The maximum number of simultaneous loopback sessions supported per network interface is 2. If a third loopback is started through CLI, an error will be displayed at the CLI prompt.

### Examples

```
-> efm-oam port 1/1 remote-loopback start
-> efm-oam port 1/1 remote-loopback stop
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- efm-oam port remote-loopback** Specifies an action that should perform when a loopback request is received from the peer on a port or on a range of ports.
- show efm-oam port remote detail** Displays the configuration and details of the related parameters of the remote port.
- show efm-oam configuration** Displays the global LINK OAM configuration.

---

## efm-oam port propagate-events

Configures whether or not the specified port or range of ports will propagate local event notifications to the remote peer.

**efm-oam port *slot/port*[-*port2*] propagate-events {critical-event | dying-gasp} {enable | disable}**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	Specifies the last port in the range of ports.
<b>critical-event</b>	Configures the notification status for critical events.
<b>dying-gasp</b>	Configures the notification status for dying gasp events.
<b>enable</b>	Enables the notification of critical-event or dying-gasp events to the peer.
<b>disable</b>	Disables the notification of critical-event or dying-gasp events to the peer.

### Defaults

By default, the notification status for both critical-event and dying-gasp events is set to enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- When the system is set for critical event or a dying-gasp event, the local OAM entity indicates the event through the OAMPDU flags to its peer OAM entity.
- In case of port admin down, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific port actually goes down.
- In case of takeover or reload of the switch, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific device actually goes down.
- The information PDUs with dying gasp bit set is transmitted towards peer as soon as link-down is detected at NI. However, if there is a link flap (i.e link comes again) before the expiry of link-flap timer, then normal information PDU transmission with dying-gasp bit reset shall resume. This will cause clearing of alarms or trap on the peer port.

### Examples

```
-> efm-oam port 1/1 propagate-events critical-event enable
-> efm-oam port 1/1 propagate-events critical-event disable
-> efm-oam port 2/1-10 propagate-events dying-gasp enable
-> efm-oam port 2/1-4 propagate-events dying-gasp disable
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

**show efm-oam port remote detail**

Displays the configuration and details of the related parameters of the remote port.

**show efm-oam port statistics**

dot3OamDyingGaspEnable

dot3OamCriticalEventEnable

---

## efm-oam errored-frame-period

Configures the threshold, window frame values and the status for notification when the number of frame-errors exceed the threshold in a given period of time (specified) by window. When the number of frame errors exceeds a threshold within a given window defined by a number of frames (for example, 10 frames out of 1000 had errors), an Errored Frame Period event is generated.

**efm-oam port** *slot/port*[-*port2*] **errored-frame-period** [**threshold** *threshold\_symbols*] [**window** *window\_frames*] [**notify** {**enable** | **disable**}]

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot. (e.g. 3/1-4 specifies ports 1,2,3 and 4 on slot 3).
<i>threshold_symbols</i>	Specifies the frame error threshold number. The range supported is 1 to maximum 4 byte integer value (4294967295).
<i>window_frames</i>	Specifies the number of frames used to define a window within which the frame period errors are measured.
<b>enable</b>	Enables notification of the Errored Frame Period event.
<b>disable</b>	Disables notification of the Errored Frame Period event.

### Defaults

parameter	default
<i>threshold_symbols</i>	1 frame error
<b>enable</b>   <b>disable</b>	enable

The default for *window\_frames* depends on the port-types. The default, minimum and maximum supported values for various port-types are:

port-type	default value	minimum value	maximum value
100 mbps	200000	20000	12000000
1000 X	2000000	200000	120000000
1000 T	2000000	200000	120000000
10 Gig	20000000	2000000	1200000000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

## Usage Guidelines

- The command can be issued in any order like window, threshold, and notify. However, at least one option needs to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

## Examples

```
-> efm-oam port 1/1 errored-frame-period threshold 1 window 3000000 notify enable
-> efm-oam port 1/1 errored-frame-period notify disable
-> efm-oam port 2/1-4 errored-frame-period threshold 1 window 3000000 notify enable
-> efm-oam port 2/1-2 errored-frame-period notify disable
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

### [efm-oam errored-frame](#)

Configures the threshold, window and notify-status for errored-frame on a port. The frame-period measures the frame-errors, within a specified window of time.

### [efm-oam errored-frame-seconds-summary](#)

Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port. The Errored Seconds are the time in seconds in which at least one frame error has occurred.

### [show efm-oam port detail](#)

Displays the Errored Frame Period Event threshold, window, and notification parameter values for a port.

## MIB Objects

```
dot3OamEventConfigTable
  dot3OamErrFramePeriodWindow
  dot3OamErrFramePeriodThreshold
  dot3OamErrFramePeriodEvNotifEnable
```

---

## efm-oam errored-frame

Configures an error frame threshold or window on a LINK OAM port and set notification status for errored frame events. When the number of frame errors exceeds a threshold within a given window defined by a period of time (for example, 10 frames in 1 second had errors), an Errored Frame Event is generated.

**efm-oam port** *slot/port[-port2]* **errored-frame** [**threshold** *threshold\_symbols*] [**window** *window\_seconds*] [**notify** {**enable** | **disable**}]

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1,2,3, and 4 on slot 3).
<i>threshold_symbols</i>	Specifies the frame error threshold number.
<i>window_seconds</i>	Specifies the window of time, in which the frame errors will be measured. The duration should be in units of 100ms.
<b>enable</b>	Enables notification of the Errored Frame event.
<b>disable</b>	Disables notification of the Errored Frame event.

### Defaults

<b>parameter</b>	<b>default</b>
<i>threshold_symbols</i>	1 frame error
<i>window_seconds</i>	1 second (10 dsec)
<b>enable</b>   <b>disable</b>	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- The various options, threshold, window and notify can be issued in any order. However, at least one option has to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

### Examples

```
-> efm-oam port 1/1 errored-frame threshold 10 window 32 notify enable
-> efm-oam port 1/1 errored-frame notify disable
-> efm-oam port 2/1-4 errored-frame threshold 10 window 32 notify enable
-> efm-oam port 2/1-2 errored-frame notify disable
```

## Release History

## efm-oam errored-frame-seconds-summary

Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port. The Errored Seconds are the time in seconds in which at least one frame error has occurred.

**efm-oam port *slot/port*[-*port2*] errored-frame-seconds-summary [threshold *threshold\_seconds*] [window *window\_seconds*] [notify {enable | disable}]**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g 3/1-4 specifies ports 1,2,3, and 4 on slot 3).
<i>threshold_symbols</i>	Specifies the frame error threshold number.
<i>window_seconds</i>	Specifies the window of time in which the frame errors will be measured.
<b>enable</b>	Enables notification of the Errored Frame Seconds Summary event.
<b>disable</b>	Disables notification of the Errored Frame Seconds Summary event.

### Defaults

parameter	default
<i>threshold_symbols</i>	1 errored frame second
<i>window_seconds</i>	60 seconds. (600 dsec).
<b>enable   disable</b>	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- The various options, threshold, window and notify can be issued in any order. However, at least one option has to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

### Examples

## efm-oam multiple-pdu-count

Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

**efm-oam multiple-pdu-count** *count*

---

### Syntax Definitions

*count* Specifies the number of PDUs that have to be sent in case of event-notification TLVs. The range is 1 to 10 PDUs.

### Defaults

By default, the PDU-count value is set to 3.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

N/A

### Examples

```
-> efm-oam multiple-pdu-count 5
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[show efm-oam configuration](#) Displays the global LINK OAM configuration.

[show efm-oam port remote detail](#) Displays the configuration and details of the related parameters of the remote port.

### MIB Objects

alaDot3OamMultiplePduCount

---

## efm-oam port l1-ping

Configures the number of frames to be sent by the current LINK OAM port to the remote port's MAC address (l1 ping) and the delay between each consecutive sent frames and to start the ping operation.

**efm-oam port *slot/port* l1-ping [num-frames *number*] [delay *milliseconds*] [start]**

---

### Syntax Definitions

<i>slot/port</i>	Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>number</i>	Specifies the number of frames that needs to be sent during ping operation. The allowed range of numbers is between 1 to 20.
<i>milliseconds</i>	Specifies time interval between two consecutive PDUs. The allowed range of delay is between 100 to 1000 milliseconds.
<b>start</b>	Specifies to start the ping operation.

### Defaults

parameter	default
<i>number</i>	5 frames
<i>milliseconds</i>	1000 milliseconds

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- The command is valid only when the LINK OAM is enabled globally, port is in active mode, discovery is done, and the port is in remote loopback mode.
- L1 ping can be started only when the port is in remote loopback mode.

### Examples

```
-> efm-oam port 1/12 l1-ping num-frames 6 delay 300 start
-> efm-oam port 1/20 l1-ping num-frames 12 delay 500 start
-> efm-oam port 1/15 l1-ping num-frames 5 delay 100 start
-> efm-oam port 1/15 l1-ping num-frames 4 delay 200 start
-> efm-oam port 1/5 l1-ping num-frames 100 delay 300 start
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

```

---

## show efm-oam configuration

Displays the global LINK OAM configuration.

**show efm-oam configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

- Use this command to display the global configuration of LINK OAM.

### Examples

```
-> show efm-oam configuration
EFM OAM Status           : enabled,
Multiple PDU Count       : 5
```

Output fields are described here:

#### *output definitions*

---

<b>EFM OAM status</b>	The current administrative status of LINK OAM on this switch ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Multiple PDU Count</b>	The number of PDUs sent when LINK OAM needs to send multiple Event Notification.

---

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<a href="#">efm-oam</a>	Enables or disables the LINK OAM protocol on the switch.
<a href="#">show efm-oam port detail</a>	Displays the LINK OAM configuration and other related parameters for a port.

## show efm-oam port

Displays the status of LINK OAM on all the ports in the system, along with other relevant information such as OAM mode, operational status and loopback status of the port.

**show efm-oam port** [*slot/port1-port2*] [**enable** | **disable**] [**active** | **passive**]

---

### Syntax Definitions

<i>slot/port1</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
-port2	The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1,2,3, and 4 on slot 3).
<b>enable</b>	Specifies whether to display the LINK OAM enabled ports.
<b>disable</b>	Specifies whether to display the LINK OAM disabled ports.
<b>active</b>	Specifies whether to display the LINK OAM active ports.
<b>passive</b>	Specifies whether to display the LINK OAM passive ports.

### Defaults

By default, displays the LINK OAM status on all ports.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

Use this command to display the state of LINK OAM on the basis of enabled or disabled port and on the basis of active or passive port.

### Examples

```
-> show efm-oam port
```

Port	EFM-OAM Status	Mode	Operational Status	Loopback Status
1/1	enabled	active	operational	remoteLoopback
1/2	disabled	active	activeSendLocal	noLoopback
1/3	enabled	passive	activeSendLocal	noLoopback
1/4	disabled	active	activeSendLocal	noLoopback
1/5	disabled	active	activeSendLocal	noLoopback
1/6	disabled	active	activeSendLocal	noLoopback
1/7	disabled	active	activeSendLocal	noLoopback

```
-> show efm-oam port 1/1-5
```

1/2   disabled        activeSendLocal     noLoopback
1/3   enabled         activeSendLocal     noLoopback
1/4   disabled        activeSendLocal     noLoopback
1/5   disabled        activeSendLocal     noLoopback
1/6   disabled        activeSendLocal     noLoopback
1/7   disabled        activeSendLocal     noLoopback

```

Output fields are described here:

#### *output definitions*

<b>Port</b>	Displays the slot/port number.
<b>EFM-OAM Status</b>	The state of the EFM-OAM. LINK OAM instance can have any of the following status. <ul style="list-style-type: none"> <li>• <b>Enabled</b> : Specifies that the LINK OAM is disabled on the interface.</li> <li>• <b>Disabled</b> : Specifies that the LINK OAM is disabled on the interface.</li> </ul>

*output definitions (continued)***Operational Status**

The status of the port in discovering whether the peer has LINK OAM capability or not. It has the following states:

- **activeSendLocal**: Specifies that the LINK OAM port is actively trying to discover whether the peer has LINK OAM capability but has not yet made that determination.
- **sendLocalAndRemote**: Specifies that the local LINK OAM port has discovered the peer but has not yet accepted or rejected the configuration of the peer. The local device will then decide that the peer device is acceptable or unacceptable and then accept or decline LINK OAM peering.
- **sendLocalAndRemoteOk**: Specifies the state when LINK OAM peering is allowed by the local port.
- **oamPeeringLocallyRejected**: Specifies the state when the local OAM entity rejects the peer OAM entity.
- **oamPeeringRemotelyRejected**: Specifies the state when the remote LINK OAM port rejects the peering.
- **operational**: Specifies the state when the local LINK OAM port learns that both the local LINK OAM entity and the remote LINK OAM entity have accepted the peering.
- **nonOperHalfDuplex**: Specifies the value nonOperHalfDuplex is returned whenever LINK OAM is enabled. Since LINK OAM functions are not designed to work completely over half-duplex interfaces, the value nonOperHalfDuplex is returned whenever LINK OAM is enabled but the interface is in half-duplex operation.
- **linkFault**: Specifies that the link between the host and the peer has detected a fault.
- **passiveWait**: Specifies that the LINK OAM ports are in passive mode.

**Loopback Status**

The state of remote loopback. It can be **initiatingLoopback**, **terminatingLoopback**, **localLoopback**, **remoteLoopback**, **noLoopback**, or **unknown**.

**Mode**

The state of LINK OAM mode, **active** or **passive**.

---

**Release History**

Release 6.4.2; command was introduced.

## Related Commands

**efm-oam multiple-pdu-count** Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

## show efm-oam port detail

Displays the LINK OAM configuration and other related parameters for a port.

**show efm-oam port *slot/port* detail**

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

Use this command when you want to get LINK OAM configuration details for a specific port.

### Examples

```
-> show efm-oam port 1/1 detail
OAM Status           : enable,
Operational Status   : activeSendLocal,
Mode                 : active,
Max OamPDU size      : 1518,
Config Revision      : 0,
Functions Supported   : loopback,event notification,
Loopback Status      : noLoopback,
Loopback Rx Status   : ignore,
Max OamPDUs          : 10,
KeepAlive Interval(seconds) : 10,
Hello Interval(seconds) : 5,
Dying Gasp Notify Status : enable,
Critical Event Notify Status : enable
```

Link Monitoring	Window	Threshold (errors)	Notify Status
errored-frame	10 dsec	10 frames	enable
errored-frame-period	2000000 frames	10 frames	enable
errored-frame-seconds-summary	600 dsec	1 framesec	enable

Output fields are described here:

#### *output definitions*

---

<b>OAM Status</b>	The state of LINK OAM on the port.
<b>Operational Status</b>	The state of the port in discovering whether the peer has LINK OAM capability or not.

*output definitions (continued)*

---

<b>Mode</b>	The state of LINK OAM mode on the port, <b>active</b> or <b>passive</b> .
<b>Max OamPDU size</b>	Displays the maximum OAMPDU that the LINK OAM port can support.
<b>Config Revision</b>	Displays the configuration revision of the LINK OAM port as reflected in the latest OAMPDU sent by the peer port.
<b>Functions Supported</b>	Displays the LINK OAM functions supported by the specified port.
<b>Loopback Status</b>	Displays the loopback status of the specified LINK OAM port.
<b>Loopback Rx Status</b>	The action that should be performed by the LINK OAM port when a loopback request is received from the peer port.
<b>Max OamPDUs</b>	Specifies the maximum OAMPDUs that can be exchanged between two peers.
<b>KeepAlive Interval</b>	Displays the timeout interval of the specified LINK OAM port for the dynamically learned peer port.
<b>Hello Interval</b>	Displays the time interval between two OAMPDUs in seconds.
<b>Dying Gasp Notify Status</b>	The state of notification for dying gasp events, <b>enable</b> or <b>disable</b> .
<b>Critical Event Notify Status</b>	The state of notification for critical events, <b>enable</b> or <b>disable</b> .
<b>Link Monitoring</b>	Displays the errors detected on the remote link.
<b>Window</b>	The frame error event window in the received OAMPDU.
<b>Threshold</b>	The number of errored frames in the period required for the event to be generated.
<b>Notify Status</b>	The state of notification for LINK OAM errors on the port, <b>enable</b> or <b>disable</b> .

---

**Release History**

## show efm-oam port statistics

Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

**show efm-oam port *slot/port*[-*port2*] statistics**

**show efm-oam port statistics**

---

### Syntax Definitions

<i>slot/port</i>	Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
- <i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1,2,3, and 4 on slot 3).

### Defaults

By default, the statistics of all ports are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

Use the **port** parameter to display the statistics of a specific port.

### Examples

```
-> show efm-oam port 1/1 statistics
Port 1/1:
Information OAMPDU Tx           : 1035,
Information OAMPDU Rx           : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx      : 1,
Loopback Control OAMPDU Rx      : 0,
Unsupported OAMPDU Tx           : 0,
Unsupported OAMPDU Rx           : 0,
Frames Lost due to OAM          : 0
```

```
-> show efm-oam port 1/1-4 statistics
Port 1/1:
Information OAMPDU Tx           : 1035,
Information OAMPDU Rx           : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx      : 1,
Loopback Control OAMPDU Rx      : 0,
Unsupported OAMPDU Tx           : 0,
```

```
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM        : 0

Port 1/2:
Information OAMPDU Tx          : 1035,
Information OAMPDU Rx          : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU Tx : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx     : 1,
Loopback Control OAMPDU Rx     : 0,
Unsupported OAMPDU Tx          : 0,
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM        : 0

Port 1/3:
Information OAMPDU Tx          : 1035,
Information OAMPDU Rx          : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx     : 1,
Loopback Control OAMPDU Rx     : 0,
Unsupported OAMPDU Tx          : 0,
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM        : 0

Port 1/4:
Information OAMPDU Tx          : 1035,
Information OAMPDU Rx          : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx     : 1,
Loopback Control OAMPDU Rx     : 0,
Unsupported OAMPDU Tx          : 0,
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM        : 0
```

-> show efm-oam statistics

```
Port 1/1:
Information OAMPDU Tx          : 1035,
Information OAMPDU Rx          : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx     : 1,
Loopback Control OAMPDU Rx     : 0,
Unsupported OAMPDU Tx          : 0,
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM        : 0
```

Port 1/2:

```

Information OAMPDU Tx           : 1035,
Information OAMPDU Rx           : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx     : 1,
Loopback Control OAMPDU Rx     : 0,
Unsupported OAMPDU Tx          : 0,
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM         : 0

```

Port 1/3:

```

Information OAMPDU Tx           : 1035,
Information OAMPDU Rx           : 988,
Unique Event Notification OAMPDU Tx : 0,
Unique Event Notification OAMPDU Rx : 0,
Duplicate Event Notification OAMPDU TX : 0,
Duplicate Event Notification OAMPDU Rx : 0,
Loopback Control OAMPDU Tx     : 1,
Loopback Control OAMPDU Rx     : 0,
Unsupported OAMPDU Tx          : 0,
Unsupported OAMPDU Rx          : 0,
Frames Lost due to OAM         : 0

```

Output fields are described here:

#### *output definitions*

<b>Information OAMPDU Tx</b>	The number of OAM PDUx transmitted by the port.
<b>Information OAMPDU Rx</b>	The number of OAM PDUx received by the port.
<b>Unique Event Notification OAMPDU Tx</b>	The number of unique event notification OAM PDUs transmitted by the port.
<b>Unique Event Notification OAMPDU Rx</b>	The number of unique event notification OAM PDUs received by the port.
<b>Duplicate Event Notification OAMPDU TX</b>	The number of duplicate event notification OAM PDUs transmitted by the port.
<b>Duplicate Event Notification OAMPDU Rx</b>	The number of duplicate event notification OAM PDUs received by the port.
<b>Unsupported OAMPDU Tx</b>	The number of unsupported OAM PDUs transmitted by the port.
<b>Unsupported OAMPDU Rx</b>	The number of unsupported OAM PDUs received by the port.
<b>Frames Lost due to OAM</b>	The number of frames discarded by the OAM port.

## show efm-oam port remote detail

Displays the LINK OAM configuration and details of the related parameters of the remote port.

**show efm-oam port *slot/port* remote detail**

---

### Syntax Definitions

*slot/port* Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

N/A.

### Examples

```
-> show efm-oam port 1/1 remote detail
Remote MAC address : 00:30:96:fd:6b:fa,
Remote Vendor (info): 0x15a1
Remote Vendor (oui) : XYZ
Mode                : active,
Max OAMPDU size    : 1518,
Config Revision    : 0,
Functions Supported : loopbackSupportEventSupport
```

Output fields are described here:

#### *output definitions*

---

<b>Remote MAC address</b>	Displays the MAC address of the remote peer.
<b>Remote Vendor (info)</b>	Displays the vendor number in hexadecimal of the remote peer.
<b>Remote Vendor (oui)</b>	Displays the Organizationally Unique Identifier (OUI) number of the remote peer.
<b>Mode</b>	The state of LINK OAM mode on the remote port, <b>active</b> or <b>passive</b> .
<b>Max OAMPDU size</b>	Displays the maximum OAMPDU size that the remote LINK OAM port can support.
<b>Config Revision</b>	Displays the configuration revision of the remote LINK OAM port.
<b>Functions Supported</b>	Displays the LINK OAM functions supported by the remote port.

---

```

---

## show efm-oam port history

Displays the log of events that have occurred on a port. Use this command to display specific event logs on a port.

**show efm-oam port *slot/port* history [log-type { link-fault | errored-frame | errored-frame-period | errored-frame-seconds | dying-gasp | critical } ]**

---

### Syntax Definitions

<i>slot/port</i>	Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<b>link-fault</b>	Displays link fault event logs. Specifies the loss of signal is detected by the receiver. This is sent once per second in the Information OAMPDU
<b>errored-frame</b>	Displays errored-frame event log. an errored frame event occurs when the number of detected error frames over a specific interval exceeds the predefined threshold.
<b>errored-frame-period</b>	Displays an errored-frame-period event logs. An errored frame period event occurs if the number of frame errors in specific number of received frames exceeds the predefined threshold.
<b>errored-frame-seconds</b>	Displays errored-frame-seconds event logs. When the number of error frame seconds detected on a port over a detection interval reaches the error threshold, an errored frame seconds event occurs.
<b>dying-gasp</b>	Specifies an unrecoverable condition (e.g., a power failure).
<b>critical</b>	Specifies a crucial event that has occurred on the port.

### Defaults

By default, all log types are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

Timestamp will be in following format:

*DAY MON Date hh:mm:ss yyyy*

### Examples

```
-> show efm-oam port 1/1 history
Legend: Location: * - Remote, # - Local
LogID   TimeStamp                Log Type                Event
-----+-----+-----+-----+-----+-----+-----+
*      1      TUE JAN 06 19:44:51 2009  linkFault                1
#      2      TUE JAN 06 19:45:51 2009  erroredFrame             1
```

```
-> show efm-oam port 1/1 history log-type link-fault
Legend: Location: * - Remote, # - Local
LogID   TimeStamp                               Event
                                               Total
-----+-----+-----+-----+-----+
*   1      TUE JAN 06 19:46:51 2009         1
#   2      TUE JAN 06 19:46:51 2009         1
```

Output fields are described here:

#### *output definitions*

---

<b>LogID</b>	Specifies individual events within the event log.
<b>Timestamp</b>	The value of actual time at the time of the logged event.
<b>Log Type</b>	Specifies the type of event log.
<b>Event Total</b>	Specifies the total number of times one or more of these occurrences have resulted in an Event Notification.

---

### **Release History**

Release 6.4.2; command was introduced.

### **Related Commands**

- show efm-oam port statistics** Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
- clear efm-oam log-history** Clears the LINK OAM event logs history on a port.

### **MIB Objects**

  dot3OamEventLogRunningTotal
  dot3OamEventLogEventTotal
```

---

## show efm-oam port l1-ping detail

Displays the frames lost during a loopback session.

**show efm-oam port *slot/port* l1-ping detail**

---

### Syntax Definitions

*slot/port* Specifies the slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

The command can also be used even on a port on which LINK OAM is not enabled.

### Examples

```
-> show efm-oam port 1/1 l1-ping detail
frames configured          = 5,
frames delay(msec)        = 100,
L1 ping status             = Successful,
frames sent                = 4,
frames received            = 4,
avg delay (msec)           = 5

-> show efm-oam port 1/4 l1-ping detail
frames configured          = 5,
frames delay(msec)        = 200,
L1 ping status             = Successful,
frames sent                = 4,
frames received            = 2,
avg delay (msec)           = 15
```

Output fields are described here:

#### *output definitions*

---

<b>frames configured</b>	Specifies the number of frames that are sent during l1-ping.
<b>delay configured</b>	Specifies the delay between transmission of two consecutive frames during L1 ping.
<b>L1 ping status</b>	The status of the L1 ping operation. The status can be <b>Successful</b> , <b>Unsuccessful</b> or <b>default</b> .
<b>frames sent</b>	Specifies the frames sent during last L1 ping.
<b>frames received</b>	Specifies the frames received during last L1 ping.
<b>average delay</b>	Specifies the average delay taken by frames during last L1 ping.

---

## Release History

Release 6.4.2; command was introduced.

## Related Commands

### [efm-oam port l1-ping](#)

Configures the number of frames that needs to be sent during L1-ping, the delay between each consecutive sent frames and to start the L1-ping operation.

## MIB Objects

```
alaDot3OamLoopbackTable
  alaDot3OamPortL1PingFramesConf
  alaDot3OamPortL1PingFramesDelay

```

---

## clear efm-oam statistics

Clears the LINK OAM statistics on a port, range of ports or all ports.

**clear efm-oam statistics** *port slot/port[-port2]*

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).

*-port2* Specifies the last port in the range of ports.

### Defaults

By default, the statistics are cleared for all the ports if no port is specified in the command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

Use the port parameter with this command to clear the statistics for a specific port or range of ports.

### Examples

```
-> clear efm-oam statistics
-> clear efm-oam statistics port 1/1
-> clear efm-oam statistics port 2/1-3
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**show efm-oam port statistics** Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

**clear efm-oam log-history** Clears the LINK OAM event logs history on a port.

### MIB Objects

```
alaDot3OamGlobalClearStats

```

---

## clear efm-oam log-history

Clears the LINK OAM event logs history a port, range of ports or all ports.

**clear efm-oam log-history** *port slot/port[-port2]*

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).

*-port2* Specifies the last port in the range of ports.

### Defaults

By default, the event logs are cleared for all the ports if no port is specified in the command.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855.

### Usage Guidelines

Use the port parameter with this command to clear the statistics for a specific port or range of ports.

### Examples

```
-> clear efm-oam log-history
-> clear efm-oam log-history port 1/1
-> clear efm-oam log-history port 2/1-3
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**show efm-oam port statistics** Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

# 47 Service Assurance Agent Commands

Service Assurance Agent (SAA) enables customers to assure new business-critical applications, as well as services that utilize data, voice, and video.

With Service Assurance Agents, users can verify service guarantees, increase network reliability by validating network performance, proactively identify network issues, and increase return on investment (ROI) by easing the deployment of new services. Service Assurance Agent uses active monitoring to generate traffic in a continuous, reliable, and predictable manner, thus enabling the measurement of network performance and health.

IP SAAs enhance the service level monitoring to become IP application-aware by measuring both end-to-end and at the IP layer. IP SAA would allow performance measurement against any IP addresses in the network (switch, server, pc). ETH-LB/DMM can be used to measure delay and jitter by sending out frames with DM information to the peer MEP and receiving frames with DM information from the peer MEP.

MIB information for the SAA commands is as follows:

*Filename:* AlcatelIND1Eoam.MIB  
*Module:* Alcatel-IND1-ETHERNET-OAM-MIB

*Filename:* IETF\_802\_1ag.MIB  
*Module:* IEEE8021-CFM-MIB

*Filename:* Alcatel-IND1-SAA-MIB.MIB  
*Module:* ALCATEL-IND1-SAA-MIB

A summary of the available commands is listed here:

---

<b>EthOAM SAA Configuration Commands</b>	<b>saa</b> <b>saa type ethoam-loopback</b> <b>saa type ethoam-two-way-delay</b> <b>saa start</b> <b>saa stop</b>
<b>IP SAA Configuration Command</b>	<b>saa type ip-ping</b>
<b>EthOAM SAA Show Commands</b>	<b>show saa</b> <b>show saa type config</b> <b>show saa statistics</b>

---

## saa

Configures a Service Assurance Agent (SAA).

**saa** *string* [**descr** *description*] [**interval** *interval*]

**no** *saa string*

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (e.g. "SAA 10").
<i>description</i>	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. "Alcatel-Lucent Marketing SAA").
<i>interval</i>	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 10 to 1500.

### Defaults

parameter	default
<i>description</i>	DEFAULT
<i>interval</i>	150

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove an SAA from the switch configuration. Note that the SAA must be stopped before it can be deleted.
- The **descr** and **interval** parameters are optional. If these values are specified, the SAA is created with those values. If these values are not specified, the SAA is created with the default values.
- If the **descr** and/or **interval** parameters are specified for an existing SAA, then the values of the existing parameters are updated with those specified.
- If the session time interval is changed for an SAA that is already running and active, the interval value is immediately updated in the database but is not applied to the SAA until after the next iteration.
- If none of the optional parameters are specified and the given SAA already exists, the CLI will return an error message, as duplicate entries are not allowed.
- A maximum of 50 SAAs is recommended if the same interval value is configured (for example, the default of 10 minutes) for all the SAAs. If more than 50 are configured with the same interval value and all of them are started together, then the SAAs may not be scheduled exactly after the specified time interval. In this scenario, each SAA is scheduled only after all the other SAAs that are ahead of it in the scheduler. If the SAAs are configured with random interval values (values that are not multiples of other SAA values), then configuring more than 50 is allowed.

## Examples

```
-> saa saal descr "saa for ip-ping"  
-> saa saa2 descr "Monitoring Default VRF-interface" interval 160  
-> saa saa2 interval 120  
-> no saa saal
```

## Release History

Release 6.4.3; command was introduced.

## Related Commands

<a href="#">show saa</a>	Displays SAA configuration information.
<a href="#">show saa statistics</a>	Displays SAA statistics.

## MIB Objects

```
alaSaaCtrlTable  
  alaSaaCtrlTestIndex  
  alaSaaCtrlRowStatus  
  alaSaaCtrlDescr  
  alaSaaCtrlInterval
```

---

## saa type ip-ping

Configure SAA for IP including the number of packets and inter-packet delay parameters.

```
saa string type ip-ping destination-ip ipv4 addr source-ip ipv4 addr type-of-service tos [num-pkts count] [inter-pkt-delay delay] [payload-size size]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (e.g. "SAA 10").
<i>ipv4 addr</i>	The IPv4 address of the destination to ping.
<i>ipv4 addr</i>	The IPv4 address of the source.
<i>tos</i>	The type of service. Valid range is 0 – 255.
<i>count</i>	The number of packets to send in one ping iteration. Valid range is 1–10.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100ms to 1000ms in multiples of 100ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 24–1472 bytes.

### Defaults

parameter	default
<i>count</i>	5
<i>delay</i>	1000ms
<i>size</i>	24 bytes

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **num-pkts**, **inter-pkt-delay** and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- Do not specify a broadcast or multicast address for the source or destination IP. In addition, do not use 0.0.0.0 as the destination IP address.

- The timeout for each ping request packet is one second. This value is not configurable.

## Examples

```
-> saa saa1 type ip-ping destination-ip 123.32.45.76 source-ip 123.35.42.124 type-  
of-service 4  
-> saa saa2 type ip-ping destination-ip 123.32.45.77 source-ip 123.35.42.124 type-  
of-service 5  
-> saa saa3 type ip-ping destination-ip 123.32.55.27 source-ip 123.35.42.125 type-  
of-service 8 inter-pkt-delay 1000  
-> saa saa4 type ip-ping destination-ip 123.46.45.77 source-ip 123.35.42.125 type-  
of-service 2 num-pkts 5  
-> saa saa5 type ip-ping destination-ip 12.53.45.77 source-ip 123.35.42.125 type-  
of-service 35 payload-size 1518  
-> saa saa6 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-  
of-service 5 inter-pkt-delay 1500 num-pkts 8 pkt-size 1000
```

  alaSaaIpCtrlPayloadSize  
  alaSaaIpCtrlNumPkts
```

---

## saa type ethoam-loopback

Configures the SAA for ETH-LB, including the number of packets and inter-packet delay parameters.

```
saa string type ethoam-loopback {target-endpoint tmep_id | target-mac address mac} source-endpoint
smep_id domain domain association assoc vlan-priority priority [drop-eligible {true | false}] [data
data] [num-pkts num] [inter-pkt-delay delay]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (e.g. "SAA 10").
<i>tmep-id</i>	The ID of the destination MEP
<i>mac</i>	The MAC address of the destination.
<i>smep-id</i>	The ID of the source MEP.
<i>domain</i>	The domain to which the source MEP belongs.
<i>assoc</i>	The association to which the source MEP belongs.
<i>priority</i>	The VLAN priority to be used for the outgoing packet. Valid range is 0 – 7.
<b>drop-eligible true</b>	Sets the drop enable bit in the VLAN tag of the outgoing packet to true.
<b>drop-eligible false</b>	Sets the drop enable bit in the VLAN tag of the outgoing packet to false.
<i>data</i>	User specified string that is included in the packet.
<i>delay</i>	The delay between packets sent during a ping iteration in milliseconds. Valid range is 100ms - 1000ms in multiples of 100ms.
<i>num</i>	The number of packets to be sent during loopback. Valid range is 1 - 10.

### Defaults

parameter	default
<b>drop-eligible true   false</b>	false
<i>num-pkts</i>	5
<i>delay</i>	1000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- Source MEP-ID, MD and MA must be created before initiating loopback.

- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When **target-endpoint** is specified then it must be learned before initiating loopback.
- When **target-endpoint** is specified and learned, Ethernet Loopback will be transmitted irrespective of whether the RMEP state is OK or failed.
- The **drop-eligible**, **data**, **num-pkts** and **inter-pkt-delay** are optional parameters. If these values are specified, the entry will be created with these values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** can be modified later.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The Target MEP/MAC, source MEP, domain, association and priority parameters are mandatory. If they are not specified, the CLI will return an error.
- The **data** parameter is optional. If this parameter is not specified, then it is not sent in the loopback message.
- The timeout value for each LB packet is one second. This value is not configurable.

## Examples

```
-> saa saa1 type ethoam-loopback target-endpoint 10 source endpoint 1 domain md1
association mal vlan-priority 5 drop-eligible false
-> saa saa2 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal vlan-priority 5 drop-eligible true data « monitor association mal »
num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-loopback target-endpoint 15 source endpoint 1 domain md1
association mal vlan-priority 5 drop-eligible false data « monitor association mal
» num-pkts 6
-> saa saa4 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal vlan-priority 5 drop-eligible true inter-pkt-delay 500
```

```

alaSaaEthoamCtrlPktData  
alaSaaEthoamCtrlVlanPriority

---

## saa type ethoam-two-way-delay

Configures SAA for two-way Ethernet frame delay measurement (ETH-DM).

```
saa string type {ethoam-two-way-delay} {target-endpoint tmep_id | target-mac address mac} source-
endpoint smep_id domain domain association assoc vlan-priority priority [num-pkts num] [inter-pkt-
delay delay]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (e.g. "SAA 10").
<i>tmep-id</i>	The ID of the destination MEP.
<i>mac</i>	The MAC address of the destination.
<i>smep-id</i>	The ID of the source MEP.
<i>domain</i>	The domain to which the source MEP belongs.
<i>assoc</i>	The association to which the source MEP belongs.
<i>priority</i>	The VLAN priority to be used for the outgoing packet. Valid range is 0–7.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100ms - 1000ms in multiples of 100ms.
<i>num</i>	The number of packets to be sent during loopback. Valid range is 1–10.

### Defaults

parameter	default
<i>num</i>	5
<i>delay</i>	1000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- The source MEP-ID, MD and MA must be created before initiating two-way ETH-DM.
- If the source MEP-ID/MA/MD does not exist, the configuration is still accepted and no error is returned.
- When the **target-endpoint** parameter is specified, then it must be learned before initiating two-way ETH-DM.

- When the **target-endpoint** parameter is specified and learned, two-way ETH-DM will transmit delay measurement message (DMM) frames and delay measurement reply (DMR) frames whether or not the RMEP state is OK.
- The **num-pkts** and **inter-pkt-delay** parameters are optional. If these values are specified, the entry will be created with those values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** values can be modified, but the **pkt-size** value cannot be modified later.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- Target MEP/MAC, source MEP, domain, association and priority parameters are mandatory. If they are not specified, the CLI will return an error.
- The timeout for each DMM packet is one second. This value is not configurable.

## Examples

```
-> saa saa1 type ethoam-two-way-delay target-endpoint 10 source endpoint 1 domain
md1 association mal vlan-priority 5
-> saa saa2 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association mal vlan-priority 5 num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-two-way-delay target-endpoint 15 source endpoint 1 domain
md1 association mal vlan-priority 5 num-pkts 6
-> saa saa4 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association mal vlan-priority 5 inter-pkt-delay 500
```

## Release History

  alaSaaEthoamCtrlVlanPriority
```

## saa start

Starts the SAA test.

**saa string start** [**at** *yyyy-mm-dd,hh:mm:ss.ds*]

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<i>yyyy-mm-dd,hh:mm:ss.ds</i>	The date and time to start the SAA.

### Defaults

By default, the SAA test is started immediately.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- Use the **saa stop** command to stop an SAA test that is already running.
- Use the **at** option to specify a date and time for the test to start.
- If an SAA is scheduled to start at a specified time and another **saa start** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.
- If the **saa start** command is given after an SAA is started, then the CLI will return an error.
- If the IP Ping SAA is configured with a source IP that does not exist or is not active, then the packet is not transmitted and no error is returned. Swlogs are updated.
- ICMP must be enabled on the switch. If ICMP is disabled and an IP Ping SAA is started, then the iteration will timeout and will be treated as failed iteration.
- Immediately after a CMM restart (reboot or takeover), the command to start SAA will be accepted, but the actual execution of the iteration will start 5 minutes after the CMM restart.
- If the ETH-DM or ETH-LB SAA type was configured with a source MEP that does not exist or is not active (admin down), then the packet is not transmitted and no error is returned on the CLI console. Swlogs are updated.
- It is recommended that all the SAAs be rescheduled if the system time is changed.

### Examples

```
-> saa saa2 start at 2009-09-12,09:00:00
-> saa saa4 start
```

## Release History

Release 6.4.3; command was introduced.

## Related Commands

[show saa](#) Displays SAA configuration information.  
[show saa statistics](#) Displays SAA statistics.

## MIB Objects

alaSaaCtrlTable  
  alaSaaCtrlTestIndex  
  alaSaaCtrlStartAt

---

## saa stop

Stops the SAA test.

**saa string stop** [**never** | **at** yyyy-mm-dd,hh:mm:ss.ds]

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<b>never</b>	Specifies that the SAA test will not be stopped unless the <b>saa stop</b> command is used with the <b>at</b> option.
<i>yyyy-mm-dd,hh:mm:ss.ds</i>	The date and time to stop the SAA test.

### Defaults

By default, the test is stopped immediately.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- The SAA must be in a 'started' state before giving the command unless the start and stop times are scheduled. If the SAA is not in a 'started' state, the CLI will return an error.
- Use the **at** option to specify a date and time for the test to stop.
- If the **never** option is specified, the SAA test will keep on running until the **saa stop** command is entered again with the **at** option.
- If SAA test is stopped while it is running an iteration, the current iteration is pre-empted. The statistics and history are updated for the partial iteration run.
- If an SAA is scheduled to stop at a specified time and another **saa stop** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.

### Examples

```
-> saa saa1 stop
-> saa saa2 stop never
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

- show saa** Displays SAA configuration information.

## MIB Objects

alaSaaCtrlTable  
  alaSaaCtrlTestIndex  
  alaSaaCtrlStopAt

---

## show saa

Displays SAA configuration information.

```
show saa [string / {descr description}]
```

---

### Syntax Definitions

*string* An existing SAA ID string.

*description* An existing SAA description string.

### Defaults

By default, information is displayed for all configured SAAs.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the *string* or *description* parameter to display information for a specific SAA.

### Examples

```
-> show saa saa31
```

```
Legend: eth-lb = ethoam-loopback
```

```
       : eth-dmm = ethoam-two-way-delay
```

SAA	Type	Status	Interval(Min.)	Time of Last-Run	Last-Run Result	Description
Saa31	ip-ping	started	180	2010-01-12,21:30:05.0	failed	Datacenter1

```
-> show saa
```

```
Legend: eth-lb = ethoam-loopback
```

```
       : eth-dmm = ethoam-two-way-delay
```

SAA	Type	Status	Interval(Min.)	Time of Last-Run	Last-Run Result	Description
Saa20	ip-ping	started	130	2010-01-15,09:31:53.0	success	DEFAULT

```

---

## show saa type config

Displays the SAA configuration for the specified SAA type.

```
show saa [string] type {ip-ping | ethoam-loopback | ethoam-two-way-delay} config
```

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<b>ip-ping</b>	Displays IP Ping SAAs.
<b>ethoam-loopback</b>	Displays ETH-LB SAAs.
<b>ethoam-two-way-delay</b>	Displays ETH-DMM SAAs.

### Defaults

By default, all SAAs with the specified type are displayed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the *string* parameter to display information for a specific SAA
- If the SAA ID string specified does not match the specified SAA type, the CLI will return an error.

### Examples

```
-> show saa type ip-ping config

---

## show saa statistics

Display SAA statistics.

**show saa** [*string*] **statistics** [**aggregate** | **history**]

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<b>aggregate</b>	Displays aggregate results for the specified SAA.
<b>history</b>	Displays a results history for the specified SAA.

### Defaults

By default, statistics are displayed for all SAAs and only for the most recent SAA test run.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the **aggregate** parameter is specified, then only the aggregate results are displayed.
- If the **history** parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the **history** option displays only the last five iterations.
- Use the *string* parameter to display statistics for a specific SAA.
- Statistics and history do not persist across a switch reboot or takeover.

### Examples

```
-> show saa statistics
Legend: eth-lb = ethoam-loopback
       : eth-dmm = ethoam-two-way-delay
Legend: - = Delay or jitter value not available

# 48 MPLS LDP Commands

The LDP (Label Distribution Protocol) is used to set up Label Switched Paths (LSPs), also referred to as Multiprotocol Label Switching (MPLS) tunnels. These tunnels are used to connect customer sites over a service provider network and form the basis of any multipoint service, such as a Virtual Private LAN Service (VPLS).

In addition to using LDP, configuring static LSPs is also supported. Both LDP and static LSPs provide the label switching mechanism required by MPLS. For more information about static LSPs, see the “Static LSP and FRR Commands” chapter in this guide.

MIB information for the LDP commands is as follows:

*Filename:* TIMETRA-LDP-MIB.mib

*Module:* TIMETRA-LDP-MIB

*Filename:* AlcatelIND1ServiceMgr.MIB

*Module:* Alcatel-IND1-SERVICE-MGR-MIB

A summary of the available commands is listed here:

<b>Global Commands</b>	<code>configure router ldp shutdown</code> <code>show router ldp parameters</code> <code>show router ldp peer</code> <code>show router ldp session</code> <code>show router ldp status</code>
<b>Interface Commands</b>	<code>configure router ldp interface-parameters interface</code> <code>configure router ldp interface-parameters interface shutdown</code> <code>configure router ldp interface-parameters hello</code> <code>configure router ldp interface-parameters keepalive</code> <code>configure router ldp interface-parameters transport-address</code> <code>show router ldp interface</code>
<b>Targeted Session Commands</b>	<code>configure router ldp targeted-session hello</code> <code>configure router ldp targeted-session keepalive</code>
<b>Graceful Restart Commands</b>	<code>configure router ldp graceful-restart-helper</code> <code>configure router ldp reconnect-time</code> <code>configure router ldp fwd-state-holding-time</code> <code>configure router ldp maximum-recovery-time</code> <code>configure router ldp neighbor-liveness-time</code>
<b>LSP Ping and Traceroute Commands</b>	<code>oam lsp-ping</code> <code>oam lsp-trace</code>

---

<b>Show LDP Bindings Commands</b>	<b>show router ldp bindings</b> <b>show router ldp bindings fec-type</b> <b>show router ldp bindings ingress-label</b> <b>show router ldp bindings egress-label</b> <b>show router ldp bindings prefix</b> <b>show router ldp bindings active</b> <b>show router ldp bindings vc-type</b> <b>show router ldp bindings service-id</b>
---------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

---

<b>Show LDP Discovery Commands</b>	<b>show router ldp discovery</b> <b>show router ldp discovery peer</b> <b>show router ldp discovery interface</b>
----------------------------------------	-------------------------------------------------------------------------------------------------------------------------

---

## configure router ldp shutdown

Configures the administrative status of the Label Distribution Protocol (LDP) instance on the router.

**configure router ldp {no shutdown | shutdown}**

---

### Syntax Definitions

<b>no shutdown</b>	Enables the LDP administrative status on the router.
<b>shutdown</b>	Disables the LDP administrative status on the router.

### Defaults

By default, LDP is enabled for the switch.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Disabling the LDP administrative status also disables any associated Label Switch Paths (LSPs) and any Service Distribution Points (SDPs) that were attached to the LSPs.
- When LDP is disabled on the switch, attaching SDPs to any of the associated LSRs is not allowed.

### Examples

```
-> configure router ldp shutdown  
-> configure router ldp no shutdown
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**show router ldp status** Displays status information and statistics for the LDP instance on the local router.

### MIB Objects

```
vRtrLdpGeneralTable  
vRtrLdpGenAdminState
```

---

## configure router ldp interface-parameters interface

Configures LDP support on the specified IP interface.

**configure router ldp interface-parameters interface** *ip-intf-name*

**configure router ldp interface-parameters no interface** *ip-intf-name*

---

### Syntax Definitions

*ip-intf-name*                      The name of an existing IP interface.

### Defaults

By default, the LDP interface is administratively enabled when the interface is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the LDP configuration from the IP interface. Disable the administrative status of the interface before attempting to remove it.
- The IP interface name specified with this command must already exist in the router configuration.
- Until LDP support is configured on an IP interface, no other LDP configuration tasks are allowed on that interface.

### Examples

```
-> configure router ldp interface-parameters interface vlan-14  
-> configure router ldp interface-parameters no interface vlan-14
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**configure router ldp interface-parameters interface shutdown** Configures the administrative status for the specified LDP interface.

**show router ldp interface** Displays the LDP interface configuration for the router.

**show router ldp parameters** Displays global LDP parameter values for the router.

## **MIB Objects**

    vRtrID

    vRtrLdpIfIndex

    vRtrLdpPeerAddress

    vRtrLdpIfRowStatus

---

## configure router ldp interface-parameters interface shutdown

Configures the administrative status for the specified LDP interface.

**configure router ldp interface-parameters interface *ip-intf-name* {no shutdown | shutdown}**

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing LDP interface.
<b>no shutdown</b>	Enables the LDP administrative status for the interface.
<b>shutdown</b>	Disables the LDP administrative status for the interface.

### Defaults

By default, the administrative status of an LDP interface is enabled.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Disabling the administrative status for an LDP interface does not remove the LDP configuration from that interface.
- The LDP interface name specified with this command must already exist in the router configuration.

### Examples

```
-> configure router ldp interface-parameters interface vlan-14 shutdown
-> configure router ldp interface-parameters interface vlan-14 no shutdown
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

- configure router ldp interface-parameters interface** Configures LDP support on an IP interface.
- show router ldp interface** Displays the LDP interface configuration for the router.

### MIB Objects

```
vRtrLdpIfTable
  vRtrID
  vRtrLdpIfIndex
  vRtrLdpPeerAddress
  vRtrLdpIfRowStatus
```

---

## configure router ldp interface-parameters hello

Configures the hello timeout (also referred to as the hold time) and the hello interval on a global (all LDP interfaces) basis or on a per-interface basis. The hello timeout determines how long LDP waits to receive hello messages from a peer before declaring that the peer is down. The hello interval determines how often LDP sends out hello messages, which advertise the hello timeout.

**configure router ldp interface-parameters** [**interface** *ip-intf-name*] **hello** *timeout factor*

**configure router ldp interface-parameters** [**interface** *ip-intf-name*] **no hello**

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing LDP interface.
<i>timeout</i>	The hello timeout, in seconds. The valid range is 1–65535 seconds.
<i>factor</i>	The number of hello messages to send during the hello timeout. The valid range is 1–255. The factor number is divided into the hello timeout to determine the hello interval value.

### Defaults

By default, the hello time is set to 15 seconds and the factor number is set to 3, which results in a default hello interval time of 5 seconds.

parameter	default
<i>ip-intf-name</i>	All LDP interfaces.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to set the hello timeout and factor parameters to the default values for these parameters. Note that if an interface name is specified with the **no** form of this command, the default values applied are the values defined globally for all interfaces.
- Use the optional **interface** *ip-intf-name* parameter to configure the hello time and hello interval for a specific LDP interface. Note that the hello parameter values configured for an interface override the global configuration of these values for the router.
- LDP uses hello messages to establish adjacencies with LDP peers. If no hello messages are received from a peer during the hello time that is advertised by that peer, the local LDP router will consider the peer as down and will not retain the adjacency with that peer.
- When LDP is establishing an adjacency between two peers, the hold time is negotiated to the lower time value of the two peers. Once an operational value is agreed upon, the hold time is divided by the factor number to determine the interval at which the peers will send each other hello messages.

## Examples

```
-> configure router ldp interface-parameters hello 40 2
-> configure router ldp interface-parameters interface vlan-14 hello 50 10
-> configure router ldp interface-parameters no hello
-> configure router ldp interface-parameters interface vlan-14 no hello
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

**configure router ldp interface-parameters interface** Configures LDP support on an IP interface.

**show router ldp parameters** Displays global LDP parameter values for the switch.

**show router ldp interface** Displays the LDP interface configuration for the switch.

## MIB Objects

```
vRtrLdpGeneralTable
  vRtrLdpGenHelloFactor
  vRtrLdpGenHelloTimeout
vRtrLdpIfTable
  vRtrID
  vRtrLdpIfIndex
  vRtrLdpPeerAddress
  vRtrLdpIfHelloFactor
  vRtrLdpIfHelloTimeout
```

---

## configure router ldp interface-parameters keepalive

Configures the keepalive timeout and the keepalive interval on a global (all LDP interfaces) basis or on a per-interface basis. The keepalive timeout determines how long LDP waits to receive keepalive messages from an LDP peer before tearing down the session with that peer. The keepalive interval determines how often LDP sends out keepalive messages, which advertise the keepalive time.

**configure router ldp interface-parameters** [**interface** *ip-intf-name*] **keepalive** *timeout factor*

**configure router ldp interface-parameters** [**interface** *ip-intf-name*] **no keepalive**

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing LDP interface.
<i>timeout</i>	The keepalive timeout, in seconds. The valid range is 1–65535 seconds.
<i>factor</i>	The number of keepalive messages to send during the keepalive timeout. The valid range is 1–255. The factor number is divided into the keepalive timeout to calculate the keepalive interval value.

### Defaults

By default, the keepalive time is set to 30 seconds and the factor number is set to 3, which results in a default keepalive interval of 10 seconds.

parameter	default
<i>ip-intf-name</i>	All LDP interfaces.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to set the keepalive time and factor parameters to the default values for these parameters. Note that if an interface name is specified with the **no** form of this command, the default values applied are the values defined globally for all interfaces.
- Use the optional **interface** *ip-intf-name* parameter to configure the keepalive time and interval for a specific LDP interface. Note that the keepalive parameter values configured for an interface override the global configuration of these values for the router.
- When LDP is establishing a session between two peers, the keepalive time is negotiated to the lower time value of the two peers. Once an operational value is agreed upon, the keepalive time is divided by the factor number to determine the interval at which the peers will send each other keepalive messages.
- If no keepalive messages are received from a peer during the keepalive time that is advertised by that peer, the local LDP router will tear down the session.

### Examples

```
-> configure router ldp interface-parameters keepalive 40 2
```

```
-> configure router ldp interface-parameters interface vlan-14 keepalive 50 10
-> configure router ldp interface-parameters no keepalive
-> configure router ldp interface-parameters interface vlan-14 no keepalive
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

**configure router ldp interface-parameters interface** Configures LDP support on an IP interface.

**show router ldp parameters** Displays global LDP parameter values for the switch.

**show router ldp interface** Displays the LDP interface configuration for the switch.

## MIB Objects

```
vRtrLdpGeneralTable
  vRtrLdpGenKeepAliveFactor
  vRtrLdpGenKeepAliveTimeout
vRtrLdpIfTable
  vRtrID
  vRtrLdpIfIndex
  vRtrLdpPeerAddress
  vRtrLdpIfKeepAliveFactor
  vRtrLdpIfKeepAliveTimeout
```

---

## configure router ldp interface-parameters transport-address

Configures the transport address for the specified LDP interface. This address is used to set up LDP TCP sessions.

```
configure router ldp interface-parameters interface ip-intf-name transport-address {system / interface}
```

```
configure router ldp interface-parameters interface ip-intf-name no transport-address
```

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing LDP interface.
<b>system</b>	Sets the transport address to the system IP address, which is the Loopback0 IP address configured for the OmniSwitch.
<b>interface</b>	Sets the transport address to the IP address of the specified LDP interface.

### Defaults

By default, the transport address for the LDP session is set to the system IP (Loopback0) address.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to set the transport address to the default value (system IP).
- Do not use the interface IP address as the transport address if multiple interfaces exist between two LDP neighbors.

### Examples

```
-> configure router ldp interface-parameters transport-address interface  
-> configure router ldp interface-parameters interface vlan-14 transport-address  
system  
-> configure router ldp interface-parameters no transport-address  
-> configure router ldp interface-parameters interface vlan-14 no transport-address
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router ldp interface-parameters interface** Configures LDP support on an IP interface.
- show router ldp parameters** Displays global LDP parameter values for the switch.
- show router ldp interface** Displays the LDP interface configuration for the switch.

---

## configure router ldp targeted-session hello

Configures the hello time (also referred to as the hold time) and the hello interval for targeted LDP sessions. A targeted session is an LDP session that exists between two peers that are not directly connected to each other. The hello time determines how long LDP waits to receive hello messages from a peer before declaring that the peer is down. The hello interval determines how often LDP sends out hello messages, which advertise the hello time.

**configure router ldp targeted-session hello** *time factor*

**configure router ldp targeted-session no hello**

---

### Syntax Definitions

<i>time</i>	The hello time, in seconds. The valid range is 1–65535 seconds.
<i>factor</i>	The number of hello messages to send during the hello time. The valid range is 1–255. The factor number is divided into the hello time to determine the hello interval value.

### Defaults

By default, the hello time is set to 45 seconds and the factor number is set to 3, which results in a default hello interval time of 15 seconds.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to set the hello timeout and factor parameters to the default values for these parameters.
- Specify a hello time value that is more than three times the value of the hello interval (hello time divided by factor).
- LDP uses hello messages to establish adjacencies with LDP peers. These messages contain a locally-configured hello time. The hello hold time is the amount of time a peer retains hello adjacencies without receiving another hello message from the adjacent peer.
- When LDP is establishing a session between two peers, the hold time is negotiated to the lower time value of the two peers. Once an operational value is agreed upon, the hold time is divided by the factor number to determine the interval at which the peers will send each other hello messages.

### Examples

```
-> configure router ldp targeted-session hello 20 2  
-> configure router ldp interface-parameters no hello
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router ldp interface-parameters hello** Configures the hello time (also referred to as the hold time) and the hello interval on a global (all LDP interfaces) basis or on a per-interface basis.
- configure router ldp targeted-session keepalive** Configures the keepalive time and the keepalive interval for targeted LDP sessions.
- show router ldp parameters** Displays the LDP graceful restart, interface, and targeted session parameter values for the local router.

