| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- To display a list of logged events, omit the *entry\_number* from the command line.
- To display statistics for a particular event, include the *entry\_number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events** *entry\_number* command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

### Examples

```
-> show rmon events
```

```
Entry Time Description
-----+-----+-----
1 00:08:00 etherStatsPkts.4008: [Falling trap] "Falling Event"
2 00:26:00 etherStatsCollisions.2008: "Rising Event"
```

```
-> show rmon events 2
```

```
Entry Time Description
-----+-----+-----
2 00:26:00 etherStatsCollisions.2008: "Rising Event"
```

# 53 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

A summary of the available commands is listed here.

---

**swlog**  
**swlog syslog-facility-id**  
**swlog appid**  
**swlog output**  
**swlog output flash-file-size**  
**swlog advanced**  
**swlog size-trap-threshold**  
**swlog clear**  
**show log swlog**  
**show swlog**  
**swlog console level**  
**show log events**  
**show log events output**

---

## swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

```
swlog {enable | disable | preamble | hash-time-limit seconds | duplicate-detect | console level num |
default level {level}}
```

```
no swlog [preamble | duplicate-detect]
```

---

### Syntax Definitions

|                                       |                                                                                                                                 |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>                         | Enables the switch logging functionality.                                                                                       |
| <b>disable</b>                        | Disables the switch logging functionality.                                                                                      |
| <b>preamble</b>                       | Enables or disables the display of the preamble to the console.                                                                 |
| <b>hash-time-limit <i>seconds</i></b> | Configures the amount of elapsed time for an entry to no longer be considered a duplicate entry.                                |
| <b>duplicate-detect</b>               | Enables or disables the duplicate detection capability.                                                                         |
| <b>console level <i>num</i></b>       | The severity level filter keyword or numeric value for the application ID. (see table for <a href="#">swlog appid</a> command). |
| <b>default level</b>                  | Immediately changes the severity level for application events. (see table for <a href="#">swlog appid</a> command).             |

### Defaults

| parameter                         | default           |
|-----------------------------------|-------------------|
| <b>enable   disable</b>           | <b>enable</b>     |
| <b>preamble</b>                   | <b>enable</b>     |
| <b>hash-time-limit <i>num</i></b> | <b>60 seconds</b> |
| <b>duplicate-detect</b>           | <b>enable</b>     |
| <b>console level <i>num</i></b>   | <b>6 (info)</b>   |
| <b>default level</b>              | <b>info</b>       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the **no** form of the command to enable or disable the **preamble** and **duplicate-detect** setting.

- The syslog preamble includes the level, appid, and timestamp that precedes the actual log messages.
- If duplicate entries are received within the configured **hash-time-limit**, only a single entry will be logged along with the number of times duplicated.
- Use the **swlog console level** command to set the switch logs of different levels to be displayed on the console.
- Configuring the **default level** will immediately set all apps, subapps and libraries to that level.

## Examples

```
-> swlog enable
-> swlog hash-time-limit 30
-> no swlog preamble
-> swlog default level event
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.3.1.R02; **gmt-time** parameter added.  
Release 8.4.1; **gmt-time** parameter removed.  
Release 8.9R3; **default level** added.

## Related Commands

|                            |                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>swlog appid</b>         | Defines the level at which switch logging information will be filtered for the specified application.                                                             |
| <b>swlog output</b>        | Enables or disables switch logging output to the console, file, or data socket.                                                                                   |
| <b>show log swlog</b>      | Displays stored switch logging information from flash.                                                                                                            |
| <b>show swlog</b>          | Displays switch logging information.                                                                                                                              |
| <b>swlog console level</b> | Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console. |

## MIB Objects

```
systemSwitchLogging
 systemSwitchLoggingEnable
 systemSwitchLoggingPreamble
 systemSwitchLoggingHashAgeLimit
 systemSwitchLoggingDuplicateDetect
 systemSwitchLoggingConsoleLevel
 systemSwitchLoggingGmtTime
 systemSwitchLoggingDefaultLevel
```

## swlog syslog-facility-id

Specifies a facility ID that switch logging includes in the priority (PRI) section of the event message.

**swlog syslog-facility-id** {*facility\_id* | *num*}

---

### Syntax Definitions

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>facility_id</i> | A facility identification keyword. Current facility IDs are listed in the table below.                                                |
| <i>num</i>         | A numerical equivalent value for the facility ID. The range is 0–23. Current numeric equivalent values are listed in the table below. |

---

### Supported Facility IDs with Numerical Equivalents

|                |                |
|----------------|----------------|
| kernel - 0     | NTP - 12       |
| user - 1       | log-audit - 13 |
| mail - 2       | log-alert - 14 |
| system - 3     | clock2 - 15    |
| sec-auth1-2    | local0 - 16    |
| syslog - 5     | local1 - 17    |
| lptr - 6       | local2 - 18    |
| net-news - 7   | local3 - 19    |
| UUCP - 8       | local4 - 20    |
| clock1 - 9     | local5 - 21    |
| sec-auth2 - 10 | local6 - 22    |
| FTP - 11       | local7 - 23    |

### Defaults

| parameter          | default |
|--------------------|---------|
| <i>facility_id</i> | local0  |
| <i>num</i>         | 16      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use the ID name (**system**) or the numeric equivalent to specify the facility ID.

## Examples

```
-> swlog syslog-facility-id system
-> swlog syslog-facility-id 3
-> swlog syslog-facility-id user
-> swlog syslog-facility-id 1
```

## Release History

Release 8.3.1; command introduced.

## Related Commands

|                                |                                                        |
|--------------------------------|--------------------------------------------------------|
| <a href="#">swlog</a>          | Enables or disables switch logging.                    |
| <a href="#">show log swlog</a> | Displays stored switch logging information from flash. |
| <a href="#">show swlog</a>     | Displays switch logging information.                   |

## MIB Objects

```
systemSwitchLogging
 systemSwitchLoggingSysLogFacilityId
```

---

## swlog appid

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured.

**swlog appid** {all | *string*} {library {all | *string*} | subapp {all | *num*} | exclude {all | *num*}} {disable | enable | level {*level* | *num*} [*vrf num*]}

---

### Syntax Definitions

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>                          | An application or library identification keyword. Enter a question mark (?) on the command line to get a list of application or library IDs.                                                                                                                                                                                                                                                                    |
| <b>subapp</b> <i>num</i>               | A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.                                                                                                                                                                                                                                                                                      |
| <b>exclude</b> <i>num</i>              | A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.                                                                                                                                                                                                                                                                                      |
| <b>disable</b>                         | Disables the logging of the associated application.                                                                                                                                                                                                                                                                                                                                                             |
| <b>enable</b>                          | Enables the logging of the associated application.                                                                                                                                                                                                                                                                                                                                                              |
| <b>level</b> <i>level</i>   <i>num</i> | The severity level filter keyword or numerical equivalent value for the application ID ( <i>see table below</i> ). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe. |
| <i>vrf num</i>                         | The VRF ID.                                                                                                                                                                                                                                                                                                                                                                                                     |

| Supported Levels | Numeric Equivalents | Description                                                |
|------------------|---------------------|------------------------------------------------------------|
| <b>off</b>       | <b>0</b>            | Disabled                                                   |
| <b>alarm</b>     | <b>1</b>            | Highest severity. The system is about to crash and reboot. |
| <b>error</b>     | <b>2</b>            | System functionality is reduced.                           |
| <b>alert</b>     | <b>3</b>            | A violation has occurred.                                  |
| <b>warning</b>   | <b>4</b>            | A unexpected, non-critical event has occurred.             |
| <b>event</b>     | <b>5</b>            | A clear readable customer event.                           |
| <b>info</b>      | <b>6</b>            | Any other non-debug message (default).                     |
| <b>debug1</b>    | <b>7</b>            | A normal event debug message.                              |
| <b>debug2</b>    | <b>8</b>            | A debug-specific message.                                  |
| <b>debug3</b>    | <b>9</b>            | All debug messages.                                        |

### Defaults

Default severity level is **info**.

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- Use the **show swlog appid** command to display available registered applications.
- Specify the **event** severity level keyword to define the new event level at which switch logging information will be filtered for the specified application.
- Logging should only be enabled based on the debugging recommendations from Service & Support. Enabling logging for too many applications at once can result in high CPU utilization.

## Examples

```

|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>swlog</b>               | Enables or disables switch logging.                                                                                                                               |
| <b>swlog output</b>        | Enables or disables switch logging output to the console, file, or data socket.                                                                                   |
| <b>show log swlog</b>      | Displays stored switch logging information from flash.                                                                                                            |
| <b>show swlog</b>          | Displays switch logging information.                                                                                                                              |
| <b>swlog console level</b> | Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console. |

## MIB Objects

```

systemSwitchLogging
 systemSwitchLoggingAppName
 systemSwitchLoggingLibraryName
 systemSwitchLoggingLevel

```

## swlog output

Enables or disables switch logging output to the console, file, data socket (remote session), or external syslog server.

```
swlog {host | ni} [slot chassis/slot] output {tty {enable | disable} | console | flash | socket {ip_address [port] | ipv6Address [port] | domain_name | console {enable | disable}} [tls] [remote command-log] [vrf-name name]}
```

```
no swlog output {console | flash | socket [ip_address | ipv6Address | domain_name]}
```

---

### Syntax Definitions

|                                 |                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>tty enable</b>               | Enables switch logging to a connected Telnet session.                                                                      |
| <b>tty disable</b>              | Disables switch logging to a connected Telnet session.                                                                     |
| <b>host</b>                     | Enable or disable host logging to remote syslog server.                                                                    |
| <b>ni</b>                       | Enable or disable NI logging to remote syslog server.                                                                      |
| <b>slot</b> <i>chassis/slot</i> | The chassis ID and slot ID of the NI output socket.                                                                        |
| <b>console</b>                  | Specifies console output. When enabled, switch logging output is printed to the user console.                              |
| <b>flash</b>                    | Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system. |
| <b>socket</b>                   | Specifies data socket output. When enabled, switch logging output is printed to a remote session.                          |
| <i>ip_address</i>               | The IPv4 address for the remote session host.                                                                              |
| <i>ipv6Address</i>              | The IPv6 address for the remote session host.                                                                              |
| <i>port</i>                     | The socket port number.                                                                                                    |
| <i>domain_name</i>              | A Fully Qualified Domain Name (FQDN) for the remote session host. Specify a domain name up to 128 characters in length.    |
| <b>console enable</b>           | Enables uploading of the console log(s) to the remote syslog server.                                                       |
| <b>console disable</b>          | Disables uploading of the console log(s) to the remote syslog server.                                                      |
| <b>tls</b>                      | Enables or disables syslog over TLS.                                                                                       |
| <b>remote command-log</b>       | Enables command logging to a remote session host.                                                                          |
| <i>name</i>                     | Specifies the VRF to be used to access the remote syslog server.                                                           |

## Defaults

| parameter                  | default           |
|----------------------------|-------------------|
| console   flash   socket   | flash and console |
| console {enable   disable} | disable           |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- Use the **socket** keyword to send output to a syslog server, followed by the IP address or FQDN of the remote host. Up to 12 servers can be configured. When an FQDN is specified, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- To enable uploading of console logs to a remote syslog server, it is mandatory to have at least one remote syslog server configured (**swlog output socket <ip\_address>**). If there is no UDP remote syslog server configured, an error message will be displayed.
- To enable host and NI logging to remote syslog server, it is mandatory to have at least one remote syslog server configured (**swlog output socket <ip\_address>**).
- The host and NI logging to remote syslog server is supported only on OS9900.
- When all the configured remote syslog server is removed, the status of all NI and host remote logging is automatically set to disabled.
- Syslog over TLS:
  - Remote command log will not work when syslog over TLS is enabled.
  - VRF cannot be used to access the syslog server when syslog over TLS is enabled.
  - In OmniSwitch 9900 only CMM swlog is transferred to the external syslog server over TLS.
  - Dying Gasp syslog messages are not captured in syslog over TLS.
  - Use the **no** form of the command to disable syslog over TLS.
- VRF name must either be 'default' or a pre-defined VRF (user-defined).

## Examples

```
-> swlog output console
-> no swlog output flash
```

```

-> swlog output socket 14.1.1.1
-> swlog output socket 14.1.1.2 1234
-> swlog output socket console enable
-> swlog host output socket enable
-> swlog host output socket disable
-> swlog ni slot 1/3 output socket enable
-> swlog ni slot 2/3 output socket disable
-> swlog output socket 14.1.1.1 remote command-log
-> swlog output socket 14.1.1.1 vrf-name vrf1
-> no swlog output socket 14.1.1.1

-> swlog output socket upam.omnivista.com
-> swlog output socket upam.omnivista.com remote command-log
-> swlog output socket upam.omnivista.com vrf-name vrf1
-> no swlog output socket upam.omnivista.com
-> swlog output socket opendaylight.com
ERROR: DNS lookup failed, unknown host opendaylight.com
-> swlog output socket 192.168.120.140 tls
-> swlog output socket 2001::1 tls
-> no swlog output socket 2001::1

```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf-name** parameter added.

Release 8.3.1; **remote command-log** parameter added.

Release 8.5R1; *domain\_name* parameter option added.

Release 8.6R1; **tls** parameter added.

Release 8.8R1; **host, ni, console {enable | disable}** parameter added.

## Related Commands

## swlog output flash-file-size

Configures the size of the switch logging file.

**swlog output flash-file-size** *kilobytes*

---

### Syntax Definitions

*kilobytes*

The size of the switch logging file in kilobytes. The range is 125–12500.

### Defaults

| parameter        | default |
|------------------|---------|
| <i>kilobytes</i> | 1250    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the [show hardware-info](#) command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog output flash-file-size 256
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[swlog advanced](#)

Clears the files that store switch logging data.

[show log swlog](#)

Displays stored switch logging information from flash.

[show swlog](#)

Displays switch logging information.

## MIB Objects

systemSwitchLogging

  systemSwitchLoggingFileSize

---

## swlog advanced

Enable or disable switch logging in RFC5424 format.

```
swlog advanced {enable | disable}
```

---

### Syntax Definitions

**enable** Enable switch logging in RFC5424 format.  
**disable** Disable switch logging in RFC5424 format.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- By default, the switch logs the messages in BSD syslog format (RFC3164) to files and remote syslog servers.
- When switch logging RFC5424 format is enabled, the old RFC3164 syslog messages are reformatted to comply with the RFC5424 before writing to files or sending to remote syslog servers.

### Examples

```
-> swlog advanced enable
-> swlog advanced disable
```

### Release History

Release 8.4.1; command introduced.

## Related Commands

[show swlog](#)

Displays switch logging information.

## MIB Objects

`systemSwitchLoggingSyslogProtocol`

---

## swlog size-trap-threshold

Configures the threshold limit of the storage space used for swlog record storage. When the storage reaches the configured threshold limit a notification is displayed in the swlog message.

**swlog size-trap-threshold** *threshold*

---

### Syntax Definitions

*threshold* The percentage of storage space to be set as threshold limit. The valid range is 50–90.

### Defaults

| parameter        | default |
|------------------|---------|
| <i>threshold</i> | 90      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to configure the threshold limit of the storage space used for swlog record storage.
- Use the [swlog clear](#) command to clear the files that store switch logging data.

### Examples

```
-> swlog size-trap-threshold 90
```

### Release History

Release 8.4.1; command introduced.

systemSwitchLoggingSizeTrapThreshold

---

## swlog clear

Clears the files that store switch logging data.

**swlog clear [all]**

---

### Syntax Definitions

**all** Clears all the contents of the switch log file.

### Defaults

By default, the contents of the switch log file is cleared but the event logs are retained.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.
- To clear all the contents including the event log use the “**all**” parameter with swlog clear command.

### Examples

```
-> swlog clear
-> swlog clear all
```

### Release History

Release 7.1.1; command was introduced.

Release 8.6R2; **all** parameter added.

**Related Commands**

## show log swlog

Displays stored switch logging information.

**show log swlog**

**show log swlog [timestamp *mm/dd/yyyy hh:mm:ss*] [slot *num*] [reverse]**

---

### Syntax Definitions

*mm/dd/yyyy hh:mm:ss*

Specify the starting time for the switch logging information to be displayed. Use the format ***mm/dd/yyyy hh:mm:ss*** where ***mm*** represents the month, ***dd*** is the day, ***yyyy*** is the year, ***hh*** is the hour, ***mm*** is the minutes and ***ss*** is the seconds. Use four digits to specify the year.

*num*

The slot number to display the logging information for. *Currently not supported.*

*reverse*

Display logs from the most recent to the oldest in time order of log files. */flash/.*

### Default

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- When the switch logging display is too long, you may use the **swlog advanced** command to clear all of the switch logging information.
- The use of **grep** and the **timestamp** parameter can be used to filter the log files.
- When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command. Only those users who provide the valid ASA credentials are allowed to view the data. For more information on Authenticated Switch Access - Enhanced Mode mode, refer to the “Managing Switch Security” chapter in *OmniSwitch AOS Release 8 Switch Management Guide*.

### Examples

```
-> show log swlog timestamp 09/30/2011 13:27:00
Displaying file contents for '/flash/swlog.6'
```

```
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
-> show log swlog | grep ChassisSupervisor
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 28 13:25:15 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
Sep 30 13:26:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command.

```
-> show log swlog
Username: test
Password: *****
```

**show log swlog | grep error** and **show log swlog | grep more** commands are not supported in enhanced mode.

## Release History

## MIB Objects

N/A

---

## show swlog

Displays switch logging information (for example, switch logging status, log devices, application IDs with non-default severity level settings).

**show swlog** [**library** | **appid** {**all** | *string*} | **dying-gasp-station**]

---

### Syntax Definitions

|                           |                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>library</b>            | Displays the entire library for all application IDs.                                                                       |
| <i>string</i>             | The name of the application ID to display. Enter a question mark (?) on the command line to get a list of application IDs. |
| <b>dying gasp-station</b> | Displays switch logging information for Dying Gasp entries.                                                                |

### Defaults

By default, the switch logging configuration for the switch is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

**Release History**

Release 7.1.1; command was introduced.

Release 8.3.1; **dying-gasp-station** parameter added.

Release 8.3.1.R02; **GMT time logging** field added.

Release 8.4.1; **GMT time logging** field replaced with **RFC5424 Format Logging. Swlog Threshold**.

Release 8.6R1; **Syslog over TLS** field added in show swlog output.

Release 8.8R1; **Host output socket, Output Socket Console, NI output socket** field added in show swlog output.

Release 8.9R3; **Swlog Default Level** added.

**Related Commands**

|                                     |                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>swlog</b>                        | Enables or disables switch logging.                                                                                      |
| <b>swlog syslog-facility-id</b>     | Configures the value of the facility ID that switch logging includes in the priority (PRI) section of the event message. |
| <b>swlog appid</b>                  | Defines the level at which switch logging information will be filtered for the specified application.                    |
| <b>swlog output</b>                 | Enables or disables switch logging output to the console, file, or data socket.                                          |
| <b>swlog output flash-file-size</b> | Configures the size of the switch logging file.                                                                          |
| <b>swlog size-trap-threshold</b>    | Configures the threshold limit of the storage space used for swlog record storage.                                       |
| <b>show log swlog</b>               | Displays stored switch logging information from flash.                                                                   |
| <b>show log events</b>              | Displays customer event logs on the switch.                                                                              |
| <b>show log events output</b>       | Captures all event log to a specified file name on the switch.                                                           |

## swlog console level

Allows to set the switch logs of different levels to be displayed on the console. All application events of defined level and lower are displayed on the console.

**swlog console level** {*num* | **alarm** | **alert** | **debug1** | **debug2** | **debug3** | **error** | **info** | **off** | **warning** }

---

### Syntax Definitions

|                                 |                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>console level</b> <i>num</i> | The severity level filter keyword or numeric value for the application ID. (see table for <b>swlog appid</b> command). |
| <b>alarm</b>                    | Sets the log level to display highest severity. (The system is about to crash and reboot)                              |
| <b>alert</b>                    | Sets the log level to display on console when a violation has occurred.                                                |
| <b>debug1</b>                   | Sets the log level to display normal event debug message to be displayed on console.                                   |
| <b>debug2</b>                   | Sets the log level to display a debug-specific message to be displayed on console.                                     |
| <b>debug3</b>                   | Sets the log level to display all debug messages on the console.                                                       |
| <b>error</b>                    | Sets the log level to display on console when system functionality is reduced.                                         |
| <b>info</b>                     | Sets the log level to display any other non-debug message on the console.                                              |
| <b>off</b>                      | Sets the log level as disabled. No logs are displayed on the console.                                                  |
| <b>warning</b>                  | Sets the log level to display on console when an unexpected, non-critical event has occurred.                          |

### Defaults

| parameter                       | default         |
|---------------------------------|-----------------|
| <b>console level</b> <i>num</i> | <b>6 (info)</b> |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the **show swlog** command to display the console display level.

## Examples

```
-> swlog console level 5
-> swlog console level info
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

|                                        |                                                                                                       |
|----------------------------------------|-------------------------------------------------------------------------------------------------------|
| <a href="#">swlog appid</a>            | Defines the level at which switch logging information will be filtered for the specified application. |
| <a href="#">swlog output</a>           | Enables or disables switch logging output to the console, file, or data socket.                       |
| <a href="#">show log swlog</a>         | Displays stored switch logging information from flash.                                                |
| <a href="#">show swlog</a>             | Displays switch logging information.                                                                  |
| <a href="#">show log events</a>        | Displays customer event logs on the switch.                                                           |
| <a href="#">show log events output</a> | Captures all event log to a specified file name on the switch.                                        |

## MIB Objects

```

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use this command to display customer event logs.

### Examples

```
-> show log events
2019 Apr 28 19:17: 8.83 : CMM : ChassisSupervisor : chassisTrapsAlert - CERTIFY w/
FLASH SYNCHRO process started
2019 Apr 28 19:17:32.697 : CMM : ChassisSupervisor : chassisTrapsAlert - CERTIFY
process completed successfully
2019 Apr 28 19:21:33.154 : CMM : ChassisSupervisor : chassisTrapsAlert - ACTIVATE
process scheduled
2019 Apr 28 19:21:57.462 : CMM : ChassisSupervisor : System Reboot
2019 Apr 28 19:25:25.302 : CMM : ChassisSupervisor : chassisTrapsAlert - Power
supply is OK
2019 Apr 28 19:25:25.303 : CMM : ChassisSupervisor : The switch was restarted by
the user
2019 Apr 28 19:25:25.304 : CMM : ChassisSupervisor : chassisTrapsAlert - CMM
startup completed
```

### *output definitions*

---

The log output is in the following format:

<SWLOG\_TIMESTAMP> : <CMM>/<NI> : <MODULE\_NAME> : <LOG\_DESCRIPTION>

---

## Release History

Release 8.6R1; command was introduced.

## Related Commands

**show log events output**

Captures all event log to a specified file name on the switch.

**swlog output**

Enables or disables switch logging output to the console, file, or data socket.

**show log swlog**

Displays stored switch logging information from flash.

**show swlog**

Displays switch logging information.

## MIB Objects

N/A

---

## show log events output

Captures all event log to a specified file name on the switch.

`show log events output filename`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to capture all event log to a filename.
- All the logs related to customer events will be appended “CUSTLOG” to the prefix to differentiate events from normal debug logs.

### Examples

```
-> show log events output /flash/myevents
```

### Release History

Release 8.6R1; command was introduced.

# 54 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

*Filename:* ALCATEL-IND1-HEALTH-MIB.mib  
*Module:* alcatelIND1HealthMonitorMIB

A summary of the available commands is listed here:

---

**health threshold**  
**health interval**  
**show health configuration**  
**show health**  
**show health all**

---

## health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and flash usage.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user.

**health threshold** {*rx percent* | *txrx percent* | **memory percent** | **cpu percent** | **flash percent**}

---

### Syntax Definitions

|                |                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rx</b>      | Specifies the maximum input (RX) traffic threshold.                                                                                                                    |
| <b>txrx</b>    | Specifies the maximum output/input (TX/RX) traffic threshold.                                                                                                          |
| <b>memory</b>  | Specifies the maximum RAM memory usage threshold.                                                                                                                      |
| <b>cpu</b>     | Specifies the maximum CPU usage threshold.                                                                                                                             |
| <b>flash</b>   | Specifies the maximum flash usage threshold.                                                                                                                           |
| <i>percent</i> | The new threshold value, in percent, for the corresponding resource ( <b>rx</b> , <b>txrx</b> , <b>memory</b> , <b>cpu</b> , <b>flash</b> ). The valid range is 1–100. |

### Defaults

| parameter         | default |
|-------------------|---------|
| <i>percentage</i> | 80      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to [page 54-5](#), or refer to the chapter titled “Diagnosing Switch Problems” in the *OmniSwitch AOS Release 8 Network Configuration Guide*.
- To view the current health threshold values, use the [show health configuration](#) command.

## Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show health configuration](#)      Displays the current health threshold settings.

## MIB Objects

```
HealthThreshInfo
 healthThreshDeviceRxLimit
 healthThreshDeviceTxRxLimit
 healthThreshDeviceMemoryLimit
 healthThreshDeviceCpuLimit
 healthThreshFlashLimit
```

---

## health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

**health interval** *seconds*

---

### Syntax Definitions

*seconds* Sampling interval (in seconds). Valid entries are 10, 12, 15, 20, 30.

### Defaults

| parameter      | default |
|----------------|---------|
| <i>seconds</i> | 10      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Decreasing the polling interval may impact switch performance.

### Examples

```
-> health interval 20
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show health](#) Displays the current health sampling interval.

### MIB Objects

HealthThreshInfo  
healthSamplingInterval

---

## show health configuration

Displays current health configuration settings.

**show health configuration**

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rx Threshold</b>      | The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>incoming traffic</i> on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the <b>health threshold</b> command. |
| <b>TxRx Threshold</b>    | The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>all incoming and outgoing traffic</i> . As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the <b>health threshold</b> command.                                           |
| <b>CPU Threshold</b>     | Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the <b>health threshold</b> command.                                                                                                                                                                                                                                             |
| <b>Memory Threshold</b>  | Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the <b>health threshold</b> command.                                                                                                                                                                                                                                                   |
| <b>Flash Threshold</b>   | Displays the current flash usage threshold. The default value is 80 percent and can be changed using the <b>health threshold</b> command.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Sampling Interval</b> | Displays the sampling interval time period in seconds. Sampling interval can be changed using the <b>health interval</b> command.                                                                                                                                                                                                                                                                                                                                                         |

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

|                         |                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------|
| <b>health threshold</b> | Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage and CPU usage. |
| <b>health interval</b>  | Configures the sampling interval between health statistics checks.                                      |

**MIB Objects**

```
HealthThreshInfo
 healthThreshDeviceRxLimit
 healthThreshDeviceTxRxLimit
 healthThreshDeviceMemoryLimit
 healthThreshDeviceCpuLimit
```

---

## show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

**show health** [*port chassis/slot/port* | *slot chassis/slot[-slot2]*] [*statistics*]

---

### Syntax Definitions

|                     |                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>      | The chassis identifier.                                                                                      |
| <i>slot/port</i>    | To view a specific port, enter the slot and port number (3/1) along with the <b>port</b> keyword (port 3/1). |
| <i>slot[-slot2]</i> | To view a series of slots, enter the range of slot numbers along with the <b>slot</b> keyword (1-10).        |
| <i>statistics</i>   | Optional command syntax. It displays the same information as the <b>show health</b> command.                 |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

### Examples

```
-> show health
CMM
Resources Current 1 Min 1 Hr 1 Day
 Avg Avg Avg Avg
-----+-----+-----+-----+
CPU 0 0 0 0
Memory 30 30 24 24

-> show health port 1/1/24
Port 1/1/24 Limit Current 1 Min 1 Hr 1 Day
Resources Avg Avg Avg Avg
-----+-----+-----+-----+
Receive 80 01 01 01 01
Transmit/Receive 80 01 01 01 01
```

|                         |                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------|
| <b>Receive</b>          | Traffic received by the switch.                                                             |
| <b>Transmit/Receive</b> | Traffic transmitted and received by the switch.                                             |
| <b>Memory</b>           | Switch memory.                                                                              |
| <b>CPU</b>              | Switch CPU.                                                                                 |
| <b>Limit</b>            | Currently configured device threshold levels.                                               |
| <b>Curr</b>             | Current device bandwidth usage.                                                             |
| <b>1 Min Avg</b>        | Average device bandwidth usage over a 1-minute period.                                      |
| <b>1 Hr Avg</b>         | Average device bandwidth usage over a 1-hour period.                                        |
| <b>1 Hr Max</b>         | Maximum device bandwidth usage over a 1-hour period (the maximum of the 1 minute averages). |

---

**Release History**

Release 7.1.1; command introduced.  
 Release 8.5R1; **Limit** output field included.

**Related Commands**

**show health all** Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

**MIB Objects**

```

```

---

## show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

**show health all** {memory | cpu | rx | txrx}

---

### Syntax Definitions

|               |                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------|
| <b>memory</b> | Displays the RAM memory health statistics for all active NI modules in the switch.                        |
| <b>cpu</b>    | Displays the CPU health statistics for all active NI modules.                                             |
| <b>rx</b>     | Displays the health statistics for traffic <i>received</i> on all active NI modules.                      |
| <b>txrx</b>   | Displays the health statistics for traffic both <i>transmitted and received</i> on all active NI modules. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

| 06     | 40   | 40           | 40          | 40          |
| 07     | 40   | 40           | 40          | 40          |
| 13     | 40   | 40           | 40          | 40          |

*output definitions*

---

|                              |                                                                                                                                                                                                                                                |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Memory (Cpu, TXX, RX)</b> | A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if <b>show health all cpu</b> is entered, <b>Cpu</b> is used as the column header. |
| <b>Curr</b>                  | Current usage of the resource on the corresponding slot, in percent (the amount of the total resource bandwidth actually being used by the switch applications).                                                                               |
| <b>1 Min Avg</b>             | Average usage of the resource on the corresponding slot over a one minute period.                                                                                                                                                              |
| <b>1 Hr Avg</b>              | Average usage of the resource on the corresponding slot over a one hour period.                                                                                                                                                                |
| <b>1 Hr Max</b>              | The highest average hourly usage for the resource on the corresponding slot.                                                                                                                                                                   |

# 55 Ethernet OAM Commands

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

*Filename:* Alcatel-IND1-ETHERNET-OAM-MIB.mib  
*Module:* alcatelIND1EoamMIB

*Filename:* IEEE8021-CFM-MIB.mib  
*Module:* ieee8021CfmMib

A summary of the available commands is listed here:

|                                                             |                                                                                                                                                                                                                                                                                                                                                                                                |

---

## ethoam vlan

Creates an association between Primary VID and Non-Primary VID(s).

**ethoam vlan** *vlanid\_list* **primary-vlan** *vlan\_id*

**no ethoam vlan** *vlanid\_list*

---

### Syntax Definitions

*vlanid\_list* A list of VLAN Identifiers (e.g., '10 30-40' or '10').

*vlan\_id* VLAN Identifier (e.g., '20').

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either 'mhf' is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan *vlan\_id*) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the **no** form of this command to dissociate Primary VID from the Non-Primary VID(s).

### Examples

```
-> ethoam vlan 10 primary-vlan 20
```

```
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam vlan](#)

Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

```

---

## ethoam domain

Creates an Ethernet domain with a specific name.

**ethoam domain** *md\_name* **format** {none | dnsname | mac-address-uint | string} **level** *num*

**no ethoam domain** *name*

---

### Syntax Definitions

|                         |                                                                               |
|-------------------------|-------------------------------------------------------------------------------|
| <i>md_name</i>          | Specifies the domain name.                                                    |
| <b>none</b>             | This format is supported for the inter-op with ITU-T Y.1731.                  |
| <b>dnsname</b>          | Domain name like string, globally unique text string derived from a DNS name. |
| <b>mac-address-uint</b> | MAC address + 2-octet (unsigned) integer.                                     |
| <b>string</b>           | Character string.                                                             |
| <i>num</i>              | MD level and it ranges from 0 to 7.                                           |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Maximum domain length is 43.
- Use format as 'none' for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs, and MIPs configured in the MD.

### Examples

```
-> ethoam domain MD format none level 3
-> ethoam domain MD1 format string level 4
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam](#)

## ethoam domain mhf

Configure the Message Handling Function (MHF) value for MD entry.

```
ethoam domain md_name mhf {none | explicit | default}
```

---

### Syntax Definitions

|                 |                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>md_name</i>  | Specifies the domain name used while creating the management domain for which this management association is created. |
| <b>none</b>     | No MHFs can be created.                                                                                               |
| <b>explicit</b> | MHFs can be created only if a MEP is created at some lower MD Level.                                                  |
| <b>default</b>  | MHFs can be created.                                                                                                  |

### Defaults

| parameter                 | default |
|---------------------------|---------|
| none   explicit   default | none    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

Domain must be created before it is modified.

### Examples

```
-> ethoam domain MD mhf default
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

**show ethoam** Displays the information of all the Management Domains (MD) configured on the bridge.

## ethoam association

Creates Maintenance Association (MA) entry.

**ethoam association** *ma\_name* **format** {**vpnid** | **unsignedint** | **string** | **primaryvid** | **icc-based**} **domain** *md\_name*

**no ethoam association** *ma\_name* **domain** *md\_name*

---

### Syntax Definitions

|                    |                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>ma_name</i>     | Association name for the created Ethernet OAM Association.                                                            |
| <b>vpnid</b>       | As specified in RFC 2685 VPN ID.                                                                                      |
| <b>unsignedint</b> | 2-octet unsigned integer.                                                                                             |
| <b>string</b>      | Character String.                                                                                                     |
| <b>primaryvid</b>  | Primary VLAN ID (12 bits represented in a 2-octet integer).                                                           |
| <b>icc-based</b>   | This format is supported for inter-op with ITU-T.                                                                     |
| <i>md_name</i>     | Specifies the domain name used while creating the management domain for which this management association is created. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as ‘icc-based’ to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.
- Use the **no** form of the command to delete the Maintenance Association (MA) entry.

## Examples

```
-> ethoam association MA format string domain MD
-> no ethoam association MA format string domain MD
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam domain association](#)

Displays the information of a specified MA in a Management Domain configured on the bridge.

## MIB Objects

```

 dot1agCfmMaNetFormat
 dot1agCfmMaNetName
 dot1agCfmMaNetRowStatus
dot1agCfmMaCompTable
 dot1agCfmMaComponentId
 dot1agCfmMaCompPrimaryVid
 dot1agCfmMaCompRowStatus
```

---

## ethoam association primary vlan

Creates a primary VLAN for the Maintenance Association (MA) entry.

**ethoam association** *ma\_name* **domain** *md\_name* **primary-vlan** *vlan\_id*

**no ethoam association** *ma\_name* **domain** *md\_name* **primary-vlan** *vlan\_id*

---

### Syntax Definitions

|                |                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>ma_name</i> | Association name for the created Ethernet OAM Association.                                                            |
| <i>md_name</i> | Specifies the domain name used while creating the management domain for which this management association is created. |
| <i>vlan_id</i> | Primary VLAN Identifier.                                                                                              |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Domain must be created before the creation of MA.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.
- Use the **no** form of the command to remove the Primary VLAN association.

### Examples

```
-> ethoam association MA domain MD primary-vlan 100
-> no ethoam association MA domain MD primary-vlan 100
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam domain association](#)

 dot1agCfmMaCompRowStatus
```

---

## ethoam association mhf

Configures the MIP Half Function (MHF) value for MA Entry.

```
ethoam association ma_name domain md_name mhf {none | default | explicit | defer}
```

---

### Syntax Definitions

|                 |                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>ma_name</i>  | Association name for the created Ethernet OAM Association.                                                            |
| <i>md_name</i>  | Specifies the domain name used while creating the management domain for which this management association is created. |
| <b>none</b>     | No MHFs can be created.                                                                                               |
| <b>default</b>  | MHFs can be created.                                                                                                  |
| <b>explicit</b> | MHFs can be created only if a MEP is created at some lower MD Level.                                                  |
| <b>defer</b>    | The creation of MHFs is determined by the corresponding MD object 'dot1agCfmMdmhfCreation'.                           |

### Defaults

| parameter                         | default |
|-----------------------------------|---------|
| none   explicit   default   defer | defer   |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- MA must be created before it is modified.
- On modification of 'mhf' for any MA, Automip shall also be invoked for all VLANs associated with this primary VID.

### Examples

```
-> ethoam association MA domain MD mhf-creation defer
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### **show ethoam domain association**

Displays the information of a specified MA in a Management Domain configured on the bridge.

| <b>interval-invalid</b>   <b>interval100ms</b>   <b>interval1s</b>   <b>interval10s</b>   <b>interval1m</b>   <b>interval10m</b> | <b>interval10s</b> |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

The *ma\_name* should be unique amid all those used by or available to the service provider within a domain.

## Examples

```
-> ethoam association MA domain MD ccm-interval interval10s
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam domain](#)

Displays the information of a specific Management Domain configured on the bridge.

## MIB Objects

```
dot1agCfmMaNetTable
 dot1agCfmMaNetName
dot1agCfmMaCompTable
 dot1agCfmMaCompMIdPermission
```

---

## ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

**ethoam association** *ma\_name* **domain** {*md\_name* | *mac\_address*} **endpoint-list** *mep\_id*[-*mep\_id2*]

**no ethoam association** *ma\_name* **domain** {*md\_name* | *mac\_address*} **endpoint-list** *mep\_id*[-*mep\_id2*]

---

### Syntax Definitions

|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ma_name</i>                    | Name of the Ethernet OAM Association.                                                                                                                      |
| <i>md_name</i>                    | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 55-5</a> . |
| <i>mac_address</i>                | Specifies the CFM system MAC address.                                                                                                                      |
| <i>mep_id</i> [- <i>mep_id2</i> ] | Specifies the MEP number. Use a hyphen to specify a range of MEP numbers.                                                                                  |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The *ma\_name* should be unique within a domain.

### Examples

```
-> ethoam association MA domain MD endpoint-list 100-200
-> no ethoam association MA domain MD endpoint-list 100-200
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam domain association](#)

Displays the information of a specified MA in a Management Domain configured on the bridge.

## MIB Objects

```
dotlagCfmMdTable
 dotlagCfmMdName
dotlagCfmMaNetTable
 dotlagCfmMaNetName
DotlagCfmMaMepList
 dotlagCfmMaMepListIdentifier
 dotlagCfmMaMepListRowStatus
```

---

## ethoam association allowed-cvlan-list

Configures allowed CVLANs on the Ethernet OAM Maintenance Association (MA).

```
ethoam association association_name domain {domain_name | mac_address}
allowed-cvlan-list num[-num2]
```

```
no ethoam association association_name domain {domain_name | mac_address}
allowed-cvlan-list num[-num2]
```

---

| No   | Yes  | Yes  | Yes   | No   | No    | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the **no** form of this command to remove the allowed CVLAN ID list from the MA.
- The CVLAN based maintenance endpoints can be created from CVLANs in the allowed CVLAN list.

### Examples

```
-> ethoam association MA domain MD allowed-cvlan-list 10-15
-> no ethoam association MA domain MD allowed-cvlan-list 10-15
```

### Release History

Release 8.8R1; command introduced.

## Related Commands

**show ethoam domain association**

Displays the information of a specified MA in a Management Domain configured on the bridge.

**ethoam endpoint**

Creates a Maintenance End Point (MEP) and a virtual MEP.

## MIB Objects

```

 dot1agCfmMdName
dot1agCfmMaNetTable
 dot1agCfmMaNetName
alaCfmMaCvlanListTable
 alaCfmMaCvlanListIdentifier
```

---

## clear ethoam statistics

Clear statistics for all MEPs or for a particular MEP.

**clear ethoam statistics** [**domain** *md\_name* **association** *ma\_name* **endpoint** *mep\_id*]

---

### Syntax Definitions

|                |                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>ma_name</i> | Association name for the created Ethernet OAM Association.                                                                            |
| <i>md_name</i> | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>mep_id</i>  | MEP Identifier. Valid Range is 1-8191.                                                                                                |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

Statistics are cleared for all MEPs if a specific MEP is not entered with this command.

### Examples

```
-> clear ethoam statistics
-> clear ethoam statistics domain MD association MA endpoint 10
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam statistics](#)

Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

## MIB Objects

```
dotlagCfmMdTable
 dotlagCfmMdName
dotlagCfmMaNetTable
 dotlagCfmMaNetName
dotlagCfmMepTable
 dotlagCfmMepIdentifier

 alaCfmGlobalClearStats
```

---

## ethoam default-domain level

Configure the effective level of all default domain entries with the level value set to **no level**.

**ethoam default-domain level** *num*

**no ethoam default-domain**

---

### Syntax Definitions

*num* The MD level value. The valid range is 0-7.

### Defaults

Default value is 0.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

The MD level specified with this command applies to all default domain values that are currently set to **no level**.

### Examples

```
-> ethoam default-domain level 1
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam default-domain configuration](#) Displays the values of scalar Default-MD objects.

### MIB Objects

Dot1agCfmDefaultMdLevel

---

## ethoam default-domain mhf

Configure the effective MHF value for all default domain entries with MHF value set to **defer**.

```
ethoam default-domain mhf {none | default | explicit}
```

```
no ethoam default-domain
```

---

### Syntax Definitions

|                 |                                                                      |
|-----------------|----------------------------------------------------------------------|
| <b>none</b>     | No MHFs can be created.                                              |
| <b>default</b>  | MHFs can be created.                                                 |
| <b>explicit</b> | MHFs can be created only if a MEP is created at some lower MD Level. |

### Defaults

Default value is none.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

N/A

### Examples

```
-> ethoam default-domain mhf default
```

### Release History

### MIB Objects

```
dot1agCfmDefaultMdDefMhfCreation
```

---

## ethoam default-domain id-permission

Configures the effective ID permission value for all default domain entries with the ID permission value set to **defer**.

**ethoam default-domain id-permission {none | chassisid}**

**no ethoam default-domain**

---

### Syntax Definitions

**none**

Sender ID TLV is not to be sent.

**chassisid**

Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

### Defaults

Default value is none.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

dot1agCfmDefaultMdDefIdPermission

---

## ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

```
ethoam default-domain primary-vlan {vlan_id} [level {no-level | num}] [mhf {none | default | explicit | defer}] [id-permission {none | chassisid | defer}]
```

```
no ethoam default-domain
```

---

### Syntax Definitions

|                  |                                                                              |
|------------------|------------------------------------------------------------------------------|
| <i>vlan_id</i>   | VLAN Identifier.                                                             |
| <b>no-level</b>  | MD level is inherited from the default domain level.                         |
| <i>num</i>       | MD Level. Valid range is 0 to 7.                                             |
| <b>none</b>      | No MHFs can be created.                                                      |
| <b>default</b>   | MHFs can be created.                                                         |
| <b>explicit</b>  | MHFs can be created only if a MEP is created at some lower MD Level.         |
| <b>defer</b>     | MHF defers to the default domain MHF value.                                  |
| <b>none</b>      | Sender ID TLV is not to be sent.                                             |
| <b>chassisid</b> | Chassis ID Length, Chassis ID Subtype, and Chassis ID TLV are to be present. |
| <b>defer</b>     | ID permission defers to the default domain ID permission value.              |

### Defaults

| parameter                                | default         |
|------------------------------------------|-----------------|
| <b>no-level   num</b>                    | <b>no-level</b> |
| <b>none   explicit   default   defer</b> | <b>defer</b>    |
| <b>none   chassisid   defer</b>          | <b>defer</b>    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANs associated with this primary VID.

## Examples

```
-> ethoam default-domain primary-vlan 10 id-permission chassisid level 3 mhf default.
-> ethoam default-domain primary-vlan 10 id-permission chassisid
-> ethoam default-domain primary-vlan 10 level 3
-> ethoam default-domain primary-vlan 10 mhf default
-> ethoam default-domain primary-vlan 10 level 3 mhf default
```

## Release History

Release 7.3.1; command was introduced..

## Related Commands

[show ethoam default-domain](#) Displays the information of all the default MD.

## MIB Objects

```
dot1agCfmDefaultMdTable
 dot1agCfmDefaultMdComponentId
 dot1agCfmDefaultMdPrimaryVid
 dot1agCfmDefaultMdLevel
```

---

## ethoam endpoint

Creates a Maintenance End Point (MEP) and virtual MEP.

**ethoam endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name* **direction** {**up** | **down**} {**port** *chassis/slot/port* | **virtual** | **linkagg** *agg\_id*} [**primary-vlan** *vlan\_id* | **cvlan** *cvlan\_id*]

**no ethoam endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

|                  |                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>mep_id</i>    | Specifies the Maintenance Association End Point. The range is 1–8191.                                                                 |
| <i>md_name</i>   | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>ma_name</i>   | Association name for the created Ethernet OAM Association.                                                                            |
| <b>up</b>        | For UP MEP.                                                                                                                           |
| <b>down</b>      | For DOWN MEP.                                                                                                                         |
| <i>chassis</i>   | The chassis identifier.                                                                                                               |
| <i>slot/port</i> | Physical slot and port number on which MEP needs to be created.                                                                       |
| <b>virtual</b>   | Keyword for creating virtual MEP.                                                                                                     |
| <i>agg_id</i>    | Linkagg Identifier on which MEP needs to be created.                                                                                  |
| <i>vlan_id</i>   | VLAN Identifier.                                                                                                                      |
| <i>cvlan_id</i>  | Specifies the customer VLAN of the MEP.<br><i>This parameter is supported only on the OmniSwitch 6465 and OmniSwitch 6865.</i>        |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Use the **no** form of this command to delete a maintenance endpoint.
- The *mep\_id* must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.

- For creating a virtual MEP the value of port must be given the keyword “virtual”.
- The CVLAN must be part of the allowed CVLAN list.
- The direction of CVLAN based MEP must always be configured as ‘UP’.
- The CVLAN based MEP must be configured on the UNI port.
- The CVLAN ID must be associated to the SVLAN (MA VLAN) and the UNI port using Ethernet service configuration.
- The SAP profile of the SVLAN (MA VLAN), CVLAN, and UNI port must be in ‘tag preserve’ mode.
- The removal of SAP, UNI port from SAP, CVLAN from the SAP, or changing the SAP profile to ‘tag translate mode’ removes the corresponding CVLAN based MEPS automatically.

## Examples

```
-> ethoam endpoint 10 domain MD association MA direction up port 1/1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-
vlan 100
-> ethoam endpoint 1 domain md1 association ma1 direction up port 1/1/1 cvlan 20
-> no ethoam endpoint 10 domain MD association MA
```

## Release History

Release 7.3.1; command was introduced.

Release 8.8R1; **cvlan** parameter added.

## Related Commands

[show ethoam domain association end-point](#)

### Syntax Definitions

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>mep_id</i>      | Specifies the Maintenance Association End Point. The range is 1–8191.                                                                 |
| <i>md_name</i>     | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>mac_address</i> | Specifies the CFM system MAC address.                                                                                                 |
| <i>ma_name</i>     | Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                     |
| <b>enable</b>      | Administratively enables MEP.                                                                                                         |
| <b>disable</b>     | Administratively disables MEP.                                                                                                        |

### Defaults

The default value is disable.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

The *mep\_id* specified must already exist in the switch configuration.

### Examples

```
-> ethoam endpoint 100 domain MD association MA admin-state enable
```

## ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name rfp {enable | disable}
```

---

### Syntax Definitions

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>mep_id</i>      | Specifies the Maintenance Association End Point. The range is 1–8191.                                                                 |
| <i>md_name</i>     | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>mac_address</i> | Specifies the CFM system MAC address.                                                                                                 |
| <i>ma_name</i>     | Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                     |
| <b>enable</b>      | Administratively enables RFP on MEP.                                                                                                  |
| <b>disable</b>     | Administratively disables RFP on MEP.                                                                                                 |

### Defaults

The default value of RFP is disable.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- The *mep\_id* specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.

## Examples

```
-> ethoam endpoint 1 domain md1 association ma1 rfp enable
-> ethoam endpoint 1 domain md1 association ma1 rfp disable
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

[show ethoam domain

## ethoam endpoint lowest-priority-defect

Configures the lowest priority fault alarm for the lowest priority defect for a MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **lowest-priority-defect** *lowest\_priority\_defect*

---

### Syntax Definitions

|                               |                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mep_id</i>                 | Specifies the Maintenance Association End Point. The range is 1–8191.                                                                                                                                      |
| <i>md_name</i>                | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .                                                                      |
| <i>mac_address</i>            | Specifies the CFM system MAC address.                                                                                                                                                                      |
| <i>ma_name</i>                | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                                                                                      |
| <i>lowest_priority_defect</i> | The lowest priority defect that can generate a Fault alarm. Possible values are <b>xcon</b> , <b>rem-err-xcon</b> , <b>no-defect</b> , <b>mac-rem-err-xcon</b> , <b>err-xcon</b> , and <b>all-defect</b> . |

### Defaults

| parameter                     | default          |
|-------------------------------|------------------|
| <i>lowest_priority_defect</i> | mac-rem-err-xcon |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain esd.ale.com association ale-sales lowest-priority-
defect all-defect
```

### Release History

Release 7.3.1; command was introduced.

---

## ethoam endpoint ctag-priority

Configures the priority value to be included in the inner tag of the CFM frames originating from CVLAN MEPs.

```
ethoam endpoint mep-id domain md-name association ma-name ctag-priority {copy-outer-to-inner | num}
```

---

### Syntax Definitions

|                            |                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>mep_id</i>              | Specifies the Maintenance Association End Point. The valid range is 1–8191.                                           |
| <i>ma-name</i>             | Association name for the created Ethernet OAM Association.                                                            |
| <i>md-name</i>             | Specifies the domain name used while creating the management domain for which this management association is created. |
| <b>copy-outer-to-inner</b> | Copies the outer tag priority to the inner tag.                                                                       |
| <i>num</i>                 | Specify an inner tag priority value. Valid range is 0 to 7.                                                           |

### Defaults

| parameter                        | default             |
|----------------------------------|---------------------|
| copy-outer-to-inner   <i>num</i> | copy-outer-to-inner |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900 V72/C32 | 6900 X48C6/T48C6/X48C4E/V48C8/C32E/T24C2/X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|--------------|------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | No   | No    | Yes  | No   | No           | No                                             | No   |

### Usage Guidelines

- If the priority value is not configured, by default, the outer tag priority value is considered as the inner-tag priority.
- The outer tag is the primary SVLAN of the MA and the inner tag is the CVLAN configured in the endpoint.

### Examples

```
-> ethoam endpoint 1 domain md1 association ma1 ctag-priority 6
-> ethoam endpoint 1 domain md1 association ma1 ctag-priority copy-outer-to-inner
```

|                                  |                                                                                                                                                                                                    |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>mac_address</i>               | Target MAC address to be transmitted.                                                                                                                                                              |
| <i>t_mepid</i>                   | Specifies the MEP for which the Loopback message is targeted.                                                                                                                                      |
| <i>s_mepid</i>                   | Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.                                                                                                                  |
| <i>md_name</i>                   | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .                                                              |
| <b>domain</b> <i>mac_address</i> | Specifies the CFM system MAC address.                                                                                                                                                              |
| <i>ma_name</i>                   | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                                                                              |
| <b>fdbonly</b>                   | Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.                                                                   |
| <i>hop_count</i>                 | Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2 <sup>32</sup> . |

### Defaults

| parameter   | default        |
|-------------|----------------|
| <b>flag</b> | <b>fdbonly</b> |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.

## Examples

```
-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD
association flag fdbonly hop-count 32
Transaction Id: 6943
```

```
-> ethoam linktrace target-endpoint 15 source 4 domain MD association
Transaction Id: 6934
```

## Release History

## ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

**ethoam loopback** {**target-endpoint** *t\_mepid* | **target-macaddress** *mac\_address*} **source-endpoint** *s\_mepid* **domain** *md\_name* **association** *ma\_name* [**number** *num*] [**data string**] [**vlan-priority** *vlan\_priority*] [**drop-eligible** {**true** | **false**}]

---

### Syntax Definitions

|                      |                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>t_mepid</i>       | Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.                                                           |
| <i>mac_address</i>   | Target MAC address to be transmitted.                                                                                                              |
| <i>s_mepid</i>       | Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.                                                                  |
| <i>md_name</i>       | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .              |
| <i>ma_name</i>       | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                              |
| <i>num</i>           | Number of loopback messages. The valid range is 1-10.                                                                                              |
| <i>string</i>        | Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1–255. |
| <i>vlan_priority</i> | VLAN Priority. The valid range is 0-7.                                                                                                             |
| <b>true</b>          | Sets the drop eligibility bit in the VLAN tag to true.                                                                                             |
| <b>false</b>         | Sets the drop eligibility bit in the VLAN tag to false.                                                                                            |

### Defaults

| parameter                                           | default      |
|-----------------------------------------------------|--------------|
| <i>num</i>                                          | 1            |
| <i>vlan_priority</i>                                | CCM priority |
| <b>drop-eligible</b> { <b>true</b>   <b>false</b> } | <b>true</b>  |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

## Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

## Examples

```
-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA
number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms
Reply form 00:0E:B1:6B:43:89: bytes=64 seq=0 time=112ms
Request timed out.

### Syntax Definitions

|                     |                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>centiseconds</i> | The Fault Notification Generation Alarm timeout value, in centiseconds. The valid range is 250–1000.                                  |
| <i>mep_id</i>       | Specifies the MEP of a specific MA. The valid range is 1–8191.                                                                        |
| <i>md_name</i>      | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>ma_name</i>      | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                 |

### Defaults

| parameter           | default |
|---------------------|---------|
| <i>centiseconds</i> | 250     |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

### Examples

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.ale.com association
ale_sales
-> no ethoam fault-alarm-time endpoint 100 domain esd.ale.com association ale_sales
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

## ethoam one-way-delay

Initiates a one-way-delay measurement (IDM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

**ethoam one-way-delay** {**target-endpoint** *t\_mepid* | **target-macaddress** *mac\_address*} **source-endpoint** *s\_mepid* **domain** *md\_name* **association** *ma\_name* [**vlan-priority** *vlan\_priority*]

---

### Syntax Definitions

|                      |                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>t_mepid</i>       | Target MEP ID. The valid range is 1-8191.                                                                                             |
| <i>mac_address</i>   | Target MAC address.                                                                                                                   |
| <i>s_mepid</i>       | Source MEP ID. The valid range is 1–8191.                                                                                             |
| <i>md_name</i>       | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>ma_name</i>       | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                 |
| <i>vlan_priority</i> | VLAN Priority. The valid range is 0-7.                                                                                                |

### Defaults

| parameter            | default |
|----------------------|---------|
| <i>vlan_priority</i> | 7       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating IDM.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if its status is RMEP\_OK or RMEP\_FAILED, before initiating IDM. So **target-macaddress** can be used to bypass such a restriction.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- If the IDM is initiated with a **target-macaddress** and an egress port is found for this MAC address, then the IDM frames are transmitted from that port. Otherwise, IDM frames are flooded in the MEP's VLAN.

- One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

## Examples

```
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
-> ethoam one-way-dealy target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

**show ethoam one-way-delay** Displays the one-way-delay and jitter parameters for all entries or for the MAC address of a specific MEP.

```

---

## ethoam two-way-delay

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

**ethoam two-way-delay** {**target-endpoint** *t\_mepid* | **target-macaddress** *mac\_address*} **source-endpoint** *s\_mepid* **domain** *md\_name* **association** *ma\_name* [**vlan-priority** *vlan\_priority*]

---

### Syntax Definitions

|                      |                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>t_mepid</i>       | Target MEP ID. The valid range is 1-8191.                                                                                             |
| <i>mac_address</i>   | Target MAC address.                                                                                                                   |
| <i>s_mepid</i>       | Source MEP ID. The valid range is 1–8191.                                                                                             |
| <i>md_name</i>       | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>ma_name</i>       | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                 |
| <i>vlan_priority</i> | VLAN Priority. The valid range is 0-7.                                                                                                |

### Defaults

| parameter            | default |
|----------------------|---------|
| <i>vlan_priority</i> | 7       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if the status is RMEP\_OK or RMEP\_FAILED, before initiating two-way-delay. So **target-macaddress** can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.

- If the DMM is initiated by UP MEP with a **target-macaddress** and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP's VLAN.
- Two-way delay measurement does *not* require NTP clock synchronization on the sending and receiving MEPs.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.lag MEPs.
- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure an SAA for continuous two-way frame delay measurement.

## Examples

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
Reply form 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

## show ethoam domain association

Displays the information of a specific MA in a Management Domain configured on the bridge.

**show ethoam domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

*md\_name* Specifies the management domain name.  
*ma\_name* Specifies the name of the Ethernet OAM Association.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

### Usage Guidelines

N/A

### Examples

```
-> show ethoam domain MD association MA
Total number of MEPs configured in this MA = 1
MA-Format : string,
Primary Vlan : 100,
Associated Vlan-list : none,
Total Number of Vlans : 1,
MA-MHFstatus : mhfDefer,
MA-IdPermission : sendIdDefer,
CCM-interval : interval10s,
MEP-List (MEP-Id) : 1-5,
CVLAN-List (CVLAN-Id) : 20-30
```

Legend: MEP-Id: \* = Inactive Endpoint

| MEP-ID | Admin State | Direction | Mac-Address       | Port  | Primary Vlan | Cvlan |
|--------|-------------|-----------|-------------------|-------|--------------|-------|
| 11     | enable      | up        | E8:E7:32:72:01:A4 | 1/1/1 | 200          | 30    |
| 12     | enable      | up        | E8:E7:32:72:01:A4 | 1/1/2 | 200          | 20    |

## show ethoam domain association end-point

Displays the information of a specific MEP in a Management Domain configured on the bridge.

**show ethoam domain *md\_name* association *ma\_name* end-point *mep\_id***

---

### Syntax Definitions

*md\_name* Specifies the management domain name.

*ma\_name* Specifies the name of the Ethernet OAM Association.

*mep\_id* Specifies the MEP of a specific MA. The valid range is 1–8191.

### Defaults

N/A

|                                 |                                                                                                                                                                                                                                |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Admin State</b>              | Indicates the administrative state ( <b>up</b> or <b>down</b> ) of the MEP.                                                                                                                                                    |
| <b>Direction</b>                | The direction of the MEP.                                                                                                                                                                                                      |
| <b>Slot/Port</b>                | The slot/port number of the Bridge port to which the MEP is attached. If the value is virtual, it indicates a virtual port.                                                                                                    |
| <b>Primary Vlan</b>             | The Primary VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 is displayed.                                                                                                                               |
| <b>C-Vlan</b>                   | The CVLAN configured for a MEP if it's a CVLAN MEP. If the MEP is SVLAN then this field will be displayed as '-'.                                                                                                              |
| <b>MAC Address</b>              | The MAC address of the MEP.                                                                                                                                                                                                    |
| <b>Fault Notification</b>       | Indicates the current state of the MEP Fault Notification Generator State Machine, which can be <b>FNG_RESET</b> , <b>FNG_DEFECT</b> , <b>FNG_REPORT_DEFECT</b> , <b>FNG_DEFECT_REPORTED</b> , or <b>FNG_DEFECT_CLEARING</b> . |
| <b>RFP Status</b>               | Indicates the status of the RFP.                                                                                                                                                                                               |
| <b>CCM Enabled</b>              | Indicates whether the MEP generates CCMs ( <b>enabled</b> ) or not ( <b>disabled</b> ).                                                                                                                                        |
| <b>CCM Linktrace Priority</b>   | Indicates the priority value for CCMs and LTMs transmitted by the MEP.                                                                                                                                                         |
| <b>CCM Not Received</b>         | Indicates if CCMs are not being received ( <b>true</b> ) or received ( <b>false</b> ) from at least one of the configured remote MEPs.                                                                                         |
| <b>CCM Error defect</b>         | Indicates if a stream of erroneous CCMs is being received ( <b>true</b> ) or not ( <b>false</b> ) from a MEP in this MA.                                                                                                       |
| <b>CCM Xcon defect</b>          | Indicates if a stream of CCMs is being received ( <b>true</b> ) or not ( <b>false</b> ) from a MEP that belongs to another MA.                                                                                                 |
| <b>MEP RDI Received</b>         | Indicates that any other MEP in this MA is transmitting the RDI bit. Options include <b>true</b> or <b>false</b> .                                                                                                             |
| <b>MEP Last CCM Fault</b>       | The last-received CCM that triggered a MA fault.                                                                                                                                                                               |
| <b>MEP Xcon Last CCM Fault</b>  | The last-received CCM that triggered a cross-connect fault.                                                                                                                                                                    |
| <b>MEP Error Mac Status</b>     | Indicates a port status TLV. Options include <b>true</b> or <b>false</b> .                                                                                                                                                     |
| <b>MEP Lbm NextSeqNumber</b>    | The next Transaction Identifier or Sequence Number to be sent in an LBM.                                                                                                                                                       |
| <b>MEP Ltm NextSeqNumber</b>    | The next Transaction Identifier or Sequence Number to be sent in an LTM.                                                                                                                                                       |
| <b>Fault Alarm Time</b>         | The time interval during which one or more defects should be detected before the fault alarm is issued                                                                                                                         |
| <b>Fault Reset Time</b>         | The time interval during which the fault alarm is re-enabled to process faults.                                                                                                                                                |
| <b>Lowest PrDefect Allowed</b>  | The lowest priority defect that allowed to generate fault alarm.                                                                                                                                                               |
| <b>Highest PrDefect Present</b> | The highest priority defect since the MEPs Fault Notification Generator in reset state.                                                                                                                                        |

|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>         | The level assigned to the default domain. Configured through the <a href="#">ethoam default-domain level</a> command.                                                                                            |
| <b>MHF-creation</b>  | Indicates the MHF value for a VLAN that is part of the default MD. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> . Configured through the <a href="#">ethoam default-domain mhf</a> command. |
| <b>ID-Permission</b> | The ID permission of the default domain. Configured through the <a href="#">ethoam default-domain id-permission</a> command.                                                                                     |

---

### Release History

Release 7.3.1; command was introduced.

## Related Commands

**show ethoam default-domain** Displays the primary VLAN configuration for the default domain.

## MIB Objects

```
dotlagCfmMaDefaultMdDefLevel
dotlagCfmMaDefaultMdDefMhfCreation
dotlagCfmMaDefaultMdDefIdPermission
```

---

## show ethoam default-domain

Displays all the default MD information for all the primary VLANs or for a specific primary VLAN.

**show ethoam default-domain [primary-vlan *vlan\_id*]**

---

### Syntax Definitions

*vlan\_id*                                      The primary VLAN ID.

### Defaults

By default, the default MD information for all primary VLANs is displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

Use the *vlan\_id* parameter with this command to view information about the default MD for a specific primary VLAN.

### Examples

-> show ethoam default-domain

```
Primary-Vlan Mhf-creation Level Id-Permission Status
-----+-----+-----+-----+-----
 1 mhfDefer no-level sendIdDefer true
 10 mhfDefault 3 sendIdNone true
```

-> show ethoam default-domain primary-vlan 10

```
Primary-Vlan Mhf-creation Level Id-Permission Status
-----+-----+-----+-----+-----
 10 mhfDefault 3 sendIdNone true
```

### output definitions

## show ethoam linktrace-reply

Displays the content of the Linktrace reply (LTR) returned by a previously transmitted LTM. This command displays the LTR based on the transaction identifier or sequence number of the LTM for which the LTR is to be displayed.

**show ethoam linktrace-reply domain *md\_name* association *ma\_name* endpoint *s\_mepid* tran-id *num***

---

### Syntax Definitions

|                |                                                                                             |
|----------------|---------------------------------------------------------------------------------------------|
| <i>md_name</i> | Specifies the domain name.                                                                  |
| <i>ma_name</i> | Name of the Ethernet OAM Association.                                                       |
| <i>s_mepid</i> | Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.          |
| <i>num</i>     | Specifies the Transaction ID or sequence number returned from a previously transmitted LTM. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- “LTM operation successful. Target is reachable.” – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- “LTM operation unsuccessful. Target not reachable.” – This message suggests that LTM is successfully initiated but the target is not reachable.
- “LTM operation unsuccessful. Target is reachable.” – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- “LTM operation in progress.” – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- “LTM Timed out.”- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.

## Examples

```
-> show ethoam linktrace-reply domain MD association MA endpoint 10 tran-id 1256
LTM operation successful. Target is reachable.
```

## show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

**show ethoam one-way-delay domain *md\_name* association *ma\_name* endpoint *s\_mepid* [*mac-address mac\_address*]**

---

### Syntax Definitions

|                    |                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>md_name</i>     | Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> . |
| <i>ma_name</i>     | Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.                                 |
| <i>s_mepid</i>     | Source MEP ID. The valid range is 1–8191.                                                                                             |
| <i>mac_address</i> | MAC Address of the remote MEP.                                                                                                        |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Dash ('-') in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when IDM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

### Examples

```
-> show ethoam one-way-delay domain MD association MA endpoint 10
```

Legend: Jitter: - = undefined value

| Remote Mac address | Delay (us) | Jitter (us) |
|--------------------|------------|-------------|
| 00:d0:95:ef:44:44  | 2369       | 1258        |
| 00:d0:95:ef:66:88  | 5896       | 282         |
| 00:d0:95:ef:88:88  | 2584       | -           |
| 00:d0:95:ef:66:55  | 2698       | 4782        |

```

-> show ethoam one-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value
Remote Mac address Delay (us) Jitter (us)
-----+-----+-----
00:d0:95:ef:44:44 2369 1258

```

### *output definitions*

|                           |                                |
|---------------------------|--------------------------------|
| <b>Remote Mac address</b> | Remote MAC address.            |
| <b>Delay</b>              | Physical slot and port number. |

| <i>s_mepid</i>     | Source MEP ID. The valid range is 1–8191.                                                                                             |
| <i>mac_address</i> | MAC Address of the remote MEP.                                                                                                        |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- If '0' appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.
- If a dash ('-') appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.
- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.

## Examples

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
```

```
Legend: Jitter: - = undefined value
 : RMEP-ID: 0 = two-way-delay was initiated with target mac-address
```

| Remote Mac address | RMEP-ID | Delay (us) | Jitter (us) |
|--------------------|---------|------------|-------------|
| 00:d0:95:ef:44:44  | 12      | 2369       | 1258        |

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 remote-mep 0
```

```
Legend: Jitter: - = undefined value
 : RMEP-ID: 0 = two-way-delay was initiated with target mac-address
```

# 56 LINK OAM Commands

Ethernet in the First Mile (EFM), also known as LINK OAM, is a collection of protocols specified in IEEE 802.3ah, defining Ethernet in the access networks that connects subscribers to their immediate service provider. EFM, EFM-OAM and LINKOAM refers to IEEE 802.3ah standard.

LINK OAM (operation, administration, and maintenance) is a tool which monitors Layer-2 link status on the network by sending OAM protocol data units (OAMPDUs) between the network devices. OAMPDUs contain control and status information used to monitor, test and troubleshoot OAM-enabled links. By enabling LINK OAM on switch ports, network administrators can monitor the link-related issues on the first mile. LINK OAM provides network administrators the ability to monitor link performance, remote fault detection and remote loopback control.

---

**Note.** EFM (LINK OAM) does not include functions such as station management, bandwidth allocation or provisioning functions.

---

MIB information for the EFM (LINK OAM) commands is as

*Filename:* alcatel-ind1-dot3-oam-mib.mib  
*Module:* ALCATEL-IND1-DOT3-OAM-MIB

*Filename:* dot3-oam-mib.mib

## efm-oam admin-state

Enables or disables the LINK OAM protocol on the switch.

**efm-oam admin-state** {enable | disable}

---

### Syntax Definitions

**enable** Enables the LINK OAM protocol.  
**disable** Disables the LINK OAM protocol.

### Defaults

By default, the LINK OAM protocol is disabled for the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- When LINK OAM is disabled globally, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.

### Examples

```
-> efm-oam admin-state enable
-> efm-oam admin-state disable
```

### Release History

Release 8.5R4; command was introduced.

## efm-oam port admin-state

Enables or disables LINK OAM protocol on the specified port or on a range of ports.

**efm-oam port *chassis/slot/port*[-*port2*] admin-state {enable | disable}**

---

### Syntax Definitions

|                  |                                                                            |
|------------------|----------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                    |
| <i>slot/port</i> | The slot number of the module and the physical port number on that module. |
| <i>-port2</i>    | Specifies the last port in the range of ports.                             |
| <b>enable</b>    | Enables LINK OAM protocol on the specified port.                           |
| <b>disable</b>   | Disables LINK OAM protocol on the specified port.                          |

### Defaults

By default, the LINK OAM protocol is disabled on all ports for the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- LINK OAM must be enabled globally for the OAM to be functional on all the ports.
- If LINK OAM is disabled for the port or globally disabled for the switch, any OAMPDUs received are discarded.
- When LINK OAM is disabled for the port, all dynamically learned information on the port, including peer information, is deleted. However, the LINK OAM configuration for the port is retained.
- LINK OAM is not supported on the mirroring ports.
- In link aggregates, LINK OAM is supported on an individual aggregable port only.

### Examples

```
-> efm-oam port 1/1/1 admin-state enable
-> efm-oam port 1/1/1 admin-state disable
-> efm-oam port 2/1/1-10 admin-state enable
-> efm-oam port 2/1/1-4 admin-state disable
```

## efm-oam port mode

Configures the LINK OAM mode on the port or on the range of ports to active or passive.

```
efm-oam port chassis/slot/port[-port2] mode {active | passive}
```

---

### Syntax Definitions

|                  |                                                                             |
|------------------|-----------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                     |
| <i>slot/port</i> | The slot number for the module and the physical port number on that module. |
| <i>-port2</i>    | Specifies the last port in the range of ports.                              |
| <b>active</b>    | Configures the LINK OAM mode to active.                                     |
| <b>passive</b>   | Configures the LINK OAM mode to passive.                                    |

### Defaults

By default, LINK OAM mode is set to active on all ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- LINK OAM discovery process is never initiated from a port when it is in passive mode. At least one of the two peer ports should be in active mode.
- An active port will respond to Loopback-control OAMPDUs only if the peer EFM-OAM client is also in active mode.

### Examples

```
-> efm-oam port 1/1/1 mode active
-> efm-oam port 1/1/1 mode passive
-> efm-oam port 2/1/1-10 mode active
-> efm-oam port 2/1/1-4 mode passive
```

### Release History

Release 8.5R4; command was introduced.

**Related Commands**

**MIB Objects**

dot3OamTable  
dot3OamMode

---

## efm-oam port keepalive-interval

Configures the timeout interval for the dynamically learned neighboring devices on a port or on a range of ports. Keepalive-interval is the maximum time period for which a LINK OAM port shall wait for a hello message from its peer before resetting a discovery session.

**efm-oam port *chassis/slot/port*[-*port2*] keepalive-interval seconds**

---

### Syntax Definitions

|                  |                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                                              |
| <i>slot/port</i> | The slot number for the module and the physical port number on that module.                          |
| <i>-port2</i>    | Specifies the last port in the range of ports.                                                       |
| <i>seconds</i>   | Specifies the keep-alive interval value in seconds. The range for this interval is 5 to 120 seconds. |

### Defaults

By default, the keep-alive interval value is 5 seconds.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- Even if unsupported OAMPDU is received on the port, keep-alive timer is reset on the port.
- To set the timer to its default value, set 5 seconds as the keepalive-interval.

### Examples

```
-> efm-oam port 1/1/1 keepalive-interval 10
-> efm-oam port 2/1/1-10 keepalive-interval 10
```

### Release History

Release 8.5R4; command was introduced.

## efm-oam port hello-interval

Configures the time interval (in seconds) by which the information OAMPDUs are transmitted out of an LINK OAM enabled port.

**efm-oam port** *chassis/slot/port[-port2]* **hello-interval** *seconds*

---

### Syntax Definitions

|                  |                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                                                                                         |
| <i>slot/port</i> | The slot number for the module and the physical port number on that module.                                                                     |
| <i>-port2</i>    | Specifies the last port in the range of ports.                                                                                                  |
| <i>seconds</i>   | Specifies the time interval (in seconds) this port waits before sending out the next hello packet. The range for this timer is 1 to 60 seconds. |

### Defaults

By default, the hello-interval value is set to 1 second.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the hello-interval value of 1 second to reset the timer to its default value.
- On a given port, hello interval time period should not be more than half of keep alive timer on the peer port.

### Examples

```
-> efm-oam port 1/1/1 hello-interval 5
-> efm-oam port 2/1/1-10 hello-interval 10
```

### Release History

Release 8.5R4; command was introduced.

|------------------|-----------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                     |
| <i>slot/port</i> | The slot number for the module and the physical port number on that module. |
| <i>-port2</i>    | Specifies the last port in the range of ports.                              |
| <b>process</b>   | Processes incoming loopback request from peer LINK OAM port.                |
| <b>ignore</b>    | Ignore (discard) incoming loopback requests.                                |

### Defaults

By default, the incoming loopback requests are ignored.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- When the remote-loopback is in **process** mode, the session started by peer LINK OAM client will be processed by local LINK OAM port. As a result, remote port will be in remote-loopback state and the local port will be local-loopback state.
- When the remote-loopback is in **ignore** mode, the session started by peer LINK OAM will not be processed by the local port.

### Examples

```
-> efm-oam port 1/1/1 remote-loopback process
-> efm-oam port 1/1/1 remote-loopback ignore
-> efm-oam port 2/1/1-10 remote-loopback process
-> efm-oam port 2/1/1-4 remote-loopback ignore
```

### Release History

Release 8.5R4; command was introduced.

## Related Commands

dot3OamLoopbackIgnoreRx

---

## efm-oam port remote-loopback start

Initiates the loopback control PDU towards the peer port to start or stop the loopback session on the specified port.

**efm-oam port *chassis/slot/port* remote-loopback {start | stop}**

---

### Syntax Definitions

|                  |                                                                             |
|------------------|-----------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                     |
| <i>slot/port</i> | The slot number for the module and the physical port number on that module. |
| <b>start</b>     | Specifies whether to start the loopback request.                            |
| <b>stop</b>      | Specifies whether to stop the loopback request.                             |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- Before issuing this command, the LINK OAM port has to be in active mode and discovery of peer ports has to be completed.
- When loopback is started from a port towards a peer port which is configured to ignore the loopback request, the loopback response timer will timeout and no error is displayed. In such case, verify the loopback-state of two ports by using the command [show efm-oam port remote detail](#).
- The maximum number of simultaneous loopback sessions supported per network interface is 2. If a third loopback is started through CLI, an error will be displayed at the CLI prompt.

### Examples

```
-> efm-oam port 1/1/1 remote-loopback start
-> efm-oam port 1/1/1 remote-loopback stop
```

### Release History

Release 8.5R4; command was introduced.

## Related Commands

- efm-oam port remote-loopback** Specifies an action that should perform when a loopback request is received from the peer on a port or on a range of ports.
- show efm-oam port remote detail** Displays the configuration and details of the related parameters of the remote port.
- show efm-oam configuration** Displays the global LINK OAM configuration.

---

## efm-oam port propagate-events

Configures whether or not the specified port or range of ports will propagate local event notifications to the remote peer.

```
efm-oam port chassis/slot/port[-port2] propagate-events {critical-event | dying-gasp} {enable | disable}
```

---

### Syntax Definitions

|                       |                                                                               |
|-----------------------|-------------------------------------------------------------------------------|
| <i>chassis</i>        | The chassis identifier.                                                       |
| <i>slot/port</i>      | The slot number for the module and the physical port number on that module.   |
| <i>-port2</i>         | Specifies the last port in the range of ports.                                |
| <b>critical-event</b> | Configures the notification status for critical events.                       |
| <b>dying-gasp</b>     | Configures the notification status for dying gasp events.                     |
| <b>enable</b>         | Enables the notification of critical-event or dying-gasp events to the peer.  |
| <b>disable</b>        | Disables the notification of critical-event or dying-gasp events to the peer. |

### Defaults

By default, the notification status for both critical-event and dying-gasp events is set to enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- When the system is set for critical event or a dying-gasp event, the local OAM entity indicates the event through the OAMPDU flags to its peer OAM entity.
- In case of port admin down, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific port actually goes down.
- In case of takeover or reload of the switch, the OAM IFU-PDU with dying-gasp bit set will be sent to peer as soon as a failure is detected and transmission will continue till the specific device actually goes down.
- The information PDUs with dying gasp bit set is transmitted towards peer as soon as link-down is detected at NI. However, if there is a link flap (link comes again) before the expiry of link-flap timer,

then normal information PDU transmission with dying-gasp bit reset shall resume. This will cause clearing of alarms or trap on the peer port.

### Examples

```
-> efm-oam port 1/1/1 propagate-events critical-event enable
-> efm-oam port 1/1/1 propagate-events critical-event disable
-> efm-oam port 2/1/1-10 propagate-events dying-gasp enable
-> efm-oam port 2/1-4 propagate-events dying-gasp disable
```

### Release History

Release 8.5R4; command was introduced.

#### [show efm-oam port remote detail](#)

Displays the configuration and details of the related parameters of the remote port.

#### [show efm-oam port statistics](#)

Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

### MIB Objects

```
dot3OamEventConfigTable
 dot3OamDyingGaspEnable
 dot3OamCriticalEventEnable
```

---

## efm-oam errored-frame-period

Configures the threshold, window frame values and the status for notification when the number of frame-errors exceed the threshold in a given period of time (specified) by window. When the number of frame errors exceeds a threshold within a given window defined by a number of frames (for example, 10 frames out of 1000 had errors), an Errored Frame Period event is generated.

**efm-oam port** *chassis/slot/port[-port2]* **errored-frame-period** [**threshold** *threshold\_symbols*] [**window** *window\_frames*] [**notify** {**enable** | **disable**}]

---

### Syntax Definitions

|                          |                                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>           | The chassis identifier.                                                                                            |
| <i>slot/port</i>         | The slot number for the module and the physical port number on that module.                                        |
| <i>-port2</i>            | The last port number in a range of ports that you want to configure on the same slot.                              |
| <i>threshold_symbols</i> | Specifies the frame error threshold number. The range supported is 1 to maximum 4 byte integer value (4294967295). |
| <i>window_frames</i>     | Specifies the number of frames used to define a window within which the frame period errors are measured.          |
| <b>enable</b>            | Enables notification of the Errored Frame Period event.                                                            |
| <b>disable</b>           | Disables notification of the Errored Frame Period event.                                                           |

### Defaults

| parameter                      | default       |
|--------------------------------|---------------|
| <i>threshold_symbols</i>       | 1 frame error |
| <b>enable</b>   <b>disable</b> | enable        |

The default for *window\_frames* depends on the port-types. The default, minimum and maximum supported values for various port-types are:

| port-type | default value | minimum value | maximum value |
|-----------|---------------|---------------|---------------|
| 100 mbps  | 200000        | 20000         | 12000000      |
| 1000 X    | 2000000       | 200000        | 120000000     |
| 1000 T    | 2000000       | 200000        | 120000000     |
| 10 Gig    | 20000000      | 2000000       | 1200000000    |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

## Usage Guidelines

- The command can be issued in any order like window, threshold, and notify. However, at least one option needs to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

## Examples

```
-> efm-oam port 1/1/1 errored-frame-period threshold 1 window 3000000 notify enable
-> efm-oam port 1/1/1 errored-frame-period notify disable
-> efm-oam port 2/1/1-4 errored-frame-period threshold 1 window 3000000 notify
enable
-> efm-oam port 2/1/1-2 errored-frame-period notify disable
```

## Release History

Release 8.5R4; command was introduced.

## Related Commands

### [efm-oam errored-frame](#)

Configures the threshold, window and notify-status for errored-frame on a port. The frame-period measures the frame-errors, within a specified window of time.

### [efm-oam errored-frame-seconds-summary](#)

Configures the threshold, window and notify-status for errored-frame-seconds-summary on a port. The Errored Seconds are the time in seconds in which at least one frame error has occurred.

### [show efm-oam port detail](#)

Displays the Errored Frame Period Event threshold, window, and notification parameter values for a port.

## MIB Objects

|--------------------------|---------------------------------------------------------------------------------------|
| <i>chassis</i>           | The chassis identifier.                                                               |
| <i>slot/port</i>         | The slot number for the module and the physical port number on that module.           |
| <i>-port2</i>            | The last port number in a range of ports that you want to configure on the same slot. |
| <i>threshold_symbols</i> | Specifies the frame error threshold number.                                           |
| <i>window_seconds</i>    | Specifies the window of time in which the frame errors will be measured.              |
| <b>enable</b>            | Enables notification of the Errored Frame Seconds Summary event.                      |
| <b>disable</b>           | Disables notification of the Errored Frame Seconds Summary event.                     |

### Defaults

| parameter                | default                |
|--------------------------|------------------------|
| <i>threshold_symbols</i> | 1 errored frame second |
| <i>window_seconds</i>    | 60 seconds (600 dsec). |
| <b>enable   disable</b>  | enable                 |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- The various options, threshold, window and notify can be issued in any order. However, at least one option has to be entered.
- To enter many ports in a single command, use a hyphen to specify a range of ports (e.g. 3/1-16).

## Examples

```
-> efm-oam port 1/1/1 errored-frame-seconds-summary threshold 1 window 700 notify
enable
-> efm-oam port 1/1/1 errored-frame-seconds-summary notify disable
-> efm-oam port 2/1/1-4 errored-frame-seconds-summary threshold 1 window 700 notify
enable
-> efm-oam port 2/1/1-2 errored-frame-seconds-summary notify disable
```

## Release History

Release 8.5R4; command was introduced.

```

---

## efm-oam multiple-pdu-count

Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

**efm-oam multiple-pdu-count** *count*

---

### Syntax Definitions

*count* Specifies the number of PDUs that have to be sent in case of event-notification TLVs. The range is 1 to 10 PDUs.

### Defaults

By default, the PDU-count value is set to 3.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

---

## efm-oam port l1-ping

Configures the number of frames to be sent by the current LINK OAM port to the remote port's MAC address (l1 ping) and the delay between each consecutive sent frames and to start the ping operation.

**efm-oam port chassis/slot/port l1-ping [num-frames number] [delay milliseconds] [start]**

---

### Syntax Definitions

|                     |                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>      | The chassis identifier.                                                                                                      |
| <i>slot/port</i>    | Specifies the slot number for the module and the physical port number on that module.                                        |
| <i>number</i>       | Specifies the number of frames that needs to be sent during ping operation. The allowed range of numbers is between 1 to 20. |
| <i>milliseconds</i> | Specifies time interval between two consecutive PDUs. The allowed range of delay is between 100 to 1000 milliseconds.        |
| <b>start</b>        | Specifies to start the ping operation.                                                                                       |

### Defaults

| parameter           | default           |
|---------------------|-------------------|
| <i>number</i>       | 5 frames          |
| <i>milliseconds</i> | 1000 milliseconds |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- The command is valid only when the LINK OAM is enabled globally, port is in active mode, discovery is done, and the port is in remote loopback mode.
- L1 ping can be started only when the port is in remote loopback mode.

### Examples

```
-> efm-oam port 1/1/12 l1-ping num-frames 6 delay 300 start
-> efm-oam port 1/1/20 l1-ping num-frames 12 delay 500 start
-> efm-oam port 1/1/15 l1-ping num-frames 5 delay 100 start
-> efm-oam port 1/1/15 l1-ping num-frames 4 delay 200 start
-> efm-oam port 1/1/5 l1-ping num-frames 100 delay 300 start
```

### Syntax Definitions

|                   |                                                                                                                                           |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>    | The chassis identifier.                                                                                                                   |
| <i>slot/port1</i> | The slot number for the module and the physical port number on that module.                                                               |
| <i>-port2</i>     | The last port number in a range of ports that you want to configure on the same slot (e.g. 3/1-4 specifies ports 1,2,3, and 4 on slot 3). |
| <b>enable</b>     | Specifies whether to display the LINK OAM enabled ports.                                                                                  |
| <b>disable</b>    | Specifies whether to display the LINK OAM disabled ports.                                                                                 |
| <b>active</b>     | Specifies whether to display the LINK OAM active ports.                                                                                   |
| <b>passive</b>    | Specifies whether to display the LINK OAM passive ports.                                                                                  |

### Defaults

By default, displays the LINK OAM status on all ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

Use this command to display the state of LINK OAM on the basis of enabled or disabled port and on the basis of active or passive port.

### Examples

```
-> show efm-oam port
Port EFM-OAM Status Mode Operational Status Loopback Status
-----+-----+-----+-----+-----+-----
1/1/1 enabled active operational remoteLoopback
1/1/2 disabled active activeSendLocal noLoopback
1/1/3 enabled passive activeSendLocal noLoopback
1/1/4 disabled active activeSendLocal noLoopback
1/1/5 disabled active activeSendLocal noLoopback
1/1/6 disabled active activeSendLocal noLoopback
1/1/7 disabled active activeSendLocal noLoopback
```

```
-> show efm-oam port 1/1/1-5
Port EFM-OAM Status Mode Operational Status Loopback Status
-----+-----+-----+-----+-----
1/1/1 enabled active operational remoteLoopback
1/1/2 disabled active activeSendLocal noLoopback
1/1/3 enabled passive activeSendLocal noLoopback
1/1/4 disabled active activeSendLocal noLoopback
1/1/5 disabled active activeSendLocal noLoopback
```

```
-> show efm-oam port 1/1/1-3 enabled
Port Mode Operational Status Loopback Status
-----+-----+-----+-----+-----
1/1/1 active operational remoteLoopback
1/1/3 passive activeSendLocal noLoopback
```

```
-> show efm-oam port enabled
Port Mode Operational Status Loopback Status
-----+-----+-----+-----+-----
1/1/1 active activeSendLocal remoteLoopback
1/1/3 passive activeSendLocal noLoopback
1/1/7 passive activeSendLocal noLoopback
```

```
-> show efm-oam port disabled
Port Mode Operational Status Loopback Status
-----+-----+-----+-----+-----
1/1/2 active activeSendLocal noLoopback
1/1/4 passive activeSendLocal noLoopback
1/1/5 active activeSendLocal noLoopback
```

```
-> show efm-oam port enabled passive
Port Operational Status Loopback Status
-----+-----+-----+-----+-----
1/1/3 activeSendLocal noLoopback
1/1/7 activeSendLocal noLoopback
```

```
-> show efm-oam port active
Port EFM-OAM Status Operational Status Loopback Status
-----+-----+-----+-----+-----
1/1/1 enabled activeSendLocal remoteLoopback
1/1/2 disabled activeSendLocal noLoopback
1/1/3 enabled activeSendLocal noLoopback
1/1/4 disabled activeSendLocal noLoopback
1/1/5 disabled activeSendLocal noLoopback
1/1/6 disabled activeSendLocal noLoopback
1/1/7 disabled activeSendLocal noLoopback
```

|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Operational Status</b> | <p>The status of the port in discovering whether the peer has LINK OAM capability or not. It has the following states:</p> <ul style="list-style-type: none"> <li>• <b>activeSendLocal:</b> Specifies that the LINK OAM port is actively trying to discover whether the peer has LINK OAM capability but has not yet made that determination.</li> <li>• <b>sendLocalAndRemote:</b> Specifies that the local LINK OAM port has discovered the peer but has not yet accepted or rejected the configuration of the peer. The local device will then decide that the peer device is acceptable or unacceptable and then accept or decline LINK OAM peering.</li> <li>• <b>sendLocalAndRemoteOk:</b> Specifies the state when LINK OAM peering is allowed by the local port.</li> <li>• <b>oamPeeringLocallyRejected:</b> Specifies the state when the local OAM entity rejects the peer OAM entity.</li> <li>• <b>oamPeeringRemotelyRejected:</b> Specifies the state when the remote LINK OAM port rejects the peering.</li> <li>• <b>operational:</b> Specifies the state when the local LINK OAM port learns that both the local LINK OAM entity and the remote LINK OAM entity have accepted the peering.</li> <li>• <b>nonOperHalfDuplex:</b> Specifies the value nonOperHalfDuplex is returned whenever LINK OAM is enabled. Since LINK OAM functions are not designed to work completely over half-duplex interfaces, the value nonOperHalfDuplex is returned whenever LINK OAM is enabled but the interface is in half-duplex operation.</li> <li>• <b>linkFault:</b> Specifies that the link between the host and the peer has detected a fault.</li> <li>• <b>passiveWait:</b> Specifies that the LINK OAM ports are in passive mode.</li> </ul> |
| <b>Loopback Status</b>    | <p>The state of remote loopback. It can be <b>initiatingLoopback</b>, <b>terminatingLoopback</b>, <b>localLoopback</b>, <b>remoteLoopback</b>, <b>noLoopback</b>, or <b>unknown</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Mode</b>               | <p>The state of LINK OAM mode, <b>active</b> or <b>passive</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Release History**

Release 8.5R4; command was introduced.

## Related Commands

**efm-oam multiple-pdu-count** Configures the value of multiple PDU count. When multiple PDU count is set to a specific number in case of any of the threshold cross events, the same event notification PDU will be transmitted that many times towards the peer.

## MIB Objects

```

---

## show efm-oam port detail

Displays the LINK OAM configuration and other related parameters for a port.

**show efm-oam port *chassis/slot/port* detail**

---

### Syntax Definitions

*chassis*                                    The chassis identifier.

*slot/port*                                The slot number for the module and the physical port number on that module.

### Defaults

N/A.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

### Usage Guidelines

Use this command when you want to get LINK OAM configuration details for a specific port.

### Examples

```
-> show efm-oam port 1/1/1 detail
OAM Status : enable,
Operational Status : activeSendLocal,
Mode : active,
Max OamPDU size : 1518,
Config Revision : 0,
Functions Supported : loopback,event notification,
Loopback Status : noLoopback,
Loopback Rx Status : ignore,
Max OamPDUs : 10,
KeepAlive Interval(seconds) : 10,
Hello Interval(seconds) : 5,
Dying Gasp Notify Status : enable,
Critical Event Notify Status : enable

 Link Monitoring Window Threshold Notify
 -----+-----+-----+-----+-----
 errored-frame 10 dsec 10 frames enable
 errored-frame-period 2000000 frames 10 frames enable
 errored-frame-seconds-summary 600 dsec 1 framesec enable
```

|                                     |                                                                                                                   |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>OAM Status</b>                   | The state of LINK OAM on the port.                                                                                |
| <b>Operational Status</b>           | The state of the port in discovering whether the peer has LINK OAM capability or not.                             |
| <b>Mode</b>                         | The state of LINK OAM mode on the port, <b>active</b> or <b>passive</b> .                                         |
| <b>Max OamPDU size</b>              | Displays the maximum OAMPDU that the LINK OAM port can support.                                                   |
| <b>Config Revision</b>              | Displays the configuration revision of the LINK OAM port as reflected in the latest OAMPDU sent by the peer port. |
| <b>Functions Supported</b>          | Displays the LINK OAM functions supported by the specified port.                                                  |
| <b>Loopback Status</b>              | Displays the loopback status of the specified LINK OAM port.                                                      |
| <b>Loopback Rx Status</b>           | The action that should be performed by the LINK OAM port when a loopback request is received from the peer port.  |
| <b>Max OamPDUs</b>                  | Specifies the maximum OAMPDUs that can be exchanged between two peers.                                            |
| <b>KeepAlive Interval</b>           | Displays the timeout interval of the specified LINK OAM port for the dynamically learned peer port.               |
| <b>Hello Interval</b>               | Displays the time interval between two OAMPDUs in seconds.                                                        |
| <b>Dying Gasp Notify Status</b>     | The state of notification for dying gasp events, <b>enable</b> or <b>disable</b> .                                |
| <b>Critical Event Notify Status</b> | The state of notification for critical events, <b>enable</b> or <b>disable</b> .                                  |
| <b>Link Monitoring</b>              | Displays the errors detected on the remote link.                                                                  |
| <b>Window</b>                       | The frame error event window in the received OAMPDU.                                                              |
| <b>Threshold</b>                    | The number of errored frames in the period required for the event to be generated.                                |
| <b>Notify Status</b>                | The state of notification for LINK OAM errors on the port, <b>enable</b> or <b>disable</b> .                      |

## show efm-oam port statistics

Displays the LINK OAM statistics on a port, or a range of ports or on all ports.

**show efm-oam port *chassis/slot/port*[-*port2*] statistics**

**show efm-oam port statistics**

---

### Syntax Definitions

|                  |                                                                                       |
|------------------|---------------------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                               |
| <i>slot/port</i> | Specifies the slot number for the module and the physical port number on that module  |
| <i>-port2</i>    | The last port number in a range of ports that you want to configure on the same slot. |

### Defaults

By default, the statistics of all ports are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

Use the **port** parameter to display the statistics of a specific port.