## MIB Objects

```
vRtrLdpGeneralTable  
  vRtrLdpGenTargHelloFactor  
  vRtrLdpGenTargHelloTimeout
```

---

## configure router ldp targeted-session keepalive

Configures the keepalive time and the keepalive interval for targeted LDP sessions. The keepalive time determines how long LDP waits to receive keepalive messages from an LDP peer before tearing down the session with that peer. The keepalive interval determines how often LDP sends out keepalive messages, which advertise the keepalive time.

**configure router ldp targeted-session keepalive** *timeout factor*

**configure router ldp targeted-session no keepalive**

---

### Syntax Definitions

<i>timeout</i>	The keepalive time, in seconds. The valid range is 1–65535 seconds.
<i>factor</i>	The number of keepalive messages to send during the keepalive time. The valid range is 1–255. The factor number is divided into the keepalive time to determine the keepalive interval value.

### Defaults

By default, the keepalive time is set to 40 seconds and the factor number is set to 4, which results in a default keepalive interval of 10 seconds.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to set the keepalive time and factor parameters to the default values for these parameters.
- Specify a keepalive time value that is more than three times the value of the keepalive interval (keepalive time divided by factor).
- When LDP is establishing a session between two peers, the keepalive time is negotiated to the lower time value of the two peers. Once an operational value is agreed upon, the keepalive time is divided by the factor number to determine the interval at which the peers will send each other keepalive messages.
- If no keepalive messages are received from a peer during the keepalive time that is advertised by that peer, the local LDP router will tear down the session.

### Examples

```
-> configure router ldp targeted-session keepalive 40 2  
-> configure router ldp interface-parameters no keepalive
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router ldp interface-parameters keepalive** Configures the keepalive time and the keepalive interval on a global (all LDP interfaces) basis or on a per-interface basis.
- configure router ldp targeted-session hello** Configures the hello time and the hello interval for targeted LDP sessions.
- show router ldp parameters** Displays the LDP graceful restart, interface, and targeted session parameter values for the local router.

```

---

## configure router ldp graceful-restart-helper

Configures the graceful restart helper status for the LDP router. When enabled, the router includes a fault tolerant (FT) TLV in LDP initialization messages. This signals to other LDP routers that this router is able to help with the graceful restart process.

**configure router ldp graceful-restart-helper**

**configure router ldp no graceful-restart-helper**

---

### Syntax Definitions

N/A.

### Defaults

By default, the graceful restart helper status is disabled for the LSR.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to disable graceful restart helper for the switch.
- Graceful Restart support for LDP is always enabled on the router, so it is not necessary to enable restart support before enabling the helper status.
- Only takeover

### Examples

```
-> configure router ldp graceful-restart-helper enable  
-> configure router ldp no graceful-restart-helper disable
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router ldp reconnect-time** Configures the Reconnect Timeout value in the fault tolerant (FT) Session TLV that is advertised in LDP messages.
- configure router ldp fwd-state-holding-time** Configures the amount of time that the LDP router retains its MPLS forwarding state after a graceful restart.
- configure router ldp maximum-recovery-time** Configures the amount of time the router retains stale MPLS label-FEC bindings received from a neighboring LDP router as the result of a graceful restart process.
- configure router ldp neighbor-liveness-time** The amount of time the router will wait for a neighboring router to re-establish an LDP session.

vRtrLdpGenGRReconnectTime

---

## configure router ldp fwd-state-holding-time

Configures the MPLS Forwarding State Holding timer value for the local LDP router. This time value specifies the amount of time, in seconds, that the LDP router retains its MPLS forwarding state after a graceful restart.

**configure router ldp fwd-state-holding-time** *seconds*

**configure router ldp no fwd-state-holding-time**

---

### Syntax Definitions

*seconds*

The Forwarding State Holding timer value, in seconds. The valid range is from 5–300.

### Defaults

By default, the MPLS Forwarding State Holding time is set to 120 seconds.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to set the Forwarding State Holding timer to the default value.
- This timer is started if the MPLS forwarding state of the restarting router was preserved after a graceful restart. The router then marks the forwarding entries as “stale” for the length of this time value. When the timer expires, any entries that are still marked as stale are deleted.
- An LDP router is considered in the process of restarting if the Forwarding State Holding timer is still active. When the end of this holding time is reached, the restart process is considered complete for the router.
- The Recovery Time advertised in the FT Session TLV of the LDP message is set to the current value of the Forwarding State Holding timer at the time the message is sent. If the router did not retain its MPLS forwarding state after a restart, then the Recovery Time is set to zero.

### Examples

```
-> configure router ldp fwd-state-holding-time 300
-> configure router ldp no fwd-state-holding-time
```

### Release History

Release 6.4.2; command was introduced.

## oam lsp-ping

Performs an Operation Administration and Maintenance (OAM) in-band connectivity test for an MPLS Label Switched Path (LSP).

**[configure] oam lsp-ping prefix *ip\_prefix/mask* [size *octets*] [ttl *label-ttl*] [timeout *timeout*] [interval *interval*] [send-count *send-count*]**

---

### Syntax Definitions

<i>ip_prefix</i>	The IP address of the destination node for the LSP.
<i>mask</i>	The subnet mask of the specified destination IP prefix. The value ranges from 1 to 32.
<i>octets</i>	The MPLS Echo request packet size in octets, expressed as a decimal integer. The value ranges from 84 to 9194.
<i>label-ttl</i>	The TTL value for the MPLS label, expressed as a decimal integer. The value ranges from 1 to 255.
<i>timeout</i>	The amount of time, in seconds, that the router will wait for a message reply after sending the MPLS Echo request message. The value ranges from 1 to 10.
<i>interval</i>	The minimum amount of time that must expire before the next MPLS Echo request message is sent. The value ranges from 1 to 10.
<i>send-count</i>	The number of Echo request messages to send, expressed as a decimal integer. The value ranges from 1 to 100.

### Defaults

Parameter	Default
<i>octets</i>	84
<i>label-ttl</i>	255
<i>timeout</i>	5
<i>interval</i>	1
<i>send-count</i>	1

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- This command is used to test the path for an existing MPLS Label Distribution Protocol (LDP) signaled LSP. If the IP address specified is not the destination address for an existing LSP, the ping will fail.
- The in-band LSP connectivity test is performed as described in the *IETF RFC 4379*.

- This command does *not* support OAM ping for static LSPs.

## Examples

```
-> oam lsp-ping prefix 5.5.5.5/32 send-count 5
LSP-PING 5.5.5.5/32: 80 bytes MPLS payload Seq=1, send from intf ip500, reply from

ip500, reply from 70.0.0.5
    udp-data-len=32 ttl=255 rtt<10ms rc=3 (EgressRtr) Seq=5, send from intf
ip500, reply from 70.0.0.5
    udp-data-len=32 ttl=255 rtt=966ms rc=3 (EgressRtr)
```

```
---- LSP 5.5.5.5/32 PING Statistics ----
5 packets sent, 5 packets received, 0.00% packet loss round-trip min < 10ms, avg =
559ms, max = 966ms, stddev = 459ms
```

### output definitions

<b>LSP-PING prefix or name</b>	IP Prefix of the destination node for the LDP-signaled LSP.
<b>MPLS payload</b>	Size of the ping message in octets.
<b>Seq</b>	Sequence number of response.
<b>Send from intf</b>	Name of the interface on which the probe was sent.
<b>reply from</b>	The IPv4 address of the node that generated this reply.
<b>udp-data-len</b>	UDP data length of the echo reply.
<b>ttl</b>	TTL specified in ping.
<b>rtt</b>	Number of milliseconds from when a probe was sent to when its response was received.
<b>rc</b>	Number and type of return code in response.
<b>packets sent</b>	Number of probes sent for this entry.
<b>packets received</b>	Number of probes received for this entry.

---

<b>packet loss</b>	Percentage of probes sent that were not returned.
<b>round-trip min</b>	The minimum round-trip time received.
<b>avg</b>	The average round-trip time received.
<b>max</b>	The maximum round-trip time received.
<b>stddev</b>	The sum of the squares for all ping responses received. This value is used to enable standard deviation calculation.

---

## Release History

## oam lsp-trace

Performs an Operation Administration and Maintenance (OAM) traceroute for an existing MPLS Label Switched Path (LSP).

**[configure] oam lsp-trace prefix** *ip\_prefix/mask* **[size** *octets* **]** **[min-ttl** *min-label-ttl* **]** **[max-ttl** *max-label-ttl* **]** **[max-fail** *no-response-count* **]** **[probe-count** *probes-per-hop* **]** **[timeout** *timeout* **]** **[interval** *interval* **]**

---

### Syntax Definitions

<i>ip_prefix</i>	The IP address of the destination node.
<i>mask</i>	The subnet mask of the specified destination IP prefix. The value ranges from 1 to 32.
<i>octets</i>	The MPLS Echo request packet size in octets, expressed as a decimal integer. The value ranges from 104 to 9194.
<i>min-label-ttl</i>	The minimum TTL value for the MPLS label for the LSP trace test, expressed as a decimal integer. The value ranges from 0 to 255.
<i>max-label-ttl</i>	The maximum TTL value for the MPLS label for the LSP trace test, expressed as a decimal integer. The value ranges from 1 to 255.
<i>no-responce-count</i>	The permissible maximum number of consecutive MPLS Echo requests that do not receive a reply before the trace operation fails for a given TTL, expressed as a decimal integer. The value ranges from 1 to 255.
<i>probes-per-hop</i>	The number of Echo request messages to send, expressed as a decimal integer. The value ranges from 1 to 10.
<i>timeout</i>	The amount of time, in seconds, that the router will wait for a message reply after sending the MPLS Echo request message. The value ranges from 1 to 60.
<i>interval</i>	The minimum amount of time that must expire before the next MPLS Echo request message is sent. A value of 0 implies the test will not be repeated. The value ranges from 0 to 10.

## Defaults

Parameter	Default
<i>octets</i>	104
<i>min-label-ttl</i>	1
<i>max-label-ttl</i>	30
<i>no-responce-count</i>	5
<i>probes-per-hop</i>	1
<i>timeout</i>	3
<i>interval</i>	1

## Platforms Supported

OmniSwitch 9000E

## Usage Guidelines

- This command is used to perform a traceroute for an existing MPLS Label Distribution Protocol (LDP) signaled LSP. If the IP address specified is not the destination address for an existing LDP LSP, the traceroute will fail.
- The LSP traceroute is performed as described in the *IETF RFC 4379*.
- This command does *not* support OAM traceroute for static LSPs.

## Examples

```
-> oam lsp-trace prefix 5.5.5.5/32
lsp-trace to 5.5.5.5/32: 1 hops min, 30 hops max, 104 byte packets
1 50.0.0.4 rtt<10ms rc=8(DSRtrMatchLabel)
   DS 1: IfAddr 80.0.0.5 MRU=1500 label=131070 proto=3(LDP)
2 70.0.0.5 rtt<10ms rc=3(EgressRtr)
```

```
-> oam lsp-trace prefix 5.5.5.5/32 size 9000

## show router ldp bindings

Displays the contents of the MPLS Label Information Base (LIB).

This section describes the base command (**show router ldp bindings**). Optional keywords are listed below and described as separate commands later in this chapter.

### show router ldp bindings

```
[fec-type {services | prefixes | fec-num} [session ip-address[:label-space]]]
[ingress-label start-label [end-label]]
[egress-label start-label [end-label]]
[prefix ip-prefix/mask [session ip-address[:label-space]]]
[active [prefix ip-prefix/mask]]
[vc-type vc-type [vc-id vc-id [session ip-address[:label-space]]]]
[service-id service-id]
```

---

### Syntax Definitions

N/A.

### Defaults

By default, the entire contents of the LIB is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the optional parameters provided with this command to display specific information for LDP label-FEC (Forwarding Equivalence Class) bindings.

### Examples

```
-> show router ldp bindings
LDP LSR ID: 10.10.10.5
```

Legend: U = Label In Use, N = Label Not In Use, W = Label Withdrawn,  
 S = Status Signaled Up, D = Status Signaled Down,  
 E = Epipe Service, V = VPLS Service, M = Mirror Service,  
 A = Apipe Service, F = Fpipe Service, I = IES Service, R = VPRN service,  
 P - Ipipe Service  
 TLV = (Type, Length: Value)

```
LDP Prefix Bindings

```

### *output definitions*

<b>Prefix</b>	The IP network address and mask used to identify the prefix binding.
<b>Peer</b>	The IP address of the LDP peer.
<b>Type</b>	The type of service ( <b>V-Eth</b> ) exchanging labels through the Service Distribution Point (SDP).
<b>VCId</b>	The virtual connection (VC) ID number used by each end of the SDP tunnel to identify the VC.
<b>SvcId</b>	The unique service identification number used to identify the service.
<b>SDPIId</b>	The SDP ID number associated with the service.
<b>IngLbl</b>	The ingress LDP label.
<b>EgrLbl</b>	The egress LDP label.
<b>EgrIntf/LspId</b>	The Label Switch Path (LSP) tunnel ID number (not the LSP path ID number).
<b>EgrNextHop</b>	The next hop IP address for the egress label.
<b>LMTU</b>	The local MTU number.
<b>RMTU</b>	The remote MTU number.

### **Release History**

Release 6.4.2; command was introduced.

## Related Commands

<b>show router ldp bindings fec-type</b>	Displays the LDP bindings for a specific type of FEC or for a specific service FEC number.
<b>show router ldp bindings ingress-label</b>	Displays ingress LDP bindings for a specific label number or for a range of label numbers.
<b>show router ldp bindings egress-label</b>	Displays egress LDP bindings for a specific label number or for a range of label numbers.
<b>show router ldp bindings prefix</b>	Displays the LDP bindings for a specific IP prefix.
<b>show router ldp bindings active</b>	Displays the LDP bindings for active IP prefixes.
<b>show router ldp bindings vc-type</b>	Displays the LDP bindings for the specified virtual circuit (VC) type.
<b>show router ldp bindings service-id</b>	Displays the LDP bindings for the specified service.

## MIB Objects

```
alaEServiceInfo  
  alaEServiceMode
```

---

## show router ldp bindings fec-type

Displays the LDP bindings for a specific type of Forwarding Equivalence Class (FEC) or for a specific service FEC number.

```
show router ldp bindings fec-type {fec-number | services | prefixes} [session ip-address[:label-space]]
```

---

### Syntax Definitions

<b>services</b>	Displays bindings for service FECs.
<b>prefixes</b>	Displays bindings for address FECs.
<i>fec-number</i>	The service FEC number. Valid numbers are 128 and 129.
<i>ip-address</i>	The LDP router ID (Loopback0 IP address configured for the switch) for a specific LDP session.
<i>:label-space</i>	The label space ID number that the router advertises on the LDP interface. This value is appended to the LDP router ID address. The valid range is 0–65535.

### Defaults

By default, LDP bindings are displayed for all LDP sessions associated with the specified FEC type.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Specify an FEC number to display label binding information for a specific FEC.
- Use the **services** parameter to display label binding information for service FECs. Note that only VPLS is supported.
- Use the **prefixes** parameter to display label binding information for address FECs. These are FECs that are associated with an IP address, instead of a service.
- Use the **session** parameter to display label binding information for a specific LDP router session. Note that entering a label-space value is optional with this parameter.

### Examples

```
->show router ldp bindings fec-type 128
LDP LSR ID: 10.10.10.5
```

Legend: U = Label In Use, N = Label Not In Use, W = Label Withdrawn,

## show router ldp bindings ingress-label

Displays ingress LDP bindings for a specific label number or for a range of label numbers.

**show router ldp bindings ingress-label** *start-label* [*end-label*]

---

### Syntax Definitions

<i>start-label</i>	The ingress label number to display. The valid range is 16–1048575.
<i>end-label</i>	The last ingress label number in a range of labels to display. The valid range is 17–1048575.

### Defaults

By default, all ingress LDP bindings starting with the specified label number are displayed

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the optional *end-label* parameter along with the *start-label* parameter to specify a range of ingress label bindings to display.
- If an ending label number is not specified, then all ingress label bindings beginning with the starting label number forward are displayed. No range is specified.

### Examples

```
->show router ldp bindings ingress-label 131068

## MIB Objects

---

## show router ldp bindings prefix

Displays the LDP bindings for a specific IP prefix.

```
show router ldp bindings prefix ip-prefix/mask [session ip-address[:label-space]]
```

---

### Syntax Definitions

<i>ip-prefix</i>	The IP address prefix used to identify the IP network. Specify 0 for the host bits.
<i>mask</i>	The IP address mask used to identify the subnet address within the IP address prefix.
<i>ip-address</i>	The LDP router ID (Loopback0 IP address configured for the switch) for a specific LDP session.
<i>:label-space</i>	The label space ID number that the router advertises on the LDP interface. This value is appended to the LDP router ID address. The valid range is 0–65535.

### Defaults

By default, LDP bindings are displayed for all sessions associated with the specified prefix.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the **session** parameter to display prefix binding information for a specific LDP router session. Note that entering a label-space value is optional with this parameter.

### Examples

```
->show router ldp bindings prefix 10.11.0.6/32
LDP LSR ID: 10.11.0.66
```

Legend: U - Label In Use, N - Label Not In Use

## show router ldp bindings active

Displays the LDP bindings for active IP prefixes.

**show router ldp bindings active** [**prefix** *ip-prefix/mask*]

---

### Syntax Definitions

<i>ip-prefix</i>	The IP address prefix used to identify the IP network. Specify 0 for the host bits.
<i>mask</i>	The IP address mask used to identify the subnet address within the IP address prefix.

### Defaults

By default, active LDP bindings are displayed for all prefixes.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the optional **prefix** parameter to display active bindings for a specific prefix.

### Examples

```
->show router ldp bindings prefix 10.11.0.6/32
LDP LSR ID: 10.11.0.66
```

Legend: U - Label In Use, N - Label Not In Use

## show router ldp bindings vc-type

Displays the LDP bindings for the specified virtual circuit (VC) type.

```
show router ldp bindings vc-type vc-type [vc-id vc-id [session ip-address [:label-space]]]
```

---

### Syntax Definitions

<i>vc-type</i>	The virtual circuit type. Valid types are <b>ethernet</b> , <b>vlan</b> , and <b>mirror</b> .
<i>vc-id</i>	The virtual circuit ID number. The valid range is 1–4294967295.
<i>ip-address</i>	The LDP router ID (Loopback0 IP address configured for the switch) for a specific LDP session.
<i>:label-space</i>	The label space ID number that the router advertises on the LDP interface. This value is appended to the LDP router ID address. The valid range is 0–65535.

### Defaults

By default, LDP bindings for all VC IDs and all sessions for each VC ID are displayed for the specified VC type.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **vc-id** parameter to display the LDP bindings for a specific VC ID number.
- Use the **session** parameter to display the LDP bindings for a specific session associated with the specified VC ID number.

### Examples

```
->show router ldp bindings vc-type ethernet

## show router ldp discovery

Displays the discovery status of the LDP Hello adjacencies between the local router and LDP peers.

**show router ldp discovery** [state {trying | established | down}] [detail]

---

### Syntax Definitions

<b>trying</b>	Displays LDP interfaces that are trying to establish an adjacency with peers.
<b>established</b>	Displays LDP interfaces that have established adjacencies with peers.
<b>down</b>	Displays LDP interfaces with adjacencies that are down.
<b>detail</b>	Displays detailed information for LDP hello adjacencies.

### Defaults

By default, the discovery status for all the LDP Hello adjacencies is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **state** parameter with the **trying**, **established**, or **down** options to display LDP adjacencies that are in a specific state of discovery.
- Use the **detail** parameter to display additional discovery information and statistics for the adjacencies.

### Examples

```
->show router ldp discovery
LDP Hello Adjacencies
```

### output definitions

<b>Interface Name</b>	The name of the local LDP IP interface.
<b>Local Addr</b>	The IP address of the local router.
<b>Peer Addr</b>	The IP address of the LDP peer.
<b>AdjType</b>	The type of adjacency between the local LDP interface and the LDP peer ( <b>Link</b> —peers directly connected establish linked sessions or <b>Targ</b> —peers not directly connected establish targeted sessions).
<b>State</b>	The status of the LDP hello adjacency ( <b>Estab</b> , <b>Trying</b> , or <b>Down</b> ).
<b>No. of Hello Adjacencies</b>	The number of LDP hello adjacencies discovered.
<b>Up Time</b>	The amount of time the adjacency has been established.
<b>Hold Time Remaining</b>	The amount of time left before the peer for this adjacency is declared down.
<b>Hello Mesg Recv</b>	The number of Hello messages received from this adjacency.
<b>Hello Mesg Sent</b>	The number of Hello messages sent for this adjacency.
<b>Local IP Address</b>	The IP address of the local IP interface for this adjacency.

*output definitions*

---

<b>Remote IP Address</b>	The IP address of the peer IP interface for this adjacency.
<b>Local Hello Timeout</b>	The Hello Timeout value configured for the local router.
<b>Remote Hello Timeout</b>	The Hello Timeout value configured for the peer.
<b>Local Cfg Seq No</b>	The configuration sequence number that was in the Hello received when this adjacency started up. This configuration sequence number changes when there is a change of configuration.
<b>Remote Cfg Seq No</b>	The configuration sequence number that was in the Hello received when this adjacency started up. This configuration sequence number changes when there is a change of configuration.

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

<b>show router ldp discovery peer</b>	Displays the discovery status for adjacencies that are associated with a specific LDP peer.
<b>show router ldp discovery interface</b>	Displays the discovery status for adjacencies that are associated with a specific LDP interface.

## show router ldp discovery peer

Displays the discovery status of the LDP Hello adjacencies associated with the specified LDP peer.

**show router ldp discovery peer** *ip-address* [state {trying | established | down}] [detail]

---

### Syntax Definitions

<i>ip-address</i>	The IP address of the LDP peer.
<b>trying</b>	Displays LDP interfaces that are trying to establish an adjacency with peers.
<b>established</b>	Displays LDP interfaces that have established adjacencies with peers.
<b>down</b>	Displays LDP interfaces with adjacencies that are down.
<b>detail</b>	Displays detailed information for LDP hello adjacencies.

### Defaults

By default, the discovery status for the LDP Hello adjacencies with the specified LDP peer is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **state** parameter with the **trying**, **established**, or **down** options to display LDP adjacencies that are in a specific state of discovery.
- Use the **detail** parameter to display additional discovery information and statistics for the adjacencies.

### Examples

```
->show router ldp discovery peer 10.11.0.6
LDP Hello Adjacencies
```

Interface Name	Local Addr	Peer Addr	AdjType	State
vlan-30	10.11.0.66	10.11.0.6	Targ	Estab

```
No. of Hello Adjacencies: 1
```

```
->show router ldp discovery peer 10.11.0.6 detail

## show router ldp discovery interface

Displays the discovery status of the LDP Hello adjacencies associated with the specified LDP interface.

**show router ldp discovery interface** *ip-intf-name* [state {trying | established | down}] [detail]

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing LDP interface.
<b>trying</b>	Displays adjacencies that the specified interface is trying to establish.
<b>established</b>	Displays established adjacencies for the specified interface.
<b>down</b>	Displays adjacencies for the specified interface that are down.
<b>detail</b>	Displays detailed information about the LDP interface.

### Defaults

By default, this command displays the discovery status for all the LDP Hello adjacencies associated with the specified interface.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **state** parameter with the **trying**, **established**, or **down** options to display LDP adjacencies that are in a specific state of discovery.
- Use the **detail** parameter to display additional discovery information and statistics for the adjacencies.

### Examples

```
->show router ldp discovery interface vlan-30
LDP Hello Adjacencies
```

Interface Name	Local Addr	Peer Addr	AdjType	State
vlan-30	10.11.0.6	10.10.0.7	Link	Estab

```
No. of Hello Adjacencies: 1
```

```
->show router ldp discovery interface vlan-30 detail

## show router ldp interface

Displays the LDP interface configuration for the local router.

**show router ldp interface** [*ip-intf-name* / *ip-address*] [**detail**]

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing LDP interface.
<i>ip-address</i>	The IP address of an existing LDP interface.
<b>detail</b>	Displays detailed adjacency information for the specified interface.

### Defaults

By default, the configuration for all LDP interfaces is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *ip-intf-name* and *ip-address* parameters to display information for a specific interface.
- Use the **detail** parameter to display additional information and statistics for LDP interfaces.

### Examples

```
->show router ldp interface
LDP Interfaces
```

Interface	Adm	Oper	Hello Factor	Hold Time	KA Factor	KA Timeout	Transport Address

```
No. of Interfaces: 1
```

### output definitions

<b>Interface</b>	The name of the local LDP IP interface. Configured through the <a href="#">configure router ldp interface-parameters interface</a> command.
<b>Adm</b>	The administrative state of the LDP interface (Up or Down). Configured through the <a href="#">configure router ldp interface-parameters interface shutdown</a> command.
<b>Opr</b>	The operational state of the LDP interface (Up or Down).
<b>Hello Factor</b>	The Hello factor value that is divided into the Hold Time value to determine the interval at which Hello messages are sent from this interface. Configured through the <a href="#">configure router ldp interface-parameters hello</a> command.
<b>Hold Time</b>	The Hold Time value (also referred to as Hello Timeout) determines the amount of time, in seconds, LDP waits to receive hello messages from a peer before declaring that the peer is down. Configured through the <a href="#">configure router ldp interface-parameters hello</a> command.
<b>KA Factor</b>	The Keepalive Factor value. This value is divided into the Keepalive Timeout value to determine the interval at which Keepalive messages are sent from this interface. Configured through the <a href="#">configure router ldp interface-parameters keepalive</a> command.

*output definitions*

---

<b>KA Timeout</b>	The amount of time, in seconds, LDP waits to receive keepalive messages from an LDP peer before tearing down the session with that peer. Configured through the <a href="#">configure router ldp interface-parameters keepalive</a> command.
<b>Transport Address</b>	The IP address used to set up an LDP session ( <b>System</b> or <b>Interface</b> ). The <b>System</b> value indicates that the Loopback0 address for the switch is used. The <b>Interface</b> value indicates that the IP address for the interface is used.
<b>Last Modified</b>	The date and time the interface configuration was last modified.
<b>Active Adjacencies</b>	The number of active adjacencies between this interface and LDP peers.
<b>Tunneling</b>	The tunneling status for the interface ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Lsp Name</b>	The name of the Label Switch Path associated with this interface.

---

**Release History**

Release 6.4.2; command was introduced.

## show router ldp parameters

Displays the global LDP parameter values (graceful restart, interface, and targeted session) for the local router.

**show router parameters**

---

### Syntax Definitions

N/A.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

The interface parameters displayed with this command are global values that serve as default values for individual LDP interfaces. Note that parameter values configured for a specific interface override the global values.

### Examples

```
->show router ldp parameters
LDP Parameters (LSR ID 10.10.0.7)

Graceful Restart Parameters
  Fwd State Hold Time (sec): 120,          Reconnect Time (sec): 120,
  Nbor Liveness Time (sec): 120,          Max Recovery Time (sec): 120

Interface Parameters
  Keepalive Timeout (sec): 30,             Keepalive Factor: 3,
  Hold Time (sec): 15,                    Hello Factor: 3,
  Propagate Policy: system,               Transport Address: system,
  Deaggregate FECs: False,                Route Preference: 9,
  Label Distribution: downstreamUnsolicited, Label Retention: liberal,
  Control Mode: ordered,                  Loop Detection: none

Targeted Session Parameters
  Keepalive Timeout (sec): 40,             Keepalive Factor: 4,
  Hold Time (sec): 45,                    Hello Factor: 3,
  Passive Mode: False,                     Targeted Sessions: Enabled
```

#### *output definitions*

---

##### **Graceful Restart Parameters:**

**Fwd State Hold Time (sec)** The amount of time, in seconds, that the LDP router retains its MPLS forwarding state after a graceful restart. Configured through the [configure router ldp fwd-state-holding-time](#) command.

*output definitions*

<b>Reconnect Time (sec)</b>	The amount of time, in seconds, that neighboring LDP routers should wait for the sender of the LDP message to gracefully restart and resume sending LDP messages. Configured through the <b>configure router ldp reconnect-time</b> command.
<b>Nbor Liveness Time (sec)</b>	The amount of time, in seconds, the router will wait for a neighboring router to re-establish an LDP session. Configured through the <b>configure router ldp neighbor-liveness-time</b> command.
<b>Max Recovery Time (sec)</b>	The amount of time, in seconds, the router retains stale MPLS label-forwarding equivalence class (FEC) bindings received from a neighboring LDP router as the result of a graceful restart process. Configured through the <b>configure router ldp maximum-recovery-time</b> command.
<b>Interface Parameters:</b>	
<b>Keepalive Timeout (sec)</b>	The amount of time, in seconds, LDP waits to receive keepalive messages from an LDP peer before tearing down the session with that peer. Configured through the <b>configure router ldp interface-parameters keepalive</b> command.
<b>Keepalive Factor</b>	The Keepalive factor value that is divided into the Keepalive Timeout value to determine the interval at which Keepalive messages are sent from this interface. Configured through the <b>configure router ldp interface-parameters keepalive</b> command.
<b>Hold Time (sec)</b>	The Hold Time value (also referred to as Hello Timeout) determines the amount of time, in seconds, LDP waits to receive hello messages from a peer before declaring that the peer is down. Configured through the <b>configure router ldp interface-parameters hello</b> command.
<b>Hello Factor</b>	The Hello factor value that is divided into the Hold Time value to determine the interval at which Hello messages are sent from this interface. Configured through the <b>configure router ldp interface-parameters hello</b> command.
<b>Propagate Policy</b>	Indicates whether or not the Label Switch Router (LSR) should generate FECs and which FECs to generate ( <b>system</b> , <b>interface</b> , <b>all</b> , or <b>none</b> ). ( <i>Note to reviewer: Is this supported on AOS switch?</i> )
<b>Transport Address</b>	The IP address used to set up an LDP session ( <b>System</b> or <b>Interface</b> ). The <b>System</b> value indicates that the Loopback0 address for the switch is used. The <b>Interface</b> value indicates that the IP address for the interface is used.
<b>Deaggregate FECs</b>	Indicates whether or not LDP aggregates multiple prefixes into a single (FEC) and advertises a single label for the FEC ( <b>True</b> or <b>False</b> ). This value only applies to LDP interfaces but is not used for targeted sessions.
<b>Route Preference</b>	The route preference assigned to LDP routes. When multiple routes are available to a destination, the route with the lowest preference will be used. This value only applies to LDP interfaces but is not used for targeted sessions.
<b>Label Distribution</b>	The label distribution method.

*output definitions***Label Retention**

The type of advertised label mappings that the router will retain (**liberal** or **conservative**).

The **liberal** value indicates that all advertised label mappings are retained whether or not they are from a valid next hop. When the label distribution value is downstream unsolicited, a router may receive label bindings for the same destination for all its neighbors. Labels for the non-next hops for the FECs are retained in the software but not used. When a network topology change occurs where a non-next hop becomes a valid next hop, the label received earlier is then used.

The **conservative** value indicates that advertised label mappings are retained only if they will be used to forward packets; for example if the label came from a valid next hop. Label bindings received from non-next hops for each FEC are discarded.

**Control Mode**

The response to label request (**ordered** or **independent**).

The **ordered** value indicates that label bindings are not distributed in response to a label request until a label binding has been received from the next hop for the destination.

The **independent** value indicates that label bindings are distributed immediately in response to a label request, even if a label binding has not yet been received from the next hop for the destination.

**Loop Detection**

The status of loop detection for this router. This field displays one of the following values:

- **Enabled**—Loop detection is enabled.
- **Disabled**—Loop detection is disabled.
- **None**—Loop detection is not supported.
- **Other**—Loop detection is supported by a method other than hopCount, pathVector, or hopCountAndPathVector.
- **hopCount**—Loop detection by hop count only.
- **pathVector**—Loop detection by path vector only.
- **hopCountAndPathVector**—Loop detection by hop count and path vector.

**Targeted Session Parameters:****Keepalive Timeout (sec)**

The amount of time, in seconds, LDP waits to receive keepalive messages from an LDP peer before tearing down the session with that peer. Configured through the [configure router ldp interface-parameters keepalive](#) command.

**Keepalive Factor**

The Keepalive factor value that is divided into the Keepalive Timeout value to determine the interval at which Keepalive messages are sent from this interface. Configured through the [configure router ldp interface-parameters keepalive](#) command.

**Hold Time (sec)**

The Hold Time value (also referred to as Hello Timeout) determines the amount of time, in seconds, LDP waits to receive hello messages from a peer before declaring that the peer is down. Configured through the [configure router ldp interface-parameters hello](#) command.

*output definitions*

---

<b>Hello Factor</b>	The Hello factor value that is divided into the Hold Time value to determine the interval at which Hello messages are sent from this interface. Configured through the <b>configure router ldp interface-parameters hello</b> command.
<b>Passive Mode</b>	Whether or not passive mode is active ( <b>True</b> or <b>False</b> ). When passive mode is active, LDP responds only when a connect request is received from a peer and does not actively try to connect with peers. When this mode is not active, LDP actively tries to connect to peers.
<b>Targeted Sessions</b>	The status of targeted sessions ( <b>Enabled</b> or <b>Disabled</b> ).

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

<b>show router ldp interface</b>	Displays the LDP interface configuration for the local router.
<b>show router ldp discovery interface</b>	Displays the discovery status of the LDP Hello adjacencies associated with the specified LDP interface.

**MIB Objects**

---

## show router ldp peer

Displays configuration information for LDP peers.

**show router ldp peer** [*ip-address*] [**detail**]

---

### Syntax Definitions

*ip-address*

The IP address of an LDP peer.

**detail**

Displays detailed information for the specified peers.

### Defaults

By default, the configuration for all LDP peers is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *ip-address* parameter to display information for a specific LDP peer.
- Use the **detail** parameter to display additional information and statistics for the specified LDP peers.

### Examples

```
->show router ldp peer
LDP Peers
```

Peer	Adm	Opr	Hello Factor	Hold Time	KA Factor	KA Timeout	Passive Mode	Auto Created
10.11.0.6	Up	Up	3	45	4	40	Disabled	Yes
20.1.2.3	Up	Up	3	45	4	40	Disabled	Yes
30.1.2.3	Up	Up	3	45	4	40	Disabled	Yes

No. of Peers: 3

```
->show router ldp peer detail
LDP Peers (Detail)
```

```

```

### *output definitions*

<b>Peer</b>	The IP address of the LDP peer.
<b>Adm</b>	The administrative state of the LDP peer ( <b>Up</b> or <b>Down</b> ).
<b>Opr</b>	The operational state of the LDP peer ( <b>Up</b> or <b>Down</b> ).
<b>Hello Factor</b>	The Hello factor value that is divided into the Hold Time value to determine the interval at which Hello messages are sent. LDP uses hello messages to discover neighbors and to detect loss of connectivity with its neighbors.
<b>Hold Time</b>	The Hold Time value (also referred to as Hello Timeout) determines the amount of time, in seconds, LDP waits to receive hello messages from a peer before declaring that the peer is down.
<b>KA Factor</b>	The Keepalive Factor value that is divided into the Keepalive Timeout value to determine the interval at which Keepalive messages are sent. LDP keepalive messages are sent to keep the LDP session from timing out when no other LDP traffic is sent between neighbors.
<b>KA Timeout</b>	The amount of time, in seconds, LDP waits to receive keepalive messages from an LDP peer before tearing down the session with that peer.
<b>Passive Mode</b>	Whether or not passive mode is active ( <b>True</b> or <b>False</b> ). When passive mode is active, LDP responds only when a connect request is received from a peer and does not actively try to connect with peers. When this mode is not active, LDP actively tries to connect to peers.
<b>Auto Created</b>	Indicates if a targeted peer was automatically created through service manager ( <b>Yes</b> or <b>No</b> ). This value is always <b>No</b> for an LDP interface.
<b>Last Modified</b>	The date and time the interface configuration was last modified.
<b>Active Adjacencies</b>	The number of active adjacencies between this interface and LDP peers.

*output definitions*

---

<b>Tunneling</b>	The tunneling status for the peer ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Lsp Name</b>	The name of the Label Switch Path (LSP) associated with the peer.

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

**show router ldp discovery peer** Displays the discovery status of the LDP Hello adjacencies associated with the specified LDP peer.

**show router ldp discovery interface** Displays the discovery status of the LDP Hello adjacencies associated with the specified LDP interface.

**MIB Objects**

---

## show router ldp session

Displays configuration information and statistics for LDP sessions.

**show router ldp session** [*ip-address[:label-space]*] [**detail** | **statistics** [*packet-type*]]

---

### Syntax Definitions

<i>ip-address</i>	The IP address of an LDP peer.
<i>:label-space</i>	The label space ID number that the router advertises on the LDP interface. This value is appended to the LDP router ID address. The valid range is 0–65535.
<b>detail</b>	Displays detailed information for the specified sessions.
<i>packet-type</i>	Displays session information for a specific packet type. Valid packet type entries for this parameter are <b>hello</b> , <b>keepalive</b> , <b>init</b> , <b>label</b> , <b>notification</b> , and <b>address</b> .

### Defaults

By default, information is displayed for all LDP sessions.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *ip-address* and *:label-space* parameters to display information for a specific LDP session. Note that entering a label-space value is not required when specifying an IP address.
- The **detail** parameter is available for use with the base command (**show router ldp session**) and in combination with the *ip-address* parameter to show additional information for a specific LDP session.
- The **statistics** parameter is available for use with the base command (**show router ldp session**), but is not used in combination with the *ip-address* parameter. Note that specifying a packet type with this parameter is optional; if no type is specified, statistics are displayed for all types.

### Examples

```
->show router ldp session
LDP Sessions
```

Peer LDP Id	Adj Type	State	Msg Sent	Msg Recv	Up Time
10.11.0.6:0	Both	Established	73211	73213	1d 23:00:59
10.11.0.66:0	Targeted	Established	2417	2419	0d 03:40:28

```
No. of Sessions: 2
```

```
->show router ldp session 10.11.0.66
LDP Sessions

```

#### *output definitions*

---

<b>Adm</b>	The administrative state of the LDP instance ( <b>Up</b> or <b>Down</b> ).
<b>Opr</b>	The operational state of the LDP instance ( <b>Up</b> or <b>Down</b> ).
<b>Created at</b>	The date and time the LDP instance was created.
<b>Up Time</b>	The length of time, in hundredths of seconds, that the LDP instance has been operationally up.

*output definitions*

---

<b>Last Change</b>	The date and time the LDP instance was last modified.
<b>Tunn Down Damp Time (sec)</b>	The amount of time, in seconds, the tunnel has been down.
<b>Import Policies</b>	None (not supported).
<b>Export Policies</b>	None (not supported).
<b>Active Adjacencies</b>	The number of active adjacencies (established sessions) associated with this LDP instance.
<b>Active Sessions</b>	The number of sessions in the process of actively attempting to establish a session.
<b>Active Interfaces</b>	The number of active (operationally up) interfaces associated with this LDP instance.
<b>Inactive Interfaces</b>	The number of inactive (operationally down) interfaces associated with this LDP instance.
<b>Active Peers</b>	The number of active LDP peers.
<b>Inactive Peers</b>	The number of inactive LDP peers.
<b>Addr FECs Sent</b>	The number of address (prefix) FEC labels sent to the peer associated with the FEC.
<b>Addr FECs Recv</b>	The number of address (prefix) FEC labels received from the peer associated with the FEC.
<b>Serv FECs Sent</b>	The number of service FEC labels sent to the peer associated with the FEC.
<b>Serv FECs Recv</b>	The number of service FEC labels received from the peer associated with the FEC.
<b>Attempted Sessions</b>	The number of attempted sessions for this LDP instance.
<b>No Hello Err</b>	The number of “Session Rejected” or “No Hello Error” notification messages sent or received by this LDP instance.
<b>Param Adv Err</b>	The number of “Session Rejected” or “Parameters Advertisement Mode Error” notification messages sent or received by this LDP instance.
<b>Max PDU Err</b>	The number of “Session Rejected” or “Parameters Max PDU Length Error” notification messages sent or received by this LDP instance.
<b>Label Range Err</b>	The total number of “Session Rejected” or “Parameters Label Range Error” notification messages sent or received by this LDP instance.
<b>Bad LDP Id Err</b>	The number of bad LDP identifier fatal errors detected for sessions associated with this LDP instance.
<b>Bad PDU Len Err</b>	The number of bad PDU length fatal errors detected for sessions associated with this LDP instance.
<b>Bad Mesg Len Err</b>	The number of bad message length fatal errors detected for sessions associated with this LDP instance.
<b>Bad TLV Len Err</b>	The number of bad TLV length fatal errors detected for sessions associated with this LDP instance.
<b>Malformed TLV Err</b>	The number of malformed TLV value fatal errors detected for sessions associated with this LDP instance.

*output definitions*

---

<b>Keepalive Expired Err</b>	The number of session Keepalive timer expired errors detected for sessions associated with this LDP instance.
<b>Shutdown Notif Sent</b>	The number of shutdown notifications sent related to sessions associated with this LDP instance.
<b>Shutdown Notif Recv</b>	The number of shutdown notifications received related to sessions associated with this LDP instance.

# 49 MPLS Static LSP and FRR Commands

MPLS forwarding is performed by routers called Label Switching Routers (LSRs). A Label Switched Path (LSP) is a path through one or more LSRs.

There are two types of LSPs that are configurable using MPLS:

- **Static LSPs.** A Static LSP specifies a statically defined path of LSRs. Configuration of label mappings and MPLS actions is required on each router that will participate in the static path. No signaling protocol, such as the Label Distribution Protocol (LDP), is required, and there is no dependence on a gateway protocol topology or local forwarding table. Static LSPs are able to cross an Autonomous System (AS) boundary.
- **Signaled LSP.** The LSPs are set up using a signaling protocol, such as LDP. The signaling protocol allows the automatic assignment of labels from an ingress router to the egress router. Signaling is triggered by the ingress router, therefore configuration is only required on this router. A signaled LSP is confined to one gateway protocol area and, therefore, cannot cross an AS boundary.

In addition to static LSPs, a static Fast Reroute feature is available that allows the configuration of backup static LSP tunnels. FRR uses the backup tunnels for alternate routes in the event an LSP goes down.

This chapter provides information about the Command Line Interface (CLI) commands used to configure static LSPs and backup static LSPs used by the FRR mechanism. For information about LDP commands used to configure signaled LSPs, see [Chapter 48, “MPLS LDP Commands.”](#)

MIB information for static LSP is as follows:

*Filename:* TIMETRA-MPLS-MIB.mib  
*Module:* TIMETRA-MPLS-MIB

MIB information for static FRR is as follows:

*Filename:* AlcatelStaticFrr.mib file  
*Module:* ALCATEL-STATIC-FRR-MIB

The following table summarizes the available static LSP and static FRR commands:

---

<b>Static LSP Commands for All Routers</b>	<code>configure router mpls shutdown</code> <code>configure router mpls interface</code> <code>configure router mpls interface shutdown</code>
<b>Static LSP Commands for Transit Router Configuration</b>	<code>configure router mpls interface label-map</code> <code>configure router mpls interface label-map swap next-hop</code> <code>configure router mpls interface label-map shutdown</code>
<b>Static LSP Commands for Egress Router Configuration</b>	<code>configure router mpls interface label-map pop</code> <code>configure router mpls interface label-map shutdown</code>
<b>Static LSP Commands for Ingress Router Configuration</b>	<code>configure router mpls static-lsp</code> <code>configure router mpls static-lsp to</code> <code>configure router mpls static-lsp push next-hop</code> <code>configure router mpls static-lsp shutdown</code>
<b>Static FRR Command</b>	<code>configure router mpls interface label-map protect-swap next-hop</code>
<b>Show Commands</b>	<code>show router mpls interface</code> <code>show router mpls label</code> <code>show router mpls label-range</code> <code>show router mpls static-lsp</code> <code>show router mpls status</code>

---

## configure router mpls shutdown

Configures the administrative status of the MPLS protocol instance.

**configure router mpls {no shutdown | shutdown}**

---

### Syntax Definitions

<b>no shutdown</b>	Enables the MPLS protocol instance.
<b>shutdown</b>	Disables the MPLS protocol instance.

### Defaults

By default, MPLS is enabled for the switch.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Disabling the MPLS instance disables the Label Switched Paths attached to the instance, as well as any Service Distribution Points (SDPs) and SDP bindings associated with the LSP. When the MPLS instance is once again enabled, the attached LSPs will attempt to re-activate.
- Note that deleting the MPLS instance is not allowed; there is no command for this purpose. Only changing the administrative status of the instance is allowed.

### Examples

```
-> configure router mpls no shutdown  
-> configure router mpls shutdown
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**show router mpls status** Displays the status of the MPLS instance on the router.

### MIB Objects

```
vRtrMplsGeneralTable  
vRtrMplsGeneralAdminState
```

---

## configure router mpls interface shutdown

Configures the administrative status for specified MPLS interface.

**configure router mpls interface** *ip-intf-name* {no shutdown | shutdown}

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<b>no shutdown</b>	Enables the MPLS administrative status for the interface.
<b>shutdown</b>	Disables the MPLS administrative status for the interface.

### Defaults

By default, the administrative status of an MPLS interface is enabled.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Disabling the administrative status for an MPLS interface does not remove the MPLS configuration from that interface. However, any Label Switched Paths (LSPs) associated with the MPLS interface are also administratively disabled.
- When a disabled MPLS interface is enabled, any associated LSPs are also enabled.
- The MPLS interface name specified with this command must already exist in the router configuration.

### Examples

```
-> configure router mpls interface vlan-20 no shutdown  
-> configure router mpls interface vlan-20 shutdown
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[configure router mpls interface](#) Configures MPLS support on an IP interface.

[show router mpls interface](#) Displays the MPLS interface configuration.

### MIB Objects

```
vRtrMplsIfTable  
vRtrMplsIfAdminState
```

---

## configure router mpls interface label-map

Configures an incoming label number that the specified MPLS interface will process. Use this command to provide this information on each transit and egress router that participates in a static Label Switched Path (LSP).

**configure router mpls interface** *ip-intf-name* **label-map** *in-label*

**configure router mpls interface** *ip-intf-name* **no label-map** *in-label*

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<i>in-label</i>	An incoming label number. The valid range is 32–1023.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the incoming label map.
- Once created, the incoming label-map number is then associated with a swap (transit router) or pop (egress router) action.
- The label-map number and associated action is not active until the label-map is administratively enabled.

### Examples

```
-> configure router mpls interface vlan-20 label-map 700  
-> configure router mpls interface vlan-20 no label-map 700
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls interface** Configures MPLS support on an IP interface.
- configure router mpls interface label-map swap next-hop** Configures the outgoing label number that is swapped for the specified incoming label number and the IP address for the next router in the static LSP.
- configure router mpls interface label-map pop** Configures a pop (remove) label operation to identify the router as an egress (endpoint) router for the static LSP.
- configure router mpls interface label-map shutdown** Configures the administrative status for the label mapping.
- show router mpls label** Displays the MPLS labels that are exchanged.

## MIB Objects

mplsInSegmentTable  
mplsInSegmentRowStatus

---

## configure router mpls interface label-map swap next-hop

Configures the outgoing label number that is swapped for the specified incoming label number. Also configures the next-hop IP address in the static Label Switched Path (LSP). Use this command to provide this information on each transit router that participates in the static LSP.

**configure router mpls interface *ip-intf-name* label-map *in-label* swap *out-label* next-hop *ip-address***

**configure router mpls interface *ip-intf-name* label-map *in-label* no swap**

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<i>in-label</i>	An incoming label number. The valid range is 32–1023.
<i>out-label</i>	An outgoing label number. The valid range is 32–1023.
<i>ip-address</i>	The IP address for the next-hop router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the outgoing label and the associated next-hop IP address.
- If an ARP entry for the next hop exists, then the static LSP is marked as operational. If an ARP entry does not exist, then the static LSP is marked as operationally down and the local router continues to ARP for the configured next hop at a fixed interval..

### Examples

```
-> configure router mpls interface vlan-20 label-map 700 swap 555 next-hop  
192.168.10.2  
-> configure router mpls interface vlan-20 no label-map 700 no swap
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls interface** Enables MPLS Protocol support on an IP interface.
- configure router mpls interface label-map** Configures an incoming label number that the specified MPLS interface will process.
- configure router mpls interface label-map pop** Configures a pop (remove) label operation to identify the router as an egress (endpoint) router for the static LSP.
- configure router mpls interface label-map shutdown** Configures the administrative status for the label mapping.
- show router mpls label** Displays the MPLS labels that are exchanged.

## MIB Objects

```
mplsInSegmentTable  
  mplsInSegmentXCIndex  
mplsOutSegmentTable  
  mplsOutSegmentTopLabel  
  mplsOutSegmentNextHopIpAddrType  
  mplsOutSegmentNextHopIpv4Addr  
  mplsOutSegmentXCIndex  
  mplsOutSegmentRowStatus  
mplsXCTable  
  mplsXCRowStatus
```

---

## configure router mpls interface label-map pop

Configures a label pop operation for the packet containing the specified incoming label number. This action is configured on an egress Label Edge Router (LER) to identify the end of MPLS switching and the static Label Switched Path (LSP).

**configure router mpls interface *ip-intf-name* label-map *in-label* pop**

**configure router mpls interface *ip-intf-name* label-map *in-label* no pop**

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<i>in-label</i>	Incoming label number. The valid range is 32–1023.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to stop the label pop operation and remove the egress router designation for this router.
- When the egress LER receives a packet with the specified label number, the label is popped off (removed from) the packet. Once the label is removed from the packet, the associated service directs any further action with the packet.

### Examples

```
-> configure router mpls interface vlan-20 label-map 800 pop
-> configure router mpls interface vlan-20 no label-map 800 no pop
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls interface** Enables MPLS Protocol support on an IP interface.
- configure router mpls interface label-map** Configures an incoming label number that the specified MPLS interface will process.
- configure router mpls interface label-map swap next-hop** Configures the outgoing label number that is swapped for the specified incoming label number and the IP address for the next router in the static LSP.
- configure router mpls interface label-map shutdown** Configures the administrative status for the label mapping.
- show router mpls label** Displays the MPLS labels that are exchanged.

## MIB Objects

  mplsOutSegmentXCIndex  
  mplsOutSegmentRowStatus  
mplsXCTable  
  mplsXCRowStatus
```

---

## configure router mpls interface label-map shutdown

Configures the administrative status for an incoming label-map on a transit Label Switch Router (LSR) or on an egress Label Edge Router (LER).

**configure router mpls interface** *ip-intf-name* **label-map** *in-label* {**no shutdown** | **shutdown**}

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<i>in-label</i>	Incoming label-map number. The valid range is 32–1023.
<b>no shutdown</b>	Enables the administrative status of the specified label-map.
<b>shutdown</b>	Disables the administrative status of the specified label-map.

### Defaults

By default, the incoming label-map is disabled at the time the label-map is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The MPLS interface and incoming label-map number specified with this command must already exist in the router configuration.
- Disabling the administrative status of the label-map does not remove the label-map configuration from the router.
- When the label-map is disabled, any packets ingressing on the router that contain the label-map number are dropped.

### Examples

```
-> configure router mpls interface vlan-20 label-map 700 shutdown
-> configure router mpls interface vlan-20 label-map 700 no shutdown
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls interface** Enables MPLS Protocol support on an IP interface.
- configure router mpls interface label-map** Configures an incoming label number that the specified MPLS interface will process.
- configure router mpls interface label-map swap next-hop** Configures the outgoing label number that is swapped for the specified incoming label number and the next-hop router IP address for the static LSP.
- configure router mpls interface label-map pop** Configures a pop (remove) label operation to identify the router as an egress (endpoint) router for the static LSP.
- show router mpls interface** Displays the MPLS interface configuration.

## MIB Objects

mplsInSegmentTable  
    mplsInSegmentXCIndex  
mplsXCTable  
    mplsXCAdminStatus

---

## configure router mpls static-lsp

Configures a static Label Switched Path (LSP) instance on an ingress Label Edge Router (LER).

**configure router mpls static-lsp** *lsp-name*

**configure router mpls no static-lsp** *lsp-name*

---

### Syntax Definitions

*lsp-name* An alphanumeric name, up to 32 characters, to assign to the static LSP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- To remove this static LSP configuration from the ingress router, administratively disable (shutdown) the LSP and then use the **no** form of this command to remove the configuration from the router.
- The Static LSP instance is identified by the LSP name on the ingress router and by the MPLS interface name and ingress label combination on both transit and egress routers.
- Configuring the static LSP instance is done only on the ingress LER to identify the origination point of the LSP.
- Once the static LSP is created and associated with a name, configuring the destination IP address, the push operation, and the next-hop router IP address for the LSP is required.

### Examples

```
-> configure router mpls static-lsp to-R3
-> configure router mpls no static-lsp to-R3
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

**configure router mpls static-lsp shutdown** Configures the administrative status of the static LSP.

**configure router mpls static-lsp to** Configures the destination System IP address for the static LSP.

**configure router mpls static-lsp push next-hop** Pushes the specified label on to the label stack and specifies the IP address for the next-hop router in the static LSP.

**show router mpls static-lsp** Displays static LSP configuration information.

## **MIB Objects**

vRtrMplsLspTable  
vRtrMplsLspRowStatus  
vRtrMplsLspName

---

## configure router mpls static-lsp shutdown

Configures the administrative status for the specified static Label Switched Path (LSP).

```
configure router mpls static-lsp lsp-name {no shutdown | shutdown}
```

---

### Syntax Definitions

<i>lsp-name</i>	The name of an existing static LSP.
<b>no shutdown</b>	Enables the administrative status of the specified static LSP.
<b>shutdown</b>	Disables the administrative status of the specified static LSP.

### Defaults

By default, the static LSP is disabled when the LSP is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The LSP name specified with this command must already exist in the router configuration.
- Disabling the administrative status of the static LSP does not remove the LSP configuration from the router, however, packet forwarding to the next-hop router is stopped. When a disabled static LSP is enabled, packet forwarding continues.

### Examples

```
-> configure router mpls static-lsp to-R3 no shutdown  
-> configure router mpls static-lsp to-R3 shutdown
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls static-lsp** Configures a static LSP on an ingress router.
- configure router mpls static-lsp to** Configures the destination System IP address for the static LSP.
- configure router mpls static-lsp push next-hop** Pushes the specified label on to the label stack and specifies the IP address for the next-hop router in the static LSP.
- show router mpls static-lsp** Displays static LSP configuration information.

## MIB Objects

vRtrMplsLspTable  
vRtrMplsLspAdminState

---

## configure router mpls static-lsp to

Configures the destination system IP address for the specified static LSP. This is configured on the ingress router to identify the destination router for the static LSP.

**configure router mpls static-lsp** *lsp-name to ip-address*

---

### Syntax Definitions

<i>lsp-name</i>	The name of an existing static LSP.
<i>ip-address</i>	The system IP address of the egress router. This is the configured Loopback0 address on an OmniSwitch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The System IP address specified with this command should match the System IP address for the far-end router of the SDP to which the static LSP is attached.
- The LSP name specified with this command must already exist in the router configuration.
- This command is also used to configure backup static LSP tunnels. To create a backup tunnel, configure a static LSP with the same destination system IP address as the protected (primary) tunnel, but with a different LSP name.
- Up to 16 backup LSP tunnels are supported per Service Distribution Point (SDP).
- Configuring a backup static LSP activates the static Fast ReRoute (FRR) mechanism that will redirect traffic to a backup tunnel should the protected LSP tunnel goes down.

### Examples

```
-> configure router mpls static-lsp to-R3 to 10.10.10.3
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls static-lsp** Configures a static LSP on an ingress LER.
- configure router mpls static-lsp shutdown** Configures the administrative status of the static LSP.
- configure router mpls static-lsp push next-hop** Pushes the specified label on to the label stack and specifies the system IP address for the next-hop router in the static LSP.
- show router mpls static-lsp** Displays static LSP configuration information.