### Examples

```
-> show efm-oam port 1/1/1 statistics
Port 1/1/1:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0
```

```
-> show efm-oam port 1/1/1-4 statistics
Port 1/1/1:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0

Port 1/1/2:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU Tx : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0

Port 1/1/3:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0

Port 1/1/4:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0
```

```

-> show efm-oam statistics
Port 1/1/1:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0

Port 1/1/2:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0

Port 1/1/3:
 Information OAMPDU Tx : 1035,
 Information OAMPDU Rx : 988,
 Unique Event Notification OAMPDU Tx : 0,
 Unique Event Notification OAMPDU Rx : 0,
 Duplicate Event Notification OAMPDU TX : 0,
 Duplicate Event Notification OAMPDU Rx : 0,
 Loopback Control OAMPDU Tx : 1,
 Loopback Control OAMPDU Rx : 0,
 Unsupported OAMPDU Tx : 0,
 Unsupported OAMPDU Rx : 0,
 Frames Lost due to OAM : 0

```

 dot3OamPeerFunctionsSupported
```

---

## show efm-oam port history

Displays the log of events that have occurred on a port. Use this command to display specific event logs on a port.

**show efm-oam port *chassis/slot/port* history [log-type { link-fault | errored-frame | errored-frame-period | errored-frame-seconds | dying-gasp | critical}]**

---

### Syntax Definitions

|                              |                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>               | The chassis identifier.                                                                                                                                                                            |
| <i>slot/port</i>             | Specifies the slot number for the module and the physical port number on that module.                                                                                                              |
| <b>link-fault</b>            | Displays link fault event logs. Specifies the loss of signal is detected by the receiver. This is sent once per second in the Information OAMPDU                                                   |
| <b>errored-frame</b>         | Displays errored-frame event log. an errored frame event occurs when the number of detected error frames over a specific interval exceeds the predefined threshold.                                |
| <b>errored-frame-period</b>  | Displays an errored-frame-period event logs. An errored frame period event occurs if the number of frame errors in specific number of received frames exceeds the predefined threshold.            |
| <b>errored-frame-seconds</b> | Displays errored-frame-seconds event logs. When the number of error frame seconds detected on a port over a detection interval reaches the error threshold, an errored frame seconds event occurs. |
| <b>dying-gasp</b>            | Specifies an unrecoverable condition (e.g., a power failure).                                                                                                                                      |
| <b>critical</b>              | Specifies a crucial event that has occurred on the port.                                                                                                                                           |

### Defaults

By default, all log types are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

Timestamp will be in following format:

*DAY MON Date hh:mm:ss yyyy*

## Examples

```
-> show efm-oam port 1/1/1 history
Legend: Location: * - Remote, # - Local
LogID TimeStamp Log Type Event
 Total
-----+-----+-----+-----+-----+
* 1 TUE JAN 06 19:44:51 2009 linkFault 1
2 TUE JAN 06 19:45:51 2009 erroredFrame 1
-> show efm-oam port 1/1/1 history log-type link-fault
Legend: Location: * - Remote, # - Local
LogID TimeStamp Event
 Total
-----+-----+-----+-----+
* 1 TUE JAN 06 19:46:51 2009 1
2 TUE JAN 06 19:46:51 2009 1
```

### output definitions

|                    |                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------|
| <b>LogID</b>       | Specifies individual events within the event log.                                                            |
| <b>Timestamp</b>   | The value of actual time at the time of the logged event.                                                    |
| <b>Log Type</b>    | Specifies the type of event log.                                                                             |
| <b>Event Total</b> | Specifies the total number of times one or more of these occurrences have resulted in an Event Notification. |

## Release History

Release 8.5R4; command was introduced.

## Related Commands

- [show efm-oam port statistics](#) Displays the LINK OAM statistics on a port, or a range of ports or on all ports.
- [clear efm-oam log-history](#) Clears the LINK OAM event logs history on a port.

```

## show efm-oam port l1-ping detail

Displays the frames lost during a loopback session.

**show efm-oam port *chassis/slot/port* l1-ping detail**

---

### Syntax Definitions

|                  |                                                                                       |
|------------------|---------------------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                               |
| <i>slot/port</i> | Specifies the slot number for the module and the physical port number on that module. |

### Defaults

N/A.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

The command can also be used even on a port on which LINK OAM is not enabled.

### Examples

```
-> show efm-oam port 1/1/1 l1-ping detail
frames configured = 5,
frames delay(msec) = 100,
L1 ping status = Successful,
frames sent = 4,
frames received = 4,
avg delay (msec) = 5

-> show efm-oam port 1/1/4 l1-ping detail
frames configured = 5,
frames delay(msec) = 200,
L1 ping status = Successful,
frames sent = 4,
frames received = 2,
avg delay (msec) = 15
```

#### *output definitions*

---

|                          |                                                                                    |
|--------------------------|------------------------------------------------------------------------------------|
| <b>frames configured</b> | Specifies the number of frames that are sent during l1-ping.                       |
| <b>delay configured</b>  | Specifies the delay between transmission of two consecutive frames during L1 ping. |

---

*output definitions (continued)*

---

|                        |                                                                                                                    |
|------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>L1 ping status</b>  | The status of the L1 ping operation. The status can be <b>Successful</b> , <b>Unsuccessful</b> or <b>default</b> . |
| <b>frames sent</b>     | Specifies the frames sent during last L1 ping.                                                                     |
| <b>frames received</b> | Specifies the frames received during last L1 ping.                                                                 |
| <b>average delay</b>   | Specifies the average delay taken by frames during last L1 ping.                                                   |

```

---

## clear efm-oam statistics

Clears the LINK OAM statistics on a port, range of ports or all ports.

**clear efm-oam statistics** [**port** *chassis/slot/port*[-*port2*]]

---

### Syntax Definitions

|                  |                                                                             |
|------------------|-----------------------------------------------------------------------------|
| <i>chassis</i>   | The chassis identifier.                                                     |
| <i>slot/port</i> | The slot number for the module and the physical port number on that module. |
| <i>-port2</i>    | Specifies the last port in the range of ports.                              |

### Defaults

By default, the statistics are cleared for all the ports if no port is specified in the command.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

# 57 CPE Test Head Commands

The Customer Provider Edge (CPE) Test Head traffic generator and analyzer is a Test-OAM (Operation, Administration, and Maintenance) tool used in the Metro Ethernet Network to validate the customer Service Level Agreements (SLA). This functionality allows the operator to validate the Metro Ethernet Network between customer end points, which is critical when provisioning or troubleshooting network services.

This implementation of CPE Test Head supports unidirectional and bidirectional ingress tests. Traffic is generated at the UNI port as if the traffic was generated from a test head connected to the UNI port. This validates the actual customer SLA by subjecting the test traffic to the ingress QoS defined at the UNI port (Ethernet SAP profile or QoS policy rules for priority and bandwidth control) and the egress QoS defined at the egress NNI port and carrier network.

The CPE test is non-disruptive to traffic running on other UNI ports that are associated with the same SAP profile as the test UNI port. All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This is important to consider when analyzing test results.

The feature provides a multi-stream test capability. The CPE multi-test feature is supported on non-metro switches with metro license. The feature supports a stack containing up to eight switches.

Multi-stream test requires a free port. The port must not be used and not have any configuration. When a multi-stream test starts, the port is made out of service. The port is made operational again and the configuration is retained when the test is stopped.

MIB information for the CPE Test Head commands are:

*Filename:* alcatelIND1testoam.mib  
*Module:* ALCATEL-IND1-TEST-OAM-MIB

A summary of available commands is listed here:

---

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

---

## test-oam

Configures the CPE test name and an optional description. The test name is used to identify and configure a CPE test profile.

**test-oam** *string* [*descr description*]

**no test-oam** *string*

---

### Syntax Definitions

*string*

The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.

*description*

The description to assign to the test name, an alphanumeric string between 1 and 32 characters.

### Defaults

| parameter          | default |
|--------------------|---------|
| <i>description</i> | DEFAULT |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the **no** form of this command to remove the specified CPE test configuration.
- This command creates a new CPE test profile that is identified by the test name. Make sure the name specified does not exist in the switch configuration.
- A maximum of 32 tests can be configured.
- Only one test can be active on the switch at any given time.

### Examples

```
-> test-oam Test1
-> test-oam Test2 descr second-test
-> no test-oam Test2
```

## Release History

Release 8.6R1; command was introduced.

## Related Commands

[show test-oam](#)

Displays the CPE test configuration and status.

[show test-oam statistics](#)

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

## MIB Objects

alaTestOamConfigTable

  alaTestOamConfigTestName

  alaTestOamConfigTestDescription

  alaTestOamConfigRowStatus

---

## test-oam direction

Configures the CPE test direction.

**test-oam** *string* [direction {**unidirectional** | **bidirectional**}]

---

### Syntax Definitions

**string** The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.

**direction** The direction of the CPE test.

### Defaults

| parameter                                    | default        |
|----------------------------------------------|----------------|
| <b>unidirectional</b>   <b>bidirectional</b> | unidirectional |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

This command assigns the direction to the CPE test.

### Examples

```
-> test-oam Test1 direction unidirectional
-> test-oam Test1 direction bidirectional
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

[show test-oam](#)

Displays the CPE test configuration and status.

[show test-oam statistics](#)

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

---

## test-oam src-endpoint dst-endpoint

Configures the source and destination endpoints for the specified test.

**test-oam** *string* [**src-endpoint** *src-string*] [**dst-endpoint** *dst-string*]

---

### Syntax Definitions

|                   |                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>     | The name of an existing CPE test. The string can be of length 1 to 32 characters.                                                                                                                                                                                                                                                                                                           |
| <i>src-string</i> | This represents the local or transmitting device. The management IP address or DNS host name of the switch that will transmit test traffic. In case of bidirectional test this also identifies the analyzer device. The string can be of length 1 to 32 characters.                                                                                                                         |
| <i>dst-string</i> | This represents the remote device. The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done. For unidirectional test this represents the analyzer device. For bidirectional test this identifies the device on which the loopback mode must be active. The string can be of length 1 to 32 characters. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- The end point can be set as switch hostname or switch management IP address.
- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- This command automatically overwrites the source and destination endpoint values previously configured for the specified CPE test.
- Multicast and broadcast address must not be configured for bidirectional test.

### Examples

```
-> test-oam Test1 src-endpoint SW1 dst-endpoint SW2
-> test-oam Test1 src-endpoint SW1
```

```
-> test-oam Test1 dst-endpoint SW2
```

## Release History

Release 8.6R1; command was introduced.

 alaTestOamConfigDestinationEndpoint
```

---

## test-oam port

Configures the port on which the CPE test will run. Use this command on the switch that will generate the test traffic. If the switch is going to receive test traffic, configuring a test port is not necessary.

**test-oam** *string* **port** *chassis/slot/port*

---

### Syntax Definitions

*string* The name of an existing CPE test.  
*chassis/slot/port* The port on which the CPE test will generate traffic.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- In an Ethernet Service environment, the UNI port is designated as the test port on the generator switch to simulate traffic coming in on the port as if it was sent from a test head device. This will subject the test traffic to the SAP profile.
- Note that the customer traffic is disrupted on ports configured as CPE test ports. Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This must be considered when test results are analyzed.
- This command automatically overwrites the port value previously configured for the specified CPE test.

### Examples

```
-> test-oam Test1 port 1/1/2
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

**test-oam vlan test-frame** Configures the source mac-address, destination mac-address, and the SVLAN for the test-frame used in the test.

**show test-oam** Displays the CPE test configuration and status.

## MIB Objects

```
alaTestOamConfigTable
 alaTestOamConfigTestName
 alaTestOamConfigPort
```

---

## test-oam vlan test-frame

Configures the SVLAN and the source and destination MAC addresses for the test frame. Use this command to configure these test parameters on both the generator (local) switch and the analyzer (remote) switch for the specified CPE test.

```
test-oam string [vlan svlan] [[test-frame [src-mac src-address] [dst-mac dst-address]]]
```

---

### Syntax Definitions

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <i>string</i>      | The name of an existing CPE test.                                                 |
| <i>svlan</i>       | The service VLAN ID. This is used for traffic analysis and test-frame accounting. |
| <i>src-address</i> | Source MAC address of the test-frame.                                             |
| <i>dst-address</i> | Destination MAC address of the test-frame.                                        |

### Defaults

| parameter          | default           |
|--------------------|-------------------|
| <i>src-address</i> | 00:00:00:00:00:00 |
| <i>dst-address</i> | 00:00:00:00:00:00 |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Although the source and destination MAC addresses are optional parameters with this command, the test will not run if these addresses are set to all zeros (the default).
- Make sure that routing is disabled on the specified SVLAN.
- Avoid configuring any IEEE reserved MAC addresses as the destination MAC address for the test.
- This command automatically overwrites the SVLAN, source MAC, or destination MAC values previously configured for the specified CPE test.

### Examples

```
-> test-oam Test1 vlan 100 test-frame src-mac 00:01:02:00:00:02 dst-mac
00:00:01:00:00:90
-> test-oam Test1 vlan 100
```

```
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02 dst-mac 00:00:01:00:00:90
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02
-> test-oam Test test-frame dst-mac 00:00:01:00:00:90
```

## Release History

Release 8.6R1; command was introduced.

 alaTestOamConfigVlan
 alaTestOamConfigFrameSrcMacAddress
 alaTestOamConfigFrameDstMacAddress
```

---

## test-oam role

Configures the role the switch will perform for the specified CPE test. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) or loopback test frames.

**test-oam** *string* **role** {**generator** | **analyzer** | **loopback**}

---

### Syntax Definitions

|                  |                                              |
|------------------|----------------------------------------------|
| <i>string</i>    | The name of an existing CPE test.            |
| <b>generator</b> | Configures the switch as the test generator. |
| <b>analyzer</b>  | Configures the switch as the test analyzer.  |
| <b>loopback</b>  | Configures the switch as loopback.           |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use this command on the switch that will perform the specified role.
- Configuring a generator and an analyzer switch for each test is required.
- Only one role can be assigned to the switch for a particular test.
- This command automatically overwrites the previously configured switch role for the specified CPE test.

### Examples

```
-> test-oam Test1 role generator
-> test-oam Test2 role analyzer
-> test-oam Test2 role loopback
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

**test-oam duration rate packet-size** Configures the test frame duration, rate and packet-size for the test.

**show test-oam** Displays the CPE test configuration and status.

## MIB Objects

```
alaTestOamConfigTable
 alaTestOamConfigTestName
 alaTestOamConfigRole
```

---

## test-oam duration rate packet-size

Configures the duration, rate, and packet-size for the specified test. Use this command to configure these test parameters on the generator switch.

**test-oam** *string* [**duration** *secs*] [**rate** *rate*] [**packet-size** *bytes*]

---

### Syntax Definitions

|               |                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i> | The name of an existing CPE test.                                                                                                                                                                            |
| <i>secs</i>   | The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 1–3600 seconds                   |
| <i>rate</i>   | The rate, in Kbps or Mbps, at which test traffic is generated. The minimum value allowed is 8 Kbps to line rate. The granularity of the transmit rate is 8 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports. |
| <i>bytes</i>  | The packet size, in bytes. The valid range is 64–9212 bytes.                                                                                                                                                 |

### Defaults

| Parameter    | Default |
|--------------|---------|
| <i>secs</i>  | 5 secs  |
| <i>rate</i>  | 8 k     |
| <i>bytes</i> | 64 byte |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- This command automatically overwrites any duration, rate, and packet size parameter values previously configured for the specified CPE test.
- The status of the CPE test will change to “ended” when the test duration time expires.
- This command automatically overwrites the duration, rate, or packet size values previously configured for the specified CPE test.

### Examples

```
-> test-oam Test1 duration 10 rate 8k packet-size 64
-> test-oam Test1 rate 8m
```

```
-> test-oam Test1 duration 10
-> test-oam Test1 packet-size 64
```

## Release History

## test-oam frame

Configures the test frame parameter values for the specified CPE test. Use this command on the switch that will generate the test frame traffic.

### test-oam *string* frame

```
[vlan-tag vlan-id priority priority drop-eligible {true | false}]
ether-type {hex-num | ipv4 {src-ip src-ipv4 dst-ip dst-ipv4 [ttl ttl] [tos tos] [protocol {udp | tcp}
{src-port src-port dst-port dst-port}]}}] [data-pattern pattern]
```

---

### Syntax Definitions

|                 |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|
| <i>string</i>   | The name of an existing CPE test.                                                       |
| <i>vlan-id</i>  | The VLAN ID of the frame.                                                               |
| <i>priority</i> | The priority value. The valid range is 0–7.                                             |
| <b>true</b>     | Sets the drop-eligible bit to true.                                                     |
| <b>false</b>    | Sets the drop-eligible bit to false.                                                    |
| <i>hex-num</i>  | The hexadecimal ethertype value. The valid range is 0x600–0xffff.                       |
| <i>src-ipv4</i> | The source IP address for an IPv4 test frame.                                           |
| <i>dst-ipv4</i> | The destination IP address for an IPv4 test frame.                                      |
| <i>ttl</i>      | The time-to-live value. The valid range is 0–255.                                       |
| <i>tos</i>      | The type-of-service value for QoS features. The valid range is 0x0–0xff.                |
| <b>udp</b>      | Specifies the UDP protocol.                                                             |
| <b>tcp</b>      | Specifies the TCP protocol.                                                             |
| <i>src-port</i> | The source port of the generated test frame.                                            |
| <i>dst-port</i> | The destination port of the generated test frame.                                       |
| <i>pattern</i>  | The data pattern present in the generated test frame. The valid range is 0x0000–0xffff. |

### Defaults

| Parameter            | Default |
|----------------------|---------|
| <i>priority</i>      | 7       |
| <b>drop-eligible</b> | false   |
| <i>ttl</i>           | 64      |
| <i>tos</i>           | 0x0     |
| <i>pattern</i>       | 0x0000  |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

## Usage Guidelines

- Specify the Ether type in hexadecimal format to configure a Layer 2 test frame.
- Specify **ipv4** as the Ether type to configure a Layer 3 test frame. When this option is selected, entering a source and destination IP address is required.
- Do not specify reserved Ether type values.
- This command automatically overwrites the test packet parameter values previously configured for the specified CPE test.

## Examples

If the ether-type is a hexadecimal number (Layer 2 test frame):

```
-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible false ether-type 0x0100
data-pattern 0x0010
```

If the ether-type is IPV4 (Layer 3 test frame):

```
-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible false ether-type ipv4
src-ip 1.1.1.1 dst-ip 2.2.2.2 ttl 4 tos 0x01 protocol udp src-port 2000 dst-port
3000 data-pattern 0x0010
```

## Release History

Release 8.6R1; command was introduced.

## Related Commands

[test-oam l2-saa](#)

Start or stop the CPE test.

[show test-oam](#)

Displays the CPE test configuration and status.

## MIB Objects

## test-oam l2-saa

Configures to run SAA tests in parallel with test streams.

**test-oam** *string* **l2-saa** [**priority** *vlan-priority*] [**count** *num-pkts*] [**interval** *inter-pkt-delay*] [**continuous**] [**size** *size*] [**drop-eligible** {**true** | **false**}]

**no test-oam** *string* **l2-saa**

---

### Syntax Definitions

|                        |                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>          | The name of an existing CPE test.                                                                                       |
| <i>vlan-priority</i>   | Specify the internal priority of MAC ping and 802.1p value on the VLAN tag header.                                      |
| <i>num-pkts</i>        | The number of packets sent in one ping iteration. Valid range is 1 to 10.                                               |
| <i>inter-pkt-delay</i> | The delay between packets sent during a ping iteration (milliseconds). Valid range is 100 to 1000, in multiples of 100. |
| <b>continuous</b>      | Allows the SAA session to run continuously until the test-oam session ends.                                             |
| <i>size</i>            | The payload size to be used for MAC ping iteration. Must be within 1500 bytes.                                          |
| <b>drop-eligible</b>   | Specify the drop precedence of the MAC ping and the Canonical Format Indicator (CFI) bit on the VLAN tag header.        |

### Defaults

| Parameter              | Default  |
|------------------------|----------|
| <i>vlan-priority</i>   | 0        |
| <i>num-pkts</i>        | 5        |
| <i>inter-pkt-delay</i> | 1000 ms  |
| <i>size</i>            | 36 bytes |
| <b>drop-eligible</b>   | false    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

## Usage Guidelines

- The L2-SAA test derives the source MAC, destination MAC, and the VLAN ID from the test OAM configuration of the individual test frames.
- The default L2-SAA configuration values will be applied if no optional parameters are configured.
- To run the L2-SAA session until the test-oam session ends, use the **continuous** parameter.
- Different SAA profiles can be configured for each individual test stream.
- Use the **no** form of this command to remove the L2-SAA configuration for the test.

## Examples

```
-> test-oam test1 l2-saa priority 5 count 5 interval 1000 size 100 drop-eligible
false
-> test-oam test1 l2-saa continuous
-> no test-oam test1 l2-saa
```

## Release History

Release 8.6R1; command was introduced.

```

---

## test-oam start stop

Starts or stops the CPE test operation.

**test-oam** *string* {[**vlan** *vlan-id*] [**port** *chassis/slot/port*] [**packet-size** *bytes*] **start** | **stop**} [**fetch-remote-stats**]

---

### Syntax Definitions

|                           |                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>             | The name of an existing CPE test.                                                                                                                                        |
| <i>vlan-id</i>            | The service VLAN ID. This value is required only for traffic analysis and test frame accounting and is not related to the VLAN tag specified for the actual test frame.  |
| <i>chassis/slot/port</i>  | The switch port on which the test is run.                                                                                                                                |
| <i>bytes</i>              | The size of the test packet, in bytes. The valid packet size range is 64–9212 bytes.                                                                                     |
| <b>start</b>              | Starts the CPE test operation.                                                                                                                                           |
| <b>stop</b>               | Stops the CPE test operation.                                                                                                                                            |
| <b>fetch-remote-stats</b> | Triggers the test at the remote device from the generator. The statistics are collected from the remote device and the test is stopped after receiving the test results. |

### Defaults

| Parameter    | Default |
|--------------|---------|
| <i>bytes</i> | 64      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Ensure that routing is disabled on the specified service VLAN.
- The optional **vlan**, **port**, and **packet-size** parameters specify “active” parameter values that are applied when the specified CPE test is started. If these same parameters are defined within a CPE test profile, they are considered “configured” parameter values. Active parameter values override configured parameter values when the test is started.

- If no active parameter values are specified with this command, the test is started using the configured values defined in the CPE test profile. However, if active parameter values are not specified and the CPE test does not contain any configured values for these parameters, the test will not run.
- Specifying any of the optional parameter values does not change the configured values associated with the CPE test.
- If the specified port resides on a switch that will transmit test traffic, the port will generate the test frames. However, if the switch is an analyzer switch, specifying a port is not required.
- Start the specified test on the analyzer switch first and then on the generator switch.
- The test will stop when the test duration time expires or when the test is manually stopped using the **test-oam stop** command.
- Manually restart the test if the test is interrupted by a takeover, restart, or hot swap.
- The previous statistics related to the test will be cleared automatically once the test is started.
- Use the **fetch-remote-stats** parameter to collect the test statistics from the remote device. This parameter must be used to start the bidirectional test.

## Examples

```
-> test-oam Test1 start
-> test-oam Test1 vlan 100 start
-> test-oam Test1 port 1/1/1 start
-> test-oam Test1 packet-size 100 start
-> test-oam Test1 vlan 100 port 1/1/1 packet-size 100 start
-> test-oam Test1 stop
-> test-oam Test1 start fetch-remote-stats
-> test-oam "test2" port 1/1/2 start fetch-remote-stats
```

## Release History

Release 8.6R1; command was introduced.

## Related Commands

### [show test-oam statistics](#)

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

### [show test-oam](#)

Displays the CPE test configuration and status.

## MIB Objects

```
alaTestOamConfigTable
 alaTestOamConfigTestName
 alaTestOamConfigVlan
 alaTestOamConfigPort
 alaTestOamConfigGeneratorPacketSize
 alaTestOamConfigTestIdState
 alaTestOamConfigRemoteStatsFetch
```

---

## test-oam remote-sys-mac

Configures the system MAC address of the remote device to receive test OAM messages.

**test-oam** *string* **remote-sys-mac** *string*

---

### Syntax Definitions

*string* The name of an existing CPE test.  
**remote-sys-mac** The system MAC address of the remote device.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use this command on the generator switch to set the system MAC address of the remote device to receive the test OAM messages.
- **remote-sys-mac** must be the primary CMM MAC address of the remote device. Use the **show cmm** command on the remote device to know the chassis MAC address of the device.
- **remote-sys-mac** is not applicable for analyzer or loopback.
- Configuring the Remote Sys MAC is mandatory for bidirectional test and optional for unidirectional test.

### Examples

```
-> test-oam Test1 remote-sys-mac 00:e0:b1:7c:7a:fa
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

alaTestOamConfigRemoteSysMacAddress

---

## test-oam statistics flash-logging

Enable or disable the option to save the statistics of the test on the file in the flash directory of the switch. The test information is appended at the end of the default text file (testoamActiveStats.txt) in the flash.

**test-oam statistics flash-logging {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

| Parameter        | Default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

Use the **more** command to read the test results stored on the switch.

### Examples

```
-> test-oam statistics flash-logging enable
-> test-oam statistics flash-logging disable
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

### [show test-oam statistics](#)

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

### [show test-oam saa statistics](#)

Clears the statistics for all CPE tests or for a specific test name.

## MIB Objects

alaTestOamConfigTable  
alaTestOamConfigStatsSave

---

## show test-oam

Displays the CPE test configuration and status.

**show test-oam** [*tests* | *string*]

---

### Syntax Definitions

**tests** Displays information for all the CPE tests.  
*string* The name of an existing CPE test.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the **tests** parameter to display information for all CPE tests configured on the switch.
- Use the *string* parameter to display detailed information for a specific CPE test.

### Examples

```
-> show test-oam tests
Total Test-Ids: 1
Test-Id Port Src-Mac Dst-Mac Vlan Direction Status Remote-Sys-Mac
-----+-----+-----+-----+-----+-----+-----+-----
Test1 none 00:00:00:00:00:00 00:00:00:00:00:00 none unidirectional not-started 00:00:00:00:00:00
```

## show test-oam statistics

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam** [*string*] statistics

---

### Syntax Definitions

*string*                                              The name of an existing CPE test.

### Defaults

By default, statistics are displayed for all CPE tests.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the *string* parameter with this command to display statistics for a specific CPE test.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

### Examples

```
-> show test-oam Test1 statistics
```

```
Test-Id TX-Ingress TX-Egress RX-Ingress Remote-Stats Throughput (Mbps)
-----+-----+-----+-----+-----+-----
Test1 19017 19017 19017 19017 9.98
```

```
-> show test-oam statistics
```

```
Test-Id TX-Ingress TX-Egress RX-Ingress Remote-Stats Throughput (Mbps)
-----+-----+-----+-----+-----+-----
Test1 1200366 1200366 0 1200366 8
Test2 0 0 1200366 1200366 8
```

### output definitions

---

|                   |                                                                  |
|-------------------|------------------------------------------------------------------|
| <b>Test-Id</b>    | The CPE test name (ID).                                          |
| <b>TX-Ingress</b> | The number of ingress test packets generated on the ingress UNI. |

**output definitions**

---

|                          |                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TX-Egress</b>         | The number of egress test packets transmitted on the egress NNI.                                                                         |
| <b>RX-Ingress</b>        | The number of test packets received on the ingress NNI. This value is relevant on the receiving (analyzer) switch for the specific test. |
| <b>Remote-Stats</b>      | The number of test frames received by the analyzer and fetched by the generator device.                                                  |
| <b>Throughput (Mbps)</b> | Displays the traffic throughput of the test.                                                                                             |

---

**Release History**

## show test-oam saa statistics

Displays the SAA test statistics for all CPE tests or for a specific test name.

**show test-oam** [*string*] **saa statistics**

---

### Syntax Definitions

*string*                                          The name of an existing CPE test.

### Defaults

By default, statistics are displayed for all CPE tests.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

Use the *string* parameter with this command to display SAA statistics for a specific CPE test.

### Examples

-> show test-oam Test1 saa statistics

```
Test Time of Last-Run RTT RTT RTT Jitter Jitter Jitter Packets Description
 +-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 | Min | Avg | Max | Min | Avg | Max | Sent | Rcvd |
Test1 2009-09-05,20:18:34.0 970 1067 1432 1 99 455 7 7 DEFAULT
```

-> show test-oam saa statistics

```
Test Time of Last-Run RTT RTT RTT Jitter Jitter Jitter Packets Description
 +-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 | Min | Avg | Max | Min | Avg | Max | Sent | Rcvd |
Test1 2009-09-05,20:18:34.0 970 1067 1432 1 99 455 7 7 DEFAULT
Test2 2009-09-05,30:28:34.0 770 865 1432 2 99 255 7 7 DEFAULT
Test3 2009-09-05,40:38:34.0 570 967 1432 3 99 355 7 7 DEFAULT
Test4 2009-09-05,50:48:34.0 770 807 1432 1 99 255 7 7 DEFAULT
Test5 2009-09-06,20:18:34.0 640 867 1432 2 99 445 7 7 DEFAULT

## clear test-oam statistics

Clears the statistics for all CPE tests or for a specific test name.

**clear test-oam** [*string*] **statistics**

---

### Syntax Definitions

*string*                                      The name of an existing CPE test.

### Defaults

By default, statistics are cleared for all CPE tests.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|             |             |             |              |             |              |             |             |                        |                                                                      |             |

| Yes         | Yes         | Yes         | Yes          | No          | No           | No          | No          | No                     | No                                                                   | No          |

### Usage Guidelines

Use the *string* parameter with this command to clear the statistics for a specific CPE test.

### Examples

```
-> clear test-oam Test1 statistics
-> clear test-oam statistics
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

### [show test-oam statistics](#)

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

### [show test-oam saa statistics](#)

Displays the SAA test statistics for all CPE tests or for a specific test name.

## MIB Objects

alaTestOamStatsTable

alaTestOamConfigTestId

alaTestOamStatsClearStats

---

## test-oam group

Configures the CPE test group name and an optional description. The group name is used to identify and configure a CPE test group.

**test-oam group** *string* [*descr description*]

**no test-oam group** *string*

---

### Syntax Definitions

*string* The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test-oam group.

*description* The description to assign to the CPE test group, an alphanumeric string between 1 and 32 characters.

### Defaults

| parameter          | default |
|--------------------|---------|
| <i>description</i> | DEFAULT |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the **no** form of this command to remove the specified CPE test group.
- This command creates a CPE test group that is identified by the test-oam name. Make sure the name specified does not exist in the switch configuration.
- To configure a CPE test group, the individual test must be configured.
- A maximum of 4 testoam profiles can be configured in a group to run the tests concurrently.
- Only one CPE test group can be active on the switch at any given time.
- Usage Guidelines for OmniSwitch 6560 and OmniSwitch 6570M:
  - A maximum of 8 testoam profiles can be configured in a group to run the tests concurrently.

### Examples

```
-> test-oam group Testgroup1
```

```
-> test-oam group Testgroup2 descr second-testgroup
-> no test-oam group Testgroup1
```

## Release History

Release 8.6R1; command was introduced.

Release 8.9R1; CPE test head group support added for OmniSwitch 6560.

## Related Commands

**show test-oam group statistics** Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam group** Displays the statistics for all CPE test groups or for a specific CPE test group.

## MIB Objects

```
alaTestOamGroupConfigTable
 alaTestOamConfigGroupId
 alaTestOamConfigGroupDescription
 alaTestOamGroupConfigRowStatus
```

---

## test-oam group tests

This defines the list of CPE test group tests that need to be added in the test-oam group.

**test-oam group** *string* [**tests** *string1.....string8*]

**test-oam group** *string* [**no tests** *string1.....string8*]

---

### Syntax Definitions

*string* The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test group.

*string1.....string8* The name of the configured test-oam tests.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- This command defines the list of test-oam tests that need to run concurrently.
- The test must exist, while configuring the test-oam list.
- A maximum of four tests can be configured to run concurrently.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.
- use the **no** form of the command to remove the test-oam tests from the CPE test group.
- Usage Guidelines for OmniSwitch 6560 and OmniSwitch 6570M:
  - A maximum of 8 tests can be configured to run concurrently.

### Examples

```
-> test-oam test1
-> test-oam test2
-> test-oam test3
```

```
-> test-oam test4
-> test-oam test5
-> test-oam test6
-> test-oam test7
-> test-oam test8
-> test-oam group Testgroup1 descr first-testgroup
-> test-oam group Testgroup1 tests test1 test2 test3 test4 test5 test6 test7 test8
-> test-oam group Testgroup1 no tests test1 test2 test3
```

## Release History

Release 8.6R1; command was introduced.

Release 8.9R1; CPE test head group support added for OmniSwitch 6560.

## Related Commands

### [show test-oam group](#)

Displays the configuration and status of the CPE test groups.

### [show test-oam group](#)

Displays the SAA statistics for all CPE test groups or for a specific CPE test group if mentioned.

## MIB Objects

```
alaTestOamGroupFlowConfigTable
 alaTestOamConfigGroupId
 alaTestOamConfigTestId
 alaTestOamGroupFlowConfigRowStatus
```

---

## test-oam feeder

This configures the feeder port globally in the system for CPE test group to feed the test traffic to generator port.

**test-oam feeder-port** *chassis/slot/port*

**no test-oam feeder-port**

---

### Syntax Definitions

*chassis/slot/port*                      The port to be used to feed the test traffic only to generator port.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- This command configures the feeder port globally in the system.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification to the feeder port shall not be allowed.
- Use the **no** form of the command to remove the feeder port from the system for CPE test group.

### Examples

```
-> test-oam feeder-port 1/1/4
-> no test-oam feeder-port
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

**test-oam group port**

Configures the port on which the CPE test group will run.

**show test-oam group**

Displays the configuration and status of the CPE test groups.

## MIB Objects

alaTestOamGlobalFeederPort

---

## test-oam group src-endpoint dst-endpoint

Configures the source and destination endpoints for the CPE test group.

```
test-oam group string [src-endpoint src_string dst-endpoint dst_string] [src-endpoint src_string] [dst-endpoint dst_string]
```

---

### Syntax Definitions

|                   |                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>     | The name of an existing CPE test group.                                                                                                        |
| <i>src_string</i> | The management IP address or DNS host name of the switch that will transmit test traffic.                                                      |
| <i>dst_string</i> | The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done. |

### Defaults

| parameter    | default |
|--------------|---------|
| src-endpoint | DEFAULT |
| dst-endpoint | DEFAULT |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

```
-> test-oam group Testgroup1 src-endpoint SW1 dst-endpoint SW2
-> test-oam group Testgroup1 src-endpoint SW1
-> test-oam group Testgroup1 dst-endpoint SW2
```

## Release History

Release 8.6R1; command was introduced.

## Related Commands

- test-oam group duration rate** Configures the duration and rate for the specified CPE test group.  
**show test-oam group** Displays the configuration and status of the CPE test groups.

## MIB Objects

```
alaTestOamGroupConfigTable
 alaTestOamConfigGroupId
 alaTestOamGroupConfigSourceEndpoint
 alaTestOamGroupConfigDestinationEndpoint
```

---

## test-oam group role

Configures the role the switch will perform for the specified CPE test group. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) test frames.

**test-oam group** *name* **role** {**generator** | **analyzer** | **loopback**}

---

### Syntax Definitions

|                  |                                              |
|------------------|----------------------------------------------|
| <i>name</i>      | The name of an existing CPE test group.      |
| <b>generator</b> | Configures the switch as the test generator. |
| <b>analyzer</b>  | Configures the switch as the test analyzer.  |
| <b>loopback</b>  | Configures the switch as loopback.           |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

```
-> test-oam group Testgroup1 role generator
-> test-oam group Testgroup2 role analyzer
-> test-oam group Testgroup2 role loopback
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

- test-oam group duration rate** Configures the duration and rate for the specified CPE test group.
- show test-oam group** Displays the configuration and status of the CPE test groups.

## MIB Objects

alaTestOamGroupConfigTable  
    alaTestOamConfigGroupId  
    alaTestOamGroupConfigRole

---

## test-oam group port

Configures the port on which the CPE test group will run. Use this command on the switch that will generate the test traffic.

**test-oam group** *string* **port** *chassis/slot/port*

---

### Syntax Definitions

*string* The name of an existing CPE test group.

*chassis/slot/port* The port on which the CPE test will generate traffic.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- This command automatically overwrites the port value previously configured for the specified CPE test group.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

```
-> test-oam group Testgroup1 port 1/1/2
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

- test-oam group start stop** Starts the traffic test for the CPE test group on the configured port or the given port.
- test-oam group remote-sys-mac** Stops the traffic test for the CPE test group on the configured port or the given port.
- show test-oam group** Displays the configuration and status of the CPE test groups.

## MIB Objects

```
alaTestOamGroupConfigTable
 alaTestOamConfigGroupId
 alaTestOamGroupConfigPort
```

---

## test-oam group direction

Configures the test direction of the test-oam group.

**test-oam group** *string* [direction {**unidirectional** | **bidirectional**}]

---

### Syntax Definitions

*string* The name of an existing CPE test group.  
**direction** The direction of the CPE test group.

### Defaults

| parameter        | default        |
|------------------|----------------|
| <b>direction</b> | unidirectional |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

```
-> test-oam group Testgroup1 direction unidirectional
-> test-oam group Testgroup2 direction bidirectional
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

- test-oam group duration rate** Configures the duration and rate for the specified CPE test group.
- show test-oam group** Displays the configuration and status of the CPE test groups.

## MIB Objects

```
alaTestOamGroupConfigTable
 alaTestOamConfigGroupId
 alaTestOamGroupConfigDirection
```

---

## test-oam group duration rate

Configures the duration and rate for the specified test-oam group. Use this command to configure these test parameters on the generator switch.

**test-oam group** *string* [**duration** *secs*] [**rate** *rate*]

---

### Syntax Definitions

|               |                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i> | The name of an existing CPE test group.                                                                                                                                                                      |
| <i>secs</i>   | The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 5–3600 seconds.                  |
| <i>rate</i>   | The rate, in Kbps or Mbps, at which test traffic is generated. The minimum value allowed is 8 Kbps to line rate. The granularity of the transmit rate is 8 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports. |

### Defaults

| Parameter   | Default |
|-------------|---------|
| <i>secs</i> | 5 secs  |
| <i>rate</i> | 8 k     |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- This command automatically overwrites any duration and rate parameter values previously configured for the specified CPE test group.
- The status of the CPE test group will change to “ended” when the test duration time expires.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

```
-> test-oam group Testgroup1 duration 10
```

```
-> test-oam group Testgroup1 rate 8m
-> test-oam group Testgroup1 duration 10 rate 8m
```

## Release History

Release 8.6R1; command was introduced.

## Related Commands

[show test-oam group](#) Displays the configuration and status of the CPE test groups.

## MIB Objects

```
alaTestOamGroupConfigTable
 alaTestOamConfigGroupId
 alaTestOamGroupConfigDuration
 alaTestOamGroupConfigGeneratorBandwidth
```

---

## test-oam group start stop

Starts or stops the traffic test for the test-oam group on the configured port or the given port.

**test-oam group** *string* {[port chassis/slot/port] **start** | **stop**} [fetch-remote-stats]

---

### Syntax Definitions

|                           |                                                                                                                                                                         |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>             | The name of an existing CPE test group.                                                                                                                                 |
| <i>chassis/slot/port</i>  | The port on which the CPE test group will generate traffic.                                                                                                             |
| <b>start</b>              | Enables the test.                                                                                                                                                       |
| <b>stop</b>               | Disables the test.                                                                                                                                                      |
| <b>fetch-remote-stats</b> | Triggers the group test at the remote device from the generator. The statistics are collected during the test and the test is stopped after receiving the test results. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.
- Use the fetch-remote-stats parameter to collect the test statistics from the remote device.

### Examples

```
-> test-oam group Testgroup1 port 1/1/2 start
-> test-oam group Testgroup2 start
-> test-oam group Testgroup1 start fetch-remote-stats
-> test-oam group testgroup2 port 1/1/2 start fetch-remote-stats
-> test-oam group Testgroup1 stop
-> test-oam group Testgroup2 stop
```

## Release History

Release 8.6R1; command was introduced.

## Related Commands

[show test-oam group](#)

Displays the configuration and status of the CPE test groups.

## MIB Objects

```
alaTestOamGroupConfigTable
 alaTestOamConfigGroupId
 alaTestOamGroupConfigPort
 alaTestOamGroupConfigState
 alaTestOamGroupConfigRemoteStatsFetchState
```

---

## test-oam group remote-sys-mac

Configures the system MAC address of the remote device to receive test OAM messages.

**test-oam group** *string* **remote-sys-mac** *string*

---

### Syntax Definitions

*string* The name of an existing CPE test group.  
**remote-sys-mac** The system MAC address of the remote device.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use this command on the switch to set the system MAC address of the remote device to receive the test OAM messages.
- The remote-sys-mac must be the primary CMM MAC address of the remote device.
- The remote-sys-mac is not applicable for analyzer or loopback.

### Examples

```
-> test-oam group Testgroup1 remote-sys-mac 00:e0:b1:7c:7a:fa
```

### Release History

Release 8.6R1; command was introduced.

### Related Commands

[show test-oam group](#) Displays the configuration and status of the CPE test groups.

```
alaTestOamGroupConfigTable

 alaTestOamGroupConfigRemoteSysMacAddress
```

---

## clear test-oam group statistics

This clears the statistics of the CPE test group.

**clear test-oam group *string* statistics**

---

### Syntax Definitions

*string*                                      The name of an existing CPE test group.  
**statistics**                                      Clears the statistics for the give CPE test group.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

### Examples

```
-> clear test-oam group Testgroup1 statistics (Clears the statistics for the
specified test-oam group)
-> clear test-oam group statistics (Clears the statistics for all the test-oam
groups)
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

| Yes  | Yes  | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Use the **tests** parameter to display information for all CPE test groups configured on the switch.
- Use the ***string*** parameter to display detailed information for a specific CPE test group.

### Examples

```
-> show test-oam group tests
```

```
Total Test-Groups: 2
Feeder Port : none
Test-Group Port Duration Rate Nb of Direction Status Remote-Sys-Mac
Test-Group Port Duration Rate Nb of Direction Status Remote-Sys-Mac
-----+-----+-----+-----+-----+-----+-----
Testgroup1 none 5 - 2 unidirectional not-started 00:00:00:00:00:00
Testgroup2 none 5 - 3 unidirectional not-started 00:00:00:00:00:00
```

### output definitions

---

|                    |                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Test-Groups</b> | The CPE test group. Configured through the <a href="#">test-oam group</a> command.                                                       |
| <b>Port</b>        | The port on which the test is run.                                                                                                       |
| <b>Duration</b>    | The amount of time the test will run.                                                                                                    |
| <b>Rate</b>        | The rate at which packets are transmitted on the test port. Configured through the <a href="#">test-oam group duration rate</a> command. |
| <b>Nb of Flows</b> | Number of test flows configured for the respective CPE test group.                                                                       |

|                             |                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Test-Groups</b>          | The CPE test group. Configured through the <a href="#">test-oam group</a> command.                                                            |
| <b>Port</b>                 | The port on which the test is run.                                                                                                            |
| <b>Source Endpoint</b>      | The host name for the source (generator) switch. Configured through the <a href="#">test-oam group src-endpoint dst-endpoint</a> command.     |
| <b>Destination Endpoint</b> | The host name for the destination (analyzer) switch. Configured through the <a href="#">test-oam group src-endpoint dst-endpoint</a> command. |
| <b>Source Mac</b>           | The source MAC address of the test frame. Configured through the <a href="#">test-oam vlan test-frame</a> command.                            |
| <b>Destination Mac</b>      | The destination MAC address of the test frame. Configured through the <a href="#">test-oam vlan test-frame</a> command.                       |
| <b>Remote Sys Mac</b>       | The MAC address of the remote device configured through the <a href="#">test-oam group remote-sys-mac</a> command.                            |
| <b>Duration</b>             | The amount of time the test will run.                                                                                                         |
| <b>Role</b>                 | The role of the switch for this test ( <b>generator</b> or <b>analyzer</b> ). Configured through the <a href="#">test-oam role</a> command.   |
| <b>Rate</b>                 | The rate at which packets are transmitted on the test port. Configured through the <a href="#">test-oam group duration rate</a> command.      |
| <b>Frame Size</b>           | The size of the test frame. Configured through the <a href="#">test-oam group duration rate</a> command.                                      |
| <b>Direction</b>            | The direction of the test traffic. Note that only unidirectional traffic tests are supported.                                                 |
| <b>Status</b>               | The operational status of the test.                                                                                                           |
| <b>L2-SAA Count</b>         | Specifies the number of packets sent in one MAC ping iteration.                                                                               |
| <b>L2-SAA Interval</b>      | Specifies the delay between two consecutive packets transmitted during a MAC ping iteration.                                                  |

## show test-oam group saa statistics

Displays the SAA test statistics for all CPE test groups or for a specific test name.

**show test-oam group** [*string*] **saa statistics**

---

### Syntax Definitions

*string* The name of an existing CPE test group.

### Defaults

By default, statistics are displayed for all CPE test group.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

## show test-oam group statistics

Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.

**show test-oam group *[string]* statistics**

---

### Syntax Definitions

*string* The name of an existing CPE test group.

### Defaults

By default, statistics are displayed for all CPE test groups.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|             |             |             |              |             |              |             |             |                        |                                                                      |             |
|-------------|-------------|-------------|--------------|-------------|--------------|-------------|-------------|------------------------|----------------------------------------------------------------------|-------------|
| <b>6360</b> | <b>6465</b> | <b>6560</b> | <b>6570M</b> | <b>6860</b> | <b>6860N</b> | <b>6865</b> | <b>6900</b> | <b>6900</b><br>V72/C32 | <b>6900</b><br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | <b>9900</b> |
| Yes         | Yes         | Yes         | Yes          | No          | No           | No          | No          | No                     | No                                                                   | No          |

### Usage Guidelines

- Use the *string* parameter with this command to display statistics for a specific CPE test group.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

### Examples

```
-> show test-oam group TestGroup4 statistics
Test-Group Flow TX-Ingress TX-Egress RX-Ingress Remote-Stats
-----+-----+-----+-----+-----+-----
TestGroup4 flow1 19017 19017 0 19017

# 58 PPPoE Intermediate Agent

Point-to-Point Protocol over Ethernet (PPPoE) provides the ability to connect a network of hosts to a Remote Access Concentrator. For example, Broadband Network Gateway over a simple bridging access device. In PPPoE model, each host utilizes its own Point-to-Point Protocol (PPP) stack and the user is presented with a familiar user interface. By using PPPoE, Access control, billing, and type of service can be configured on a per-user, rather than a per-site, basis.

PPPoE Intermediate Agent (PPPoE-IA) solution is designed for the PPPoE access method and is based on the Access Node implementing a PPPoE-IA function to insert access loop identification in PPPoE discovery packets (PADI/PADR/PADT) received from the user side.

MIB information for the PPPoE-IA commands is as follows:

*Filename:* alcatel-ind1-pppoe-ia-mib.mib  
*Module:* ALCATEL-IND1-PPPOEIA-MIB

A summary of the available commands is listed here.

---

**pppoe-ia**  
**pppoe-ia {port | linkagg}**  
**pppoe-ia {trust | client}**  
**pppoe-ia access-node-id**  
**pppoe-ia circuit-id**  
**pppoe-ia remote-id**  
**clear pppoe-ia statistics**  
**show pppoe-ia configuration**  
**show pppoe-ia {port | linkagg}**  
**show pppoe-ia statistics**

---

Configuration procedures for PPPoE-IA are explained in the “Configuring PPPoE Intermediate Agent” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*.

## pppoe-ia

Enable or disable PPPoE-IA globally on the switch.

`pppoe-ia {enable | disable}`

---

### Syntax Definitions

**enable** Enable PPPoE-IA.  
**disable** Disable PPPoE-IA.

### Defaults

By default, PPPoE-IA is disabled globally on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | No    | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

All PPPoE-IA parameters are configurable irrespective of the global status of PPPoE-IA.

### Examples

```
-> pppoe-ia enable
-> pppoe-ia disable
```

### Release History

Release 8.6R1; command introduced.

## Related Commands

|                                       |                                                                                                                                                                                         |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pppoe-ia {port   linkagg}</b>      | Enable or disable PPPoE-IA on a port or a link aggregate port.                                                                                                                          |
| <b>pppoe-ia {trust   client}</b>      | Configures a port or a link aggregate port as trust or client port for PPPoE-IA.                                                                                                        |
| <b>pppoe-ia access-node-id</b>        | Globally configures a format to form an identifier that uniquely identifies an access node.                                                                                             |
| <b>pppoe-ia circuit-id</b>            | Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop on which the PADI/PADR/PADT is received from the user side. |
| <b>pppoe-ia remote-id</b>             | Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.                                                                       |
| <b>clear pppoe-ia statistics</b>      | Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.                                  |
| <b>show pppoe-ia configuration</b>    | Displays the global configuration for PPPoE-IA.                                                                                                                                         |
| <b>show pppoe-ia {port   linkagg}</b> | Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.                                         |
| <b>show pppoe-ia statistics</b>       | Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.                                            |

## MIB Objects

alaPPPoE-IA-GlobalStatus

---

## pppoe-ia {port | linkagg}

Enable or disable PPPoE-IA on a port or a link aggregate port. Link aggregate can be either static or dynamic.

**pppoe-ia {port chassis/slot/port[-port2] | linkagg agg\_num} {enable | disable}**

---

### Syntax Definitions

|                        |                                                        |
|------------------------|--------------------------------------------------------|
| <i>chassis</i>         | The chassis identifier.                                |
| <i>slot</i>            | The slot number for the module.                        |
| <i>port</i>            | Port number of the interface to be configured.         |
| <i>port2</i>           | Last port number in a range of ports to be configured. |
| <b>linkagg agg_num</b> | The link aggregate identification number.              |
| <b>enable</b>          | Enable PPPoE-IA on a port.                             |
| <b>disable</b>         | Disable PPPoE-IA on a port.                            |

### Defaults

By default, PPPoE-IA is disabled on all ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | No    | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of the per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- PPPoE-IA is not supported on port mirroring destination ports. However, the configurations are accepted.
- PPPoE-IA is not supported on aggregable ports.

### Examples

```
-> pppoe-ia port 1/1/1 enable
-> pppoe-ia port 1/1/4 disable
-> pppoe-ia linkagg 1 enable
```

## Release History

Release 8.6R1; command introduced.

## Related Commands

**pppoe-ia**

Enable or disable PPPoE-IA globally on the switch.

**show pppoe-ia configuration**

Displays the global configuration for PPPoE-IA.

**show pppoe-ia {port | linkagg}**

Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.

**show pppoe-ia statistics**

Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

## MIB Objects

alaPPPoEIAPortConfigTable

alaPPPoEIAPortConfigStatus

---

## pppoe-ia {trust | client}

Configures a port or a link aggregate port as trusted or client port for PPPoE-IA.

A trust port is a port that is connected to the Broadband Network Gateway whereas a client port is connected to the host.

**pppoe-ia {port chassis/slot/port[-port2] | linkagg agg\_num} {trust | client}**

---

### Syntax Definitions

|                        |                                                        |
|------------------------|--------------------------------------------------------|
| <i>chassis</i>         | The chassis identifier.                                |
| <i>slot</i>            | The slot number for the module.                        |
| <i>port</i>            | Port number of the interface to be configured.         |
| <i>port2</i>           | Last port number in a range of ports to be configured. |
| <b>linkagg agg_num</b> | Specifies the link aggregate identification number.    |
| <b>trust</b>           | Specifies the mode of the port as trust.               |
| <b>client</b>          | Specifies the mode of the port as client.              |

### Defaults

By default, all ports are client ports.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | No    | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- For PPPoE-IA to work, it must be enabled on a client port as well as a trusted port.
- PPPoE-IA is not supported on aggregable ports.
- PPPoE-IA is not supported on port mirroring destination ports; however, the configurations are accepted.

### Examples

```
-> pppoe-ia port 1/1 /1
```

```
-> pppoe-ia port 1/1/2-4 client
-> pppoe-ia linkagg 7 trust
-> pppoe-ia linkagg 0 client
```

## Release History

Release 8.6R1; command introduced.

## Related Commands

[pppoe-ia](#)

Enable or disable PPPoE-IA globally on the switch.

[pppoe-ia {port | linkagg}](#)

Enable or disable PPPoE-IA on a port or a link aggregate port.

[pppoe-ia {trust | client}](#)

Configures a port or a link aggregate port as trust or client port for PPPoE-IA.

[show pppoe-ia configuration](#)

Displays the global configuration for PPPoE-IA.

[show pppoe-ia {port | linkagg}](#)

Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.

[show pppoe-ia statistics](#)

Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

## MIB Objects

```
alaPPPoEIAPortConfigTable
 alaPPPoEIAPortConfigTrustMode
```

---

## pppoe-ia access-node-id

Globally configures a format to form an identifier that uniquely identifies an access node.

```
pppoe-ia access-node-id {base-mac | system-name | mgnt-address | user-string string}
```

---

### Syntax Definitions

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <b>base-mac</b>     | The base MAC address of the switch.                       |
| <b>system-name</b>  | The configured name of the switch.                        |
| <b>mgnt-address</b> | The IP address of the management interface of the switch. |
| <i>string</i>       | The value of user configured string.                      |

### Defaults

By default, PPPoE-IA uses the base MAC address of the switch as the Access-Node-Identifier.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | No    | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- The access-node-identifier can have a maximum of 32 characters. The access-node-identifier longer than 32 characters is truncated to 32 characters.
- The access-node-identifier when configured as user-string must not contain spaces.
- The value of user string must not be NULL.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address '0.0.0.0' is used as management address.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.

### Examples

```
-> pppoe-ia access-node-id base-mac
-> pppoe-ia access-node-id user-string accessnode1
```

## Release History

Release 8.6R1; command introduced.

| <code>pppoe-ia {trust   client}</code>      | Configures a port or a link aggregate port as trust or client port for PPPoE-IA.                                                                       |
| <code>clear pppoe-ia statistics</code>      | Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA. |
| <code>show pppoe-ia configuration</code>    | Displays the global configuration for PPPoE-IA.                                                                                                        |
| <code>show pppoe-ia {port   linkagg}</code> | Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.        |
| <code>show pppoe-ia statistics</code>       | Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.           |

## MIB Objects

```
alaPPPoEIAGlobalAccessNodeIDFormatType
alaPPPoEIAGlobalAccessNodeIDStringValue
```

---

## pppoe-ia circuit-id

Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop that receives the PPPoE Active Discovery Initiation (PADI) or PPPoE Active Discovery Request (PADR) or PPPoE Active Discovery Terminate (PADT) from the user end.

```
pppoe-ia circuit-id {default [atm] ascii [base-mac | system-name | interface | vlan | cvlan | interface-alias | user-string string | delimiter char]}
```

---

### Syntax Definitions

|                        |                                                                                                                                                                                                                                                       |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>         | The default value of the Circuit-ID used for the Ethernet parameter.                                                                                                                                                                                  |
| <b>atm</b>             | When the PPPoE-IA Circuit-ID format is configured as “default atm” the Circuit-ID encoding happens for “ATM” (Asynchronous Transfer Mode) parameter.                                                                                                  |
| <b>ascii</b>           | Circuit-ID format used to configure Circuit-ID string using the five parameters and delimiter. Maximum five parameters can be selected from the given seven options: base-mac, system-name, interface, vlan, cvlan, interface-alias, and user-string. |
| <b>base-mac</b>        | The base MAC address of the switch.                                                                                                                                                                                                                   |
| <b>system-name</b>     | Name configured for the switch.                                                                                                                                                                                                                       |
| <b>interface</b>       | The interface on which the PPPoE message is received.                                                                                                                                                                                                 |
| <b>vlan</b>            | VLAN interface on which the PPPoE message is received.                                                                                                                                                                                                |
| <b>cvlan</b>           | Inner-VLAN or customer VLAN of the PPPoE message.                                                                                                                                                                                                     |
| <b>interface-alias</b> | Configured alias of the interface on which the PPPoE message is received.                                                                                                                                                                             |
| <i>string</i>          | The value of user configured string.                                                                                                                                                                                                                  |
| <b>delimiter</b>       | A user configurable delimiter used to separate the fields of an ASCII string forming the Circuit-ID.                                                                                                                                                  |
| <i>char</i>            | The value (a character) of the user configurable delimiter.                                                                                                                                                                                           |

### Defaults

| parameter   | default |
|-------------|---------|
| <i>char</i> | :       |

By default, “:” (colon) is used as the delimiter.

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | No    | Yes  | No   | No              | No                                                            | No   |

## Usage Guidelines

- Circuit-ID identification is configurable only globally and cannot be configured on a per-port or per-VLAN basis.
- To configure ethernet default parameter, use “default” in the CLI command.
- To configure default parameter as “atm”, use “default ATM” in the CLI command.
- When the PPPoE-IA Circuit-ID format is configured as “default atm” the Circuit-ID encoding happens for “ATM” (Asynchronous Transfer Mode) parameter.
- By default, the value of the Circuit-ID is "access-node-id eth slot/port[:vlan-id]". For example, if the value of access-node-id is "vxTarget", the default value of Circuit-ID is "vxTarget eth 1/1:10", if the packet is received on the interface 1/1 in vlan 10.
- By default, the delimiter used is “:”. The available delimiters are: “:” (colon), “|” (pipe), “/” (forward slash), “\” (backward slash), “-” (hyphen), “\_” (underscore), “ ” (space), “#” (hash), “.” (full stop), “,” (comma), “;” (semicolon).
- The Circuit-ID can have a maximum of 63 characters. The Circuit-ID longer than 63 characters is truncated to 63 characters.
- At most, five fields out of the available seven is encoded for the Circuit-ID in the order specified by the user.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.
- You can configure the same Circuit-ID format multiple times (for example, base MAC address of the switch can be configured multiple times in ASCII format of Circuit-ID).
- If the Circuit-ID format is default, irrespective of the ASCII fields (if configured), the Circuit-ID configuration is not visible in **show pppoe-ia configuration** output.

## Examples

```
-> pppoe-ia circuit-id default
-> pppoe-ia circuit-id default atm
-> pppoe-ia circuit-id ascii base-mac vlan
-> pppoe-ia circuit-id ascii system-name interface user-string cid1
-> pppoe-ia circuit-id ascii system-name delimiter #
```

## Release History

Release 8.6R1; command introduced.

## Related Commands

**pppoe-ia**

Enable or disable PPPoE-IA globally on the switch.

**pppoe-ia {trust | client}**

Configures a port or a link aggregate port as trust or client port for PPPoE-IA.

**show pppoe-ia configuration**

Displays the global configuration for PPPoE-IA.

**show pppoe-ia {port | linkagg}**

Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.

**show pppoe-ia statistics**

Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

```

---

## pppoe-ia remote-id

Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.

```
pppoe-ia remote-id {base-mac | system-name | mgnt-address | user-string string}
```

---

### Syntax Definitions

|                     |                                          |
|---------------------|------------------------------------------|
| <b>base-mac</b>     | The base MAC address of the switch.      |
| <b>system-name</b>  | The name configured for the switch.      |
| <b>mgnt-address</b> | The management IP address of the switch. |
| <i>string</i>       | The value configured for user string.    |

### Defaults

By default, the base MAC address of the switch is used as the format for Remote-ID.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | Yes  | Yes   | Yes  | No    | Yes  | No   | No              | No                                                            | No   |

### Usage Guidelines

- Remote-ID is configurable only globally and cannot be configured on a per-port or per-VLAN basis.
- Remote-ID can have a maximum of 63 characters. The Remote-ID longer than 63 characters is truncated to 63 characters.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address '0.0.0.0' is used as management address.
- If the Remote-ID is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.

### Examples

```
-> pppoe-ia remote-id base-mac
-> pppoe-ia remote-id user-string remoteuser1
```

## show pppoe-ia {port | linkagg}

Displays the following:

- PPPoE-IA configuration for a physical or link-aggregate port, physical port range, or all the physical or link-aggregate ports.
- Port or port range configuration for ports with PPPoE-IA enabled or disabled
- Ports that are configured as trust or client port for PPPoE-IA.

**show pppoe-ia {port {chassis/lot/port[-port2] | linkagg agg\_num} [enabled | disabled | trusted | client]**

---

### Syntax Definitions

|                               |                                                        |
|-------------------------------|--------------------------------------------------------|
| <i>chassis</i>                | The chassis identifier.                                |
| <i>slot</i>                   | The slot number for the module.                        |
| <i>port</i>                   | Port number of the interface to be configured.         |
| <i>port2</i>                  | Last port number in a range of ports to be configured. |
| <b>linkagg</b> <i>agg_num</i> | Specifies the link aggregate identification number.    |
| <b>enabled</b>                | PPPoE-IA enabled port.                                 |
| <b>disable</b>                | PPPoE-IA disabled port.                                |
| <b>trust</b>                  | Port configured as trust.                              |
| <b>client</b>                 | Port configured as client.                             |

# 59 Service Assurance Agent Commands

Service Assurance Agent (SAA) enables customers to assure new business-critical applications, as well as services that utilize data, voice, and video. Use SAAs to verify service guarantees, increase network reliability by validating network performance, proactively identify network issues, and increase return on investment (ROI) by easing the deployment of new services. The SAA feature uses active monitoring to generate traffic in a continuous, reliable, and predictable manner, thus enabling the measurement of network performance and health.

IP SAAs enhance the service level monitoring to become IP application-aware by measuring both end-to-end and at the IP layer. IP SAA would allow performance measurement against any IP addresses in the network (switch, server, pc). Use ETH-LB/DMM to measure delay and jitter by sending out frames with DM information to the peer MEP and receiving frames with DM information from the peer MEP.

MIB information for the SAA commands is as follows:

*Filename:* Alcatel-IND1-ETHERNET-OAM-MIB.mib  
*Module:* alcatelIND1EoamMIB

*Filename:* IEEE8021-CFM-MIB.mib  
*Module:* ieee8021CfmMib

*Filename:* ALCATEL-IND1-SAA-MIB.mib  
*Module:* alcatelIND1SaaMIB

A summary of the available commands is listed here:

|                            |                                                                                                     |

## saa

Configures a Service Assurance Agent (SAA).

```
[vrf vrf_name] saa string [descr description] [interval interval] [jitter-threshold jitter_thresh] [rtt-threshold rtt_thresh]
```

```
[vrf vrf_name] no saa string
```

---

### Syntax Definitions

|                      |                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vrf_name</i>      | The name of an existing VRF instance.                                                                                                                         |
| <i>string</i>        | SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (for example “SAA 10”).                |
| <i>description</i>   | Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing SAA”). |
| <i>interval</i>      | The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10 to 1500.                                              |
| <i>jitter_thresh</i> | The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.                                    |
| <i>rtt_thresh</i>    | The round-trip time threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.                           |

### Defaults

| parameter            | default      |
|----------------------|--------------|
| <i>description</i>   | DEFAULT      |
| <i>interval</i>      | 150 minutes  |
| <i>jitter_thresh</i> | 0 (disabled) |
| <i>rtt_thresh</i>    | 0 (disabled) |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the **no** form of this command to remove an SAA from the switch configuration. Note that the SAA must be stopped before it can be deleted.

- The **desc** and **interval** parameters are optional. If these values are specified, the SAA is created with those values. If these values are not specified, the SAA is created with the default values.
- If the **desc** and/or **interval** parameters are specified for an existing SAA, then the values of the existing parameters are updated with those specified.
- If the session time interval is changed for an SAA that is already running and active, the interval value is immediately updated in the database but is not applied to the SAA until after the next iteration.
- If none of the optional parameters are specified and the given SAA exists, the CLI will return an error message, as duplicate entries are not allowed.
- Any number of SAAs can be configured (MAX 127). It is recommended not to start many aggressive SAAs (having session interval  $\leq 10$ ). To achieve proper scheduling of all the started SAA (aggressive and relaxed) it is recommended not to start more than 50 SAAs.
- Ensure the interval value is greater than the execution time (number of packets \* inter packet delay).
- When SAA processes an iteration of a session, it will compare the results against the following criteria to see if an SNMP trap should be sent. A trap with the session name is sent if:
  - At least one packet is lost.
  - Warning: Average RTT/Jitter crosses 90% of threshold.
  - Critical: Average RTT/Jitter at or above threshold.

## Examples

```
-> saa saal descr "saa for ip-ping"
-> saa saal jitter-threshold 100 rtt-threshold 500
-> saa saa2 descr "Monitoring Default VRF-interface" interval 160
-> saa saa2 interval 120
-> no saa saal
```

## Release History

Release 7.3.1; command was introduced.

Release 7.3.2; **jitter-threshold** and **rtt-threshold** parameters added.

## Related Commands

**show saa** Displays SAA configuration information.

**show saa statistics** Displays SAA statistics.

 alaSaaCtrlDescr
 alaSaaCtrlInterval
 alaSaaCtrlJitterThreshold
 alaSaaCtrlRTTThreshold
```

## saa type ip-ping

Configure SAA for IP including the number of packets and inter-packet delay parameters.

```
[vrf vrf_name] saa string type ip-ping destination-ip ip_address source-ip ip_address type-of-service
tos [num-pkts count] [inter-pkt-delay delay] [payload-size size]
```

---

### Syntax Definitions

|                                         |                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vrf_name</i>                         | The name of an existing VRF instance.                                                                                                               |
| <i>string</i>                           | SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10"). |
| <b>destination-ip</b> <i>ip_address</i> | The IPv4 address of the destination to ping.                                                                                                        |
| <b>source-ip</b> <i>ip_address</i>      | The IPv4 address of the source.                                                                                                                     |
| <i>tos</i>                              | The type of service. Valid range is 0 – 255.                                                                                                        |
| <i>count</i>                            | The number of packets to send in one ping iteration. The valid range is 1–100.                                                                      |
| <i>delay</i>                            | The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.              |
| <i>size</i>                             | The size of the ICMP payload to be used for the ping iteration. Valid range is 24–1472 bytes.                                                       |

### Defaults

| parameter    | default  |
|--------------|----------|
| <i>count</i> | 5        |
| <i>delay</i> | 1000 ms  |
| <i>size</i>  | 24 bytes |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.

- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay** (number of packets \* inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- Do not specify a broadcast or multicast address for the source or destination IP. In addition, do not use 0.0.0.0 as the destination IP address.
- The timeout for each ping request packet is 1 sec. This value is not configurable.
- If a VRF is specified, the SAA for IP is configured in the specified VRF. By default, the SAA is configured in the 'default' VRF.

## Examples

```
-> saa saa1 type ip-ping destination-ip 123.32.45.76 source-ip 123.35.42.124 type-
of-service 4
-> saa saa2 type ip-ping destination-ip 123.32.45.77 source-ip 123.35.42.124 type-
of-service 5
-> saa saa3 type ip-ping destination-ip 123.32.55.27 source-ip 123.35.42.125 type-
of-service 8 inter-pkt-delay 1000
-> saa saa4 type ip-ping destination-ip 123.46.45.77 source-ip 123.35.42.125 type-
of-service 2 num-pkts 5
-> saa saa5 type ip-ping destination-ip 12.53.45.77 source-ip 123.35.42.125 type-
of-service 35 payload-size 1000
-> saa saa6 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-
of-service 5 inter-pkt-delay 1000 num-pkts 8 pkt-size 1000
-> vrf vrf3 saa saa7 type ip-ping destination-ip 123.22.45.66 source-ip
123.35.42.125 type-of-service 5 inter-pkt-delay 1000 num-pkts 8 pkt-size 1000
```

## Release History

Release 7.3.1; command was introduced.

## saa type mac-ping

Configure SAA for a MAC address including the VLAN, VLAN ID, number of packets and inter-packet delay parameters.

```
saa string type mac-ping destination-mac mac_address vlan vlan_id [vlan-priority vlan_priority]
[drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size]
[isid-check isid]
```

---

### Syntax Definitions

|                      |                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>        | SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10"). |
| <i>mac_address</i>   | The destination MAC address to ping.                                                                                                                |
| <i>vlan_id</i>       | The VLAN on which the L2 SAA Packets will be sent out. Valid range is 1-4094.                                                                       |
| <i>vlan_priority</i> | Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.                               |
| <b>true</b>          | Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.                                              |
| <b>false</b>         | Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.                                             |
| <i>data</i>          | User specified string to be included in the packet (Data TLV). Maximum string length for data is 255.                                               |
| <i>count</i>         | The number of packets to send in one ping iteration. The valid range is 1–100.                                                                      |
| <i>delay</i>         | The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.              |
| <i>size</i>          | The size of the ICMP payload to be used for the ping iteration. Valid range is 36–1500 bytes.                                                       |
| <i>isid</i>          | A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.                         |

### Defaults

| parameter            | default  |
|----------------------|----------|
| <i>vlan_priority</i> | 0        |
| <b>true   false</b>  | false    |
| <i>count</i>         | 5        |
| <i>delay</i>         | 1000 ms  |
| <i>size</i>          | 36 bytes |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay** (number of packets \* inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- The timeout for each ping request packet is 1 sec. This value is not configurable.
- If data-TLV is specified and payload size is not specified, then payload size will be increased internally to accommodate the data TLV.
- If data TLV and payload size both are specified and payload size is less than [dataTLV + 36] bytes (for time-stamping and other packet info), then the CLI will be rejected.
- Destination-MAC cannot be broadcast/multicast address.
- Timeout for each ping request packet is 1 sec. This value is non-configurable.
- For SAA mac-ping over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained. Session iteration may see packet loss over linkagg if request and reply packets are not received on the same member port. This will not be seen in the subsequent iterations of the session.

## Examples

```
-> saa saa1 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10
-> saa saa4 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 inter-pkt-delay
100
-> saa saa5 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 num-pkts 10
-> saa saa6 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 payload-size
400
-> saa saa8 type mac-ping destination-mac 00:11:11:11:11:11 vlan 1001 isid-check
1002
```

## saa spb

Configures session parameters for the Shortest Path Bridging (SPB) SAA. The SPB feature dynamically discovers SPB-enabled switches. Each discovered switch is identified by the pairing of a SPB VLAN (BVLAN) and the backbone MAC address (BMAC) for the switch. SPB advertises these BVLAN-BMAC pairs to the SAA feature, which in turn creates and starts MAC ping sessions based on the parameters configured with this command.

```
saa spb [auto-create] [auto-start] [interval interval] [vlan-priority vlan_priority] [drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size] [jitter-threshold jitter_thresh] [rtt-thresh rtt_thresh] [keep]
```

---

### Syntax Definitions

|                      |                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>auto-create</b>   | Automatically creates an SPB SAA session for each discovered BVLAN-BMAC pair.                                                      |
| <b>auto-start</b>    | Automatically starts each SPB SAA session.                                                                                         |
| <i>interval</i>      | The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10–1500.                      |
| <i>vlan_priority</i> | Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.              |
| <b>true</b>          | Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.                             |
| <b>false</b>         | Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.                            |
| <i>data</i>          | User specified string to be included in the packet (Data TLV). Maximum string length for data is 255.                              |
| <i>count</i>         | The number of packets to send in one ping iteration of the test. Valid range is 1–100.                                             |
| <i>delay</i>         | The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.        |
| <i>size</i>          | The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.                                      |
| <i>jitter_thresh</i> | The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.         |
| <i>rtt_thresh</i>    | The round-trip time threshold value, in microseconds. A trap is generate when this value is crossed. The valid range is 0–1000000. |
| <b>keep</b>          | Retains SPB SAA session information even when SPB signals that a BMAC or BVLAN no longer exists.                                   |

## Defaults

| parameter                           | default      |
|-------------------------------------|--------------|
| <b>auto-create</b>                  | off          |
| <b>auto-start</b>                   | off          |
| <i>interval</i>                     | 150 minutes  |
| <i>vlan-priority</i>                | 0            |
| <b>drop-eligible {true   false}</b> | false        |
| <i>data</i>                         | null         |
| <i>count</i>                        | 5            |
| <i>delay</i>                        | 1000 ms      |
| <i>size</i>                         | 32 bytes     |
| <i>jitter_thresh</i>                | 0 (disabled) |
| <i>rtt-thresh</i>                   | 0 (disabled) |
| <b>keep</b>                         | off          |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- The **auto-create** and **auto-start** parameters enable the SPB SAA functionality required to automatically create and start this type of SAA session.
- Ensure the interval value is greater than the execution time (number of packets \* inter-packet delay).
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay** (number of packets \* inter-packet delay) for an SAA iteration must be less than the sum of interval and inter-packet delay.
- SPB SAA sessions cannot be modified but are automatically configured with “SPB” as the owner of the session so they can be easily identified within the applicable SAA **show** command displays.
- The SAA ID for an SPB SAA is the prefix SPB- combined with the BVLAN and BMAC pairing used to generate the session. For example, SPB-*bvlan-bmac* (SPB-4000-e8-e7-32-07-98-cd).
- For SAA mac-ping over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained. Session iteration may see packet loss over linkagg if request and reply packets are not received on the same member port. This will not be seen in the subsequent iterations of the session.

## Examples

```
-> saa spb auto-create auto-start interval 160 num-pkts 50 inter-pkt-delay 100 keep
-> saa spb auto-create auto-start jitter-threshold 100 rtt-threshold 500
-> saa spb keep
```

## Release History

Release 7.3.2; command was introduced.

Release 8.6R1; **vlan-priority** and **drop-eligible** parameters deprecated.

### Usage Guidelines

When this command is used, the SPB SAA session parameters are set to the following default values:

| parameter            | default      |
|----------------------|--------------|
| <b>auto-create</b>   | off          |
| <b>auto-start</b>    | off          |
| <i>interval</i>      | 150 minutes  |
| <i>vlan-priority</i> | 0            |
| <i>drop-eligible</i> | false        |
| <i>data</i>          | null         |
| <i>count</i>         | 5            |
| <i>delay</i>         | 1000 ms      |
| <i>size</i>          | 32 bytes     |
| <i>jitter_thresh</i> | 0 (disabled) |
| <i>rtt-thresh</i>    | 0 (disabled) |
| <b>keep</b>          | off          |

### Examples

saa string type ethoam-loopback {target-endpoint t_mepid | target-mac address mac_address} source-
endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [drop-eligible
{true | false}] [data data] [num-pkts num] [inter-pkt-delay delay]
```

---

### Syntax Definitions

|                      |                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>        | SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10"). |
| <i>t_mepid</i>       | The ID of the destination MEP.                                                                                                                      |
| <i>mac_address</i>   | The MAC address of the destination.                                                                                                                 |
| <i>s_mepid</i>       | The ID of the source MEP.                                                                                                                           |
| <i>md_name</i>       | The domain to which the source MEP belongs.                                                                                                         |
| <i>ma_name</i>       | The association to which the source MEP belongs.                                                                                                    |
| <i>vlan_priority</i> | The VLAN priority to be used for the outgoing packet. The valid range is 0-7.                                                                       |
| <b>true</b>          | Sets the drop eligibility bit in the VLAN tag to true.                                                                                              |
| <b>false</b>         | Sets the drop eligibility bit in the VLAN tag to false.                                                                                             |
| <i>data</i>          | User specified string that is included in the packet. Maximum string length for data is 255.                                                        |
| <i>num</i>           | The number of packets to send during loopback. Valid range is 1– 100.                                                                               |
| <i>delay</i>         | The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.                         |

### Defaults

| parameter                    | default |
|------------------------------|---------|
| drop-eligible {true   false} | false   |
| num-pkts <i>num</i>          | 5       |
| <i>delay</i>                 | 1000    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- Source MEP-ID, MD and MA must be created before initiating loopback.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When **target-endpoint** is specified then it must be learned before initiating loopback.
- When **target-endpoint** is specified and learned, Ethernet Loopback will be transmitted irrespective of whether the RMEP state is OK or failed.
- The **data**, **num-pkts**, and **inter-pkt-delay** are optional parameters. If these values are specified, the entry will be created with these values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** can be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay** (number of packets \* inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The Target MEP/MAC, source MEP, domain, and association parameters are mandatory. If they are not specified, the CLI will return an error.
- The **data** parameter is optional. If this parameter is not specified, then it is not sent in the loopback message.
- The timeout value for each LB packet is one second. This value is not configurable.
- For SAA Ethernet OAM over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained.

## Examples

```
-> saa saa1 type ethoam-loopback target-endpoint 10 source endpoint 1 domain md1
association mal
-> saa saa2 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal data « monitor association mal » num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-loopback target-endpoint 15 source endpoint 1 domain md1
association mal data « monitor association mal » num-pkts 6
-> saa saa4 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal inter-pkt-delay 500
```

## Release History

Release 7.3.1; command was introduced.

Release 8.6R1; **vlan-priority** and **drop-eligible** parameters deprecated.

## Related Commands

- show saa** Displays SAA configuration information.
- show saa statistics** Displays SAA statistics.

```

---

## saa type ethoam-two-way-delay

Configures SAA for ETH-DMM, including the number of packets and inter-packet delay parameters.

```
saa string type {ethoam-two-way-delay} {target-endpoint t_mepid | target-mac address mac_address}
source-endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [num-
pkts num] [inter-pkt-delay delay]
```

### Syntax Definitions

|                      |                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>string</i>        | SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, “SAA 10”). |
| <i>t_mepid</i>       | The ID of the destination MEP.                                                                                                                      |
| <i>mac_address</i>   | The MAC address of the destination.                                                                                                                 |
| <i>s_mepid</i>       | The ID of the source MEP.                                                                                                                           |
| <i>md_name</i>       | The domain to which the source MEP belongs.                                                                                                         |
| <i>ma_name</i>       | The association to which the source MEP belongs.                                                                                                    |
| <i>vlan_priority</i> | The VLAN priority to be used for the outgoing packet. The valid range is 0-7.                                                                       |
| <i>num</i>           | The number of packets to send during loopback. Valid range is 1– 100.                                                                               |
| <i>delay</i>         | The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.                         |

### Defaults

| parameter    | default |
|--------------|---------|
| <i>num</i>   | 5       |
| <i>delay</i> | 1000    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The SAA should exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- The source MEP-ID, MD, and MA must be created before initiating DMM.

- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When the **target-endpoint** parameter is specified, then it must be learned before initiating DMM.
- When the **target-endpoint** parameter is specified and learned, ETH-DMM will be transmitted irrespective of whether the RMEP state is OK or failed.
- The **num-pkts** and **inter-pkt-delay** parameters are optional. If these values are specified, the entry will be created with those values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** values can be modified, but the **pkt-size** value cannot be modified later.
- Total execution time, that is, the product of **num-pkts** and **inter-pkt-delay** (number of packets \* inter-packet delay) for a SAA iteration must be less than the sum of interval and inter-packet delay.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- Target MEP/MAC, source MEP, domain, and association parameters are mandatory. If they are not specified, the CLI will return an error.
- The timeout for each DMM packet is 1 sec. This value is not configurable.
- For SAA Ethernet OAM over linkagg, it is recommended to have 5 (default) or more packets per session to ensure that accurate RTT and jitter values are obtained.

## Examples

```
-> saa saa1 type ethoam-two-way-delay target-endpoint 10 source endpoint 1 domain
md1 association ma1
-> saa saa2 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association ma1 num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-two-way-delay target-endpoint 15 source endpoint 1 domain
md1 association ma1 num-pkts 6
-> saa saa4 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association ma1 inter-pkt-delay 500
```

## Release History

Release 7.3.1; command was introduced.

Release 8.6R1; **vlan-priority** parameter deprecated.

## Related Commands

```

---

## saa start

Starts the SAA test.

```
[vrf vrf_name] saa string start [at yyyy-mm-dd, hh:mm:ss]
```

---

### Syntax Definitions

|                             |                                       |
|-----------------------------|---------------------------------------|
| <i>vrf_name</i>             | The name of an existing VRF instance. |
| <i>string</i>               | An existing SAA ID string.            |
| <i>yyyy-mm-dd, hh:mm:ss</i> | The date and time to start the SAA.   |

### Defaults

By default, the SAA test is started immediately.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- Use the **saa stop** command to stop an SAA test that is already running.
- Use the **at** option to specify a date and time for the test to start.
- If an SAA is scheduled to start at a specified time and another **saa start** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.
- If the **saa start** command is given after an SAA is started, then the CLI will return error.
- If the SAA type is configured with a source IP that does not exist or is not active, then the packet will not be transmitted and no error will be returned. Swlogs will be updated.
- ICMP must be enabled on the switch. If ICMP is disabled and an SAA of type 'ip-ping' is started, then the iteration will timeout and will be treated as failed iteration.
- Immediately after a CMM restart (reboot or takeover), the command to start SAA will be accepted, but the actual execution of the iteration will start 5 minutes after the CMM restart.
- If the SAA type is configured with a source MEP that does not exist or is not active (admin down), then the packet will not be transmitted and no error will be returned on the CLI console. Swlogs will be updated.

- It is recommended that all the SAAs be rescheduled if the system time is being changed.

## Examples

```
-> saa saa2 start at 2009-09-12,09:00:00
-> saa saa4 start
```

## Release History

Release 7.3.1; command was introduced.

 alaSaaCtrlStartAt
```

---

## saa stop

Stops the SAA test.

```
[vrf vrf_name] saa string stop [never | at yyyy-mm-dd,hh:mm:ss]
```

---

### Syntax Definitions

|                            |                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>vrf_name</i>            | The name of an existing VRF instance.                                                                                 |
| <i>string</i>              | An existing SAA ID string.                                                                                            |
| <b>never</b>               | Specifies that the SAA test will not be stopped unless the <b>saa stop</b> command is used with the <b>at</b> option. |
| <i>yyyy-mm-dd,hh:mm:ss</i> | The date and time to start the SAA.                                                                                   |

### Defaults

By default, the test is stopped immediately.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- The SAA must be in a ‘started’ state before giving the command unless the start and stop times are scheduled. If the SAA is not in a ‘started’ state, the CLI will return an error.
- Use the **at** option to specify a date and time for the test to stop.
- If the **never** option is specified, the SAA test will keep on running until the **saa stop** command is entered again with the **at** option.
- If SAA test is stopped while it is running an iteration, the current iteration is pre-empted. The statistics and history are updated for the partial iteration run.
- If an SAA is scheduled to stop at a specified time and another **saa stop** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.

### Examples

```
-> saa saa1 stop
-> saa saa2 stop never
```

## Release History

Release 7.3.1; command was introduced.

  alaSaaCtrlStopAt

---

## saa jitter-calculation enhanced

Calculates jitter values on each SAA probe. Each and every jitter that is calculated will be implemented as per the formula specified in RFC 1889.

**saa jitter-calculation enhanced**

**[no] saa jitter-calculation enhanced**

---

### Syntax Definitions

N/A

### Defaults

By default, the inter-arrival jitter calculation is based on the round-trip-time difference between two successive packets.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |       |      |       |      |      |                 |                     |      |
|------|------|-------|------|-------|------|------|-----------------|---------------------|------|
| 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6 | 9900 |
| Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                 | Yes  |

### Usage Guidelines

- When the jitter calculation mode is set to **enhanced**, then jitter calculation will be made as per RFC 1889 defined formula.

Formula:

$$\text{Jitter} = \text{Jitter} + (\text{abs}(\text{ElapsedTime} - \text{OldElapsedTime}) - \text{Jitter}) / 16$$

Where

‘Jitter’ - Jitter value calculated from successive packets RTT.

Elapsed - RTT value involved in the packet.

- The jitter calculation is applicable for IP SAA, ETH SAA, MAC SAA, and SAA SPB.
- The enhanced jitter calculation will only affect the jitter calculation for the overall iteration. The calculation of jitter for individual packets will not change with enhanced mode.
- Use the **no** form of this command to set the jitter calculation to default.

### Examples

```
-> saa jitter-calculation enhanced
```

```
-> no saa jitter-calculation enhanced
```

## Release History

Release 8.8R1; command introduced.

## Related Commands

[show saa](#)

Displays the mode which is set for jitter calculation.

## MIB Objects

```
alaSaaJitterCalculationConfigGroup
alaSaaJitterCalculationEnhanced
```

---

## saa xml

Configures SAA XML parameters that determine when and where an SAA XML history file is created.

**saa xml** [**file-name** *xml\_filename* [**interval** *interval*] [**admin-state** {**enable** | **disable**}]

---

### Syntax Definitions

|                     |                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>xml_filename</i> | The name of the file where SAA history entries are stored. This file must reside in the <b>/flash/network</b> directory on the local switch. |
| <i>interval</i>     | The amount of time, in minutes, between each generation of the XML history file. Valid range is from 1–15000.                                |
| <b>enable</b>       | Enables XML history file generation.                                                                                                         |
| <b>disable</b>      | Disables XML history file generation.                                                                                                        |

### Defaults

| parameter                                             | default    |
|-------------------------------------------------------|------------|
| <i>xml_filename</i>                                   | saa.xml    |
| <i>interval</i>                                       | 20 minutes |
| <b>admin-state</b> { <b>enable</b>   <b>disable</b> } | Disabled   |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- When this function is enabled, SAA will periodically generate an XML file containing the following entries:
  - SAA name and ID
  - VRF name
  - Iteration number (1-5)
  - Last run time
  - Reason
  - Packets sent/received
  - InterPktDelay
  - EgressPort
  - RTT min/avg/max (value is '-1' in case of failed test)
  - Jitter min/avg/max (value is '-1' in case of failed test)
  - Subports

## Examples

```
-> saa xml interval 60 admin-state enable
-> saa xml file-name switch1_saa.xml interval 120 admin-status enable
```

## Release History

Release 7.3.2; command was introduced.

## Related Commands

[show saa xml](#) Displays the SAA XML file generation parameters.

## MIB Objects

```
alaSaaXmlFeature
 alaSaaXmlStatus
 alaSaaXmlFilename
 alaSaaXmlInterval
```

---

## show saa

Displays SAA session information.

```
[vrf vrf_name] show saa [string | {descr description}] [owner saa_owner]
```

---

### Syntax Definitions

|                    |                                                 |
|--------------------|-------------------------------------------------|
| <i>vrf_name</i>    | The name of an existing VRF instance.           |
| <i>string</i>      | An existing SAA ID.                             |
| <i>description</i> | An existing SAA description string.             |
| <i>saa_owner</i>   | The owner name associated with the SAA session. |

### Defaults

By default, information is displayed for all SAA sessions.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the *string* or **descr** *description* parameter to display information for a specific SAA.
- Use the **owner** *saa\_owner* parameter to display only those sessions initiated by a specific owner. The owner of an SAA session is not user configurable, but identifies the entity that created the session.
- When an SAA is created, an owner name is assigned to the agent. This name is based on the Alcatel-Lucent Enterprise application that generated the SAA and is not configurable. For example:
  - CLI SAA owner name = “USER”
  - OmniVista owner name = “OV”
  - Shortest Path Bridging owner name = “SPB” (SAA ID is SPB-*bvlan-bmac*)

### Examples

```
-> show saa
Legend: eth-lb = ethoam-loopback
 eth-dmm = ethoam-two-way-delay
 jitter-calculation = Default
SAA Owner Type Status Interval Time of Last Run Last Run Description
-----+-----+-----+-----+-----+-----+-----+-----
SPB-4000-e8-e7-32-07-98-cd SPB mac-ping started 1 2013-03-06,18:01:35.0 success DEFAULT
Saa20 USER ip-ping started 130 2013-01-15,09:31:53.0 success DEFAULT
```

```

Saa31 USER ip-ping started 180 2013-01-12,21:30:05.0 failed DC1
Saa90 USER eth-lb stopped 150 NOT RUN undetermined DC5
Saa95 USER eth-lb stopped 300 2013-01-6,11:31:53.0 success EthLB
-> show saa SPB-4000-e8-e7-32-07-98-cd owner spb

```

```

Legend: eth-lb = ethoam-loopback
 eth-dmm = ethoam-two-way-delay

```

```

SAA Owner Type Status Interval Time of Last Run Last Run Description
 (min) Result
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
SPB-4000-e8-e7-32-07-98-cd SPB mac-ping started 1 2013-03-06,18:01:35.0 success DEFAULT

```

```

-> vrf vrf3 show saa

```

## show saa type config

Displays the SAA configuration for the specified SAA type.

```
[vrf vrf_name] show saa [string] type {mac-ping | ip-ping | ethoam-loopback | ethoam-two-way-delay} config
```

---

### Syntax Definitions

|                             |                                       |
|-----------------------------|---------------------------------------|
| <i>vrf_name</i>             | The name of an existing VRF instance. |
| <i>string</i>               | An existing SAA ID.                   |
| <b>mac-ping</b>             | Displays MAC Ping SAAs.               |
| <b>ip-ping</b>              | Displays IP Ping SAAs.                |
| <b>ethoam-loopback</b>      | Displays ETH-LB SAAs.                 |
| <b>ethoam-two-way-delay</b> | Displays ETH-DMM SAAs.                |

### Defaults

By default, all SAAs with the specified type are displayed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the *string* parameter to display information for a specific SAA
- If the SAA ID string specified does not match the specified SAA type, the CLI will return an error.
- If a specific VRF is specified, the IP ping sessions for that VRF is displayed.

### Examples

```
-> show saa type ip-ping config

### Usage Guidelines

This command displays the SAA parameters that are applied to SPB SAA sessions. Use the **show saa** command to get specific session status and information.

### Examples

```
-> show saa spb
```

```
SPB creation parameters:
```

```
Auto-create : Disabled,
Auto-start : Disabled,
Interval(minutes) : 150,
Jitter Threshold (ms) : 0,
RTT Threshold (ms) : 0,
Payload-Size (bytes) : 32,
Num-pkts : 5,
Inter-pkt-delay : 1000,
Keep : Disabled,
Data : ""
```

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> show saa xml
```

XML file creation parameters:

```
Admin status : Disabled,
File : saa.xml,
Interval : 20
```

#### *output definitions*

---

|                     |                                                                                  |
|---------------------|----------------------------------------------------------------------------------|
| <b>Admin status</b> | The status (Enabled or Disabled) of SAA XML history file generation.             |
| <b>File</b>         | The name of the XML file to which SAA writes session history entries.            |
| <b>Interval</b>     | The amount of time, in minutes, between each generation of the XML history file. |

---

### Release History

Release 7.3.2; command was introduced.

## Related Commands

[saa xml](#)

Configures SAA XML file generation parameters.

## MIB Objects

```
alaSaaXmlFeature
 alaSaaXmlStatus
 alaSaaXmlFilename
 alaSaaXmlInterval
```

---

## show saa statistics

Display SAA statistics.

```
[vrf vrf_name] show saa [string] statistics [aggregate | history]
```

---

### Syntax Definitions

|                  |                                                   |
|------------------|---------------------------------------------------|
| <i>vrf_name</i>  | The name of an existing VRF instance.             |
| <i>string</i>    | An existing SAA ID string.                        |
| <b>aggregate</b> | Displays aggregate results for the specified SAA. |
| <b>history</b>   | Displays a results history for the specified SAA. |

### Defaults

By default, statistics are displayed for all SAAs and only for the most recent SAA test run.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If the **aggregate** parameter is specified, then only the aggregate results are displayed.
- If the **history** parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the **history** option displays only the last five iterations of each SAA test.
- Specify the SAA ID to display statistics for a specific SAA.
- Statistics and history do not persist across a switch reboot or takeover.

### Examples

```
-> show saa statistics
Legend: eth-lb = ethoam-loopback
 eth-dmm = ethoam-two-way-delay
 - = Delay or jitter value not available
```

```
Aggregate Record:

# 60 CMM Commands

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

*Filename:* ALCATEL-IND1-CHASSIS-MIB.mib  
*Module:* alcatelIND1ChassisMIB

*Filename:* ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS.mib  
*Module:* alcatelIND1ConfigMgrMIB

A summary of available commands is listed here:

---

**reload secondary**  
**reload slot**  
**reload all**  
**reload from**  
**issu from**  
**issu slot**  
**write memory**  
**reload chassis-id**  
**copy certified**  
**copy running certified**  
**modify running-directory**  
**copy flash-synchro**  
**takeover**  
**show running-directory**  
**show reload**  
**show microcode**  
**show issu status**  
**usb**  
**usb backup admin-state**  
**usb auto-copy**  
**mount**  
**umount**  
**show usb statistics**  
**auto-config-abort**  
**image integrity check**  
**image integrity get-key**

---

## reload secondary

Reloads the secondary CMM from the *certified* directory.

**reload** [*chassis-id chassis*] **secondary** [*in* [*hours:*] *minutes* | *at* *hour:minute* [*month day* | *day month*]]

**reload secondary cancel**

---

### Syntax Definitions

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>                             | The chassis identifier.                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>in</i> [ <i>hours:</i> ] <i>minutes</i> | Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.                                                                                                                                                                                                                                             |
| <i>at</i> <i>hour:minute</i>               | Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day. |
| <i>month day</i>   <i>day month</i>        | The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.                                                                                                                                                                                                                                                  |
| <b>cancel</b>                              | Cancels a pending time delayed reboot.                                                                                                                                                                                                                                                                                                                                                                          |

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

### Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### reload from

Reloads both CMMs from the specified directory.

## MIB Objects

```
chasEntPhysicalTable
 csEntPhysicalIndex
 chasEntPhysAdminStatus
chasControlRedundantTable
 chasControlDelayedRebootTimer
```

---

## reload all

Reloads both Chassis Management Modules (CMMs) from the *certified* directory.

**reload** [**chassis-id** *chassis*] **all** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* | *day month*]]

**reload all cancel**

---

### Syntax Definitions

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>                             | The chassis identifier.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>in</b> [ <i>hours:</i> ] <i>minutes</i> | Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.                                                                                                                                                                                                                                                                      |
| <b>at</b> <i>hour:minute</i>               | Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day. |
| <i>month day</i>   <i>day month</i>        | The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.                                                                                                                                                                                                 |
| <b>cancel</b>                              | Cancels a pending time delayed reload.                                                                                                                                                                                                                                                                                                                                                                         |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Can be issued from the Primary CMM only.

### Examples

```
-> reload all
-> reload all in 1:30
-> reload all at 12:00 july 25
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[reload slot](#) Reloads a specific NI module.

## MIB Objects

```
chasEntPhysicalTable
 chasEntPhysAdminStatus
chasGlobalControl
 chasGlobalControlDelayedResetAll
```

---

## reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

**reload** [**chassis-id** *chassis*] **from** *image\_dir* {**rollback-timeout** *minutes* | **no rollback-timeout** [**in** [*hours:*] *minutes* | **at** *hour:minute*] [**redundancy-time** *minutes*]}

---

### Syntax Definitions

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>                             | The chassis identifier when running in virtual chassis mode.                                                                                                                                                                                                                                                                                                                                    |
| <i>image_dir</i>                           | The directory that contains the image files to be loaded onto the switch.                                                                                                                                                                                                                                                                                                                       |
| <b>rollback-timeout</b> <i>minutes</i>     | Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the <i>certified</i> directory. The valid range of rollback timeout minutes is 1–15.                                                                                                                                |
| <b>no rollback-timeout</b>                 | Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.                                                                                                                                                                                                                            |
| <b>in</b> [ <i>hours:</i> ] <i>minutes</i> | Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.                                                                                                                                                                                                                                                               |
| <b>at</b> <i>hour:minute</i>               | Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day. |
| <b>redundancy-time</b> <i>minutes</i>      | Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the <i>certified</i> directory.                                                                                                                                                                                                         |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Can be issued from Primary CMM only.

- This command is used to reload the switch from the specified directory.
- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.
- The image directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.
- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the **certified** directory. The reboot can be halted by issuing a cancel order as described in the **reload all** command.
- If the **redundancy-time** parameter is entered, any reboot of the Primary CMM prior to the redundancy timer expiring will cause the switch to reboot. If the Primary CMM reboots after the redundancy timer expires, the secondary CMM will take over without a reboot.

## Examples

```
-> reload from working rollback-timeout 5
-> reload from working no rollback-timeout
-> reload from working no rollback-timeout in 50
-> reload from working rollback-timeout 10 at 12:50
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**reload all** Reboots both CMMs from the *certified* directory.