## MIB Objects

vRtrMplsLspTable  
vRtrMplsLspToAddr

---

## configure router mpls static-lsp push next-hop

Pushes the specified label on to the label stack and specifies the IP address for the next-hop router in the static Label Switched Path (LSP). After the push operation is complete, the packet is then forwarded to the specified next-hop router.

```
configure router mpls static-lsp lsp-name push out-label next-hop ip-address
```

```
configure router mpls static-lsp lsp-name no push out-label
```

---

### Syntax Definitions

<i>lsp-name</i>	The existing LSP name.
<i>out-label</i>	An outgoing label number. The valid range is 32–1023.
<i>ip-address</i>	The next-hop router IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the push label configuration associated with the static LSP.
- The LSP name specified with this command must already exist in the router configuration.
- If an ARP entry for the next hop exists, then the static LSP is marked as operational. If an ARP entry does not exist, then the static LSP is marked as operationally down and the local router continues to ARP for the configured next hop at a fixed interval.

### Examples

```
-> configure router mpls static-lsp to-R3 push 777 next-hop 192.168.10.2  
-> configure router mpls static-lsp to-R3 no push 777
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- configure router mpls static-lsp** Configures a static LSP on an ingress LER.
- configure router mpls static-lsp shutdown** Configures the administrative status of the static LSP.
- configure router mpls static-lsp to** Configures the system IP address of the static LSP egress router.
- show router mpls static-lsp** Displays static LSP configuration information.

## MIB Objects

```
vRtrMplsLspTable
  vRtrMplsLspOutSegIndx
mplsOutSegmentTable
  mplsOutSegmentTopLabel
  mplsOutSegmentNextHopIpAddrType
  mplsOutSegmentNextHopIpv4Addr
  mplsOutSegmentXCIndex
  mplsOutSegmentRowStatus
mplsXCTable
  mplsXCRowStatus
```

---

## configure router mpls interface label-map protect-swap next-hop

Configures static Fast Reroute (FRR) protection on a transit Label Switch Router (LSR). This command defines an alternate static swap label-map that FRR will use if the next-hop segment goes down.

**configure router mpls interface** *ip-intf-name* **label-map** *in-label* **protect-swap** *out-label* **next-hop** *ip-address*

**configure router mpls interface** *ip-intf-name* **label-map** *in-label* **no protect-swap**

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<i>in-label</i>	An incoming label number. The valid range is 32–1023.
<i>out-label</i>	An outgoing label number. The valid range is 32–1023.
<i>ip-address</i>	The next-hop router IP address.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the FRR configuration.
- Dynamic FRR is not supported on the OmniSwitch; only static FRR is supported. Static FRR is not compatible with dynamic FRR, which is supported on other Alcatel-Lucent platforms. As a result, a router with dynamic FRR enabled cannot set up backup paths with a downstream node that is an OmniSwitch router.

### Examples

```
-> configure router mpls interface vlan-20 label-map 556 protect-swap 557 next hop  
192.168.10.2  
-> configure router mpls interface vlan-20 label-map 556 no protect-swap
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- show router mpls label**      Displays information about MPLS labels.  
**show router mpls static-lsp**      Displays the static LSP configuration.

## MIB Objects

  vRtrStaticFrrMplsOutSegmentNextHopIpv4Addr  
  vRtrStaticFrrMplsOutSegmentXCIndex  
  vRtrStaticFrrMplsOutSegmentRowStatus  
vRtrStaticFrrMplsXCTable  
  vRtrStaticFrrMplsXCRowStatus
```

---

## show router mpls interface

Displays the MPLS interface configuration.

```
show router mpls interface [ip-intf-name] [label-map label [protect-swap [out-label]]]
```

---

### Syntax Definitions

<i>ip-intf-name</i>	The name of an existing MPLS IP interface.
<i>label</i>	A label number. The valid range is 32–131071.
<i>out-label</i>	The outgoing label number for a protected LSP association. The valid range is 32–131071.

### Defaults

By default, the configuration for all MPLS interfaces is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the command parameters provided to display information for specific interfaces.
- Fields that contain “N/A” are not supported.

### Examples

```
-> show router mpls interface
```

```
MPLS Interfaces
```

Interface	Port-id	Adm	Opr	Te-metric
vlan-20	N/A	Up	Up	N/A

**output definitions**

<b>Interface</b>	The name of an existing MPLS IP interface.
<b>Port-id</b>	The existing port-id.
<b>Adm</b>	The administrative state of the LSP peer ( <b>Up</b> or <b>Down</b> ).

---

<b>Opr</b>	The operational state of the LSP peer ( <b>Up</b> or <b>Down</b> ).
<b>In Label</b>	An incoming label number.
<b>Protected Out Label</b>	An outgoing label number.
<b>Protected Next Hop</b>	Ip address of the next hop.
<b>Type</b>	Type of label to display.

---

### **Release History**

Release 6.4.2; command was introduced.

### **Related Commands**

[configure router mpls interface](#) Configures MPLS support on an IP interface.

### **MIB Objects**

---

## show router mpls label

Displays the MPLS labels that are exchanged.

```
show router mpls label start-label [end-label [label-filter]]
```

---

### Syntax Definitions

<i>start-label</i>	The label value assigned to the ingress router.
<i>end-label</i>	The label value assigned to the egress router.
<i>label-filter</i>	The types of labels to display. The valid entries for this parameter are <b>in-use</b> , <b>bgp</b> , <b>ildp</b> , <b>mirror</b> , <b>rsvp</b> , <b>static</b> , <b>svcmgr</b> , <b>tldp</b> , or <b>vprn</b> . Enter one type per command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the command parameters provided to display information for specific types of labels.

### Examples

```
-> show router mpls label 500
```

```
MPLS Label 500
```

Label	Label Type	Label Owner
500	static-lsp	STATIC

## show router mpls static-lsp

Displays static Label Switched Path (LSP) information.

**show router mpls static-lsp** [*lsp-name* / **transit** | **terminate** | **count**]

---

### Syntax Definitions

<i>lsp-name</i>	The name of an existing LSP.
<b>transit</b>	Displays transit information for static LSPs.
<b>terminate</b>	Displays endpoint information for static LSPs.
<b>count</b>	Displays the total number of static LSPs.

### Defaults

By default, information for all static LSPs is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the command parameters provided to display information for a specific static LSP or to provide a count of the number of static LSPs.

### Examples

```
-> show router mpls static-lsp
```

```
MPLS Static LSPs (Originating)
```

LSP Name ID	To	Next Hop	Out Label Out Port	Up/Down Time	Adm	Opr
lsp-1 1	10.1.1.4	20.20.20.1*	734 n/a	0d 05:56:45	Up	Up
lsp-2 2	10.11.0.6	20.20.20.1*	750 n/a	0d 05:56:45	Up	Up
lsp-3 3	5.5.5.5	20.20.20.1*	750 n/a	0d 05:56:45	Up	Up

```

```
LSPs : 2
```

```
-> show router mpls static-lsp count
```

```
MPLS Static-LSP Count
```

Originate	Transit	Terminate
3	5	2

### *output definitions*

<b>LSP Name ID</b>	The name of an existing LSP.
<b>To</b>	Ip address of the destination.
<b>Out Label Out Port</b>	Outgoing label number.
<b>Up/Down Time</b>	Time for Up or Down state.
<b>Opr</b>	The operational state of the LSP peer ( <b>Up</b> or <b>Down</b> ).

## Release History

Release 6.4.2; command was introduced.

## Related Commands

[configure router mpls static-lsp](#) Configures a static LSP on an ingress Label Edge Router (LER).

## MIB Objects

---

## show router mpls status

Displays the MPLS status.

**show router mpls status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

This command administrative and operational information for the MPLS instance on the router.

### Examples

```
-> show router mpls status
```

```
MPLS Status
```

```
Admin Status:      Up,          Oper Status:      Up,
Oper Down Reason:  N/A
```

LSP Counts	Originate	Transit	Terminate
Static LSPs	0	4	0
Dynamic LSPs	0	0	0
Detour LSPs	0	0	0

### *output definitions*

---

<b>Admin Status</b>	The administrative state of the LSP peer ( <b>Up</b> or <b>Down</b> ).
<b>Oper Status</b>	The operational state of the LSP peer ( <b>Up</b> or <b>Down</b> ).
<b>Oper Down Reason</b>	Reason for operational state - Down.
<b>LSP Counts</b>	Displays the total number of static LSPs.
<b>Originate</b>	Displays originate information for static LSPs.
<b>Transit</b>	Displays transit information for static LSPs.
<b>Terminate</b>	Displays endpoint information for static LSPs.

---

### Release History

Release 6.4.2; command was introduced.

### **Related Commands**

**show router mpls static-lsp** Displays detailed static LSP information.

### **MIB Objects**

# 50 Virtual Private LAN Service (VPLS) Commands

A Virtual Private LAN Service (VPLS) is a Virtual Private Network (VPN) technology that allows any-to-any (multipoint) connectivity. The provider network emulates a LAN by connecting all the remote customer sites at the edge of the provider network to a single bridged LAN. A full mesh of pseudo-wires (PW) needs to be established to form a VPLS.

A VPLS-capable network consists of Customer Edges (CE), Provider Edges (PE), and a core MPLS network. The CE device is a router or switch located at the customer's premises and is connected to the PE via an Attachment Circuit (AC). In the case of VPLS, it is assumed that Ethernet is the layer 2 protocol used between the CE and the PE.

The PE device is where the services originate and terminate and where all the necessary tunnels are set up to connect to all the other PEs. As VPLS is an Ethernet Layer 2 service, the PE must be capable of Media Access Control (MAC) learning, bridging, and replication on a per-VPLS basis.

The IP/MPLS core network interconnects the PEs but does not participate in the VPN functionality. Traffic is simply switched based on the MPLS labels.

This implementation of VPLS makes use of a service-based architecture that provides the following logical entities that are required to provision a service:

- **Customers (subscribers).** An account is created for each customer and assigned an ID. The customer ID is required and associated with the service at the time the service is created.
- **Service Access Points (SAPs).** Each subscriber service type is configured with at least one SAP. A SAP identifies the point at which customer traffic enters the service.
- **Service Distribution Points (SDPs).** A SDP provides a logical point at which customer traffic is directed from one PE to another PE through a one-way service tunnel.

A distributed service consists of at least one SAP on a local node, one SAP on a remote node, and an SDP binding the service to the service tunnel.

This chapter provides information about the Command Line Interface (CLI) commands used to configure the above entities required to provision a service.

MIB information for the LDP commands is as follows:

*Filename:* AlcatelIND1ServiceMgr.MIB  
*Module:* Alcatel-IND1-SERVICE-MGR-MIB

*Filename:* TIMETRA-SDP.MIB\_mib  
*Module:* TIMETRA-SDP-MIB

A summary of the available commands is listed here:

<b>Customer Account Commands</b>	<pre>configure service customer create configure service customer contact configure service customer phone configure service customer description</pre>
<b>Service Distribution Point (SDP) Commands</b>	<pre>configure service sdp create configure service sdp description configure service sdp far-end configure service sdp shutdown configure service sdp ldp configure service sdp signaling configure service sdp lsp configure service sdp adv-mtu-override configure service sdp path-mtu</pre>
<b>VPLS Commands</b>	<pre>configure service vpls create configure service vpls description configure service vpls shutdown configure service vpls def-mesh-vc-id configure service vpls send-flush-on-failure configure service vpls service-mtu configure service vpls mesh-sdp configure service vpls mesh-sdp shutdown configure service vpls mesh-sdp egress vc-label configure service vpls mesh-sdp ingress vc-label configure service vpls mesh-sdp static-mac</pre>
<b>Service Access Point (SAP) Commands</b>	<pre>configure service l2profile configure service port mode access configure service port l2profile configure service port encap-type configure service vpls sap create configure service vpls sap description configure service vpls sap trusted configure service vpls sap shutdown configure service vpls sap static-mac</pre>
<b>Clear Commands</b>	<pre>clear service id fdb clear service id mesh-sdp ingress-vc-label</pre>
<b>Show Commands</b>	<pre>show service l2profile show service port show service customer show service sdp show service id all show service id base show service id labels show service id sap show service id sdp show service sap-using show service sdp-using show service egress-label show service ingress-label show service fdb-info show service fdb-mac</pre>

## configure service customer create

Creates a customer ID that is used to associate account information with a specific customer. The customer ID is associated with a Virtual Private LAN Service (VPLS) that is used to carry traffic between customer sites over a provider-managed MPLS network.

**configure service customer** *customer-id* **create**

**configure service no customer** *customer-id*

---

### Syntax Definitions

*customer-id*                      A unique numerical value to associate with a specific customer. The valid ID range is 2–2147483647.

### Defaults

A default customer account ID (customer 1) exists on each router and is automatically assigned to new services.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Specify a customer ID that does not already exist in the router configuration.
- Use the **no** form of this command to remove a customer ID and all associated customer information. Note that deleting all service associations with a customer ID is required before the ID is removed from the router configuration.
- Editing or removing the default customer 1 account is not allowed.

### Examples

```
-> configure service customer 10 create  
-> configure service no customer 10
```

### Release History

Release 6.4.2; command was introduced.

**Related Commands**

<b>configure service customer contact</b>	Configures contact information for a customer account.
<b>configure service customer description</b>	Configures a description for a customer account.
<b>configure service customer phone</b>	Configures phone number information for a customer account.
<b>show service customer</b>	Displays the customer account information configured for the router.

**MIB Objects**

```
custInfoTable  
  custId
```

---

## configure service customer contact

Configures contact information for the specified customer account. Use this command to provide information about the customer, such as a contact name or account contract name.

**configure service customer** *customer-id* **contact** *contact-info*

**configure service customer** *customer-id* **no contact**

---

### Syntax Definitions

*customer-id* An existing customer ID number.

*contact-info* An ASCII text string up to 80 characters in length. Enclose special characters, such as #, \$, or spaces, in double quotation marks (for example "Technical Support").

### Defaults

By default, no customer contact information is configured when a customer account ID is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove customer contact information from the specified customer account ID.
- Printable, 7-bit ASCII characters are allowed in the contact information string.

### Examples

```
-> configure service customer 10 contact "Thomas Smith - Tech Support"  
-> configure service no contact
```

### Release History

Release 6.4.2; command was introduced.

**Related Commands**

<b>configure service customer create</b>	Creates a customer account and associates that account with a customer ID.
<b>configure service customer description</b>	Configures a description for a customer account.
<b>configure service customer phone</b>	Configures phone number information for a customer account.
<b>show service customer</b>	Displays the customer account information configured for the router.

**MIB Objects**

```
custInfoTable  
  custId  
  custContact
```

---

## configure service customer phone

Configures telephone number information for the specified customer account.

**configure service customer** *customer-id* **phone** *phone-info*

**configure service customer** *customer-id* **no phone**

---

### Syntax Definitions

*customer-id*

An existing customer ID number.

*phone-info*

An ASCII text string up to 80 characters in length. Enclose special characters, such as #, \$, or spaces, in double quotation marks (for example "800-444-1234").

### Defaults

By default, telephone information is not added when a customer account is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the telephone information from the specified customer account ID.
- Printable, 7-bit ASCII characters are allowed in the description text string.

### Examples

```
-> configure service customer 10 phone "888-444-1234"  
-> configure service customer 10 no phone
```

### Release History

Release 6.4.2; command was introduced.

**Related Commands**

<code>configure service customer create</code>	Creates a customer account and associates that account with a customer ID.
<code>configure service customer contact</code>	Configures contact information for a customer account.
<code>configure service customer description</code>	Configures a description for a customer account.
<code>show service customer</code>	Displays the customer account information configured for the router.

**MIB Objects**

```
custInfoTable
  custId
  custPhone
```

---

## configure service customer description

Configures an optional description for the specified customer account. Use this command to add more information about the customer or additional account details.

**configure service customer** *customer-id* **description** *desc-info*

**configure service customer** *customer-id* **no description**

---

### Syntax Definitions

*customer-id* An existing customer ID number.

*desc-info* An ASCII text string up to 80 characters in length. Enclose special characters, such as #, \$, or spaces, in double quotation marks (for example "Services Contract #4000").

### Defaults

By default, a description is not added when a customer account is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the description from the specified customer account ID.
- Printable, 7-bit ASCII characters are also allowed in the description text string.

### Examples

```
-> configure service customer 10 description "PT-Cal_Service_Manager"  
-> configure service customer 10 no description
```

### Release History

Release 6.4.2; command was introduced.

**Related Commands**

<b>configure service customer create</b>	Creates a customer account and associates that account with a customer ID.
<b>configure service customer contact</b>	Configures contact information for a customer account.
<b>configure service customer phone</b>	Configures phone number information for a customer account.
<b>show service customer</b>	Displays the customer account information configured for the router.

**MIB Objects**

```
custInfoTable
  custId
  custDescription
```

---

## configure service sdp create

Configures a Service Distribution Point (SDP). An SDP is a logical entity that directs traffic to another router through MPLS-based service tunnels.

**configure service sdp** *sdp-id* [**mpls**] **create**

**configure service no sdp** *sdp-id*

---

### Syntax Definitions

<i>sdp-id</i>	The identification number to associate with the specified SDP. The valid ID range is 1–17407.
<b>mpls</b>	The delivery mechanism for the SDP. No other mechanism is supported at this time.

### Defaults

By default, MPLS is the delivery mechanism for the SDP and the SDP administrative state is disabled.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the specified SDP. Disable the administrative status and remove any services associated with the SDP before attempting to remove the SDP.
- Administratively enabling the SDP is not allowed until a far-end router address is configured for the SDP. Specifying this address identifies the router on which the SDP will terminate. As a result, an SDP tunnel is configured that will provide a path from Point A to Point B.
- Configure an SDP on each participating provider edge (PE) router.
- Once created, an SDP is then bound to a specific customer Virtual Private LAN Service (VPLS). This binding process allows routers to participate in a service.
- Binding multiple services to one SDP is allowed; up to 32 SDP sessions are allowed at the same time.

### Examples

```
-> configure service sdp 10 create
-> configure service sdp 20 mpls create
-> configure service no sdp 20
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service sdp description</b>	Configures a description for the specified SDP.
<b>configure service sdp far-end</b>	Configures the system IP address of the far-end destination router for the SDP.
<b>configure service sdp shutdown</b>	Configures the administrative status of the specified SDP.
<b>configure service sdp ldp</b>	Enables or disables an LDP-signaled Label Switch Path (LSP) for the specified SDP.
<b>configure service sdp signaling</b>	Enables or disables auto-label signaling for the specified SDP;
<b>configure service sdp adv-mtu-override</b>	Enables or disables VC-type MTU override for the specified SDP.
<b>configure service sdp path-mtu</b>	Configures the administrative MTU value for the SDP.
<b>show service sdp-using</b>	Displays the SDP usage for the local router or for a far-end router IP address.
<b>show service id sdp</b>	Displays the SDP configuration for the specified service.

## MIB Objects

sdpInfoTable  
  sdpId  
  sdpDelivery

---

## configure service sdp description

Configures a description for the specified SDP.

**configure service sdp** *sdp-id* **description** *desc-info*

**configure service sdp** *sdp-id* **no description**

---

### Syntax Definitions

<i>sdp-id</i>	An existing SDP ID number.
<i>desc-info</i>	An ASCII text string up to 80 characters in length. Enclose special characters, such as #, \$, or spaces, in double quotation marks (for example "PE1 to PE2").

### Defaults

By default, a description is not added when the SDP is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the description from the specified SDP.
- Printable, 7-bit ASCII characters are also allowed in the description text string.

### Examples

```
-> configure service sdp 10 description "SW-A to SW-B"  
-> configure service sdp 10 no description
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service sdp create</b>	Configures an SDP, which is used to direct traffic to another router through MPLS-based service tunnels.
<b>configure service sdp far-end</b>	Configures the system IP address of the far-end destination router for the SDP.
<b>configure service sdp shutdown</b>	Configures the administrative status of the specified SDP.
<b>configure service sdp ldp</b>	Enables or disables an LDP-signaled Label Switch Path (LSP) for the specified SDP.
<b>configure service sdp signaling</b>	Enables or disables auto-label signaling for the specified SDP;
<b>configure service sdp adv-mtu-override</b>	Enables or disables VC-type MTU override for the specified SDP.
<b>configure service sdp path-mtu</b>	Configures the administrative MTU value for the SDP.
<b>show service sdp-using</b>	Displays the SDP usage for the local router or for a far-end router IP address.
<b>show service id sdp</b>	Displays the SDP configuration for the specified service.

## MIB Objects

```
sdpInfoTable  
  sdpId  
  sdpDescription
```

---

## configure service sdp far-end

Configures the system IP address of the far-end destination router for the Service Distribution Point (SDP). This far-end address identifies the SDP endpoint, which is where the service associated with the SDP will terminate.

**configure service sdp** *sdp-id* **far-end** *ip-address*

**configure service sdp** *sdp-id* **no far-end**

---

### Syntax Definitions

<i>sdp-id</i>	An existing SDP ID number.
<i>ip-address</i>	The system IP address for the far-end router. This is the user-configured Loopback0 address if the far-end router is an OmniSwitch.

### Defaults

By default, a far-end address is not defined when the SDP is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the far-end system IP address for the specified SDP. Administratively disable the SDP before attempting to remove the far-end address.
- Removing the far-end IP address from the SDP also removes all Label Switch Paths (LSPs) associated with the SDP.
- Administratively enabling an SDP is not allowed until a far-end router address is configured for the SDP. Specifying this address identifies the router on which the SDP will terminate. As a result, an SDP tunnel is configured that will provide a path from Point A to Point B.
- The SDP is operational when the SDP is administratively enabled and the protocol routing table contains the far-end IP address as a host route. OSPF ABRs should not summarize host routes between areas. This can cause SDPs to become operationally down. To avoid this potential problem, configure static host routes (direct and indirect) in the local router.
- If the SDP uses MPLS encapsulation (OmniSwitch supports MPLS only), the far-end IP address is used to check LSP names when added to the SDP. If the “**to** IP address” defined within the LSP configuration does not exactly match the SDP far-end IP address, the LSP is not added to the SDP and an error is generated.

### Examples

```
-> configure service sdp 10 far-end 10.1.1.2
-> configure service sdp 10 no far-end
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service sdp create</b>	Configures an SDP, which is used to direct traffic to another router through MPLS-based service tunnels.
<b>configure service sdp description</b>	Configures a description for the specified SDP.
<b>configure service sdp shutdown</b>	Configures the administrative status of the specified SDP.
<b>configure service sdp ldp</b>	Enables or disables an LDP-signaled Label Switch Path (LSP) for the specified SDP.
<b>configure service sdp signaling</b>	Enables or disables auto-label signaling for the specified SDP;
<b>configure service sdp adv-mtu-override</b>	Enables or disables VC-type MTU override for the specified SDP.
<b>configure service sdp path-mtu</b>	Configures the administrative MTU value for the SDP.
<b>show service sdp-using</b>	Displays the SDP usage for the local router or for a far-end router IP address.
<b>show service id sdp</b>	Displays the SDP configuration for the specified service.

## MIB Objects

```
sdpInfoTable
  sdpId
  sdpFarEndIpAddress
```

---

## configure service sdp shutdown

Configures the administrative status of the specified Service Distribution Point (SDP).

**configure service sdp** *sdp-id* {no shutdown | shutdown}

---

### Syntax Definitions

<i>sdp-id</i>	An existing SDP ID number.
<b>no shutdown</b>	Administratively enables the SDP.
<b>shutdown</b>	Administratively disables the SDP.

### Defaults

By default, the SDP administrative status is disabled.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Administratively enabling an SDP is not allowed until a system IP address for a far-end router is configured for the SDP.
- Disabling the SDP administrative status does not remove the SDP configuration from the router.
- The SDP is operational when the SDP is administratively enabled and the protocol routing table contains the far-end IP address as a host route. OSPF ABRs should not summarize host routes between areas. This can cause SDPs to become operationally down. To avoid this potential problem, configure static host routes (direct and indirect) in the local router.

### Examples

```
-> configure service sdp 10 no shutdown
-> configure service sdp 20 shutdown
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service sdp create</b>	Configures an SDP, which is used to direct traffic to another router through MPLS-based service tunnels.
<b>configure service sdp description</b>	Configures a description for the specified SDP.
<b>configure service sdp far-end</b>	Configures the system IP address of the far-end destination router for the SDP.
<b>configure service sdp ldp</b>	Enables or disables an LDP-signaled Label Switch Path (LSP) for the specified SDP.
<b>configure service sdp signaling</b>	Enables or disables auto-label signaling for the specified SDP;
<b>configure service sdp adv-mtu-override</b>	Enables or disables VC-type MTU override for the specified SDP.
<b>configure service sdp path-mtu</b>	Configures the administrative MTU value for the SDP.
<b>show service sdp-using</b>	Displays the SDP usage for the local router or for a far-end router IP address.
<b>show service id sdp</b>	Displays the SDP configuration for the specified service.

## Related Commands

- configure service sdp create** Configures an SDP, which is used to direct traffic to another router through MPLS-based service tunnels.
- configure service sdp shutdown** Configures the administrative status of the specified SDP.
- configure service sdp signaling** Enables or disables auto-label signaling for the specified SDP. Enable signaling if LDP-signaled LSPs are configured for the SDP.
- configure service sdp adv-mtu-override** Enables or disables VC-type MTU override for the specified SDP.
- configure service sdp path-mtu** Configures the administrative MTU value for the SDP.
- show service sdp-using** Displays the SDP usage for the local router or for a far-end router IP address.
- show service id sdp** Displays the SDP configuration for the specified service.

## MIB Objects

sdpInfoTable  
  sdpId  
  sdpLdpEnabled

---

## configure service sdp signaling

Enables or disables auto-label signaling for the specified SDP. Enable signaling if the specified SDP is using LDP-signaled LSPs for targeted LDP (TLDP) sessions. Disable signaling if the specified SDP is using static LSPs, which use manually configured label mappings and actions.

**configure service sdp** *sdp-id* **signaling** {**off** | **tldp**}

---

### Syntax Definitions

<i>sdp-id</i>	An existing SDP ID number.
<b>off</b>	Disables auto-label signaling for the specified SDP.
<b>tldp</b>	Enables auto-label signaling for the specified SDP.

### Defaults

By default, auto-label signaling (TLDP) is enabled for the SDP.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- If signaling is disabled, then labels are manually configured when a service is bound to the SDP.
- Enabling or disabling auto-label signaling is only allowed when the SDP is administratively disabled.

### Examples

```
-> configure service sdp 10 signaling off  
-> configure service sdp 10 signaling tldp
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service sdp create</b>	Configures an SDP, which is used to direct traffic to another router through MPLS-based service tunnels.
<b>configure service sdp description</b>	Configures a description for the specified SDP.
<b>configure service sdp far-end</b>	Configures the system IP address of the far-end destination router for the SDP.
<b>configure service sdp shutdown</b>	Configures the administrative status of the specified SDP.

## MIB Objects

```
sdpInfoTable  
  sdpId  
  sdpLabelSignaling
```

---

## configure service sdp lsp

Configures a static Label Switched Path (LSP) association with the specified Service Distribution Point (SDP). A static LSP is a user-configured path through Label Switching Routers (LSRs). Each participating LSR in the path requires manual configuration of MPLS actions and label mappings. However, associating a static LSP with an SDP is only done on the SDP router.

**configure service sdp** *sdp-ip* **lsp** *lsp-name*

**configure service sdp** *sdp-ip* **no lsp** *lsp-name*

---

### Syntax Definitions

*sdp-id* An existing SDP ID number.

*lsp-name* The name of an existing static LSP to assign to the SDP ID.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the static LSP association with the specified SDP.
- There are two types of LSPs: LDP and static. This command attaches a static LSP to a SDP. See [Chapter 49, “MPLS Static LSP and FRR Commands,”](#) for more information.
- LDP and static LSPs are mutually exclusive for the same SDP. If LDP is enabled for the SDP, disable LDP first before attempting to configure a static LSP for the SDP. The reverse is also true; disable any static LSPs associated with the SDP before attempting to enable LDP for the SDP.
- Configuring LSPs is only allowed when the SDP is administratively disabled.
- The specified SDP must have LDP signaling enabled if the SDP is going to use LDP-signaled LSPs.
- The static LSPs associated with an SDP must terminate at the same far-end router IP address used by the SDP.

### Examples

```
-> configure service sdp 10 lsp to-r4
-> configure service sdp 10 no lsp to-r4
```

### Release History

Release 6.4.2; command was introduced.

## MIB Objects

```
sdpInfoTable  
  sdpId  
  sdpAdvertisedVl1MtuOverride
```

---

## configure service sdp path-mtu

Configures the administrative Maximum Transmission Unit (MTU) value for the SDP. This value specifies the largest service frame size that the SDP can transmit to the far-end router without dropping packets or requiring IP fragmentation.

**configure service sdp *sdp-ip* path-mtu bytes**

**configure service sdp *sdp-ip* no path-mtu**

---

### Syntax Definitions

<i>sdp-id</i>	An existing SDP ID number.
<i>bytes</i>	The largest service frame size, in bytes, allowed through this SDP. The valid range is 576–9194.

### Defaults

By default, the path MTU for the SDP is set to zero. This specifies that the MTU value is dynamically calculated from the corresponding tunnel.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to revert the path MTU to the default value of zero.
- If the physical MTU on an egress interface or channel indicates the next hop on an SDP path cannot support the current path MTU, the operational path MTU on that SDP is modified to a value that can be transmitted without fragmentation.
- If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding is placed in an operational state.

### Examples

```
-> configure service sdp 10 path-mtu 1514
-> configure service sdp 10 no path-mtu
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service sdp create</b>	Configures an SDP, which is used to direct traffic to another router through MPLS-based service tunnels.
<b>configure service sdp description</b>	Configures a description for the specified SDP.

sdpInfoTable  
  sdpId  
  sdpAdvertisedVllMtuOverride
```

---

## configure service vpls create

Configures a Virtual Private LAN Service (VPLS) and associates that service with a customer account. A VPLS connects multiple customer sites together across a provider-managed core network by creating a virtual zero-hop, Layer 2 switched domain.

**configure service vpls** *service-id* **customer** *customer-id* **create**

**configure service no vpls** *service-id*

---

### Syntax Definitions

<i>service-id</i>	A unique numerical value to associate with a specific VPLS. The valid service ID range is 1–2147483647.
<i>customer-id</i>	An existing customer ID number to associate with the specified service ID number.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the specified VPLS. Before attempting to remove the VPLS, shutdown the administrative status of the service and shutdown and delete any Service Access Points (SAPs) or Service Distribution Points (SDPs) associated with the service.
- Creating more than one VPLS for a single customer ID is allowed. However, once a customer ID is associated with a VPLS, changing the customer ID for that association is not allowed. If it is necessary to make such a change, delete the VPLS and create the service again with the new customer ID.
- Once a VPLS is created, it is then possible to bind the service to SAPs and SDPs.
- Up to 1024 VPLS services are supported.

### Examples

```
-> configure service vpls 10 customer 10 create  
-> configure service no vpls 10
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls description</b>	Configures a description for the specified VPLS.
<b>configure service vpls shutdown</b>	Configures the administrative status of the specified VPLS.
<b>configure service vpls def-mesh-vc-id</b>	Configures a virtual circuit (VC) ID number used by each end of an MPLS tunnel to identify the VC.
<b>configure service vpls send-flush-on-failure</b>	Enables or disables the sending of a MAC flush message when a port or Service Access Point associated with the VPLS goes down
<b>configure service vpls service-mtu</b>	Configures the administrative MTU value for the specified VPLS
<b>show service id all</b>	Displays detailed configuration information about the specified service ID, including the SDP and SAP configuration that is associated with the service.

## MIB Objects

```
svcBaseInfoTable
  svcId
  svcCustId
```

---

## configure service vpls description

Configures a description for the specified Virtual Private LAN Service (VPLS).

**configure service vpls** *service-id* [**customer** *customer-id*] **description** *desc-info*

**configure service vpls** *service-id* [**customer** *customer-id*] **no description**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>customer-id</i>	Optional. The customer ID number associated with the specified service ID number.
<i>desc-info</i>	An ASCII text string up to 80 characters in length. Enclose special characters, such as #, \$, or spaces, in double quotation marks (for example "PE1 to PE2 Service1").

### Defaults

By default, a description is not added when the VPLS is created.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the description from the specified VPLS.
- Specifying the customer ID associated with this VPLS is not required when using this command. However, if the customer ID specified is not the one associated with the VPLS, the command is not allowed.
- Printable, 7-bit ASCII characters are also allowed in the description text string.

### Examples

```
-> configure service vpls 10 description "VPLS1-CustA"  
-> configure service vpls 10 customer 10 description "VPLS1-CustA"  
-> configure service vpls 10 no description
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls create</b>	Configures a VPLS and associates the service with a customer account.
<b>configure service vpls shutdown</b>	Configures the administrative status of the specified VPLS.

<b>configure service vpls send-flush-on-failure</b>	Enables or disables the sending of a MAC flush message when a port or Service Access Point associated with the VPLS goes down
<b>configure service vpls service-mtu</b>	Configures the administrative MTU value for the specified VPLS
<b>show service id all</b>	Displays detailed configuration information about the specified service ID, including the SDP and SAP configuration that is associated with the service.

## MIB Objects

```
svcBaseInfoTable
  svcId
  svcCustId
  svcDescription
```

---

## configure service vpls shutdown

Configures the administrative status of the specified VPLS.

**configure service vpls** *service-id* [**customer** *customer-id*] {**no shutdown** | **shutdown**}

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>customer-id</i>	Optional. The customer ID number associated with the specified service ID number.
<b>no shutdown</b>	Administratively enables the service.
<b>shutdown</b>	Administratively disables the service.

### Defaults

By default, the administrative status for the service is disabled.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Disable the administrative status of the VPLS and any associated SAPs and SDPs before attempting to remove a VPLS.
- Disabling the VPLS administrative status does not remove the VPLS configuration from the router.
- Specifying the customer ID associated with this VPLS is not required when using this command. However, if the customer ID specified is not the one associated with the VPLS, the command is not allowed.

### Examples

```
-> configure service vpls 10 no shutdown
-> configure service vpls 20 customer 20 no shutdown
-> configure service vpls 20 shutdown
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls create</b>	Configures a VPLS and associates the service with a customer account.
<b>configure service vpls description</b>	Configures a description for the specified VPLS.
<b>configure service vpls def-mesh-vc-id</b>	Configures a virtual circuit (VC) ID number used by each end of an MPLS tunnel to identify the VC.
<b>configure service vpls send-flush-on-failure</b>	Enables or disables the sending of a MAC flush message when a port or Service Access Point associated with the VPLS goes down
<b>configure service vpls service-mtu</b>	Configures the administrative MTU value for the specified VPLS
<b>show service id all</b>	Displays detailed configuration information about the specified service ID, including the SDP and SAP configuration that is associated with the service.

## MIB Objects

```
svcBaseInfoTable
  svcId
  svcCustId
  svcAdminStatus
```

---

## configure service vpls def-mesh-vc-id

Configures a virtual circuit (VC) ID number used by each end of an MPLS tunnel to identify the VC. This value is used to identify the VC instead of getting this information from the label. Configuring the VC ID only applies to services bound to mesh SDPs.

**configure service vpls** *service-id* [**customer** *customer-id*] **def-mesh-vc-id** *vc-id*

**configure service no vpls** *service-id* [**customer** *customer-id*] **no def-mesh-vc-id**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>customer-id</i>	Optional. The customer ID number associated with the specified service ID number.
<i>vc-id</i>	The VC ID number to assign. The valid range is 1–4294967295.

### Defaults

By default, the VPLS ID number is used as the VC ID.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the VC ID number.
- Specifying the customer ID associated with this VPLS is not required when using this command. However, if the customer ID specified is not the one associated with the VPLS, the command is not allowed.
- The VC ID number is significant between peer routers on the same hierarchical level.
- The value of a VC ID is conceptually independent from the value of the label or any other datalink specific information for the VC.

### Examples

```
-> configure service vpls 10 def-mesh-vc-id 20
-> configure service vpls 10 customer 10 def-mesh-vc-id 20
-> configure service vpls 10 no def-mesh-vc-id 20
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls create</b>	Configures a VPLS and associates the service with a customer account.

<b>configure service vpls send-flush-on-failure</b>	Enables or disables the sending of a MAC flush message when a port or Service Access Point associated with the VPLS goes down
<b>configure service vpls service-mtu</b>	Configures the administrative MTU value for the specified VPLS
<b>show service id all</b>	Displays detailed configuration information about the specified service ID, including the SDP and SAP configuration that is associated with the service.

## MIB Objects

```
svcBaseInfoTable
  svcId
  svcCustId
  svcDefMeshVcId
```

---

## configure service vpls send-flush-on-failure

Enables or disables the sending of a MAC flush message when a port or Service Access Point (SAP) associated with the VPLS goes down.

**configure service vpls** *service-id* [**customer** *customer-id*] **send-flush-on-failure**

**configure service no vpls** *service-id* [**customer** *customer-id*] **no send-flush-on-failure**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>customer-id</i>	Optional. A customer ID number associated with the specified service ID number.

### Defaults

By default, the sending of a MAC flush message on failure is disabled.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to disable sending of MAC flush messages.
- Specifying the customer ID associated with this VPLS is not required when using this command. However, if the customer ID specified is not the one associated with the VPLS, the command is not allowed.
- This functionality provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service.

### Examples

```
-> configure service vpls 10 send-flush-on-failure
-> configure service vpls 10 customer 10 send-flush-on-failure
-> configure service vpls 10 no send-flush-on-failure
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

## MIB Objects

```
svcBaseInfoTable
    svcId
    svcCustId
svcTlsInfoTable
    svcTlsMacFlushOnFail
```

---

## configure service vpls service-mtu

Configures the administrative Maximum Transmission Unit (MTU) value for the specified Virtual Private LAN Service (VPLS). This value specifies the largest frame size that the VPLS can transmit to the far-end router without dropping packets or requiring IP fragmentation.

**configure service vpls** *service-ip* [**customer** *customer-id*] **service-mtu** *bytes*

**configure service vpls** *service-ip* [**customer** *customer-id*] **no service-mtu**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>customer-id</i>	Optional. A customer ID number associated with the specified service ID number.
<i>bytes</i>	The largest service frame size, in bytes, allowed through this service. The valid range is 1–9194.

### Defaults

By default, the service MTU for VPLS is set to 1514.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to revert the service MTU to the default value.
- Specifying the customer ID associated with this VPLS is not required when using this command. However, if the customer ID specified is not the one associated with the VPLS, the command is not allowed.
- The service MTU and the service delineation encapsulation overhead (for example., 4 bytes for a 802.1Q tag) of the SAP is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP is able to transition to an operative state.
- When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU is dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path.
- If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding is placed in an operational state.

## Examples

```
-> configure service vpls 10 service-mtu 3000
-> configure service vpls 10 customer 10 service-mtu 3000
-> configure service vpls 10 no service-mtu
```

## Release History

Release 6.4.2; command was introduced.

## MIB Objects

```
svcBaseInfoTable
  svcId
  svcMtu
```

---

## configure service vpls mesh-sdp

Configures a mesh binding between a Virtual Private LAN Service (VPLS) and a Service Distribution Point (SDP). Mesh SDPs bound to a service are logically treated as a single bridge port for flooded traffic, where flooded traffic received on any mesh SDP for the service is replicated to other ports and not transmitted on any mesh SDPs.

**configure service vpls** *service-id* **mesh-sdp** *sdp-id[:vc-id]* [**vc-type** {**ether** | **vlan**}] **create**

**configure service vpls** *service-id* **no mesh-sdp** *sdp-id*

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number to bind to the specified service ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<b>ether</b>	Specifies Ethernet as the VC type for the mesh-SDP binding.
<b>vlan</b>	Specifies Ethernet VLAN as the VC type for the mesh-SDP binding.

### Defaults

<b>parameter</b>	<b>default</b>
<i>vc-id</i>	<i>service-id</i> number
<b>ether / vlan</b>	<b>ether</b>

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the SDP binding for the specified VPLS. Note that the SDP configuration is not removed, just the SDP binding with the service. Once the binding is removed, no packets are forwarded to the far-end router.
- Binding a service (VPLS instance) to an SDP is required to set up a Virtual Circuit (VC)/Pseudo Wire (PW) to the far end of the MPLS tunnel. If an SDP is not explicitly bound to a service, no far-end routers can participate in the service.
- When configuring services between OmniSwitch and SR Series routers, set the VC type to Ethernet if the null encapsulation type is used or to VLAN if the dot1q encapsulation type is used.
- The administrative and operational state of the SDP determines the state of that SDP for the service to which it is bound.

## Examples

```
-> configure service vpls 10 mesh-sdp 100 create
-> configure service vpls 20 mesh-sdp 200 vc-type vlan create
-> configure service no mesh-sdp 100
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

### **configure service vpls mesh-sdp shutdown**

Enables or disables the administrative status of the specified SDP mesh binding.

### **configure service vpls mesh-sdp egress vc-label**

Configures the static MPLS VC label used by this router to send packets to the far-end router using the specified SDP mesh binding.

### **configure service vpls mesh-sdp ingress vc-label**

Configures the static MPLS VC label used by the far-end router to send packets to this router using the specified mesh SDP binding.

### **configure service vpls mesh-sdp static-mac**

Configures a static MAC address entry in the VPLS forwarding database that is associated with the specified mesh SDP binding.

### **show service sdp-using**

Displays the SDP usage for the local router or for a far-end router IP address.

### **show service id sdp**

Displays configuration information for the SDPs associated with the specified service.

## MIB Objects

```
sdpBindTable
  sdpBindId
  sdpBindType
svcBaseInfoTable
  svcId
  svcDefMeshVcId
```

---

## configure service vpls mesh-sdp shutdown

Enables or disables the administrative status of the specified mesh-SDP binding.

```
configure service vpls service-id mesh-sdp sdp-id[:vc-id] {no shutdown | shutdown}
```

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number to bind to the specified service ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<b>no shutdown</b>	Enables the VPLS–SDP binding.
<b>shutdown</b>	Disables the VPLS–SDP binding.

### Defaults

By default, the administrative status of the mesh–SDP binding is disabled.

---

parameter	default
<i>vc-id</i>	<i>service-id</i> value

---

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Administratively disabling a VPLS–SDP binding does not remove the binding configuration from the router.

### Examples

```
-> configure service vpls 10 mesh-sdp 100 no shutdown  
-> configure service no mesh-sdp 100 shutdown
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

**configure service vpls mesh-sdp**

Configures a binding between a VPLS and a SDP.

**configure service vpls mesh-sdp egress vc-label**

Configures the static MPLS VC label used by this router to send packets to the far-end router using the specified SDP mesh binding.

**configure service vpls mesh-sdp ingress vc-label**

Configures the static MPLS VC label used by the far-end router to send packets to this router using the specified mesh SDP binding.

**configure service vpls mesh-sdp static-mac**

Configures a static MAC address entry in the VPLS forwarding database that is associated with the specified mesh SDP binding.

**show service sdp-using**

Displays the SDP usage for the local router or for a far-end router IP address.

**show service id sdp**

Displays configuration information for the SDPs associated with the specified service.

---

## configure service vpls mesh-sdp egress vc-label

Configures the static MPLS VC label used by this router to send packets to the far-end router using the specified mesh SDP binding.

**configure service vpls** *service-id* **mesh-sdp** *sdp-id[:vc-id]* **egress vc-label** *egress-vc-label*

**configure service vpls** *service-id* **no mesh-sdp** *sdp-id* **no egress vc-label**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number that is bound to the specified service ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<i>egress-vc-label</i>	The egress VC value that identifies a specific connection. The valid range is 16–1048575.

### Defaults

By default, the egress VC label value is set to zero (0).

parameter	default
<i>vc-id</i>	<i>service-id</i> value

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the **no** form of this command to remove the egress VC label from the specified VPLS.

### Examples

```
-> configure service vpls 100 mesh-sdp 20 egress vc-label 131070  
-> configure service vpls 100 mesh-sdp 20 egress no vc-label
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

## configure service vpls mesh-sdp ingress vc-label

Configures the static MPLS VC label used by the far-end router to send packets to this router using the specified mesh SDP binding.

**configure service vpls** *service-id* **mesh-sdp** *sdp-id[:vc-id]* **ingress vc-label** *ingress-vc-label*

**configure service vpls** *service-id* **no mesh-sdp** *sdp-id* **no ingress vc-label**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number that is bound to the specified service ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<i>vc-label</i>	The ingress VC value that identifies a specific connection. The valid range is 2048–18431.

### Defaults

By default, the ingress VC label value is set to zero (0).

parameter	default
<i>vc-id</i>	<i>service-id</i> value

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use the **no** form of this command to remove the ingress VC label from the specified VPLS.

### Examples

```
-> configure service vpls 100 mesh-sdp 20 ingress vc-label 131069  
-> configure service vpls 100 mesh-sdp 20 ingress no vc-label
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls mesh-sdp</b>	Configures a binding between a VPLS and a SDP.

  sdpBindId
  sdpBindType
  sdpBindAdminIngressLabel
svcBaseInfoTable
  svcId
  svcDefMeshVcId
```

---

## configure service vpls mesh-sdp static-mac

Configures a static MAC address entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) that is associated with the specified mesh-Service Distribution Point (SDP) binding. Static MACs associated with SDPs are classified as remote MACs. A remote MAC is used by the associated VPLS so that MAC addresses are not learned on the edge device.

**configure service vpls** *service-id* **mesh-sdp** *sdp-id[:vc-id]* **static-mac** *mac-address*

**configure service vpls** *service-id* **mesh-sdp** *sdp-id* **no static-mac** *mac-address*

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number that is bound to the specified service ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

---

parameter	default
<i>vc-id</i>	<i>service-id</i> value

---

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the remote static MAC address entry from the VPLS forwarding database.
- Static MAC addresses configured on one edge device are not propagated to other edge devices associated with the same VPLS instance. Each edge device has an independent forwarding database for the associated VPLS.
- A MAC address can participate in only one static MAC address entry (local or remote) for a specific VPLS.

### Examples

```
-> configure service vpls 100 mesh-sdp 20 static-mac 00:00:da:3e:44:01
-> configure service vpls 100 mesh-sdp 20 no static-mac 00:00:da:3e:44:01
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls mesh-sdp</b>	Configures a binding between a VPLS and a SDP.

<b>show service sdp-using</b>	Displays the SDP usage for the local router or for a far-end router IP address.
<b>show service id sdp</b>	Displays configuration information for the SDPs associated with the specified service.

## MIB Objects

```
tlsFdbInfoTable
  tlsFdbMacAddr
  tlsFdbType
  tlsFdbLocale
  tlsFdbSdpId
  tlsFdbVcId
svcBaseInfoTable
  svcId
  svcDefMeshVcId
```

---

## configure service l2profile

Configures a Layer 2 profile that is applied to an access (customer facing) port. This profile is used to specify how to process Layer 2 control frames ingressing on the access port.

```
configure service l2profile profile-name [create] {stp | 802.1x | 802.1ab | 802.3ad | gvrp | mvrp | amap}
{peer | discard | tunnel}
```

```
configure service no l2profile profile-name
```

---

### Syntax Definitions

<i>profile-name</i>	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").
<b>create</b>	Creates the Layer 2 profile if the <i>profile-name</i> specified does not exist in the switch configuration.
<b>stp</b>	Specifies how to process Spanning Tree BPDU.
<b>802.1x</b>	Specifies how to process 802.1x control frames.
<b>802.1ab</b>	Specifies how to process 802.1ab control frames.
<b>802.3ad</b>	Specifies how to process 802.3ad control frames.
<b>gvrp</b>	Specifies how to process GARP VLAN Registration Protocol packets.
<b>mvrp</b>	Specifies how to process Multiple VLAN Registration Protocol packets.
<b>amap</b>	Specifies how to process Alcatel-Lucent Management Adjacency Protocol packets.
<b>peer</b>	Allows the UNI port to participate in the specified protocol.
<b>discard</b>	Discards the specified PDU.
<b>tunnel</b>	Tunnels the specified PDU across the provider network.

### Defaults

A default Layer 2 profile (**def-access-profile**) exists with the following default values:

parameter	default
stp	tunnel
802.1x	discard
802.1ab	discard
802.3ad	peer
gvrp	tunnel
mvrp	tunnel
amap	discard

## Platforms Supported

OmniSwitch 9000E

## Usage Guidelines

- Use the **no** form of this command to delete a Layer 2 profile. Removing the **def-access-profile** is not allowed.
- Remove any profile associations with access ports before attempting to modify or delete the profile.
- Not all of the protocol parameters are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

	<b>peer</b>	<b>discard</b>	<b>tunnel</b>
<b>stp</b>	no	yes	yes
<b>802.1x</b>	no	yes	yes
<b>802.1ab</b>	no	yes	yes
<b>802.3ad</b>	yes	no	no
<b>gvrp</b>	no	yes	yes
<b>mvrp</b>	no	yes	yes
<b>amap</b>	no	yes	no

- If a user-configured Layer 2 profile is *not* associated with an access port, then the **def-access-profile** is used to process control packets ingressing on the port.

## Examples

```
-> configure service l2profile "sap_1_profile" create stp discard
-> configure service l2profile "sap_1_profile" gvrp discard
-> configure service no l2profile "sap_1_profile"
```

## Release History

Release 6.4.2; command was introduced.

Release 6.4.3; **mvrp** parameter added.

## Related Commands

- configure service port mode access** Configures a switch port or link aggregate as an access port.
- configure service port l2profile** Assigns a Layer 2 profile to the specified service access port.
- show service l2profile** Displays the Layer 2 profile configuration information for the router..

```

---

## configure service port mode access

Configures a switch port or link aggregate as an access port for customer traffic.

**configure service port** {*slot/port* / **linkagg** *agg\_num*} **mode access**

**configure service port** {*slot/port* / **linkagg** *agg\_num*} **no mode**

---

### Syntax Definitions

*slot/port1* The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg\_num* The link aggregate ID number (0–31).

### Defaults

By default, switch ports and link aggregates are classified as network ports.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to revert the port mode back to the default mode (network).
- Access ports are required to configure a Service Access Point (SAP). A SAP is the point at which customer traffic enters and exits the provider service. SAPs are not configured on network ports

### Examples

```
-> configure service port 1/3 mode access
-> configure service port linkagg 10 mode access
-> configure service port 1/3 no mode
-> configure service port linkagg 10 no mode
```

### Release History

Release 6.4.2; command was introduced.

| <b>show service port</b>                  | Displays the access (customer-facing) port configuration for the router.                                                                                       |

## MIB Objects

```
alaServiceMgrAccessPortTable  
  alaServiceMgrPortID  
  alaServiceMgrPortMode
```

---

## configure service port l2profile

Assigns an existing Layer 2 profile to the specified service access port. This profile determines how Layer 2 protocol frames ingressing on the access port are processed.

```
configure service port {slot/port / linkagg agg_num} l2profile {default | profile-name}
```

---

### Syntax Definitions

<i>slot/port1</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>default</b>	Assigns the default profile to the specified port.
<i>profile-name</i>	The name of an existing Layer 2 profile.

### Defaults

By default, the default Layer 2 profile (**def-access-profile**) is assigned when a port is configured as a service access port.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to revert the associated profile back to the default profile.
- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to network ports.
- Specify a profile name that already exists in the router configuration.

### Examples

```
-> configure service port 1/3 l2profile sap_1_profile
-> configure service port linkagg 10 l2profile sap_1_profile
-> configure service port 1/3 l2profile default
-> configure service port linkagg 10 l2profile default
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service port mode access</b>	Configures a switch port or link aggregate as an access port.
<b>configure service l2profile</b>	Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames ingressing on the access port.
<b>configure service port encaps-type</b>	Configures an encapsulation type for the specified service access port. The encapsulation type determines if an access port will support one or more services.
<b>show service port</b>	Displays the access (customer-facing) port configuration for the router.

## MIB Objects

```
alaServiceMgrAccessPortTable  
  alaServiceMgrPortID  
  alaServiceMgrPortMode  
  alaServiceMgrPortProfileID
```

---

## configure service port encap-type

Configures an encapsulation type for the specified service access port. The encapsulation type determines if the access port will support single or multiple Service Access Points (SAPs) for customer services.

**configure service port** {*slot/port* / **linkagg** *agg\_num*} **encap-type** {**null** | **dot1q**}

---

### Syntax Definitions

<i>slot/port1</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>null</b>	Allows only one SAP (one customer service) on the port. All customer traffic (tagged and untagged) is allowed.
<b>dot1q</b>	Allows multiple SAP associations (customer services) for the port. Only 802.1Q-tagged traffic on the port.

### Defaults

By default, the **null** encapsulation type is selected when the port is configured as a service access port.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to network ports.
- The encapsulation type configured for the access port determines the encapsulation type for any SAPs associated with the port.

### Examples

```
-> configure service port 1/3 encap-type null
-> configure service port linkagg 10 encap-type null
-> configure service port 1/17 encap-type dot1q
-> configure service port linkagg 20 encap-type dot1q
```

### Release History

Release 6.4.2; command was introduced.

## MIB Objects

alaServiceMgrAccessPortTable  
  alaServiceMgrPortId  
  alaServiceMgrPortMode  
  alaServiceMgrPortEncapType

---

## configure service vpls sap create

Configures a Service Access Point (SAP) by associating a SAP ID with a Virtual Private LAN Service (VPLS). A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

**configure service vpls** *service-id* **sap** {*slot/port* | **linkagg** *agg\_num*} [**:0** | **:all** | *:qtagl*] **create**

**configure service vpls** *service-id* **no sap** {*slot/port* | **linkagg** *agg\_num*} [**:0** | **:all** | *:qtagl*]

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>slot/portl</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>:0</b>	Specifies a null encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on <b>null</b> encapsulation access ports.
<i>:qtagl</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on <b>null</b> encapsulation access ports.

### Defaults

parameter	default
<b>:0</b>   <b>:all</b>   <i>:qtagl</i>	<b>:0</b> (null)

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- To specify a SAP ID, use the *slot/port* and **linkagg** *agg-num* parameters combined with the **:0**, *:qtag*, or **:all** parameters. For example, enter **1/2:all** to specify the SAP on access port 1/2 that maps all traffic to this service that is not already mapped to other SAPs.
- Use the **no** form of this command to remove a a SAP.
- Specify only ports or link aggregates that are configured as service access ports (see [configure service port mode access](#)). This command does not apply to network ports.
- The encapsulation mode for the access port determines how many SAPs are allowed on the access port. If the port is set to **null** encapsulation, only one default SAP is allowed on the port. If the port is set to

**dot1q** encapsulation, multiple SAPs (services) are allowed on the one port (see [configure service port encaps-type](#)).

- If the SAP is configured to use the **null** encapsulation type, the access port encapsulation mode determines if both tagged and untagged traffic or only untagged traffic is allowed on the SAP. For example, if the access port is set to **null** encapsulation, both tagged and untagged traffic is mapped to the SAP. If the access port is set to **dot1q** encapsulation, then only tagged traffic is mapped to the SAP.