## MIB Objects

```
chasControlModuleTable
 chasControl
 chasControlVersionMngt
 chasControlActivateTimeout
 chasControlRedundancyTime
 chasControlDelayedActivateTimer
 chasControlWorkingVersion
 chasControlNextRunningVersion
```

---

## reload slot

Reloads the NI in the specified slot using the current running image.

**reload slot** *chassis/slot*

---

### Syntax Definitions

|                |                                 |
|----------------|---------------------------------|
| <i>chassis</i> | The chassis identifier.         |
| <i>slot</i>    | The slot number to be reloaded. |

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Can be issued from Primary CMM only.

### Examples

```
-> reload slot 1/2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[reload from](#) Reloads both CMMs from the specified directory.

### MIB Objects

chasEntPhysicalTable  
  chasEntPhysAdminStatus

---

## reload chassis-id

Reloads the specified chassis id when running in virtual chassis mode.

**reload chassis-id** *chassis* [**all**] [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* | *day month*]]

**reload chassis-id cancel**

---

### Syntax Definitions

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i>                             | The chassis identifier.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>in</b> [ <i>hours:</i> ] <i>minutes</i> | Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.                                                                                                                                                                                                                                             |
| <b>at</b> <i>hour:minute</i>               | Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day. |
| <i>month day</i>   <i>day month</i>        | The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.                                                                                                                                                                                                                                                  |
| <b>cancel</b>                              | Cancels a pending time delayed reboot.                                                                                                                                                                                                                                                                                                                                                                          |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

### Examples

```
-> reload chassis-id 1
-> reload chassis-id 1 in 15:25
-> reload chassis-id 1 at 15:25 august 10
```

```
-> reload chassis-id 1 at 15:25 10 august
-> reload chassis-id 1 cancel
```

## Release History

Release 7.3.1; command introduced.

## Related Commands

**reload from** Reloads both CMMs from the specified directory.

## MIB Objects

```
chasEntPhysicalTable
 csEntPhysicalIndex
 chasEntPhysAdminStatus
chasControlRedundantTable
 chasControlDelayedRebootTimer
```

---

## copy certified

Copies the contents of the *certified* directory to the specified directory.

**copy certified** *image\_dir* [**make-running-directory**]

---

### Syntax Definitions

*image\_dir*

The directory that the contents of the *certified* directory will be copied to.

**make-running-directory**

Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Using the **make-running-directory** parameter changes the RUNNING DIRECTORY allowing changes to be saved using the **write memory** command.
- This command does not delete any extra files in the target directory.
- This command does not affect the synchronization status of the running configuration.
- To synchronize the running and saved configuration, use the **write memory** command.

### Examples

```
-> copy certified mydir
-> copy certified mydir make-running-directory
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

## MIB Objects

```
chasControlModuleTable
 chasControlVersionMngt
 chasControlWorkingVersion
```

---

## issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

**issu from** *image\_dir* [**redundancy-time** *minutes*]

---

### Syntax Definitions

*image\_dir* Specifies the pathname for the directory that contains the image files.  
**redundancy-time** *minutes* This parameter is not supported with the **issu** command.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The new code must support ISSU with the current running version of code.
- A text file named '*issu\_version*' is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

### Examples

```
-> issu from myissu
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[issu slot](#) Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

### MIB Objects

```
chasControlWorkingVersion
chasControlRedundancyTime
```

---

## issu slot

Causes a reset of the NI in the specified slot after an ISSU upgrade.

**issu slot** *num*

---

### Syntax Definitions

*num* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | No   | No    | No   | No   | No              | No                                                            | Yes  |

### Usage Guidelines

Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

### Examples

```
-> issu slot 2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[issu from](#) Upgrades the system with the images stored in the specified directory without disruption to traffic.

### MIB Objects

```
chasEntPhysicalTable
 entPhysicalIndex
```

---

## write memory

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

**write memory [flash-synchro]**

---

### Syntax Definitions

**flash-synchro** Synchronizes the primary and secondary CMM.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM certified directory.
- This command is only valid if the switch isn't running from the *certified* directory. Use the [show running-directory](#) command to check where the switch is running from.
- During flash synchronization configuration changes may time out causing error messages to be displayed. Once the synchronization is complete configuration changes can resume.

### Examples

```
-> write memory
-> write memory flash-synchro
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****[copy flash-synchro](#)**

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

**MIB Objects**

configManager

configWriteMemory

---

## copy running certified

Copies the current RUNNING DIRECTORY configuration to the *certified* directory on both CMMs.

**copy running certified [flash-synchro]**

---

### Syntax Definitions

**flash-synchro** Synchronizes the primary and secondary CMM.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- This command is used to overwrite the contents of the *certified* directory with the configuration from the RUNNING DIRECTORY. This should only be done if the running configuration has been verified.
- This command only synchronizes the image and configuration files in the RUNNING DIRECTORY, no other directories, such as the **switch** or **network** directories, are synchronized.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM *certified* directory. Beginning in 7.3.1 the flash-synchro functionality is done automatically; entering the **flash-synchro** parameter is no longer required.
- In 7.3.3 the flash-synchro parameter will display an error on the OS6900 if there is no secondary CMM.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the *certified* directory. To view where the switch is running from, see the **show running-directory** command.
- This command may take up to two minutes to complete.

### Examples

```
-> copy running certified
```

## Release History

Release 7.1.1; command introduced.

Release 7.3.1; **flash-synchro** parameter no affect; the functionality is performed automatically.

## Related Commands

### [copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

## MIB Objects

```
chasControlModuleTable
 chasControlVersionMngt
 chasControlWorkingVersion
```

---

## modify running-directory

Changes the RUNNING DIRECTORY to the specified directory.

**modify running-directory** *image\_dir*

---

### Syntax Definitions

*image\_dir*

The directory name to become the new RUNNING DIRECTORY.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use this command to change the RUNNING DIRECTORY and allow configuration changes to be saved to the new RUNNING DIRECTORY.

### Examples

```
-> modify running-directory user-config1
-> write memory
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[write memory](#)

Copies the running primary RAM version of the CMM software to the RUNNING DIRECTORY.

### MIB Objects

chasControlModuleTable  
CurrentRunningVersion

---

## copy flash-synchro

Copies the *certified* directory version of the primary CMM software to the *certified* directory of the secondary CMM.

**copy flash-synchro**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- This command is used to synchronize the *certified* directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.
- This command is a shorter version of the ‘**copy running certified flash-synchro**’ command. Beginning in 7.3.1 the flash-synchro functionality is done automatically; this command is no longer required.

### Examples

```
-> copy flash-synchro
-> configure copy flash-synchro
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [copy running certified](#)

Copies the RUNNING DIRECTORY configuration to the *certified* directory on the primary CMM.

### MIB Objects

```
chasControlModuleTable
 chasControlVersionMngt
```

---

## takeover

Forces the current secondary CMM to assume the role of the primary CMM.

**takeover** [*chassis*]

---

### Syntax Definitions

*chassis*                                The chassis identifier.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- This command causes the secondary CMM to take over the functions of the primary CMM. After this command, the old primary CMM is the new secondary CMM.
- Be sure that the secondary CMM has all software (i.e., image and configuration files) required to continue CMM operations, before issuing the **takeover** command.
- For information on synchronizing the primary and secondary CMM software before issuing the **takeover** command, see the [copy flash-synchro](#) command.

### Examples

```
-> takeover
```

### Release History

Release 7.1.1; command introduced.

### Related Command

[reload all](#)                                Reboots the switch.

### MIB Objects

chasEntPhysicalTable  
    chasEntPhysAdminStatus

---

## show running-directory

Shows the current state of version and configuration management for a CMM.

**show running-directory**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Once a switch boots up and is running, it runs either from the *working*, *certified*, or a *user-defined* directory. If the switch is running from the *certified* directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.
- Depending on the switch configuration there may be a small delay before the information is displayed.

### Examples

```
-> show running-directory
```

```
CONFIGURATION STATUS
 Running CMM : PRIMARY,
 CMM Mode : MONO CMM,
 Current CMM Slot : A,
 Running configuration : CERTIFIED,
 Certify/Restore Status : CERTIFIED,
SYNCHRONIZATION STATUS
 Flash Between CMMs : SYNCHRONIZED
 Running Configuration : SYNCHRONIZED
BOOT STATUS
 Machine State : SHUTDOWN
```

#### output definitions

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot is going to occur.
- If the **reload from** command is used, and a rollback timeout is set, the rollback occurs and is shown using the **show reload** command.

### Examples

```
-> show reload status
Primary Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [reload secondary](#)

Reboots the primary or secondary CMM to its startup software configuration.

### [reload from](#)

Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

## MIB Objects

    chasControlDelayedActivateTimer

chasGlobalControl

    chasGlobalControlDelayedResetAll

---

## show microcode

Displays microcode versions installed on the switch.

**show microcode** [**working** | **certified** | **loaded** | **issu** | *image\_dir*]

---

### Syntax Definitions

|                  |                                                                   |
|------------------|-------------------------------------------------------------------|
| <b>working</b>   | Specifies the <i>working</i> directory.                           |
| <b>certified</b> | The chassis identifier when running in virtual chassis mode.      |
| <b>loaded</b>    | Specifies the loaded (i.e., currently-active) microcode versions. |
| <b>issu</b>      | Specifies the <i>issu</i> directory.                              |
| <i>image_dir</i> | Specifies the <i>user-defined</i> directory.                      |

### Defaults

| parameter        | default       |
|------------------|---------------|
| <i>microcode</i> | <b>loaded</b> |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If no additional parameters are entered the command defaults to the **loaded** parameter and the currently active microcode information is displayed.
- If a different version of code than the currently active version is copied to the RUNNING directory the image will be marked as 'Stale'.

### Examples

```
-> show microcode
Package Release Size Description
-----+-----+-----+-----
Ros.img 7.1.1.403.R01 1828255 Alcatel-Lucent OS
Reni.img 7.1.1.403.R01 1359435 Alcatel-Lucent NI
```

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

- If an Alcatel-Lucent Enterprise certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

### Examples

```
-> usb enable
-> cp /flash/working/boot.cfg /uflash/boot.cfg
-> ls /uflash
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****usb auto-copy**

## usb backup admin-state

Enables or disables USB backup on the switch.

```
usb backup admin-state {enable | disable} {[key string | hash-key string [bootable]}
```

---

### Syntax Definitions

|                 |                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>   | Enables Administrative control to USB backup on the switch                                                                        |
| <b>disable</b>  | Disables Administrative control to USB backup on the switch                                                                       |
| <b>key</b>      | Keyword which will be used for encryption. <i>This parameter is only supported on the OmniSwitch 6465.</i>                        |
| <b>hash-key</b> | Keyword which will be decrypted and then used for encryption. <i>This parameter is only supported on the OmniSwitch 6465.</i>     |
| <b>bootable</b> | Keyword which will enable the advanced backup. <i>This parameter is only supported on the OmniSwitch 6465 and OmniSwitch 6865</i> |

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

- When this command is enabled, the images and configuration from certified and running directories are copied into `/uflash/6860/certified` and `/uflash/6860/running` directories.
- When **write memory** is executed and backup is enabled, the configuration files from `/flash/running-directory` are copied to `/uflash/6860/running-directory name`
- When **usb backup admin-state** is enabled and **copy running certified** and **write memory flash-synchro** commands are executed, the configuration and images from `/flash/certified` will be copied to `/uflash/6860/certified`.
- If the image files are manually deleted from `/uflash` after a backup subsequent 'write memory flash-synchro' commands will not copy the image files `/uflash` again. Use the **usb backup** command to disable and re-enable usb backup and copy the image files to `/uflash` again.

- Encryption is supported only on the OmniSwitch 6465.
  - When a key or hash key is specified, all of the configuration files and images will be encrypted and copied to the USB device.
  - If a key or hash key is not specified, all of the configuration files and images will be copied as is to the USB device.
  - Maximum length of key should be 32 characters. Minimum key length should be 8 characters.
  - If the user has gone through one back up cycle of encryption and wants to disable encryption, then the user must disable the USB back up and enable it again with no password.
- On the OmniSwitch 6465, when power supply configurations are added by the **powersupply enable** command, the power supply configurations are backed up in */uflash/6465/system* folder when backup is enabled.
- Back-up cannot be enabled if auto-copy is enabled and auto-copy cannot be enabled if back-up is enabled. So only one of these features can be enabled at any given time.
- The **bootable** option is used to indicate advanced backup. The advanced backup is supported only on OmniSwitch 6465 and OmniSwitch 6865 platforms.
- When **bootable** option is enabled:-
  - The images from certified and running directories are copied into */uflash/6465/certified* and */uflash/6465/running* directories as the existing USB backup.
  - Compress the files (along with directory path) and use it for switch operation located in */flash* to a tar file, then encrypt it with input key / hash-key as “**configuration.tar.enc**” and copy the output file to */uflash/6465* directory.

## Examples

```
-> usb backup admin-state enable
-> usb backup admin-state disable
-> usb backup admin-state enable key "abc12345"
-> usb backup admin-state enable hash-key "a05234d"
-> usb backup admin-state enable key "abc12345" bootable
-> usb backup admin-state enable hash-key "a05234d" bootable
```

## Release History

Release 8.5R1; command was introduced.

Release 8.5R2; **key** and **hash-key** parameter added.

Release 8.8R1; **bootable** parameter added.

### Syntax Definitions

|                 |                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>   | Enables Administrative control to USB auto copy on the switch                                                                 |
| <b>disable</b>  | Disables Administrative control to USB auto copy on the switch                                                                |
| <b>key</b>      | Keyword which will be used for encryption. <i>This parameter is only supported on the OmniSwitch 6465.</i>                    |
| <b>hash-key</b> | Keyword which will be decrypted and then used for encryption. <i>This parameter is only supported on the OmniSwitch 6465.</i> |

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

- If the automatic copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/6465/working* or */uflash/6860/working* directory to be copied to the */flash/working* directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.
- If **copy-config** is enabled, configuration files will also be copied in addition to image files to the */flash/working* directory from */uflash/6860/working* directory.

- Encryption is supported only on the OmniSwitch 6465.
  - When a key or hash key is specified, all of the configuration files and images will be decrypted and copied to the AOS flash.
  - If a key or hash key is not specified, all of the configuration files and images will be copied as is to the AOS flash.
  - Maximum length of key should be 32 characters. Minimum key length should be 8 characters.
- On the OmniSwitch 6465, when power supply configurations are added by the **powersupply enable** command, the power supply configurations are backed up in `/uflash/6465/system` folder when backup is enabled.
- Back-up cannot be enabled if auto-copy is enabled and auto-copy cannot be enabled if back-up is enabled. So only one of these features can be enabled at any given time.

## Examples

```
-> usb auto-copy enable copy-config enable
-> usb auto-copy enable copy-config disable
-> usb auto-copy enable copy-config enable key "abc12345"
-> usb auto-copy enable copy-config enable hash-key "a05234d"
```

## Release History

Release 7.1.1; command was introduced.

Release 8.5R1; **copy-config** parameter added.

Release 8.5R2; **key** and **hash-key** parameter added.

## Related Commands

|                               |                                                              |
|-------------------------------|--------------------------------------------------------------|
| <b>usb</b>                    | Enables access to the device connected to the USB interface. |
| <b>usb backup admin-state</b> | Enables or disables USB backup on the switch.                |

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use this command to stop the Automatic Remote Configuration download process.

### Examples

```
-> auto-config-abort
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

N/A

### MIB Objects

N/A

---

## image integrity check

Verifies whether the SHA256 hash key of an image file located in the specified directory matches the SHA256 hash key in the specified key file.

**image integrity check** *image\_dir* **key-file** *filename*

---

### Syntax Definitions

*image\_dir*

The directory on the switch that contains the image file to verify. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).

*filename*

The name of the file that contains the key for the image file in the specified directory. Enter the name of the key file or include the full path (for example, “hash.txt” or “/flash/hash.txt”).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If the name of the key file is specified without the directory path, the switch will look for the key file in the same directory specified for the image file.
- The following format is used to store the hash key values in the key file:  
Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

### Example

```
-> image integrity check /flash/working key-file /flash/hash.txt
This operation may take several minutes...
```

```
Success: Key matched.
```

### Release History

Release 8.3.1; command introduced.

**Related Commands****[image integrity get-key](#)**

Calculates and displays the SHA256 key for image files.

**MIB Objects**

```
systemServicesAction
systemServicesArg1
systemServicesArg2
```

---

## image integrity get-key

Displays the SHA256 hash key of the image present in the specified location.

**image integrity get-key** *image\_dir*

---

### Syntax Definitions

*image\_dir*                      The directory on the switch that contains the image file. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- When this command is entered, the SHA256 hash of the image files in the specified directory is calculated and displayed. It can be manually verified against the hash provided in the file.
- To store the hash key value in a text file that can be used with the **image file integrity check** command, use the following format:  
Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

### Example

```
-> image integrity get-key /working
This operation may take several minutes...
```

```
Image Name SHA256 Key
-----+-----
Uos.img c64d6b23312a6f9c4b99642b31ed0e87e600bce58d6fdd089d09e1f8077bd208
```

```
-> image integrity get-key /flash/certified
This operation may take several minutes...
```

```
Image Name SHA256 Key
-----+-----
Uos.img 3d4d488a73eb798325bacb5793ef0d67bdf377527278a6732270d3a4801bb44b
```

## Release History

Release 8.3.1; command introduced.

## Related Commands

### [image integrity check](#)

Verifies the SHA256 hash key for the image file matches the key specified in a text file.

## MIB Objects

```
systemServicesAction
systemServicesArg1
systemServicesArg2
```

# 61 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

---

**Additional Information.** Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

---

MIB information for the Chassis Management and Monitoring commands is as follows:

*Filename:* ALCATEL-IND1-CHASSIS-MIB.mib  
*Module:* alcatelIND1ChassisMIB

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

*Filename:* ALCATEL-IND1-CAPMAN-MIB.mib  
*Module:* alcatelIND1CapManMIB

A summary of available commands is listed here:

---

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>VFL Commands</b>                                                                   | <code>capability vfl-type</code><br><code>show capability vfl-type</code>                                                                                                                                                                                                                                                                   |

---

## system contact

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

**system contact** *text\_string*

---

### Syntax Definitions

*text\_string*

The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “Jean Smith Ext. 477 jsmith@company.com”.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"
-> system contact engineering-test@company.com
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

|                                  |                                                        |
|----------------------------------|--------------------------------------------------------|
| <b>system name</b>               | Modifies the current system name of the switch.        |
| <b>system location</b>           | Specifies the current physical location of the switch. |
| <b>capability trap-threshold</b> | Displays the basic system information for the switch.  |

**MIB Objects**

```
system
 systemContact
```

---

## system name

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

**system name** *text\_string*

---

### Syntax Definitions

*text\_string*

The new system name. The system name can range from 1 to 64 characters in length. No spaces are allowed in the system name.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Spaces are not allowed in the system name.
- The OmniSwitch can be configured with a DHCP client interface that allows the switch to dynamically obtain the system name (DHCP Option-12) from the DHCP server. The user-defined system name configuration (through CLI, WebView, SNMP) always gets priority over the DHCP server values. For more information on DHCP client options, refer to the “Configuring DHCP” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*, and “IP Commands” chapter of the *OmniSwitch AOS Release 8 CLI Reference Guide*.

### Examples

```
-> system name OmniSwitch6900
-> system name OS6900
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

|                                  |                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------|
| <b>system contact</b>            | Specifies the administrative contact of the switch (for example, an individual or a department). |
| <b>system location</b>           | Specifies the current physical location of the switch.                                           |
| <b>capability trap-threshold</b> | Displays the basic system information for the switch.                                            |

**MIB Objects**

```
system
 systemName
```

---

## system location

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

**system location** *text\_string*

---

### Syntax Definitions

*text\_string*

The physical location of the switch. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “NMS Test Lab”.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> system location "NMS Test Lab"
-> system location TestLab
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

|                                  |                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------|
| <b>system contact</b>            | Specifies the administrative contact of the switch (for example, an individual or a department). |

| <b>capability trap-threshold</b> | Displays the basic system information for the switch.                                            |

**MIB Objects**

```
system
 systemLocation
```

---

## system date

Displays or modifies the current system date on the switch.

**system date** [*mm/dd/yyyy*]

---

### Syntax Definitions

*mm/dd/yyyy*

The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the [system timezone command on page 61-14](#).

### Examples

```
-> system date 08/08/2010
-> system date
08/08/2010
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****system time**

Displays or modifies the current system time on the switch.

**system timezone**

Displays or modifies the time zone for the switch.

**MIB Objects**

systemServices

    systemServicesDate

---

## system time

Displays or modifies the switch current system time.

**system time** [*hh:mm:ss*]

---

### Syntax Definitions

*hh:mm:ss*

The new time specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If a new system time is not specified in the command line, the current system time is displayed.
- Setting the year to 1970 is not supported. The system interprets 1970 as meaning the internal clock has never been set and will reset to the year 2014.
- The OmniSwitch 6360 does not contain a real-time clock.
  - It is recommended to use NTP to ensure time synchronization on an OmniSwitch 6360.
  - When the switch is reset, the switch will boot up from an approximation of the last known good time.
  - When the switch is powered off, it cannot detect the time left in the powered off state. When it boots up, it will have the same time as when the switch was last powered off.

### Examples

```
-> system time 14:30:00
-> system time
14:30:08
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****system date**

Displays or modifies the current system date on the switch.

**system timezone**

Displays or modifies the time zone for the switch.

**MIB Objects**

systemServices

    systemServicesTime

---

## system timezone

Displays or modifies the time zone for the switch.

**system timezone** [*timezone\_abbrev*]

---

### Syntax Definitions

*timezone\_abbrev*

Specifies a time zone for the switch and sets the system clock to run on UTC. If a time zone abbreviation is specified, the hours offset from UTC is automatically calculated by the switch.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax **system timezone**.
- If the configured timezone supports DST, it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST, it is automatically disabled and cannot be enabled.
- The OmniSwitch can be configured with a DHCP client interface that allows the switch to dynamically obtain the time zone (DHCP Option-2) from the DHCP server. The user-defined time zone configuration (through CLI, WebView, SNMP) always gets priority over the DHCP server values. For more information on DHCP client options, refer to the “Configuring DHCP” chapter of the *OmniSwitch AOS Release 8 Network Configuration Guide*, and “IP Commands” chapter of the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of time zone abbreviations.

### Examples

```
-> system timezone mst
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**system date**

Displays or modifies the current system date on the switch.

**system time**

Displays or modifies the current system time on the switch.

## MIB Objects

systemServices

```
systemServicesTimezone
systemServicesTimezoneStartWeek
systemServicesTimezoneStartDay
systemServicesTimezoneStartMonth
systemServicesTimezoneStartTime
systemServicesTimezoneOffset
systemServicesTimezoneEndWeek

| <code>system time</code>     | Displays or modifies the current system time on the switch. |
| <code>system timezone</code> | Displays or modifies the timezone for the switch.           |
| <code>system date</code>     | Displays or modifies the current system date on the switch. |

## MIB Objects

```
systemServices
 systemServicesTimezone
 systemServicesEnableDST
```

---

## update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

```
update uboot {cmm slot | ni {all | slot} file filename}
```

---

### Syntax Definitions

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| <b>cmm</b>      | Specifies that the update is performed for the Chassis Management Module (CMM). |
| <b>all</b>      | Specifies that the update is performed for all slots within a chassis.          |
| <i>slot</i>     | Specifies the slot number of the module within a chassis.                       |
| <i>filename</i> | Specifies the path and name of the upgrade file.                                |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | No    | Yes  | Yes  | No              | No                                                            | Yes  |

### Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

### Examples

```
-> update uboot ni all file 9999.tar.gz
-> update uboot cmm 1 file /flash/temp/9999.tar.gz
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[reload slot](#) Reloads the specified NI module.

### MIB Objects

## update fpga-cpld

Updates the FPGA/CPLD versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

**update fpga-cpld** {**cmm** {**all** | *chassis/cmm*} | **ni** {**all** | *chassis/ni* | **daughter num**} [**power**] **file filename**}

---

### Syntax Definitions

|                   |                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------|
| <b>cmm</b>        | Specifies that the update is performed for the Chassis Management Module (CMM).            |
| <b>daughter</b>   | Specifies the number of the daughter board on the NI module.                               |
| <b>power</b>      | Specifies to update the power version. ( <i>Supported on CMM2 and OS99-CNI-U20 only.</i> ) |
| <i>chassis/ni</i> | Specifies the chassis and slot number of the module.                                       |
| <i>filename</i>   | Specifies the path and name of the upgrade file.                                           |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.
- When updating CMMs with the **all** option an “fpga\_kit” file must be used. If upgrading a CMM using the *chassis/cmm* option, a “vme” file must be used.
- A \*.updater file can be used for upgrading ONIE-based devices.
- Refer to the appropriate release notes for release specific file information.

### Examples

```
-> update fpga-cpld ni 4 file 9999.vme
-> update fpga-cpld cmm 1/1 file /flash/OS6865_U28X_CPLD_V11.vme
-> update fpga-cpld cmm all file fpga_kit_4960
-> update fpga-cpld cmm 1/1 file os6860n_p24m_p24z_maincpld_20220309.updater
-> update fpga-cpld cmm 1/1 power file fpga_kit_8405
```

## Release History

Release 7.1.1; command introduced.  
Release 7.3.4; **fpga** parameter changed to **fpga-cpld**.  
Release 8.9R3; **power** parameter added.

## Related Commands

**reload slot** Reloads the specified NI module.

## MIB Objects

```
systemServices
 systemServicesArg1
 systemServicesAction
```

---

## reload slot

Reloads or reboots a specified Network Interface (NI) module.

**reload slot** *slot*

---

### Syntax Definitions

*slot* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The **reload slot** command reboots only the specified NI. Other modules installed on the chassis, including primary and secondary CMMs, are not affected

### Examples

```
-> reload slot 2
```

### Release History

Release 7.1.1; command introduced.

 powerOff
```

---

## **powersupply enable**

Enables the power supply unit identified by the PSU-ID.

**powersupply enable** [*slot*]

**no powersupply enable** [*slot*]

---

### **Syntax Definitions**

*slot* Slot number of power supply.

### **Defaults**

N/A

### **Platforms Supported**

Not supported in this release.

### **Usage Guidelines**

N/A

### **Release History**

Release 7.1.1; command introduced.

### **Related Commands**

**power slot** Turns the power on or off for a specified Network Interface (NI) module.

### **MIB Objects**

N/A

---

## powersupply powersave

Enables the power saving functionality on the switch.

```
powersupply powersave {enable | disable}
```

---

### Syntax Definitions

**enable | disable** Enables or disables the power saving functionality.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | enable  |

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- When enabled unneeded power-supplies are shut down to conserve energy, only the power supplies required to provide N+1 redundancy remain on.
- If enabled and power is lost to all active power supplies simultaneously, the switch will lose power since N+1 redundancy applies only to the active power supplies.
- If the power-save mode is disabled, all available power supplies are switched on at all times.

### Examples

```
-> powersupply powersave disable
-> powersupply powersave enable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show powersupply](#) Displays the hardware information and current status for chassis power supplies.

### MIB Objects

```
chasEntPhysicalTable
chasEntPhysAdminStatus
```

---

## powersupply type

Configures the type of power supply that is connected to the chassis.

```
powersupply num name string type {ALE {xl-ac | lo-ac | hi-ac} | phoenix-contact {48VDC | 24VDC} | third-party wattage num} [chassis-id chassis_id]
```

---

### Syntax Definitions

|                                             |                                                            |
|---------------------------------------------|------------------------------------------------------------|
| <i>num</i>                                  | Power supply connector ID.                                 |
| <i>string</i>                               | The descriptive name of the power supply.                  |
| <b>xl-ac</b>   <b>lo-ac</b>   <b>hi-ac</b>  | The type of ALE power supply.                              |
| <b>phoenix-contact 48VDC</b>   <b>24VDC</b> | The type of Phoenix Contact power supply.                  |
| <b>third-party wattage</b> <i>num</i>       | The wattage value of the attached third-party power supply |

### Defaults

| parameter | default |
|-----------|---------|
| N/A       |         |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | No   | No    | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- The OmniSwitch 6465 cannot auto-detect the type of power supply connected. This command is used to configure the type of power supply that is connected.
- Refer to the OmniSwitch 6465 Hardware User Guide for chassis power requirements when using third-party power supplies.
- Refer to the OmniSwitch 6465 Hardware Users Guide for power supply specifications using the power supply part number mapping below. A power supply may be associated with multiple part numbers depending on ALE branding, ordering part number or manufacturer part number.
  - **lo-ac** (OS6465-BPN, PS-I75AC, SDR-75-48)
  - **hi-ac** (O6465-BPN-H, PS-I185AC-P, SDR-240-55)
  - **xl-ac** (OS6465-BPN-X, PS-I275AC-P, SDR-480-48)

### Examples

```
-> powersupply 1 name ALE-75W-ps1 type ale lo-ac
```

```
-> powersupply 2 name ALE-75W-ps2 type ale lo-ac
-> powersupply 1 name third-party-ps type third-party wattage 75
```

## Release History

Release 8.5 R1; command introduced.

## Related Commands

[show powersupply](#) Displays the hardware information and current status for chassis power supplies.

## MIB Objects

---

## hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

**hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}**

**hash-control extended no udp-tcp-port**

---

### Syntax Definitions

|                         |                                                                                    |
|-------------------------|------------------------------------------------------------------------------------|
| <b>brief</b>            | Sets hashing to brief mode.                                                        |
| <b>extended</b>         | Sets hashing to extended mode.                                                     |
| <b>udp-tcp-port</b>     | Sets extending hashing to use UDP/TCP ports.                                       |
| <b>enable   disable</b> | Enables or disables the load balancing of non-unicast traffic on a link aggregate. |

### Defaults

| parameter           | default                                                                      |
|---------------------|------------------------------------------------------------------------------|
| <b>hash-control</b> | brief (OS6465, OS6900)<br>extended (OS6560, OS6570M, OS6860, OS6865, OS9900) |
| <b>udp-tcp-port</b> | disabled                                                                     |
| <b>non-ucast</b>    | disabled                                                                     |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.

- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

### Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

### Release History

Release 7.2.1; command introduced.

### Related Commands

[show hash-control](#) Displays the current hash control setting for the switch.

```

---

## bluetooth

Enables or disables USB adapter with Bluetooth technology connectivity and configures the power level.

**bluetooth {admin-state [enable | disable] | transmit-power [low | high]}**

---

### Syntax Definitions

**enable | disable** Enables or disables USB adapter with Bluetooth technology connectivity.

**low | high** Configures the power level to low or high.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | enable  |
| low   high       | low     |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | No                                                            | No   |

### Usage Guidelines

This command will configure all USB adapters with Bluetooth technology in a virtual chassis.

### Examples

```
-> bluetooth admin-state enable
-> bluetooth transmit-power high
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

  systemServicesBluetoothTxPower

---

## capability profile

Configures the mode of the switch to be either *switch* or *router*.

**capability profile** {switch | router}

---

### Syntax Definitions

**switch** Configures the *switch* profile.  
**router** Configures the *router* profile.

### Defaults

| parameter       | default |
|-----------------|---------|
| switch   router | switch  |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | No   | Yes   | No   | X72  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Use this command to change the mode of a switch between *switch* and a *router*. This will adjust the L2 and L3 table entries based on the network requirements.
- The *switch* profile provides more L2 entries. The *router* profile provides more LPM entries. Refer to the Specifications Guide for details on the L2 and L3 entries.
- The switch must be rebooted for the configured profile to take effect.

### Examples

```
-> capability profile router
```

### Release History

Release 8.5R2; command was introduced.

**Related Commands****show capability profile**

Displays the active and configured profile settings.

**MIB Objects**

alaCapManProfile

    alaCapManProfileMode

---

## capability profile tcam mode

Configures the TCAM (Ternary Content Addressable Memory) mode of the switch to support source IPv6 filtering.

**capability profile tcam mode {source-ipv6 | dest-ipv6}**

---

### Syntax Definitions

**source-ipv6** Selects the source IPv6 (enhanced) mode.  
**dest-ipv6** Selects the destination IPv6 mode.

### Defaults

By default, the TCAM mode supports destination IPv6 filtering only; source IPv6 filtering is not allowed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | Yes  | Yes   | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Setting the TCAM mode to source IPv6 filtering is required to support DHCPv6 Snooping IPv6 source filtering on an OmniSwitch 6560 and OmniSwitch 6570M.
- When the TCAM mode is changed, a warning message is displayed (see command examples below).
- After the TCAM mode is changed and the configuration is saved with the **write memory** command, reboot the switch to activate the specified mode.
- When the TCAM mode is set to source IPv6 filtering, the TCAM will operate in an enhanced mode to support the use of source IPv6 conditions in QoS policy rules.
- The following functionality is *not* supported when the source IPv6 filtering mode is active:
  - Destination IPv6 source filtering.
  - ISSU
  - QoS anti-spoofing
  - Fewer QoS policy rules supported.

### Examples

```
-> capability profile tcam mode source-ipv6
WARNING: Source ipv6 tcam mode would not support : QoS policy with destination ipv6
address / destination network group / ipv6 Tcpflags.
Reboot is needed for the capability profile tcam mode to use source-ipv6
```

```
-> capability profile tcam mode dest-ipv6
WARNING: Destination ipv6 tcam mode would not support : QoS policy with source ipv6
address / source network group.
Reboot is needed for the capability profile tcam mode to use dest-ipv6
```

## Release History

- |                                                    |                                                                                                                              |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">dhcpv6-snooping ipv6-source-filter</a> | Configures the IPv6 source filtering capability for a port, link aggregate, or VLAN using the DHCPv6 Snooping binding table. |
| <a href="#">show tcam utilization detail</a>       | Displays additional TCAM usage information, such as application usage.                                                       |
| <a href="#">show capability profile</a>            | Displays the active and configured profile settings.                                                                         |

## MIB Objects

```
alaCapManProfile
 alaCapManProfileTcamMode
```

---

## capability trap-threshold

Configures the MAC and ARP table utilization high and low values for generating the associated traps.

**capability trap-threshold** {**MAC** | **ARP**} {**HIGH num** | **LOW num**}

---

### Syntax Definitions

**MAC** Configures the MAC table threshold.  
**ARP** Configures the ARP table threshold.

### Defaults

| parameter       | default |
|-----------------|---------|
| <b>HIGH num</b> | 95      |
| <b>LOW num</b>  | 90      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If the table utilization reaches the configured HIGH value a trap will be sent indicating the usage has reached the HIGH value. The trap will continue to be periodically sent until the usage drops below the configured HIGH value.
- Once the usage drops to the configured LOW value, a trap will be sent indicating the usage has dropped below the configured LOW value.
- The minimum LOW value is 5% and the maximum HIGH value is 95%. It is recommended to have a difference of at least 5% between LOW and HIGH values.

### Examples

```
-> capability trap-threshold ARP HIGH 90 LOW 80
-> capability trap-threshold MAC HIGH 88 LOW 80
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

**show capability trap-threshold** Displays the capability trap-threshold configured values.

---

## capability shared-vlan-learning

Enables or disables shared VLAN learning. When enabled (the default), this functionality provides system resources for a Private VLAN (PVLAN) configuration.

**capability shared-vlan-learning {enable | disable}**

---

### Syntax Definitions

|                |                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------|
| <b>enable</b>  | Shared VLAN learning is enabled to support PVLAN configuration.                                     |
| <b>disable</b> | Shared VLAN learning is disabled to free up system resources. PVLAN configuration is not available. |

### Defaults

---

| parameter        | default |
|------------------|---------|
| enable   disable | enable  |

---

### Platforms Supported

Not supported in this release.

### Usage Guidelines

A switch reboot is required whenever shared VLAN learning is enabled or disabled.

### Examples

```
-> capability shared-vlan-learning disable
-> capability shared-vlan-learning enable
```

### Release History

Release 8.7R2; command introduced.

### Related Commands

**show pvlan** Displays a list of PVLANS configured on the switch.

### MIB Objects

```
alaCapManSharedVlanLearningConfig
alaCapManSharedVlanLearning
```

---

## uboot access

Enables or disables the U-boot access.

**uboot access {enable | disable}**

---

### Syntax Definitions

**enable** Enable the U-boot access.  
**disable** Disable the U-boot access.

### Defaults

By default, U-boot access is enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | No    | Yes  | Yes  | No              | No                                                            | Yes  |

### Usage Guidelines

- Only the admin user can enable or disable the U-boot access.
- When the U-boot access is enabled, U-boot shell can be accessed with any key-press at AOS boot.
- When the U-boot access is disabled, any key-press at AOS boot does not allow access to U-boot shell. AOS images are booted with the pre-set parameters. If the AOS images are not valid or corrupted, switch goes to no response state, where only watch-dog reboots are possible. U-boot cannot start AOS and recover options cannot be used, as these options need U-boot access. In this case, the switch must be returned to the factory for repair as it cannot be recovered by the admin user.
- In case of VC, U-boot access configuration shall be synched to all the units of VC. The U-boot access configuration shall not be synched to any new unit (slave) joining the VC later. The U-boot access configuration must be applied before the new slave joins the VC or reapplied on the VC master after the new slave joins the VC.
- U-boot authentication feature does not have any effect, when U-boot access is disabled. When U-boot access enabled, it takes the latest authentication status.

### Examples

```
-> uboot access enable
-> uboot access disable
```

## Release History

Release 8.7R3; command introduced.

## Related Commands

[uboot authentication](#)

Enables or disables the U-boot authentication.

[show uboot config](#)

Displays the U-boot authentication status.

## MIB Objects

alaAaaU-bootAccess

---

## uboot authentication

Enables or disables the U-boot authentication.

**uboot authentication** {enable password *password* | disable}

---

### Syntax Definitions

**enable** Enable the U-boot authentication.

**disable** Disable the U-boot authentication.

*password* The U-boot password. The password can be between 8 to 30 characters.

### Defaults

By default, U-boot authentication is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | No    | Yes  | Yes  | No              | No                                                            | Yes  |

### Usage Guidelines

- When the authentication option is enabled, password input must be given. The U-boot shell is allowed to access only after authenticating with the password.
- Maximum of five retries are allowed for the U-boot password. If the user enters the wrong password for five times, U-boot will proceed with the normal AOS boot.
- U-boot does not prompt for the password if AOS has not enabled the U-boot authentication with a password.
- The U-boot password cannot be modified at the U-boot prompt. Only the admin user can modify or set the password using the U-boot authentication command. If the user forgets the password, user can continue to normal AOS boot. The admin user can then modify or reset the U-boot password.
- In case of VC, the U-boot authentication password must be applied before the new slave joins the VC or reapplied on the VC master after the new slave joins the VC.

### Examples

```
-> uboot authentication enable password abcd1234
-> uboot authentication disable
```

### Release History

Release 8.7R3; command introduced.

**Related Commands****uboot access**

## license apply file

Activates the license for licensed protocols on the switch.

**license apply** {file *file\_name* | key *license\_key*} [**order-id** *order\_id*]

---

### Syntax Definitions

|                    |                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>file_name</i>   | The name of the license file containing the license keys.                                                                               |
| <i>license_key</i> | Enter the individual license key. The license key can contain special characters, the key must encase using single quote character ("). |
| <i>order_id</i>    | The order ID for the MACsec license.                                                                                                    |

### Defaults

By default, licensed protocols are not activated on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The license file can have any name.
- The license file is only used to activate the licensed features and does not need to remain on the switch.
- Using **key** option, the license key can be directly entered in the command. The license key can contain special characters; it is required to encase the key using single quote character ("). The **key** input is needed only for applying MACsec license.
- Performance software license (OS6560-SW-PERF) is optional allowing ports 25/26 (OS6560-24X4/P24X4) and ports 49/50 (OS6560-48X4/P48X4) to operate at 10G speed. Ports support 1G by default. There is no reboot required after applying this license, but the ports should be administratively disabled and re-enabled.
- Performance software license (OS6360-SW-PERF) is optional allowing the two RJ45/SFP+ combo ports (25/26) of the OS6360-PH24 model to operate at 10G speed. Ports support 1G by default. There is no reboot required after applying this license, but the ports should be administratively disabled and re-enabled.
- The module type will continue to display as 'U16L' even after upgrading a 'U16' to a 'U16E'.
- The **order-id** parameter is mandatory for MACsec license but it is not applicable for other licenses.

- The MACsec license is a site license and does not use the serial number and the MAC address of the switch. However, **order-id** is required for the license generator to generate MACsec license. The order ID value entered in this command is validated against the order ID in the license file. If this value does not match with the value stored in license file, MACsec license will not be installed.
- The order ID is a seven digit number and the license generation process appends the digit 0 at the beginning implicitly. Hence, it is required to provide eight digits (0 + 7 digits of the order ID) to install the license successfully.
- The Metro license is created based on the generic Metro type (feature ID), this is based on MAC address and the serial number of the unit.
- Following features are part of Metro license: CPE Test Head, PPPoE-IA, Ethernet OAM, SAA, Link OAM, VLAN Stacking, Dynamic Proxy ARP, Hardware Loopback. Metro license is required to configure these features on the switch.
- The Metro license is applicable for all OmniSwitch 6560 and OmniSwitch 6570M, which support Metro feature. The Metro configuration will be rejected if the Metro license is not installed prior to configuration. On other platforms, Metro features does not require a license.
- The switch must be rebooted to reflect the licensed feature set. For MACsSec, 10G license, and Metro license, a reboot is not required.

## Examples

```
-> license apply file /flash/swlicense.txt
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y

-> license apply file \flash\swlicense.dat order-id "07766551"

-> license apply key 'hasJ-i{v!-[qVW-YPrt-t@YK' order-id "01234567"
```

## Release History

Release 7.2.1; command was introduced.  
Release 7.3.1; **key** and **deactivate** parameters deprecated.  
Release 8.6R1; MACsec site-wide license and OmniSwitch 6560 10-Gigabit port license support added.  
Release 8.6R2; **key** parameter added.  
Release 8.9R1; Metro license support added for OmniSwitch 6560.

```

---

### Syntax Definitions

|                   |                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <b>default</b>    | The server IP address belonging to the default VRF. <i>Currently, only default VRF is supported.</i>     |
| <i>vrf_name</i>   | The name of the VRF to which the server IP address belongs.                                              |
| <i>ip_address</i> | The IP address of the network switch where the SILOS functionality is enabled.                           |
| <i>num</i>        | Port number on which SILOS application communication would be allowed. The valid range is 1024 to 65535. |
| <b>enable</b>     | Administratively enable the status of the license server.                                                |
| <b>disable</b>    | Administratively disable the status of the license server.                                               |

### Defaults

| parameter               | default                     |
|-------------------------|-----------------------------|
| <b>enable   disable</b> | disable                     |
| <i>num</i>              | 8883                        |
| <i>ip_address</i>       | IP address on the localhost |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | No   | Yes   | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

Only default VRF is supported.

### Examples

```
-> license server ip-address 10.10.10.1 listen-port 27001 admin-state enable
```

```
-> license server ip-address 10.10.10.1 admin-state enable
```

## Release History

Release 8.9R3; command introduced.

alaSILOSBrokerConfigAdminState
```

---

## license server apply

Install site or node license on the SILOS.

```
license server apply {file file_name | key license_key}
```

---

### Syntax Definitions

|                    |                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>file_name</i>   | The name of the license file containing the site or node license keys.                                                 |
| <i>license_key</i> | The license key. The license key can contain special characters, the key must encase using single quote character ('). |

### Defaults

By default, no site or node licenses are activated in the SILOS running on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | No   | Yes   | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- The user needs to generate the site or node licenses on the License Portal, copy the license file or the key to the switch and install to the SILOS running on the switch.
- The license server can install multiple licenses of the same type to increase the number of supported sites or nodes on the server.

### Examples

```
-> license server apply file "/flash/license.txt"
```

```
-> license server apply key 'pMJJ-i22p-Ps0y-%ROh-UCAx-54{T-}NE1-hJQK'
```

### Release History

### Syntax Definitions

|                |                                                                                                |
|----------------|------------------------------------------------------------------------------------------------|
| <i>site_id</i> | Specify the site ID to remove all the licenses from all nodes using the corresponding site ID. |
| <i>node_ip</i> | Specify the node IP address to remove the license from the specified network IP.               |
| <i>node_id</i> | Specify the node ID to remove the license from the specified network node.                     |
| <b>mpls</b>    | Removes the MPLS license.                                                                      |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | No   | Yes   | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

To get the specific site ID or node IP address, use [show license-server usage](#) command. Also, use this command to verify that the node has been removed from SILOS.

### Examples

```
-> license server remove site blockA
```

```
-> license server remove node-ip 192.168.120.51
```

```
-> license server remove node-id test1 license mpls
```

### Release History

Release 8.9R3; command introduced.

|----------------------------------------|----------------------------------------------------------------------------|
| <code>show license-server</code>       | Displays the status of SILOS running on the switch.                        |
| <code>show license-server info</code>  | Displays the licenses installed in the SILOS.                              |
| <code>show license-server usage</code> | Displays the information related to sites or nodes connected to the SILOS. |

## MIB Objects

```
alaSILOSRemoveConfigTypeArg
alaSILOSRemoveConfigTypeArgIpAddr
alaSILOSRemoveConfigTypeArg
alaSILOSRemoveConfigFeature
```

---

## license client

Configure the site ID for the Switch License Client (SWLIC), set the SILOS IP address and port that can establish a connection to the SILOS.

```
license client {site-id site_id | server-ip ip_address [server-port num]}
```

---

### Syntax Definitions

|                   |                                                          |
|-------------------|----------------------------------------------------------|
| <i>site_id</i>    | The alphanumerical string to identify the site.          |
| <i>ip_address</i> | The IP address of the SILOS.                             |
| <i>num</i>        | Port number which is used to communicate with the SILOS. |

### Defaults

| parameter         | default                                   |
|-------------------|-------------------------------------------|
| <i>site_id</i>    | 'default', which indicates separate node. |
| <i>ip_address</i> | IP address on the localhost               |
| <i>num</i>        | 8883                                      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | No   | Yes   | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- If the site ID is not set before establishing the connection to SILOS, SWLIC will connect to SILOS as an separate node. [show license-client info](#) command output will display the site ID as 'default'.
- When changing the IP address or the port number of the SILOS in this command, the existing connection to the current SILOS will be disconnected and the connection to the new IP address will be established.

### Examples

```
-> license client site-id ABCBlock
-> license client site-id ABCBlock server-ip 10.120.0.120 server-port 27000
-> license client server-ip 10.120.0.122
```

alaSWLICBrokerConfigSiteIdala
SWLICBrokerConfigIpAddress
alaSWLICBrokerConfigPort
```

---

## license client remove

Remove the feature license received from the SILOS on the switch.

**license client remove {all | mpls}**

---

### Syntax Definitions

**all** Remove all the feature licenses received from the SILOS on the switch.  
**mpls** Remove MPLS feature license received from the SILOS on the switch.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | No   | Yes   | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

After removal of the license using this command, the system will check if the previous demo period is still available on the switch. If it is available, it will switch back to the demo period.

### Examples

```
-> license client remove mpls
```

```
-> license client remove all
```

### Release History

Release 8.9R3; command introduced.

### Related Commands

[show license-client info](#) Displays the configuration and status of the SWLIC.

### MIB Objects

alaSWLICLicenseRemoveFeature

---

## show system

Displays basic system information for the switch. Information includes a user-defined system description, name, administrative contact, location, object ID, up time, and system services.

**show system**

---

## show chassis

Displays the basic configuration and status information for the switch chassis.

**show chassis**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|             |             |             |              |             |              |             |             |                        |                                                                      |             |
|-------------|-------------|-------------|--------------|-------------|--------------|-------------|-------------|------------------------|----------------------------------------------------------------------|-------------|
| <b>6360</b> | <b>6465</b> | <b>6560</b> | <b>6570M</b> | <b>6860</b> | <b>6860N</b> | <b>6865</b> | <b>6900</b> | <b>6900</b><br>V72/C32 | <b>6900</b><br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | <b>9900</b> |
| Yes         | Yes         | Yes         | Yes          | Yes         | Yes          | Yes         | Yes         | Yes                    | Yes                                                                  | Yes         |

### Usage Guidelines

N/A

### Examples

```
-> show chassis
Local Chassis ID 1 (Master)
 Model Name: OS9900,
 Description: Chassis,
 Part Number: 903722-90,
 Hardware Revision: B,
 Serial Number: T4720029,
 Manufacture Date: Feb 1 2016,
 Admin Status: POWER ON,
 Operational Status: UP,
 Free Slots: 4,
 Power Left: 1540,
 Number Of Resets: 28,
 MAC Address: 2c:fa:a2:13:e4:02
```

|--------------------|----------------------------------------------------------------------------|
| <b>Model Name</b>  | The factory-set model name for the switch. This field cannot be modified.  |
| <b>Description</b> | The factory-set description for the switch. This field cannot be modified. |
| <b>Part Number</b> | The part number for the chassis.                                           |

---

*output definitions (continued)*

---

|                           |                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Hardware Revision</b>  | The hardware revision level for the chassis.                                                                                     |
| <b>Serial Number</b>      | The serial number for the chassis.                                                                                               |
| <b>Manufacture Date</b>   | The date the chassis was manufactured.                                                                                           |
| <b>Admin Status</b>       | The current power status of the chassis. Chassis information is obtained from a running CMM. Hence the value is always POWER ON. |
| <b>Operational Status</b> | The current operational status of the chassis.                                                                                   |
| <b>Free Slots</b>         | The number of free slots available for NIs.                                                                                      |
| <b>Power Left</b>         | The power remaining for additional NIs.                                                                                          |
| <b>Number of Resets</b>   | The number of times the CMM has been reset (reloaded or rebooted) since the last cold boot of the switch.                        |
| <b>MAC Address</b>        | The base MAC address of the chassis.                                                                                             |

## show cmm

Displays basic hardware and status information for the CMM modules in a standalone switch.

**show cmm** [*slot*]

---

### Syntax Definitions

*slot* Specifies the CMM by slot number or letter.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|             |             |             |              |             |              |             |             |                        |                                                                      |             |
|-------------|-------------|-------------|--------------|-------------|--------------|-------------|-------------|------------------------|----------------------------------------------------------------------|-------------|
| <b>6360</b> | <b>6465</b> | <b>6560</b> | <b>6570M</b> | <b>6860</b> | <b>6860N</b> | <b>6865</b> | <b>6900</b> | <b>6900</b><br>V72/C32 | <b>6900</b><br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | <b>9900</b> |
| Yes         | Yes         | Yes         | Yes          | Yes         | Yes          | Yes         | Yes         | Yes                    | Yes                                                                  | Yes         |

### Usage Guidelines

On chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B.

### Examples

```
-> show cmm
Chassis ID 1 Module in slot CMM-A
 Model Name: OS99-CMM,
 Module Type: 0x7100101,
 Description: MGMT MODULE,
 Part Number: 903754-90,
 Hardware Revision: C06,
 Serial Number: U1820028,
 Manufacture Date: May 10 2016,
 FPGA - Control: 2.0.0,
 FPGA - Power: 0.8,
 Admin Status: POWER ON,
 Operational Status: UP,
 Max Power: 64,
 CPU Model Type: Intel Atom C2518,
 MAC Address: 2c:fa:a2:13:e4:02,
 Coreboot Version: 8.3.1.103.R01
```

### output definitions

|-------------------|----------------------------------------------------|
| <b>Model Name</b> | The model name of the switch.                      |
| <b>Model Type</b> | A unique module ID specific to the type of module. |

*output definitions (continued)*

---

|                           |                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>        | A factory-defined description of the associated board.                                                               |
| <b>Part Number</b>        | The part number for the board.                                                                                       |
| <b>Hardware Revision</b>  | The hardware revision level for the board.                                                                           |
| <b>Serial Number</b>      | The serial number for the board.                                                                                     |
| <b>Manufacture Date</b>   | The date the board was manufactured.                                                                                 |
| <b>FPGA - Control</b>     | FPGA version.                                                                                                        |
| <b>FPGA - Power</b>       | FPGA version                                                                                                         |
| <b>Admin Status</b>       | The current power status of the CMM. Information is obtained from a running CMM. Hence the value is always POWER ON. |
| <b>Operational Status</b> | The current operational status of the CMM.                                                                           |
| <b>Max Power</b>          | The maximum power for the CMM.                                                                                       |
| <b>CPU Model Type</b>     | The CPU Model type.                                                                                                  |
| <b>MAC Address</b>        | The MAC address assigned to the chassis.                                                                             |
| <b>Coreboot Version</b>   | The boot version number for the CMM.                                                                                 |

---

**Release History**

## show slot

Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the chassis.

**show slot** [*slot*]

---

### Syntax Definitions

*slot* The slot number for a specific NI module installed in the chassis. If no slot number is specified, information for all the NI modules is displayed.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as 'UNKNOWN'.

### Examples

```
-> show slot 1
Module in slot 1
 Model Name: OS10-GNI-C48,
 Description: 10-1000 RJ45,
 Part Number: 902434-90,
 Hardware Revision: A07,
 Serial Number: H03Q0008,
 Manufacture Date: JAN 31 2007,
 FPGA - Physical 1: 007,
 Daughter FPGA - Physical 1: 002,
 Daughter FPGA - Physical 2: 002,
 Admin Status: POWER ON,
 Operational Status: UP,
 Power Consumption: 200,
 CPU Model Type : Motorola MPC854
 MAC Address: 00:d0:95:01:04:
 ASIC - Physical 1: BCM56620_A1,
 ASIC - Physical 2: BCM56620_A1,
 ASIC - Physical 3: BCM56620_A1,
 ASIC - Physical 4: BCM56620_A1,
```

```

ASIC - Physical 5: BCM56620_A1,
ASIC - Physical 6: BCM56620_A1,
UBOOT Version: 7.1.1.412.R01,

```

### output definitions

---

|                           |                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Model Name</b>         | The NI module name. For example, OS9-GNI-C24 indicates a twenty four-port 10/100/1000BaseT Ethernet module.                                                          |
| <b>Description</b>        | A general description of the NI. For example, 24pt 10/100/1000BaseT Mod indicates a twenty four-port 10/100/1000BaseT Ethernet module.                               |
| <b>Part Number</b>        | The part number for the NI.                                                                                                                                          |
| <b>Hardware Revision</b>  | The hardware revision level for the NI.                                                                                                                              |
| <b>Serial Number</b>      | The serial number for the NI printed circuit board (PCB).                                                                                                            |
| <b>Manufacture Date</b>   | The date the NI was manufactured.                                                                                                                                    |
| <b>FPGA/Daughter FPGA</b> | The FPGA versions.                                                                                                                                                   |
| <b>Admin Status</b>       | The current power status of the NI. Options include POWER ON or POWER OFF.                                                                                           |
| <b>Operational Status</b> | The operational status of the NI. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue. |
| <b>Power Consumption</b>  | The current power consumption for the module.                                                                                                                        |
| <b>CPU Model Type</b>     | The CPU model type.                                                                                                                                                  |
| <b>MAC Address</b>        | The MAC address assigned to the NI.                                                                                                                                  |
| <b>ASIC - Physical</b>    | General information regarding the NI module ASICs.                                                                                                                   |
| <b>UBOOT Version</b>      | UBOOT version of the NI.                                                                                                                                             |

## show module status

Displays the basic status information for either a specified module or all modules installed in a standalone switch chassis.

**show module status** [*slot*]

---

### Syntax Definitions

*slot* The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, information for all modules is displayed.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as 'UNKNOWN'.

### Examples

```
-> show module status
```

```

 Operational Firmware
Slot Status Admin-Status Rev MAC
-----+-----+-----+-----+-----
CMM-A UP POWER ON N/A 00:d0:95:a3:e5:09
SLOT-1 UP POWER ON N/A 00:d0:95:a3:e5:0b

```

### output definitions

---

## show powersupply

Displays the hardware information and current status for chassis power supplies.

**show powersupply** [*slot*]

---

### Syntax Definitions

**slot** The slot number for a specific power supply installed in the chassis. If no power supply number is specified, information for all power supplies is displayed.

**powersave status** Displays the status of the power saving functionality.

### Defaults

The OmniSwitch 6465 and 6570 cannot auto-detect the type of power supply connected and will not display a power supply that is not powered up. Use the **powersupply type** command on the OS6465 to manually configure a power supply.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

|                           |                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Model Name</b>         | The power supply model number.                                                                                      |
| <b>Description</b>        | A description of the associated power supply. This field reflects the model name in most cases.                     |
| <b>Part Number</b>        | The part number for the power supply.                                                                               |
| <b>Hardware Revision</b>  | The hardware revision level for the power supply.                                                                   |
| <b>Serial Number</b>      | The serial number for the power supply.                                                                             |
| <b>Manufacture Date</b>   | The date the power supply was manufactured.                                                                         |
| <b>Operational Status</b> | The operational status of the power supply. Options include UP or DOWN.                                             |
| <b>Power Provision</b>    | The number of watts provided by this power supply.                                                                  |
| <b>PS</b>                 | The slot number of the power supply.                                                                                |
| <b>Total Power</b>        | The number of watts provided by this power supply.                                                                  |
| <b>Power Used</b>         | The number of watts being used by this power supply.                                                                |
| <b>Input Voltage</b>      | The input line voltage of this power supply.                                                                        |
| <b>PS type</b>            | The type of power supply. AC or DC.                                                                                 |
| <b>Operational Status</b> | The operational status of the power supply. Options include UP, DOWN, or UNPLUG.                                    |
| <b>Location</b>           | The location of the power supply. Options include Internal or External. Slots 5-8 are for the optional power shelf. |
| <b>Airflow</b>            | Direction of airflow.                                                                                               |

---

### **Release History**

Release 7.1.1; command introduced.

**Related Commands**

- show chassis** Displays the basic configuration and status information for the switch chassis.
- powersupply type** Configures the type of power supply that is connected to the chassis.

**MIB Objects**N/A

---

## show fan

Displays the current operating status of chassis fans.

**show fan** [*slot*]

---

### Syntax Definitions

*slot* Specifies the slot number of the fantray.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

|---------------------|------------------------------------------------|
| <b>Chassis/Tray</b> | The chassis/Tray ID.                           |
| <b>Status</b>       | The current operational status of the fantray. |
| <b>Working Fans</b> | The number of working fans.                    |
| <b>Fan Load %</b>   | The load of the fantray.                       |

---

### Release History

Release 7.1.1; command introduced.

**Related Commands****show fantray**

Displays the current operating status of chassis fantrays.

**MIB Objects**N/A

---

## show temperature

Displays the internal operating temperature of the chassis, as well as current temperature threshold settings.

**show temperature** [*fabric* [*index*] | *slot* [*index*] | *fantray* [*index*] | *cmm* [*index* | *cmm\_letter*] | *chassis-id* *chassis*]

---

### Syntax Definitions

|                   |                               |
|-------------------|-------------------------------|
| <i>index</i>      | Specifies the index number.   |
| <i>cmm_letter</i> | Specifies the CMM letter.     |
| <i>chassis</i>    | The ID number of the chassis. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- This command displays the internal operating temperature, not the ambient temperature, of the current operating chassis as well as current temperature threshold settings.
- Refer to the appropriate *Hardware Users Guide* for detailed information about temperature thresholds for a specific OmniSwitch model.

### Examples

```
-> show temperature
Chassis/Device | Current | Range | Danger | Thresh | Status
-----+-----+-----+-----+-----+-----
1/CMMA | 48 | -45 to 93 | 98 | 93 | UNDER THRESHOLD
```

#### output definitions

---

|                       |                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------|
| <b>Chassis/Device</b> | The device being measured (CMM, Fabric, or NI)                                               |
| <b>Current</b>        | The current CPU temperature in Celsius.                                                      |
| <b>Range</b>          | The supported threshold range.                                                               |
| <b>Danger</b>         | The danger threshold value. This value is based on the switch model and is not configurable. |

*output definitions (continued)*

---

|               |                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Thresh</b> | The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user. |
| <b>Status</b> | Whether the current temperature has reached the threshold.                                                                                                                                     |

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.
- The module type will continue to display as 'U16L' even after upgrading a 'U16' to a 'U16E'.

### Examples

```
-> show license-info
```

| VC | device | License  | Type | Time (Days)<br>Remaining | Upgrade<br>Status | Expiration<br>Date |
|----|--------|----------|------|--------------------------|-------------------|--------------------|
| 1  | 0      | 10G      | PERM | NA                       | NA                | NA                 |
| 1  | 0      | MACSEC   | PERM | NA                       | NA                | NA                 |

---

## Release History

Release 8.1.1; command introduced.

## Related Commands

### **bluetooth**

Enables or disables a USB adapter with Bluetooth technology and configures the power level.

## MIB Objects

N/A

---

## show me

Executes an LED blink pattern for 10 seconds that is used by the USB adapter with Bluetooth technology to identify the connected switch.

show me

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guideline

Use this command in a virtual chassis to identify which switch currently has USB adapter with Bluetooth technology connectivity.

### Examples

```
-> show me
The Chassis ID LED will blink for 10 seconds.
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

#### bluetooth

Enables or disables a USB adapter with Bluetooth technology and configures the power level.

### MIB Objects

N/A

---

## show tcam utilization

Displays runtime information about the Ternary Content Addressable Memory (TCAM) utilization for each stage of each TCAM on each slot of the switch.

**show tcam utilization** [*chassis/slot*] [*chassis/slot/tcam*]

---

### Syntax Definitions

*chassis/slot* A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.

*chassis/slot/tcam* A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

### Defaults

By default, TCAM utilization is displayed for the entire switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | Yes   | No   | No   | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The utilization is represented in terms of the minimum-sized entry supported by the TCAM.
- On an OmniSwitch 6860N, utilization statistics for the EM stage will display if the resource is configured. If the resource is not configured, all statistics for EM will show as zero. On the other OmniSwitch platforms, EM statistics will always show as zero.
- This command replaces the **show qos slice** command on the supported OmniSwitch platforms listed above; the **show qos slice** command, however, is still available on the other OmniSwitch platforms.

### Examples

```
-> show tcam utilization
```

Legend:

C/S/T = Chassis/Slot/TCAM  
 PI = Pre-Ingress  
 I = Ingress  
 E = Egress  
 EM = ExactMatch

| C/S/T | Stage | Min-<br>entry- | Reserved<br>min-key- | Total<br>min-key- | Utilization |

---

## show tcam utilization detail

Displays the Ternary Content Addressable Memory (TCAM) utilization of each application (or application group) for each stage of each TCAM on each slot of the switch.

**show tcam utilization** [*chassis/slot*] [*chassis/slot/tcam*] **detail**

---

### Syntax Definitions

*chassis/slot* A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.

*chassis/slot/tcam* A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

### Defaults

By default, the detailed TCAM utilization is displayed for the entire switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

## show tcam app-groups

Displays the application groups and the applications that belong to each group within the context of Ternary Content Addressable Memory (TCAM) utilization.

**show tcam app-groups**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | No   | Yes   | No   | No   | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> show tcam app-groups
```

```

App-Group Name App Name

## show capability profile

Displays the active and configured profile settings.

**show capability profile**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | Yes  | Yes   | No   | Yes   | No   | X72  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- The switch must be rebooted for the configured profile to take effect.
- On the OmniSwitch 6900-V72/C32, and OmniSwitch 6900-X72, this command displays the configured and active mode to indicate if the switch is operating in the router or switch mode. The configured mode is changed using the **capability profile** command.
- On the OmniSwitch 6560 and OmniSwitch 6570M, this command displays the configured and active TCAM mode (source or destination IPv6 filtering). The configured TCAM mode is changed using the **capability profile tcam mode** command.

### Examples

Sample output on the OmniSwitch 6900-V72/C32, and OmniSwitch 6900-X72:

```
-> show capability profile
Configured Profile : Router
Active Profile : Switch
```

Sample output on the OmniSwitch 6560:

```
-> show capability profile
Configured TCAM Mode : dest-ipv6
Active TCAM mode : dest-ipv6
```

### Release History

Release 8.5R2; command introduced.

Release 8.6R1; TCAM mode display added.

## Related Commands

- capability profile** Configures the mode of the switch to be either switch or router.
- capability profile tcam mode** Configures the source IPv6 filtering or destination IPv6 filtering TCAM mode for the switch.

## MIB Objects

```
alaCapManProfile
 alaCapManProfileMode
alaCapManProfile
 alaCapManProfileTcamMode
```

---

## show pmd-files

Displays a list of PMD files generated on the switch.

**show pmd-files**

---

---

## show tech-support

Creates a log or tar file gathering important switch information that can be used by technical support.

**show tech-support [layer2 | layer3 | eng [complete]]**

---

### Syntax Definitions

|                       |                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>layer2</b>         | Gathers layer 2 switch configuration information.                                                                                                            |
| <b>layer3</b>         | Gathers layer 3 switch configuration information.                                                                                                            |
| <b>eng [complete]</b> | Gathers all relevant switch information from flash such as log files, configuration files, directories and creates an archive file with all the information. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Running the command with no parameters creates a **tech\_support.log** file.
- The **layer2** parameter creates a **tech\_support\_layer2.log** file.
- The **layer3** parameter creates a **tech\_support\_layer3.log** file.
- The **eng** parameter creates a **tech\_support\_eng.tar** file. The **complete** parameter creates a **tech\_support\_complete.tar** file with information from all switches in a VC along with the log files.
- Files with the prefix "smemcap" may be generated when the switch is operating at high memory usage. Ten files are generated before the switch reboots due to being out of memory. These files are cleared when the **show tech-support eng complete** command is run.

### Examples

```
-> show tech-support
-> show tech-support layer2
-> show tech-support layer3
-> show tech-support eng
-> show tech-support eng complete
```

## Release History

Release 7.3.4.R02; command introduced.

## Related Commands

### [show chassis](#)

Displays the basic configuration and status information for the switch chassis.

## MIB Objects

N/A

---

## show mac-range

Displays the MAC range table.

**show mac-range** [*index*]

---

### Syntax Definitions

*index* Identifies the MAC range by referring to its position in the MAC range table.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:
  - Base chassis MAC address
  - Ethernet Management Port (EMP)
  - VLAN router ports
- Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address *range*.
- The MAC address range is stored on the switch's EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses.
- Because the switch currently supports one MAC address range only, index position 1 displays.

### Examples

```
-> show mac range
```

```

Mac
Range Row Status Local/
-----+-----+-----+-----+-----+
01 ACTIVE GLOBAL 00:d0:95:6a:79:6e 00:d0:95:6a:79:8d

```

---

*output definitions*

---

|                       |                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mac Range</b>      | The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.                                                                                                                                                                                                                                                                        |
| <b>Row Status</b>     | The current status of the MAC range. The status <b>ACTIVE</b> refers to MAC addresses that are available for allocation to VLAN router ports and other applications.                                                                                                                                                                                                                                |
| <b>Local/Global</b>   | The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as <i>EEPROM</i> MAC addresses) have the global bit set in the first byte of the address and are stored on the switch's EEPROM. Because the switch's default MAC range is stored on EEPROM, the status GLOBAL displays. |
| <b>Start Mac Addr</b> | The first MAC address in the MAC address range.                                                                                                                                                                                                                                                                                                                                                     |
| <b>End Mac Addr</b>   | The last MAC address in the MAC address range.                                                                                                                                                                                                                                                                                                                                                      |

|                    |                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Range</b>       | The MAC range's index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to <a href="#">page 61-109</a> for more information.                                                                                            |
| <b>Mac Address</b> | Current MAC address allocated for a specific application.                                                                                                                                                                                                                                                                                                          |
| <b>Application</b> | The application for which the allocated MAC address is being used. Current options include <b>VLAN</b> , <b>802.1X</b> , and <b>CHASSIS</b> . <b>VLAN</b> refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. <b>CHASSIS</b> refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP). |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Id</b> | An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0. |

### Usage Guidelines

N/A

### Examples

```
-> show uboot config
Uboot access: Disabled
Uboot authentication: Enabled
```

### Release History

Release 8.7R3; command introduced

### Related Commands

- [uboot access](#)                      Enables or disables the U-boot access.
- [uboot authentication](#)            Enables or disables the U-boot authentication.

### MIB Objects

```
alaAaaUbootAccess
alaAaaUbootAuthenticationPassword
```

---

## security key-chain gen-random-key

Generates a 32-byte or 64-byte random key.

```
security key-chain {gen-random-key | gen-random-key-256}
```

---

### Syntax Definitions

**gen-random-key** Generates a 32-byte random key.

**gen-random-key-256** Generates a 64-byte random key.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The generated key can be used as an input value for hex-key or encrypt-key while creating a security key.

### Examples

```
-> security key-chain gen-random-key
0x0102030405060708090A0B0C0D0E0F
```

```
-> security key-chain gen-random-key-256
0x0102030405060708090A0B0C0D0E0F0102030405060708090A0B0C0D0E0F
```

### Release History

Release 8.4.1 R03; command introduced.

Release 8.7R1; **gen-random-key-256** keyword added.

### Related Commands

[security key](#) This command creates an authentication key into the system.

### MIB Objects

N/A

### Syntax Definitions

|                    |                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>key_id</i>      | The key ID. This can be in the range 1-256.                                                                                                                                                                                        |
| <b>simple</b>      | Specifies that the simple authentication algorithm is used as authentication key. <i>This parameter is currently not supported.</i>                                                                                                |
| <b>sha512</b>      | Specifies that the SHA512 authentication algorithm is used as the authentication key. <i>This parameter is currently not supported.</i>                                                                                            |
| <b>sha384</b>      | Specifies that the SHA384 authentication algorithm is used as the authentication key. <i>This parameter is currently not supported.</i>                                                                                            |
| <b>sha256</b>      | Specifies that the SHA256 authentication algorithm is used as the authentication key.                                                                                                                                              |
| <b>sha224</b>      | Specifies that the SHA224 authentication algorithm is used as the authentication key. <i>This parameter is currently not supported.</i>                                                                                            |
| <b>sha1</b>        | Specifies that the SHA1 authentication algorithm is used as the authentication key. <i>This parameter is currently not supported.</i>                                                                                              |
| <b>md5</b>         | Specifies that the MD5 authentication algorithm is used as the authentication key. <i>This parameter is currently not supported.</i>                                                                                               |
| <i>encrypt_key</i> | The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. The key can range from 16 to 512 characters in length. |
| <i>simple_key</i>  | Key will be plain text ASCII up to 118 characters. Use quotes ("" ) around the string if the key contains multiple words with spaces between them. Plain text key can range from 16 to 118 characters in length.                   |
| <i>mm/dd/yyyy</i>  | Key activation time. Granularity is up to minutes.<br>Enter the start time in the format mm/dd/yyyy hh:mm where mm is the month, dd is the day, yyyy is the year, hh is the hour, mm is the minutes. For example, 08/08/2005 14:30 |
| <i>days</i>        | Validity duration of the key in terms of days and time. Lifetime can be in the range 1 - 9125 days.                                                                                                                                |
| <b>aes-gcm-256</b> | Specifies that the AES-GCM-256 authentication algorithm is used as authentication key. <i>This parameter is currently not supported.</i>                                                                                           |
| <b>aes-gcm-128</b> | Specifies that the AES-GCM-128 authentication algorithm is used as authentication key.                                                                                                                                             |

|                               |                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>aes-cmac-256</b>           | Specifies that the AES-CMAC-256 authentication algorithm is used as authentication key. <i>This parameter is only supported on the OmniSwitch 6860N and OmniSwitch 6900-X48C4E.</i>                                                                                                                                          |
| <b>aes-cmac-128</b>           | Specifies that the AES-CMAC-128 authentication algorithm is used as authentication key.                                                                                                                                                                                                                                      |
| <b>hex-key</b> <i>hex_key</i> | The key value in hexadecimal format (0xhex). Configuration snapshot displays the authentication key in the encrypted form.<br>The key can range from 1 to 32 characters in length (16 byte) for AES-GCM-128 or AES-CMAC-128 algorithm, and 1 to 64 characters in length (32 byte) for AES-GCM-256 or AES-CMAC-256 algorithm. |
| <b>encrpt-key</b> <i>hex</i>  | The key in hexadecimal format. The key can range from 1 to 32 characters in length (16 byte) for AES-GCM-128 or AES-CMAC-128 algorithm, and 1 to 64 characters in length (32 byte) for AES-GCM-256 or AES-CMAC-256 algorithm.                                                                                                |
| <b>encrpt-key</b> <i>num</i>  | The key in numerical format. The key can range from 1 to 32 characters in length (16 byte) for AES-GCM-128 or AES-CMAC-128 algorithm, and 1 to 64 characters in length (32 byte) for AES-GCM-256 or AES-CMAC-256 algorithm.                                                                                                  |
| <i>hex-kn</i>                 | The Connectivity Association Key Name (CKN) value in hexadecimal format (0xhex). The key can range from 1 to 64 characters in length (32 byte) for AES-CMAC-128 algorithm, and 1 to 128 characters in length (64 byte) for AES-CMAC-256 algorithm.                                                                           |

## Defaults

| parameter                   | default  |
|-----------------------------|----------|
| <b>lifetime</b> <i>days</i> | 180 days |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- The switch can have a maximum of 256 keys.
- Current active key is determined based on the lowest numerical key ID. When the current active key expires, if the keychain has multiple active keys, the switch will switchover to active key having lowest key ID.
- When the current active key expires, if the keychain does not have any other active key, the switch will bring down all the adjacencies formed using that keychain.

- Parameters of a key can be modified if the key is not in use. Once the key is attached to any of the keychains, no more modification is allowed.
- Use the **no** form of this command to delete a key.
- To delete a key, first disassociate the keychain from a user application, and detach the key from the keychain.
- The show commands will always display the key-string in an encrypted format.
- Use the command [security key-chain gen-random-key](#) to generate a the hex-key to be configured for the AES-GCM-128 and AES-GCM-256 or AES-CMAC-128 and AES-CMAC-256 algorithm.
- A keychain must have all keys of either 128-bit type or 256-bit type.
- A keychain using the AES-GCM-128 authentication algorithm must be attached only to MACsec interface for its static-SAK configured under MACsec mode 'static'. A keychain using the AES-CMAC-128 or AES-CMAC-256 authentication algorithm can be attached only to MACsec interface for its Static Connectivity Association Key (static-CAK) using Pre-Shared key configured under MACsec mode 'dynamic'.

For more information on MACsec configuration, refer to the “Ethernet Port Commands” chapter in this guide.

## Examples

```
-> security key 5 algorithm sha256 key "passwordstring123" start-time 1/31/2017
00:00 life-time 180 10:30
-> security key 5 algorithm sha256 key "passwordstring123" start-time 5/2/2017
life-time 150
-> security key 1 algorithm aes-gcm-128 hex-key 0x0102030405060708090A0B0C0D0E0F
-> security key 1 algorithm aes-cmac-128 hex-key 0x0102030405060708090A0B0C0D0E0F
keyed-name 0x0102030405060708090A0B0C0D0FFF
-> no security key 5
```

## Release History

Release 8.4.1; command introduced.  
Release 8.4.1 R03; **aes-gcm-128** keyword added.  
Release 8.5R2; **aes-cmac-128** keyword added.  
Release 8.7R1; **aes-gcm-256** and **aes-cmac-256** keyword added.

## Related Commands

[show security key](#) This command displays the configured keys in the system.

```

## security key-chain

This command creates a system level security keychain.

**security key-chain** *key\_chain\_id* [**name** *key\_chain\_name*]

**no security key-chain** *key\_chain\_id1* [-*key\_chain\_id2*]

---

### Syntax Definitions

*key\_chain\_id*

The keychain ID. This can be in the range 1-32.

*key\_chain\_name*

The keychain name. The keychain name can range from 1 to 16 characters in length.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- There can be a maximum of 32 keychains in the device, and each of them can hold multiple keys of the same algorithm type.
- Use the **no** form of this command to delete a keychain.
- To delete a keychain, first disassociate the keychain from the user application.
- Deleting a keychain will not delete the keys associated with the keychain. Keys will subsequently remain configured, but will not be associated to any keychain, until reassociation.
- The keychain ID is associated to user applications such as ISIS, OSPF. The authentication information is carried in the Hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines should have same current key ID, key and same authentication type.
- Changing the switch system clock impacts the status of the keys.

### Examples

```
-> security key-chain 1 globalKeyChain
-> no security key-chain 1-3
-> no security key-chain 4
```

## Release History

Release 8.4.1; command introduced.

## Related Commands

[show security key-chain](#) This command displays the configured keychains in the system.

## MIB Objects

alaSecKeyChainId  
alasecKeyChainName

---

## security key-chain key

This command associates a key into the specified keychain.

```
security key-chain key_chain_id key key_id [-key_id2]
```

```
no security key-chain key_chain_id1 [-key_chain_id2]
```

---

### Syntax Definitions

*key\_chain\_id* The keychain ID.

*key\_id* The key ID.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- A keychain can be configured with multiple keys of the same algorithm type.
- Use the **no** form of this command to disassociate a key from a security keychain.
- To disassociate a key from the keychain, first disassociate the keychain from the user application, and detach the key from the keychain.

### Examples

```
-> security key-chain 1 key 5
-> no security key-chain 1
```

### Release History

Release 8.4.1; command introduced.

## alarm in

Configures an alarm input. For an alarm input, action can be configured to either send an SNMP trap, log a SWLog message locally, or set alarm output.

```
alarm in alr_in_name [chassis-in chassis_id_in] action {swlog | trap | alarm-out} [admin-state {enable | disable}]
```

```
no alarm alr_in_name
```

---

### Syntax Definitions

|                                               |                                                    |
|-----------------------------------------------|----------------------------------------------------|
| <i>alr_in_name</i>                            | Name of the alarm input (1 to 32 characters).      |
| <i>chassis_id_in</i>                          | Chassis identifier where alarm input is connected. |
| <b>swlog</b>   <b>trap</b>   <b>alarm-out</b> | Specify the action to be sent on the alarm output. |
| <b>enable</b>                                 | Enable the alarm input.                            |
| <b>disable</b>                                | Disable the alarm input.                           |

### Defaults

| parameter                        | default |
|----------------------------------|---------|
| <b>enabled</b>   <b>disabled</b> | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | No   | No    | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- By default, alarm is disabled for all actions.
- If the chassis ID is not configured, by default, local chassis is considered for the alarm input.
- Use the **no** form of this command to remove the alarm input.
- OmniSwitch 6465 switch has a single alarm input.
- The alarm status and alarm output will be updated to reflect a change in the alarm input.
- On reload of the switch, the alarm status and output alarm is set based on the current alarm input.

### Examples

```
-> alarm in "temperature-sensor" action alarm-out
```

```
-> alarm in "door-sensor" chassis-in 1 action alarm-out admin-state enable
-> alarm in "smoke-sensor" chassis-in 2 action trap swlog alarm-out admin-state
enable

-> no alarm temperature-sensor
```

## Release History

Release 8.5 R1; command introduced.

```

---

## alarm event

Configures the listed system events or any trap for alarm output.

```
alarm event alr_event_name {event {vc-status-change | temperature | system-health | power-supply |
port-violation network-port userport [-userport2] | port-health | link-down network-port userport
[-userport2] | authentication-failure} | trapid id}} [chassis-in chassis_id_in] [admin-state {enable |
disable}]
```

```
no alarm alr_event_name
```

---

### Syntax Definitions

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <i>alr_event_name</i> | Name of the alarm event or trap (1 to 32 characters). |
| <i>userport</i>       | Network port of the switch.                           |
| <i>id</i>             | Trap ID.                                              |
| <i>chassis_id_in</i>  | Chassis identifier where alarm input is connected.    |
| <b>enable</b>         | Enable the alarm event.                               |
| <b>disable</b>        | Disable the alarm event.                              |

### Defaults

| parameter               | default |
|-------------------------|---------|
| <b>enable   disable</b> | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | Yes  | No   | No    | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- By default, alarm output action is disabled for all the alarm events.
- System events corresponds to critical failures of the switch. Alarm event can be configured for any of these supported system events.
- Trap ID corresponds to the SNMP traps supported in the switch. Use **show snmp-trap config** command to view the supported traps. Alarm event can be configured for any of these supported traps.
- Both event as well as trap cannot be configured for the same alarm event. If configured, the later is ignored with an error message.

- Alarm event of the single chassis can be mapped to multiple alarm outputs on different chassis for redundancy.
- Alarm events from multiple chassis can be mapped to alarm output on the single chassis.
- Same network port can be configured for both link down as well as port violation event but with a different event name.
- A network port that falls in the network port range, which is already configured to an event cannot be configured to another event.
- If the chassis ID is not configured, by default, local chassis is considered for the alarm event.
- Use the **no** form of this command to remove the alarm event.

## Examples

```
-> alarm event system-fail event system-health
-> alarm event link-failure-critical event link-Down network-port 10-15 chassis-in
1 admin-state enable

-> no alarm system-fail
```

## Release History

Release 8.5 R1; command introduced.

### Usage Guidelines

- If the chassis ID is not configured, by default, local chassis is considered for the alarm output.
- Use the **no** form of this command to remove the alarm output.
- OmniSwitch 6465 switch has single alarm output.

### Examples

```
-> alarm out "critical-fault-detector"
-> alarm out "minor-fault-detector" chassis-out 2 action admin-state enable
-> alarm out "critical-fault-detector"
```

### Release History

Release 8.5 R1; command introduced.

## Related Commands

### **show alarm status**

Displays all the traps, system events, or alarm input for which the alarm output is raised.

## MIB Objects

```
alaAlarmOutputConfigTable
 alaAlarmOutputConfigName
 alaAlarmOutputConfigChassis
 alaAlarmOutputConfigRowStatus
```

---

## alarm map

Maps an alarm input or event with an alarm output within a chassis or any other chassis in the VC.

**alarm map** *alarm\_name* **out** *alr\_out\_name*

**no alarm map** *alarm\_name*

---

### Syntax Definitions

*alarm\_name* Name of the alarm input or system event (1 to 32 characters).

*alr\_out\_name* Name of the alarm output (1 to 32 characters)

### Defaults

| parameter               | default |
|-------------------------|---------|
| <b>enable   disable</b> | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |

### Usage Guidelines

- In a virtual chassis (VC) setup, alarm duration configuration applies to all the chassis of the VC.
- A minimum alarm duration of five minutes and a maximum alarm duration of 48 hours can be configured.
- An alarm is switched off for an input or event after the configured duration. If there are multiple events or input, alarm is switched off after the elapsed duration of all the events and input.
- Use **alarm clear status** command to force stop the alarm before the set alarm duration for any alarm event or input.
- Modification or updated duration is applied only to those alarms raised after the configuration change. Alarms which are in progress are not impacted.
- Use **default** option to reset the alarm duration to 24 hours 0 minutes.

### Examples

```
-> alarm duration 2
-> alarm duration default
```

### Release History

Release 8.5 R1; command introduced.

## Related Commands

### **alarm clear status**

Clears the status of the specified alarm.

### **show alarm status**

Displays all the traps, system events, or alarm input for which the alarm output is raised.

## MIB Objects

alarmDurationConfigHour  
alarmDurationConfigMin

---

## alarm clear status

Clears the status of the specified alarm.

**alarm clear status** [*alarm\_name*]

---

### Syntax Definitions

*alarm\_name*                      Name of the alarm input or alarm event.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | No   | No    | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- The command does not disable or remove the alarm.
- The command can be used to forcibly stop the alarm and clear the status.
- If the output alarm is ON for multiple events or input, all the alarms have to be cleared to switch off the alarm output.
- If the alarm name is not specified, all the configured alarms are cleared.

### Examples

```
-> alarm clear status temperature-sensor
-> alarm clear status
```

### Release History

Release 8.5 R1; command introduced.

## Related Commands

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | No   | No    | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- The command displays configuration of all the chassis if chassis ID is not specified.
- Network port is only applicable for link-down and port violation event.

### Examples

```
-> show alarm event config
Alarm Duration 5 hrs 30 Mins
```

| Alarm-Name    | Chassis-In | Network-Port | Trap-Id | Event-Name    | Alarm-Output-Name    | Chassis_out | Admin-State |
|---------------|------------|--------------|---------|---------------|----------------------|-------------|-------------|
| system-fail   | 1          | N/A          | N/A     | system-health | minor-fault-detector | 2           | enable      |
| power-fail    | 1          | N/A          | N/A     | power-supply  | minor-fault-detector | 2           | enable      |
| login-failure | 2          | N/A          | 5       | N/A           | minor-fault-detector | 2           | enable      |

### output definitions

```

---

## show alarm status

Displays all the traps, system events, or alarm input for which the alarm output is raised. For a VC, the alarm status for each chassis is displayed.

**show alarm status chassis** *chassis-id*

---

### Syntax Definitions

*chassis\_id* Chassis identifier.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms :

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | Yes  | No   | No    | No   | No    | No   | No   | No              | No                                                            | No   |

### Usage Guidelines

- Network port displays the status on the port range or a specific port.
- If the same failure (input or event or trap) is repeated, the data structure is updated with the latest failure.

### Examples

```
-> show alarm status chassis-id 2
```

| Alarm-Name    | Chassis-In | Time-Stamp            | Network-Port | Trap-Id | Event-Name | Alarm-Output         | Chassis-Out |
|---------------|------------|-----------------------|--------------|---------|------------|----------------------|-------------|
| login-failure | 2          | 09/31/2017 : 14:30:00 | N/A          | 5       | N/A        | minor-fault-detector | 2           |

#### *output definitions*

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Enter **appmgr** without any parameters to see the command syntax.
- The package manager and app manager commands can be run by administrators only with write privileges to the SYSTEM partition management family.
- If a specific VRF name or instance is not mentioned while starting the iot-profiler, the default VRF instance is considered automatically.

## Examples

```
-> appmgr start ams broker
-> appmgr start ams config-sync
-> appmgr start ams config-dbase
-> appmgr start ams cron-app argument "5 python3 /flash/python/hello.py , 1 python3
/flash/python/hello1.py"
-> write memory
-> show appmgr
Legend: (+) indicates application is not saved across reboot
```

| Application  | Status  | Package Name | User  | Status Time Stamp        |
|--------------|---------|--------------|-------|--------------------------|
| broker       | started | ams          | admin | Tue Nov 26 13:28:27 2019 |
| config-sync  | started | ams          | admin | Tue Nov 26 13:28:27 2019 |

```
-> appmgr start ams-apps iot-profiler -args -h 10.10.10.1 -p 1883
Success to start iot-profiler
-> appmgr start ams-apps iot-profiler -args --vrf-name vrf1
```

## Release History

Release 8.6R1; command introduced.  
 Release 8.6R2; command syntax and command output modified.  
 Release 8.7R3; **cron-app** support added.  
 Release 8.9R3; **VRF** support for **iot-profiler** added.

## Related Commands

**appmgr list** Displays the application currently launched/stopped/committed.  
**appmgr commit** Use this command to save the configuration across reboots.  
**show appmgr** Displays the application currently started/stopped/committed.

## MIB Objects

N/A

## appmgr list

Displays the application currently started/stopped/committed.

**appmgr list** [*app\_name*]

---

### Syntax Definitions

*app\_name* Specify the name of the application.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Enter **appmgr** without any parameters to see the command syntax.

### Examples

```
-> appmgr list
Legend: (+) indicates application is not saved across reboot
Application Status Package Name User Status TimeStamp
-----+-----+-----+-----+-----
+ broker stopped ams admin Mon Nov 25 17:07:54 2019
 config-sync started ams admin Tue Nov 12 11:43:12 2019
 config-dbase started ams admin Tue Nov 12 11:43:39 2019
```

```
-> appmgr list iot-profiler
Package Name : ams-apps
Committed (Yes/No) : No
Status : started
Timestamp : Apr 16, 2014: 02:20:02
User : admin
Command line arguments : -h 10.10.10.1 -p 1883
Installation script : /flash/working/pkg/ams-apps/install.sh
```

### output definitions

Enter **appmgr** without any parameters to see the command syntax.

### Examples

```
-> appmgr commit
```

### Release History

Release 8.6R2; command introduced.

Release 8.7R2; command deprecated. Use [write memory](#).

### Related Commands

[appmgr](#)

Use this command to start the tasks for AOS Micro Services (AMS).

### MIB Objects

N/A

---

## pkgmgr

Installs Debian packages for non-AOS software applications.

```
pkgmgr {[install | verify] package_file_name | remove package_name}
```

---

### Syntax Definitions

|                          |                                                                                 |
|--------------------------|---------------------------------------------------------------------------------|
| <b>install</b>           | Extracts and installs the contents of the package to system memory.             |
| <b>remove</b>            | Removes all the files of this package from system memory.                       |
| <b>verify</b>            | Verifies the ALE signature and the checksums for the Debian package.            |
| <i>package_file_name</i> | Name of the Debian package file                                                 |
| <i>package_name</i>      | Name of the package displayed in output of <a href="#">show pkgmgr</a> command. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The package manager and app manager commands can be run by administrators only with write privileges to the SYSTEM partition management family.
- The Debian package must be downloaded from the service and support website ([businessportal2.alcatel-lucent.com](http://businessportal2.alcatel-lucent.com)).
- The Debian package file must be copied to the *pkg* in the running directory. For example, if working is the running directory, then copy to */flash/working/pkg* directory of the switch.
- Use the **pkgmgr verify** command to verify the contents of the package. It also provides the version compatibility information for the release.
- Compatible release in the **pkgmgr verify** output displays the release which is compatible with the package. The ">=" sign means the package is compatible for AOS release version greater than or equal to the version displayed in "Compatible release". If the sign is not displayed then it is compatible only for that release version only.
- Use the **pkgmgr install** command to install the package.

- After the package is installed successfully, use the **write memory** command to save the installation permanently.
- If the switch restricts installation of the package due to memory threshold, use the **health threshold memory** command to increase the RAM memory threshold of the switch.
- Use the **pkgmgr remove** command to remove the package.

---

**Note.** In a Virtual Chassis environment, if this **pkgmgr** command is successful on Master unit, it will be automatically executed on all units of the Virtual Chassis.

---

## Examples

```
-> pkgmgr verify uos-ams-apps-v1.deb
uos-ams-apps-v1.deb
Verifying MD5 checksum.. OK
Compatible release: >=8.7.3-0
```

```
-> pkgmgr install uosn-ams-apps-v1.deb
```

```
Verifying MD5 checksum.. OK
System Memory check.. PASS
Extracting control files for package uosn-ams-apps-v1.deb .. OK
TARGET_AOS_PLATFORMS
No requirement to check target platform
Package target platforms check.. PASS
Package Dependency check.. PASS
Preparing to replace ams-apps 1 (using /flash/working/pkg/uosn-ams-apps-v1.deb)...
Setting up ams-apps (1)...
Installing package uosn-ams-apps-v1.deb .. OK
Write memory is required complete package ams-apps installation
```

```
-> write memory
```

```
-> pkgmgr remove ams
```

```
CLI output:
Purging ams-apps (1)...
Removing package ams-apps.. OK
Write memory is required complete package ams-apps removal
```

```
-> pkgmgr verify package-webview-v1.deb
```

```
CLI output:
Verifying MD5 checksum.. OK
Compatible release: >= 8.7.3-0
```

```
-> pkgmgr install package-webview-v1.deb
```

```
Verifying MD5 checksum.. OK
System Memory check.. PASS
Extracting control files for package package-webview-v1.deb .. OK
TARGET_AOS_PLATFORMS
No requirement to check target platform
Package target platforms check.. PASS
Package Dependency check.. PASS
```

```
Unpacking webview (from /flash/working/pkg/package-webview-v1.deb)...
Setting up webview (1)...
Installing package package-webview-v1.deb .. OK
Write memory is required complete package webview installation

-> write memory

-> pkgmgr remove webview
CLI output:
Purging webview (1)...
Removing package webview.. OK
Write memory is required complete package webview removal
```

## Release History

Release 8.6R2; command introduced.

Release 8.7R3; **pkgmgr** compatible release added.

## Related Commands

### **show pkgmgr**

Displays the packages currently installed/committed.

### **write memory**

Use this command to save all 'installed' packages so that they can be restored after reboot.

## MIB Objects

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

This command replaces the **pkgmgr list** command which was deprecated in 8.7R2.

### Examples

```
-> show pkgmgr ams
Package Name : ams,
Committed (Yes/No) : Yes,
Version : default,
Filename : uosn-ams-apps-v1.deb,
Status : installed,
Timestamp : ,
User : root,
Installation script : default
```

```
-> show pkgmgr
Legend: (+) indicates package is not saved across reboot
 (*) indicates packages will be installed or removed after reload
Name Version Status Install Script
-----+-----+-----+-----
ams 1 installed /flash/working/pkg/ams/install.sh
webview 1 installed /flash/working/pkg/webview/install.sh
ams-apps 1 installed /flash/working/pkg/ams-apps/install.sh
```

---

## pkgmgr commit

Saves all 'installed' packages so that they can be restored after reboot.

**pkgmgr commit**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

This command was deprecated in 8.7R2. Use the **write memory** command.

### Examples

```
-> pkgmgr commit
```

### Release History

Release 8.6R2; command introduced.

Release 8.7R2; command deprecated.

### Related Commands

#### [pkgmgr](#)

Use this command to install the required non-AOS software applications (developed by ALE and/or ALE-approved partners) Debian package.

#### [show pkgmgr](#)

Displays the packages currently installed/committed.

### MIB Objects

N/A

---

## capability vfl-type

Configures the VFL type to be either **standard** or **mixed**.

**capability vfl-type** {**standard** | **mixed**}

---

### Syntax Definitions

**standard** Configures the VFL type to be standard.  
**mixed** Configures the VFL type to be mixed.

### Defaults

| parameter | default                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------|
| vfl-type  | <b>standard</b> (OS6900-X48C6/T48C6/X48C4E/V48C8/C32E/T24C2/X24C2)<br><b>mixed</b> (OS6900-X48C4E) |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | No   | No    | No   | No   | No              | Yes                                                           | No   |

### Usage Guidelines

- Use this command to allow a mixed VC of OS6900-X48C4E and OS6900-X48C6/T48C6/V48C8/C32E/T24C2/X24C2 models.
- The OS6900-X48C4E only supports VFL type **mixed**.
- To have a mix of the OS6900-X48C4E and OS6900-X48C6/T48C6/V48C8/C32E/T24C2/X24C2 models the mode of the OS6900-X48C6/T48C6/V48C8/C32E/T24C2/X24C2 models must be changed to **mixed** and the VC must be rebooted.
- The OS6900-X48C4E supports forming a VC with other OS6900-X48C4E models or with OS6900-X48C6/T48C6/V48C8/C32E/T24C2/X24C2 models, no other models are supported.
- The switch must be rebooted for the mode to take effect.