## Examples

```
-> configure service vpls 10 sap 1/2
-> configure service vpls 11 sap 1/2:all
-> configure service vpls 12 sap 1/2:10
-> configure service vpls 13 linkagg 20
-> configure service vpls 14 linkagg 20:all
-> configure service vpls 15 linkagg 20:100
-> configure service vpls 10 no sap 1/2
-> configure service vpls 13 no linkagg 20
```

## Release History

## MIB Objects

```
sapBaseInfoTable
  sapPortId
  sapEncapValue
svcBaseInfoTable
  svcId
```

---

## configure service vpls sap description

Configures a description for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

**configure service vpls** *service-id* **sap** {*slot/port* | **linkagg** *agg\_num*} [**:0** | **:all** | *:qtag1*] **description** *desc-info*

**configure service vpls** *service-id* **no sap** {*slot/port* | **linkagg** *agg\_num*} [**:0** | **:all** | *:qtag1*] **no description**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>slot/port1</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>:0</b>	Specifies a null encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on null encapsulation access ports.
<i>:qtag1</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on null encapsulation access ports.
<i>desc-info</i>	An ASCII text string up to 80 characters in length. Enclose special characters, such as #, \$, or spaces, in double quotation marks (for example “CE1 to VPLS1 SAP”).

### Defaults

By default, a description is not added when the SAP is created.

parameter	default
<b>:0</b>   <b>:all</b>   <i>:qtag1</i>	<b>:0</b> (null)

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- To specify a SAP ID, use the *slot/port* and **linkagg** *agg-num* parameters combined with the **:0**, *:qtag*, or **:all** parameters. For example, enter **1/2:all** to specify the SAP on access port 1/2 that maps all traffic to this service that is not already mapped to other SAPs.
- Use the **no** form of this command to remove the description from the specified SAP.

- Specify an existing VPLS service ID number and the associated access port for this SAP.
- Printable, 7-bit ASCII characters are also allowed in the description text string.

### Examples

```
-> configure service vpls 10 sap 1/2:10 description "CE1 to VPLS1 SAP"  
-> configure service vpls 13 linkagg 20 description "CE2 to VPLS2 SAP"  
-> configure service vpls 10 sap 1/2:10 no description  
-> configure service vpls 13 linkagg 20 no description
```

### Release History

```

---

## configure service vpls sap trusted

Configures the trust mode for the specified Service Access Port (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

A trusted SAP can accept 802.1p values in incoming packets; an untrusted SAP will set any 802.1p values to zero in incoming packets, unless an 802.1p value is configured with this command.

**configure service vpls *service-id* sap {*slot/port* | linkagg *agg\_num*} [:0 | :all | :*qtag1*] trusted**

**configure service vpls *service-id* sap {*slot/port* | linkagg *agg\_num*} [:0 | :all | :*qtag1*] no trusted**  
**priority *value***

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>slot/port1</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>:0</b>	Specifies a null encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on null encapsulation access ports.
<i>:qtag1</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on null encapsulation access ports.
<b>trusted</b>	Allows the SAP to use the priority value obtained from tagged packets ingressing on the SAP port. Untagged packets use the default port priority value.
<i>value</i>	The priority value to set. Values range from 0 (lowest priority) to 7 (highest priority). This is the priority assigned to tagged and untagged packets ingressing on an untrusted SAP.

### Defaults

By default, the SAP is trusted with the priority set to best effort (zero). These default values are set when a port is configured as an access port and then associated with the SAP.

parameter	default
<b>:0   :all   :<i>qtag1</i></b>	<b>:0 (null)</b>

### Platforms Supported

OmniSwitch 9000E

## Usage Guidelines

- To specify a SAP ID, use the *slot/port* and **linkagg** *agg-num* parameters combined with the **:0**, *:qtag*, or **:all** parameters. For example, enter **1/2:all** to specify the SAP on access port 1/2 that maps all traffic to this service that is not already mapped to other SAPs.
- Use the **no trusted** form of this command with the **priority** *value* parameter to configure a priority value to assign to packets ingressing on the SAP.
- Administratively disabling the SAP is not required to change the trust mode for the SAP.
- When the trust mode is changed from untrusted to trusted, the priority value is automatically set to the default best effort priority value (zero).
- Note that untagged Layer 2 control packets (for example, BPDU, GVRP, and AMAP) are always tunneled (if enabled) through the MPLS cloud with the default EXP bits set to 7, so that they can arrive at the destination router at the highest COS queue of 7. As a result, trusted and untrusted SAPs configured on the access ports will not affect the Layer 2 control packets ingressing on the access ports.
- Configuring the trust mode on an access port is not allowed. These settings are configured for the SAP to which the access port is associated.

## Examples

```
-> configure service vpls 10 sap 1/2:10 trusted
-> configure service vpls 13 linkagg 20 trusted
-> configure service vpls 10 sap 1/2:10 no trusted priority 7
-> configure service vpls 13 linkagg 20 no trusted priority 3
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

<b>configure service vpls sap create</b>	Configures a SAP by associating a SAP ID with a Virtual Private LAN Service (VPLS).
<b>configure service vpls sap description</b>	Configures a description for the specified SAP ID.
<b>configure service vpls sap shutdown</b>	Configures the administrative status for the specified SAP ID.
<b>configure service vpls sap static-mac</b>	Configures a static MAC address entry in the forwarding database for the service that is associated with the specified SAP ID.
<b>show service id sap</b>	Displays configuration information about the Service Access Points (SAPs) associated with the specified service.
<b>show service sap-using</b>	Displays the SAP configuration for the local router.

## MIB Objects

```
alaSapExtraInfoTable
  alaSapInfoTrusted
  alaSapInfoPriority
```

---

## configure service vpls sap shutdown

Configures the administrative status for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

```
configure service vpls service-id sap [slot/port | linkagg agg_num] [:0 | :all | :qtag1] {no shutdown | shutdown}
```

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>slot/port1</i>	The slot and port number of the service access port.
<b>:0</b>	Specifies a null encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on null encapsulation access ports.
<i>:qtag1</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on null encapsulation access ports.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>no shutdown</b>	Enables the administrative status of the SAP.
<b>shutdown</b>	Disables the administrative status of the SAP.

### Defaults

By default, the administrative status of the SAP is disabled.

parameter	default
<b>:0</b>   <b>:all</b>   <i>:qtag1</i>	<b>:0</b> (null)

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- To specify a SAP ID, use the *slot/port* and **linkagg** *agg-num* parameters combined with the **:0**, *:qtag*, or **:all** parameters. For example, enter **1/2:all** to specify the SAP on access port 1/2 that maps all traffic to this service that is not already mapped to other SAPs.
- Specify an existing VPLS service ID number and the associated access port for this SAP.

- Disabling the SAP administrative status does not remove the SAP configuration from the router.
- If an access port goes down, all SAPs associated with that port are operationally taken down as well.
- A SAP does not appear operationally down when a service is shutdown, even though traffic for that service is discarded.

## Examples

```
-> configure service vpls 10 sap 1/2:10 no shutdown
-> configure service vpls 13 linkagg 20 no shutdown
-> configure service vpls 10 sap 1/2:10 shutdown
-> configure service vpls 13 linkagg 20 shutdown
```

## Release History

Release 6.4.2; command was introduced.

---

## configure service vpls sap static-mac

Configures a static MAC address entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) that is associated with the specified SAP ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

**configure service vpls** *service-id* **sap** {*slot/port* | **linkagg** *agg\_num*} [**:0** | **:all** | *:qtag1*] **static-mac** *mac-address*

**configure service vpls** *service-id* **sap** {*slot/port* | **linkagg** *agg\_num*} [**:0** | **:all** | *:qtag1*] **no static-mac** *mac-address*

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>slot/port1</i>	The slot and port number of the service access port.
<b>:0</b>	Specifies a null encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on null encapsulation access ports.
<i>:qtag1</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on null encapsulation access ports.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

parameter	default
<b>:0</b>   <b>:all</b>   <i>:qtag1</i>	<b>:0</b> (null)

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- To specify a SAP ID, use the *slot/port* and **linkagg** *agg-num* parameters combined with the **:0**, *:qtag*, or **:all** parameters. For example, enter **1/2:all** to specify the SAP on access port 1/2 that maps all traffic to this service that is not already mapped to other SAPs.
- Use the **no** form of this command to remove the remote static MAC address entry from the VPLS forwarding database.

- Static MACs associated with a SAP are classified as local MACs. A local MAC is used by the associated VPLS so that MAC addresses are not learned on the edge device.
- A MAC address can participate in only one static MAC address entry (local or remote) for a specific VPLS.
- Static MAC addresses configured on one edge device are not propagated to other edge devices associated with the same VPLS instance. Each edge device has an independent forwarding database for the associated VPLS.

## Examples

```
-> configure service vpls 100 sap 1/2:10 static-mac 00:00:da:3e:44:01
-> configure service vpls 101 sap linkagg 20:all static-mac 00:01:95:44:2a:10
-> configure service vpls 100 sap 1/2:10 no static-mac 00:00:da:3e:44:01
-> configure service vpls 101 sap linkagg 20:all no static-mac 00:01:95:44:2a:10
```

## Release History

Release 6.4.2; command was introduced.

  svcId
```

---

## clear service id fdb

Clears MAC addresses (including static) from the Source Learning MAC address Forwarding Database (FDB) for the specified VPLS service.

```
clear service id service-id fdb {all | mac mac-address | sap {slot/port | linkagg agg_num} [:0 | :all | :qtag1] | mesh-sdp sdp-id[:vc-id]}
```

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<b>all</b>	Clear all MAC addresses from the FDB for the specified service.
<i>mac-address</i>	A 48-bit MAC address ( <i>aa:bb:cc:dd:ee:ff</i> ) to clear from the FDB. Clears FDB entries related to this address.
<i>slot/port1</i>	The slot and port number of a service access port that identifies the specified SAP.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate that identifies an existing SAP.
<b>:0</b>	The encapsulation type portion of the SAP ID that specifies a null encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	The encapsulation type portion of the SAP ID that determines if untagged and tagged traffic is mapped to the SAP. Combine this parameter with the <i>slot/port</i> or <b>linkagg</b> parameters.
<i>:qtag1</i>	The encapsulation type portion of the SAP ID that identifies a VLAN ID tag for SAP traffic. Combine this parameter with the <i>slot/port</i> or <b>linkagg</b> parameters.
<i>sdp-id</i>	An existing SDP ID number.
<i>vc-id</i>	A VC ID number that identifies the VC ID portion of each mesh SDP binding defined for the service.

### Defaults

parameter	default
<b>:0   :all   :qtag</b>	null
<i>vc-id</i>	<i>service-id</i> value

### Platforms Supported

OmniSwitch 9000E

## Usage Guidelines

- Use this command to clear all MACs, a specific MAC, or all MACs associated with a specific SAP or mesh SDP from the FDB associated with the specified VPLS.
- A SAP ID is comprised of an access port or link aggregate number and an encapsulation type. To specify an existing SAP ID with this command, combine the **:all** or *:qtag1* parameter with the *slot/port* or **linkagg agg\_num** parameter. For example, if a SAP is mapped to access port 1/10 and customer traffic ingressing on this SAP is tagged with VLAN ID 200, enter 1/10:200 (*slot/port:qtag*) for the SAP ID.

## Examples

```
-> clear service id 10 fdb all
-> clear service id 20 fdb mac 00:00:1a:22:33:10
-> clear service id 30 fdb 1/10:all
-> clear service id 40 fdb linkagg 10:all
-> clear service id 50 fdb mesh-sdp 10
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

## clear service id mesh-sdp ingress-vc-label

Clears the static MPLS VC label used by the far-end router to send packets to this router.

**clear service id** *service-id* **mesh-sdp** *sdp-id[:vc-id]* **ingress-vc-label**

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number.
<i>vc-id</i>	A VC ID number that identifies the VC ID portion of each mesh SDP binding defined for the service.

### Defaults

parameter	default
<i>vc-id</i>	<i>service-id</i> value

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

Use this command to clear ingress VC label information for the specified service-SDP association.

### Examples

```
-> clear service id 10 mesh-sdp 20 ingress-vc-label
-> clear service id 20 mesh-sdp 30:10 ingress-vc-label
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<a href="#">configure service vpls mesh-sdp ingress vc-label</a>	Configures the static MPLS VC label used by the far-end router to send packets to this router using the specified service and SDP binding.

```

---

## show service l2profile

Displays the Layer 2 profile configuration information for the router. This type of profile is applied to access (customer-facing) ports and specifies how to process Layer 2 protocol frames ingressing on such ports.

**show service l2profile** [*profile-name*]

---

### Syntax Definitions

*profile-name* An existing Layer 2 profile name. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., "Alcatel-Lucent Engineering").

### Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *profile-name* parameter to display information for a specific profile. Entering a profile name is case sensitive.
- If there are no profiles configured for the router, this command still displays the information for the default profile (def-access-profile). This profile is applied to access ports that were not associated with a specific profile.

### Examples

```
->show service l2profile
```

```
Port Profile Table
```

Profile Name	Stp	802.1x	802.3ad	802.1ab	GVRP	AMAP	MVRP
DropBPDU	drop	drop	peer	drop	tunnel	drop	tunnel
Tunnel-Amap	tunnel	drop	peer	drop	tunnel	tunnel	tunnel
def-access-profile	tunnel	drop	peer	drop	tunnel	drop	tunnel

```
Number of Port Profiles: 3
```

```
->show service l2profile Tunnel-Amap
```

```
Port Profile Table
```

Profile Name	Stp	802.1x	802.3ad	802.1ab	GVRP	AMAP	MVRP
Tunnel-Amap	tunnel	drop	peer	drop	tunnel	tunnel	tunnel

```
Number of Port Profiles: 1
```

*output definitions*

---

<b>Profile Name</b>	The name of the Layer 2 profile.
<b>Stp</b>	Indicates how Spanning Tree traffic control packets are processed.
<b>802.1x</b>	Indicates how IEEE 802.1x control packets are processed.
<b>802.3ad</b>	Indicates how IEEE 802.3ad control packets are processed.
<b>802.1AB</b>	Indicates how IEEE 802.1AB control packets are processed.
<b>GVRP</b>	Indicates how GARP VLAN Registration Protocol packets are processed.
<b>AMAP</b>	Indicates how Alcatel-Lucent Mapping Adjacency Protocol packets are processed.
<b>MVRP</b>	Indicates how Multiple VLAN Registration Protocol packets are processed.

---

**Release History**

Release 6.4.2; command was introduced.

Release 6.4.3: **mvrp** field was added.

**Related Commands**

<b>configure service l2profile</b>	Configures a Layer 2 profile that is applied to a service access port.
<b>configure service port l2profile</b>	Assigns an existing Layer 2 profile to the specified service access port
<b>show service port</b>	Displays the access (customer-facing) port configuration for the router.

  alaServiceMgrPortProfileMvrpTreatment
```

---

## show service port

Displays the access (customer-facing) port configuration for the router.

**show service port** [*slot/port* / **linkagg** *agg\_num*]

---

### Syntax Definitions

*slot/port*                      The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*agg-num*                        The link aggregate ID number (0–31).

### Defaults

By default, all service access ports are displayed if a port or link aggregate number is not specified.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *slot/port* and **linkagg** *agg-num* parameters to display the configuration for a specific port or link aggregate.
- Access ports are required to configure a Service Access Point (SAP). A SAP is the point at which customer traffic enters and exits the provider service. SAPs are not configured on network ports

### Examples

```
-> show service port
```

Port Table

Port Id	Admin Status	Link Status	Cfg MTU	Oper MTU	Port Mode	Port Encp	L2Profile
8/7	Down	Down	1528	1528	accs	null	def-access-profile

0/19	Up	Up	9212	9212	accs	null	def-access-profile

```
Number of Ports : 1
```

### output definitions

<b>Port Id</b>	The access port number or link aggregate ID number.
<b>Admin Status</b>	The administrative status ( <b>Up</b> or <b>Down</b> ) of the access port.
<b>Link Status</b>	The status of the link connection to the access port ( <b>Up</b> or <b>Down</b> ).
<b>Cfg MTU</b>	The configured MTU value for the access port.
<b>Oper MTU</b>	The operational MTU value for the access port.
<b>Port Mode</b>	The port mode ( <b>accs</b> ) indicates that the port is a service access port. Configured through the <b>configure service port mode access</b> command.
<b>Port Encp</b>	The encapsulation type associated with the access port. Configured through the <b>configure service port encap-type</b> command.
<b>L2Profile</b>	The name of the Layer 2 profile associated with the access port. Configured through the <b>configure service port l2profile</b> command.

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<b>show service l2profile</b>	Displays the Layer 2 profile configuration for the router.
<b>show service sap-using</b>	Displays the Service Access Point (SAP) configuration for the local router.
<b>show service id sap</b>	Displays configuration information about the Service Access Points (SAPs) associated with the specified service.

### MIB Objects

```

  alaServiceMgrPortID
  alaServiceMgrPortMode
  alaServiceMgrPortEncapType
  alaServiceMgrPortProfileId
```

## show service customer

Displays the customer account information configured for the router.

**configure service customer** [*customer-id*]

---

### Syntax Definitions

*customer-id*                      An existing customer ID number.

### Defaults

By default, configuration information for all customer accounts is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *customer-id* parameter to display information for a specific customer account.
- A default customer account (ID 1) exists on each router and is included in the general display of all customer accounts. This account is not user-configurable.

### Examples

```
-> show service customer
```

```
Customer
  Customer-ID 1
    Description:      Default customer

  Customer-ID 129
    Contact:         VJ Pedapudi,
    Description:     Customer 129,
    Phone:          100-232-4407

  Customer-ID 1234
    Contact:         John Clark,
    Description:     Customer 1234,
    Phone:          100-434-1248

Total Customers : 3
```

```
-> show service customer 129
```

```
Customer
  Customer-ID 129
    Contact:         VJ Pedapudi,
    Description:     Customer 129,
    Phone:          100-232-4407
```

*output definitions*

---

<b>Customer-Id</b>	The customer account ID number. Configured through the <b>configure service customer create</b> command.
<b>Contact</b>	Contact information for the customer account. Configured through the <b>configure service customer contact</b> command. This field does not display if a contact was not configured for this customer.
<b>Description</b>	Additional descriptive information for the customer account. Configured through the <b>configure service customer description</b> command. This field does not display if a description was not configured for this customer.
<b>Phone</b>	The contact phone number for the customer account. Configured through the <b>configure service customer phone</b> command. This field does not display if a phone number was not configured for this customer.

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

**show service id all** Displays the detailed configuration for the specified service ID and associated service distribution and access points.

**MIB Objects**

## show service sdp

Displays the Service Distribution Point (SDP) configuration for the switch.

**show service sdp** [*sdp-id*] [**detail**]

---

### Syntax Definitions

*sdp-id*                                      An existing SDP ID number.

**detail**                                      Displays detailed SDP information.

### Defaults

By default, a list of all SDPs is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *sdp-id* parameter to display information for a specific SDP.
- Use the **detail** parameter to display additional information about the SDPs.

### Examples

```
-> show service sdp
```

```
Services: Service Destination Points
```

SdpId	Adm MTU	Opr MTU	IP address	Adm	Opr	Deliver	Signal

### *output definitions*

---

<b>SDP Id</b>	The SDP identifier comprised of the SDP ID number and the IP address of the far-end router for this SDP tunnel. For example, <b>10: - (1.1.1.2)</b> identifies SDP 10 with the tunnel endpoint at router 1.1.1.2.
<b>Admin Path MTU</b>	The desired largest frame size that can pass through this SDP to the far-end router without requiring fragmentation. Configured through the <b>configure service sdp path-mtu</b> command.
<b>Oper Path MTU</b>	The actual largest frame size that can pass through this SDP to the far-end router without requiring fragmentation.
<b>Far End</b>	The IP address of the remote end of the MPLS tunnel defined by this SDP. Configured through the <b>configure service sdp far-end</b> command.
<b>Delivery</b>	Specifies the type of delivery used by this SDP. In this case, LDP-based MPLS is the supported delivery method; GRE is not supported.
<b>Admin State</b>	The administrative state of this SDP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service sdp shutdown</b> command.
<b>Oper State</b>	The operational state of this SDP ( <b>Up</b> or <b>Down</b> ).
<b>Signaling</b>	Indicates whether or not Targeted LDP signaling is enabled ( <b>none</b> or <b>TLDP</b> ). Note that if TLDP is not enabled, only static LSPs are configurable for this SDP.
<b>Collect Stats</b>	Specifies whether or not LDP statistics are collected for this SDP.
<b>Last Status Change</b>	The date and time of the last operational status change to this SDP.
<b>Last Mgmt Change</b>	The date and time of the last management-initiated change to this SDP.
<b>Flags</b>	The conditions that affect the operational status of this SDP.
<b>Associated LSP List</b>	Displays static LSP information.
<b>Programmed LSP List</b>	Displays LDP-signaled LSP information.

---

### **Release History**

Release 6.4.2; command was introduced.

### **Related Commands**

<b>show service sdp-using</b>	Displays the Service Distribution Point (SDP) usage for the local router or for a far-end router IP address.
<b>show service id sdp</b>	Displays the detailed configuration for the specified service ID, including all SDPs and SAPs associated with the service.

### **MIB Objects**

---

## show service id all

Displays detailed configuration information about the specified service ID, including the SDP and SAP configuration associated with the service.

**show service id** *service-id* **all**

---

### Syntax Definitions

*service-id* An existing VPLS ID number.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

The service ID is a unique number that identifies a specific VPLS. All information associated with the service ID is displayed.

### Examples

```
-> show service id 100 all
```

#### Service Detailed Information

```

*output definitions*

<b>SvcId</b>	The unique service identification number used to identify the service. Configured through the <b>configure service vpls create</b> command.
<b>Service Type</b>	The type of service (only VPLS is supported).
<b>Customer Id</b>	The customer account ID number. Configured through the <b>configure service customer create</b> command.
<b>Last Status Change</b>	The date and time of the last operational status change to this service.
<b>Last Mgmt Change</b>	The date and time of the last management-initiated change to this service.
<b>Admin State</b>	The administrative state of the service ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service vpls shutdown</b> command.
<b>Oper State</b>	The operational state of the service ( <b>Up</b> or <b>Down</b> ).

*output definitions*

<b>MTU</b>	The largest frame size that can pass through this service without requiring fragmentation. Configured through the <b>configure service vpls service-mtu</b> command.
<b>Def. Mesh VC Id</b>	The default VC ID for the mesh SDP binding for this service. Configured through the <b>configure service vpls def-mesh-vc-id</b> command.
<b>SAP Count</b>	The number of SAPs associated with this service.
<b>SDP Bind Count</b>	The number of SDPs bound to this service.
<b>Send Flush on Fail</b>	Whether or not ( <b>Enabled</b> or <b>Disabled</b> ) a MAC flush message is sent when an access port or SAP failure occurs. Configured through the <b>configure service vpls send-flush-on-failure</b> command.
<b>Service Destination Points (SDPs)</b>	The following fields display configuration information for each SDP associated with this service.
<b>SDP Id</b>	The SDP identifier comprised of the SDP ID number, the service ID number, and the IP address of the far-end router for this SDP tunnel. For example, <b>10:100 -(10.11.0.6)</b> identifies SDP 10 bound to VPLS 100 with the tunnel endpoint at router 10.11.0.6.
<b>Type</b>	The SDP binding type ( <b>mesh</b> or <b>spoke</b> ) for this service. The spoke binding type is not supported. Configured through the <b>configure service vpls mesh-sdp</b> command.
<b>VC Type</b>	The type of VC ( <b>Ether</b> , <b>Vlan</b> , or <b>Vpls</b> ). Configured through the <b>configure service vpls mesh-sdp</b> command.
<b>Admin Path MTU</b>	The desired largest frame size that can pass through this SDP to the far-end router without requiring fragmentation. Configured through the <b>configure service sdp path-mtu</b> command.
<b>Oper Path MTU</b>	The actual largest frame size that can pass through this SDP to the far-end router without requiring fragmentation.
<b>Far End</b>	The IP address of the remote end of the MPLS tunnel defined by this SDP. Configured through the <b>configure service sdp far-end</b> command.
<b>Delivery</b>	Specifies the type of delivery used by this SDP. In this case, LDP-based MPLS is the supported delivery method; GRE is not supported.
<b>Admin State</b>	The administrative state of this SDP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service sdp shutdown</b> command.
<b>Oper State</b>	The operational state of this SDP ( <b>Up</b> or <b>Down</b> ).
<b>Collect Stats</b>	Specifies whether or not LDP statistics are collected for this SDP.
<b>Ingress Label</b>	The VC label used by the far-end device to send packets to the local device for this SDP binding.
<b>Egress Label</b>	The VC label used by the local device to send packets to the far-end device for SDP binding.
<b>Last Status Change</b>	The date and time of the last operational status change to this SDP.
<b>Signaling</b>	The signaling protocol used to obtain the ingress and egress labels from frames transmitted and received on this SDP.
<b>Last Mgmt Change</b>	The date and time of the last management-initiated change to this SDP.
<b>Flags</b>	The conditions that affect the operational status of this SDP.

*output definitions*

---

<b>Service Access Points (SAPs)</b>	The following fields display configuration information for each SDP associated with this service.
<b>Service Id</b>	The service ID associated with the SAP. Configured through the <b>configure service vpls create</b> command and bound to the SAP using the <b>configure service vpls sap create</b> command.
<b>SAP</b>	The access port number for the SAP. Configured through the <b>configure service port mode access</b> command and bound to the SAP using the <b>configure service vpls sap create</b> command.
<b>Encap</b>	The encapsulation type ( <b>null</b> or <b>dot1q</b> ) configured for the access port. This indicates the value of the label used to identify the SAP on the access port. Configured through the <b>configure service port encaps-type</b> command.
<b>Admin State</b>	The administrative state of this SAP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service vpls sap shutdown</b> command.
<b>Oper State</b>	The operational state of this SAP ( <b>Up</b> or <b>Down</b> ).
<b>Flags</b>	The conditions that affect the operational status of this SAP.
<b>Multi Svc Site</b>	The multi-service site of which the SAP is a member.
<b>Last Status Change</b>	The date and time of the last operational status change to this SAP.
<b>Last Mgmt Change</b>	The date and time of the last management-initiated change to this SAP.

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

<b>show service id base</b>	Displays the basic configuration for the specified service ID and a list of service distribution and access points associated with the service.
<b>show service id labels</b>	Displays a list of all labels that the specified service is using.

**MIB Objects**

---

*output definitions*

<b>SvcId</b>	The unique service identification number used to identify the service. Configured through the <b>configure service vpls create</b> command.
<b>Service Type</b>	The type of service (only VPLS is supported).
<b>Customer Id</b>	The customer account ID number. Configured through the <b>configure service customer create</b> command.

<b>SAP Count</b>	The number of SAPs associated with this service.
<b>SDP Bind Count</b>	The number of SDPs bound to this service.
<b>Send Flush on Fail</b>	Whether or not ( <b>Enabled</b> or <b>Disabled</b> ) a MAC flush message is sent when an access port or SAP failure occurs. Configured through the <b>configure service vpls send-flush-on-failure</b> command.
<b>Service Access and Destination Points</b>	The following fields display basic information for each SAP and SDP associated with this service.
<b>Identifier</b>	The SAP or SDP identifier: <ul style="list-style-type: none"> <li>• The SAP ID is comprised of the access port number and encapsulation value (0, VLAN ID, or all). For example, <b>sap:1/2:100</b> identifies a SAP on access port 1/2 using a VLAN ID 100 to map customer traffic tagged with VLAN 100 to the service associated with the SAP.</li> <li>• The SDP identifier is comprised of the SDP ID number, the service ID number, and the IP address of the far-end router for this SDP tunnel. For example, <b>10:100 -M(10.11.0.6)</b> identifies SDP 10 bound to VPLS 100 with the tunnel endpoint at router 10.11.0.6.</li> </ul>
<b>Type</b>	The encapsulation type ( <b>null</b> or <b>dot1q</b> ) configured for the access port. This indicates the value of the label used to identify the SAP on the access port. Configured through the <b>configure service port encaps-type</b> command. Note that the encapsulation type does not apply to SDPs;
<b>AdmMTU</b>	The desired largest frame size that can pass through the service or SDP to the far-end router without requiring fragmentation. Configured through the <b>configure service vpls service-mtu</b> or <b>configure service sdp path-mtu</b> commands.
<b>OprMTU</b>	The actual largest frame size that can pass through the service or SDP to the far-end router without requiring fragmentation.

*output definitions*

---

<b>Adm</b>	The administrative state of the SAP or SDP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service vpls sap shutdown</b> or <b>configure service sdp shutdown</b> commands.
<b>Opr</b>	The operational state of the SAP or SDP ( <b>Up</b> or <b>Down</b> ).

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

<b>show service id all</b>	Displays the detailed configuration for the specified service ID and associated service distribution and access points.
<b>show service id labels</b>	Displays a list of all labels that the specified service is using.

**MIB Objects**

---

## show service id labels

Displays a list of all labels that the specified service is using.

**show service id** *service-id* labels

---

### Syntax Definitions

*service-id* An existing VPLS ID number.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

The service ID is a unique number that identifies a specific VPLS. All ingress and egress labels that this service is using are displayed.

### Examples

```
-> show service id 100 labels
Martini Service Labels
```

Svc Id	Sdp Binding	Type	I.Lbl	E.Lbl
100	10:100	Mesh	131069	131070

Number of Bindings Found : 1

### *output definitions*

---

<b>Svc Id</b>	The unique service identification number used to identify the service.
<b>SDP Binding</b>	The SDP ID number associated with the service.
<b>Type</b>	The SDP binding type ( <b>mesh</b> or <b>spoke</b> ) for the service. The spoke SDP binding type is not supported.
<b>I.Lbl</b>	The VC label used by the far-end device to send packets to the local device for the SDP binding.
<b>E.Lbl</b>	The VC label used by the local device to send packets to the far-end device for the SDP binding.

---

### Release History

Release 6.4.2; command was introduced.

**Related Commands**

<b>show service id all</b>	Displays the detailed configuration for the specified service ID and associated service distribution and access points.
<b>show service egress-label</b>	Displays a list of services that are using the specified egress labels.
<b>show service ingress-label</b>	Displays a list of service that are using the specified ingress labels.

**MIB Objects**

---

## show service id sap

Displays configuration information about the Service Access Points (SAPs) associated with the specified service.

**show service id** *service-id* **sap** [*slot/port* | **linkagg** *agg\_num*] [:**0** | **:all** | *:qtag1*]

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>slot/port1</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>:0</b>	Specifies no (null) encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All 802.1q-tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on null encapsulation access ports.
<i>:qtag1</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on null encapsulation access ports.

### Defaults

By default, a list of all SAPs associated with the specified service ID is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

To display detailed information for an individual SAP, specify a SAP ID using the *slot/port* and **linkagg** *agg-num* parameters combined with the **:0**, *:qtag*, or **:all** parameters. For example, enter **1/2:all** to display information for the SAP on access port 1/2 that maps all traffic that is not classified into other SAPs to this service.

### Examples

```
-> show service id 100 sap
```

PortId	SvcId	Adm	Oper	Trusted	Pri
1/11:200	100	Up	Up	Yes	0
1/11:all	100	Up	Up	Yes	0
1/11:0	100	Down	Down	Yes	0

Number of SAPs : 3

*output definitions*

---

<b>PortId</b>	The access port number and encapsulation type for the SAP. Configured through the <b>configure service port mode access</b> command.
<b>Service Id</b>	The service ID associated with the SAP. Configured through the <b>configure service vpls create</b> command and bound to the SAP using the <b>configure service vpls sap create</b> command.
<b>Adm</b>	The administrative state of this SAP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service vpls sap shutdown</b> command.
<b>Oper</b>	The operational state of this SAP ( <b>Up</b> or <b>Down</b> ).
<b>Trusted</b>	The trusted status ( <b>Yes</b> or <b>No</b> ) for traffic mapped to this SAP. If <b>Yes</b> is displayed, the internal priority value for ingress traffic is used. If <b>No</b> is displayed, the value displayed in the <b>Pri</b> field is used.
<b>Pri</b>	The priority value assigned to the traffic mapped to this SAP. This value is only applied if the <b>Trusted</b> status for the SAP is set to <b>Yes</b> .

---

```
-> show service id 100 sap 1/11:200
```

## MIB Objects

---

## show service id sdp

Displays configuration information for the Service Distribution Points (SDPs) associated with the specified service.

**show service id** *service-id* **sdp** [*sdp-id[:vc-id]* | **far-end** *ip-address*] [**detail**]

---

### Syntax Definitions

<i>service-id</i>	An existing VPLS ID number.
<i>sdp-id</i>	An existing SDP ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<i>ip-address</i>	The system IP address for the far-end router. This is the user-configured Loopback0 address if the far-end router is an OmniSwitch.
<b>detail</b>	Displays detailed SDP information.

### Defaults

By default, a list of all SDPs associated with the specified service ID is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *sdp-id* parameter to display information for a specific SDP.
- Use the **far-end** *ip-addr* parameter to display information about an SDP with a specific far-end address.
- Use the **detail** parameter to display additional information about the SDPs.

### Examples

```
-> show service id 100 sdp
```

```
Services: Service Destination Points
```

SdpId	Type	IP address	Adm	Opr	I.Lbl	E.Lbl
10:100	Mesh	10.11.0.6	Up	Up	131069	131070

```
Number of SDPs : 1
```

```
-> show service id 100 sdp detail
```

```
Services: Service Destination Points Details
```

```
Sdp Id 10:100 -(10.11.0.6)
SDP Id:          10:100,          Type:          Mesh,
```

```

*output definitions*

---

<b>SDP Id</b>	The SDP identifier comprised of the SDP ID number, the service ID number, and the IP address of the far-end router for this SDP tunnel. For example, <b>10:100 -(10.11.0.6)</b> identifies SDP 10 bound to VPLS 100 with the tunnel endpoint at router 10.11.0.6.
<b>Type</b>	The SDP binding type ( <b>mesh</b> or <b>spoke</b> ) for this service. The spoke binding type is not supported. Configured through the <b>configure service vpls mesh-sdp</b> command.
<b>VC Type</b>	The type of VC ( <b>Ether</b> , <b>Vlan</b> , or <b>Vpls</b> ). Configured through the <b>configure service vpls mesh-sdp</b> command.
<b>Admin Path MTU</b>	The desired largest frame size that can pass through this SDP to the far-end router without requiring fragmentation. Configured through the <b>configure service sdp path-mtu</b> command.
<b>Oper Path MTU</b>	The actual largest frame size that can pass through this SDP to the far-end router without requiring fragmentation.
<b>Far End</b>	The IP address of the remote end of the MPLS tunnel defined by this SDP. Configured through the <b>configure service sdp far-end</b> command.
<b>Delivery</b>	Specifies the type of delivery used by this SDP. In this case, LDP-based MPLS is the supported delivery method; GRE is not supported.
<b>Admin State</b>	The administrative state of this SDP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service sdp shutdown</b> command.
<b>Oper State</b>	The operational state of this SDP ( <b>Up</b> or <b>Down</b> ).
<b>Collect Stats</b>	Specifies whether or not LDP statistics are collected for this SDP.
<b>Ingress Label</b>	The VC label used by the far-end device to send packets to the local device for this SDP binding.
<b>Egress Label</b>	The VC label used by the local device to send packets to the far-end device for SDP binding.
<b>Last Status Change</b>	The date and time of the last operational status change to this SDP.
<b>Signaling</b>	The signaling protocol used to obtain the ingress and egress labels from frames transmitted and received on this SDP.
<b>Last Mgmt Change</b>	The date and time of the last management-initiated change to this SDP.
<b>Flags</b>	The conditions that affect the operational status of this SDP.

---

**Release History**

Release 6.4.2; command was introduced.

## Related Commands

<b>show service id all</b>	Displays the detailed configuration for the specified service ID, including all SDPs and SAPs associated with the service.
<b>show service id labels</b>	Displays a list of all labels that the specified service is using.
<b>show service sdp-using</b>	Displays the SDP usage for the local router or for a far-end router IP address.
<b>show service sdp</b>	Displays the SDP configuration for the switch.

## MIB Objects

---

## show service sap-using

Displays the Service Access Point (SAP) configuration for the local router.

```
show service sap-using [sap {slot/port | linkagg agg_num}] [:0 | :all | :qtag]
```

---

### Syntax Definitions

<i>slot/port</i>	The slot and port number of the service access port.
<i>agg_num</i>	The link aggregate ID number (0–31) of a service access link aggregate.
<b>:0</b>	Specifies no (null) encapsulation value for the SAP. Depending on the pre-configured encapsulation type for the access port, a SAP using a null encapsulation will direct tagged and untagged or only untagged traffic to the associated service.
<b>:all</b>	Specifies a wildcard SAP. All 802.1q-tagged or untagged traffic that is not classified into another SAP is mapped to the wildcard SAP. Not configurable on null encapsulation access ports.
<i>:qtag</i>	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP. Not configurable on null encapsulation access ports.

### Defaults

By default, a list of all SAPs configured for the router is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

To display detailed information for an individual SAP, specify a SAP ID using the *slot/port* and **linkagg agg-num** parameters combined with the **:0**, **:qtag**, or **:all** parameters. For example, enter **1/2:all** to display information for the SAP on access port 1/2 that maps all traffic that is not classified into other SAPs to this service.

### Examples

```
-> show service sap-using
```

```
Service Access Points
```

PortId	SvcId	Adm	Opr	Trusted	Pri
1/2:100	100	Up	Down	Yes	0
1/2:110	100	Up	Down	Yes	0
1/2:all	100	Up	Down	Yes	0
1/11:200	100	Up	Up	Yes	0
8/8:300	100	Up	Up	Yes	0
1/3	200	Up	Up	Yes	0
0/5:400	200	Up	Up	Yes	0

```
-> show service sap-using sap linkagg 5:400
```

```
Service Access Points Using Port 0/5:400
```

PortId	SvcId	Adm	Opr	Trusted	Pri
0/5:400	200	Up	Up	Yes	0

```
Number of SAPs : 1
```

### *output definitions*

---

<b>PortId</b>	The access port number and encapsulation type for the SAP. Configured through the <b>configure service port mode access</b> command.
<b>Service Id</b>	The service ID associated with the SAP. Configured through the <b>configure service vpls create</b> command and bound to the SAP using the <b>configure service vpls sap create</b> command.
<b>Adm</b>	The administrative state of this SAP ( <b>Up</b> or <b>Down</b> ). Configured through the <b>configure service vpls sap shutdown</b> command.
<b>Oper</b>	The operational state of this SAP ( <b>Up</b> or <b>Down</b> ).
<b>Trusted</b>	The trusted status ( <b>Yes</b> or <b>No</b> ) for traffic mapped to this SAP. If <b>Yes</b> is displayed, the internal priority value for ingress traffic is used. If <b>No</b> is displayed, the value displayed in the <b>Pri</b> field is used.
<b>Pri</b>	The priority value assigned to the traffic mapped to this SAP. This value is only applied if the <b>Trusted</b> status for the SAP is set to <b>Yes</b> .

---

### **Release History**

Release 6.4.2; command was introduced.

### **Related Commands**

- show service id sap** Displays the detailed configuration for the specified service ID, including all SDPs and SAPs associated with the service.
- show service port** Displays the access (customer-facing) port configuration for the router.

### **MIB Objects**

---

## show service sdp-using

Displays the Service Distribution Point (SDP) usage for the local router or for a far-end router IP address.

**show service sdp-using** [*sdp-id[:vc-id]*] | **far-end** *ip-address*]

---

### Syntax Definitions

<i>sdp-id</i>	An existing SDP ID number.
<i>vc-id</i>	A VC ID number used to validate the VC ID portion of each mesh SDP binding defined for the service.
<i>ip-address</i>	The system IP address for the far-end router. This is the user-configured Loopback0 address if the far-end router is an OmniSwitch.

### Defaults

By default, a list of all associated SDPs configured for the switch is displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the *sdp-id* parameter to display information for a specific SDP.
- Use the **far-end** *ip-addr* parameter to display information about an SDP with a specific far-end address.

### Examples

```
-> show service sdp-using
```

```
SDP Using
```

SvcId	SdpId	Type	Far End	Opr	I.Label	E.Label
100	10:100	Mesh	10.11.0.6	Up	131069	131070
200	30:200	Mesh	30.1.2.3	Down	0	0

```
Number of SDPs : 2
```

```
-> show service sdp-using 10
```

```
Service Destination Point (Sdp Id : 10:0)
```

SvcId	SdpId	Type	Far End	Opr	I.Label	E.Label
100	10:100	Mesh	10.11.0.6	Up	131069	131070

```
Number of SDPs : 1
```

```
-> show service sdp-using far-end 10.11.0.5
```

```
Service Destination Point(Far-End : 10.11.0.6)
```

SvcId	SdpId	Type	Far End	Opr	I.Label	E.Label
100	10:100	Mesh	10.11.0.6	Up	131069	131070

```
Number of SDPs : 1
```

### output definitions

<b>SvcId</b>	The service ID associated with the SDP. Configured through the <a href="#">configure service vpls create</a> command and bound to the SAP using the <a href="#">configure service vpls mesh-sdp</a> command.
<b>SDP Id</b>	The SDP identifier comprised of the SDP ID number, the service ID number, and the IP address of the far-end router for this SDP tunnel. For example, <b>10:100</b> identifies SDP 10 bound to VPLS 100 with the tunnel endpoint at router 10.11.0.6.
<b>Type</b>	The SDP binding type ( <b>mesh</b> or <b>spoke</b> ) for this service. The spoke binding type is not supported. Configured through the <a href="#">configure service vpls mesh-sdp</a> command.
<b>Far End</b>	The IP address of the remote end of the MPLS tunnel defined by this SDP. Configured through the <a href="#">configure service sdp far-end</a> command.
<b>Oper S</b>	The operational state of this SDP ( <b>Up</b> or <b>Down</b> ).
<b>I. Label</b>	The VC label used by the far-end device to send packets to the local device for this SDP binding.
<b>E. Label</b>	The VC label used by the local device to send packets to the far-end device for SDP binding.

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<a href="#">show service id all</a>	Displays the detailed configuration for the specified service ID, including all SDPs and SAPs associated with the service.
<a href="#">show service id labels</a>	Displays a list of all labels that the specified service is using.
<a href="#">show service id sdp</a>	Displays configuration information for the Service Distribution Points (SDPs) associated with the specified service.
<a href="#">show service sdp</a>	Displays the SDP configuration for the switch.

### MIB Objects

## show service egress-label

Displays the services that are using a specific egress label or a range of egress labels.

**show service egress-label** *start-label* [*end-label*]

---

### Syntax Definitions

<i>start-label</i>	An egress label number. The valid range is 0 or 16–131071.
<i>end-label</i>	The last egress label number in a range of labels. The valid range is 2049–131071.

### Defaults

By default, all services associated with the starting label number are displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the optional *end-label* parameter along with the *start-label* parameter to specify a range of egress labels.
- If an ending label number is not specified, then all services using the starting label number are displayed. No range is specified.

### Examples

```
-> show service egress-label 131070
Martini Service Labels
```

Svc Id	Sdp Binding	Type	I.Lbl	E.Lbl
100	10:100	Mesh	131069	131070

```
Number of Bindings Found : 1
```

#### output definitions

---

<b>Svc Id</b>	The unique service identification number used to identify the service.
<b>SDP Binding</b>	The SDP ID number associated with the service.
<b>Type</b>	The SDP binding type ( <b>mesh</b> or <b>spoke</b> ) for the service. The spoke SDP binding type is not supported.
<b>I.Lbl</b>	The VC label used by the far-end device to send packets to the local device for this SDP binding.
<b>E.Lbl</b>	The VC label used by the local device to send packets to the far-end device for this SDP binding.

---

|--------------------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#">show service ingress-label</a> | Displays the services that are using a specific ingress label or a range of ingress labels. |
| <a href="#">show service id labels</a>     | Displays a list of all labels that the specified service is using.                          |

## MIB Objects

---

## show service ingress-label

Displays the services that are using a specific ingress label or a range of ingress labels.

**show service ingress-label** *start-label* [*end-label*]

---

### Syntax Definitions

<i>start-label</i>	An ingress label number. The valid range is 0 or 2048–131071.
<i>end-label</i>	The last ingress label number in a range of labels. The valid range is 2049–131071.

### Defaults

By default, all services associated with the starting label number are displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the optional *end-label* parameter along with the *start-label* parameter to specify a range of ingress labels.
- If an ending label number is not specified, then all services using the starting label number are displayed. No range is specified.

### Examples

```
-> show service ingress-label 2048 131071
Martini Service Labels
```

Svc Id	Sdp Binding	Type	I.Lbl	E.Lbl
100	10:100	Mesh	131069	131070
200	30:200	Mesh	0	0

Number of Bindings Found : 2

#### *output definitions*

---

<b>Svc Id</b>	The unique service identification number used to identify the service.
<b>SDP Binding</b>	The SDP ID number associated with the service.
<b>Type</b>	Indicates the SDP binding type ( <b>mesh</b> or <b>spoke</b> ) for the service. The spoke SDP binding type is not supported.
<b>I.Lbl</b>	The VC label used by the far-end device to send packets to the local device for this SDP binding.
<b>E.Lbl</b>	The VC label used by the local device to send packets to the far-end device for this SDP binding.

---

## Release History

Release 6.4.2; command was introduced.

## Related Commands

**show service egress-label**

Displays the services that are using a specific egress label or a range of egress labels.

**show service id labels**

Displays a list of all labels that the specified service is using.

**clear service id mesh-sdp  
ingress-vc-label**

Clears the static MPLS VC label used by the far-end router to send packets to this router.

## MIB Objects

---

## show service fdb-info

Displays global forwarding database (FDB) information for the router.

**show service fdb-info**

---

### Syntax Definitions

N/A.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

This command displays the FDB information that exists for all services. Fields that display “N/A” are currently not supported.

### Examples

```
-> show service fdb-info
Forwarding Database (FDB) Information
```

```
Service 100
  Service Id:          100,          Mac Move:          N/A,
  Mac Move Rate:      N/A,          Mac Move Timeout: N/A,
  Table Size:         N/A,          Total Count:       5,

  Mac Learning:       N/A,          Discard Unknown:  N/A,
  Mac Aging:          N/A,          Relearn Only:     N/A

Service 200
  Service Id:          200,          Mac Move:          N/A,
  Mac Move Rate:      N/A,          Mac Move Timeout: N/A,
  Table Size:         N/A,          Total Count:       1,
  Learned Count:      0,            Static Count:      1,
  OAM-learned Count: N/A,          DHCP-learned Count: N/A,
  Host-learned Count: N/A,
  Remote Age:         N/A,          Local Age:         N/A,
  Mac Learning:       N/A,          Discard Unknown:  N/A,
  Mac Aging:          N/A,          Relearn Only:     N/A

Total Service FDBs          : 2
Total FDB Configured Size : N/A
Total FDB Entries In Use   : 6
```

*output definitions*

---

<b>Service Id</b>	The unique service identification number used to identify the service.
<b>Total Count</b>	The number of MAC address entries (both learned and static) in the FDB for this service.
<b>Learned Count</b>	The number of dynamically learned MAC address entries in the FDB for this service.
<b>Static Count</b>	The number of static MAC address entries in the FDB for this service.
<b>Total Service FDBs</b>	The total number of service FDBs.
<b>Total FDB Entries In Use</b>	The total number of entries (both learned and static) in use.

---

**Release History**

Release 6.4.2; command was introduced.

**Related Commands**

<a href="#">show service fdb-mac</a>	Displays the MAC address entry information found in the forwarding database (FDB).
<a href="#">clear service id fdb</a>	Clears MAC addresses (including static) from the Source Learning MAC address forwarding database for the specified service.

**MIB Objects**

---

## show service fdb-mac

Displays the MAC address entry information found in the forwarding database (FDB).

**show service fdb-mac** [*mac-address*]

---

### Syntax Definitions

*mac-address*

A 48-bit MAC address for the static ARP (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

### Defaults

By default, all MAC address entries are displayed.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the optional *mac-address* parameter with this command to display information for a specific MAC address.
- Fields that display “N/A” are currently not supported.

### Examples

```
-> show service fdb-mac 00:02:da:16:02:0c
```

```
Service Forwarding Database for 00:02:da:16:02:0c
```

ServId	MAC Address	Source-Identifier	Type	Last-Change
2000	00:02:da:16:02:0c	sap:16/6:2	Learn	N/A

```
No. of Entries: 1
```

### output definitions

---

<b>Service Id</b>	The unique service identification number used to identify the service.
<b>MAC Address</b>	The MAC address entry associated with this service.
<b>Source-Identifier</b>	The Service Access Point (SAP) on which the address was learned or configured.
<b>Type</b>	The type of MAC address ( <b>Learned</b> =dynamically learned address or <b>Static</b> =management configured permanent address).

---

### Release History

Release 6.4.2; command was introduced.

## Related Commands

### **show service fdb-info**

Displays global forwarding database (FDB) information for the router.

### **clear service id fdb**

Clears MAC addresses (including static) from the Source Learning MAC address forwarding database for the specified service.

## MIB Objects

---

# 51 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

*Filename:* AlcatelIND1System.MIB  
*Module:* ALCATEL-IND1-SYSTEM-MIB

A summary of the available commands is listed here.

---

**swlog**  
**swlog syslog-facility-id**  
**swlog appid level**  
**swlog remote command-log**  
**swlog remote command-log**  
**swlog output flash file-size**  
**swlog clear**  
**show log swlog**  
**show swlog**

---

## swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

**swlog**

**no swlog**

---

### Syntax Definitions

N/A

### Defaults

By default, switch logging is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> swlog  
-> no swlog
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">swlog appid level</a>	Defines the level at which switch logging information will be filtered for the specified application.
<a href="#">swlog remote command-log</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

```
systemSwitchLoggingGroup  
  systemSwitchLoggingEnable
```

---

## swlog syslog-facility-id

Specifies a facility ID that switch logging will include in the priority (PRI) section of the event message.

**swlog syslog-facility-id** {*facility\_id* | *integer*}

---

### Syntax Definitions

*facility\_id* A facility identification keyword. Current facility IDs are listed in the table below.

*integer* A numerical equivalent value for the facility ID, in the range of 0–23. Current numeric equivalent values are listed in the table below.

---

### Supported Facility IDs and their Numeric Equivalents

kernel - 0	NTP - 12
user - 1	log-audit - 13
mail - 2	log-alert - 14
system - 3	clock2 - 15
sec-auth1-4	local0 - 16
syslog - 5	local1 - 17
lptr - 6	local2 - 18
net-news - 7	local3 - 19
UUCP - 8	local4 - 20
clock1- 9	local5 - 21
sec-auth2 - 10	local6 - 22
FTP - 11	local7 - 23

### Defaults

parameter	default
<i>facility_id</i>	local0
<i>integer</i>	16

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

Use the ID name (i.e., **system**) or the numeric equivalent to specify the facility ID.

### Examples

```
-> swlog syslog-facility-id system
-> swlog syslog-facility-id 3
```

### Release History

Release 6.3.1.R02; command was introduced.

**Related Commands**

<b>swlog</b>	Enables or disables switch logging.
<b>swlog remote command-log</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>show log swlog</b>	Displays stored switch logging information from flash.
<b>show swlog</b>	Displays switch logging information.

---

## swlog appid level

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured. Applications can be specified by their application ID (i.e., subsystem) or by their numeric equivalent.

**swlog appid** {*app\_id* | *integer*} **level** {*level* | *integer*}

**no swlog appid** *app\_id*

---

### Syntax Definitions

*app\_id* An application identification keyword. Current application IDs are listed in the table below.

*integer* A numerical equivalent value for the application ID. Current numeric equivalent values are listed in the table below.

---

### Supported Application IDs and their Numeric Equivalents

802.1q - 7	ip - 15	psm - 81
aaa - 20	ipc-diag - 1	qdispatcher - 3
amap - 18	ip-helper - 22	qdriver - 2
bridge - 10	ipc-link - 4	qos - 13
chassis - 64	ipc-mon - 21	rmon - 79

idle - 255	policy - 73	vrrp - 77
interface - 6	port-mgr - 64	web - 69

*level* The severity level filter keyword value for the application ID (*see table on the following page*). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.

*integer* A numerical equivalent value for the severity level (*see table on the following page*). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe. Values range from 2–9.

Supported Levels	Numeric Equivalents	Description
<b>alarm</b>	<b>2</b>	Highest severity. The system is about to crash and reboot.
<b>error</b>	<b>3</b>	System functionality is reduced.
<b>alert</b>	<b>4</b>	A violation has occurred.
<b>warning</b>	<b>5</b>	A unexpected, non-critical event has occurred.
<b>info</b>	<b>6</b>	Any other non-debug message (default).
<b>debug1</b>	<b>7</b>	A normal event debug message.
<b>debug2</b>	<b>8</b>	A debug-specific message.
<b>debug3</b>	<b>9</b>	Lowest severity. A maximum verbosity debug message.

## Defaults

Default severity level is **info**. The numeric equivalent for info is 6.

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- You may enter multiple application IDs in the command line. Separate each application ID with a space and no comma.
- Application IDs may be entered in any order.
- This command can also be used on the secondary CMM.

## Examples

```
-> swlog appid 254 level alarm
-> swlog appid policy level info
-> swlog appid policy snmp web aaa vlan level alert
-> no swlog appid debug2
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog remote command-log</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>show log swlog</b>	Displays stored switch logging information from flash.
<b>show swlog</b>	Displays switch logging information.

## MIB Objects

```
systemSwitchLoggingGroup  
  systemSwitchLoggingLevelAppId  
  systemSwitchLoggingLevel
```

---

## swlog remote command-log

Enables or disables remote command logging.

`swlog remote command-log {enable | disable}`

---

### Syntax Definitions

N/A

### Defaults

By default, switch logging is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> swlog remote command-log enable
-> swlog remote command-log disable
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

```
systemSwitchLoggingGroup
  systemSwitchLoggingEnable
```

---

## swlog output

Enables or disables switch logging output to the console, file, or data socket (remote session).

**swlog output** {**console** | **flash** | **socket** [*ip\_address*] [**remote command-log**]}

**no swlog output** {**console** | **flash** | **socket** [*ip\_address*]}

---

### Syntax Definitions

<b>console</b>	Specifies console output. When enabled, switch logging output is printed to the user console.
<b>flash</b>	Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system.
<b>socket</b>	Specifies data socket output. When enabled, switch logging output is printed to a remote session.
<i>ip_address</i>	The IPv4 or IPv6 address for the remote session host.
<b>remote command-log</b>	Specifies command-log output to be sent to a remote session.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>console</b>   <b>flash</b>   <b>socket</b>	<b>flash and console</b>

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- You can send files to multiple hosts (maximum of four) using the **socket** keyword, followed by the IP address of the remote host.
- When sending the output to a syslog server, the Loopback0 address is used if configured, otherwise the VLAN's IP address is used.

### Examples

```
-> swlog output console
-> no swlog output flash
-> swlog output socket 14.1.1.1
-> swlog output socket 15.1.1.1 remote command-log
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">swlog</a>	Enables or disables switch logging.

  systemSwitchLoggingHostStatus
```

---

## swlog output flash file-size

Configures the size of the switch logging file.

**swlog output flash file-size** *bytes*

---

### Syntax Definitions

*bytes*

The size of the switch logging file. The minimum value is 32000 while the maximum value is the total amount of free space in flash memory.

### Defaults

---

parameter	default
<i>bytes</i>	128000

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **ls** command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog output flash file size 400000
```

### Release History

Release 6.1; command was introduced.

### Related Commands

### MIB Objects

systemSwitchLoggingGroup  
  systemSwitchLoggingFileSize

---

## swlog clear

Clears the files that store switch logging data.

swlog clear

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog clear
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">swlog remote command-log</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

```
systemSwitchLoggingGroup  
  systemSwitchLoggingClear
```

---

## show log swlog

Displays stored switch logging information.

**show log swlog**

**show log swlog** [*session session\_id*] [*timestamp start\_time [end\_time]*] [*appid appid*] [*level level*]

---

### Syntax Definitions

<i>session_id</i>	Identification number of the session for which switch logging information is displayed.
<i>start_time</i>	Specify the starting time for the switch logging information to be displayed. Use the format mm/dd/yyyy hh:mm where mm represents the month, dd is the day, yyyy is the year, hh is the hour, and mm is the minutes. Use four digits to specify the year.
<i>end_time</i>	Specify the ending time for the switch logging information to be displayed. Use the format mm/dd/yyyy hh:mm where mm represents the month, dd is the day, yyyy is the year, hh is the hour, mm is the minutes. Use four digits to specify the year.
<i>appid</i>	A digit that represents the application ID for the switch logging information to be displayed. Values are listed in the following table.

---

### Supported Application IDs and their Numeric Equivalents

802.1q - 7	ip - 15	qdispatcher - 3
aaa - 20	ipc-diag - 1	qdriver - 2
amap - 18	ip-helper - 22	qos - 13
bridge - 10	ipc-link - 4	rmon - 79
chassis - 64	ipc-mon - 21	rsvp - 14
cli - 67	ipms - 17	session - 71
config - 66	ipx - 16	slb - 25
dbggw - 89	ldap - 86	smni - 83
diag - 0	linkagg - 12	snmp - 68
distrib - 84	mipgw - 70	ssl - 88
drc - 74	module - 24	stp - 11
eipc - 26	nan-driver - 78	system - 75
epilogue - 85	ni-supervision - 5	telnet - 80
ftp - 82	nosnmp - 87	trap - 72
gmap - 19	pmm - 23	vlan - 8
health - 76	policy - 73	vrrp - 77
idle - 255	port-mgr - 64	web - 69
interface - 6	psm - 81	

---

*level*

A numerical equivalent value for the severity level (*see table below*). All switch logging messages of the specified level and lower will be shown. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe. Values range from 2–9.

Supported Levels	Numeric Equivalents	Description
<b>alarm</b>	<b>2</b>	Highest severity. The system is about to crash and reboot.
<b>error</b>	<b>3</b>	System functionality is reduced.
<b>alert</b>	<b>4</b>	A violation has occurred.
<b>warning</b>	<b>5</b>	A unexpected, non-critical event has occurred.
<b>info</b>	<b>6</b>	Any other non-debug message (default).
<b>debug1</b>	<b>7</b>	A normal event debug message.
<b>debug2</b>	<b>8</b>	A debug-specific message.
<b>debug3</b>	<b>9</b>	Lowest severity. A maximum verbosity debug message.

## Defaults

N/A

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- When the switch logging display is too long, you may use the **show log swlog** command to clear all of the switch logging information.
- This command can also be used on the secondary CMM.

## Examples

```
-> show log swlog
Displaying file contents for 'swlog2.log'
FILEID: fileName[swlog2.log], endPtr[32]
configSize[64000], currentSize[64000], mode[2]
Displaying file contents for 'swlog1.log'
FILEID: fileName[swlog1.log], endPtr[395]
configSize[64000], currentSize[64000], mode[1]
```

```
Time Stamp           Application      Level   Log Message

l!
MON NOV 11 13:18:24 2002              WEB       info The HTTP session login successfu
l!
MON NOV 11 13:24:03 2002          TELNET    info New telnet connection, Address ,
```

```
128.251.30.88
MON NOV 11 13:24:03 2002      TELNET    info Session 4, Created
MON NOV 11 13:59:04 2002      WEB       info The HTTP session user logout successful!
```

*output definitions*

---

<b>Time Stamp</b>	The day, date and time for which Switch Logging log information is displayed.
<b>Application</b>	The Application ID (Subsystem) for which Switch Logging log information is displayed.
<b>Level</b>	The corresponding Severity Level for which Switch Logging information was stored. Levels include alarm, error, alert, warning, info, debug1, debug2, and debug3.
<b>Log Message</b>	The condition that resulted in the logging information being stored.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid level</b>	Adds or removes a filter level for a specified subsystem.
<b>swlog remote command-log</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>swlog clear</b>	Clears the files that store switch logging data.
<b>show swlog</b>	Displays switch logging information.

---

## show swlog

Displays switch logging information (e.g., switch logging status, log devices, application IDs with non-default severity level settings).

**show swlog**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> show swlog
Operational Status           : On,
Log Device 1                 : flash,
Log Device 2                 : console,
Log Device 3                 : ipaddr 1.1.1.1 remote command-log,
Syslog FacilityID           : local0(16),
Remote command-log          : Disabled,
Console Display Level       : debug3 (9),
All Applications Trace Level : info (6)
```

### *output definitions*

---

<b>Operational Status</b>	The operational status of switch logging.
<b>Log Device</b>	The device where the output is being logged.
<b>Syslog FacilityID</b>	The facility ID that switch logging will include in the priority (PRI) section of the event message.
<b>Remote command-log</b>	The status of the remote command-log feature.
<b>Console Display Level</b>	The Console Display Level. Levels include alarm (2), error (3), alert (4), warning (5), info (6), debug1 (7), debug2 (8), and debug3 (9).
<b>All Applications Trace Level</b>	The Severity Level of the Application ID. Levels include alarm (2), error (3), alert (4), warning (5), info (6), debug1 (7), debug2 (8), and debug3 (9).

---

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid level</b>	Defines the level at which switch logging information will be filtered for the specified application.
<b>swlog remote command-log</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>show log swlog</b>	Displays stored switch logging information from flash.

---

# 52 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (e.g., bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

*Filename:* AlcatelIND1Health.mib  
*Module:* healthMIB

A summary of the available commands is listed here:

---

**health threshold**  
**health interval**  
**health statistics reset**  
**show health threshold**  
**show health interval**  
**show health**  
**show health all**  
**show health slice**  
**show health fabric**

---

## health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user. The temperature threshold specifies the maximum operating temperature, in Celsius, allowed within the chassis before a trap is sent.

**health threshold** {*rx percent* | *txrx percent* | **memory percent** | **cpu percent** | **temperature degrees**}

---

### Syntax Definitions

<b>rx</b>	Specifies the maximum input (RX) traffic threshold.
<b>txrx</b>	Specifies the maximum output/input (TX/RX) traffic threshold.
<b>memory</b>	Specifies the maximum RAM memory usage threshold.
<b>cpu</b>	Specifies the maximum CPU usage threshold.
<i>percent</i>	The new threshold value, in percent, for the corresponding resource—i.e., <b>rx</b> , <b>txrx</b> , <b>memory</b> , <b>cpu</b> —(0–100).
<b>temperature</b>	Specifies the temperature threshold for the chassis.
<i>degrees</i>	The new threshold value, in Celsius, for the chassis temperature threshold (0–100).

### Defaults

parameter	default
<i>percentage</i>	80
<i>degrees</i>	50

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (i.e., switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to [page 52-6](#), or refer to the “Diagnosing Switch Problems” chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide*.
- To view the current health threshold values, use the **show health threshold** command. Do not use the **show temperature** command as it does not display health threshold statistics. These two **show** commands are unrelated.

## Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
-> health threshold temperature 40
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[show health threshold](#) Displays the current health threshold settings.

## MIB Objects

```
HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceTempLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
```

---

---

## health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the switch's consumable resources to see if it is performing within set thresholds.

**health interval** *seconds*

---

### Syntax Definitions

*seconds* Sampling interval (in seconds). Valid entries are 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Decreasing the polling interval may impact switch performance.

### Examples

```
-> health interval 6
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show health interval](#) Displays the current health sampling interval.

### MIB Objects

HealthThreshInfo  
healthSamplingInterval

---

## health statistics reset

Resets health statistics for the switch.

**health statistics reset**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command clears statistics for the entire switch. You cannot clear statistics for a module or port only.

### Examples

```
-> health statistics reset
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show health](#) Displays health statistics for the switch.

### MIB Objects

HealthThreshInfo  
healthSamplingReset

---

## show health threshold

Displays current health threshold settings.

**show health threshold** [**rx** | **txrx** | **memory** | **cpu** | **temperature**]

---

### Syntax Definitions

<b>rx</b>	Displays the current input (RX) traffic threshold.
<b>txrx</b>	Displays the current output/input (TX/RX) traffic threshold.
<b>memory</b>	Displays the current RAM memory usage threshold.
<b>cpu</b>	Displays the current CPU usage threshold.
<b>temperature</b>	Displays the current chassis temperature threshold.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Unless a specific resource type (i.e., **rx**, **txrx**, **memory**, **cpu**, or **temperature**) is specified, threshold information for *all* resources displays.
- To display only a specific threshold, enter the command, followed by the specific resource type (**rx**, **txrx**, **memory**, **cpu**, or **temperature**). For example, to display only the memory threshold, enter the following syntax: **show health threshold memory**.

### Examples

```
-> show health threshold
Rx Threshold           = 80
TxRx Threshold        = 80
Memory Threshold      = 80
CPU Threshold         = 80
Temperature Threshold = 50
```

**output definitions**

---

<b>Rx Threshold</b>	The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>incoming traffic</i> on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed via the <a href="#">health threshold</a> command.
<b>TxRx Threshold</b>	The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>all incoming and outgoing traffic</i> . As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed via the <a href="#">health threshold</a> command.
<b>Memory Threshold</b>	Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed via the <a href="#">health threshold</a> command.
<b>CPU Threshold</b>	Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed via the <a href="#">health threshold</a> command.
<b>Temperature Threshold</b>	Displays the current chassis temperature threshold, in Celsius. The default value is 50 degrees Celsius and can be changed via the <a href="#">health threshold</a> command.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[health threshold](#) Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

**MIB Objects**

HealthThreshInfo

```
healthThreshDeviceRxLimit
healthThreshDeviceTxRxLimit
healthThreshDeviceTempLimit
healthThreshDeviceMemoryLimit
healthThreshDeviceCpuLimit
```

---

---

## show health interval

Displays the current health sampling interval.

```
show health interval
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the [health interval](#) command to set the sampling interval.

### Examples

```
-> show health interval  
Sampling Interval = 5
```

#### *output definitions*

---

<b>Sampling Interval</b>	Currently configured interval between health statistics checks (in seconds).
--------------------------	------------------------------------------------------------------------------

---

### Release History

Release 6.1; command was introduced.

### Related Commands

[health interval](#) Configures the interval between health statistics checks.

### MIB Objects

```
HealthThreshInfo  
  healthSamplingInterval
```

---

## show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

**show health** [*slot/port*] [**statistics**]

---

### Syntax Definitions

*slot/port*

To view a specific slot, enter the slot number (e.g., 3). To view a specific port, enter the slot and port number (e.g., 3/1).

**statistics**

Optional command syntax. It displays the same information as the **show health** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If no slot/port information is specified, the aggregate health statistics for all ports is displayed.
- Use the [health statistics reset](#) command to reset health statistics for the switch.

### Examples

```
-> show health
* - current value exceeds threshold
```

Device	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
Receive	80	01	01	01	01
Transmit/Receive	80	01	01	01	01
Memory	80	66	66	66	66
CPU	80	41	40	32	30

```
-> show health 4/3
* - current value exceeds threshold
```

Port 04/03	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
Receive	80	01	01	01	01
Transmit/Receive	80	01	01	01	01

*output definitions*

---

<b>Receive</b>	Traffic received by the switch.
<b>Transmit/Receive</b>	Traffic transmitted and received by the switch.
<b>Memory</b>	Switch memory.
<b>CPU</b>	Switch CPU.
<b>Limit</b>	Currently configured device threshold levels (percentage of total available bandwidth).
<b>Curr</b>	Current device bandwidth usage.
<b>1 Min Avg</b>	Average device bandwidth usage over a 1-minute period.
<b>1 Hr Avg</b>	Average device bandwidth usage over a 1-hour period.
<b>1 Hr Max</b>	Maximum device bandwidth usage over a 1-hour period (i.e., the maximum of the 1 minute averages).

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[health statistics reset](#)

Resets health statistics for the switch.

[show health all](#)

Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

**MIB Objects**

```
healthModuleTable
  healthModuleSlot
  healthModuleRxLatest
  healthModuleRx1MinAvg
  healthModuleRx1HrAvg
  healthModuleRx1HrMax
  healthModuleRxTxLatest
  healthModuleRxTx1MinAvg
  healthModuleRxTx1HrAvg
  healthModuleRxTx1HrMax
  healthModuleMemoryLatest
  healthModuleMemory1MinAvg
  healthModuleMemory1HrAvg
  healthModuleMemory1HrMax
  healthModuleCpuLatest
  healthModuleCpu1MinAvg
  healthModuleCpu1HrAvg
  healthModuleCpu1HrMax
```

---

## show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

**show health all {memory | cpu | rx | txrx}**

---

### Syntax Definitions

<b>memory</b>	Displays the RAM memory health statistics for all active NI modules in the switch.
<b>cpu</b>	Displays the CPU health statistics for all active NI modules.
<b>rx</b>	Displays the health statistics for traffic <i>received</i> on all active NI modules.
<b>txrx</b>	Displays the health statistics for traffic both <i>transmitted and received</i> on all active NI modules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show health all memory
* - current value exceeds threshold
```

Memory	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
01	80	40	40	40	40
02	80	40	40	40	40
03	80	40	40	40	40
04	80	40	40	40	40
05	80	40	40	40	40
06	80	40	40	40	40
07	80	40	40	40	40
13	80	40	40	40	40

*output definitions*

---

<b>Memory (Cpu, TXX, RX)</b>	A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if <b>show health all cpu</b> is entered, <b>Cpu</b> is used as the column header.
<b>Limit</b>	Current usage threshold for the specified resource type, on the corresponding slot (in percent). The usage threshold refers to the maximum amount of the resource's total bandwidth that can be used by switch applications before a notification is sent to the user. The default value for all resource types is 80 percent. This threshold can be changed via the <b>health threshold</b> command.
<b>Curr</b>	Current usage of the resource on the corresponding slot, in percent (i.e., the amount of the resource's total bandwidth actually being used by switch applications).
<b>1 Min Avg</b>	Average usage of the resource on the corresponding slot over a one minute period.
<b>1 Hr Avg</b>	Average usage of the resource on the corresponding slot over a one hour period.
<b>1 Hr Max</b>	The highest average hourly usage for the resource on the corresponding slot.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

**show health**

Displays the health statistics for the switch.

**health threshold**

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

**MIB Objects**

```
healthModuleTable
  healthModuleSlot
  healthModuleRxLatest
  healthModuleRx1MinAvg
  healthModuleRx1HrAvg
  healthModuleRx1HrMax

  healthModuleRxTx1HrMax
  healthModuleMemoryLatest
  healthModuleMemory1MinAvg
  healthModuleMemory1HrAvg
  healthModuleMemory1HrMax
  healthModuleCpuLatest
  healthModuleCpu1MinAvg
  healthModuleCpu1HrAvg
  healthModuleCpu1HrMax
```

---

## show health slice

Displays the health statistics for a particular slice. The term *slice* refers to an amount of CPU time and RAM memory allotted for switch applications. By monitoring slice statistics on the switch, users can determine whether there are any potential usage issues with CPU and RAM memory that may affect switch multi-tasking.

**show health slice** *slot*

---

### Syntax Definitions

*slot* A specific physical slot number for which slice statistics are to be displayed (e.g., 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show health slice 13
Slot 13      slice
Resources    1
-----+-----
Memory      40
Cpu         21
```

### *output definitions*

---

<b>Slot</b>	The physical slot number for the corresponding slice.
<b>slice</b>	The on-board slice number (1–64).
<b>Memory</b>	The slice-level RAM memory utilization over the latest sample period, in percent (0–100).
<b>Cpu</b>	The slice-level CPU utilization over the latest sample period, in percent (0–100).

---

### Release History

Release 6.1; command was introduced.

### Related Commands

N/A

## **MIB Objects**

```
healthSliceTable
  healthSliceSlot
  healthSliceSlice
  healthSliceMemoryLatest

```

---

## show health fabric

Displays the health statistics of a fabric for a particular slot or a range of slots.

**show health fabric** *slot 1[-slot2]*

---

### Syntax Definitions

*slot* A specific physical slot number for which fabric statistics are to be displayed (e.g., 3).

*slot2* Last fabric slot number in a range of slots you want to display.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show health fabric 3
* - current value exceeds threshold
```

```
Slot 03
Fabric          Limit  Curr  1 Min  1 Hr  1 Hr
                +-----+-----+-----+-----+-----+
                |         |         |         |         |         |
Receive
  Primary       80      00     00     00     00
  Secondary     80      00     00     00     00
Transmit/Receive
  Primary       80      00     00     00     00
  Secondary     80      00     00     00     00
```

### output definitions

---

<b>Slot</b>	The physical slot number for the corresponding fabric.
<b>Limit</b>	Currently configured device threshold levels (percentage of total available bandwidth or temperature measured in degrees Celsius).
<b>Curr</b>	Current device bandwidth usage or temperature (measured in degrees Celsius).
<b>1 Min Avg</b>	Average device bandwidth usage or temperature (measured in degrees Celsius) over a 1-minute period.

*output definitions (continued)*

---

<b>1 Hr Avg</b>	Average device bandwidth usage or temperature (measured in degrees Celsius) over a 1-hour period.
<b>1 Hr Max</b>	Maximum device bandwidth usage or temperature (measured in degrees Celsius) over a 1-hour period (i.e., the maximum of the 1 minute averages).

# 53 CMM Commands

The Chassis Management Module (CMM) CLI commands allow you to manage switch software files in the working directory, the certified directory, and the running configuration.

MIB information for the CMM commands is as follows:

*Filename:* AlcatelIND1Chassis.mib  
*Module:* ALCATEL-IND1-CHASSIS-MIB

*Filename:* AlcatelIND1ConfigMgr.mib  
*Module:* ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS

*Filename:* AlcatelIND1System\_mib  
*Module:* ALCATEL-IND1-SYSTEM-MIB

A summary of available commands is listed here:

---

**reload**  
**reload working**  
**reload issu**  
**write memory**  
**write memory flash-synchro**  
**copy working certified**  
**copy flash-synchro**  
**takeover**  
**show running-directory**  
**show reload**  
**show microcode**  
**show microcode history**  
**show microcode issu**  
**usb**  
**usb auto-copy**  
**usb disaster-recovery**  
**mount**  
**umount**  
**show usb statistics**

---

## reload

Reboots the CMM to its startup software configuration.

**reload** [**primary** | **secondary**] [**with-fabric**] [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* | *day month*]]

**reload** [**primary** | **secondary**] [**with-fabric**] **cancel**

---

### Syntax Definitions

<b>primary</b>   <b>secondary</b>	Reboot the primary or secondary CMM to its startup software configuration. If the primary CMM is already running the startup version, a primary reboot will result in a secondary takeover.
<b>with-fabric</b>	Performs a complete CMM reload. This parameter is available only on OmniSwitch chassis-based series switches.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the software to take effect in the specified minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload will take place on the following day.
<i>month day</i>   <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.
<b>cancel</b>	Cancels a pending time delayed reboot.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command causes the specified CMM to reboot. If no CMM is specified, the primary CMM reboots.
- The CPM, CFM and CPU of CMM can be reset independently.
- If a reload command is issued and the local/remote fabric module is in up state, only the CPM will be reset.
- If a reload command is issued and the local/remote fabric module is in a down state, then the complete CMM will be reloaded.

- If a reload command is issued, and another reload is currently scheduled, a message appears informing the user of the next reload time and asks for confirmation to change to the new reload time.
- If the switch has a redundant CMM and the primary CMM is rebooted, the switch will fail over to the secondary CMM. For more information on CMM failover, see “Managing CMM Directories” in the *OmniSwitch AOS Release 6 Switch Management Guide*.
- If the switch is part of a stack with three or more switches, the next switch in “idle” mode becomes the secondary CMM, and the original primary CMM becomes “idle.” For more information on stacks, see the appropriate *Hardware Users Guide*. The **cancel** keyword stops a pending reboot.
- This command can also be used on the secondary CMM.

## Examples

```
-> reload
-> reload primary
-> reload primary with-fabric
-> reload primary in 15:25
-> reload primary at 15:25 august 10
-> reload primary at 15:25 10 august
```

## Release History

Release 6.1; command was introduced.

## Related Commands

### [reload working](#)

Immediate primary CMM reboot to the working software configuration without secondary CMM takeover.

## MIB Objects

```
chasEntPhysicalTable
  csEntPhysicalIndex
  chasEntPhysAdminStatus
chasControlRedundantTable
  chasControlDelayedRebootTimer
```

---

## reload working

Immediately reboots the primary CMM from the working directory. There is no CMM fail over during this reboot, causing a loss of switch functionality during the reboot. All NIs reboot as well, including the secondary CMM.

**reload working** {**rollback-timeout** *minutes* / **no rollback-timeout**} [**in** [*hours:*] *minutes* | **at** *hour:minute*]

---

### Syntax Definitions

<b>rollback-timeout</b> <i>minutes</i>	Sets a timeout period, in minutes. The switch immediately reboots from the working directory and then at the end of this time period, automatically reboots again from the certified directory. The range is 1–15.
<b>no rollback-timeout</b>	Specifies no timeout to rollback. If the command is issued with this keyword, then the switch will continue to run from the working directory until manually rebooted.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the working directory to take effect in the specified minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload of the working directory to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload will take place on the following day.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is used to reload the primary CMM from the working directory as opposed to the certified CMM. The working directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.
- The **in** or **at** keywords allow you to schedule a working reload sometime in the future. A schedule working reboot is called an **activate**.
- If a reload or an immediate working reload is initiated before a scheduled activate is enacted, a message appears displaying the number of seconds until the scheduled activate and if it should be overridden.
- If a timeout is set, the switch reboots again after the set number of minutes, from the certified directory. The reboot can be halted by issuing a cancel order as described in the **reload** command.

- If the switch is a part of a stack, using this command synchronizes the working directories of all the switches in the stack to the working directory of the primary CMM switch.

### Examples

```
-> reload working rollback-timeout 5
-> reload working no rollback-timeout
-> reload working no rollback-timeout in 50
-> reload working rollback-timeout 10 at 12:50
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**reload** Reboots the CMM to its startup software configuration.

### MIB Objects

```
chasControlModuleTable
  csEntPhysicalIndex
  chasControlActivateTimeout
```

---

## reload issu

Upgrades the system with the images stored in the /flash/issu directory with minimal disruption to the data traffic.

**reload issu** [*in* [*hours:*] *minutes* | *at* *hour:minute*]

---

### Syntax Definitions

<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the primary CMM to take effect in the specified minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload of the primary CMM to take place at the specified time using a 24-hour clock.

### Defaults

By default, the switch starts copying the image files to the working directory of the primary CMM immediately after issuing the command if no time delay is specified.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- The switch must be running an In-Service Software Upgrade (ISSU) capable build, which is only those builds that are part of the ‘S##’ branch (for example, 6.4.1.###.S01).
- The primary and secondary CMMs should be fully synchronized, certified, redundant, and running an ISSU capable ‘S##’ build, such as 6.4.1.123.S01, to invoke the ISSU feature.
- Before using this command, create an ISSU directory on the switch flash (for example, /flash/issu), then download the “S###” image files into this directory.
- Image files used for the upgrade must be within the same ‘S##’ branch to perform an ISSU upgrade. For example, 6.4.1.###.S02 image files cannot be used to upgrade a switch running 6.4.1.###.S01.
- There are four image files that are ISSU capable: **Jbase.img**, **Jsecu.img**, **Jadvrout.img** and **Jos.img**.
- Admin user privileges are required to invoke the ISSU feature.
- A minimum of 25MB flash space is required on the switch to accommodate all the image files needed for the upgrade.
- Once the images are upgraded, use the **copy working certified flash-synchro** command to restore redundancy between the Primary and Secondary CMM.

### Examples

```
-> reload issu
-> reload issu in 45
-> reload issu at 09:25
```

## Release History

Release 6.4.1; command was introduced

## Related Commands

<a href="#">reload</a>	Reboots the CMM to its startup software configuration
<a href="#">reload working</a>	Immediate primary CMM reboot to the working software configuration without secondary CMM takeover.
<a href="#">show microcode issu</a>	Displays the microcode version information of the images in the ISSU directory.

## MIB Objects

```
chasControlModuleTable
  chasControlVersionMngt
  chasGlobalcontrolDelayedActivatetimer
```

---

## copy running-config working

Copies the running configuration (RAM) to the working directory.

[configure] copy running-config working

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is used to copy the changes made using the CLI commands from the running configuration (RAM) to the working directory.
  - This command is only valid if the switch is running from the working directory. Use the [show running-directory](#) command to check from where the switch is running.
  - This command performs the same function as the [write memory](#) command.
- 

**Note.** The saved `boot.cfg` file will be overwritten if the [takeover](#) command is executed after the [write memory](#) commands, in an OmniSwitch set up with redundant CMMs.

---

### Examples

```
-> configure copy running-config working
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### [write memory](#)

Copies the running primary RAM version of the CMM software to the working primary flash.

### [copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

## MIB Objects

chasControlModuleTable  
  csEntPhysicalIndex  
  chasControlVersionMngt

---

---

## write memory

Copies the running configuration (RAM) to the working directory.

**[configure] write memory**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is used to copy the changes made using the CLI commands from the running configuration (RAM) to the working directory.
- This command is only valid if the switch is running from the working directory. Use the [show running-directory](#) command to check from where the switch is running.

---

**Note.** On an OmniSwitch set up with redundant CMMs, the saved **boot.cfg** file will be overwritten if the [takeover](#) command is executed after the **write memory** command.

---

### Examples

```
-> configure write memory
-> write memory
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

### MIB Objects

```
configManager
  configWriteMemory
```

---

## write memory flash-synchro

Copies the running configuration (RAM) to the working directory, certifies the primary CMM and synchronizes the primary and secondary CMM.

**[configure] write memory flash-synchro**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is a combination of the ‘write memory’ and ‘copy working certified flash-synchro’ commands and does the following:
  - 1 Copies the running configuration (RAM) to the working directory.
  - 2 Overwrites the contents of the certified directory on the primary CMM with the contents of the working directory on the primary CMM.
  - 3 Synchronizes the primary and secondary CMMs.
- This command is only valid if the switch is running from the working directory. Use the [show running-directory](#) command to check from where the switch is running.

### Examples

```
-> write memory flash-synchro
```

### Release History

Release 6.3.4; command was introduced.

### Related Commands

[write memory](#)

Copies the running configuration (RAM) to the working directory.

[copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

## **MIB Objects**

configManager

configWriteMemory

---

## copy working certified

Copies the working directory version of the CMM software to the certified directory, on the primary CMM. This command also allows you to synchronize the primary and secondary CMMs.

[configure] copy working certified [flash-synchro]

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is used to overwrite the contents of the certified directory with the contents of the working directory. This should only be done if the contents of the working directory have been verified as the best version of the CMM files.
- The **flash-synchro** keyword, when used with the **copy certified working** command, synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM certified directory with the contents of the primary CMM certified directory. If the switch is part of a stack, all switches in the stack are updated with the primary CMM files.
- In order for this command to work, the amount of free space in flash must equal the size of the files being copied. If there isn't enough free space, the copy attempt will fail and an error message is generated. Only image files, the boot.cfg file, and the certs.pem file should be kept in the working directory.
- This command will not work if the switch is running from the certified directory. To view where the switch is running from, see the [show running-directory](#) command.

### Examples

```
-> copy working certified  
-> copy working certified flash-synchro
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### **copy working certified**

Copies the running primary RAM version of the CMM software to the working primary flash. Or copy the startup primary flash version of the CMM software to the working primary flash.

### **copy flash-synchro**

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

## MIB Objects

```
chasControlModuleTable  
  csEntPhysicalIndex  
  chasControlVersionMngt
```

---

## copy flash-synchro

Copies the certified directory version of the primary CMM software to the certified directory of the secondary CMM.

[configure] copy flash-synchro

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command is used to synchronize the certified directories of the primary and secondary CMMs. The two CMMs must be in synchronization if a fail over occurs, otherwise switch performance is lost.
- If the switch is part of a stack, all switches in the stack are updated with the primary CMM files.

### Examples

```
-> copy flash-synchro  
-> configure copy flash-synchro
```

### Release History

Release 6.1; command was introduced.

### Related Commands

#### [copy working certified](#)

Copies the working primary flash version of the CMM software to certified primary flash. Or copies the working primary flash version of the CMM software to startup secondary flash.

### MIB Objects

```
chasControlModuleTable  
  csEntPhysicalIndex  
  chasControlVersionMngt
```

---

## Examples

```
-> takeover  
-> takeover with-fabric
```

## Release History

Release 6.1; command was introduced.

## Related Command

**reload** Reboots the CMM to its startup software configuration.

## MIB Objects

```
chasEntPhysicalTable  
  csEntPhysicalIndex  
  chasEntPhysAdminStatus
```

---

## show running-directory

Shows the directory from where the switch was booted.

**show running-directory**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Once a switch has booted and is running, it will run either from the working or certified directory. If running from the certified, changes made to the running configuration using CLI commands cannot be saved. A switch must be running from the working directory in order to save the current running configuration.
- This command can also be used on the secondary CMM.

### Examples

The following is an example of the display on OmniSwitch 6850 Series switches:

```
-> show running-directory
```

```
CONFIGURATION STATUS
  Running CMM           : PRIMARY,
  CMM Mode              : DUAL CMMs,
  Current CMM Slot     : 1,
  Running configuration : WORKING,
  Certify/Restore Status : CERTIFY NEEDED
SYNCHRONIZATION STATUS
  Flash Between CMMs   : SYNCHRONIZED,
  Running Configuration : NOT AVAILABLE,
  Stacks Reload on Takeover: ALL STACKs (SW Activation)
```

#### *output definitions*

---

<b>Running CMM</b>	The CMM currently controlling the switch, either PRIMARY or SECONDARY.
<b>CMM Mode</b>	Displays whether the primary and secondary CMMs are synchronized. In the case that there is no secondary CMM, MONO-CMM-CHASSIS is shown.
<b>Current CMM Slot</b>	The slot number of the primary CMM.

*output definitions (continued)*

<b>Running Configuration</b>	Where the switch is running from, either WORKING or CERTIFIED. A switch running from the certified directory will not be able to manipulate files in the directory structure.
<b>Certify/Restore Status</b>	Indicates if the CM has been certified (i.e., the Working directory matches the Certified directory).
<b>Flash Between CMMs</b>	Displays whether the Working and Certified directories are the same.
<b>NIs Reload On Takeover Stacks Reload on Takeover</b>	Displays how many Network Interface (NI) modules or switches in a stack will be reloaded in the event of a management module takeover. Options include NONE, ALL, or a list of specific NIs. If there are <i>no</i> unsaved configuration changes <i>and</i> the flash directories on both the primary and secondary management modules have been synchronized via the <b>copy flash-synchro</b> command, no NIs will be reloaded if a management module takeover occurs. As a result, data flow is not interrupted on the NIs during the takeover. If a configuration change is made to one or more NI modules (e.g., a VLAN is configured on several different interfaces), and <i>the changes are not saved via the write memory</i> command, the corresponding NIs will automatically reload if a management module takeover occurs. Data flow on the affected NIs will be interrupted until the reload is complete. Note that the NIs will reload whether or not the flash synchronization status shows SYNCHRONIZED. This is because the unsaved changes have occurred in the running configuration (i.e., RAM), and have not been written to the flash directory's configuration file. In this case, a list of only the affected NIs displays in the table output (e.g., 1 6 9 12). If the flash directories on the primary and secondary management modules are <i>not synchronized</i> (e.g., a <b>copy flash-synchro</b> command has not been issued recently), all NIs will be reloaded automatically if a management module takeover occurs. Data flow will be interrupted on all NIs until the reload is complete.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>reload</b>	Reboots the CMM to its startup software configuration.
<b>write memory</b>	Copies the running configuration (RAM) to the working directory.
<b>copy flash-synchro</b>	Copies the certified directory version of the primary CMM software to the certified directory of the secondary CMM.

**MIB Objects**

```
chasControlModuleTable
  chasControlRunningVersion
  chasControlActivateTimeout
  chasControlVersionMngt
  chasControlDelayedActivateTimer
  chasControlCertifyStatus
```

`chasControlSynchronizationStatus`

---

## show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

**show reload** [status]

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot will occur.
- If the **reload working** command was used, and a rollback timeout was set, the time the rollback will occur is shown using the **show reload** command.
- This command can also be used on the secondary CMM.

### Examples

```
-> show reload status
Primary   Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**reload** Reboots the primary or secondary CMM to its startup software configuration.

**reload working** Immediate primary CMM reboot to the working software configuration without secondary CMM takeover.

## show microcode

Displays microcode versions installed on the switch.

**show microcode** [**working** | **certified** | **loaded**]

---

### Syntax Definitions

<b>working</b>	Specifies the switch's working directory; only microcode information from the working directory will be displayed.
<b>certified</b>	Specifies the switch's certified directory; only microcode information from the certified directory will be displayed.
<b>loaded</b>	Specifies that only loaded (i.e., currently-active) microcode versions will be displayed. Idle microcode versions will not be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If no additional parameters are entered (i.e., **working**, **certified**, or **loaded**), microcode information for the running configuration will be displayed.
- This command can also be used on the secondary CMM.

### Examples

```
-> show microcode
Package           Release           Size           Description
-----+-----+-----+-----
Jbase.img         6.1.1.403.R01    10520989      Alcatel-Lucent Base Software
Jos.img           6.1.1.403.R01    1828255       Alcatel-Lucent OS
Jadvrout.img      6.1.1.403.R01    1359435       Alcatel-Lucent Advanced Routing
```

*output definitions*

<b>Package</b>	File name.
<b>Release</b>	Version number.
<b>Size</b>	File size.
<b>Description</b>	File description.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[show microcode history](#) Displays the archive history for microcode versions installed on the switch.

---

## show microcode history

Displays the archive history for microcode versions installed on the switch.

**show microcode history** [**working** | **certified**]

---

### Syntax Definitions

**working** The history for the working directory's microcode will be displayed.

**certified** The history for the certified directory's microcode will be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6850, 6850E, 6855, 9000E

### Usage Guidelines

If no additional parameters are entered (i.e., **working** or **certified**), the microcode history for the running directory will be displayed.

### Examples

```
-> show microcode history
Archive Created 8/27/05 23:45:00
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show microcode](#) Displays microcode versions installed on the switch.

---

## show microcode issu

Displays the microcode version information of the images in the ISSU directory of the flash memory.

**show microcode issu**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

N/A

### Examples

```
-> show microcode issu
  Package           Release           Size           Description
-----+-----+-----+-----
jos.img            6.4.1.733.S01    1854193        Alcatel-Lucent OS

Release 6.4.1; command was introduced.

## Related Commands

<a href="#">reload issu</a>	Upgrades the working directory of the primary CMM with minimal disruption to the data traffic.
<a href="#">show microcode</a>	Displays microcode versions installed on the switch.
<a href="#">show microcode history</a>	Displays the archive history for microcode versions installed on the switch.

## MIB Objects

systemMicrocodeTable  
  systemMicrocodeEntry

---

## usb

Enables access to the device connected to the USB port.

**usb {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

---

parameter	default
enable / disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Must use an Alcatel-Lucent certified USB device.
- If a Alcatel-Lucent certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

### Examples

```
-> usb enable
-> cp /flash/working/boot.cfg /uflash/boot.cfg
-> ls /uflash
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

#### MIB Objects

##### usb auto-copy

Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected

```
systemServices
  systemServicesUsbEnable
```

---

## usb auto-copy

Upgrades the image files from the USB device to the */flash/working* directory on the switch immediately after the USB device is connected.

**usb auto-copy {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/6850/working*, */uflash/6855/working*, */uflash/6400/working* or */uflash/9000E/working* directory, based upon the platform performing the operation, to be copied to the */flash/working* directory and then reboot the switch.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.

### Examples

```
-> usb auto-copy enable  
-> usb auto-copy disable
```

### Release History

Release 6.4.3; command was introduced.

## Related Commands

**usb**

Enables access to the device connected to the USB interface.

## MIB Objects

systemServices

systemServicesUsbAutoCopyEnable

---

## usb disaster-recovery

Enables the disaster-recovery access to the USB device connected to the USB port when the switch is unable to boot properly.

**usb disaster-recovery** {enable | disable}

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable / disable	enable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The USB device must contain the proper file structure and image files mentioned below.
- If miniboot is unable to load AOS from the os.img file then the disaster-recovery operation will begin. The disaster recovery operation will format the switch flash, copy all of the files from the */uflash/6850/certified*, */uflash/6855/certified*, */uflash/6400/certified*, or */uflash/9000E/certified* directory, based upon the platform performing the operation, to the */flash/certified* directory and reboot the switch.
- Disaster recovery should be run on a standalone unit so that it does not affect any other units in a stack.
- A minimum 6.4.3 version of uboot/miniboot is required.

### Examples

```
-> usb disaster-recovery enable
-> usb disaster-recovery disable
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

**usb** Enables access to the device connected to the USB interface.

### MIB Objects

```
systemServices
  systemServicesUsbDisasterRecoveryEnable
```

---

## umount

Unmounts the /uflash file system from AOS.

**umount /uflash**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command unmounts the USB drive and should be used prior to unplugging the USB drive to prevent possible data corruption.

### Examples

```
-> umount /uflash
```

### Release History

Release 6.4.3; command was introduced.

### Related Commands

[mount](#) Mounts the /uflash file system from AOS.

### MIB Objects

```
systemServicesAction  
  systemServicesArg1
```

---

## show usb statistics

Displays the status USB setting and features.

**show usb statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show usb statistics
USB:                               Disabled
USB auto-copy:                     Enabled
USB disaster-recovery:             Disabled
/uflash is not mounted
```

### *output definitions*

---

<b>USB</b>	Status of USB device interface.
<b>USB auto-copy</b>	Status of USB auto-copy feature.
<b>USB disaster-recovery</b>	Status of USB auto-copy feature.
<b>/uflash</b>	Whether the USB device is mounted or unmounted.

---

### Release History

Release 6.4.3; command was introduced.

### Related Commands

<b>usb</b>	Enables access to the device connected to the USB interface.
<b>usb auto-copy</b>	Allows backup files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected.
<b>usb disaster-recovery</b>	Enables the disaster-recovery access to the USB device connected to the interface.

# 54 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

---

**Additional Information.** Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

---

MIB information for the Chassis Management and Monitoring commands is as follows:

*Filename:* AlcatelIND1Chassis.mib  
*Module:* ALCATEL-IND1-CHASSIS-MIB

*Filename:* AlcatelIND1System.MIB  
*Module:* ALCATEL-IND1-SYSTEM-MIB

*Filename:* AlcatelIND1StackManager.MIB  
*Module:* ALCATEL-IND1-STACK-MANAGER-MIB

A summary of available commands is listed here:

---

<b>Management Commands</b>	<code>system contact</code> <code>system name</code> <code>system location</code> <code>system date</code> <code>system time</code> <code>system time-and-date synchro</code> <code>system timezone</code> <code>system daylight savings time</code> <code>update</code> <code>update lanpower</code> <code>reload ni</code> <code>reload all</code> <code>reload pass-through</code> <code>power ni</code> <code>temp-threshold</code> <code>stack set slot</code> <code>stack clear slot</code> <code>hash-control</code>
<b>Monitoring Commands</b>	<code>show system</code> <code>show hardware info</code> <code>show chassis</code> <code>show cmm</code> <code>show ni</code> <code>show module</code> <code>show module long</code> <code>show module status</code> <code>show power</code> <code>show fan</code> <code>show temperature</code> <code>show stack topology</code> <code>show stack status</code> <code>show hash-control</code>
<b>Licensing Commands</b>	<code>license apply</code> <code>show license info</code> <code>show license file</code>

---

## system contact

Specifies the switch's administrative contact. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

**system contact** *text\_string*

---

### Syntax Definitions

*text\_string*

The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **"Jean Smith Ext. 477 jsmith@company.com"**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"  
-> system contact engineering-test@company.com
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">system name</a>	Modifies the switch's current system name.
<a href="#">system location</a>	Specifies the switch's current physical location.
<a href="#">show system</a>	Displays the basic system information for the switch.

### MIB Objects

system  
    systemContact

---

## system name

Modifies the switch's current system name. The system name can be any simple, user-defined text description for the switch.

**system name** *text\_string*

---

### Syntax Definitions

*text\_string*

The new system name. The system name can range from 1 to 255 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, "**OmniSwitch 6850**".

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> system name "OmniSwitch 6850"  
-> system name OS-6850
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[system contact](#)

Specifies the switch's administrative contact (e.g., an individual or a department).

[system location](#)

Specifies the switch's current physical location.

[show system](#)

Displays the basic system information for the switch.

### MIB Objects

system

systemName

---

## system location

Specifies the switch's current physical location. If you need to determine the switch's location from a remote site, entering a system location can be very useful.

**system location** *text\_string*

---

### Syntax Definitions

*text\_string*

The switch's physical location. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **"NMS Test Lab"**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

N/A

### Examples

```
-> system location "NMS Test Lab"  
-> system location TestLab
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- |                                |                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------|
| <a href="#">system contact</a> | Specifies the switch's administrative contact (e.g., an individual or a department). |
| <a href="#">system name</a>    | Modifies the switch's current system name.                                           |
| <a href="#">show system</a>    | Displays the basic system information for the switch.                                |

### MIB Objects

```
system  
  systemLocation
```

---

## system date

Displays or modifies the switch's current system date.

**system date** [*mm/dd/yyyy*]

---

### Syntax Definitions

*mm/dd/yyyy*

The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If you do not specify a new system date in the command line, the current system date will be displayed.
- For more information on setting time zone parameters (e.g., Daylight Savings Time), refer to the [system timezone command on page 54-9](#).

### Examples

```
-> system date 08/08/2005
-> system date
08/08/2005
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[system time](#)

Displays or modifies the switch's current system time.

[system timezone](#)

Displays or modifies the time zone for the switch.

### MIB Objects

systemServices

systemServicesDate

---

## system time

Displays or modifies the switch's current system time.

**system time** [*hh:mm:ss*]

---

### Syntax Definitions

*hh:mm:ss*

The new time being specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

If you do not specify a new system time in the command line, the current system time will be displayed.

### Examples

```
-> system time 14:30:00
-> system time
15:48:08
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[system date](#)

Displays or modifies the switch's current system date.

[system timezone](#)

Displays or modifies the time zone for the switch.

### MIB Objects

systemServices

systemServicesTime

---

## system time-and-date synchro

Synchronizes the time and date settings between primary and secondary CMMs.

**system time-and-date synchro**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- The **system time-and-date synchro** command applies only to switches with redundant CMM configurations.
- Synchronizing date and time settings is an important step in providing effective CMM failover for switches in redundant configurations. Be sure to periodically synchronize the primary and secondary CMMs using this command.
- For detailed redundancy information on OmniSwitch chassis-based switches refer to the “Chassis Management Module (CMM)” chapter in the *Hardware Users Guide* and “Managing CMM Directory Content” in the *OmniSwitch AOS Release 6 Switch Management Guide*. For stackable switches, refer to “Managing Stacks” in addition to “Managing CMM Directory Content”.

### Examples

```
-> system time-and-date synchro
```

### Release History

Release 6.1; command was introduced.

### Related Commands

#### [copy flash-synchro](#)

Copies the certified directory version of the primary CMM software to the certified directory of the secondary CMM.

### MIB Objects

systemServices

---

## system timezone

Displays or modifies the time zone for the switch.

**system timezone** [*timezone\_abbrev* | *offset\_value* | *time\_notation*]

---

### Syntax Definitions

*timezone\_abbrev*

Specifies a time zone for the switch and sets the system clock to run on UTC. Refer to the table below for a list of supported time zone abbreviations. If you specify a time zone abbreviation, the hours offset from UTC will be automatically calculated by the switch.

*offset\_value*

Specifies the number of hours offset from UTC. Values may range from -13 through +12. The switch automatically enables UTC. However, if you do not want your system clock to run on UTC, simply enter the offset +0 for the system time zone. This sets UTC to run on local time.

*time\_notation*

Specifies a non-integer time-notation offset for areas that are offset from UTC by increments of 15, 30, or 45 minutes (e.g., 05:30).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- To display the current time zone for the switch, enter the syntax **system timezone**.
- When Daylight Saving Time (DST)—also referred to as *summertime*—is enabled, the clock automatically sets up default DST parameters for the local time zone.
- Refer to the table below for a list of supported time zone abbreviations.

Abbreviation	Name	Hours from UTC	DST Start	DST End	DST Change

-> system timezone -7
-> system timezone +0
-> system timezone +12
-> system timezone 12
-> system timezone 05:30
-> system timezone 00:00 hour from UTC
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">system date</a>	Displays or modifies the switch's current system date.
<a href="#">system time</a>	Displays or modifies the switch's current system time.

## MIB Objects

```
systemServices
  systemServicesTimezone
  systemServicesTimezoneStartWeek
  systemServicesTimezoneStartDay
  systemServicesTimezoneStartMonth
  systemServicesTimezoneStartTime
  systemServicesTimezoneOffset
  systemServicesTimezoneEndWeek
  systemServicesTimezoneEndDay
  systemServicesTimezoneEndMonth
  systemServicesTimezoneEndTime
  systemServicesEnabledDST
```

---

## system daylight savings time

Enables or disabled Daylight Savings Time (DST) on the switch.

```
system daylight savings time [{enable | disable} | start {week} {day} in {month} at {hh:mm} end {week}
{day} in {month} at {hh:mm} [by min]]
```

---

### Syntax Definitions

<b>enable</b>	Enables DST. The switch clock will automatically adjust for DST as specified by one of the default time zone or by the specifications set with the system daylight savings time start command.
<b>disable</b>	Disables DST. The switch clock will not change for DST.
<b>start</b>	For non-default time zone, you can specify the <i>week</i> , <i>day</i> , <i>month</i> , and <i>hour</i> for DST to start. (You must also specify the <i>week</i> , <i>day</i> , <i>month</i> , and <i>hour</i> for DST to end.)
<b>end</b>	For non-default time zone, if you specify the week, day, month, and hour for DST to end, you must also specify the <i>week</i> , <i>day</i> , <i>month</i> , and <i>hour</i> for DST to end.
<i>week</i>	Indicate whether first, second, third, fourth, or last.
<i>day</i>	Indicate whether Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, or Saturday.
<i>month</i>	Indicate whether January, February, March, April, May, June, July, August, September, October, November, or December.
<i>hh:mm</i>	Use two digits between 00 and 23 to indicate hour. Use two digits between 00 and 59 to indicate minutes. Use as for a 24 hour clock.
<b>by min</b>	Use two digits to indicate the number of minutes your switch clock will be offset for DST. The range is from 00 to 50.

### Defaults

- By default, DST is disabled.
- Unless a different value is set with the **by** syntax, the system clock will offset one hour for DST.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- If your timezone shows a default value in the DST Start and DST End columns of the “Time Zone and DST Information Table” found in Chapter 2, “Managing System Files,” of the *OmniSwitch AOS Release 6 Switch Management Guide*, you do not need to set a start and end time. Your switch clock will automatically adjust for DST as shown in the table.

- You must enable DST whether you use a default DST timezone or if you specify your offset using the **daylight savings time start** syntax.
- Setting the start and end date and time for DST is only supported when a custom timezone is configured.

## Examples

```
-> system daylight savings time enable
-> system daylight savings time disable
-> system daylight savings time start first Sunday in May at 23:00 end last Sunday
in November at 10:00
-> system daylight savings time start first Sunday in May at 23:00 end last Sunday
in November at 10:00 by 45
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">system time</a>	Displays or modifies the switch's current system time.
<a href="#">system timezone</a>	Displays or modifies the timezone for the switch.

---

## update

Updates the versions of Uboot, FPGA, BootROM, or Miniboot. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

**update** {uboot {cmm | ni {all | slot}} uboot-miniboot | fpga cmm | bootrom {all | slot} | [default | backup] miniboot [all | slot] }

---

### Syntax Definitions

<b>uboot</b>	Updates the uboot version.
<b>cmm</b>	Specifies that the update is performed for the Chassis Management Module (CMM). <i>Not supported on OmniSwitch 6850 switches</i>
<b>ni</b>	Specifies that the update is performed for the Network Interface (NI) Module.
<b>all</b>	Specifies that the update is performed for all slots within a chassis or all switches within a stack.
<i>slot</i>	Specifies the number of the NI module within a chassis or the switch number within a stack for which the update is performed.
<b>uboot-miniboot</b>	Updates the uboot <i>and</i> the miniboot version on all available slots within a chassis or on all available switches within a stack.
<b>fpga</b>	Updates the FPGA version. <i>Not supported on OmniSwitch 6850 switches.</i>
<b>miniboot</b>	Updates the miniboot version.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- On OmniSwitch chassis-based switches, the *slot* parameter is not allowed with the **cmm** parameter.
- Note that when performing an update, it is important that the correct update file is used and that the file is located in the **/flash** directory on the switch. Specifying the wrong file may impact the operation of the switch.
- A different update file is required depending on the type of switch and the type of update. The following table provides a list of the required update files:

OmniSwitch	Update Type	Update File
6400	Uboot	kuboot.bin
	Miniboot	gminiboot.uboot

OmniSwitch	Update Type	Update File
	Uboot and Miniboot	kuboot.bin gminiboot.uboot
	FPGA	Gfpga.upgrade_kit
6850	Uboot	kuboot.bin
	Uboot and Miniboot	kuboot.bin kminiboot.uboot
	Miniboot	kminiboot.uboot
6855	Uboot	kuboot.bin
	Miniboot	k2lminiboot.uboot
	Uboot and Miniboot	kuboot.bin k2lminiboot.uboot
	FPGA	K2lfpga.upgrade_kit
9000E	Uboot	uboot.bin
	Uboot and Miniboot	uboot.bin miniboot.uboot
	FPGA	Jfpga.upgrade_kit
	Miniboot	miniboot.uboot

## Examples

```
OS6850-> update uboot 3
OS6850-> update uboot-miniboot
OS6850-> update miniboot all
```

```
OS6855-> update uboot 1
OS6855-> update uboot-miniboot
OS6855-> update miniboot all
```

```
OS6400-> update uboot 2
OS6400-> update uboot-miniboot
OS6400-> update fpga cmm
OS6400-> update miniboot 3
```

## Release History

Release 6.1.1; command was introduced.

Release 6.1.2; *slot* and **bootrom** parameters were added.

Release 6.1.3; **uboot** support for OmniSwitch 6850 added; **uboot-miniboot** parameter added, *file\_path* parameter deprecated.

## Related Commands

### [reload all](#)

Reloads all the NIs and CMMs in a chassis.

systemServices

    systemServicesArg1

    systemServicesAction

---

## update lanpower

Uploads new firmware to the POE controller. Please contact your Alcatel-Lucent support representative before using this command.

**update lanpower** {*lanpower\_num* | **all**}

---

### Syntax Definitions

<i>lanpower_num</i>	The POE unit number to update.
<b>all</b>	Updates all POE units in the switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

N/A

### Examples

```
-> update lanpower 3  
-> update lanpower all
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

<a href="#">update</a>	Updates the versions of Uboot, FPGA, BootROM, or Miniboot.
------------------------	------------------------------------------------------------

---

## reload ni

Reloads (i.e., reboots) a specified Network Interface (NI) module.

**reload ni** [*slot*] *number*

---

### Syntax Definitions

<b>slot</b>	Optional command syntax.
<i>number</i>	Slot (i.e., switch) number within a stack that represents the NI module to be reloaded.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- On OmniSwitch chassis based switches, the **reload ni** command reboots only the specified NI. Other modules installed in the chassis, including primary and secondary CMMs, are not affected
- On OmniSwitch stackable series switches, the **reload ni** command reboots only the specified switch. However, if you use this command on a switch that has a primary CMM role in a stack, it will no longer be primary. Instead, it will be secondary in a two-switch stack and idle in a stack consisting of three or more switches.

### Examples

```
-> reload ni slot 2
-> reload ni 2
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>reload all</b>	Reloads all the NIs and CMMs in a chassis.
<b>power ni</b>	Turns the power on or off for a specified Network Interface (NI) module.
<b>show ni</b>	Shows the hardware information and the current status for Network Interface (NI) modules currently running in the chassis.

## MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  reset
```

---

## reload all

Reloads (i.e., reboots) all the Network Interfaces (NIs) and Chassis Management Module (CMMs) in an OmniSwitch chassis, a standalone switch, or all the switches in an OmniSwitch stack.

**reload all** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* / *day month*]]

**reload all cancel**

---

### Syntax Definitions

**in** [*hours:*] *minutes*

Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.

**at** *hour:minute*

Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload will take place on the following day.

*month day* / *day month*

The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.

**cancel**

Cancels a pending time delayed reload.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

N/A

### Examples

```
-> reload all
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>reload ni</b>	Reloads a specific NI module.
<b>power ni</b>	Turns the power on or off for a specified Network Interface (NI) module.
<b>show ni</b>	Shows the hardware information and current status for Network Interface (NI) modules currently running in the chassis.

## MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  reset
```

---

## reload pass-through

Reloads (i.e., reboots) a switch in a stackable configuration which has been forced into the pass-through mode. The pass-through mode is a state in which a switch has been assigned a slot number that is not available in the current stacked configuration. When a switch is in the pass-through mode, its Ethernet ports are brought down (i.e, they cannot pass traffic). However, its stacking ports are fully functional and can pass traffic through to other switches in the stack; in this way, pass-through mode provides a mechanism to prevent the stack ring from being broken.

---

**Note.** If a switch is forced into the pass-through mode, the rest of the virtual chassis (i.e., stack) will not be disrupted. Any elements in the stack *not* operating in pass-through mode continue to operate normally.

---

**reload pass-through** *slot-number*

---

### Syntax Definitions

*slot-number*

The virtual chassis slot number of the switch currently in the pass-through mode (1001–1008). For more information on pass-through slot numbering, refer to the “Usage Guidelines” section below.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- Switches in the pass-through mode are given distinct slot numbers. These slot numbers are *not* related to their position in the stack. Instead, they are assigned the prefix “100,” followed by the numerical order in which they were forced into pass-through. In other words, if only one switch in a stack is forced into the pass-through mode, it is given the slot number 1001. If multiple switches in a stack are forced into pass-through, the first switch in pass-through is given the slot number 1001, the second switch is given the slot number 1002, the third switch is given the slot number 1003, etc.
- Before issuing the **reload pass-through** command, be sure that the corresponding switch has been given a unique *saved slot* number. The saved slot number is the slot number the switch will assume after it has been rebooted. If the saved slot number is not unique, the switch will simply return to pass-through mode. To view the current and saved slot numbers for all switches in a stack, use the [show stack topology](#) command. To assign a unique saved slot number to a switch before rebooting, use the [stack set slot](#) command.

### Examples

```
-> reload pass-through 1001
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show stack topology](#)

Displays the current operating topology of switches within a stack.

[stack set slot](#)

Assigns a new saved slot number to a switch in a stacked configuration.

## MIB Objects

alaStackMgrChassisTable

    alaStackMgrSlotNINumber

    alaStackMgrCommandAction

    reloadPassThru

---

## power ni

Turns the power on or off for a specified Network Interface (NI) module.

**power ni** [slot] *slot-number*

**no power ni** [slot] *slot-number*

---

### Syntax Definitions

<b>slot</b>	Optional command syntax.
<i>slot-number</i>	The chassis slot number containing the NI module being powered on or off.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use the **no** form of this command to power off an NI module.
- This command is not supported on OmniSwitch stackable switches.