### Examples

```
-> capability vfl-type mixed
```

### Release History

Release 8.9R4; command was introduced.

# 62 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

*Filename:* ALCATEL-IND1-NTP-MIB.mib  
*Module:* alcatelIND1NTPMIB

A summary of available commands is listed here:

---

**ntp server**  
**ntp server synchronized**  
**ntp server unsynchronized**  
**ntp client**  
**ntp src-ip preferred**  
**ntp broadcast**  
**ntp broadcast-client**  
**ntp broadcast-delay**  
**ntp key**  
**ntp key load**  
**ntp authenticate**  
**ntp master**  
**ntp interface**  
**ntp max-associations**  
**ntp broadcast**  
**ntp peer**  
**ntp vrf-name**  
**show ntp status**  
**show ntp client**  
**show ntp client server-list**  
**show ntp server client-list**  
**show ntp server status**  
**show ntp keys**  
**show ntp peers**  
**show ntp server disabled-interfaces**

---

## ntp server

Specifies an NTP server from which the switch will receive updates.

**ntp server** {*ip\_address* | *server\_name*} [**key** *key\_id* | | **minpoll** *poll* | **maxpoll** *poll* | **version** *version* | **prefer** | **burst** | **iburst** | **preempt**]

**no ntp server** *ip\_address*

---

### Syntax Definitions

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i>          | The IP address of the NTP server to be added or deleted to the client's server list. The IP address can be IPv4 or IPv6 address.                                                                                                                                                                                                                                                                                                                                 |
| <i>server_name</i>         | Fully qualified NTP server domain name.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>key_id</i>              | The key identification number that corresponds to the specified NTP server. The value ranges from 0 to 65534. 0 can be used to unconfigure the key ID.                                                                                                                                                                                                                                                                                                           |
| <b>minpoll</b> <i>poll</i> | It specifies the minimum polling interval for NTP messages, in seconds. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 3 (8 s) and an upper limit of 17 (36.4h).                                                              |
| <b>maxpoll</b> <i>poll</i> | It specifies the maximum polling interval for NTP messages, in seconds. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the maximum poll time would be 16 seconds ( $2^4 = 16$ ). The maximum poll interval defaults to 10 (1,024 s), but can be increased by the maxpoll option to an upper limit of 17 (36.4 h) and a lower limit of 3 (8 s).<br>The maxpoll must not be less than the minpoll value. |
| <i>version</i>             | The version of NTP being used. This will be 1, 2, 3, or 4.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>prefer</b>              | Marks this server as the preferred server. A preferred server's timestamp will be used before another server.                                                                                                                                                                                                                                                                                                                                                    |
| <b>burst</b>               | Enables burst mode. The burst mode allows the exchange of eight NTP messages (instead of one) when the server is reachable and at each poll interval to achieve faster synchronization.<br>The spacing between the first and the second packet is 16 seconds to allow a modem call to complete, while the spacing between the remaining packets is 2 seconds.                                                                                                    |
| <b>iburst</b>              | Enables initial burst (iburst) mode. The iburst mode allows immediate exchange of eight NTP messages (instead of one) when the server is unreachable and at each poll interval, to achieve faster initial synchronization acquisition.<br>The spacing between the packets is 16 seconds to allow a modem call to complete. Once the server is reachable, the spacing between the packets is 2 seconds.                                                           |
| <b>preempt</b>             | Enables the preemption mode for the server rather than the default persistent.                                                                                                                                                                                                                                                                                                                                                                                   |

## Defaults

| Parameter                  | Default       |
|----------------------------|---------------|
| <i>version</i>             | 4             |
| <b>minpoll</b> <i>poll</i> | 6             |
| <b>maxpoll</b> <i>poll</i> | 10            |
| <b>prefer</b>              | not preferred |
| <b>burst</b>               | no burst      |
| <b>iburst</b>              | no iburst     |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 12 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The client will poll the server for a time update when the **minpoll** time is exceeded.
- Use the **maxpoll** keyword to specifies the maximum polling interval for NTP messages. This number is determined by raising 2 to the power of the number entered. The maximum poll interval defaults to 10 (1,024 s), but can be increased by the maxpoll option to an upper limit of 17 (36.4 h) and a lower limit of 3 (8 s). The maxpoll must not be less than the minpoll value.

- NTP authentication must be disabled before adding or removing an NTP server.
- Burst mode of operation improves timekeeping quality with the server command and iburst mode of operation is designed to speed the initial synchronization acquisition with the server command.
- When preempt is enabled, the specified server is marked unavailable for selection if any error (authentication failure) is detected on a connection between the local device and reference clock. The server is marked available for selection if no other connections are available and no error is detected on the connection between the local device and reference clock.

## Examples

```
-> ntp server 1.1.1.1
-> ntp server 4100:1000::124
-> ntp server 0.pool.ntp.org
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server 0.pool.ntp.org minpoll 5
-> ntp server 0.pool.ntp.org maxpoll 6
-> ntp server 1.1.1.1 burst
-> ntp server 1.1.1.1 iburst
-> ntp server 1.1.1.1 preempt
-> no ntp server 1.1.1.1
```

## Release History

Release 7.1.1; command was introduced.

Release 8.5R4; **server name**, **maxpoll**, **burst**, **iburst**, **preempt** keywords added.

Release 8.7R3; NTP support for IPv6 added.

## Related Commands

### [ntp client](#)

Enables or disables NTP operation on the switch.

### [show ntp client server-list](#)

Displays a list of the servers with which the NTP client synchronizes.

### [show ntp server status](#)

Displays the basic server information for a specific NTP server or a list of NTP servers.

---

## ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

**ntp server synchronized**

---

### Syntax Definitions

N/A

### Defaults

By default, NTP synchronization is enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

### Examples

```
-> ntp server synchronized
```

### Release History

Release 7.1.1; command was introduced.

Release 8.5R4; command deprecated.

### Related Commands

#### [ntp server unsynchronized](#)

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

### MIB Objects

```
alaNtpConfig
 alaNtpPeerTests
```

---

## ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

**ntp server unsynchronized**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

### Examples

```
-> ntp server unsynchronized
```

### Release History

Release 7.1.1; command was introduced.

Release 8.5R4; command deprecated.

### Related Commands

#### [ntp server synchronized](#)

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

### MIB Objects

```
alaNtpConfig
 alaNtpPeerTests
```

---

## ntp client

Enables or disables NTP time synchronization discipline.

**ntp client admin-state {enable | disable}**

---

### Syntax Definitions

**enable** Enables NTP.  
**disable** Disables NTP.

### Defaults

NTP protocol is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the [ntp server](#) command. Up to 12 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.
- NTP client will not synchronize with an unsynchronized NTP server (Stratum 16).

### Examples

```
-> ntp client enable
-> ntp client disable
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****ntp server**

Specifies an NTP server from which the switch will receive updates.

**MIB Objects**

alaNtpEnable

---

## ntp src-ip preferred

Configures a source IP address to use as the source for NTP packets.

```
ntp src-ip preferred {default | no-loopback0 | ip_address}
```

```
no ntp src-ip preferred
```

---

### Syntax Definitions

#### default

The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the EMP-VC IP address will be used. If no EMP-VC IP address is configured, the preferred IP address will be used. If no preferred IP address is configured the first available IP address on the switch will be used.

#### no-loopback0

The Loopback0 address will not be used for the source IP address field and either the preferred IP address (if configured) or the first available IP address on the switch will be used.

#### ip\_address

The IP address to be used in the source IP field.

### Defaults

By default, the NTP source IP preferred setting is set to the **default** parameter.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- By default The Loopback0 address, if configured, will be used for the source IP address.
- If no Loopback0 is configured, the VC-EMP IP address will be used for the source IP address.
- If no VC-EMP IP address is configured, the preferred IP address will be used for the source IP address.
- If no preferred IP address is configured the first available IP address on the switch will be used as the source IP address.
- When configuring a preferred IP address, that address must already exist on the switch.
- If the configured preferred IP address is the same as the IP address that would have been automatically chosen by the switch, then the 'ntp src-ip preferred' command will not be included in the output of the 'configuration snapshot' command since only non-default settings are included in the output.

- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

### Examples

```
-> ntp src-ip preferred 192.168.10.1
-> ntp src-ip preferred no-loopback0
-> ntp src-ip preferred default
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; command deprecated.

### Related Commands

---

## ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

**ntp broadcast-client** {enable | disable}

---

### Syntax Definitions

**enable** Enables the client broadcast mode.  
**disable** Disables the client broadcast mode.

### Defaults

Broadcast mode is disabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

### Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

[ntp broadcast-delay](#) Sets the broadcast delay time in microseconds.

**MIB Objects**

alaNtpBroadcastEnable

---

## ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

**ntp broadcast-delay** *microseconds*

---

### Syntax Definitions

*microseconds*                      The number of microseconds for the broadcast delay.

### Defaults

| parameter           | default |
|---------------------|---------|
| <i>microseconds</i> | 4000    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

### Examples

```
-> ntp broadcast-delay 1000
-> ntp broadcast-delay 10000
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ntp broadcast**                      Enables or disables the client's broadcast mode.

### MIB Objects

alaNtpBroadcastDelay

---

## ntp key

Labels the specified authentication key identification as trusted or untrusted.

**ntp key** *key* [**trusted** | **untrusted**]

---

### Syntax Definitions

|                  |                                                                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>key</i>       | The key number matching an NTP server.                                                                                                                      |
| <b>trusted</b>   | Signifies that the specified key is trusted and can be used for authentication.                                                                             |
| <b>untrusted</b> | Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key. |

### Defaults

By default, all authentication key are untrusted.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used. The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to 'trusted' status to allow NTP to use the key for authentication.

## Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ntp key** Sets the public key the switch uses when authenticating with the specified NTP server.

**ntp client** Enables or disables NTP operation on the switch.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

### Examples

```
-> ntp key load
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

- ntp key** Labels the specified authentication key identification as trusted or untrusted.

---

## ntp authenticate

Enables or disables the authentication on a configured NTP server.

**ntp authenticate {enable | disable}**

---

### Syntax Definitions

**enable** Enables authentication for NTP server.  
**disable** Disables authentication for NTP server.

### Defaults

By default, NTP authentication is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using [ntp client](#) command.
- Before enabling the NTP operation, NTP server must be specified using the [ntp server](#) command.
- NTP authentication must be disabled before adding or removing an NTP server.

### Examples

```
-> ntp authenticate enable
-> ntp authenticate disable
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ntp status**

Displays the information about the current NTP status.

---

## ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

**ntp master** *stratum\_number*

---

### Syntax Definitions

*stratum\_number* Integer value ranging from 2 to 16.

### Defaults

| Parameter             | Default |
|-----------------------|---------|
| <i>stratum_number</i> | 16      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

### Examples

```
-> ntp master 4
```

### Release History

Release 7.1.1; command was introduced.

Release 8.5R4; command deprecated.

**Related Commands**

**show ntp status** Displays current NTP status.

**MIB Objects**

alaNtpConfig  
alaNtpSysStratum

---

## ntp interface

Enables or Disables NTP server functionality for an interface.

**ntp interface** {*interface\_ip*} {**enable** | **disable**}

---

### Syntax Definitions

*interface\_ip* IP address of an interface on which NTP server functionality is to be disabled. The IP address can be a IPv4 or IPv6 address.

**enable** Enables NTP server functionality on an interface.

**disable** Disables NTP sever functionality on an interface.

### Defaults

By default, NTP server functionality is enabled on all the interfaces.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

### Examples

```
-> ntp interface 10.10.10.1 disable
-> ntp interface 10.10.10.1 enable
-> ntp interface 4100:1000::125 enable
-> ntp interface 4100:1000::125 disable
```

### Release History

Release 7.1.1; command was introduced.

Release 8.7R3; NTP support for IPv6 added.

## Related Commands

**show ntp status**                      Displays current NTP status.

## MIB Objects

```
alaNtpInterfaceDisabledTable
 alaNtpInterfaceDisabledIpAddressType
 alaNtpInterfaceDisabledIpAddress
 alaNtpInterfaceDisabledRestrictions
 alaNtpInterfaceDisabledRowStatus
```

---

## ntp max-associations

Configures the maximum number of associations on the switch.

**ntp max-associations** *number*

---

### Syntax Definitions

*number* Maximum no of client/server and peer associations. Integer value ranging from 0 to 512.

### Defaults

By default, 128 associations are allowed on the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 128 to any value between 0 to 512.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

### Examples

```
-> ntp max-associations 20
```

### Release History

Release 7.1.1; command was introduced.  
Release 8.6R2; max value increased to 512.

**Related Commands**

**show ntp status**                      Displays current NTP status.

**MIB Objects**

alaNtpConfig  
    alaNtpMaxAssociation

---

## ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

**ntp broadcast** {*broadcast\_addr*} [**version** *version*] [**minpoll** *poll\_interval*]

**no ntp broadcast** {*broadcast\_addr*}

---

### Syntax Definitions

|                       |                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------|
| <i>broadcast_addr</i> | Subnet for which broadcast updates are regularly sent.                                                  |
| <i>version</i>        | NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4. |
| <i>poll_interval</i>  | Polling interval for NTP broadcast message. This value is measured in seconds.                          |

### Defaults

| Parameter            | Default |
|----------------------|---------|
| <i>version</i>       | 4       |
| <i>poll_interval</i> | 6       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers. This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to be defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

## Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

```

---

## ntp peer

Configures NTP to operate in the symmetric active peering mode. This also enables the establishment of an active symmetric association with the specified remote peer.

**ntp peer** {*ip\_address*} [**key** *key\_id*] [**version** *version*] [**minpoll** *poll\_interval*]

**no ntp peer** {*ip\_address*}

---

### Syntax Definitions

|                      |                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i>    | IP address of the remote peer. The IP address can be IPv4 or IPv6 address.                                      |
| <i>key_id</i>        | Authentication key for the remote peer.                                                                         |
| <i>version</i>       | NTP packet version to be used for the peer association.                                                         |
| <i>poll_interval</i> | Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer. |

### Defaults

| Parameter            | Default |
|----------------------|---------|
| <i>version</i>       | 4       |
| <i>poll_interval</i> | 6       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode. This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x).
- *ip-address* is the mandatory parameter to be entered in the command while *key id* is the optional parameter. If *key id* is not specified, then peering will not be authenticated.

## Examples

```
-> ntp peer 172.18.16.112
-> ntp peer 4100:1000::124
-> no ntp peer 172.18.16.112
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.7R3; NTP support for IPv6 added.

## Related Commands

[show ntp peers](#) Displays current NTP peer association.

### Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

### Example

```
-> show ntp status
Current time: Mon, Jan 21 2019 7:31:04.685 (UTC),
Last NTP update: Mon, Jan 21 2019 7:30:10.160 (UTC),
Server reference: 10.10.10.10,
Client mode: enabled,
Broadcast client mode: disabled,
Broadcast delay (microseconds): 4000,
Stratum: 4,
Maximum Associations Allowed: 32,
Authentication: enabled,
VRF Name: default
```

---

|                         |                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Current time</b>     | The current time for the NTP client.                                                                                |
| <b>Last NTP update</b>  | The time of the last synchronization with an NTP server.                                                            |
| <b>Server reference</b> | The source of the time signal, which is the address of the NTP server that provided the currently-used time update. |
| <b>Client mode</b>      | Whether the NTP client software is enabled or disabled.                                                             |

---

|                              |                                                                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast client mode</b> | What NTP mode the client is running in, either client or broadcast.                                                               |
| <b>Broadcast delay</b>       | The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled. |
| <b>Stratum</b>               | The stratum of the server. The stratum number is the number of hops from a UTC time source.                                       |
| <b>Max-Association</b>       | Maximum association on the switch that restricts the number of client/server and peer association                                 |
| <b>Authentication</b>        | Whether Authentication is enabled or disabled                                                                                     |
| <b>VRF Name</b>              | Name of the VRF.                                                                                                                  |

---

## Release History

Release 7.1.1; command introduced.

Release 7.3.1; **vrf** parameter added.

## Related Command

|                                             |                                                                                                        |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">ntp client</a>                  | Enables or disables NTP operation on the switch.                                                       |
| <a href="#">ntp server</a>                  | Specifies an NTP server from which the switch will receive updates                                     |
| <a href="#">ntp server synchronized</a>     | Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol. |
| <a href="#">ntp max-associations</a>        | Configures the maximum number of associations on the switch.                                           |
| <a href="#">ntp master</a>                  | Specifies the stratum value for unsynchronized switch                                                  |
| <a href="#">ntp broadcast</a>               | Enables or disables the client's broadcast mode.                                                       |

#### output definitions

---

|                   |                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>       | "+" indicates an active peer<br>"-" indicates a pasive peer<br>"=" indicates a client<br>"*" indicates current system peer<br>"^" indicates a broadcast server<br>"'" indicates a broadcast client     |
| <b>IP Address</b> | The server IP address.                                                                                                                                                                                 |
| <b>Ver</b>        | The version of NTP the server is using. Versions 3 and 4 are valid.                                                                                                                                    |
| <b>Key</b>        | The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered. |

**output definitions**

---

|               |                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>St</b>     | The stratum of the server.                                                                                                                                                                                                                                          |
| <b>When</b>   | Number of seconds passed since last response from remote host.                                                                                                                                                                                                      |
| <b>Poll</b>   | Polling interval to the remote host in seconds.                                                                                                                                                                                                                     |
| <b>Reach</b>  | This is a shift register used to determine the reachability status of this peer. This register is displayed to the user in octal values instead of binary, decimal or even hex. The maximum value of an eight-bit binary number is 11111111, which is 377 in octal. |
| <b>Delay</b>  | The delay received from the server in its timestamp.                                                                                                                                                                                                                |
| <b>Offset</b> | The offset received from the server in its timestamp.                                                                                                                                                                                                               |
| <b>Disp</b>   | The dispersion value received from the server in its timestamp.                                                                                                                                                                                                     |

## show ntp server client-list

Displays the information about the current NTP clients connected to the server.

**show ntp server client-list**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use this command to display the tabular information on the current NTP client connected to the server (switch).

### Examples

```
-> show ntp server client-list
IP Address Ver Key
-----+-----+-----
172.23.0.201 4 0
10.255.24.121 4 0
```

### output definitions

### Usage Guidelines

- This command displays information on the status of any or all configured NTP servers/peers.
- To display a specific server, enter the command with the server's IP address. To display all servers, enter the command with no server IP address.

### Examples

```
-> show ntp server status
IP address = clock3.ovcirrus.com [123.108.200.124],
Host mode = client,
Peer mode = server,
Prefer = no,
Version = 4,
Key = 0,
Stratum = 2,
Minpoll = 6 (64 seconds),
Maxpoll = 10 (1024 seconds),
Poll = 1024 seconds,
when = 283 seconds,
Delay = 0.016 seconds,
Offset = -180.232 seconds,
Dispersion = 7.945 seconds
Root distance = 0.026,
Precision = -14,
Reference IP = 209.81.9.7,
Status = configured : reachable : rejected,
Uptime count = 1742 seconds,
```

```

Reachability = 1,
Unreachable count = 0,
Stats reset count = 1680 seconds,
Packets sent = 1,
Packets received = 1,
Duplicate packets = 0,
Bogus origin = 0,
Bad authentication = 0,
Bad dispersion = 0,

-> show ntp server status 198.206.181.139
IP address = 198.206.181.139,
Host mode = client,
Peer mode = server,
Prefer = no,
Version = 4,
Key = 0,
Stratum = 2,
Minpoll = 6 (64 seconds),
Maxpoll = 10 (1024 seconds),
Poll = 1024 seconds,
when = 283 seconds,
Delay = 0.016 seconds,
Offset = -180.232 seconds,
Dispersion = 7.945 seconds
Root distance = 0.026,
Precision = -14,
Reference IP = 209.81.9.7,
Status = configured : reachable : rejected,
Uptime count = 1742 seconds,
Reachability = 1,
Unreachable count = 0,
Stats reset count = 1680 seconds,
Packets sent = 1,
Packets received = 1,
Duplicate packets = 0,
Bogus origin = 0,
Bad authentication = 0,
Bad dispersion = 0,
Last Event = peer changed to reachable,

```

|                   |                                                                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP address</b> | The server IP address.                                                                                                                                                                                 |
| <b>Host mode</b>  | The host mode of this remote association.                                                                                                                                                              |
| <b>Peer mode</b>  | The peer mode of this remote association.                                                                                                                                                              |
| <b>Prefer</b>     | Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.                                                                  |
| <b>Version</b>    | The version of NTP the server is using. Versions 3 and 4 are valid.                                                                                                                                    |
| <b>Key</b>        | The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered. |
| <b>Stratum</b>    | The stratum of the server. The stratum number is the number of hops from a UTC time source.                                                                                                            |

*output definitions (continued)*

---

|                           |                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Minpoll</b>            | The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded. |
| <b>Maxpoll</b>            | The maximum poll time.                                                                                            |
| <b>When</b>               | Number of seconds passed since last response from remote host.                                                    |
| <b>Poll</b>               | Polling interval to the remote host in seconds.                                                                   |
| <b>Delay</b>              | The delay received from the server in its timestamp.                                                              |
| <b>Offset</b>             | The offset received from the server in its timestamp.                                                             |
| <b>Dispersion</b>         | The dispersion value received from the server in its timestamp.                                                   |
| <b>Root distance</b>      | The total round trip delay (in seconds) to the primary reference source.                                          |
| <b>Precision</b>          | The advertised precision of this association.                                                                     |
| <b>Reference IP</b>       | The IP address identifying the peer's primary reference source.                                                   |
| <b>Status</b>             | The peer selection and association status.                                                                        |
| <b>Uptime count</b>       | The time period (in seconds) during which the local NTP server was associated with the switch.                    |
| <b>Reachability</b>       | The reachability status of the peer.                                                                              |
| <b>Unreachable count</b>  | Number of times the NTP entity was unreachable.                                                                   |
| <b>Stats reset count</b>  | The time delay (in seconds) since the last time the local NTP server was restarted.                               |
| <b>Packets sent</b>       | Number of packets sent.                                                                                           |
| <b>Packets received</b>   | Number of packets received.                                                                                       |
| <b>Duplicate packets</b>  | Number of duplicated packets received.                                                                            |
| <b>Bogus origin</b>       | Number of bogus packets.                                                                                          |
| <b>Bad authentication</b> | Number of NTP packets rejected for not meeting the authentication standards.                                      |
| <b>Bad dispersion</b>     | Number of bad dispersions.                                                                                        |
| <b>Last Event</b>         | The last event.                                                                                                   |

|---------------|--------------------------------------------------------|
| <b>Key</b>    | The key number corresponding to a key in the key file. |
| <b>Status</b> | Whether the key is trusted or untrusted.               |

---

### Release History

Release 7.1.1; command was introduced.

**Related Command**

**ntp key** Labels the specified authentication key identification as trusted or untrusted.

**ntp key load** Loads the current key file into memory.

**MIB Objects**

alaNtpAccessKeyIdTable

---

## show ntp peers

Displays the information about the current status on the NTP peer association.

**show ntp peers**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

### Examples

```
-> show ntp peers
```

| IP Address    | Ver | Key | St | When | Poll | Reach | Delay | Offset | Disp   |
|---------------|-----|-----|----|------|------|-------|-------|--------|--------|
| 172.23.0.202  | 4   | 0   | 3  | 895  | 1024 | 377   | 0.300 | 0.404  | 0.0024 |
| 10.255.24.120 | 4   | 0   | 3  | 591  | 1024 | 377   | 0.016 | 0.250  | 0.0017 |

#### *output definitions*

|                   |                                                                                                                                                                                                       |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IP Address</b> | Peer IP Address                                                                                                                                                                                       |
| <b>Ver</b>        | The version of NTP the server is using. Versions 3 and 4 are valid.                                                                                                                                   |
| <b>Key</b>        | The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered. |
| <b>St</b>         | The stratum of the server.                                                                                                                                                                            |
| <b>When</b>       | Number of seconds passed since last response from remote host.                                                                                                                                        |
| <b>Poll</b>       | Polling interval to the remote host in seconds.                                                                                                                                                       |

**output definitions**

---

|               |                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reach</b>  | This is a shift register used to determine the reachability status of this peer. This register is displayed to the user in octal values instead of binary, decimal or even hex. The maximum value of an eight-bit binary number is 11111111, which is 377 in octal. |
| <b>Delay</b>  | The delay received from the server in its timestamp.                                                                                                                                                                                                                |
| <b>Offset</b> | The offset received from the server in its timestamp.                                                                                                                                                                                                               |
| <b>Disp</b>   | The dispersion value received from the server in its timestamp.                                                                                                                                                                                                     |

---

**Release History**

Release 7.1.1; command was introduced.  
Release 8.5R4; When, Poll, Reach fields added.

**Related Command**

# 63 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

|                       | OmniSwitch |
|-----------------------|------------|
| <b>Telnet(v4)</b>     | 6          |
| <b>FTP(v4)</b>        | 4          |
| <b>SSH + SFTP(v4)</b> | 8          |
| <b>HTTP</b>           | 4          |

MIB information for commands in this chapter are as follows:

*Filename:* ALCATEL-IND1-SESSION-MGR-MIB.mib  
*Module:* alcatelIND1SessionMgrMIB

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

*Filename:* ALCATEL-IND1-IP-MIB.mib  
*Module:* alcatelIND1IPMIB

A summary of the available commands is listed here:

---

**session login-attempt**  
**session login-timeout**  
**session banner**  
**session timeout**  
**session session-limit**  
**session prompt**  
**session reauthentication**  
**session xon-xoff**  
**session cli-auto-complete-space**  
**show prefix**  
**user profile save**  
**user profile reset**  
**history**  
**command-log**  
**kill**  
**exit**  
**who**  
**whoami**  
**show session config**  
**show session xon-xoff**

**ssh login-grace-time**  
**ssh enforce-pubkey-auth**  
**ssh strong-ciphers**  
**ssh strong-hmacs**  
**installsshkey**  
**revokesshkey**  
**show command-log status**  
**show telnet**  
**show ssh**

---

## session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

**session login-attempt** *integer*

---

### Syntax Definitions

*integer* The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

### Defaults

Default is 3 login attempts.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> session login-attempt 5
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

### [session login-timeout](#)

Sets or resets the amount of time the user can take to accomplish a successful login to the switch.

### [session timeout](#)

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

## MIB Objects

sessionMgr

    sessionLoginAttempt

---

## session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

**session login-timeout** *seconds*

---

### Syntax Definitions

*seconds* The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

### Defaults

Login timeout default is 55 seconds.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> session login-timeout 30
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.

### [session login-attempt](#)

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

### [session timeout](#)

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

## MIB Objects

sessionMgr

    sessionLoginTimeout

---

## session banner

Sets or resets the file name of the user-defined banner. The banner is a welcome banner that appears after the user successfully logs onto the switch.

**session** {cli | ftp | http} banner *file\_name*

**no session** {cli | ftp | http} banner

---

### Syntax Definitions

|                  |                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>cli</b>       | Creates/modifies the CLI banner file name.                                                                                             |
| <b>ftp</b>       | Creates/modifies the FTP banner file name.                                                                                             |
| <b>http</b>      | Creates/modifies the HTTP banner file name.                                                                                            |
| <i>file_name</i> | Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters. |

### Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.
- The banner file must be manually copied to each unit in a VC.

### Examples

```
-> session cli banner /switch/banner.txt
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

  SessionType

  SessionBannerFileName

---

## session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

**session** {cli | http | ftp} **timeout** *minutes*

---

### Syntax Definitions

|                |                                                                 |
|----------------|-----------------------------------------------------------------|
| <b>cli</b>     | Sets the inactivity timeout for CLI sessions.                   |
| <b>http</b>    | Sets the inactivity timeout for HTTP sessions.                  |
| <b>ftp</b>     | Sets the inactivity timeout for FTP sessions.                   |
| <i>minutes</i> | Inactivity timeout value (in minutes). Valid range 1 to 596523. |

### Defaults

| parameter      | default |
|----------------|---------|
| <i>minutes</i> | 4       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

### Examples

```
-> session cli timeout 5
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

  SessionType

  SessionInactivityTimerValue

---

## session session-limit

Configures the concurrent session limit for FTP, SSH, Telnet and HTTP or HTTPS.

```
session {ftp | ssh | telnet | http} session-limit num
```

---

### Syntax Definitions

|               |                                                                                        |
|---------------|----------------------------------------------------------------------------------------|
| <b>ftp</b>    | Sets the number of concurrent session for FTP sessions. Valid range 1 to 4.            |
| <b>ssh</b>    | Sets the number of concurrent session for ssh sessions. Valid range 1 to 8.            |
| <b>telnet</b> | Sets the number of concurrent session for telnet sessions. Valid range 1 to 6.         |
| <b>http</b>   | Sets the number of concurrent session for http or https sessions. Valid range 1 to 32. |
| <i>num</i>    | The concurrent session limit.                                                          |

### Defaults

| parameter     | default |
|---------------|---------|
| <b>ftp</b>    | 4       |
| <b>ssh</b>    | 8       |
| <b>telnet</b> | 6       |
| <b>http</b>   | 32      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The access is denied when the number of sessions exceed the configured session-limit.

### Examples

```
-> session ftp session-limit 2
-> session ssh session-limit 4
-> session telnet session-limit 3
-> session http session-limit 20
```

## Release History

Release 8.9R2; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

```
sessionFtpLimitNum
sessionSshLimitNum
sessionTelnetLimitNum
sessionHttpLimitNum
```

---

## session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

**session prompt default** [*string*]

---

### Syntax Definitions

*string* Prompt string. Maximum length 31 characters.

### Defaults

| parameter     | default |
|---------------|---------|
| <i>string</i> | ->      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The new prompt will not take effect until you log off and back onto the switch.

### Examples

```
-> session prompt default -->
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show session config](#) Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

### MIB Objects

```
SessionConfigTable
 SessionType
 sessionDefaultPromptString
```

---

## session reauthentication

Configures the timeout interval to reauthenticate for TACACS+ session.

**session reauthentication** [*minutes*]

---

### Syntax Definitions

*minutes* The number of minutes the switch waits before retrying the TACACS+ authentication request. The valid range is from 1 to 1200 minutes.

### Defaults

| parameter      | default |
|----------------|---------|
| <i>minutes</i> | 5       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- By default, the TACACS+ reauthentication timer is enabled. The default interval is 5 minutes.
- The reauthentication is disabled when the interval is configured as 0.
- The reauthentication is enabled when the interval is configured from 1 to 1200.
- The session reauthentication CLI is applicable only for TACACS+ authentication.

### Examples

```
-> session reauthentication 6
-> session reauthentication 0
```

### Release History

Release 8.8R1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information such as banner file name, session timeout value, default prompt value and TACACS+ reauthentication interval.

## MIB Objects

  SessionType

  sessionReauthenticationInterval

---

## session xon-xoff

Enable or disable the XON-XOFF protocol on the console port.

```
session xon-xoff {enable | disable}
```

---

### Syntax Definitions

**enable** Enables XON-XOFF on the console port.  
**disable** Disables XON-XOFF on the console port.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

### Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show session xon-xoff** Displays whether the console port is enabled or disabled for XON-XOFF.

### MIB Objects

sessionXonXoffEnable

---

## session cli-auto-complete-space

Enable or disable the CLI auto completion using space key.

```
session cli-auto-complete-space {enable | disable}
```

---

### Syntax Definitions

**enable** Enables CLI auto completion on the switch.  
**disable** Disables CLI auto completion on the switch.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Auto completion of CLI command can be enabled or disabled using this command.
- With CLI auto-complete feature enabled, the space key can be used for auto completion of the CLI command similar to the TAB key.

### Examples

```
-> session cli-auto-complete-space enable
-> session cli-auto-complete-space disable
```

### Release History

Release 8.9R2; command introduced.

## Related Commands

### [show session config](#)

Displays session manager configuration information (for example, default prompt, banner file name, inactivity timer, login timer, login attempts, and CLI console shell status).

## MIB Objects

`sessionCliAutoCompleteSpace`

---

## show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

**show prefix**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

### Examples

```
-> show prefix
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show prefix](#)

This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

### MIB Objects

N/A

---

## user profile save

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

**user profile save**

---

### Syntax Definitions

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [history](#)

Sets the number of commands that will be stored in the CLI history buffer.

## MIB Objects

N/A

---

## command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

**command-log** {enable | disable}

---

### Syntax Definitions

|                |                                                                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>  | Creates a file called <b>command.log</b> in the switch's <b>/flash</b> directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled. |
| <b>disable</b> | Disables logging of current session commands to the <b>command.log</b> file.                                                                                                                              |

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

### Examples

```
-> command-log enable
-> command-log disable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[show command-log](#)

Displays the contents of the **command.log** file.

[show command-log status](#)

Shows the current status of the command logging function (i.e., enabled or disabled).

## MIB Objects

`sessionCliCommandLogEnable`

---

## kill

Kills an active session. The command takes effect immediately.

**kill** *session\_number*

---

### Syntax Definitions

*session\_number*                      Number of the session you want to kill.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

### Examples

```
-> kill 3
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**who**

Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

## MIB Objects

SessionMgr

  sessionIndex

  sessionRowStatus

---

## exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

---

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Use the [who](#) command to display all sessions on the switch.

### Examples

```
-> whoami
Session number = 5
 User name = admin,
 Access type = telnet,
 Access port = NI,
 IP address = 121.251.17.76,
 Read-only domains = None,
 Read-only families = ,
 Read-Write domains = All ,
 Read-Write families = ,
```

### Usage Guidelines

- You can identify your current login session by using the IP address.
- This command applies to the following session types: Console, Telnet, SSH, FTP, SFTP, HTTP, HTTPS, SNMP.

### Examples

```
-> who
Session number = 0
 User name = (at login),
 Access type = console,
 Access port = Local,
 IP address = 0.0.0.0,
 Read-only domains = None,
 Read-only families = ,
 Read-Write domains = None,
 Read-Write families = ,

Session number = 5
 User name = admin,
 Access type = telnet,
 Access port = NI,
 IP address = 128.251.17.176,
 Read-only domains = None,
 Read-only families = ,
 Read-Write domains = All ,
 Read-Write families = ,
```

|-----------------------------|----------------------------------------------------------------------------------------------|
| <b>Cli Default Prompt</b>   | Default prompt displayed for CLI sessions.                                                   |
| <b>Cli Banner File Name</b> | Name of the file that contains the banner information that will appear during a CLI session. |

*output definitions (continued)*

---

|                                                     |                                                                                                                                                                     |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cli Inactivity Timer in minutes</b>              | Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.                                                           |
| <b>Ftp Banner File Name</b>                         | Name of the file that contains the banner information that will appear during an FTP session.                                                                       |
| <b>Ftp Inactivity Timer in minutes</b>              | Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.                                                           |
| <b>Http Inactivity Timer in minutes</b>             | Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.                                      |
| <b>Login Timer in seconds</b>                       | The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch. |
| <b>Maximum number of Login Attempts</b>             | The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.                                                   |
| <b>Session reauthentication interval in minutes</b> | The number of minutes the switch waits for before retrying the TACACS+ authentication request.                                                                      |
| <b>Cli auto-complete space</b>                      | Displays if auto completion of CLI command using space key is enabled or disabled.                                                                                  |
| <b>Ftp session limit</b>                            | Displays the concurrent FTP session limit.                                                                                                                          |
| <b>Ssh session limit</b>                            | Displays the concurrent SSH session limit.                                                                                                                          |
| <b>Telnet session limit</b>                         | Displays the concurrent Telnet session limit.                                                                                                                       |
| <b>Http session limit</b>                           | Displays the concurrent HTTP/HTTPs session limit.                                                                                                                   |

---

**Release History**

Release 7.1.1; command was introduced.

Release 8.8R1; **Session reauthentication interval in minutes** field added.

Release 8.9R2; **Cli auto-complete space, Ftp session limit, Ssh session limit, Telnet session limit, and Http session limit** field added.

## Related Commands

|----------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>session session-limit</b>           | Configures the default CLI prompt for console and Telnet sessions.                                                     |
| <b>session banner</b>                  | Sets the file name of the user-defined banner.                                                                         |
| <b>session timeout</b>                 | Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface.                                 |
| <b>session login-attempt</b>           | Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed. |
| <b>session login-timeout</b>           | Sets the amount of time the user can take to accomplish a successful login to the switch.                              |
| <b>session reauthentication</b>        | Configures the timeout interval to reauthenticate for TACACS+ session.                                                 |
| <b>session cli-auto-complete-space</b> | Enable or disable the CLI auto completion using space key.                                                             |

## MIB Objects

```
SessionConfigTable
 sessionType
 sessionBannerFileName
 sessionInactivityTimerValue
 sessionDefaultPromptString
 sessionReauthenticationInterval
 sessionFtpLimitNum
 sessionSshLimitNum
 sessionTelnetLimitNum
 sessionHttpLimitNum
```

---

## show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

**show session xon-xoff**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the [session reauthentication](#) command), traffic to the console port may be stopped.

### Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[session reauthentication](#) Enables/disables the XON-XOFF protocol on the console port.

### MIB Objects

```
sessionXonXoffEnable
```

---

**more**

Enables the more mode for your console screen display.

**more** *filename*

**Syntax Definitions**

*filename*                                      The file to display.

**Defaults**

N/A

**Platforms Supported**

This command is supported on the following OmniSwitch platforms:

|             |             |             |              |             |              |             |             |                        |                                                                      |             |
|-------------|-------------|-------------|--------------|-------------|--------------|-------------|-------------|------------------------|----------------------------------------------------------------------|-------------|
| <b>6360</b> | <b>6465</b> | <b>6560</b> | <b>6570M</b> | <b>6860</b> | <b>6860N</b> | <b>6865</b> | <b>6900</b> | <b>6900</b><br>V72/C32 | <b>6900</b><br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | <b>9900</b> |
| Yes         | Yes         | Yes         | Yes          | Yes         | Yes          | Yes         | Yes         | Yes                    | Yes                                                                  | Yes         |

**Usage Guidelines**

- This parameter can also be used to pipe output from the CLI.
- This command is case sensitive.

**Examples**

```
-> more textfile.txt
-> write terminal | more
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands****MIB Objects**

```
SystemServices
 systemServicesArg1
 systemServicesAction
```

## telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```
[vrf name] telnet {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

---

### Syntax Definitions

|                         |                                                                 |
|-------------------------|-----------------------------------------------------------------|
| <i>name</i>             | Name of the VRF.                                                |
| <b>default</b>          | Sets the port back to the default of 23.                        |
| <i>service_port</i>     | The TCP service port number. Must be 23 or between 20000-20999. |
| <b>enable   disable</b> | Enables or disables telnet access.                              |
| <i>ip_address</i>       | Specifies the IPv4 or IPv6 address for the Telnet session.      |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The default directory for Telnet is **/flash**.

### Examples

```
-> telnet port 20999
-> telnet admin-state disable
-> telnet 172.17.6.228
-> vrf vrf1 telnet admin-state enable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [ssh](#)

Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.

### [show telnet](#)

Displays the current configuration specifying the ports the telnet daemons are listening on.

## MIB Objects

SystemServices

```
systemServicesArg1

```

---

## ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

```
[vrf name] ssh {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

---

### Syntax Definitions

|                         |                                                                 |
|-------------------------|-----------------------------------------------------------------|
| <i>name</i>             | Name of the VRF.                                                |
| <b>default</b>          | Sets the port back to the default of 22.                        |
| <i>service_port</i>     | The TCP service port number. Must be 23 or between 20000-20999. |
| <b>enable   disable</b> | Enables or disables Secure Shell.                               |
| <i>ip_address</i>       | Specifies the IPv4 or IPv6 address for the Secure Shell.        |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

You must have a valid username and password for the specified host.

### Examples

```
-> ssh port 20000
-> ssh admin-state disable
-> ssh 172.155.11.211
login as:

-> vrf vrf1 ssh admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

## ssh login-grace-time

Configures the duration in which the user has to enter a login password and authenticate for an SSH session.

**ssh login-grace-time** *seconds*

---

### Syntax Definitions

*seconds* The number of seconds for the grace time period. The range is 30–600.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

By default, the login grace time period is set to 120 seconds.

### Examples

```
-> ssh login-grace-time 300
-> ssh login-grace-time 600
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

```

---

## ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

`ssh enforce-pubkey-auth {enable | disable}`

---

### Syntax Definitions

**enable** Enforces only SSH public key authentication.

**disable** Enforces both SSH public key and password authentication.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

## ssh strong-ciphers

Enables or disables the enforcement of a Secure Shell (SSH) cipher configuration across a switch reboot.

```
ssh strong-ciphers {enable | disable}
```

---

### Syntax Definitions

**enable** Enables the enforcement of an SSH cipher configuration.

**disable** Disables the enforcement of an SSH cipher configuration.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |

### Usage Guidelines

N/A

### Examples

```
-> ssh strong-ciphers enable
-> ssh strong-ciphers disable
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

**show ssh** Displays the current SSH configuration for the switch.

### MIB Objects

```
alaIpSshConfig
 alaIpSshStrongCiphersAdminStatus
```

---

## ssh strong-hmacs

Enables or disables the enforcement of a Secure Shell (SSH) HMAC configuration across a switch reboot.

```
ssh strong-hmacs {enable | disable}
```

---

### Syntax Definitions

**enable** Enables the enforcement of an HMAC configuration.

**disable** Disables the enforcement of an HMAC configuration.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | disable |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- SSH HMAC refers to message authentication codes that use cryptographic hash functions.
- Enable strong-hmacs will enforce the use of “*hmac-sha2-256*, *hmac-sha2-512*” in ssh server.
- Disable will select default hmacs in the configuration.

### Examples

```
-> ssh strong-hmacs enable
-> ssh strong-hmacs disable
```

### Release History

Release 8.3.1; command was introduced.  
Release 8.7R2; *hmac-sha1* removed.

---

## Related Commands

**show ssh**

Displays the current SSH configuration for the switch.

## MIB Objects

alaIpSshConfig

alaIpSshStrongHmacsAdminStatus

---

## installsshkey

Used to install the public key used for SSH onto the switch.

`installsshkey user path`

---

### Syntax Definitions

*user*                                                 The user that the key will be associated with.  
*path*                                                 The location of the key file.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Be sure the associated private key is stored on the client device.
- Verify that the user that will use SSH is a valid user name on the OmniSwitch.
- Refer to the Switch Management Guide for information on generating the public/private keys.

### Examples

```
-> installsshkey new_ssh_user /flash/system/new_ssh_user_rsa.pub
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

[revokesshkey](#)                                         Used to revoke a key from an SSH user.  
[show ssh](#)                                                 Displays the current SSH configuration for the switch.

### MIB Objects

N/A

---

## revokesshkey

Used to revoke a key from an SSH user.

```
revokesshkey user remote-user
```

---

### Syntax Definitions

*user* The local user name.  
*remote-user* The user on the remote client device.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

### Usage Guidelines

N/A

### Examples

```
-> revokesshkey new_ssh_user remote_ssh_user@192.168.10.1
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

[installsshkey](#) Used to install the public key used for SSH onto the switch.  
[show ssh](#) Displays the current SSH configuration for the switch.

### MIB Objects

N/A

---

## show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to [page 63-26](#).

**show command-log**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The most recent commands are listed first.
- The command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

### Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
 UserName : admin
 Date : FRI JAN 09 00:20:01
 Ip Addr : 128.251.19.240
 Result : SUCCESS
Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
 UserName : admin
 Date : FRI JAN 09 00:19:44
 Ip Addr : 128.251.19.240
 Result : ERROR: Ip Address must not belong to IP VLAN 44 subnet
Command : command-log enable
 UserName : admin
 Date : FRI JAN 09 00:18:49
 Ip Addr : 128.251.19.240
 Result : SUCCESS
```

|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command</b>  | The exact syntax of the command, as entered by the user.                                                                                                                                                                                                                               |
| <b>UserName</b> | The name of the user session that entered the command. For more information on different user session names, refer to the <a href="#">user command on page 41-60</a> , or the “Managing Switch User Accounts” chapter in the <i>OmniSwitch AOS Release 8 Switch Management Guide</i> . |
| <b>Date</b>     | The date and time, down to the second, when the command was entered.                                                                                                                                                                                                                   |
| <b>IpAddr</b>   | The IP address of the terminal from which the command was entered.                                                                                                                                                                                                                     |
| <b>Result</b>   | The outcome of the command entry. Options include <b>SUCCESS</b> and <b>ERROR</b> . For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.                                              |

---

### Usage Guidelines

If VRF is specified, the current status of the SSH daemon for the specified VRF is displayed.

### Examples

```
vrfl::-> show ssh
Ssh Admin-State = Enabled
Ssh Port = 22
Ssh Enforce-Pubkey-Auth = Disabled
Ssh Strong-Ciphers = Disabled
Ssh Strong-Hmacs = Disabled
Ssh login-grace-time = 600 seconds
```

### Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **Ssh Strong-Ciphers** and **Ssh Strong-Hmacs** fields added.

Release 8.3.1.R02; **Ssh login-grace-time** field added.

## Related Commands

# 64 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

*Filename:* ALCATEL-IND1-CHASSIS-MIB.mib  
*Module:* alcatelIND1ChassisMIB

A summary of the available commands is listed here:

---

|                        |                                                                                                                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>File System</b>     | <b>cd</b><br><b>pwd</b><br><b>mkdir</b><br><b>rmdir</b><br><b>ls</b><br><b>rm</b><br><b>cp</b><br><b>sep</b><br><b>mv</b><br><b>chmod</b><br><b>freespace</b><br><b>fck</b><br><b>newfs</b> |
| <b>System Services</b> | <b>vi</b><br><b>tty</b><br><b>show tty</b><br><b>tftp</b><br><b>sftp</b><br><b>ftp</b><br><b>show ftp</b>                                                                                   |

---

## cd

Changes the current working directory of the switch.

`cd [path]`

---

### Syntax Definitions

*path* Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

### Defaults

The default working directory of the switch is `/flash`.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

### Examples

```
-> cd
-> cd /flash/certified
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

|              |                                                                                  |
|--------------|----------------------------------------------------------------------------------|
| <b>pwd</b>   | Displays the current working directory of the switch.                            |
| <b>mkdir</b> | Creates a new directory.                                                         |
| <b>rmdir</b> | Deletes an existing directory.                                                   |
| <b>ls</b>    | Displays the contents of a specified directory or the current working directory. |
| <b>rm</b>    | Deletes the contents of a specified directory or the current working directory.  |

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The **mkdir** command can also be used on the secondary CMM.