### Examples

```
-> no power ni 1  
-> power ni 1
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">reload ni</a>	Reloads (i.e., reboots) a specified Network Interface (NI) module.
<a href="#">show ni</a>	Shows the hardware information and current status for Network Interface (NI) modules currently running in the chassis.

### MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  powerOn  
  powerOff
```

---

## temp-threshold

Sets the warning temperature threshold for the switch.

**temp-threshold** *temp slot slot-number*

---

### Syntax Definitions

<i>temp</i>	The new temperature threshold value, in Celsius.
<i>slot-number</i>	The chassis slot number for which the warning temperature threshold is set. <i>This parameter is supported only on stackable switches.</i>

### Defaults

Refer to the appropriate *Hardware Users Guide* for platform specific temperature values.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- Use the [show temperature](#) command to display the current value for the temperature warning threshold.
- Do not use the [show health threshold](#) command as it does not display temperature threshold information.

### Examples

```
-> temp-threshold 45
-> temp-threshold 55 slot 2
```

### Release History

Release 6.1; command was introduced.

Release 6.1.5; **slot** parameter added.

### Related Commands

[show temperature](#) Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

### MIB Objects

```
chasChassisTable
  chasTempThreshold
```

---

## stack set slot

Sets the *saved slot* number or mode for stackable configuration switches. The saved slot number is the slot position the switch will assume following a reboot. The **stack set slot** command also provides syntax for immediately rebooting the corresponding switch.

**stack set slot** *slot-number* {**saved-mode** {**OS6850E** / **OS6850**} | **saved-slot** *slot-number* [**reload**]}

---

### Syntax Definitions

<i>slot-number</i>	The current slot position used by the switch (1–8; 1001–1008). Note that the valid slot number range also includes slot positions 1001 through 1008, reserved for switches in pass-through mode.
<b>OS6850E</b> / <b>OS6850</b>	The stacking mode of the OS6850E.
<i>saved-slot-number</i>	The new (i.e., saved) slot number (1–8). The saved slot number is the slot position the switch will assume following a reboot.
<b>reload</b>	Optional command syntax. When <b>reload</b> is entered in the command line, a confirmation prompt is issued. If the user approves the reload, the corresponding switch will be rebooted immediately and the new (i.e., saved) slot number will take effect when the switch comes back up—barring any pass-through mode conditions, such as duplicate slot numbers. This parameter is not supported when changing the mode.

### Defaults

parameter	default
<b>saved-mode</b> (Only supported on OS6850E Models)	6850

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- When the **stack set slot** command is issued, the new saved slot value is written to the **boot.slot.cfg** file. This file is located in the switch's /flash directory and is used when assigning a slot number for the switch during the boot process.
- In order to avoid duplicate slot numbers within the virtual chassis—which can force one or more switches into pass-through mode—be sure that the saved slot number being configured is not already being used by another switch in the stack. To view the saved slot numbers currently assigned, use the **show stack topology** command. For detailed information on assigning saved slot numbers, as well as information on pass-through mode, refer to the *Hardware Users Guide*.
- Changing the mode is only supported on OS6850E models. Mode must be set to **OS6580** when stacking with OS6580 switches and **OS6850E** when stacking with OS6855-U24X switches.

## Examples

```
-> stack set slot 2 saved-slot 3
-> stack set slot 1001 saved-slot 4 reload
-> stack set slot 1 saved-mode 6850E
```

## Release History

Release 6.1; command was introduced.

Release 6.4.4; **saved-mode** parameter was added.

## Related Commands

- |                                     |                                                                                                 |

```

---

## stack clear slot

Clears the current saved slot information for a switch within a stacked configuration. When the saved slot information has been cleared via the **stack clear slot** command, the corresponding switch will automatically be assigned a unique slot number following a reboot.

**stack clear slot** *slot-number*

---

### Syntax Definitions

*slot-number*

The current slot position used by the switch (1–8; 1001–1008). Note that the valid slot number range also includes slot positions 1001 through 1008, reserved for switches in pass-through mode.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- When the **stack clear slot** command is issued, the **boot.slot.cfg** file is immediately removed from the switch's /flash directory. As a result, no slot assignment information will be found the next time the switch is booted. Because the switch's slot will be considered *undefined* during the boot process, the switch is automatically assigned a unique slot number.
- Primary and secondary management modules *cannot* be forced into pass-through mode using the **stack clear slot** command. If the user attempts to force the secondary management module into pass-through, the secondary switch will reboot and assume idle status when it comes back up. Meanwhile, an idle switch within the stack is selected and rebooted; when it comes up it assumes the secondary role.

### Examples

```
-> stack clear slot 1002  
-> stack clear slot 3
```

### Release History

Release 6.1; command was introduced.

## show hardware info

Displays the current system hardware information. Includes CPU, flash, RAM, NVRAM battery, jumper positions, BootROM, and miniboot and FPGA information.

**show hardware info**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

This command may be used when logged into the switch that performs either as the primary or secondary CMM role in a stack.

### Examples

```
-> show hardware info
CPU Type                : PowerPC 8245,
Flash Manufacturer      : TOSHIBA,
Flash size              : 67108864 bytes (64 MB),
RAM Manufacturer        : (null),
RAM size                : 268435456 bytes (256 MB),
NVRAM Battery OK ?     : YES,
BootROM Version         : 6.1.2.20.R02 ,
Backup Miniboot Version : 6.1.2.20.R02,
Default Miniboot Version : 6.1.2.20.R02,
Product ID Register     : 54
Hardware Revision Register : 00
CPLD Revision Register  : 06
XFP Module ID           : 02
```

#### *output definitions*

---

<b>CPU Type</b>	The manufacturer and model number of the CPU used on the CMM.
<b>Flash Manufacturer</b>	The manufacturer of the flash memory used on the CMM.
<b>Flash size</b>	The total amount of flash memory (i.e., file space) on the CMM. This field specifies the total flash memory size only and does not indicate the amount of memory free or memory used.
<b>RAM Manufacturer</b>	The manufacturer of the RAM memory used on the CMM.
<b>RAM size</b>	The total amount of RAM memory on the CMM. This field specifies the total RAM memory only and does not indicate the amount of memory free or memory used.

*output definitions (continued)*

---

<b>NVRAM Battery OK</b>	The current status of the NVRAM battery. If the battery is OK, YES is displayed in this field. If the battery charge becomes low, NO is displayed in this field.
<b>BootROM Version</b>	The current BootROM version.
<b>Backup Miniboot Version</b>	The current backup miniboot version.
<b>Default Miniboot Version</b>	The current default miniboot version.
<b>Product ID Register</b>	The register number of the product ID.
<b>Hardware Revision Register</b>	The register number of the hardware revision.
<b>CPLD Revision Register</b>	The register number of the CPLD revision.
<b>XFP Module ID</b>	The ID number of the XFP module.

## show chassis

Displays the basic configuration and status information for the switch chassis.

**show chassis** [*number*]

---

### Syntax Definitions

*number* Specifies the slot (i.e., switch) number within a stack of switches. The valid range of slot numbers is 1–8, depending on the size of the stack.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- This command may be used when logged into either the primary or secondary CMM.
- The *number* parameter is not an option when using this command on a standalone switch or chassis.

### Examples

```
-> show chassis
```

```
Chassis 1
  Model Name:           OS6850-48,
  Description:          10/100/1000,
  Part Number:          902274-10,
  Hardware Revision:    002,
  Serial Number:        E23L9052,
  Manufacture Date:     JUN 09 2004,
  Admin Status:         POWER ON,
  Operational Status:   UP,
  Number Of Resets:     115
```

```
Chassis 2
  Model Name:           OS6850-48,

  Manufacture Date:    JUN 09 2004,
  Admin Status:        POWER ON,
  Operational Status:  UP,
  Number Of Resets:    115
```

### *output definitions*

---

<b>Model Name</b>	The factory-set model name for the switch. This field cannot be modified.
<b>Description</b>	The factory-set description for the switch. This field cannot be modified.
<b>Part Number</b>	The Alcatel-Lucent part number for the chassis.
<b>Hardware Revision</b>	The hardware revision level for the chassis.
<b>Serial Number</b>	The Alcatel-Lucent serial number for the chassis.
<b>Manufacture Date</b>	The date the chassis was manufactured.
<b>Admin Status</b>	The current power status of the chassis. Because chassis information is obtained from a running CMM, the value will always be POWER ON.
<b>Operational Status</b>	The current operational status of the chassis.
<b>Number of Resets</b>	The number of times the CMM has been reset (i.e., reloaded or rebooted) since the last cold boot of the switch.

---

## **Release History**

Release 6.1; command was introduced.

## **Related Commands**

<a href="#">show hardware info</a>	Displays the current system hardware information.
<a href="#">show power</a>	Displays the hardware information and current status for chassis power supplies.
<a href="#">show fan</a>	Displays the current operating status of chassis fans.

## **MIB Objects**

```
chasChassisTable
  chasFreeSlots
  chasPowerLeft
```

---

## show cmm

Displays basic hardware and status information for the CMM modules in a standalone switch or the switches that perform the CMM role running in a stack.

**show cmm** [*number*]

---

### Syntax Definitions

*number* Specifies the CMM slot number within a standalone switch or the CMM switch number within a stack switches.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- On OmniSwitch chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B. CMM modules on these switches are made up of two subcomponents: the fabric board and the processor board. The fabric board is CMM subcomponent 1; the processor board is subcomponent 2.
- On OmniSwitch chassis-based switches, a CMM installed in the top CMM slot position is defined as CMM-A. A CMM installed in the bottom position is CMM-B.
- On OmniSwitch chassis-based switches, CMM information is displayed separately for each subcomponent. For example, on OmniSwitch 9000E switches, CMM-A-1 refers to the fabric board of a CMM installed in the left position; on OmniSwitch 9000E switches CMM-A-2 refers to the processor board of the same CMM.
- If a switch, which performs a secondary CMM role is installed and runs in a stack, the hardware and status information for both the switches that perform the primary and secondary CMM role will be displayed.
- This command may be used when logged into the switch that performs either the primary or secondary CMM role in a stack.

## Examples

```
-> show cmm
CMM in slot 1
  Model Name:                OS6850-U24,
  Description:               10/100/1000,
  Part Number:               902271-10,
  Hardware Revision:         002,
  Serial Number:             E23L9059,
  Manufacture Date:          JUN 08 2004,
  Firmware Version:          N/A,
  Admin Status:              POWER ON,
  Operational Status:        UP,
  Power Consumption:         0,
  Power Control Checksum:    0x0,
  MAC Address:               00:d0:95:a3:e5:09,
```

### *output definitions*

---

<b>Model Name</b>	The model name of the switch. Note that on OmniSwitch chassis-based switches, CMM modules are made up of two major subcomponents: the fabric board and the processor board. Fabric boards are denoted as OS9*00-CMM and processor boards are denoted as CMM-PROC. Information for each board is displayed separately.
<b>Description</b>	A factory-defined description of the associated board (e.g., BBUS Bridge or PROCESSOR).
<b>Part Number</b>	The Alcatel-Lucent part number for the board.
<b>Hardware Revision</b>	The hardware revision level for the board.
<b>Serial Number</b>	The Alcatel-Lucent serial number for the board.
<b>Manufacture Date</b>	The date the board was manufactured.
<b>Firmware Version</b>	The firmware version for the board's ASICs.
<b>Admin Status</b>	The current power status of the CMM. Because information is obtained from a running CMM, the value will always be POWER ON.
<b>Operational Status</b>	The current operational status of the CMM.
<b>Power Consumption</b>	The current power consumption for the CMM.
<b>Power Control Checksum</b>	The current power control checksum for the corresponding CMM.
<b>MAC Address</b>	The MAC address assigned to the chassis. This base chassis MAC address is a unique identifier for the switch and is stored on an EEPROM card in the chassis. It is not tied to the CMM. Therefore, it will not change if the CMM is replaced or becomes secondary. The MAC address is used by the Chassis MAC Server (CMS) for allocation to various applications. Refer to the "Managing MAC Addresses and Ranges" chapter of the <i>OmniSwitch AOS Release 6 Switch Management Guide</i> for more information.

---

## Release History

Release 6.1; command was introduced.

**Related Commands**

<b>show chassis</b>	Displays the basic configuration and status information for the switch chassis.
<b>show ni</b>	Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the switch.
<b>show module</b>	Displays the basic information for either a specified module or all the modules installed in the chassis.
<b>show module long</b>	Displays the detailed information for either a specified module or all modules installed in the chassis.
<b>show module status</b>	Displays the basic status information for either a specified module or all modules installed in the chassis.
<b>show system</b>	Displays the status and configuration of Switch Fabric Modules (SFMs) on OmniSwitch chassis-based switches.

---

*output definitions*

---

<b>Model Name</b>	The NI's module name. For example, OS9-GNI-C24 indicates a twenty four-port 10/100/1000BaseT Ethernet module.
<b>Description</b>	A general description of the NI. For example, 24pt 10/100/1000BaseT Mod indicates a twenty four-port 10/100/1000BaseT Ethernet module.
<b>Part Number</b>	The Alcatel-Lucent part number for the NI.
<b>Hardware Revision</b>	The hardware revision level for the NI.
<b>Serial Number</b>	The Alcatel-Lucent serial number for the NI's printed circuit board (PCB).
<b>Manufacture Date</b>	The date the NI was manufactured.
<b>Firmware Version</b>	The firmware version for the NI's ASICs.
<b>Admin Status</b>	The current power status of the NI. Options include POWER ON or POWER OFF.
<b>Operational Status</b>	The operational status of the NI. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
<b>Power Consumption</b>	The current power consumption for the CMM.
<b>Power Control Checksum</b>	The current power control checksum for the corresponding NI.
<b>MAC Address</b>	The MAC address assigned to the NI.
<b>ASIC - Physical</b>	General information regarding the NI module's ASICs.
<b>CPLD - Physical</b>	General information regarding the CPLD.
<b>UBOOT Version</b>	UBOOT version of the NI.
<b>UBOOT-miniboot Version</b>	UBOOT-miniboot version of the NI.
<b>POE SW Version</b>	POE software version of the NI (POE modules only).
<b>C20L Upgd FailCount</b>	The number of failed upgrade attempts (C20L modules that have attempted to be upgraded only).

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.5; fields added.

## Related Commands

<b>reload ni</b>	Reloads (i.e., reboots) a specified Network Interface (NI) module.
<b>power ni</b>	Turns the power on or off for a specified Network Interface (NI) module.
<b>show module</b>	Displays the basic information for either a specified module or all modules installed in the chassis.
<b>show module long</b>	Displays the detailed information for either a specified module or all modules installed in the chassis.
<b>show module status</b>	Displays the basic status information for either a specified module or all modules installed in the chassis.

## MIB Objects

chasEntPhysOperStatus

---

## show module

Displays the basic information for either a specified module or all modules installed in a standalone switch chassis or a stack. Modules include switches performing the primary and secondary CMM roles and Network Interface (NI) in a stack.

**show module** [*number*]

---

### Syntax Definitions

*number*                      The slot number for a specific module installed in a standalone switch chassis or the switch number within a stack. If no slot number is specified, information for all modules is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

This command may be used when logged into the switch that performs either the primary or secondary CMM role in a stack.

### Examples

-> show module

Slot	Part-Number	Serial #	HW Rev	Mfg Date	Model Name
CMM-1	902271-10	E23L9059	002	JUN 08 2004	OS6850
NI-1	902271-10	E23L9059	002	JUN 08 2004	OS6850

### output definitions

---

<b>Slot</b>	The chassis slot position of the module. For detailed slot numbering information, refer to the “Chassis and Power Supplies” chapter of the <i>Hardware User Manual</i> . Refer to <a href="#">page 54-36</a> for additional information on CMM location callouts.
<b>Part-Number</b>	The Alcatel-Lucent part number for the module.
<b>Serial #</b>	The Alcatel-Lucent serial number for the module.
<b>Rev</b>	The hardware revision level for the module.
<b>Date</b>	The date the module was manufactured.
<b>Model Name</b>	The descriptive name for the module. For example, OS9-GNI-U24 indicates a twenty four-port Gigabit Ethernet module.

---

## Release History

Release 6.1; command was introduced.

-

*output definitions (continued)*

---

<b>Firmware Rev</b>	The firmware version for module's ASICs.
<b>MAC</b>	For the CMM, the base chassis MAC address is displayed. For detailed information on this base chassis MAC address, refer to the "Managing MAC Addresses and Ranges" chapter of the <i>OmniSwitch AOS Release 6 Switch Management Guide</i> . For NI modules, the MAC address for the corresponding NI is displayed.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<a href="#">show module</a>	Displays the basic information for either a specified module or all the modules installed in the chassis.
<a href="#">show module long</a>	Displays the detailed information for either a specified module or all the modules installed in the chassis.

---

## show power

Displays the hardware information and current status for chassis power supplies.

**show power** [**supply**] [*number*]

---

### Syntax Definitions

<b>supply</b>	Optional command syntax.
<i>number</i>	The single-digit number for a specific power supply installed in the chassis. If no power supply number is specified, information for all power supplies is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- When the **show power** command is entered on stackable switches, information is displayed only for power supplies that are installed in the chassis *and powered on*. If a power supply is present in a power supply bay, but the power supply is unplugged or its on/off switch is in the off position, the power supply is not listed in the command output.
- On OmniSwitch chassis-based switches, power supplies are numbered from top to bottom. For example, a power supply installed in the top position in the chassis is Power Supply 1, or PS-1.
- On OmniSwitch chassis-based switches, power supplies are numbered from left to right. For detailed slot numbering information, see the “Chassis and Power Supplies” chapter of your *Hardware Users Guide*.

### Examples

```
-> show power
Slot  PS   Wattage  Type  Status  Location
-----+-----+-----+-----+-----
      1     600    AC   UP     Internal
      2     600    AC   UP     Internal
      3     --     --   --     --
      4     600    IP   UP     External
      5     600    IP   UP     External
      6     600    IP   UP     External
      7     600    IP   UP     External
```

```
-> show power 5
Module in slot PS-5
(Power Shelf slot 5)
  Model Name:          OS-IPS-600A,
  Description:        ILPS AC,
  Part Number:        902252-10,
```

```
Hardware Revision:      A01 ,
Serial Number:         E51P4078 ,
Manufacture Date:      JAN 07 2005 ,
Operational Status:    UP ,
Power Provision:       600
```

*output definitions*

---

<b>Model Name</b>	The power supply's model number.
<b>Description</b>	A description of the associated power supply. This field will reflect the model name in most cases.
<b>Part Number</b>	The Alcatel-Lucent part number for the power supply.
<b>Hardware Revision</b>	The hardware revision level for the power supply.
<b>Serial Number</b>	The Alcatel-Lucent serial number for the power supply.
<b>Manufacture Date</b>	The date the power supply was manufactured.
<b>Type</b>	The type of power supply. Options include AC or IP.
<b>Location</b>	The location of the power supply. Options include Internal or External.
<b>Operational Status</b>	The operational status of the power supply. Options include UP or DOWN.
<b>Power Provision</b>	The number of Watts used by this power supply.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[show chassis](#) Displays the basic configuration and status information for the switch chassis.

---

## show fan

Displays the current operating status of chassis fans.

**show fan** [*number*]

---

### Syntax Definitions

*number*

Specifies the switch (slot) number of the chassis for stackable switches or a fan number for chassis-based switches.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 9000E

### Usage Guidelines

- On chassis-based switches if no fan number is specified the status of all fans is displayed.
- On stackable switches if no switch number is specified the status of all fans for all switches is displayed.

### Examples

```
-> show fan
Chassis Fan  Status
-----+-----+-----
  1         1  Running
  1         2  Running
  1         3  Running
  2         1  Running
  2         2  Running
  2         3  Running
```

#### *output definitions*

---

<b>Chassis</b>	The number of the switch in a stack.
<b>Fan</b>	The fan number describing the fan position.
<b>Status</b>	The current operational status of the corresponding fan.

---

### Release History

Release 6.1; command was introduced.

## **Related Commands**

### **show temperature**

Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

---

## show temperature

Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

**show temperature** [*number*]

---

### Syntax Definitions

*number* Specifies the slot (i.e., switch) number within the stack. The valid range of slot numbers is 1–8, depending on the size of the stack.

### Defaults

If a slot number is not specified with this command on an OmniSwitch stackable switch, temperature information for all switches operating in the stack is displayed by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

The *number* parameter is not an option when using this command on a single-chassis, standalone switch, such as the OmniSwitch 9000E.

### Examples

```
-> show temperature
```

```
Temperature for chassis 1
  Hardware Board Temperature (deg C)           = 41,
  Temperature Upper Threshold Range (deg C)    = 15 to 80,
  Temperature Upper Threshold (deg C)         = 57,
  Temperature Status                           = UNDER THRESHOLD,
  Temperature Danger Threshold (deg C)        = 80

Temperature for chassis 2
  Hardware Board Temperature (deg C)           = 40,
  Temperature Upper Threshold Range (deg C)    = 15 to 80,
  Temperature Upper Threshold (deg C)         = 57,
  Temperature Status                           = UNDER THRESHOLD,
  Temperature Danger Threshold (deg C)        = 80

Temperature for chassis 3
  Hardware Board Temperature (deg C)           = 40,
  Temperature Upper Threshold Range (deg C)    = 15 to 80,
  Temperature Upper Threshold (deg C)         = 57,
  Temperature Status                           = UNDER THRESHOLD,
  Temperature Danger Threshold (deg C)        = 80
```

*output definitions*

---

<b>Hardware Board Temperature</b>	The current chassis temperature as determined by the built-in temperature sensor. The temperature is displayed in degrees Celsius. This temperature is checked against the upper threshold value. If the threshold is exceeded, a warning is sent to the user.
<b>Temperature Upper Threshold Range</b>	The supported threshold range when specifying a threshold for the switch via the <b>temp-threshold</b> command.
<b>Temperature Upper Threshold</b>	The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM's TEMP LED displays amber and a warning is sent to the user. For information on changing the upper threshold value, refer to the <b>temp-threshold</b> command on page 54-25.
<b>Temperature Status</b>	The current threshold status of the switch. Displays whether the switch is UNDER THRESHOLD or OVER THRESHOLD. If the status is OVER THRESHOLD, the primary CMM's TEMP LED displays amber and a warning is sent to the user.
<b>Temperature Danger Threshold</b>	The factory-defined danger threshold. This field is not configurable. If the chassis temperature reaches this value the switch will power off all Network Interface (NI) modules until the temperature conditions (e.g., chassis air flow obstruction or ambient room temperature) have been addressed.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>temp-threshold</b>	Sets the chassis warning temperature threshold.
<b>show fan</b>	Shows the hardware information and current status for the chassis fans.

**MIB Objects**

```
chasChassisTable
  chasHardwareBoardTemp
  chasTempRange
  chasTempThreshold
  chasDangerTempThreshold
```

---

## show stack topology

Displays the current operating topology of switches within a stack.

**show stack topology** [*slot-number*]

---

### Syntax Definitions

*slot-number*

Optional syntax specifying a single slot number within the stack (1–8). When a slot number is specified, topology information for only the corresponding slot displays.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

- The OS6850E must be in the correct mode depending on which model it is being stacked with.

### Examples

-> show stack topology

NI	Role	State	Saved Slot	Link A State	Link A Remote NI	Link A Remote Port	Link B State	Link B Remote NI	Link B Remote Port
1	PRIMARY	RUNNING	1	UP	3	StackB	UP	2	StackA
2	IDLE	RUNNING	2	UP	1	StackB	UP	3	StackA
3	SECONDARY	RUNNING	3	UP	2	StackB	UP	1	StackA

### output definitions

#### NI

The current slot position for each switch in the virtual chassis (i.e., stacked configuration). Note that the order of the slot numbers does not necessarily correspond with the physical positions of switches within the stack. In other words, slot position 1 may not be the uppermost (top) switch in the stack. To manually assign these slot numbers via the CLI, use the [stack set slot](#) command.

#### Role

The current management role of the corresponding switch within the stack. Options include PRIMARY (the switch is the primary management module in the stack; standalone switches also display this role), SECONDARY (the switch is the secondary—or backup—management module in the stack), IDLE (the switch does not have a management role but is operating normally as a network interface module within the stack), PASS-THRU (the switch is operating in pass-through mode), UNDEFINED (the switch's current role is not known).

*output definitions (continued)*

---

<b>State</b>	The current operational state of the corresponding switch. Options include RUNNING (the switch is up and operating normally), DUP-SLOT (the switch has a duplicate saved slot number or incorrect mode and has automatically entered pass-through mode), INC-SLOT (the switch is in the incorrect mode and has automatically entered pass-through mode), CLR-SLOT (the switch has been manually “cleared” via the <b>stack clear slot</b> command and is now in pass-through mode), OUT-SLOT (the current stacked configuration already has eight switches and therefore cannot accommodate this switch), OUT-TOK (there are not enough unused tokens remaining in the current stacked configuration to accommodate this switch), UNKNOWN (the switch’s current state is not known).
<b>Saved Slot</b>	The designated saved slot number for the corresponding switch. The saved slot number is the slot position the switch will assume following a reboot. A value of zero (0) indicates that the switch has been “cleared” and, as a result, is designated for pass-through mode. To assign saved slot numbers, use the <b>stack set slot</b> command. To clear a switch and designate it for pass-through mode, use the <b>stack clear slot</b> command.
<b>Link A State</b>	The current status of the stacking cable link at the switch’s stacking port A. Options include UP, DOWN, or UNKNOWN.
<b>Link A Remote NI</b>	The slot number of the switch to which stacking cable A’s <i>remote end</i> is connected. In other words, if a switch in slot position 1 displays a Link A Remote NI value of 3, this indicates that the stacking cable plugged into slot 1 stacking port A is connected to the <i>slot 3</i> switch. If no stacking cable link exists, the value 0 displays.
<b>Link A Remote Port</b>	The specific stacking port to which stacking cable A’s <i>remote end</i> is connected. Options include StackA, StackB, and 0. If stacking cable A’s remote end is connected to stacking port B on the other switch, the value displays StackB. If no stacking cable link exists, the value 0 displays.
<b>Link B State</b>	The current status of the stacking cable link at the switch’s stacking port B. Options include UP, DOWN, or UNKNOWN.
<b>Link B Remote NI</b>	The slot number of the switch to which stacking cable B’s <i>remote end</i> is connected. In other words, if a switch in slot position 6 displays a Link A Remote NI value of 7, this indicates that the stacking cable plugged into slot 6 stacking port B is connected to the <i>slot 7</i> switch.
<b>Link B Remote Port</b>	The specific stacking port to which stacking cable B’s <i>remote end</i> is connected. Options include StackA, StackB, and 0. If stacking cable B’s remote end is connected to stacking port B on the other switch, the value displays StackB. If no stacking cable link exists, the value 0 displays.

---

**Release History**

Release 6.1; command was introduced.

Release 6.4.4; INC-SLOT output parameter was added.

## Related Commands

- show stack status** Displays the current redundant stacking cable status and token availability for a stacked configuration.
- stack clear slot** Sets the *saved slot* number or mode for stackable configuration switches.

## show stack status

Displays the current redundant stacking cable status and token availability for a stacked configuration.

**show stack status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855

### Usage Guidelines

N/A

### Examples

```
-> show stack status
```

```
Redundant cable status : present  
Tokens used            : 8  
Tokens available       : 24
```

### *output definitions*

---

<b>Redundant cable status</b>	Indicates whether a redundant stacking cable is currently installed. Options include <b>present</b> and <b>not present</b> . To provide added resiliency and redundancy, it is strongly recommended that a redundant stacking cable is connected from the top switch in the stack to the bottom switch in the stack at all times. For more information on stack redundancy, refer to the <i>Hardware Users Guide</i> .
<b>Tokens used</b>	The number of tokens used in the current stacked configuration. Each virtual chassis (also referred to as a stacked configuration) is allocated a number of tokens per stack. If a switch is added to a stack in which there are not enough tokens available, the incoming switch is automatically placed in pass-through mode. For detailed information on stack-related topics, including tokens and pass-through mode, refer to the <i>Hardware Users Guide</i> .
<b>Tokens available</b>	The number of remaining tokens for any incoming switches in a stack.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

**show stack topology**      Displays the current operating topology of switches within a stack.

## MIB Objects

alaStackMgrStackStatus  
alaStackMgrTokensUsed  
alaStackMgrTokensAvailable

---

## hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding will be affected.

**hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}**

**hash-control extended no udp-tcp-port**

---

### Syntax Definitions

<b>brief</b>	Sets hashing to brief mode.
<b>extended</b>	Sets hashing to extended mode.
<b>udp-tcp-port</b>	Sets extending hashing to use UDP/TCP ports.
<b>enable   disable</b>	Enables or disables the the load balancing of non-unicast traffic on a link aggregate.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>hash-control</b> (6400/6850/6855)	brief
<b>hash-control</b> (9000E)	extended
<b>udp-tcp-port</b>	disabled
<b>non-ucast</b>	disabled

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E.

### Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and EMCP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation will only load balance unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

## Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

## Release History

Release 6.4.2; command was introduced.

Release 6.4.3; **load-balance non-ucast** parameter was added.

## Related Commands

[show hash-control](#) Displays the current hash control setting for the switch.

## MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUHashControl
```

---

## show hash-control

Displays the current hash control settings for the switch.

**show hash-control [non-ucast]**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show hash-control
Hash Mode      = brief,
Udp-Tcp-Port  = disabled
-> show hash-control non-ucast
Non-ucast Hash Status = Enabled,
```

#### *output definitions*

---

<b>Hash Mode</b>	The current hash mode.
<b>Udp-Tcp-Port</b>	Status of UDP/TCP hashing.
<b>Non-ucast Hash Status</b>	Status of Non-ucast hash status.

---

### Release History

Release 6.4.2; command was introduced.  
Release 6.4.3; **non-ucast** parameter was added.

### Related Commands

[hash-control](#) Configures the hash mode of the switch..

### MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUHashControl
```

---

## license apply

Activates the license for licensed protocols on the switch.

**license apply**

---

### Syntax Definitions

NA

### Defaults

By default licensed protocols are not activated on the switch.

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Currently, MPLS is the only licensed feature on an OmniSwitch.
- Ensure the license file *lmLicense.dat* is placed in the **/flash** directory of the primary CMM.
- When the **license apply** command is issued, the switch displays a message to ensure the installation. Enter 'Y' to apply the license and reboot the switch.
- Use [show license file](#) command to verify the installed license.

### Examples

```
-> license apply
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?
Y
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

<a href="#">show license info</a>	Displays all the licensed applications installed on the switch.
<a href="#">show license file</a>	Displays the license file information of the switch.

### MIB Objects

aluLicenseManagerApplyLicense

---

## show license info

Displays all the licensed applications installed on the switch.

**show license info**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is determined only by the switch up time. If a switch is turned off the Time Remaining is not decremented.

### Examples

```
->show license info
Application      License Type
-----+-----
MPLS             Permanent
```

### *output definitions*

---

<b>Application</b>	Displays the name of the licensed applications installed on the switch.
<b>Type</b>	The type of license.

---

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[show license file](#) Displays the license file information of the switch.

### MIB Objects

```
aluLicenseManagerInfoTable
aluLicenseedApplication
aluLicenseType
```

---

## show license file

Displays the information contained in the license file.

**show license file**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 9000E

### Usage Guidelines

- Use this command to display the contents of the *lmLicense.dat* license file.
- The *lmLicense.dat* file can contain licenses for other switches.

### Examples

```
-> show license file
MAC Address          Application
-----+-----
00:d0:95:d5:e6:01    MPLS
00:d0:95:d5:e6:0a    MPLS
00:d0:95:d5:e6:0b    MPLS
00:d0:95:d5:e6:0c*   MPLS
```

\* - indicates entry applicable for local switch

#### *output definitions*

---

<b>MAC Address</b>	Displays the base MAC address of the switch. An asterisk indicates the MAC address of the local switch.
<b>Application</b>	Displays the name of the licensed application.

---

### Release History

Release 6.4.2; command was introduced.

## Related Commands

**show license info**                      Displays all the licensed applications installed on the switch.

## MIB Objects

```
aluLicenseManagerFileInfoTable  
aluSwitchMacAddress  
aluLicensedFileApplication
```

---

# 55 Chassis MAC Server (CMS) Commands

The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:

- Base chassis MAC address
- Ethernet Management Port (EMP)
- VLAN router ports

Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address *range*.

The MAC address range is stored on the switch's EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses. Users may add additional MAC addresses; the maximum capacity for the switch's default range is 256 MAC addresses.

In stackable switches, CMS is responsible for sharing the base MAC address of the primary switch with all the other switches in the stack. This helps the secondary switch to retain the same MAC address during takeover. This is called MAC Address Retention.

---

**Note.** MAC Retention is supported on the OmniSwitch 6850 Series and OmniSwitch 6400 Series switches.

---

MIB information for the Chassis MAC Server commands is as follows:

*Filename:* AlcatelIND1MacServer.MIB  
*Module:* Alcatel-IND1-MAC-SERVER-MIB

A summary of the available commands is listed here:

---

[mac-range eeprom](#)  
[mac-retention status](#)  
[mac-retention dup-mac-trap](#)  
[mac release](#)  
[show mac-range](#)  
[show mac-range alloc](#)  
[show mac-retention status](#)

---

## mac-range eeprom

Modifies the default MAC range on the switch's EEPROM.

---

**Note.** Use caution when modifying the default MAC range. Improper use of this command can disable your system and adversely affect your network. Contact Alcatel-Lucent Customer Support for further assistance.

---

**mac-range eeprom** *start\_mac\_address count*

---

### Syntax Definitions

<i>start_mac_address</i>	The first MAC address in the modified range. Enter the MAC address in the following format: <b>xx:xx:xx:xx:xx:xx</b> , where <b>x</b> is a hex value (0–f).
<i>count</i>	Specifies the number of MAC addresses in the range (1–256).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Because the factory-installed 32 MAC addresses are sufficient for most network configurations, this command should only be used by qualified network administrators for special network requirements.
- After modifying a MAC address range by using the **mac-range eeprom** command, you must reboot the switch. Otherwise, MAC addresses for existing VLAN router ports will not be allocated properly.
- All MAC addresses in a range must be contiguous (i.e., there cannot be any gaps in the sequence of MAC addresses).

### Examples

```
-> mac-range eeprom 00:20:da:23:45:35 32
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show mac-range](#)

Displays the MAC range table.

## MIB Objects

chasMacAddressRangeTable

  chasMacRangeIndex

  chasGlobalLocal

  chasMacAddressStart

  chasMacAddressCount

---

---

## mac-retention status

Enables or disables the MAC retention status.

**mac-retention status {enable | disable}**

---

### Syntax Definitions

**enable** Enables the administrative status of MAC retention.  
**disable** Disables the administrative status of MAC retention.

### Defaults

Parameter	Status
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X

### Usage Guidelines

- When MAC retention is enabled, the stack uses the MAC address of the primary switch even after it has failed.
- When the administrative status of MAC retention is enabled, the stack performance is enhanced.

### Examples

```
-> mac-retention status enable
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show mac-retention status](#) Displays the MAC retention status.

### MIB Objects

```
chasmacaddrretentionobjects  
  chasmacaddrretentionstatus
```

---

## mac-retention dup-mac-trap

Enables or disables the duplicate MAC address trap status.

**mac-retention dup-mac-trap {enable | disable}**

---

### Syntax Definitions

**enable** Enables the duplicate MAC address trap status.  
**disable** Disables the duplicate MAC address trap status.

### Defaults

Parameter	Status
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X

### Usage Guidelines

If the old primary switch is not detected and included in the stack within a pre-defined time period, an SNMP trap will be generated.

### Examples

```
-> mac-retention dup-mac-trap enable
```

### Release History

Release 6.2.1; command was introduced.

### Related Commands

[show mac-retention status](#) Displays the MAC retention status.

### MIB Objects

chasMacAddrRetentionObjects  
chasPossibleDuplicateMacTrapStatus

---

## mac release

Releases the MAC address currently being used as the primary base MAC address.

**mac release**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X

### Usage Guidelines

The MAC address is released only if the address has not been derived from the EEPROM (i.e., it should be a retained MAC address of the old primary switch).

### Examples

```
-> mac release
```

### Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **mac-retention** keyword was replaced with the **mac** keyword.

### Related Commands

N/A

### MIB Objects

chasMacAddrRetentionObjects

chasMacAddrRetentionStatus

---

## Related Commands

### **mac-range eeprom**

Modifies the default MAC range on the switch's EEPROM.

## MIB Objects

```
chasMacAddressRangeTable
  chasMacRangeIndex
  chasGlobalLocal
  chasMacAddressStart
  chasMacAddressCount
  chasMacRowStatus
```

---

## show mac-range alloc

Displays all allocated addresses from the MAC range table.

**show mac-range** [*index*] **alloc**

---

### Syntax Definitions

*index* Identifies the MAC range by referring to its position in the MAC range table. Currently, index position 1 only is supported.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If you are assigning VLAN router ports while the switch is in *single MAC router mode*, all VLAN router ports will use the base chassis MAC address (ID value 0).

### Examples

```
-> show mac-range alloc
Range      Mac Address          Application      Id
-----+-----+-----+-----
01         00:d0:95:6b:09:40 CHASSIS         0
01         00:d0:95:6b:09:41 802.1X         0
01         00:d0:95:6b:09:5f CHASSIS         1
```

#### *output definitions*

---

<b>Range</b>	The MAC range's index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to <a href="#">page 55-7</a> for more information.
<b>Mac Address</b>	Current MAC address allocated for a specific application.

*output definitions (continued)*

---

<b>Application</b>	The application for which the allocated MAC address is being used. Current options include <b>VLAN</b> , <b>802.1X</b> , and <b>CHASSIS</b> . <b>VLAN</b> refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. <b>CHASSIS</b> refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP).
<b>Id</b>	An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

[mac-range eeprom](#)      Modifies the default MAC range on the switch's EEPROM.

**MIB Objects**

ChasMacAddressAllocTable  
  chasAppId  
  chasObjectId  
  chasAllocMacRangeIndex  
  chasAllocMacAddress

---

## show mac-retention status

Displays the MAC retention status.

**show mac-retention status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X

### Usage Guidelines

- If the administrative status of MAC retention is not configured, it will be displayed as disabled by default.
- If the administrative status of the duplicate MAC address trap is not configured, it will be displayed as disabled by default.
- If the source of the currently used MAC address is not configured, it will be displayed as EEPROM by default.

### Examples

```
-> show mac-retention status
```

```
MAC RETENTION STATUS
```

```
=====
```

```
Admin State           : Enabled
Trap admin state      : Enabled
Current MAC address   : 00:0a:0b:0c:0d:0e
MAC address source    : Retained
Topology Status       : Ring present
```

#### *output definitions*

---

<b>Admin State</b>	Displays the administrative status of MAC retention ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Trap admin state</b>	Displays the administrative status of the duplicate MAC address trap ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Current MAC address</b>	Displays the MAC address currently used by the switch.
<b>MAC address source</b>	Displays the source of the currently used MAC address. Options include <b>EEPROM</b> and <b>Retained</b> .
<b>Topology Status</b>	Displays the topology status of the stack. Options include <b>Ring present</b> and <b>Ring Not Present</b> .

---

## Release History

Release 6.2.1; command was introduced.

Release 6.3.1; **EEPROM MAC Address** field was deleted.

# 56 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

*Filename:* AlcatelIND1Ntp.mib  
*Module:* alcatelIND1NTPMIB

A summary of available commands is listed here:

---

- [ntp server](#)
- [ntp server synchronized](#)
- [ntp server unsynchronized](#)
- [ntp client](#)
- [ntp src-ip preferred](#)
- [ntp broadcast-client](#)
- [ntp broadcast-delay](#)
- [ntp key](#)
- [ntp key load](#)
- [ntp authenticate](#)
- [ntp master](#)
- [ntp interface](#)
- [ntp max-associations](#)
- [ntp broadcast](#)
- [ntp peer](#)
- [show ntp status](#)
- [show ntp client](#)
- [show ntp client server-list](#)
- [show ntp server client-list](#)
- [show ntp server status](#)
- [show ntp keys](#)
- [show ntp peers](#)
- [show ntp server disabled-interfaces](#)

---

## ntp server

Specifies an NTP server from which the switch will receive updates.

**ntp server** {*ip\_address*} [**key** *keyid*] [**minpoll** *poll*] [**version** *version*] [**prefer**]

**no ntp server** {*ip\_address*}

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the NTP server to be added or deleted to the client's server list.
<i>key id</i>	The key identification number that corresponds to the specified NTP server. The value ranges from 1 to 65534.
<i>poll</i>	It specifies the minimum polling interval for NTP message. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The maximum poll interval is fixed at 10 (1,024 s). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 4 (16 s), or increase to the maximum limit of 10.
<i>version</i>	The version of NTP being used. This will be 1, 2, 3, or 4.
<b>prefer</b>	Marks this server as the preferred server. A preferred server's timestamp will be used before another server.

### Defaults

Parameter	Default
<i>version</i>	4
<i>exponent</i>	6
<b>prefer</b>	not preferred

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 3 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.

- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The client will poll the server for a time update when the **minpoll** time is exceeded.

## Examples

```
-> ntp server 1.1.1.1
-> ntp server spartacus
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server spartacus minpoll 5
-> no ntp server 1.1.1.1
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**ntp client** Enables or disables NTP operation on the switch.

## MIB Objects

```
alaNtpConfig
  alaNtpPeerAddressType
  alaNtpPeerType
  alaNtpPeerAuth
  alaNtpPeerMinpoll
  alaNtpPeerVersion
  alaNtpPeerPrefer
  alaNtpPeerAddress
```

---

## ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

**ntp server synchronized**

---

### Syntax Definitions

N/A

### Defaults

By default, NTP synchronization is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

### Examples

```
-> ntp server synchronized
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

#### [ntp server unsynchronized](#)

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

### MIB Objects

alaNtpConfig

alaNtpPeerTests

---

## ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

**ntp server unsynchronized**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

### Examples

```
-> ntp server unsynchronized
```

### Release History

Release 6.1.5; command was introduced.

### Related Commands

[ntp server synchronized](#) Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

### MIB Objects

alaNtpConfig  
alaNtpPeerTests

---

## ntp client

Enables or disables NTP time synchronization discipline.

**ntp client** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Enables NTP.
<b>disable</b>	Disables NTP.

### Defaults

NTP protocol is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the [ntp server](#) command. Up to 3 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.

### Examples

```
-> ntp client enable  
-> ntp client disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ntp server](#) Specifies an NTP server from which the switch will receive updates.

### MIB Objects

alaNtpEnable

---

## ntp src-ip preferred

Configures the source IP address field of the NTP source

**ntp src-ip preferred** {**default** | **no-loopback0** | *ip\_address*}

**no ntp src-ip preferred**

---

### Syntax Definitions

<b>default</b>	The Loopback0 address, if configured, will be used for the source IP address field. If no loopback0 is configured, the vlan configured IP interface on the switch will be used.
<b>no-loopback0</b>	The Loopback0 address should not be used for the source IP address field and the first available IP address on the switch should be used for this field. It takes the vlan configured IP even if the loopback0 is configured on the switch.
<i>ip_address</i>	The IP address to be used in the source IP field.

### Defaults

By default, the NTP source ip preferred setting is set to the **default** parameter.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When configuring a specific IP address, that address must already exist on the switch.
- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

### Examples

```
-> ntp src-ip preferred 192.168.10.1
-> ntp src-ip preferred no-loopback0
-> ntp src-ip preferred default
```

### Release History

Release 6.3.4; command was introduced

Release 6.4.3; command was deprecated, use [ip managed-interface](#).

**Related Commands****ntp server**

Specifies an NTP server from which the switch will receive updates.

**MIB Objects**

alaNtpSrcIp  
alaNtpSrcIpConfig

---

## ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

**ntp broadcast {enable | disable}**

---

### Syntax Definitions

**enable** Enables the client broadcast mode.

**disable** Disables the client broadcast mode.

### Defaults

Broadcast mode is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

### Examples

```
-> ntp broadcast-client enable  
-> ntp broadcast-client disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**ntp broadcast-delay** Sets the broadcast delay time in microseconds.

### MIB Objects

alaNtpBroadcastEnable

---

## ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

**ntp broadcast-delay** *microseconds*

---

### Syntax Definitions

*microseconds*                      The number of microseconds for the broadcast delay.

### Defaults

parameter	default
<i>microseconds</i>	4000

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

### Examples

```
-> ntp broadcast-delay 1000
-> ntp broadcast-delay 10000
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[ntp broadcast-client](#)                      Enables or disables the client's broadcast mode.

### MIB Objects

alaNtpBroadcastDelay

---

## ntp key

Labels the specified authentication key identification as trusted or untrusted.

**ntp key** *key* [**trusted** | **untrusted**]

---

### Syntax Definitions

<i>key</i>	The key number matching an NTP server.
<b>trusted</b>	Signifies that the specified key is trusted and can be used for authentication.
<b>untrusted</b>	Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

### Defaults

By default, all authentication key are untrusted.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used. The location of the file containing set of generated authentication keys is `/flash/network/ntp.keys`.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the `ntp.conf` key file are untrusted therefore keys must be set to 'trusted' status to allow NTP to use the key for authentication.

### Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

## Release History

Release 6.1; command was introduced.

## Related Commands

- ntp key** Sets the public key the switch uses when authenticating with the specified NTP server.
- ntp client** Enables or disables NTP operation on the switch.

## MIB Objects

```
alaNtpAccessKeyIdTable  
  alaNtpAccessKeyIdKeyId  
  alaNtpAccessKeyIdTrust
```

---

## ntp key load

Loads the current key file into memory.

**ntp key load**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

### Examples

```
-> ntp key load
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- |                   |                                                                                 |
|-------------------|---------------------------------------------------------------------------------|
| <b>ntp key</b>    | Labels the specified authentication key identification as trusted or untrusted. |
| <b>ntp server</b> | Specifies an NTP server from which this switch will receive updates.            |

### MIB Objects

alaNtpAccessRereadkeyFile

---

---

## ntp authenticate

Enables or disables the authentication on a configured NTP server.

**ntp authenticate {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables authentication for NTP server.
<b>disable</b>	Disables authentication for NTP server.

### Defaults

By default, NTP authentication is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using [ntp client](#) command.
- Before enabling the NTP operation, NTP server must be specified using the [ntp server](#) command.

### Examples

```
-> ntp authenticate enable
-> ntp authenticate disable
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[show ntp status](#) Displays the information about the current NTP status.

### MIB Objects

alaNtpAuthenticate

---

## ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

**ntp master** *{stratum-number}*

---

### Syntax Definitions

*stratum-number* Integer value ranging from 2 to 16

### Defaults

Parameter	Default
<i>stratum-number</i>	16

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

### Examples

```
-> ntp master 4
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

alaNtpConfig  
alaNtpSysStratum

---

## ntp interface

Enables or Disables NTP server functionality for an interface.

**ntp interface** {*interface-ip*} {**enable** | **disable**}

---

### Syntax Definitions

<i>interface-ip</i>	IP address of an interface on which NTP server functionality is to be disabled.
<b>enable</b>	Enables NTP server functionality on an interface.
<b>disable</b>	Disables NTP sever functionality on an interface.

### Defaults

By default, NTP server functionality is enabled on all the interfaces.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

### Examples

```
-> ntp interface 10.10.10.1 disable  
-> ntp interface 10.10.10.1 enable
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

```
alaNtpAccessRestrictedTable  
  alaNtpAccessRestrictedIpAddress
```

---

## ntp max-associations

Configures the maximum number of associations on the switch.

**ntp max-associations** *{number}*

---

### Syntax Definitions

*number* Maximum no of client/server and peer associations. Integer value ranging from 0 to 64.

### Defaults

By default, 32 associations are allowed on the switch.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 32 to any value between 0 to 64.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

### Examples

```
-> ntp max-associations 20
```

### Release History

Release 6.4.2; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

alaNtpConfig  
alaNtpMaxAssociation

---

## ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

**ntp broadcast** {*broadcast-addr*} [**version** *version*] [**minpoll** *poll interval*]

**no ntp broadcast** {*broadcast-addr*}

---

### Syntax Definitions

<i>broadcast-addr</i>	Subnet for which broadcast updates are regularly sent.
<i>version</i>	NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
<i>poll interval</i>	Polling interval for NTP broadcast message. This value is measured in seconds.

### Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers. This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to be defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

### Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

### Release History

Release 6.4.2; command was introduced.

## Related Commands

- |                                      |                                                  |
|--------------------------------------|--------------------------------------------------|
| <a href="#">ntp broadcast-client</a> | Enables or disables the client's broadcast mode. |
| <a href="#">ntp broadcast-delay</a>  | Sets the broadcast delay time in microseconds    |

## MIB Objects

```
alaNtpPeerTable  
  alaNtpPeerType  
  alaNtpPeerVersion  
  alaNtpPeerMinpoll
```

---

## ntp peer

Configures NTP to operate in the symmetric active peering mode. This also enables the establishment of an active symmetric association with the specified remote peer.

**ntp peer** {*ip-address*} [**key** *keyid*] [**version** *version*] [**minpoll** *poll interval*]

**no ntp peer** {*ip-address*}

---

### Syntax Definitions

<i>ip-address</i>	IP address of the remote peer.
<i>key-id</i>	Authentication key for the remote peer.
<i>version</i>	NTP packet version to be used for the peer association.
<i>poll interval</i>	Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

### Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode. This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x)
- *ip-address* is the mandatory parameter to be entered in the command while key id is the optional parameter. If key id is not specified, then peering will not be authenticated.

### Examples

```
-> ntp peer 172.18.16.112
-> no ntp peer 172.18.16.112
```

## Release History

Release 6.4.2; command was introduced.

## Related Commands

[show ntp peers](#) Displays current NTP peer association.

## MIB Objects

```
alaNtpPeerTable  
  alaNtpPeerType  
  alaNtpPeerAuth  
  alaNtpPeerVersion

```

---

## show ntp status

Displays the information about the current NTP status.

**show ntp status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

### Example

```
-> show ntp status
Current time           : Tue APR 29 2003   18:48:01 (UTC),
Last NTP update       : Tue APR 29 2003   18:44:15 (UTC),
Server reference:     : 0.0.0.0,
Client mode            : enabled,
Broadcast client mode : disabled,
Broadcast mode delay (microseconds) : 4000,
Server qualification  : synchronized,
Stratum                : 16,
Max-Associations       : 32,
Authentication        : disabled,
Source IP Configuration : Preferred,
Source IP              : 10.145.15.15
```

### *output definitions*

---

<b>Current time</b>	The current time for the NTP client.
<b>Last NTP update</b>	The time of the last synchronization with an NTP server.
<b>Client mode</b>	Whether the NTP client software is enabled or disabled.
<b>Broadcast client mode</b>	What NTP mode the client is running in, either client or broadcast.
<b>Broadcast delay</b>	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.

<b>server qualification</b>	Server qualification status.
<b>Stratum</b>	The stratum of the server. The stratum number is the number of hops from a UTC time source.
<b>Max-Association</b>	Maximum association on the switch that restricts the number of client/server and peer association
<b>Authentication</b>	Whether Authentication is enabled or disabled
<b>Source IP Configuration</b>	Source IP Configuration type which is configured.
<b>Source IP</b>	Source IP address for NTP that send updates to clients.

---

## show ntp client

Displays information about the current client NTP configuration.

**show ntp client**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

### Examples

```
-> show ntp client
Current time           : SAT APR 16 2005 00:19:02 (UTC)
Last NTP update       : SAT APR 16 2005 00:06:45 (UTC)
Client mode           : enabled
Broadcast client mode : disabled
Broadcast delay (microseconds): 4000
```

#### *output definitions*

---

<b>Current time</b>	The current time for the NTP client.
<b>Last NTP update</b>	The time of the last synchronization with an NTP server.
<b>Client mode</b>	Whether the NTP client software is enabled or disabled.
<b>Broadcast client mode</b>	What NTP mode the client is running in, either client or broadcast.
<b>Broadcast delay</b>	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
<b>Server Qualification</b>	Indicates whether they server must be synchronized or not.

---

## show ntp server status

Displays the basic server information for a specific NTP server or a list of NTP servers.

**show ntp server status** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      The IP address of the NTP server to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command displays information on the status of any or all configured NTP servers/peers.
- To display a specific server, enter the command with the server's IP address. To display all servers, enter the command with no server IP address.

### Examples

```
-> show ntp server status
IP address      = 172.18.16.147,
Host mode       = server,

*output definitions*

---

<b>IP address</b>	The server IP address.
<b>Host mode</b>	The host mode of this remote association.
<b>Peer mode</b>	The peer mode of this remote association.
<b>Prefer</b>	Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.
<b>Version</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>Stratum</b>	The stratum of the server. The stratum number is the number of hops from a UTC time source.
<b>Minpoll</b>	The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded.
<b>Maxpoll</b>	The maximum poll time.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Dispersion</b>	The dispersion value received from the server in its timestamp.
<b>Root distance</b>	The total round trip delay (in seconds) to the primary reference source.
<b>Precision</b>	The advertised precision of this association.
<b>Reference IP</b>	The IP address identifying the peer's primary reference source.
<b>Status</b>	The peer selection and association status.
<b>Uptime count</b>	The time period (in seconds) during which the local NTP server was associated with the switch.
<b>Reachability</b>	The reachability status of the peer.
<b>Unreachable count</b>	Number of times the NTP entity was unreachable.
<b>Stats reset count</b>	The time delay (in seconds) since the last time the local NTP server was restarted.
<b>Packets sent</b>	Number of packets sent.
<b>Packets received</b>	Number of packets received.
<b>Duplicate packets</b>	Number of duplicated packets received.
<b>Bogus origin</b>	Number of bogus packets.
<b>Bad authentication</b>	Number of NTP packets rejected for not meeting the authentication standards.
<b>Bad dispersion</b>	Number of bad dispersions.
<b>Last Event</b>	The last event.

---

**Release History**

Release 6.1; command was introduced.

Release 6.1.5; fields added.

### **Related Command**

**ntp client**

Enables or disables NTP operation on the switch.

### **MIB Objects**

alaNtpPeerListTable

alaNtpPeerShowStatus

---

## show ntp keys

Displays information about all authentication keys.

```
show ntp keys
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command displays the information on the current set of trusted authentication keys.

### Examples

```
-> show ntp keys
Key      Status
=====+=====
1        untrusted
2        untrusted
3        trusted
4        trusted
5        untrusted
6        untrusted
7        trusted
8        trusted
```

### *output definitions*

---

<b>Key</b>	The key number corresponding to a key in the key file.
<b>Status</b>	Whether the key is trusted or untrusted.

---

### Release History

Release 6.1; command was introduced.

### **Related Command**

- |                     |                                                                                 |
|---------------------|---------------------------------------------------------------------------------|
| <b>ntp key</b>      | Labels the specified authentication key identification as trusted or untrusted. |
| <b>ntp key load</b> | Loads the current key file into memory.                                         |

### **MIB Objects**

---

## show ntp peers

Displays the information about the current status on the NTP peer association.

**show ntp peers**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

### Examples

```
-> show ntp peers
IP Address      Ver    Key    St    Delay    Offset    Disp
-----+-----+-----+-----+-----+-----+-----
172.23.0.202   4      0     3     0.300    0.404    0.0024
10.255.24.120  4      0     3     0.016    0.250    0.0017
```

#### *output definitions*

---

<b>IP Address</b>	Peer IP Address
<b>Ver</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>St</b>	The stratum of the server.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Disp</b>	The dispersion value received from the server in its timestamp.

---

### Release History

# 57 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

Session	Maximum Number of Sessions
Telnet(v4 or v6)	4
FTP(v4 or v6)	4
SSH + SFTP(v4 or v6 secure sessions)	8
HTTP	4
Total Sessions	20
SNMP	50

MIB information for commands in this chapter are as follows:

*Filename:* AlcatelInd1SessionMgr.mib  
*Module:* AlcatelIND1SessionMgrMIB

*Filename:* AlcatelIND1AAA.mib  
*Module:* Alcatel-IND1-AAA-MIB

*Filename:* AlcatelIND1System.mib  
*Module:* Alcatel-IND1ConfigMgr.mib

*Filename:* AlcatelIND1Ssh.mib  
*Module:* ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

---

- session login-attempt**
- session login-timeout**
- session banner**
- session timeout**
- session prompt**
- session xon-xoff**
- prompt**
- show prefix**
- alias**
- show alias**
- user profile save**
- user profile reset**
- history size**
- show history**
- !**
- command-log**
- kill**
- exit**
- who**
- whoami**
- show session config**
- show session xon-xoff**
- more size**
- more**
- show more**
- telnet**
- telnet6**
- ssh**
- ssh6**
- ssh enforce pubkey-auth**
- show ssh config**
- show command-log**
- show command-log status**

---

## session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

**session login-attempt** *integer*

---

### Syntax Definitions

*integer*                      The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

### Defaults

Default is 3 login attempts.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> session login-attempt 5
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- |                                       |                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">show session config</a>   | Displays Session Manager information such as banner file name, session timeout value, and default prompt value.                                                                              |
| <a href="#">session login-timeout</a> | Sets or resets the amount of time the user can take to accomplish a successful login to the switch.                                                                                          |
| <a href="#">session timeout</a>       | Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch. |

### MIB Objects

sessionMgr  
    sessionLoginAttempt

---

---

## session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

**session login-timeout** *seconds*

---

### Syntax Definitions

*seconds*                      The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

### Defaults

Login timeout default is 55 seconds.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> session login-timeout 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show session config</a>	Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.
<a href="#">session login-attempt</a>	Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.
<a href="#">session timeout</a>	Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

### MIB Objects

sessionMgr  
    sessionLoginTimeout

---

## session banner

Sets or resets the file name of the user-defined banner. The banner is a welcome banner that appears after the user successfully logs onto the switch.

**session banner** {cli | ftp | http} *file\_name*

**session banner no** {cli | ftp | http}

---

### Syntax Definitions

<b>cli</b>	Creates/modifies the CLI banner file name.
<b>ftp</b>	Creates/modifies the FTP banner file name.
<b>http</b>	Creates/modifies the HTTP banner file name.
<i>file_name</i>	Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters.

### Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **session banner no** command is used to disable a user defined session banner file from displaying when you log onto the switch. The text file containing the custom banner will remain on the switch until you remove it with the **rm** command.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.

### Examples

```
-> session banner cli/switch/banner.txt
```

### Release History

Release 6.1; command was introduced.  
Release 6.1.3; **http** keyword was added.

**Related Commands****show session config**

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

**MIB Objects**

SessionConfigTable

  SessionType

  SessionBannerFileName

---

## session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

`session timeout {cli | http | ftp} minutes`

---

### Syntax Definitions

<code>cli</code>	Sets the inactivity timeout for CLI sessions.
<code>http</code>	Sets the inactivity timeout for HTTP sessions.
<code>ftp</code>	Sets the inactivity timeout for FTP sessions.
<code>minutes</code>	Inactivity timeout value (in minutes). Valid range 1 to 596523.

### Defaults

---

<b>parameter</b>	<b>default</b>
<code>minutes</code>	4

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

### Examples

```
-> session timeout cli 5
```

### Release History

Release 6.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

  SessionType

  SessionInactivityTimerValue

---

## session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

**session prompt default** [*string*]

---

### Syntax Definitions

*string* Prompt string.

### Defaults

parameter	default
<i>string</i>	->

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The maximum prompt string length is 31 characters.
- The new prompt will not take effect until you log off and back onto the switch.

### Examples

```
-> session prompt default -->
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[show session config](#) Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

### MIB Objects

SessionConfigTable  
  SessionType  
  sessionDefaultPromptString

---

---

## session xon-xoff

Enables/disables the XON-XOFF protocol on the console port.

**session xon-xoff** {enable | disable}

---

### Syntax Definitions

*enable* Enables XON-XOFF on the console port.

*disable* Disables XON-XOFF on the console port.

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

### Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show session xon-xoff** Displays whether the console port is enabled or disabled for XON-XOFF.

### MIB Objects

sessionXonXoffEnable

---

## prompt

This command defines the CLI prompt.

**prompt** [**user**] [**time**] [**date**] [**string** *string*] [**prefix**]

**no prompt**

---

### Syntax Definitions

<b>user</b>	The name of the current user is displayed as part of the CLI prompt.
<b>time</b>	The current system time is displayed as part of the CLI prompt.
<b>date</b>	The current system date is displayed as part of the CLI prompt.
<i>string</i>	You can specify a text string as the prompt. Prompts specified with this parameter are limited to four characters.
<b>prefix</b>	The current prefix (if any) is displayed as part of the CLI prompt. Prefixes are stored for command families that support the prefix recognition feature. See Usage Guidelines.

### Defaults

The default prompt is the arrow (->, or dash greater-than).

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to remove the CLI prompt.
- Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.
- To set the CLI prompt back to the arrow (->), enter the **prompt string ->** (prompt string dash greater-than) syntax.

### Examples

```
-> prompt user
-> prompt user time date
-> prompt prefix
-> prompt string 12->
-> prompt prefix ->
```

### Release History

Release 6.1; command was introduced.

**Related Commands****show prefix**

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

**MIB Objects**

N/A

---

## show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

show prefix

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

### Examples

```
-> show prefix
```

### Release History

Release 6.1; command was introduced.

### Related Commands

#### **prompt**

This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

### MIB Objects

N/A

---

## alias

Defines substitute command text for the switch's CLI command keywords.

**alias** *alias command\_name*

---

### Syntax Definitions

*alias* Text string that defines the new CLI command name (alias) that you will use to replace an old CLI command name.

*command\_name* The old CLI command name being replaced by your alias.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Alias commands are stored until the user session ends. To save alias settings, you must execute the **user profile save** command. Otherwise, once you log off the switch, substitute commands configured with the **alias** command are destroyed.
- You can eliminate excess typing by reducing the number of characters required for a command. For instance, the group syntax can be defined as gp.
- You can change unfamiliar command words into familiar words or patterns. For instance, if you prefer the term “privilege” to the term “attribute” with reference to a login account’s read/write capabilities, you can change the CLI command from attrib to privileges.
- To reset commands set with alias back to their factory default, use the **user profile reset** command.

### Examples

```
-> alias gp group
-> alias privilege attrib
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show alias](#)

Lists all current commands defined by the use of the **alias** CLI command.

[user profile reset](#)

Resets the alias, prompt, and more values to their factory defaults.

## MIB Objects

N/A

---

## show alias

Displays all current commands defined by the use of the **alias** CLI command.

**show alias**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

The following will display where the alias **gp** was defined to replace the **group** command, and the alias **privilege** was defined to replace the **attrib** command.

```
-> show alias
gp:          group
privilege:  attrib
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**alias** Defines substitute command text for the switch's CLI command keywords.

### MIB Objects

N/A

---

## user profile save

Saves the user account settings for aliases, prompts, and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

user profile save

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to save alias definitions, prompt definitions, and more mode screen settings for use in future login sessions for the current user account.
- If you do not use the **user profile save**, **alias**, **prompt**, and **more size** commands, settings are lost when the user account logs off.
- Use the **user profile reset** command to set the alias, prompt, and more size values to their factory defaults.

### Examples

```
-> user profile save
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">alias</a>	Defines substitute command text for the switch's CLI command keywords.
<a href="#">prompt</a>	Defines substitute command text for the switch's CLI command keywords.
<a href="#">more size</a>	Specifies the number of lines that your console screen will display.
<a href="#">user profile reset</a>	Resets the alias, prompt and more values to their factory defaults.

### MIB Objects

N/A

---

## user profile reset

Resets the alias, prompt, and more values to their factory defaults.

user profile reset

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> user profile reset
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">alias</a>	Defines substitute command text for the switch's CLI command keywords.
<a href="#">prompt</a>	Defines substitute command text for the switch's CLI command keywords.
<a href="#">more size</a>	Specifies the number of lines that your console screen will display.
<a href="#">user profile save</a>	Saves the user account settings for aliases, prompts and the more screen.

### MIB Objects

N/A

---

## history size

Sets the number of commands that will be stored in the CLI's history buffer.

**history size** *number*

---

### Syntax Definitions

*number*

Enter an integer between 1 and 500. The history buffer can store up to 500 commands.

### Defaults

By default, the history buffer size is set to 100 commands.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> history size 10
```

### Release History

Release 6.1; command was introduced.

Release 6.1.5; history buffer size increased to 500.

### Related Commands

[show history](#)

Displays commands that you have recently issued to the switch. The commands are displayed in a numbered list.

!

Recalls commands listed in the history buffer and displays them at the CLI prompt.

### MIB Objects

N/A

---

## show history

Displays commands that you have recently issued to the switch. The commands are displayed in a numbered list.

**show history [parameters]**

---

### Syntax Definitions

**parameters** When this syntax is used, the CLI displays the history buffer size, the current number of commands in the history buffer, and the index range of the commands.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show history
1 show cmm
2 show fan
3 show sensor
4 show temp
5 show time
6 show arp
7 clear arp
8 show prefix
```

```
-> show history parameters
History size: 10
Current Size: 7
Index Range: 1-7
```

#### *output definitions*

---

<b>History Size</b>	The size of the history buffer.
<b>Current Size</b>	The number of commands currently stored in the history buffer for this session.
<b>Index Range</b>	The index range of the commands for this CLI session currently stored in the history buffer.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### history size

Sets the number of commands that will be stored in the CLI's history buffer.

!

Recalls commands listed in the history buffer and displays them at the CLI prompt.

## MIB Objects

N/A

---

**!**

Recalls commands listed in the history buffer and displays them at the CLI prompt.

!**{ | n**}

---

**Syntax Definitions**

<b>!</b>	Recalls the last command listed in the history buffer and displays that command at the CLI prompt.
<i>n</i>	Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

**Defaults**

N/A

**Platforms Supported**

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

**Usage Guidelines**

- You can use the **show history** command to list all commands in the history buffer, then use the **!*n*** syntax to issue a single command from the list.
- When you use **!*n*** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

**Examples**

```
-> show history
1* show cmm
2 show fan
3 show sensor
4 show temp
5 show time
6 show arp
7 clear arp
```

**Release History**

Release 6.1; command was introduced.

## Related Commands

### [history size](#)

Sets the number of commands that will be stored in the CLI's history buffer.

### [show history](#)

Displays commands you have recently issued to the switch. The commands are displayed in a numbered list.

## MIB Objects

N/A

---

## command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

**command-log** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Creates a file called <b>command.log</b> in the switch's <b>/flash</b> directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.
<b>disable</b>	Disables logging of current session commands to the <b>command.log</b> file.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

### Examples

```
-> command-log enable
-> command-log disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">show command-log</a>	Displays the contents of the <b>command.log</b> file.
<a href="#">show command-log status</a>	Shows the current status of the command logging function (i.e., enabled or disabled).

### MIB Objects

sessionCliCommandLogEnable

---

# kill

Kills an active session. The command takes effect immediately.

**kill** *session\_number*

---

## Syntax Definitions

*session\_number*                      Number of the session you want to kill.

## Defaults

N/A

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

## Examples

```
-> kill 3
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**who**                                      Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP, Secure Shell, and Secure Shell FTP).

## MIB Objects

```
SessionMgr  
  sessionIndex  
  sessionRowStatus
```

---

## exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

If changes were made using the CLI and have not been saved with the **reload issu** command, a warning message appears asking to confirm the user exit. To save changes, enter **N** at the warning prompt and use the **reload issu** command.

### Examples

```
-> exit
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**kill** Kills an active session. The command takes effect immediately.

### MIB Objects

```
SessionMgr  
  sessionIndex  
  sessionRowStatus
```

---

# whoami

Displays the current user session.

**whoami**

---

## Syntax Definitions

N/A

## Defaults

N/A

## Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

Use the **who** command to display all sessions on the switch.

## Examples

```
-> whoami
Session number = 5
  User name     = admin,
  Access type   = telnet,
  Access port   = NI,
  IP address    = 121.251.17.76,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
  End-User profile =
```

### *output definitions*

---

<b>Session Number</b>	The session number assigned to the user.
<b>User name</b>	User name.
<b>Access type</b>	Type of access protocol used to connect to the switch.
<b>Access port</b>	Switch port used for access during this session.
<b>Ip Address</b>	User IP address.
<b>Read-only domains</b>	The command domains available with the user's read-only access. See the table beginning on <a href="#">page 57-28</a> for a listing of valid domains.
<b>Read-only families</b>	The command families available with the user's read-only access. See the table beginning on <a href="#">page 57-28</a> for a listing of valid families.
<b>Read-Write domains</b>	The command domains available with the user's read-write access. See the table beginning on <a href="#">page 57-28</a> for a listing of valid domains.

*output definitions*

<b>Read-Write families</b>	The command families available with the user's read-write access. See the table beginning on <a href="#">page 57-28</a> for a listing of valid families.
<b>End-User Profile</b>	The name of an end-user profile associated with the user.

Possible values for command domains and families are listed here:

<b>domain</b>	<b>families</b>
domain-admin	file image bootrom telnet reset dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm flood health
domain-network	ip rip ospf bgp vrrp iprm ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	ldap dhcp dns
domain-policy	qos policy slb
domain-security	session binding avlan aaa

**Release History**

Release 6.1; command was introduced.

**Related Commands**

<b>who</b>	Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP, Secure Shell, and Secure Shell FTP).
<b>kill</b>	Kills another user's session.

## **MIB Objects**

### SessionActive

- sessionIndex
- sessionAccessType

---

## who

Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP, Secure Shell, and Secure Shell FTP).

**who**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

You can identify your current login session by using IP address.

### Examples

```

-> who
Session number = 0
  User name    = (at login),
  Access type  = console,
  Access port  = Local,
  IP address   = 0.0.0.0,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = None,
  Read-Write families = ,
  End-User profile =
Session number = 5
  User name    = admin,
  Access type  = telnet,
  Access port  = NI,
  IP address   = 128.251.17.176,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
  End-User profile =

```

### *output definitions*

---

<b>Session Number</b>	The session number assigned to the user.
<b>User name</b>	User name.
<b>Access type</b>	Type of access protocol used to connect to the switch.
<b>Access port</b>	Switch port used for access during this session.

### *output definitions (continued)*

---

<b>Ip Address</b>	User IP address.
<b>Read-only domains</b>	The command domains available with the user's read-only access. See the table beginning on <a href="#">page 57-31</a> for a listing of valid domains.
<b>Read-only families</b>	The command families available with the user's read-only access. See the table beginning on <a href="#">page 57-31</a> for a listing of valid families.
<b>Read-Write domains</b>	The command domains available with the user's read-write access. See the table beginning on <a href="#">page 57-31</a> for a listing of valid domains.
<b>Read-Write families</b>	The command families available with the user's read-write access. See the table beginning on <a href="#">page 57-31</a> for a listing of valid families.
<b>End-User Profile</b>	The name of an end-user profile associated with the user.

---

Possible values for command domains and families are listed here:

<b>domain</b>	<b>families</b>
domain-admin	file image bootrom telnet reset dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm flood health
domain-network	ip rip ospf bgp vrrp iprm ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	ldap dhcp dns
domain-policy	qos policy slb
domain-security	session binding avlan aaa

## **Release History**

Release 6.1; command was introduced.

## **Related Commands**

<a href="#">whoami</a>	Displays current user session.
<a href="#">kill</a>	Kills another user's session.

## **MIB Objects**

SessionActive

```
sessionIndex  
sessionAccessType  
sessionPhysicalPort  
sessionUserName  
sessionUserReadPrivileges  
sessionUserWritePrivileges  
sessionUserProfileNumber  
sessionUserIpAddress  
sessionRowStatus
```

---

## show session config

Displays session manager configuration information (e.g., default prompt, banner file name, inactivity timer, login timer, and login attempts).

**show session config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the configuration commands detailed in this section to modify any of the values displayed.

### Examples

```
-> show session config
```

```
Cli Default Prompt           = ->
Cli Banner File Name        = ,
Cli Inactivity Timer in minutes = 60
Ftp Banner File Name        = ,
Ftp Inactivity Timer in minutes = 60
Http Inactivity Timer in minutes = 60
Login Timer in seconds       = 60
Maximum number of Login Attempts = 2
```

#### *output definitions*

---

<b>Cli Default Prompt</b>	Default prompt displayed for CLI sessions.
<b>Cli Banner File Name</b>	Name of the file that contains the banner information that will appear during a CLI session.
<b>Cli Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.
<b>Ftp Banner File Name</b>	Name of the file that contains the banner information that will appear during an FTP session.
<b>Ftp Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.
<b>Http Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.

*output definitions (continued)*

---

<b>Login Timer in seconds</b>	The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.
<b>Maximum number of Login Attempts</b>	The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">session prompt</a>	Configures the default CLI prompt for console and Telnet sessions.
<a href="#">session banner</a>	Sets the file name of the user-defined banner.
<a href="#">session timeout</a>	Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface.
<a href="#">session login-attempt</a>	Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
<a href="#">session login-timeout</a>	Sets the amount of time the user can take to accomplish a successful login to the switch.

## MIB Objects

SessionConfigTable  
  sessionType  
  sessionBannerFileName  
  sessionInactivityTimerValue  
  sessionDefaultPromptString

---

## show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

```
show session xon-xoff
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the [session xon-xoff](#) command), traffic to the console port may be stopped.

### Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[session xon-xoff](#) Enables/disables the XON-XOFF protocol on the console port.

### MIB Objects

```
sessionXonXoffEnable
```

---

## more size

Specifies the number of lines that your console screen will display.

**more size** *lines*

---

### Syntax Definitions

*lines* Specify the number of lines for your console to display.

### Defaults

parameter	default
<i>lines</i>	128

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- If the display from the switch contains more lines than specified with this command, the switch will display only the number of lines specified. The last line on your console will display as follows:  

```
More? [next screen <sp>, next line <cr>, filter pattern </>, quit </>]
```
- To display more lines, press the spacebar to show another full screen, press Enter to show the next line, or press q to quit the display and return to the system prompt.

### Examples

```
-> more size 12  
-> more size 30
```

### Release History

Release 6.1; command was introduced.

### Related Commands

- [more](#) Enables the more mode for your console screen display.
- [show more](#) Shows the enable status of the more mode along with the number of lines specified for the screen display.

### MIB Objects

SystemServices  
  systemServicesArg1  
  systemServicesAction

---

## more

Enables the more mode for your console screen display.

**more**

**no more**

---

### Syntax Definitions

N/A

### Defaults

Disabled

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command enables the **more** mode where your console screen display is determined by the value set with the **more size** command.

### Examples

```
-> more
-> no more
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<b>show more</b>	Shows the number of TTY lines and columns to be displayed.
<b>more size</b>	Specifies the number of lines that your console screen will display.

### MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

---

## show more

Shows the enable status of the more mode along with the number of lines specified for the screen display.

`show more`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command shows the enable status of the **more** mode.
- The number of lines displayed is the value set with the **more size** command.

### Examples

```
-> show more
```

The more feature is enabled and the number of line is set to 12

### Release History

Release 6.1; command was introduced.

### Related Commands

**more**

Enables the more mode for your console screen display.

**more size**

Specifies the number of lines that your console screen will display.

### MIB Objects

---

## telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```
telnet {host_name | ip_address} [port port]
```

---

### Syntax Definitions

<i>host_name</i>	Specifies the host name for the Telnet session.
<i>ip_address</i>	Specifies the IP address for the Telnet session.
<i>port</i>	The Telnet port on the destination device. Valid range is from 1024 to 65535.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To abort a Telnet session, enter **CTRL + ]** and then **CTRL + D**. Refer to your switch's User Manual for more information on using Telnet.
- Refer to the table on [page 57-1](#) for number of sessions supported.

### Examples

```
-> telnet 172.17.6.228
Trying 172.17.6.228...
Connected to 172.17.6.228.
Escape character is '^]'.

```

### Release History

Release 6.1; command was introduced.

## Related Commands

### telnet6

Invokes a Telnetv6 session. A Telnetv6 session is used to connect to a remote system or device over an IPv6 network

### ssh

Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.

## MIB Objects

systemServicesArg1

systemServicesAction

---

## telnet6

Invokes a Telnetv6 session. A Telnetv6 session is used to connect to a remote system or device over an IPv6 network.

```
telnet6 {ipv6_address | hostname} [if_name] [port port]
```

---

### Syntax Definitions

<i>ipv6_address</i>	Specifies the IPv6 address for the Telnetv6 server.
<i>hostname</i>	Specifies the hostname for the Telnetv6 server.
<i>if_name</i>	The name of the interface used to reach the Telnetv6 server, if the target has been specified using the link-local address.
<i>port</i>	The Telnet port on the destination device. Valid range is from 1024 to 65535.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- To abort a Telnet session, enter **CTRL + ]** and then **CTRL + D**. Refer to your switch's User Manual for more information on using Telnet.
- If the session is invoked using the server's link-local address, the source interface name must be provided.
- Refer to the table on [page 57-1](#) for number of sessions supported.

### Examples

```
-> telnet6 fe80::a00:20ff:fea8:8961 intf1
-> telnet6 ::1
-> telnet6 Sun.com
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

### telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

### ssh6

Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.

## MIB Objects

SystemServices

systemServicesArg1

systemServicesAction

---

## ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

```
ssh {host_name | ip_address / enable / disable}
```

---

### Syntax Definitions

<i>host_name</i>	Specifies the host name for Secure Shell.
<i>ip_address</i>	Specifies the IP address for Secure Shell.
<b>enable</b>	Administratively enables Secure Shell on the switch.
<b>disable</b>	Administratively disables Secure Shell on the switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You must have a valid username and password for the specified host.
- Refer to the table on [page 57-1](#) for number of sessions supported.

### Examples

```
-> ssh enable
-> ssh 172.155.11.211
login as:
```

### Release History

Release 6.1; command was introduced.  
Release 6.1.3; **enable** and **disable** parameters added.

## Related Commands

<a href="#">telnet</a>	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```

---

## ssh6

Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.

```
ssh6 {ipv6_address | hostname} [if_name]
```

---

### Syntax Definitions

<i>ipv6_address</i>	Specifies the IPv6 address for Secure Shell.
<i>hostname</i>	Specifies the host name for Secure Shell.
<i>if_name</i>	The name of the interface used to reach the sshv6 server, if the target has been specified using the link-local address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You must have a valid username and password for the specified host.
- If the session is invoked using the server's link-local address, the source interface name must be provided.
- Refer to the table on [page 57-1](#) for number of sessions supported.

### Examples

```
-> ssh6 fe80::a00:20ff:fea8:8961 int1
-> ssh6 ::1
-> ssh6 Sun.com
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

<a href="#">telnet6</a>	Invokes a Telnetv6 session. A Telnetv6 session is used to connect to a remote system or device over an IPv6 network

## ssh enforce pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

**ssh enforce pubkey-auth {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enforces only SSH public key authentication.
<b>disable</b>	Enforces both SSH public key and password authentication.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Note that if a public key file (i.e., **thomas\_dsa.pub**) exists in the **flash/network/pub** directory on the switch, public key authentication is used even if this method of authentication is disabled using this command. Rename, move, or delete the public key file to ensure that public key authentication is disabled.

### Examples

```
-> ssh enforce pubkey-auth enable
```

### Release History

Release 6.1.3; command was introduced.

### Related Commands

<b>telnet</b>	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

## show ssh config

Displays the status of Secure Shell, SCP/SFTP on the switch.

**show ssh config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show ssh config
SSH = Enabled
SCP/SFTP = Enabled
Public Key Authentication Enforced = False
```

### *output definitions*

---

<b>SSH</b>	Displays the SSH status ( <b>enabled</b> or <b>disabled</b> ).
<b>SCP/SFTP</b>	Displays the SCP/SFTP status ( <b>enabled</b> or <b>disabled</b> ).
<b>Public Key Authentication Enforced</b>	Displays whether the Public Key Authentication is enforced. Options include <b>true</b> or <b>false</b> .

---

### Release History

Release 6.1.3; command was introduced.

## Related Commands

### ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

### ftp6

Enables or disables secure copy (SCP) and secure FTP (SFTP) at the same time on the switch.

## MIB Objects

alaSshConfigGroup

alaSshAdminStatus

alaScpSftpAdminStatus

alaSshPubKeyEnforceAdminStatus

---

## show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to [page 57-24](#).

**show command-log**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **show command-log** command lists CLI commands in the *descending order*. In other words, the most recent commands are listed first. In the example below, the **command-log enable** syntax is the *least recent* command logged; the **ip interface Marketing address 17.11.5.2 vlan 255** syntax is the *most recent*.
- By default, command logging is disabled. To enable command logging on the switch, use the **command-log** command.
- As mentioned above, command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

### Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date      : FRI JAN 09 00:20:01
  Ip Addr   : 128.251.19.240
  Result    : SUCCESS

Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date      : FRI JAN 09 00:19:44
  Ip Addr   : 128.251.19.240
  Result    : ERROR: Ip Address must not belong to IP VLAN 44 subnet

Command : command-log enable
  UserName : admin
  Date      : FRI JAN 09 00:18:49
  Ip Addr   : 128.251.19.240
  Result    : SUCCESS
```

*output definitions*

---

<b>Command</b>	The exact syntax of the command, as entered by the user.
<b>UserName</b>	The name of the user session that entered the command. For more information on different user session names, refer to the <a href="#">user command on page 36-49</a> , or the “Managing Switch User Accounts” chapter in the <i>OmniSwitch AOS Release 6 Switch Management Guide</i> .
<b>Date</b>	The date and time, down to the second, when the command was entered.
<b>IpAddr</b>	The IP address of the terminal from which the command was entered.
<b>Result</b>	The outcome of the command entry. Options include <b>SUCCESS</b> and <b>ERROR</b> . For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.

---

**Release History**

Release 6.1; command was introduced.

**Related Commands**

---

## show command-log status

Shows the current status of the command logging function (i.e., enabled or disabled). For more information on enabling and disabling command logging, refer to the [command-log command on page 57-24](#).

**show command-log status**

---

### Syntax Definitions

N/A

### Defaults

Command logging is disabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show command-log status
CLI command logging : Enable
```

### *output definitions*

---

<b>CLI command logging</b>	The current status of command logging on the switch. Options include <b>Disable</b> and <b>Enable</b> . Disable indicates that the command logging function is currently disabled (default). Enable indicates that the command logging function has been enabled via the <a href="#">command-log</a> command. For more information, refer to <a href="#">page 57-24</a> .

# 58 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the switch's memory.

MIB information for the system commands is as follows:

*Filename:* AlcatelIND1System.mib  
*Module:* ALCATEL-IND1-SYSTEM-MIB

*Filename:* AlcatelIND1Chassis.mib  
*Module:* ALCATEL-IND1-CHASSIS-MIB

*Filename:* AlcatelIND1Ssh.mib  
*Module:* ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

---

<b>File System</b>	<b>cd</b> <b>pwd</b> <b>mkdir</b> <b>rmdir</b> <b>ls</b> <b>dir</b> <b>rename</b> <b>rm</b> <b>delete</b> <b>cp</b> <b>scp</b> <b>mv</b> <b>move</b> <b>chmod</b> <b>attrib</b> <b>freespace</b> <b>fsck</b> <b>newfs</b> <b>rcp</b> <b>rrm</b> <b>rls</b>
<b>System Services</b>	<b>vi</b> <b>view</b> <b>tty</b> <b>show tty</b> <b>more</b> <b>ftp</b> <b>ftp6</b> <b>scp-sftp</b> <b>show ssh config</b> <b>sftp</b> <b>sftp6</b> <b>tftp</b> <b>rz</b>

---

## cd

Changes the switch's current working directory.

**cd** [*path*]

---

### Syntax Definitions

*path* Specifies a particular working directory. If no path is specified, the switch's working directory is changed to the top level.

### Defaults

The switch's default working directory is **/flash**.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories, including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

### Examples

```
-> cd  
-> cd test_path
```

### Release History

Release 6.1; command was introduced.

**Related Commands**

<b>pwd</b>	Displays the switch's current working directory.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>dir</b>	Displays the contents of a specified directory or the current working directory.

**MIB Objects**

systemServices  
systemServicesWorkingDirectory

---

## pwd

Displays the switch's current working directory.

pwd

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> pwd  
/flash
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">cd</a>	Changes the switch's current working directory.
<a href="#">mkdir</a>	Creates a new directory.
<a href="#">rmdir</a>	Deletes an existing directory.
<a href="#">ls</a>	Displays the contents of a specified directory or the current working directory.
<a href="#">dir</a>	Displays the contents of a specified directory or the current working directory.

### MIB Objects

```
systemServices  
  systemServicesWorkingDirectory
```

---

## mkdir

Creates a new directory.

```
mkdir [path]/dir
```

---

### Syntax Definitions

*path*

The path in which the new directory is being created. If no path is specified, the new directory is created in the current path.

*dir*

A user-defined name for the new directory. Up to thirty-two (32) characters may be used (e.g., **test\_directory**).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate path directories with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

### Examples

```
-> mkdir test_directory  
-> mkdir flash/test_directory
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>cd</b>	Changes the switch's current working directory.
<b>pwd</b>	Displays the switch's current working directory.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>dir</b>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## rmdir

Deletes an existing directory.

**rmdir** [*path*]/*dir*

---

### Syntax Definitions

<i>path</i>	The path containing the directory to be removed. If no path is specified, the command assumes the current path.
<i>dir</i>	The name of the existing directory being removed. Up to thirty-two (32) characters may be used (e.g., <b>test_directory</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate path directories with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for the specified path.
- This command can also be used on the secondary CMM.

### Examples

```
-> rmdir ../working  
-> rmdir flash/working
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<b>cd</b>	Changes the switch's current working directory.
<b>pwd</b>	Displays the switch's current working directory.
<b>mkdir</b>	Creates a new directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>dir</b>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## ls

Displays the contents of a specified directory or the current working directory.

**ls** [-r] [[*path*]/*dir*]

---

### Syntax Definitions

<b>-r</b>	Optional syntax that displays the contents of the current directory in addition to <i>recursively</i> displaying all subdirectories. Be sure to include a space between the syntax <b>ls</b> and <b>-r</b> (i.e., <b>ls -r</b> ).
<i>path/</i>	Specifies the path (i.e., location) of a particular directory to be displayed. If no path is specified, the command assumes the current location.
<i>dir</i>	Specifies a particular directory to be displayed. If no directory name is specified, the contents of the current working directory are displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate multiple path directories with a slash (/).
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

## Examples

```
-> ls
```

```
Listing Directory /flash:
```

```
-rw      268 Oct  2 09:54 boot.params
drw     2048 Sep 29 15:36 certified/

## Related Commands

<b>cd</b>	Changes the switch's current working directory.
<b>pwd</b>	Displays the switch's current working directory.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>dir</b>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## dir

Displays the contents of a specified directory or the current working directory.

**dir** *[[path/]dir]*

---

### Syntax Definitions

*path/*

Specifies the path (i.e., location) of a particular directory to be displayed. If no path is specified, the command assumes the current location.

*dir*

Specifies a particular directory to be displayed. If no directory name is specified, the contents of the current working directory are displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate multiple path directories with a slash (/).
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

## Examples

```
-> dir /certified
```

```
Listing Directory /certified:
```

```
drw      2048 Jul  8 11:05 ./
drw      2048 Aug 21 13:54 ../
-rw     3555538 Jul  5 09:37 Jeni.img

```

```
2390016 bytes free
```

## Release History

Release 6.1; command was introduced.

## Related Commands

<b>cd</b>	Changes the switch's current working directory.
<b>pwd</b>	Displays the switch's current working directory.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg22
  systemServicesAction
```

---

## rename

Renames an existing file or directory.

```
rename [path]/old_name [path]/new_name
```

---

### Syntax Definitions

<i>path</i> /	Specifies the particular path (i.e., location) containing the file or directory to be renamed. If no path is specified, the command assumes the current directory.
<i>old_name</i>	The name of the existing file or directory to be renamed.
<i>new_name</i>	The new user-defined file or directory name. Up to thirty-two (32) characters may be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

### Examples

```
-> rename flash/working/asc.1.snap new_file
```

### Release History

Release 6.1; command was introduced.

## Related Commands

<code>cp</code>	Copies an existing file or directory.
<code>mv</code>	Moves an existing file or directory to a new location.
<code>move</code>	Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## rm

Permanently deletes an existing file. This command can also delete a directory if the `-r` keyword is used.

**rm** [-r] [path/]filename

---

### Syntax Definitions

<b>-r</b>	Syntax that <i>recursively</i> removes directories, as well as any associated subdirectories and files. Be sure to include a space between the syntax <b>rm</b> and <b>-r</b> (i.e., <b>rm -r</b> ).
<i>path</i>	The path (i.e., location) containing the file being removed. If no path is specified, the command assumes the current directory.
<i>filename</i>	The name of the existing file being deleted. Up to thirty-two (32) characters may be used (e.g., <b>test_config_file</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

### Examples

```
-> rm test_config_file
-> rm flash/test_config_file
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[delete](#) Deletes an existing file.

## **MIB Objects**

systemServices

    systemServicesArg1

    systemServicesAction

---

## delete

Deletes an existing file.

**delete** [*path/*]*filename*

---

### Syntax Definitions

*path/*

The path (i.e., location) containing the file being removed. If no path is specified, the command assumes the current directory.

*filename*

The name of the existing file being removed. Up to thirty-two (32) characters may be used (e.g., **test\_config\_file**).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

### Examples

```
-> delete test_config_file
-> delete flash/test_config_file
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**rm** Deletes an existing file or directory.

### MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## cp

Copies an existing file. This command can also copy a directory if the `-r` keyword is used.

```
cp [-r] [path/]orig_filename [dest_path/]dupl_filename
```

---

### Syntax Definitions

<code>-r</code>	Syntax that <i>recursively</i> copies directories, as well as any associated subdirectories and files. Be sure to include a space between the syntax <code>cp</code> and <code>-r</code> (i.e., <code>cp -r</code> ).
<code>path/</code>	Specifies the path containing the original file to be copied. If no path name is specified, the command assumes the current path.
<code>orig_filename</code>	The name of the existing file to be copied.
<code>dest_path/</code>	Specifies the destination path for the resulting file copy. If no destination path is specified, the file copy will be placed in the current path.
<code>dupl_filename</code>	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original. Up to thirty-two (32) characters may be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You should verify that your switch's `/flash` directory has enough available memory to hold the new files and directories that will result from using the `cp -r` command.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including `/flash`.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

## Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**mv** Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## scp

Copies an existing file in a secure manner.

```
scp user_name@remote_ip_addr:[path/]source [path/]target
```

```
scp [path/]source user_name@remote_ip_addr:[path/]target
```

---

### Syntax Definitions

<i>user_name@remote_ip_addr:</i>	The username along with the IP address of the remote switch.
<i>path/</i>	Specifies the path containing the file to be copied and the path where the file will be copied.
<i>source</i>	The name of the file(s) to be copied.
<i>target</i>	The new user-defined file name for the resulting file copy. Up to thirty-two (32) characters may be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- If SCP is not enabled, use the **ftp6** command to enable it.
- SCP is not supported between OmniSwitch and Windows currently.

## Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
```

## Release History

Release 6.1.2; command was introduced.

## Related Commands

**mv** Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## mv

Moves an existing file or directory to a new location.

```
mv {[path/]filename dest_path[/new_filename]} | {[path/]dir dest_path[/new_dir]}
```

---

### Syntax Definitions

<i>path/</i>	Specifies the path (i.e., location) containing the file or directory being moved. If no path name is specified, the command assumes the current path.
<i>filename</i>	Specifies the name of the existing file to be moved.
<i>dest_path/</i>	Specifies the destination path (i.e., new location) for the file or directory that is being moved.
<i>new_filename</i>	Specifies a new file name for the file being moved. If a new name is not specified, the existing name will be used.
<i>dir</i>	Specifies the name of the existing directory to be moved.
<i>new_dir</i>	Specifies a new directory name for the directory being moved. If a new name is not specified, the existing name will be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the [cp command on page 58-19](#).
- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

### Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**rename**                      Renames an existing file or directory.  
**cp**                              Copies an existing file or directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## move

Moves an existing file or directory to a new location.

```
move {[path/]filename dest_path[/new_filename] | [path/]dir dest_path[/new_dir]}
```

---

### Syntax Definitions

<i>path/</i>	Specifies the path (i.e., location) containing the file or directory being moved. If no path name is specified, the command assumes the current path.
<i>filename</i>	Specifies the name of the existing file to be moved.
<i>dest_path</i>	Specifies the destination path (i.e., new location) for the file or directory that is being moved.
<i>/new_filename</i>	Specifies a new file name for the file being moved. If a new name is not specified, the existing name will be used.
<i>dir</i>	Specifies the name of the existing directory to be moved.
<i>/new_dir</i>	Specifies a new directory name for the directory being moved. If a new name is not specified, the existing name will be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **move** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Be sure to separate path directories and file names with a slash (/). Refer to the examples below.
- Up to 255 characters may be used for a fully qualified path.
- A path can contain up to a maximum of seven (7) directories including **/flash**.
- As with files names, up to thirty-two (32) characters may be used for a directory name.
- File and directory names can include only the following character types: a-z, A-Z, 0-9, dashes (-), dots (.), and underscores (\_).
- This command can also be used on the secondary CMM.

### Examples

```
-> move flash/asc.1.snap flash/backup_files/asc.1.snap
```

## Release History

Release 6.1; command was introduced.

## Related Commands

**rename**                      Renames an existing file or directory.  
**cp**                              Copies an existing file or directory.

## MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesArg2  
  systemServicesAction
```

---

## chmod

Changes the write privileges for a specified file.

```
chmod {+w | -w} [path/]file
```

---

### Syntax Definitions

<code>+w</code>	Enables read-write privileges for the file.
<code>-w</code>	Disables write privileges for the file—i.e., the file becomes read-only.
<code>path/</code>	The path containing the file for which privileges are being changed. Be sure to separate path directories and file names with a slash (/). Up to 255 characters may be used for the specified path. Also, a path may contain a maximum of thirty-two (32) directories.
<code>file</code>	The name of the file for which read-write privileges are being changed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> chmod +w vlan.config  
-> chmod -w flash/backup_configs/vlan.config
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[attrib](#) Changes the write privileges for a specified file.

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## attrib

Changes the write privileges for a specified file.

```
attrib {+w | -w} [path]/file
```

---

### Syntax Definitions

<i>+w</i>	Enables read-write privileges for the file.
<i>-w</i>	Disables write privileges for the file—i.e., the file becomes read-only.
<i>path/</i>	The path containing the file for which write privileges are being changed. Be sure to separate path directories and file names with a slash (/). Up to 255 characters may be used for the specified path. Also, a path may contain a maximum of thirty-two (32) directories.
<i>file</i>	The name of the file for which write privileges are being changed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> attrib +w vlan.config  
-> attrib -w flash/backup_configs/vlan.config
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[chmod](#) Changes the write privileges for a specified file.

## freespace

Displays the amount of free space available in the **/flash** directory.

**freespace** [/flash]

---

### Syntax Definitions

**/flash** Optional syntax. The amount of free space is shown for the **/flash** directory.

### Defaults

N/A

### Usage Guidelines

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Examples

```
-> freespace /flash
/flash 3143680 bytes free
```

```
-> freespace
/flash 3143680 bytes free
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**fsc** Performs a file system check, including diagnostic information in the event of file corruption. If the **fsc** command detects a problem with the **/flash** file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

### MIB Objects

SystemFileSystemTable  
    systemFileSystemFreespace

---

## fsck

Performs a file system check, including diagnostic information in the event of file corruption.

**fsck /flash [no-repair | repair]**

---

### Syntax Definitions

<b>/flash</b>	Indicates that the file system check will be performed on the <b>/flash</b> directory.
<b>no-repair</b>	Performs only the file system check on the <b>/flash</b> directory.
<b>repair</b>	Performs file system check on the <b>/flash</b> directory and also repairs any errors found on the file system.

### Defaults

parameter	default
<b>no-repair   repair</b>	<b>no-repair</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The file system check is performed on the **/flash** directory by default.
- Specifying the parameter **repair** along with the command performs the file system check and also repairs any errors found. The switch will display the errors found and specify those errors that have been repaired. If there are no errors found, then just the file system information is displayed.
- This command only applies to the primary and secondary CMM in an OmniSwitch chassis-based switch or the primary and secondary switch in an OmniSwitch stack.

### Examples

```
-> fsck /flash no-repair
/flash/ - disk check in progress ...
/flash/ - Volume is OK

        total # of clusters: 29,758
        # of free clusters: 18,886
        # of bad clusters: 0
        total free space: 77,357,056
max contiguous free space: 55,451,648 bytes
        # of files: 59
        # of folders: 5
total bytes in files: 44,357,695
        # of lost chains: 0
total bytes in lost chains: 0
```

```
(Example Continued on Next Page)
-> fsck /flash repair
/flash/ - disk check in progress ...
/flash/ - Volume is OK
Change volume Id from 0x0 to 0xef2e3c
```

```
total # of clusters: 29,758
# of free clusters: 18,886
# of bad clusters: 0
total free space: 77,357,056
max contiguous free space: 55,451,648 bytes
# of files: 59
# of folders: 5
total bytes in files: 44,357,695
# of lost chains: 0
total bytes in lost chains: 0
```

## Release History

Release 6.1; command was introduced.

Release 6.3.3; **no-repair** and **repair** parameters added.

## Related Commands

### [freespace](#)

Displays the amount of free space available in the **/flash** directory.

## MIB Objects

```
systemServices
  systemServicesArg1

```

---

## newfs

Deletes the complete file system and all files within it, replacing it with a new, empty file system. Use this command when you want to reload all files in the file system or in the unlikely event that the file system becomes corrupt.

**newfs** {/flash | /uflash}

---

### Syntax Definitions

**/flash** This indicates that the complete flash file system will be replaced.

**/uflash** This indicates that the complete uflash file system will be replaced.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.
- This command can also be used on the secondary CMM.

### Examples

```
-> newfs /flash  
-> newfs /uflash
```

### Release History

Release 6.1; command was introduced.

Release 6.4.3; **/uflash** parameter was added.

### Related Commands

N/A

## rcp

Copies a file from a primary to a non-primary switch in a stack and vice versa.

**rcp** [**cmm-b:** | *slot:*] *source\_filepath* [**cmm-b:** | *slot:*] *destination\_filepath*

---

### Syntax Definitions

<i>slot</i>	The slot number of the non-primary switch in a stack.
<i>source_filepath</i>	The name and path of the source file.
<i>destination_filepath</i>	The name and path of the destination file.
<b>cmm-b:</b>	Specifies the secondary CMM. This parameter is available on OmniSwitch chassis-based switches only.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X, 9000E

### Usage Guidelines

- On OmniSwitch chassis-based switches this command copies any file from the secondary CMM to the primary CMM.
- On OmniSwitch stackable switches this command copies a file from any non-primary switch to the primary switch in a stack. You must specify the slot number on these switches.

### Examples

```
-> rcp 3:/flash/file.txt file.txt
-> rcp /flash/working/file.txt 3:/flash/working/file.txt
-> rcp cmm-b:/flash/file.txt file.txt

-> rcp /flash/working/file.txt cmm-b:/flash/working/file.txt
```

### Release History

Release 6.1; command was introduced.

## Related Commands

- rrm** Removes a file from a secondary CMM or from a non-primary switch in a stack.
- rls** Displays the content of a non primary CMM in a switch or a non-primary switch in a stack.

## MIB Objects

  chasSupervisionRfsCommandsDestFileName
```

---

## rrm

Removes a file from a secondary CMM in a switch or from a non-primary switch in a stack.

**rrm** *slot* *filepath*

---

### Syntax Definitions

*slot* The slot number of the non-primary switch in a stack.

*filepath* The name and path of the file to be deleted.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X, 9000E

### Usage Guidelines

- On OmniSwitch chassis-based switches this command deletes any file from the secondary CMM.
- On OmniSwitch stackable switches this command deletes a file from any non-primary switch. You must specify the slot number on these switches.

### Examples

```
-> rrm 5 /flash/boot.params
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**rcp** Copies a file from a secondary CMM to a primary CMM or from a non-primary switch to a primary switch in a stack.

**rls** Displays the content of a non primary CMM in a switch or a non-primary switch in a stack.

  chasSupervisionRfsCommandsSlot  
  chasSupervisionRfsCommandsCommand  
  chasSupervisionRfsCommandsSrcFileName

---

## rls

Displays the content of a non primary CMM in a switch or a non-primary switch in a stack.

**rls** *slot directory* [*file\_name*]

---

### Syntax Definitions

<i>slot</i>	The slot number of the non-primary switch in a stack. <i>This parameter is only required on a stack of switches.</i>
<i>directory</i>	The name of the directory on the non-primary CMM or switch.
<i>file_name</i>	The file to be displayed on the non-primary CMM or switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855-U24X, 9000E

### Usage Guidelines

- On OmniSwitch chassis-based switches this command displays directory content on the secondary CMM.
- On OmniSwitch stackable switches, this command displays directory content on any non-primary switch in a stack. You must specify the slot number on these switches.

### Examples

On OmniSwitch 6850 Series switches:

```
-> rls 5 /flash
-rw      324  Mar  3 11:32  boot.params
drw     2048  Mar  3 11:32  certified/
drw     2048  Mar  3 11:32  working/
-rw    64000  Mar  7 09:54  swlog1.log
-rw       29  Feb  5 2023  policy.cfg
-rw   3369019  Mar  3 11:20  cs_system.pmd
-rw   394632  Jan  1 1980  bootrom.bin
-rw   511096  Jan  1 1980  miniboot.backup
-rw   511096  Jan  1 1980  miniboot.default
drw     2048  Feb 25 06:34  network/
drw     2048  Mar  3 11:29  switch/
-rw       256  Mar  3 11:29  random-seed
```

### Release History

Release 6.1; command was introduced.

## Related Commands

- rcp** Copies a file from a secondary CMM to a primary CMM or from a non-primary switch to a primary switch in a stack.
- rrm** Removes a file from a secondary CMM or from a non-primary switch in a stack.

  chasSupervisionRfsLsFileDateTime

---

## vi

Launches the switch's UNIX-like Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

**vi** [*path*]/*filename*

---

### Syntax Definitions

*path* The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.

*filename* The name of the existing file being viewed or edited. Up to thirty-two (32) characters may be used (e.g., **test\_config\_file**).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

### Examples

```
-> vi test_config_file
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**view** Allows you to view the contents of a specified file by invoking the Vi text editor in read-only mode.

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## view

Allows you to view the contents of a specified file by invoking the Vi text editor in read-only mode.

**view** [*path*]/*filename*

---

### Syntax Definitions

<i>path</i>	The path directory leading to the file being viewed. If no path is specified, the command assumes the current directory.
<i>filename</i>	The name of the existing file being viewed. Up to thirty-two (32) characters may be used (e.g., <b>test_config_file</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> view flash/text_file.txt
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**vi** Launches the switch's Vi text editor.

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

**tty** *lines columns*

---

### Syntax Definitions

*lines* The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.

*columns* The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

### Defaults

parameter	default
<i>lines</i>	24
<i>columns</i>	80

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The number of lines and columns set with this command control the screen size when the switch is editing or viewing a text file with the **vi** or **more** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

### Examples

```
-> tty 10 60
```

### Release History

Release 6.1; command was introduced.

## Related Commands

[show tty](#)

Displays current TTY settings.

[more](#)

Displays a switch text file onto the console screen.

## MIB Objects

---

## show tty

Displays current TTY settings.

```
show tty
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Shows the settings made with the `tty` command.
- This command can also be used on the secondary CMM.

### Examples

```
-> show tty  
lines = 24, columns = 80
```

### Release History

Release 6.1; command was introduced.

### Related Commands

`tty` Specifies the number of TTY lines and columns to be displayed.

### MIB Objects

```
systemServices  
  systemServicesTtyLines

```

---

## more

Displays a switch text file onto the console screen.

**more** [*path*]/*file*

---

### Syntax Definitions

*path* The directory path leading to the file to be displayed. If no path is specified, the command assumes the current path.

*file* The name of the text file to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- This command displays the specified text file within the line and column parameters set with the **tty** command.
- If the specified text file contains more columns than set with the **tty** command, the text will wrap to the next line displayed.
- If the text file contains more lines than set with the **tty** command, the switch will display only the number of lines specified. To display more lines, press the spacebar to show another full screen, press Enter to show the next line, or press q to quit the display and return to the system prompt.
- This command can also be used on the secondary CMM.

### Examples

```
-> more config_file1  
-> more flash/config_file1  
-> more flash/working/config_file1
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**tty** Specifies the number of TTY lines and columns to be displayed.

## **MIB Objects**

systemServices

## ftp

Starts an FTP session.

**ftp** {*host\_name* | *ip\_address*}

---

### Syntax Definitions

*host\_name* Specifies the host name for the FTP session.

*ip\_address* Specifies the IP address for the FTP session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You must have a valid username and password for the specified host.
- You can establish up to 9 FTP sessions from an OmniSwitch (when it acts as FTP Client) and up to 4 FTP sessions towards an OmniSwitch (when it acts as FTP Server).
- After logging in, FTP commands are supported. They are defined in the following table:

<b>ascii</b>	Set transfer type to ASCII (7-bit).
<b>binary</b>	Set transfer type to binary (8-bit).
<b>bye</b>	Close session gracefully.
<b>cd</b>	Change to a new directory on the remote machine.
<b>delete</b>	Delete a file on the remote machine.
<b>dir</b>	Obtain a long listing on the remote machine.
<b>get</b>	Retrieve a file from the remote machine.
<b>hash</b>	Print the hash symbol (#) for every block of data transferred. (This command toggles hash enabling and disabling.)
<b>ls</b>	Display summary listing of the current directory on the remote host.
<b>put</b>	Send a file to the remote machine.
<b>pwd</b>	Display the current working directory on the remote host.
<b>quit</b>	Close session gracefully.
<b>remotehelp</b>	List the commands that the remote FTP server supports.
<b>user</b>	Send new user information.
<b>lpwd</b>	Display the current working directory on the local host.
<b>?</b>	Display list of available FTP commands.

## Examples

```
-> ftp 172.17.6.228
Connecting to 172.17.6.228 [172.17.6.228]...connected.
220 Annex FTP server (Version RA4000 R14.1.15) ready.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## ftp6

Starts an FTPv6 session.

**ftp6** {*ipv6\_address* | *hostname*} [*if\_name*]

---

### Syntax Definitions

<i>ipv6_address</i>	Specifies the IPv6 address of the FTPv6 server.
<i>hostname</i>	Specifies the hostname of the FTPv6 server.
<i>if_name</i>	The name of the interface used to reach the FTPv6 server, if the target has been specified using the link-local address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You must have a valid username and password for the specified host.
- A console, a telnet or an SSH session can handle only one FTPv6 client session.
- You can establish up to 9 FTP or FTPv6 sessions from an OmniSwitch (when it acts as FTP Client) and up to 4 FTP or FTPv6 sessions towards an OmniSwitch (when it acts as FTP Server).
- If the session is invoked using the server's link-local address, the source interface name must be provided.
- After logging in, FTPv6 commands are supported. They are defined in the following table:

<b>ascii</b>	Set transfer type to ASCII (7-bit).
<b>binary</b>	Set transfer type to binary (8-bit).
<b>bye</b>	Close session gracefully.
<b>cd</b>	Change to a new directory on the remote machine.
<b>close</b>	Terminate the ftp session.
<b>delete</b>	Delete a file on the remote machine.
<b>dir</b>	Obtain a long listing on the remote machine.
<b>get</b>	Retrieve a file from the remote machine.
<b>hash</b>	Print the hash symbol (#) for every block of data transferred. (This command toggles hash enabling and disabling.)
<b>help</b>	Display list of available FTP commands.
<b>lcd</b>	Change to a new directory on the local machine.

<b>ls</b>	Display summary listing of the current directory on the remote host.
<b>?</b>	Display list of available FTP commands.
<b>mgets</b>	Receive multiple files.
<b>mputs</b>	Receive multiple files.
<b>prompt</b>	Enable/disable interactive prompting.
<b>put</b>	Send a file to the remote machine.
<b>pwd</b>	Print current working directory.
<b>quit</b>	Close session gracefully.
<b>remotehelp</b>	List the commands that the remote FTP server supports.
<b>user</b>	Send new user information.
<b>ls</b>	Display list content of local directory.

### Examples

```
-> ftp6 fe80::a00:20ff:fea8:8961 int3
-> ftp6 ::5

    alaScpSftpAdminStatus

    alaSshPubKeyEnforceAdminStatus

---

## sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

**sftp** {*host\_name* | *ip\_address*}

---

### Syntax Definitions

*host\_name* Specifies the host name for the SFTP session.

*ip\_address* Specifies the IP address for the SFTP session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You must have a valid username and a password for the specified host.
- If SFTP is not enabled, use the **ftp6** command to enable it.
- You can establish up to 4 SFTP sessions from an OmniSwitch (when it acts as FTP Client) and up to 8 SFTP sessions towards an OmniSwitch (when it acts as FTP Server).
- After logging in, SFTP commands are supported. They are defined in the following table:

<b>cd path</b>	Change remote path to 'path'.
<b>lcd path</b>	Change local directory to 'path'.
<b>chmod mode path</b>	Change permissions of file 'path' to 'mode'.
<b>help</b>	Display command help information.
<b>get remote-path [local path]</b>	Download a file from the remote path to the local path.
<b>lls [path]</b>	Display local directory listing.
<b>ln oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>symlink oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>mkdir path</b>	Create local directory.
<b>lpwd</b>	Print local working directory.
<b>ls [path]</b>	Display remote directory listing.
<b>mkdir path</b>	Create remote directory.
<b>put local-path [remote-path]</b>	Upload file.
<b>pwd</b>	Display remote working directory.
<b>exit</b>	Quit the sftp mode.

<b>quit</b>	Exit the sftp mode.
<b>rename oldpath newpath</b>	Rename a remote file.
<b>rmdir path</b>	Remove remote directory.
<b>rm path</b>	Delete remote file.
<b>version</b>	Show the current SFTP version.
<b>?</b>	Synonym for help. Displays command help information.

## Examples

```
-> sftp 12.251.11.122  
login as:
```

## Release History

Release 6.1; command was introduced.

---

## sftp6

Starts an SFTPv6 session. An SFTPv6 session provides a secure file transfer method.

**sftp6** {*host\_name* | *ipv6\_address*} [*if\_name*]

---

### Syntax Definitions

<i>host_name</i>	Specifies the host name for the SFTPv6 session.
<i>ipv6_address</i>	Specifies the IPv6 address for the SFTPv6 session.
<i>if_name</i>	The name of the interface used to reach the SFTPv6 server, if the target has been specified using the link-local address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- You must have a valid username and a password for the specified host.
- A console or a telnet session can handle only one SSHv6 client session.
- If the session is invoked using the server's link-local address, the source interface name must be provided.
- You can establish up to 4 SFTP6 sessions from an OmniSwitch (when it acts as FTP Client) and up to 8 SFTP6 sessions towards an OmniSwitch (when it acts as FTP Server).
- At anytime, there can be only 4 SFTP sessions (including SFTPv4 or SFTPv6) to any SSH servers.
- After logging in, SFTPv6 commands are supported. They are defined in the following table:

<b>cd path</b>	Change remote path to 'path'.
<b>lcd path</b>	Change local directory to 'path'.
<b>chmod mode path</b>	Change permissions of file 'path' to 'mode'.
<b>help</b>	Display command help information.
<b>get remote-path [local path]</b>	Download a file from the remote path to the local path.
<b>lls [path]</b>	Display local directory listing.
<b>ln oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>symlink oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>mkdir path</b>	Create local directory.
<b>lpwd</b>	Print local working directory.
<b>ls [path]</b>	Display remote directory listing.

<b>mkdir path</b>	Create remote directory.
<b>put local-path [remote-path]</b>	Upload file.
<b>pwd</b>	Display remote working directory.
<b>exit</b>	Quit the sftp mode.
<b>quit</b>	Exit the sftp mode.
<b>rename oldpath newpath</b>	Rename a remote file.
<b>rmdir path</b>	Remove remote directory.
<b>rm path</b>	Delete remote file.
<b>version</b>	Show the current SFTP version.
<b>?</b>	Synonym for help. Displays command help information.

### Examples

```
-> sftp6 fe80::a00:20ff:fea8:8961 int1
-> sftp6 ::1
-> sftp6 Sun.com
```

### Release History

Release 6.3.1; command was introduced.

### Related Commands

<b>ftp6</b>	Starts an FTP6 session.
<b>ssh6</b>	Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.

### MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

---

## tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

```
tftp {host_name | ip_address} {get | put} source-file [src_path]/src_file [destination-file [dest_path]/dest_file] [ascii]
```

---

### Syntax Definitions

<i>host_name</i>	Specifies the hostname of the TFTP server.
<i>ip_address</i>	Specifies the IP address of the TFTP server.
<b>get</b>	Specifies to download the file from the TFTP server.
<b>put</b>	Specifies to upload the file to the TFTP server.
<i>src_path</i>	Specifies the path containing the source file to be transferred.
<i>src_file</i>	Specifies the file name of the source file to be transferred.
<i>dest_path</i>	Specifies the destination path of the file to be transferred.
<i>dest_file</i>	Specifies the destination file name of the file to be transferred.
<b>ascii</b>	Sets the transfer type to ASCII (7-bit).

### Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a destination filename is not specified, the source filename is used by default.
- The default file transfer mode for a TFTP client session is Binary mode.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- Only one active TFTP client session is allowed at a time.
- When downloading a file to the switch, the file size must not exceed the available flash space.

## Examples

```
-> tftp tftp.server.com get source-file abc.img destination-file xyz.img
-> tftp tftp.server.com put source-file abc.txt destination-file xyz.txt ascii
-> tftp 10.211.17.1 get source-file boot.cfg destination-file /flash/working/
boot.cfg ascii
-> tftp 10.211.17.1 get source-file boot.cfg ascii
```

## Release History

Release 6.3.3; command was introduced.

## Related Commands

N/A

## MIB Objects

```
systemServices

  systemServicesArg2
  systemServicesArg3
  systemServicesArg4
  systemServicesArg5
  systemServicesAction
```

---

## **rz**

Starts a Zmodem session.

**rz**

---

### **Syntax Definitions**

N/A

### **Defaults**

N/A

### **Platforms Supported**

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### **Usage Guidelines**

- To use Zmodem, you must have a terminal emulator that supports the Zmodem protocol.
- Activate the Zmodem transfer according to the instructions that came with your terminal emulation software.
- When the transfer is complete, you can use the **ls** command to verify that the files were loaded successfully.
- To abort a Zmodem session, enter **CTRL + X** five times in succession. Refer to your switch's User Manual for more information on uploading files via Zmodem.
- This command can also be used on the secondary CMM.

### **Examples**

```
-> rz
Upload directory: /flash
rz ready to receive file, please start upload (or send 5 CTRL-X's to abort).
```

### **Release History**

Release 6.1; command was introduced.

### **Related Commands**

N/A

### **MIB Objects**

```
systemServices
  systemServicesAction
```

# 59 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

*Filename:* AlcatelInd1WebMgt.mib  
*Module:* alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

---

**http server**  
**http ssl**  
**http port**  
**https port**  
**debug http sessiondb**  
**show http**

---

## http server

Enables/disables web management on the switch. When enabled, a user is able to configure the switch using the WebView application.

**{[ip] http | https} server**

**no {[ip] http | https} server**

---

### Syntax Definitions

**ip** Optional syntax. Using this optional syntax is the same as using the **http server** command.

### Defaults

Web management is enabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to disable web management. If web management is disabled, you will not be able to access the switch using WebView.

### Examples

```
-> http server
-> no http server
-> https server
-> no https server
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">http ssl</a>	Enables/disables SSL on the switch.
<a href="#">debug http sessiondb</a>	Displays web management session information.
<a href="#">show http</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtAdminStatus
```

---

## http ssl

Enables/disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients across the Internet.

**{[ip] http | https} ssl**

**no {[ip] http | https} ssl**

---

### Syntax Definitions

**ip** Optional syntax. Using this optional syntax is the same as using the **http ssl** command.

### Defaults

SSL is enabled by default.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Use the **no** form of this command to disable SSL.

### Examples

```
-> http ssl
-> no http ssl
-> https ssl
-> no https ssl
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[http server](#) Enables/disables web management on the switch.

[show http](#) Displays web management configuration information.

### MIB Objects

alaIND1WebMgtConfigMIBGroup  
alaInd1WebMgtSsl

---

## http port

Changes the port number for the embedded Web server in the switch.

```
[ip] http port {default | port}
```

---

### Syntax Definitions

<b>ip</b>	Optional syntax.
<b>default</b>	Restores the port to its default (80) value.
<i>port</i>	The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

parameter	default
<i>port</i>	80

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> http port 1025
-> http port default
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">http server</a>	Enables/disables web management on the switch.
<a href="#">show http</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaIND1WebMgtHttpPort
```

---

## https port

Changes the default secure HTTP (HTTPS) port for the embedded Web server.

**https port** {default | *port*}

---

### Syntax Definitions

**default**

Restores the port to its default (443) value.

*port*

The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

---

parameter	default
<i>port</i>	443

---

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> https port 1026
-> https port default
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[http server](#)

Enables/disables web management on the switch.

[show http](#)

Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaIND1WebMgtHttpsPort
```

---

## debug http sessiondb

Displays web management session information.

**debug http sessiondb**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> debug http sessiondb
```

```
Sess      SessName  Name  TimeOut  Status  URL Name--&--StatMsg
-----+-----+-----+-----+-----+-----+-----
0 6  sess_21606  admin  5848035  AUTHENTICATED  /web/content/index.html
1 -2  sess_28257  5999940  IN_PROGRESS  /ip/content/index.html
Current Active WebView Session: 1
```

### *output definitions*

---

<b>Sess</b>	The first number is the session number.
<b>SessName</b>	Unique ID assigned by the browser.
<b>Name</b>	User name.
<b>TimeOut</b>	User-configured inactivity timer, in minutes.
<b>Status</b>	Session status. If the user has successfully logged in, the status is "Authenticated."
<b>URL Name&amp;StatMsg</b>	Current page being viewed by the user.

---

### Release History

Release 6.1; command was introduced.

### **Related Commands**

[http server](#)

Enables/disables web management on the switch.

[http ssl](#)

Enables/disables SSL on the switch.

[show http](#)

Displays web management configuration information.

### **MIB Objects**

N/A

---

## show http

Displays web management configuration information.

show [ip] http

---

### Syntax Definitions

**ip** Optional syntax. Using this optional syntax is the same as using the **show http** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show http
```

```
Web Management = on
Force SSL = on
Web Management Http Port = 80
Web Management Https Port = 443
```

### *output definitions*

<b>Web Management</b>	Indicates whether web management is enabled (on) or disabled (off) on the switch.
<b>Force SSL</b>	Indicates whether Force SSL is enabled (on) or disabled (off) on the switch. If this is set to <b>on</b> this means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server. For example, an “http://switchname.com” URL will be redirected to an “https://switchname.com” URL.
<b>Web Management Http Port</b>	The port configured for the HTTP connection.
<b>Web Management Https Port</b>	The port configured for a secure HTTP connection (SSL enabled).

### Release History

Release 6.1; command was introduced.

## Related Commands

<a href="#">http server</a>	Enables/disables web management on the switch.

  alaInd1WebMgtSsl  
  alaInd1WebMgtHttpPort  
  alaInd1WebMgtHttpsPort
```

---

# 60 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

*Filename:* AlcatelIND1System.mib  
*Module:* Alcatel-IND1ConfigMgr.mib

A summary of the available commands is listed here:

---

**configuration apply**  
**configuration error-file limit**  
**show configuration status**  
**configuration cancel**  
**configuration syntax check**  
**configuration snapshot**  
**show configuration snapshot**  
**write terminal**

---

## configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

**configuration apply** *filename* [**at** *hh:mm month dd* [*year*]] | [**in** *hh[:mm]*] [**verbose**]

---

### Syntax Definitions

<i>filename</i>	The name of the configuration text file to be applied to the switch (e.g., <b>newfile1</b> ).
<b>at</b> <i>hh:mm</i> { <i>dd month</i>   <i>month dd</i> } [ <i>year</i> ]	Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59. Values for <i>dd</i> range from 01 through 31. Values for <i>month</i> range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.
<b>in</b> <i>hh[:mm]</i>	Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59.
<b>verbose</b>	When <b>verbose</b> is entered, information is displayed on your workstation's console as each command in the configuration file is applied.

### Defaults

By default, **verbose** error checking is not performed.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **boot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.

- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword represents a login password that has been encrypted *twice*. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to [page 36-53](#).

## Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

---

**Note.** When the **configuration apply** command is entered *without at* or *in* syntax information, one or more dots “.” is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

**configuration syntax check** Performs a syntax and authorization check of all CLI commands contained in a configuration file.

## MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
  configFileName
  configFileMode
  configFileAction
  configTimerFileName
  configTimerFileTime
```

---

## Related Commands

- configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
- configuration cancel** Cancels a pending timer session for a configuration file.

## MIB Objects

alcatelIND1ConfigMgrMIBObjects  
configErrorFileMaximum

---

## show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

**show configuration status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- A timer session can be scheduled using the [configuration apply](#) command. For more information, refer to [page 60-2](#).
- The screen output **File configuration </path/filename>: scheduled at dd/mm hh:mm** indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration </path/filename>: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the [write memory](#) command.

### Examples

```
-> show configuration status
```

### Release History

Release 6.1; command was introduced.

## Related Commands

- configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
- configuration cancel** Cancels a pending timer session for a configuration file.
- configuration error-file limit** Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory.
- write memory** Copies the running configuration (RAM) to the working directory.

## MIB Objects

configTimerFileGroup  
configTimerFileStatus

---

## configuration cancel

Cancels a pending timer session for a configuration file.

**configuration cancel**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> configuration cancel
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

**show configuration status** Displays whether there is a pending timer session scheduled for a configuration file.

### MIB Objects

```
configTimerFileGroup  
configTimerClear
```

---

## configuration syntax check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

**configuration syntax check** *path/filename* [**verbose**]

---

### Syntax Definitions

*path/filename*

The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, **/flash/working/asc.1.snap**.

**verbose**

When **verbose** is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When **verbose** is *not* specified in the command line, cursory information (number of errors and error log file name) will be printed to the console *only if a syntax or configuration error is detected*.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

### Examples

```
-> configuration syntax check vlan_file1
..
```

---

**Note.** When the **configuration syntax check** command is entered, one or more dots “.” is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

- configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
- show configuration status** Displays whether there is a pending timer session scheduled for a configuration file.

## MIB Objects

```
configFileGroup
  configErrorFileName
  configErrorFileMaximum
  configFileMode
  configFileStatus
```

---

## configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

**configuration snapshot** *feature\_list* [*path/filename*]

---

### Syntax Definitions

*feature\_list*

The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Current snapshot-supported network features are listed below.

---

#### snapshot-supported features

<b>802.1q</b>	<b>ipmr</b>	<b>rdp</b>
<b>aaa</b>	<b>ipms</b>	<b>rip</b>
<b>aip</b>	<b>ipx</b>	<b>ripng</b>
<b>all</b>	<b>ipv6</b>	<b>session</b>
<b>bgp</b>	<b>linkagg</b>	<b>slb</b>
<b>bridge</b>	<b>module</b>	<b>snmp</b>
<b>chassis</b>	<b>ntp</b>	<b>stp</b>
<b>health</b>	<b>ospf</b>	<b>system</b>
<b>interface</b>	<b>ospf3</b>	<b>vlan</b>
<b>ip</b>	<b>pmm</b>	<b>vrrp</b>
<b>ip-helper</b>	<b>policy</b>	<b>webmgt</b>
<b>ip-routing</b>	<b>qos</b>	<b>udld</b>
<b>netsec</b>		

*path/filename*

A user-defined name for the resulting snapshot file. For example, **test\_snmp\_snap**. You may also enter a specific path for the resulting file. For example, the syntax **/flash/working/test\_snmp\_snap** places the **test\_snmp\_snap** file in the switch's **/flash/working** directory.

### Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

## Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

## Examples

```
-> configuration snapshot all
-> configuration snapshot new_file1 qos health aggregation
-> configuration snapshot snmp_snapshot snmp
-> configuration snapshot 802.1q
```

## Release History

Release 6.1; command was introduced.

## Related Commands

N/A

## **MIB Objects**

```

---

## show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

**show configuration snapshot** [*feature\_list*]

---

### Syntax Definitions

*feature\_list* Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma.

---

#### snapshot-supported features

802.1q	ipmr	rdp
aaa	ipms	rip
aip	ipx	ripng
all	ipv6	session
bgp	linkagg	slb
bridge	module	snmp
chassis	ntp	stp
health	ospf	system
interface	ospf3	vlan
ip	pmm	vrrp
ip-helper	policy	webmgt
ip-routing	qos	udld
netsec		

---

### Defaults

By default, this command shows configuration information for *all* features.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use this command to view the current configuration for any feature shown in the table.
- To show a list of features on the switch, use the **show configuration snapshot ?** syntax.
- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

## Examples

```
-> show configuration snapshot
-> show configuration snapshot aaa bridge
! Bridging :

! AAA :
aaa authentication default "local"
aaa authentication console "local"
user "public" read All write All no auth authkey 391b0e74dbd13973d703ccea4a8e30
```

## Release History

Release 6.1; command was introduced.

## Related Commands

## write terminal

Displays the switch's current running configuration for all features.

**write terminal**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

### Examples

```
-> write terminal
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show configuration snapshot** Displays the switch's current running configuration for all features or for the specified feature(s).

### MIB Objects

```
configManager  
  mib_configSnapshotAllSelect
```

---

# 61 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

*Filename:* IETFsnmpCommunity.MIB  
*Module:* IETF SNMP-COMMUNITY.MIB

MIB information for Trap Manager commands is as follows:

*Filename* AlcatelIND1TrapMgr.MIB  
*Module:* ALCATEL-IND1-TRAP-MGR.MIB

MIB information for SNMP Agent commands is as follows:

*Filename:* AlcatelIND1SNMPAgent.MIB  
*Module:* ALCATEL-IND1-SNMP-AGENT.MIB

---

A summary of the available commands is listed here:

---

<b>SNMP station commands</b>	<b>snmp station</b> <b>snmp source ip preferred</b> <b>show snmp station</b>
<b>SNMP community map commands</b>	<b>snmp community map</b> <b>snmp community map mode</b> <b>show snmp community map</b>
<b>SNMP security commands</b>	<b>snmp security</b> <b>show snmp security</b> <b>show snmp statistics</b> <b>show snmp mib family</b>
<b>SNMP trap commands</b>	<b>snmp trap absorption</b> <b>snmp trap to webview</b> <b>snmp trap replay</b> <b>snmp trap filter</b> <b>snmp authentication trap</b> <b>show snmp trap replay</b> <b>show snmp trap filter</b> <b>snmp authentication trap</b> <b>show snmp trap config</b>

---

## snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

**snmp station** {*ip\_address* | *ipv6\_address*} {[*udp\_port*] [*username*] [**v1** | **v2** | **v3**] [**enable** | **disable**]}

**no snmp station** {*ip\_address* | *ipv6\_address*}

---

### Syntax Definitions

<i>ip_address</i>	The IP address to which SNMP unicast traps will be sent. A maximum of 16 SNMP stations can be configured.
<i>ipv6_address</i>	The IPv6 address to which SNMP unicast traps will be sent.
<i>udp_port</i>	A UDP destination port.
<i>username</i>	The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
<b>v1</b>	Specifies that traps are sent using SNMP version 1.
<b>v2</b>	Specifies that traps are sent using SNMP version 2.
<b>v3</b>	Specifies that traps are sent using SNMP version 3.
<b>enable</b>	Enables the specified SNMP station.
<b>disable</b>	Disables the specified SNMP station.

### Defaults

parameter	default
<i>udp_port</i>	162
<b>v1</b>   <b>v2</b>   <b>v3</b>	<b>v3</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the no form of the command to remove an existing SNMP station.
- The user name specified must match an existing user account name.
- When adding an SNMP station, you must specify an IP address *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- You can establish up to 50 SNMP sessions towards an OmniSwitch.

- When modifying an SNMP station, you must specify an IP address *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- The default UDP port 162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified in the command line must correspond with the UDP destination port configured at the receiving SNMP station(s).
- When the SNMP station is enabled the switch will send ICMP echo requests to verify reachability. The switch transmits traps to the specified IP or IPv6 address immediately after receiving the ICMP echo response.

## Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
-> snmp station 300::1 enable
-> no snmp station 300::1
```

## Release History

Release 6.1; command was introduced.

Release 6.3.1; *ipv6\_address* parameter added.

## Related Commands

[show snmp station](#) Displays the current SNMP station information.

  alaTrapInetStationIPType
  alaTrapInetStationIP
  alaTrapInetStationPort
  alaTrapInetStationRowStatus
  alaTrapInetStationProtocol
  alaTrapInetStationUser
```

---

## snmp source ip preferred

Configures the source IP address field of the SNMP client packets.

**snmp source ip preferred** {**default** | **no-loopback** | *ip\_address*}

**no snmp source ip preferred**

---

### Syntax Definitions

<b>default</b>	The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the first IP address on the switch will be used.
<b>no-loopback</b>	The Loopback0 address should not be used for the source IP address field and the first available IP address on the switch should be used for this field.
<i>ip_address</i>	The IP address to be used in the source IP field.

### Defaults

By default, the setting is set to the **default** parameter.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When configuring a specific IP address, that address must already exist on the switch.
- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

### Examples

```
-> snmp source ip preferred 192.168.10.1
-> snmp source ip preferred no-loopback
-> snmp source ip preferred default
```

### Release History

Release 6.3.4; command was introduced

Release 6.4.3; command was deprecated, use [ip managed-interface](#).

### Related Commands

[snmp station](#) Adds a new SNMP station; modifies or deletes an existing SNMP station.

## show snmp station

Displays the current SNMP station status.

**show snmp station**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show snmp station
ipAddress/udpPort          status    protocol user
-----
199.199.100.200/8010      enable   v3      NMSuserV3MD5DES
199.199.101.201/111      disable  v2      NMSuserV3MD5
199.199.102.202/8002      enable   v1      NMSuserV3SHADES
199.199.103.203/8003      enable   v3      NMSuserV3SHADES
199.199.104.204/8004      enable   v3      NMSuserV3SHA
```

The following is an example of the output display using IPv6.

```
-> show snmp station
ipAddress/udpPort          status    protocol user
-----+-----+-----+
172.21.160.32/4000        enable   v3      abc
172.21.160.12/5000        enable   v3      user1
0300:0000:0000:0000:0211:d8ff:fe47:470b/4001  enable   v3      user2
0300:0000:0000:0000:0211:d8ff:fe47:470c/5001  enable   v2      abc
```

### output definitions

---

<b>IPAddress</b>	IP Address of the SNMP management station that replayed the trap. <b>Note:</b> OmniSwitch stackable and chassis-based switches support both IP and IPv6 SNMP stations.
<b>UDP Port</b>	UDP port number.
<b>Status</b>	The Enabled/Disabled status of the SNMP management station.
<b>Protocol</b>	The version of SNMP set for this management station.
<b>User</b>	The user account name.

---

## Release History

Release 6.1; command was introduced.

## snmp community map

Configures and enables a community string on the switch and maps it to an existing user account name.

```
snmp community map community_string [{user useraccount_name] | {enable | disable}}
```

```
no snmp community map community_string
```

---

### Syntax Definitions

<i>community_string</i>	A community string in the form of a text string. This string must be between 1 and 32 characters.
<i>useraccount_name</i>	A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
<b>enable</b>	Enables SNMP community string mapping.
<b>disable</b>	Disables SNMP community string mapping.

### Defaults

By default, SNMP community map authentication is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.

### Examples

```
-> snmp community map community1 user testname1  
-> snmp community map community1 enable
```

### Release History

Release 6.1; command was introduced.

## Related Commands

**snmp community map mode** Enables the local community strings database.

## MIB Objects

SNMPCommunityTable  
    snmpCommunityIndex  
    snmpCommunitySecurityName  
    snmpCommunityStatus

---

---

## snmp community map mode

Enables the local community strings database.

`snmp community map mode {enable | disable}`

---

### Syntax Definitions

<b>enable</b>	Enables SNMP community map database.
<b>disable</b>	Disables SNMP community map database.

### Defaults

By default, SNMP community strings database is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- When enabled, the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the [snmp community map](#) command.
- When disabled, the community strings carried over each incoming v1 or v2c request must be *equal* to a user account name in order to be processed by the SNMP agent.

### Examples

```
-> snmp community map mode enable
-> snmp community map mode disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

[snmp community map](#) Configures and enables a community string on the switch and maps it to an existing user account name.

### MIB Objects

```
SNMPCommunityTable
  snmpCommunityIndex
  snmpCommunitySecurityName
  snmpCommunityStatus
```

---

## show snmp community map

Shows the local community strings database.

**show snmp community map**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guideline

N/A

### Examples

```
-> show snmp community map
Community mode : enabled
```

```
status  community string          user name
-----+-----+-----
enabled test_string1              bb_username
enabled test_string2              rr_username
disabled test_string3              cc_username
disabled test_string4              jj_username
```

#### *output definitions*

---

<b>Status</b>	The Enabled/Disabled status of the community string.
<b>Community String</b>	The text that defines the community string.
<b>User Name</b>	The user account name.

---

### Release History

Release 6.1; command was introduced.

### Related Commands

[snmp community map](#) Configures and enables a community string on the switch and maps it to an existing user account name.

---

## snmp security

Configures SNMP security settings.

**snmp security** {no security | authentication set | authentication all | privacy set | privacy all | trap only}

---

### Syntax Definitions

<b>no security</b>	The switch will accept all SNMP v1, v2, and v3 requests.
<b>authentication set</b>	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.
<b>authentication all</b>	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.
<b>privacy set</b>	The switch will accept <i>only</i> authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.
<b>privacy all</b>	The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.
<b>trap only</b>	All SNMP get, get-next, and set requests will be rejected.

### Defaults

By default, the SNMP security default is set to **privacy all**, which is the highest level of security.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Refer to the table below for a quick-reference list of security parameter and the SNMP request allowances for each parameter.

	v1 set v2 set v3 non-auth set	v1 get v2 get v3 non-auth get/ get-next	v3 auth set	v3 auth get/ get-next	v3 encryp set	v3 encryp get/ get-next
<b>no security</b>	accepted	accepted	accepted	accepted	accepted	accepted
<b>authentication set</b>	rejected	accepted	accepted	accepted	accepted	accepted
<b>authentication all</b>	rejected	rejected	accepted	accepted	accepted	accepted
<b>privacy set</b>	rejected	rejected	rejected	accepted	accepted	accepted
<b>privacy all</b>	rejected	rejected	rejected	rejected	accepted	accepted
<b>trap only</b>	rejected	rejected	rejected	rejected	rejected	rejected

## Examples

```
-> snmp security no security
-> snmp security authentication set
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap only
```

## Release History

Release 6.1; command was introduced.

## Related Commands

[show snmp security](#) Displays the current SNMP security status.

## MIB Objects

```
SNMPAgtConfig
  SmpAgtSecurityLevel
```

---

## show snmp security

Displays the current SNMP security status.

```
show snmp security
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

Refer to the command on page [61-12](#) for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.

### Examples

```
-> show snmp security
snmp security = no security
```

```
-> show snmp security
snmp security = authentication set
```

```
-> show snmp security
snmp security = authentication all
```

```
-> show snmp security
snmp security = privacy set
```

```
-> show snmp security
snmp security = privacy all
```

```
-> show snmp security
snmp security = trap only
```

### Release History

Release 6.1; command was introduced.

## **Related Commands**

[\*\*snmp security\*\*](#)

Configures the SNMP security settings.

---

## show snmp statistics

Displays the current SNMP statistics.

```
show snmp statistics
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> show snmp statistics
From RFC1907
  snmpInPkts                = 801
  snmpOutPkts               = 800
  snmpInBadVersions         = 0
  snmpInBadCommunityNames  = 0
  snmpInBadCommunityUses   = 0
  snmpInASNParseErrs       = 0
  snmpEnableAuthenTraps    = disabled(2)
  snmpSilentDrops           = 0
  snmpProxyDrops            = 0
  snmpInTooBigs             = 0
  snmpOutTooBigs            = 0
  snmpInNoSuchNames        = 0
  snmpOutNoSuchNames       = 0
  snmpInBadValues          = 0
  snmpOutBadValues         = 0
  snmpInReadOnlys          = 0
  snmpOutReadOnlys        = 0
  snmpInGenErrs            = 0
  snmpOutGenErrs           = 0
  snmpInTotalReqVars       = 839
  snmpInTotalSetVars       = 7
  snmpInGetRequests        = 3
  snmpOutGetRequests       = 0
  snmpInGetNexts           = 787
  snmpOutGetNexts          = 0
  snmpInSetRequests        = 7
  snmpOutSetRequests       = 0
  snmpInGetResponses       = 0
  snmpOutGetResponses      = 798
```

```
snmpInTraps           = 0
snmpOutTraps          = 0
From RFC2572
snmpUnknownSecurityModels = 0
snmpInvalidMsgs       = 0
snmpUnknownPDUHandlers = 0
From RFC2573
snmpUnavailableContexts = 0
snmpUnknownContexts    = 1
From RFC2574
usmStatsUnsupportedSecLevels = 0
usmStatsNotInTimeWindows   = 1
usmStatsUnknownUserNames   = 1
usmStatsUnknownEngineIDs   = 0
usmStatsWrongDigests       = 0
usmStatsDecryptionErrors   = 0
```

### *output definitions*

---

<b>From RFCxxxx</b>	Displays the RFC number that defines the SNMP MIB objects listed.
<b>MIB Objects</b>	Name of the MIB object listed as an SNMP statistic.
<b>= (integer)</b>	The number of times the MIB object has been reported to the SNMP management station since the last reset.

---

### **Release History**

Release 6.1; command was introduced.

### **Related Commands**

N/A

---

## snmp trap absorption

Enables or disables the trap absorption function.

**snmp trap absorption {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.
<b>disable</b>	Disables SNMP trap absorption.

### Defaults

By default, trap absorption is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

To view the current trap absorption status, use the **show snmp trap config** command.

### Examples

```
-> snmp trap absorption enable  
-> snmp trap absorption disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show snmp trap config** Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

### MIB Objects

```
trapFilterTable  
  trapAbsorption
```

---

---

## snmp trap to webview

Enables the forwarding of traps to WebView.

`snmp trap to webview {enable | disable}`

---

### Syntax Definitions

<b>enable</b>	Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
<b>disable</b>	Disables WebView forwarding.

### Defaults

By default, WebView forwarding is enabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

To view the current WebView forwarding status, use the **show snmp trap config** command.

### Examples

```
-> snmp trap to webview enable
-> snmp trap to webview disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show snmp trap config** Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.

### MIB Objects

```
trapFilterTable
  trapToWebView
```

---

## snmp trap replay

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

```
snmp trap replay {ip_address | ipv6_address} [seq_id]
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station to which traps will be replayed from the switch.
<i>ipv6_address</i>	The IPv6 address for the SNMP station to which traps will be replayed from the switch.
<i>seq_id</i>	The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the [show snmp station](#) command to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

### Examples

```
-> snmp trap replay 172.12.2.100  
-> snmp trap replay 300::1
```

## Release History

Release 6.1; command was introduced.

Release 6.3.1; *ipv6\_address* parameter added.

## Related Commands

**show snmp station** Displays the current SNMP station status.

**show snmp trap replay** Displays the SNMP trap replay information.

## MIB Objects

trapStationTable

    trapStation Replay

AlaTrapInetStationEntry

    alaTrapInetStationReplay

    alaTrapInetStationNextSeq

---

## snmp trap filter

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

**snmp trap filter** {*ip\_address* | *ipv6\_address*} *trap\_id\_list*

**no snmp trap filter** {*ip\_address* / *ipv6\_address*} *trap\_id\_list*

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station for which trap filtering is being enabled or disabled.
<i>ipv6_address</i>	The IPv6 address for the SNMP station for which trap filtering is being enabled or disabled.
<i>trap_id_list</i>	Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

### Defaults

By default, SNMP trap filtering is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- The amount of traps that can be specified is equal to the number of traps supported in the AOS release.
- To *enable* trap filtering, use the syntax **snmp trap filter** *ip\_address trap\_id\_list*.
- To *disable* trap filtering, use the syntax **no snmp trap filter** *ip\_address trap\_id\_list*.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp trap config** command.

### Examples

```
-> snmp trap filter 172.1.2.3 1
-> snmp trap filter 172.1.2.3 0 1 3 5
-> snmp trap filter 300::1 1 3 4
-> no snmp trap filter 172.1.2.3 1
-> no snmp trap filter 172.1.2.3 0 1 3 5
-> no snmp trap filter 300::1 1 3
```

## Release History

Release 6.1; command was introduced.  
Release 6.3.1; *ipv6\_address* parameter added.

## Related Commands

<a href="#">show snmp trap filter</a>	Displays the current SNMP trap filter status.
<a href="#">show snmp trap config</a>	Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

## MIB Objects

```
trapFilterTable
  trapFilterStatus
alaTrapInetFilterTable
  alaTrapInetFilterStatus
```

---

## snmp authentication trap

Enables or disables SNMP authentication failure trap forwarding.

**snmp authentication trap {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables authentication failure trap forwarding. When enabled, the standard authentication failure trap is sent each time an SNMP authentication failure is detected.
<b>disable</b>	Disables authentication failure trap forwarding.

### Defaults

By default, authentication failure trap forwarding is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

```
-> snmp authentication trap enable  
-> snmp authentication trap disable
```

### Release History

Release 6.1; command was introduced.

### Related Commands

**show snmp authentication trap** Displays the current authentication failure trap forwarding status.

### MIB Objects

```
snmpGroup  
  snmpEnableAuthenTraps
```

---

## show snmp trap replay

Displays SNMP trap replay information.

```
show snmp trap replay
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

A maximum of 60 traps will be replayed.

### Examples

```
-> show snmp trap replay
ipAddress      : oldest replay number
-----
199.199.101.200 :      1234
199.199.105.202 :       578
199.199.101.203 :     1638
199.199.101.204 :     2560
```

The following is an example of the output display with IPv6 information.

```
-> show snmp trap replay
ipAddress      oldest replay number
-----+-----
172.21.160.32      12
172.21.160.12     57
0300:0000:0000:0000:0211:d8ff:fe47:470b  12
0300:0000:0000:0000:0211:d8ff:fe47:470c  42
```

#### *output definitions*

---

<b>IPAddress</b>	IP address of the SNMP station manager that replayed the trap. <b>Note:</b> OmniSwitch stackable and chassis-based switches support both IP and IPv6 SNMP stations.
<b>Oldest Replay Number</b>	Number of the oldest replayed trap.

---

### Release History

Release 6.1; command was introduced.

## Related Commands

### [snmp trap replay](#)

Replays stored traps from the switch to a specified SNMP station.

## MIB Objects

trapStationTable

    snmpStation Replay

AlaTrapInetStationEntry

    alaTrapInetStationReplay

---

## show snmp trap filter

Displays the current SNMP trap filter status.

**show snmp trap filter**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

To display a list of traps and their ID numbers, use the [show snmp trap config](#) command.

### Examples

```
-> show snmp trap filter
ipAddress      : trapId list
-----
199.199.101.200 :    0  1  2  3
199.199.101.201 : no filter
199.199.105.202 :    0  1  2  3  4  5  6  7  8  9 10 11 12 13 14
                  15 16 17 18 19
199.199.101.203 :   20 22 30
199.199.101.204 : no filter
```

The following is an example of the output display with IPv6 information.

```
-> show snmp trap filter
ipAddress      : trapId list
-----+-----
172.21.160.32  :          1  3  4
172.21.160.12  :          no filter
0300:0000:0000:0000:0211:d8ff:fe47:470b :    4  5  6
0300:0000:0000:0000:0211:d8ff:fe47:470c :          no filter
```

#### *output definitions*

---

<b>IPAddress</b>	IP address of the SNMP management station that recorded the traps. <b>Note:</b> OmniSwitch stackable and chassis-based switches support both IP and IPv6 SNMP stations.
<b>TrapId List</b>	Identification number for the traps being filtered.

---

## Release History

Release 6.1; command was introduced.

## Related Commands

# 62 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

*Filename:* AlcatelIND1System.mib  
*Module:* ALCATEL-IND1-SYSTEM.MIB

A summary of the available commands is listed here.

---

[ip domain-lookup](#)  
[ip name-server](#)  
[ipv6 name-server](#)  
[ip domain-name](#)  
[show dns](#)

---

---

## ip domain-lookup

Enables or disables the DNS resolver.

**ip domain-lookup**

**no ip domain-lookup**

---

### Syntax Definitions

N/A

### Defaults

By default, the DNS resolver is disabled.

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

### Examples

```
-> ip domain-lookup  
-> no ip domain-lookup
```

### Release History

Release 6.1; command was introduced.

### Related Commands

<a href="#">ip name-server</a>	Specifies the IP addresses of up to three servers to query on a host lookup.
<a href="#">ipv6 name-server</a>	Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
<a href="#">ip domain-name</a>	Sets or deletes the default domain name for DNS lookups.
<a href="#">show dns</a>	Displays the current DNS resolver configuration and status.

### MIB Objects

```
systemDNS  
  systemDNSEnableDnsResolver
```

---

## ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

**ip name-server** *server-address1* [*server-address2* [*server-address3*]]

**no ip name-server** {*server-address1* [*server-address2* [*server-address3*]] | **all**}

---

### Syntax Definitions

<i>server-address1</i>	The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
<i>server-address2</i>	The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
<i>server-address3</i>	The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.
<b>all</b>	Removes all configured DNS servers.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Use the no form of this command to remove individual or all DNS servers.
- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

### Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1
-> ip name-server 10.255.11.66
-> no ip name-server 10.255.11.66
-> no ip name-server all
```

### Release History

Release 6.1; command was introduced.

Release 6.3.4; 'no' parameter was added for removing DNS servers.

## Related Commands

[ip domain-lookup](#)

Enables or disables the DNS resolver.

[ip domain-name](#)

Sets or deletes the default domain name for DNS lookups.

[show dns](#)

Displays the current DNS resolver configuration and status.

## MIB Objects

systemDNS

systemDNSNsAddr1

systemDNSNsAddr2

systemDNSNsAddr3

---

## ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

**ipv6 name-server** *server-ipv6\_address1* [*server-ipv6\_address2* [*server-ipv6\_address3*]]

---

### Syntax Definitions

<i>server-ipv6_address1</i>	The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
<i>server-ipv6_address2</i>	The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
<i>server-ipv6_address3</i>	The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IPv6 addresses of the IPv6 DNS servers by using the **ipv6 name-server** command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

### Examples

```
-> ipv6 name-server fec0::2d0:d3:f3fc
-> ipv6 name-server fe2d::2c f302::3de1:1 f1bc::202:fd40:f3
```

### Release History

Release 6.3.1; command was introduced.

## Related Commands

[ip domain-lookup](#)

Enables or disables the DNS resolver.

[ip domain-name](#)

Sets or deletes the default domain name for DNS lookups.

[show dns](#)

Displays the current DNS resolver configuration and status.

## MIB Objects

systemDNS

  systemDNSNsIPv6Addr1

  systemDNSNsIPv6Addr2

  systemDNSNsIPv6Addr3

---

## show dns

Displays the current DNS resolver configuration and status.

```
show dns
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6400, 6850, 6850E, 6855, 9000E

### Usage Guidelines

N/A

### Examples

The following is an example of the output display on OmniSwitch stackable and chassis-based switches:

```
-> show dns
Resolver is          : enabled
domainName          : company.com
IPv4 nameServer(s) : 189.202.191.14
                   : 189.202.191.15
                   : 188.255.19.1
IPv6 nameServer(s) : fe2d::2c
                   : f302::3de1:1
                   : f1bc::202:fd40:f3
```

#### *output definitions*

<b>Resolver is</b>	Indicates whether the DNS resolver is enabled or disabled.
<b>domainName</b>	Indicates the default domain name assigned to the DNS lookups. This value is set using the <b>ip domain-name</b> command.
<b>IPv4 nameServer(s)</b>	Indicates the IP address(es) of the IPv4 DNS server(s). These addresses are set using the <b>ip name-server</b> command.
<b>IPv6 nameServer(s)</b>	Indicates the IPv6 address(es) of the IPv6 DNS server(s). These addresses are set using the <b>ipv6 name-server</b> command.

### Release History

Release 6.1; command was introduced.

Release 6.3.1; **IPv4 nameServer(s)** and **IPv6 nameServer(s)** fields are added.

## Related Commands

# A Software License and Copyright Statements

This appendix contains Alcatel-Lucent and third-party software vendor license and copyright statements.

## Alcatel-Lucent License Agreement

### ALCATEL-LUCENT SOFTWARE LICENSE AGREEMENT

---

**IMPORTANT.** Please read the terms and conditions of this license agreement carefully before opening this package.

---

**By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.**

1. **License Grant.** This is a license, not a sales agreement, between you (the “Licensee”) and Alcatel-Lucent. Alcatel-Lucent hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the “Licensed Files”) and the accompanying user documentation (collectively the “Licensed Materials”), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee’s system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that Alcatel-Lucent products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **Alcatel-Lucent’s Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of Alcatel-Lucent and its licensors (herein “its licensors”), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with Alcatel-Lucent and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** Alcatel-Lucent considers the Licensed Files to contain valuable trade secrets of Alcatel-Lucent, the unauthorized disclosure of which could cause irreparable harm to Alcatel-Lucent. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold Alcatel-Lucent harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation Alcatel-Lucent's reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** Alcatel-Lucent warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. Alcatel-Lucent further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to Alcatel-Lucent for either replacement or, if so elected by Alcatel-Lucent, refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALCATEL-LUCENT AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** Alcatel-Lucent's cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to Alcatel-Lucent for the Licensed Materials. IN NO EVENT SHALL ALCATEL-LUCENT BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALCATEL-LUCENT HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between Alcatel-Lucent and Licensee, if any, Alcatel-Lucent is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and Alcatel-Lucent has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to Alcatel-Lucent and certifying to Alcatel-Lucent in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. Alcatel-Lucent may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by Alcatel-Lucent, Licensee agrees to return to Alcatel-Lucent or destroy the Licensed Materials and all copies and portions thereof.

10. **Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

11. **Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

12. **No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

13. **Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with Alcatel-Lucent's reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

14. **Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to Alcatel-Lucent by certain third party licensors. Some third party licensors (e.g., Wind River and their licensors with respect to the Run-Time Module) are third party beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "[Third Party Licenses and Notices](#)" on page A-4 for the third party license and notice terms.

# Third Party Licenses and Notices

The licenses and notices related only to such third party software are set forth below:

## A. Booting and Debugging Non-Proprietary Software

A small, separate software portion aggregated with the core software in this product and primarily used for initial booting and debugging constitutes non-proprietary software, some of which may be obtained in source code format from Alcatel-Lucent for a limited period of time. Alcatel-Lucent will provide a machine-readable copy of the applicable non-proprietary software to any requester for a cost of copying, shipping and handling. This offer will expire 3 years from the date of the first shipment of this product.

## B. The OpenLDAP Public License: Version 2.8, 17 August 2003

Redistribution and use of this software and associated documentation (“Software”), with or without modification, are permitted provided that the following conditions are met:

- 1 Redistributions of source code must retain copyright statements and notices.
- 2 Redistributions in binary form must reproduce applicable copyright statements and notices, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution.
- 3 Redistributions must contain a verbatim copy of this document.
- 4 The names and trademarks of the authors and copyright holders must not be used in advertising or otherwise to promote the sale, use or other dealing in this Software without specific, written prior permission.
- 5 Due credit should be given to the OpenLDAP Project.
- 6 The OpenLDAP Foundation may revise this license from time to time. Each revision is distinguished by a version number. You may use the Software under terms of this license revision or under the terms of any subsequent revision of the license.

THIS SOFTWARE IS PROVIDED BY THE OPENLDAP FOUNDATION AND CONTRIBUTORS “AS IS” AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. OpenLDAP is a trademark of the OpenLDAP Foundation.

Copyright 1999-2000 The OpenLDAP Foundation, Redwood City, California, USA. All Rights Reserved. Permission to copy and distributed verbatim copies of this document is granted.

## C. Linux

Linux is written and distributed under the GNU General Public License which means that its source code is freely-distributed and available to the general public.

## D. GNU GENERAL PUBLIC LICENSE: Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc. 675 Mass Ave, Cambridge, MA 02139, USA  
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

### Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

### **GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION**

**0** This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either

verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term “modification”.) Each licensee is addressed as “you”.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

**1** You may copy and distribute verbatim copies of the Program’s source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

**2** You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a** You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b** You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c** If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it. Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

**3** You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a** Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

**b** Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

**c** Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

**4** You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

**5** You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

**6** Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

**7** If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on

consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

**8** If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

**9** The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and “any later version”, you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

**10** If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

**11** BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

**12** IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

## Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the “copy-right” line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.> Copyright (C)
19yy <name of author>
```

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 675 Mass Ave, Cambridge, MA 02139, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19yy name of author Gnomovision comes with
ABSOLUTELY NO WARRANTY; for details type 'show w'. This is free software,
and you are welcome to redistribute it under certain conditions; type 'show c' for details.
```

The hypothetical commands ‘show w’ and ‘show c’ should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than ‘show w’ and ‘show c’; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a “copyright disclaimer” for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision'
(which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

Provided with this product is certain BOOTP Relay software developed by Carnegie-Mellon University.

## G. Random.c

PR 30872 B Kesner created May 5 2000

PR 30872 B Kesner June 16 2000 moved batch\_entropy\_process to own task iWhirlpool to make code more efficient

random.c -- A strong random number generator

Version 1.89, last modified 19-Sep-99

Copyright Theodore Ts'o, 1994, 1995, 1996, 1997, 1998, 1999. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, and the entire permission notice in its entirety, including the disclaimer of warranties.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission. ALTERNATIVELY, this product may be distributed under the terms of the GNU Public License, in which case the provisions of the GPL are required INSTEAD OF the

above restrictions. (This clause is necessary due to a potential bad interaction between the GPL and the restrictions contained in a BSD-style copyright.)

THIS SOFTWARE IS PROVIDED “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, ALL OF WHICH ARE HEREBY DISCLAIMED. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF NOT ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

## **H. Apptitude, Inc.**

Provided with this product is certain network monitoring software (“MeterWorks/RMON”) licensed from Apptitude, Inc., whose copyright notice is as follows: Copyright (C) 1997-1999 by Apptitude, Inc. All Rights Reserved. Licensee is notified that Apptitude, Inc. (formerly, Technically Elite, Inc.), a California corporation with principal offices at 6330 San Ignacio Avenue, San Jose, California, is a third party beneficiary to the Software License Agreement. The provisions of the Software License Agreement as applied to MeterWorks/RMON are made expressly for the benefit of Apptitude, Inc., and are enforceable by Apptitude, Inc. in addition to Alcatel-Lucent. IN NO EVENT SHALL APPTITUDE, INC. OR ITS SUPPLIERS BE LIABLE FOR ANY DAMAGES, INCLUDING COSTS OF PROCUREMENT OF SUBSTITUTE PRODUCTS OR SERVICES, LOST PROFITS, OR ANY SPECIAL, INDIRECT, CONSEQUENTIAL OR INCIDENTAL DAMAGES, HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, ARISING IN ANY WAY OUT OF THIS AGREEMENT.

## **I. Agranat**

Provided with this product is certain web server software (“EMWEB PRODUCT”) licensed from Agranat Systems, Inc. (“Agranat”). Agranat has granted to Alcatel-Lucent certain warranties of performance, which warranties [or portion thereof] Alcatel-Lucent now extends to Licensee. IN NO EVENT, HOWEVER, SHALL AGRANAT BE LIABLE TO LICENSEE FOR ANY INDIRECT, SPECIAL, OR CONSEQUENTIAL DAMAGES OF LICENSEE OR A THIRD PARTY AGAINST LICENSEE ARISING OUT OF, OR IN CONNECTION WITH, THIS DISTRIBUTION OF EMWEB PRODUCT TO LICENSEE. In case of any termination of the Software License Agreement between Alcatel-Lucent and Licensee, Licensee shall immediately return the EMWEB Product and any back-up copy to Alcatel-Lucent, and will certify to Alcatel-Lucent in writing that all EMWEB Product components and any copies of the software have been returned or erased by the memory of Licensee’s computer or made non-readable.

## **J. RSA Security Inc.**

Provided with this product is certain security software (“RSA Software”) licensed from RSA Security Inc. RSA SECURITY INC. PROVIDES RSA SOFTWARE “AS IS” WITHOUT ANY WARRANTY WHATSOEVER. RSA SECURITY INC. DISCLAIMS ALL WARRANTIES, EXPRESS, IMPLIED OR STATUTORY, AS TO ANY MATTER WHATSOEVER INCLUDING ALL IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT OF THIRD PARTY RIGHTS.

## K. Sun Microsystems, Inc.

This product contains Coronado ASIC, which includes a component derived from designs licensed from Sun Microsystems, Inc.

## L. Wind River Systems, Inc.

Provided with this product is certain software (“Run-Time Module”) licensed from Wind River Systems, Inc. Licensee is prohibited from: (i) copying the Run-Time Module, except for archive purposes consistent with Licensee’s archive procedures; (ii) transferring the Run-Time Module to a third party apart from the product; (iii) modifying, decompiling, disassembling, reverse engineering or otherwise attempting to derive the source code of the Run-Time Module; (iv) exporting the Run-Time Module or underlying technology in contravention of applicable U.S. and foreign export laws and regulations; and (v) using the Run-Time Module other than in connection with operation of the product. In addition, please be advised that: (i) the Run-Time Module is licensed, not sold and that Alcatel-Lucent and its licensors retain ownership of all copies of the Run-Time Module; (ii) WIND RIVER DISCLAIMS ALL IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, (iii) The SOFTWARE LICENSE AGREEMENT EXCLUDES LIABILITY FOR ANY SPECIAL, INDIRECT, PUNITIVE, INCIDENTAL AND CONSEQUENTIAL DAMAGES; and (iv) any further distribution of the Run-Time Module shall be subject to the same restrictions set forth herein. With respect to the Run-Time Module, Wind River and its licensors are third party beneficiaries of the License Agreement and the provisions related to the Run-Time Module are made expressly for the benefit of, and are enforceable by, Wind River and its licensors.

## M. Network Time Protocol Version 4

The following copyright notice applies to all files collectively called the Network Time Protocol Version 4 Distribution. Unless specifically declared otherwise in an individual file, this notice applies as if the text was explicitly included in the file.

```

## N.Remote-ni

Provided with this product is a file (part of GDB), the GNU debugger and is licensed from Free Software Foundation, Inc., whose copyright notice is as follows: Copyright (C) 1989, 1991, 1992 by Free Software Foundation, Inc. Licensee can redistribute this software and modify it under the terms of General Public License as published by Free Software Foundation Inc.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

## O.GNU Zip

GNU Zip -- A compression utility which compresses the files with zip algorithm.

Copyright (C) 1992-1993 Jean-loup Gailly.

BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

## P. FREESCALE SEMICONDUCTOR SOFTWARE LICENSE AGREEMENT

Provided with this product is a software also known as DINK32 (Dynamic Interactive Nano Kernel for 32-bit processors) solely in conjunction with the development and marketing of your products which use and incorporate microprocessors which implement the PowerPC (TM) architecture manufactured by Motorola. The licensee comply with all of the following restrictions:

1. This entire notice is retained without alteration in any modified and/or redistributed versions.
2. The modified versions are clearly identified as such. No licenses are granted by implication, estoppel or otherwise under any patents or trademarks of Motorola, Inc.

The SOFTWARE is provided on an "AS IS" basis and without warranty. To the maximum extent permitted by applicable law, MOTOROLA DISCLAIMS ALL WARRANTIES WHETHER EXPRESS OR IMPLIED, INCLUDING IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE AND ANY WARRANTY AGAINST INFRINGEMENT WITH REGARD TO THE SOFTWARE (INCLUDING ANY MODIFIED VERSIONS THEREOF) AND ANY ACCOMPANYING WRITTEN MATERIALS. To the maximum extent permitted by applicable law, IN NO EVENT SHALL MOTOROLA BE LIABLE FOR ANY DAMAGES WHATSOEVER.

Copyright (C) Motorola, Inc. 1989-2001 All rights reserved.

Version 13.1

## Q. Boost C++ Libraries

Provided with this product is free peer-reviewed portable C++ source libraries.

Version 1.33.1

Copyright (C) by Beman Dawes, David Abrahams, 1998-2003. All rights reserved.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE AND NON-INFRINGEMENT. IN NO EVENT SHALL THE COPYRIGHT HOLDERS OR ANYONE DISTRIBUTING THE SOFTWARE BE LIABLE FOR ANY DAMAGES OR OTHER LIABILITY, WHETHER IN CONTRACT, TORT OR OTHERWISE,

ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

## R. U-Boot

Provided with this product is a software licensed from Free Software Foundation Inc. This is used as OS Bootloader; and located in on-board flash. This product is standalone and not linked (statically or dynamically) to any other software.

Version 1.1.0

Copyright (C) 2000-2004. All rights reserved.

## S. Solaris

Provided with this product is free software; Licensee can redistribute it and/or modify it under the terms of the GNU General Public License.

Copyright (C) 1992-1993 Jean-loup Gailly. All rights reserved.

## T. Internet Protocol Version 6

Copyright (C) 1982, 1986, 1990, 1991, 1993. The Regents of the University of California. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgement: This product includes software developed by the University of California, Berkeley and its contributors.

4. Neither the name of the University nor the names of its contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE REGENTS AND CONTRIBUTORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE REGENTS OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION). HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The copyright of the products such as crypto, dhcp, net, netinet, netinet6, netley, netwrs, libinet6 are same as that of the internet protocol version 6.

## U. CURSES

Copyright (C) 1987. The Regents of the University of California. All rights reserved.

Redistribution and use in source and binary forms are permitted provided that the above copyright notice and this paragraph are duplicated in all such forms and that any documentation, advertising materials, and other materials related to such distribution and use acknowledge that the software was developed by the University of California, Berkeley. The name of the University may not be used to endorse or promote products derived from this software without specific prior written permission.

## V. ZModem

Provided with this product is a program or code that can be used without any restriction.

Copyright (C) 1986 Gary S. Brown. All rights reserved.

## W.Boost Software License

Provided with this product is reference implementation, so that the Boost libraries are suitable for eventual standardization. Boost works on any modern operating system, including UNIX and Windows variants.

Version 1.0

Copyright (C) Gennadiy Rozental 2005. All rights reserved.

## X. OpenLDAP

Provided with this software is an open source implementation of the Lightweight Directory Access Protocol (LDAP).

Version 3

Copyright (C) 1990, 1998, 1999, Regents of the University of Michigan, A. Hartgers, Juan C. Gomez. All rights reserved.

This software is not subject to any license of Eindhoven University of Technology. Redistribution and use in source and binary forms are permitted only as authorized by the OpenLDAP Public License.

This software is not subject to any license of Silicon Graphics Inc. or Purdue University. Redistribution and use in source and binary forms are permitted without restriction or fee of any kind as long as this notice is preserved.

## **Y. BITMAP.C**

Provided with this product is a program for personal and non-profit use.

Copyright (C) Allen I. Holub, All rights reserved.

## **Z. University of Toronto**

Provided with this product is a code that is modified specifically for use with the STEVIE editor. Permission is granted to anyone to use this software for any purpose on any computer system, and to redistribute it freely, subject to the following restrictions:

1. The author is not responsible for the consequences of use of this software, no matter how awful, even if they arise from defects in it.
2. The origin of this software must not be misrepresented, either by explicit claim or by omission.
3. Altered versions must be plainly marked as such, and must not be misrepresented as being the original software.

Version 1.5

Copyright (C) 1986 by University of Toronto and written by Henry Spencer.

## **AA.Free/OpenBSD**

```

## RMON Commands

```
rmon probes {stats | history | alarm} [entry-number] {enable | disable}
show rmon probes [stats | history | alarm] [entry-number]
show rmon events [event-number]
```

## VLAN Stacking Commands

```
ethernet-service {svlan | ipmvlan | management-vlan} svid1[-svid2] [enable | disable] [[1x1 |
flat] stp {enable | disable}] [name description]
no ethernet-service {svlan | ipmvlan | management-vlan} svid1[-svid2]
```

```
ethernet-service {svlan | ipmvlan} svid1[-svid2] source-learning {enable| disable}
Creates a VLAN Stacking service and associates the service with an SVLAN or an IP
Multicast VLAN (IPMV). The SVLAN or IPMV specified is the VLAN that will
transport traffic for the service.
ethernet-service service-name service-name {svlan | ipmvlan} svid
no ethernet-service service-name service-name {svlan | ipmvlan} svid
ethernet-service svlan svid1[-svid2] nni {slot/port1[-port2] | linkagg agg_num} [stp | erp]
no ethernet-service svlan svid1[-svid2] nni {slot/port1[-port2] | linkagg agg_num}
ethernet-service nni {slot/port1[-port2] | agg_num} [tpid value] [{stp | gvrp | mvrp} legacy-
bpdu {enable | disable}] [transparent-bridging {enable | disable}]
ethernet-service sap sapid service-name service-name

## Numerics

- 802.1ab 12-1
  - notification of local system MIB changes 12-12
  - reinit delay 12-8
  - show port statistics 12-34
  - tlv management 12-18
  - transmit time interval 12-5
- 802.1p
  - mapped to ToS or DSCP 33-154
  - QoS port default 32-56
- 802.1Q 6-1
  - show 6-6
  - untrusted ports 32-5
- 802.1X 35-1
  - device classification policy 35-21
  - supplicant policy authentication 35-9, 35-11, 35-13
  - supp-polling retry 35-7

## A

- AAA 36-1
  - password-size min 36-55
  - show user network profile 36-140, 36-144, 36-146, 36-148, 36-150, 36-152, 36-157, 36-160, 36-163, 36-166
  - show user password-expiration 36-123
- accounting 1-79, 1-113
- actions
  - supported by hardware 33-133
- active login sessions 57-30
- Alcatel Mapping Adjacency Protocol 13-1
  - adjacent switches 13-2
  - common transmission state 13-5
  - discovery transmission state 13-3
- alerts 51-6, 51-14
- alias 57-14
- AMAP
  - see* Alcatel Mapping Adjacency Protocol
- assigning ports to VLANs 5-11
- authenticated mobile ports 37-29, 37-31, 37-33, 37-34, 37-35
- authenticated VLANs 5-8
  - DHCP Relay 20-8

## B

- BGP 25-1