### Examples

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mkdir [OPTIONS] DIRECTORY...
```

```
Create DIRECTORY
```

```
Options:
```

```
-m Mode
-p No error if exists; make parent directories as needed
```

## Release History

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> rmdir ./working
-> rmdir flash/working
-> rmdir ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: rmdir [OPTIONS] DIRECTORY...

Remove DIRECTORY if it is empty

Options:

```
-p|--parents Include parents
--ignore-fail-on-non-empty
```

### Release History

| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

### Examples

```
-> ls
-> ls -l /flash/certified
-> ls ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: ls [-lAacCddeFfiIlmnrRrSsTtuvwxXhk] [FILE]...
```

List directory contents

Options:

```
-l List in a single column
-A Don't list . and ..
-a Don't hide entries starting with .
-C List by columns
-c With -l: sort by ctime
--color[={always,never,auto}] Control coloring
-d List directory entries instead of contents
-e List full date and time
-F Append indicator (one of */=@|) to entries
-i List inode numbers
-l Long listing format
```

```
-n List numeric UIDs and GIDs instead of names
-p Append indicator (one of /=@|) to entries
-L List entries pointed to by symlinks
-R Recurse
-r Sort in reverse order
-S Sort by file size
-s List the size of each file, in blocks
-T N Assume tabstop every N columns
-t With -l: sort by modification time
-u With -l: sort by access time
-v Sort by version
-w N Assume the terminal is N columns wide
-x List by lines
-X Sort by extension
-h List sizes in human readable format (1K 243M 2G)
```

## Release History

| <b>rmdir</b> | Deletes an existing directory.                                                   |
| <b>rm</b>    | Displays the contents of a specified directory or the current working directory. |

## MIB Objects

```
systemServices
 systemServicesArg1
 systemServicesAction
```

---

## rm

Permanently deletes an existing file.

**rm** [*options*] [*path/filename*]

---

### Syntax Definitions

*options* Use the '?' on the command line for a list of options.  
*filename* Specifies the file or directory path.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

### Examples

```
-> rm test_config_file
-> rm flash/test_config_file
-> rm ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: rm [OPTIONS] FILE...

Remove (unlink) FILEs

Options:

```
-i Always prompt before removing
-f Never prompt
-R, -r Recurse
```

## Release History

## cp

Copies an existing file. This command can also copy a directory if the `-r` keyword is used.

`cp [options] source destination`

---

### Syntax Definitions

|                    |                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>options</i>     | Use the '?' on the command line for a list of options.                                                                                                                                       |
| <i>source</i>      | The name of the existing file to be copied.                                                                                                                                                  |
| <i>destination</i> | The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- You should verify that the **/flash** directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
-> cp ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: cp [OPTIONS] SOURCE DEST

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:

- a Same as -dpR
- R,-r Recurse
- d,-P Preserve symlinks (default if -R)
- L Follow all symlinks
- H Follow symlinks on command line
- p Preserve file attributes if possible
- f Force overwrite
- i Prompt before overwrite
- l,-s Create (sym)links

### Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

### Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
```

```
-> scp ?
```

```
usage: scp [-1246BCpqr] [-c cipher] [-F ssh_config] [-i identity_file]
 [-l limit] [-o ssh_option] [-P port] [-S program]
 [[user@]host1:]file1 ... [[user@]host2:]file2

### Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY
```

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:

```
-f Don't prompt before overwriting
-i Interactive, prompt before overwrite
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**rm** Renames an existing file or directory.  
**cp** Copies an existing file or directory.

## MIB Objects

 systemServicesArg1
 systemServicesArg2
 systemServicesAction
```

---

## chmod

Changes the write privileges for a specified file.

```
chmod {+w |-w} [path/]file
```

---

### Syntax Definitions

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| <code>+w</code>    | Enables read-write privileges for the file.                              |
| <code>-w</code>    | Disables write privileges for the file—i.e., the file becomes read-only. |
| <code>path/</code> | The path containing the file for which privileges are being changed.     |
| <code>file</code>  | The name of the file for which read-write privileges are being changed.  |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

## newfs

Deletes the complete **/uflash** file system and all files within it, replacing it with a new, empty **/uflash** file system. Use this command when you want to reload all files in the file system or in the unlikely event that the **/uflash** file system becomes corrupt.

**newfs /uflash**

---

### Syntax Definitions

**/uflash** This indicates that the complete file system will be replaced.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.

### Examples

```
-> newfs /uflash
```

### Release History

Release 7.1.1; command introduced.

## vi

Launches the switch's Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

**vi** [*options*] [*path*]/*filename*

---

### Syntax Definitions

|                 |                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>options</i>  | Use the '?' on the command line for a list of options.                                                                                    |
| <i>path</i> /   | The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory. |
| <i>filename</i> | The name of the existing file being viewed or edited.                                                                                     |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

### Examples

```
-> vi test_config_file
-> vi ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: vi [OPTIONS] [FILE]...

Edit FILE

Options:

```
-c Initial command to run ($EXINIT also available)
-R Read-only
-H Short help regarding available features
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**tty** Displays current TTY settings.

## MIB Objects

```
systemServices
 systemServicesTtyLines
 systemServicesTtyColumns
```

---

## tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

**tty** *lines columns*

---

### Syntax Definitions

*lines* The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.

*columns* The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

### Defaults

| parameter      | default |
|----------------|---------|
| <i>lines</i>   | 24      |
| <i>columns</i> | 80      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the **vi** or **tftp** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

### Examples

```
-> tty 10 60
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**show tty** Displays current TTY settings.

 systemServicesTtyColumns
```

---

## tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

**tftp** [*options*] **host** [**port**]

---

### Syntax Definitions

|                |                                                     |
|----------------|-----------------------------------------------------|
| <i>options</i> | Enter a question mark (?) to get a list of options. |
| <i>host</i>    | Specifies the IP address of the TFTP server.        |
| <i>port</i>    | Specifies the port for the TFTP transfer.           |

### Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

### Examples

```
-> tftp -g -l local_file -r remote_file 198.51.100.100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

|------------|----------------------------------------------------------------------------------|
| <b>cd</b>  | Changes the current working directory of the switch.                             |
| <b>pwd</b> | Displays the current working directory of the switch.                            |
| <b>ls</b>  | Displays the contents of a specified directory or the current working directory. |

## **MIB Objects**

N/A

---

## sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

**sftp** [*options*] {*ip\_address*}

---

### Syntax Definitions

*options* Enter a question mark (?) to get a list of options.  
*ip\_address* Specifies the IPv4 or IPv6 address for the SFTP session.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

|                                     |                                                         |
|-------------------------------------|---------------------------------------------------------|
| <b>cd path</b>                      | Change remote path to 'path'.                           |
| <b>lcd path</b>                     | Change local directory to 'path'.                       |
| <b>chmod mode path</b>              | Change permissions of file 'path' to 'mode'.            |
| <b>help</b>                         | Display command help information.                       |
| <b>get remote-path [local path]</b> | Download a file from the remote path to the local path. |
| <b>lls [path]</b>                   | Display local directory listing.                        |
| <b>ln oldpath newpath</b>           | Creates a symbolic link (symlink) to the remote file.   |
| <b>symlink oldpath newpath</b>      | Creates a symbolic link (symlink) to the remote file.   |
| <b>mkdir path</b>                   | Create local directory.                                 |
| <b>lpwd</b>                         | Print local working directory.                          |
| <b>ls [path]</b>                    | Display remote directory listing.                       |
| <b>mkdir path</b>                   | Create remote directory.                                |

---

|                                     |                                                      |
|-------------------------------------|------------------------------------------------------|
| <b>put local-path [remote-path]</b> | Upload file.                                         |
| <b>pwd</b>                          | Display remote working directory.                    |
| <b>exit</b>                         | Quit the sftp mode.                                  |
| <b>quit</b>                         | Exit the sftp mode.                                  |
| <b>rename oldpath newpath</b>       | Rename a remote file.                                |
| <b>rmdir path</b>                   | Remove remote directory.                             |
| <b>rm path</b>                      | Delete remote file.                                  |
| <b>version</b>                      | Show the current SFTP version.                       |
| <b>?</b>                            | Synonym for help. Displays command help information. |

---

## Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
usage: sftp [-lCv] [-B buffer_size] [-b batchfile] [-F ssh_config]
 [-o ssh_option] [-P sftp_server_path] [-R num_requests]
 [-S program] [-s subsystem | sftp_server] host
sftp [[user@]host[:file [file]]]
sftp [[user@]host[:dir[/]]]
sftp -b batchfile [user@]host
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ftp** Starts an FTP session.

**ssh** Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

## MIB Objects

```
SystemServices
 systemServicesArg1
 systemServicesAction
```

---

## ftp

Starts an FTP session.

```
ftp {port [default | service_port] | admin-state [enable | disable] | ip_address}
[vrf name] ftp admin-state [enable | disable]
```

---

### Syntax Definitions

|                         |                                                                         |
|-------------------------|-------------------------------------------------------------------------|
| <i>name</i>             | The name of the VRF.                                                    |
| <b>default</b>          | Sets the port back to the default of 21.                                |
| <i>service_port</i>     | The TCP service port number. Must be 21 or between between 20000-20999. |
| <b>enable   disable</b> | Enables or disables FTP access.                                         |
| <i>ip_address</i>       | Specifies the IPv4 address for the FTP session.                         |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- You must have a valid username and password for the specified host.
- The default FTP directory is **/flash**.

### Examples

```
-> ftp port 20000
-> ftp admin-state disable
-> ftp 172.17.6.228
-> vrf vrf1 ftp admin-state enable
```

### Release History

Release 7.1.1; command introduced.  
Release 7.3.1; **vrf** parameter added.

## Related Commands

|                  |                                                                                  |
|------------------|----------------------------------------------------------------------------------|
| <code>cd</code>  | Changes the current working directory of the switch.                             |
| <code>pwd</code> | Displays the current working directory of the switch.                            |
| <code>ls</code>  | Displays the contents of a specified directory or the current working directory. |

## MIB Objects

```
systemServices
 systemServicesArg1
 systemServicesAction
 alaIpFtpAdminStatus
```

---

## show ftp

Displays the current FTP server settings like the port used for FTP, the FTP server's status in the given VRF.

```
[vrf name] show ftp
```

---

### Syntax Definitions

*name* The name of the VRF.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |

# 65 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

*Filename:* ALCATEL-IND1-WEBMGT-MIB.mib  
*Module:* alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

---

**webview server**  
**webview access**  
**webview force-ssl**  
**webview http-port**  
**webview https-port**  
**webview ssl-strong-ciphers**  
**webview wlan cluster-virtual-ip precedence**  
**webview wlan cluster-virtual-ip**  
**show webview**  
**show webview wlan config**

---

## webview server

Enables or disables the web management server on the switch.

`[vrf name] webview server {enable | disable}`

---

### Syntax Definitions

|                |                                                   |
|----------------|---------------------------------------------------|
| <i>name</i>    | The name of the VRF.                              |
| <b>enable</b>  | Enables the web management server on the switch.  |
| <b>disable</b> | Disables the web management server on the switch. |

### Defaults

| parameter      | default |
|----------------|---------|
| WebView Server | Enabled |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If the WebView Server is disabled, WebView Access is automatically disabled.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

### Examples

```
-> webview server enable
-> webview server disable
-> vrf vrf1 webview server enable
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

**Related Commands**[webview access](#)

Enables/disables WebView access on the switch.

[show webview](#)

Displays web management configuration information.

**MIB Objects**

alaIND1WebMgtConfigMIBGroup

alaInd1WebMgtServerStatus

---

## webview access

Enables or disables web management access on the switch.

`[vrf name] webview access {enable | disable}`

---

### Syntax Definitions

|                |                                                   |
|----------------|---------------------------------------------------|
| <i>name</i>    | The name of the VRF.                              |
| <b>enable</b>  | Enables the web management access on the switch.  |
| <b>disable</b> | Disables the web management access on the switch. |

### Defaults

| parameter      | default |
|----------------|---------|
| WebView Access | Enabled |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If Web Access is enabled, the WebView Server is automatically enabled.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

### Examples

```
-> webview access enable
-> webview access disable
-> vrf vrf1 webview access enable
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

## Related Commands

[webview server](#)

Enables/disables the web server on the switch.

Displays web management configuration information.

## MIB Objects

alaIND1WebMgtConfigMIBGroup

alaInd1WebMgtAdminStatus

---

## webview force-ssl

Enables or Disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients.

`webview force-ssl {enable | disable}`

---

### Syntax Definitions

|                |                                                                              |
|----------------|------------------------------------------------------------------------------|
| <b>enable</b>  | Enables the requirement to use SSL to access the switch when using WebView.  |
| <b>disable</b> | Disables the requirement to use SSL to access the switch when using WebView. |

### Defaults

| parameter | default |
|-----------|---------|
| Force SSL | Enabled |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The switch contains a self-signed certificate that may prompt a certificate warning.

### Examples

```
-> webview force-ssl enable
-> webview force-ssl disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

|                                |                                                    |
|--------------------------------|----------------------------------------------------|
| <a href="#">webview access</a> | Enables/disables WebView access on the switch.     |
| <a href="#">show webview</a>   | Displays web management configuration information. |

### MIB Objects

alaIND1WebMgtConfigMIBGroup

alaInclWebMgtSsl

---

## webview http-port

Changes the port number for the embedded web management server.

```
webview http-port {default | port port}
```

---

### Syntax Definitions

**default**

Restores the port to its default (80) value.

*port*

The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

| parameter   | default |
|-------------|---------|
| <i>port</i> | 80      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> webview http-port port 1025
-> webview http-port default
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[webview access](#)

Enables/disables WebView access on the switch.

[show webview](#)

Displays web management configuration information.

## MIB Objects

alaIND1WebMgtConfigMIBGroup

alaIND1WebMgtHttpPort

---

## webview https-port

Changes the default secure (HTTPS) port for the embedded web management server.

```
webview https-port {default | port port}
```

---

### Syntax Definitions

**default** Restores the port to its default (443) value.

*port* The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

| parameter   | default |
|-------------|---------|
| <i>port</i> | 443     |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> webview https-port port 1026
-> webview https https-port default
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[webview access](#)

Enables/disables WebView access on the switch.

[show webview](#)

Displays web management configuration information.

## MIB Objects

alaIND1WebMgtConfigMIBGroup

alaIND1WebMgtHttpsPort

---

## webview ssl-strong-ciphers

Enables or disables support of only SSL strong cipher algorithms in order to prevent client opening connections to the switch using weak algorithms.

`webview ssl-strong-ciphers {enable | disable}`

---

### Syntax Definitions

**enable** Enables the strong cipher requirement.

**disable** Disables the strong cipher requirement.

### Defaults

| parameter        | default |
|------------------|---------|
| enable   disable | enable  |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

When enabled the following algorithms will not be supported: RC4-SHA, RC4-MD5, ECDHE-RSA-RC4-SHA, IDEA-CBC-SHA, DES-CBC3-SHA, EDH-RSA-DES-CBC3-SHA, ECDHE-RSA-DES-CBC3-SHA, aNULL, eNULL, EXPORT, DES, MD5, PSK, RC4.

### Examples

```
-> webview ssl-strong-ciphers enable
-> webview ssl-strong-ciphers disable
```

### Release History

Release 8.4.1.R02; command was introduced.

### Related Commands

---

## webview wlan cluster-virtual-ip precedence

Sets the preference for obtaining the cluster virtual IP address for WebView re-direct. The WLAN cluster virtual IP address can be obtained from LLDP or configured manually. The precedence allows to set the preference between the LLDP and manual configuration in case when both are available.

**webview wlan cluster-virtual-ip precedence {lldp | configured}**

---

### Syntax Definitions

|                   |                                                                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>lldp</b>       | The preference to obtain the WLAN cluster virtual IP address is set to LLDP.                                                    |
| <b>configured</b> | The preference to obtain the WLAN cluster virtual IP address is set to the manually configured WLAN cluster virtual IP address. |

### Defaults

| parameter         | default |
|-------------------|---------|
| lldp   configured | lldp    |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | Yes  | Yes   | Yes  | No   | No              | No                                                            | Yes  |

### Usage Guidelines

- Use this command to set the preference for obtaining the cluster virtual IP address for WebView re-direct.
- If more than one cluster virtual IP address is obtained through LLDP on the same port, the recently obtained IP is considered.
- If more than one cluster virtual IP is obtained through LLDP on different ports, the recently obtained IP is considered.
- If the precedence is set for LLDP obtained IP address, but there is no LLDP obtained cluster virtual IP address, then the manually configured cluster virtual IP address will be considered if configured.
- If the precedence is set for manually configured cluster virtual IP address, but there is no configured IP address present, then the LLDP obtained cluster virtual IP address will be considered if received.

### Examples

```
-> webview wlan cluster-virtual-ip precedence lldp
-> webview wlan cluster-virtual-ip precedence configured
```

## Release History

Release 8.4.1 R02; command was introduced.

## Related Commands

[show webview wlan config](#) Displays the AP cluster virtual IP configured on the switch.

## MIB Objects

alaIND1WebMgtWlanIpPrecedence

---

## webview wlan cluster-virtual-ip

Configures the cluster virtual IP address of the Access Point (AP) in the switch. The WebView server on the switch redirects the URL to the AP (Virtual IP Address) URL when the WLAN Management is accessed from WebView.

**webview wlan cluster-virtual-ip** *virtual-ip-address-of-wlan-cluster*

---

### Syntax Definitions

*virtual-ip-address-of-wlan-cluster* Virtual IP address (IPV4) of the AP cluster.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | Yes  | Yes   | Yes  | No   | No              | No                                                            | Yes  |

### Usage Guidelines

Use this command to configure the AP cluster virtual IP address to access the OAW-AP web interface from the WebView.

### Examples

```
-> webview wlan cluster-virtual-ip 10.25.6.8
```

### Release History

Release 8.4.1 R02; command was introduced.

### Related Commands

[show webview wlan config](#) Displays the AP cluster virtual IP configured on the switch.

### MIB Objects

alaIND1WebMgtWlanConfiguredIpAddress

---

## show webview wlan config

Displays the cluster virtual IP precedence configuration, WLAN AP cluster virtual IP configured on the switch, and WLAN AP cluster virtual IP obtained through LLDP.

**show webview wlan config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | Yes  | Yes   | Yes  | No   | No              | No                                                            | Yes  |

### Usage Guidelines

N/A

### Examples

```
-> show webview wlan config
WebView WLAN Cluster-Virtual-IP Precedence = LLDP
WebView WLAN Cluster-Virtual-IP configured address = 0.0.0.0
WebView WLAN Cluster-Virtual-IP LLDP address = 1.1.1.1
```

#### *output definitions*

---

**WebView WLAN Cluster-Virtual-IP Precedence** The precedence set for obtaining the cluster virtual IP address of the AP.

**WebView WLAN Cluster-Virtual-IP configured address** The manually configured cluster virtual IP address.

**WebView WLAN Cluster-Virtual-IP LLDP address** The cluster virtual IP address obtained from the LLDP packets.

---

### Release History

Release 8.4.1R02; command was introduced.

## Related Commands

- webview wlan cluster-virtual-ip precedence** Allows to set the preference for the choice of cluster virtual IP address for WebView re-direct.
- webview wlan cluster-virtual-ip** Configures the virtual IP address of the Access Point (AP) clusters in the switch.

## MIB Objects

```

```

---

## show webview

Displays web management configuration information.

`[vrf name] show webview`

---

### Syntax Definitions

*name* The name of the VRF.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

If a VRF name is specified, the enabled/disabled state for WebView Server and WebView Access for the specified VRF is displayed.

### Examples

```
-> show webview
```

```
WebView Server = Enabled
WebView Access = Enabled
WebView Force-SSL = Enabled
WebView HTTPS-Port = 443
WebView SSL-Strong-Ciphers = Enabled
WebView TLS Version = 1.2
```

```
vrf1::-> show webview
WebView Server = Enabled,
WebView Access = Enabled,
WebView Force-SSL = Enabled,
WebView HTTPS-Port = 443
WebView SSL-Strong-Ciphers = Enabled
```

### output definitions

---

|                       |                                                                 |
|-----------------------|-----------------------------------------------------------------|
| <b>WebView Server</b> | Indicates whether web management server is enabled or disabled. |
| <b>WebView Access</b> | Indicates whether web management access is enabled or disabled. |

*output definitions (continued)*

---

|                                  |                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Force SSL</b>                 | Indicates whether Force SSL is enabled or disabled. If this is enabled it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server. |
| <b>Web Management Https Port</b> | The port configured for a secure HTTP connection (SSL enabled).                                                                                                                             |
| <b>Web SSL-Strong-Ciphers</b>    | Indicates whether SSL strong cipher requirement is enabled or disabled.                                                                                                                     |

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

**Related Commands**

# 66 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

*Filename:* ALCATEL-IND1-CONFIG-MGR-MIB.mib  
*Module:* alcatelIND1ConfigMgrMIB

A summary of the available commands is listed here:

---

**configuration apply**  
**configuration error-file-limit**  
**show configuration status**  
**configuration cancel**  
**configuration syntax-check**  
**configuration snapshot**  
**show configuration snapshot**  
**write terminal**  
**configuration apply network-sync**

---

## configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

**configuration apply** *filename* [**at** *hh:mm month dd [year]*] | [**in** *hh[:mm]*] [**verbose**]

---

### Syntax Definitions

|                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>filename</i>                                                          | The name of the configuration text file to be applied to the switch (e.g., <b>newfile1</b> ).                                                                                                                                                                                                                                                                                                                                                  |
| <b>at</b> <i>hh:mm</i><br>{ <i>dd month   month dd</i> } [ <i>year</i> ] | Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59. Values for <i>dd</i> range from 01 through 31. Values for month range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date. |
| <b>in</b> <i>hh[:mm]</i>                                                 | Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00–59.                                                                                                                                                                                                                    |
| <b>verbose</b>                                                           | When verbose is entered, information is displayed on your workstation's console as each command in the configuration file is applied.                                                                                                                                                                                                                                                                                                          |

### Defaults

By default, **verbose** error checking is not performed.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **boot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.

- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.
- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword represents a login password that has been encrypted *twice*. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to [page 41-65](#).

## Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

---

**Note.** When the **configuration apply** command is entered *without at or in* syntax information, one or more dots “.” is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**configuration syntax-check** Performs a syntax and authorization check of all CLI commands contained in a configuration file.

## MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
 configFileName
 configFileMode
 configFileAction
 configTimerFileName
 configTimerFileTime
```

---

## configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their **.err** extension. When the maximum number of **.err** files is exceeded, any new error file will overwrite the **.err** file with the oldest timestamp.

**configuration error-file-limit** *number*

---

### Syntax Definitions

*number* Indicate the number of error files allowed in the **/flash** directory. The valid range is from 1 to 25 files.

### Defaults

| parameter     | default |
|---------------|---------|
| <i>number</i> | 1       |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the **.err** extension.
- If you want to save an error file, you may change the file name so that it does not have the **.err** extension, or you can move it from the **/flash** directory.

### Examples

```
-> configuration error-file-limit 2
-> configuration error-file-limit 1
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

**configuration cancel** Cancels a pending timer session for a configuration file.

**MIB Objects**

alcatelIND1ConfigMgrMIBObjects

---

## show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

**show configuration status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- A timer session can be scheduled using the **configuration apply** command. For more information, refer to [page 66-2](#).
- The screen output **File configuration </path/filename>: scheduled at dd/mm hh:mm** indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration </path/filename>: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the **write memory** command.

## Examples

```
-> show configuration status
```

```

---

## configuration syntax-check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

**configuration syntax-check** *path/filename* [**verbose**]

---

### Syntax Definitions

*path/filename*

The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, **/flash/working/asc.1.snap**.

**verbose**

When **verbose** is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When **verbose** is *not* specified in the command line, cursory information (number of errors and error log file name) will be printed to the console *only if a syntax or configuration error is detected*.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax-check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

## Examples

```
-> configuration syntax-check vlan_file1
..
```

---

**Note.** When the **configuration syntax-check** command is entered, one or more dots “.” is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

---

## Release History

## configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

**configuration snapshot** [*feature\_list* | **all**] [*path/filename*]

---

### Syntax Definitions

|                      |                                                                                                                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>feature_list</i>  | The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Enter a question mark (?) on the command line to get a list of features ( <b>configuration snapshot ?</b> ).                                                 |
| <b>all</b>           | Includes all network features in the snapshot.                                                                                                                                                                                                                                                           |
| <i>path/filename</i> | A user-defined name for the resulting snapshot file. For example, <b>test_snmp_snap</b> . You may also enter a specific path for the resulting file. For example, the syntax <b>/flash/working/test_snmp_snap</b> places the <b>test_snmp_snap</b> file in the switch's <b>/flash/working</b> directory. |

### Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

### Examples

```
-> configuration snapshot all
-> configuration snapshot qos health aggregation new_file1
-> configuration snapshot snmp_snapshot snmp
```

## show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

**show configuration snapshot** [*feature\_list*]

---

### Syntax Definitions

*feature\_list*

Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma. Enter a question mark (?) on the command line to get a list of features (**show configuration snapshot ?**).

### Defaults

By default, this command shows configuration information for *all* features.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

## configuration backup restore

Allows to backup or restore the user custom configuration in the **/flash** directory.

**configuration {backup | restore}**

---

### Syntax Definitions

**backup** Backups the user custom configuration (session banner, user table and vcboot.cfg) in the **/flash** directory.

**restore** Restores the user custom configuration in the **/flash** directory.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- When backup option is issued, the session banner file, the vcboot.cfg of the current running directory and all the userTable files are collected and stored in a single tar file (sing tar file) in "/flash/config-recovery" folder.
- When restore option is issued, the backup file is extracted and restored to the current running directory. The switch must be reloaded for the restored files to be applied.
- The backup option can be issued multiple times. However only 10 backup occurrences will be stored in the recovery folder. Post the 10th occurrence the first occurrence is deleted to save the current backup file.

### Examples

```
-> configuration backup
-> configuration restore
```

### Release History

Release 8.7 R2; command was introduced.

|                       |                                                                                  |
|-----------------------|----------------------------------------------------------------------------------|
| <i>filename</i>       | The name of the file with the AOS configuration to be synchronized.              |
| <i>community-name</i> | Performs synchronization only on switches with the corresponding community name. |
| local-apply           | Apply the configuration to the local switch.                                     |

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the [configuration syntax-check](#) command to validate the configuration file syntax before network synchronization.
- It is recommended to have only global, and not local, level switch configuration information propagated for network level configurations.
- The file name “preprovision.txt” is a pre-defined name used for pre-provisioning purposes. Pre-provisioning applies only to new nodes that join the network, the configuration will not be applied to existing nodes. Refer to the AMS section of the Switch Management Guide for additional information.

### Examples

```
-> configuration apply network-sync preprovision.txt
-> configuration apply network-sync adaptive-test
```

### Release History

Release 8.6R1; command not supported.

### Related Commands

[configuration syntax-check](#) Performs a syntax and authorization check of all CLI commands contained in a configuration file.

### MIB Objects

N/A

# 67 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

*Filename:* SNMP-COMMUNITY-MIB.mib  
*Module:* snmpCommunityMIB

MIB information for Trap Manager commands is as follows:

*Filename* ALCATEL-IND1-TRAP-MGR-MIB.mib  
*Module:* alcatelIND1TrapMgrMIB

MIB information for SNMP Agent commands is as follows:

*Filename:* ALCATEL-IND1-SNMP-AGENT-MIB.mib  
*Module:* alcatelIND1SNMPAgentMIB

A summary of the available commands is listed here:

---

## snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

**snmp station** {*ip\_address* | *ipv6\_address* | *domain\_name*} [{*port*] [*username*] [**v1** | **v2** | **v3** | **v3 tsm local-identity** *local\_string* **remote-identity** *remote\_string*] [**enable** | **disable**]

**no snmp station** {*ip\_address* | *ipv6\_address* | *domain\_name*}

---

### Syntax Definitions

|                      |                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i>    | The IP address to which SNMP unicast traps will be sent.                                                                                                        |
| <i>ipv6_address</i>  | The IPv6 address to which SNMP unicast traps will be sent.                                                                                                      |
| <i>domain_name</i>   | A Fully Qualified Domain Name (FQDN) to which SNMP unicast traps will be sent. Specify a domain name up to 255 characters in length.                            |
| <i>port</i>          | A UDP or TLSTCP destination port.                                                                                                                               |
| <i>username</i>      | The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name. |
| <b>v1</b>            | Specifies that traps are sent using SNMP version 1.                                                                                                             |
| <b>v2</b>            | Specifies that traps are sent using SNMP version 2.                                                                                                             |
| <b>v3</b>            | Specifies that traps are sent using SNMP version 3.                                                                                                             |
| <b>tsm</b>           | The TSM security model for SNMP. The security model can be selected only for SNMP version 3.                                                                    |
| <i>local_string</i>  | The file name of the local certificate. To be configured when TSM mode is selected.                                                                             |
| <i>remote_string</i> | The file name of the remote certificate. To be configured when TSM mode is selected.                                                                            |
| <b>enable</b>        | Enables the specified SNMP station.                                                                                                                             |
| <b>disable</b>       | Disables the specified SNMP station.                                                                                                                            |

### Defaults

| parameter                         | default                             |
|-----------------------------------|-------------------------------------|
| <i>port</i>                       | 162 (for UDP)<br>10162 (for TLSTCP) |
| <b>v1</b>   <b>v2</b>   <b>v3</b> | <b>v3</b>                           |
| <b>enable</b>   <b>disable</b>    | <b>enable</b>                       |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

## Usage Guidelines

- Use the **no** form of the command to remove an existing SNMP station.
- When adding an SNMP station, specify an IP address or FQDN *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- A maximum of 50 SNMP sessions can be established in the switch.
- When modifying an SNMP station, specify an IP address or FQDN *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.
- For UDP the default port 162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified must correspond with the UDP destination port configured at the receiving SNMP station(s).
- For TLSTCP the default port 10162 is commonly used for traps; however, the destination port can be redefined to accommodate an SNMP station using a nonstandard port. The destination port specified must correspond with the TLSTCP destination port configured at the receiving SNMP station(s).
- To send SNMP traps over TLS connection, the SNMP station needs to be configured with TSM user along with certificate identities.
- The `local_identity` and `remote_identity` are the names of certificate file. If the contents of local or remote certificates are changed, the updated certificates must be manually copied from master or primary to all secondaries and slaves. A reboot is required for the changes to be applied.
- When TSM security model is enabled, all the v1/v2/v3 USM requests and traps are discarded.
- When TSM security model is disabled, all v1/v2/v3 (USM and TSM) requests and traps are allowed.
- In TSM security model SNMP requests are supported over IPv4 transport only.

## Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
```

```
-> snmp station 300::1 enable
-> no snmp station 300::1

-> snmp station upam.omnivista.com username2 v1 disable
-> snmp station upam.omnivista.com v2
-> no snmp station upam.omnivista.com
-> snmp station opendaylight.com enable v2 public
ERROR: DNS lookup failed, unknown host opendaylight.com
-> snmp station 168.22.1.1 joe v3 tsm local-identity aluSubagent.crt
remote-identity manager.crt enable
```

## Release History

Release 7.1.1; command was introduced.

Release 8.5R1; *domain\_name* parameter option added.

Release 8.6R1; **tsm**, **local-identity**, and **remote-identity** parameters added.

## Related Commands

[show snmp station](#) Displays the current SNMP station information.

### Syntax Definitions

|                     |                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------|
| <i>text_string</i>  | A text string that will be converted to a hexadecimal value. The valid range is 1–27 characters. |
| <i>mac_address</i>  | A specific MAC Address (for example, 00:00:39:59:f1:0c).                                         |
| <i>ipv4_address</i> | An IPv4 address that will be converted to a hexadecimal value.                                   |
| <i>ipv6_address</i> | An IPv6 address that will be converted to a hexadecimal value.                                   |

### Defaults

By default, the SNMP engine ID is set to the base MAC address for the switch appended to the enterprise value for OmniSwitch platforms (for example, if the enterprise value is “8000195603” and the switch base MAC address is “2c:fa:a2:13:e4:02”, then the default engine ID is set to “80001956032cfaa213e402”).

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- To set the engine ID back to the default value, specify the **mac-address** parameter and the **default** parameter with this command. For example, **snmp snmp-engineid-type mac-address snmp-engineid default**.
- Note that the **snmp-engineid** keyword is entered after the parameter that specifies the type of engine ID format to use and before the actual value that matches the specified parameter type. For example, if the **ipv4-address** parameter is specified, enter the IPv4 address value after the **snmp-engineid** keyword (**snmp snmp-engineid-type ipv4-address snmp-engineid 10.2.2.1**).
- When a text string, an IPv4 address, or an IPv6 address is specified, the value is automatically converted to a hexadecimal value that is then appended to the OmniSwitch enterprise value to form the SNMP engine ID for the switch.

### Examples

```
-> snmp snmp-engineid-type text snmp-engineid "test lab"
```

```
-> snmp snmp-engineid-type mac-address snmp-engineid 00:2a:95:01:02:03
-> snmp snmp-engineid-type ipv4-address snmp-engineid 168.22.2.2 111
-> snmp snmp-engineid-type mac-address snmp-engineid default
```

## Release History

### Syntax Definitions

|                         |                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>hash-key string</i>  | The hashed format of a community string.                                                                                                                                                                                        |
| <i>community_string</i> | A community string in the form of a text string. This string must be between 1 and 32 characters.                                                                                                                               |
| <i>useraccount_name</i> | A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters. |
| <b>enable</b>           | Enables SNMP community string mapping.                                                                                                                                                                                          |
| <b>disable</b>          | Disables SNMP community string mapping.                                                                                                                                                                                         |

### Defaults

By default, SNMP community map authentication is enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Community strings are stored in a hashed format in the **show configuration snapshot snmp** output. To view community string mappings in plain-text use the **show snmp community-map** command.
- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.

### Examples

```
-> snmp community-map community1 user testname1
-> snmp community-map community1 enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp community-map mode](#) Enables the local community strings database.

### MIB Objects

```
SNMPCommunityTable
 snmpCommunityIndex
 snmpCommunitySecurityName
 snmpCommunityStatus
```

---

## snmp community-map mode

Enables the local community strings database.

`snmp community-map mode {enable | disable}`

---

### Syntax Definitions

**enable** Enables SNMP community map database.  
**disable** Disables SNMP community map database.

### Defaults

| parameter      | default  |
|----------------|----------|
| Community mode | disabled |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name with SNMP privileges in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the [snmp community-map](#) command.

### Examples

```
-> snmp community-map mode enable
-> snmp community-map mode disable
```

### Release History

Release 7.1.1; command was introduced.

## Examples

```
-> snmp security no-security
-> snmp security authentication set
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap-only
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show snmp security](#) Displays the current SNMP security status.

## MIB Objects

```
SNMPAgtConfig
 SnpAgtSecurityLevel
```

## snmp security tsm

Enables or disables TLS encryption for SNMP access.

**snmp security tsm [enable | disable]**

---

### Syntax Definitions

**enable** Enables TLS encryption for SNMP access.

**disable** Disables TLS encryption for SNMP access.

### Defaults

By default, the TLS encryption for SNMP access is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The TLS encryption can be enabled only for SNMP version 3.
- In Common Criteria mode (CC mode) TLS encryption for SNMP is enabled by default and cannot be disabled.

### Examples

```
-> snmp security tsm enable
-> snmp security tsm disable
```

### Release History

Release 8.6R1; command was introduced.

### Related Commands

[snmp tsm-map](#) Displays the current SNMP security status.

### MIB Objects

```
SNMPAgtConfig
 snmpAgtTsmAdminState
```

---

## snmp tsm-map

Allows to map a remote identity or certificate to a user in TSM mode.

```
snmp tsm-map remote-identity remote_string user user_string
```

---

### Syntax Definitions

*remote\_string* File name of remote certificate to be mapped with the user. This string must be between 1 and 128 characters.

*user\_string* The user name. This string must be between 1 and 32 characters.

### Defaults

N/A.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- The remote identity mapping for user can be done only in TSM mode.
- The remote identity mapping can be done for only one user at a time. It cannot be mapped to multiple users. Mapping it to a different user will replace the existing user.
- If the content of remote certificate is changed, the updated certificate must be manually copied from master or primary to all secondaries and slaves. A reboot is required for the changes to be applied.

### Examples

```
-> snmp tsm-map remote-identity manager.crt user joe
-> snmp security tsm disable
```

### Release History

Release 8.6R1; command was introduced.

## Related Commands

### [show snmp tsm-map](#)

Displays the current SNMP TSM remote identity mapping for a user.

## MIB Objects

 alaSnmpTsmUserRemoteIdentity
 alaSnmpTsmUserName
```

---

## show snmp tsm-map

Displays the current SNMP TSM remote identity mapping for a user.

```
show snmp tsm-map
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

Enter the specific file name of the remote certificate to view the mapping related to it.

### Examples

```
-> show snmp tsm-map
Remote Identity User
-----+-----
manager.crt adam

-> show snmp tsm-map manager.pem
Remote Identity User
-----+-----
manager.pem joecool
```

## show snmp security

Displays the current SNMP security status.

**show snmp security [tsm]**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Refer to the command on page [67-18](#) for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.
- Use the optional parameter **tsm** along with the command to display the configured SNMP TSM status.

### Examples

```
-> show snmp security
snmp security = no security
```

```
-> show snmp security
snmp security = authentication set
```

```
-> show snmp security
snmp security = authentication all
```

```
-> show snmp security
snmp security = privacy set
```

```
-> show snmp security
snmp security = privacy all
```

```
-> show snmp security
snmp security = trap only
```

```
-> show snmp security tsm
snmp security tsm = disable
```

*output definitions*

## show snmp mib-family

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

**show snmp mib-family** [*table\_name*]

---

### Syntax Definitions

*table\_name*                      The name of the MIB table to be displayed.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

### Examples

```
-> show snmp mib-family trapStationTable
MIP ID MIB TABLE NAME FAMILY
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
73733 trapStationTable snmp
```

### output definitions

---

|                       |                                                                   |
|-----------------------|-------------------------------------------------------------------|
| <b>MIP ID</b>         | Identification number for the MIP associated with this MIB Table. |
| <b>MIB Table Name</b> | Name of the MIB table.                                            |
| <b>Family</b>         | Command family to which this MIB table belongs.                   |

## snmp-trap absorption

Enables or disables the trap absorption function.

`snmp-trap absorption {enable | disable}`

---

### Syntax Definitions

|                |                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>  | Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch. |
| <b>disable</b> | Disables SNMP trap absorption.                                                                                                                                                                                                                  |

### Defaults

By default, trap absorption is enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

To view the current trap absorption status, use the `show snmp-trap config` command.

### Examples

```
-> snmp-trap absorption enable
-> snmp-trap absorption disable
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****[show snmp-trap config](#)**

Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

**MIB Objects**

```
trapFilterTable
 trapAbsorption
```

---

## snmp-trap to-webview

Enables the forwarding of traps to WebView.

`snmp-trap to-webview {enable | disable}`

---

### Syntax Definitions

**enable** Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.

**disable** Disables WebView forwarding.

### Defaults

By default, WebView forwarding is enabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

### Usage Guidelines

To view the current WebView forwarding status, use the `show snmp-trap config` command.

### Examples

```
-> snmp-trap to-webview enable
-> snmp-trap to-webview disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show snmp-trap config](#) Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.

### MIB Objects

```
trapFilterTable
 trapToWebView
```

---

## snmp-trap replay-ip

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

**snmp-trap replay-ip** {*ip\_address* | *ipv6\_address* | *domain\_name*} [*seq\_id*]

---

### Syntax Definitions

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i>   | The IP address for the SNMP station to which traps will be replayed from the switch.                                                                                                                                                                                                                                                                                                                                   |
| <i>ipv6_address</i> | The IPv6 address for the SNMP station to which traps will be replayed from the switch.                                                                                                                                                                                                                                                                                                                                 |
| <i>domain_name</i>  | A Fully Qualified Domain Name (FQDN) for the SNMP station to which traps will be replayed. Specify a domain name up to 255 characters in length.                                                                                                                                                                                                                                                                       |
| <i>seq_id</i>       | The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Use the [show snmp station](#) command on [page 67-6](#) to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.

- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

## Examples

```
-> snmp-trap replay-ip 172.12.2.100
-> snmp-trap replay-ip 300::1
-> snmp-trap replay-ip upam.omnivista.com
```

## Release History

Release 7.1.1; command was introduced.

Release 8.5R1; *domain\_name* parameter option added.

## Related Commands

trapStationTable
 trapStationReplay
 trapStationNextSeq
alaTrapInetStationTable
 alaTrapInetStationReplay
 alaTrapInetStationNextSeq
```

---

## snmp-trap filter-ip

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

**snmp-trap filter-ip** {*ip\_address* | *ipv6\_address* | *domain\_name*} *trap\_id\_list*

**no snmp-trap filter-ip** {*ip\_address* | *ipv6\_address* | *domain\_name*} *trap\_id\_list*

---

### Syntax Definitions

|                     |                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i>   | The IP address for the SNMP station for which trap filtering is enabled or disabled.                                                                                                                                                |
| <i>ipv6_address</i> | The IPv6 address for the SNMP station for which trap filtering is enabled or disabled.                                                                                                                                              |
| <i>domain_name</i>  | A Fully Qualified Domain Name (FQDN) for the SNMP station for which trap filtering is enabled or disabled. Specify a domain name up to 255 characters in length.                                                                    |
| <i>trap_id_list</i> | Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma. |

### Defaults

By default, SNMP trap filtering is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- To *enable* trap filtering, use the syntax **snmp-trap filter-ip** *ip\_address* *trap\_id\_list*.
- To *disable* trap filtering, use the syntax **no snmp-trap filter-ip** *ip\_address* *trap\_id\_list*.
- When an FQDN is specified with this command, the switch will resolve the domain name to an IP address. Make sure the domain name maps to a valid and reachable IP address.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

## Examples

```
-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> snmp-trap filter-ip upam.omnivista.com 1 3 5
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> no snmp-trap filter-ip 300::1 1 3
-> no snmp-trap filter-ip upam.omnivista.com 1 3 5
```

## Release History

Release 7.1.1; command was introduced.

Release 8.5R1; *domain\_name* parameter option added.

## Related Commands

[show snmp-trap filter-ip](#)

Displays the current SNMP trap filter status.

[show snmp-trap config](#)

Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

## MIB Objects

```
trapFilterTable
 trapFilterStatus
alaTrapInetFilterTable
 alaTrapInetFilterStatus
```

---

## snmp authentication-trap

Enables or disables SNMP authentication failure trap forwarding.

**snmp authentication-trap {enable | disable | mode {standard | private | both}}**

---

### Syntax Definitions

|                 |                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable</b>   | Enables authentication failure trap forwarding. When enabled, an authentication failure trap is sent each time an SNMP authentication failure is detected. |
| <b>disable</b>  | Disables authentication failure trap forwarding.                                                                                                           |
| <b>standard</b> | Only standard <i>authenticationFailure</i> notification will be sent.                                                                                      |
| <b>private</b>  | Only <i>alaAuthenticationFailure</i> notification failure will be sent.                                                                                    |
| <b>both</b>     | Both <i>authenticationFailure</i> and <i>alaAuthenticationFailure</i> notifications will be sent.                                                          |

### Defaults

| parameter        | default  |
|------------------|----------|
| enable   disable | disabled |
| mode             | standard |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

The *alaAuthenticationFailure* trap is enhanced to include the source IP address of the authentication failure.

### Examples

```
-> snmp authentication-trap enable
-> snmp authentication-trap disable
-> snmp authentication-trap mode private
```

### Release History

Release 7.1.1; command was introduced.

Release 8.9R3; **mode** parameter added.

## Related Commands

**show snmp authentication-trap** Displays the current authentication failure trap forwarding status.

## MIB Objects

```
snmpGroup
 snmpEnableAuthenTraps
 snmpAuthTrapMode
```

---

## show snmp-trap replay-ip

Displays SNMP trap replay information.

```
show snmp-trap replay-ip
```

---

| <a href="#">show snmp mib-family</a> | Displays SNMP MIB information.                               |
| <a href="#">snmp-trap absorption</a> | Enables or disables the trap absorption function.            |
| <a href="#">snmp-trap to-webview</a> | Enables or disables the forwarding of SNMP traps to WebView. |

**MIB Objects**

```
trapConfigTable
 trapConfigEntry
```

---

## event-action

Triggers the specified script to run when the specified event occurs.

```
event-action {trap trigger_string script script_string | script-time-limit num}
```

```
no event-action trap name
```

---

### Syntax Definitions

|                       |                                                                        |
|-----------------------|------------------------------------------------------------------------|
| <i>trigger_string</i> | The name of the trigger. In the case of a trap, this is the trap name. |
| <i>script_string</i>  | The path and the name of the script to run.                            |
| <i>num</i>            | The maximum amount of time a script can run (30-600).                  |
| <i>name</i>           | The name of the trap to remove the event from.                         |

### Defaults

| parameter         | default     |
|-------------------|-------------|
| script-time-limit | 60 seconds. |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- If the prefix for the script is not **/flash/python**, the path will be assumed to be under that directory.
- Each event can only be assigned a single script but a script can be assigned to multiple events.
- Only users that have write privileges for the AAA partition management family can create scripts in the **/flash/python** directory.
- The **show snmp-trap config** command can be used to view the list of traps available on the switch.

### Examples

```
-> event-action trap linkDown script /flash/python/link_event.py
-> event-action trap stpNewRoot script stp_event.py
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

### [show event-action](#)

Shows the scripts and statistics associated with the events.

## MIB Objects

```
alaEventActionTable
 alaEventActionType
 alaEventActionName
 alaEventActionScriptName
 alaEventActionRowStatus
```

---

## show event-action

Displays the scripts and statistics associated with the events.

**show event-action** [**statistics** | **trap** *name* [**statistics**]]

---

### Syntax Definitions

**name** The name of the trap to display statistics for.

**statistics** Displays the statistics for all configured events or a specific trap.

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

In the case of a virtual-chassis, the event-script can be run independently on the Master or Slave chassis. The Master and slave chassis have separate launch counters and the script launch counter will not be synchronized across chassis.

### Examples

```
-> show event-action
```

```

type name script (/flash/python/...)
-----+-----+-----+-----+
trap linkDown link_event.py
trap stpNewRoot stp_event.py
trap sessionAuthenticationTrap catchAll.py

```

```
-> show event-action statistics
```

```

Type Name Script Launch
Type Name Last Launched Count
-----+-----+-----+-----+
trap linkDown 2014-10-23 13:45:34 2

```

### output definitions

---

**Type** The type of event trigger.

**Name** The name of the event. In the case of a trap, this is the trap name.

**Script** The name and location of the script associated with the event.

*output definitions (continued)*

---

|                             |                                                                |
|-----------------------------|----------------------------------------------------------------|
| <b>Script Last Launched</b> | The date and time the script was last run.                     |
| <b>Launch Count</b>         | The number of times the script has been launched by the event. |

---

**Release History**

Release 7.3.4; command was introduced.

**Related Commands**

[event-action](#) This command will cause the specified script to be run when the specified event occurs.

**MIB Objects**

# 68 OmniVista Cirrus Commands

OmniVista Cirrus is a network management solution to deliver zero touch provisioning using cloud.

OmniVista Cirrus solution provides reduced costs, ease of devices provisioning and a unified wired/wireless management from the cloud. The solution also provides an ability to identify each device uniquely and provide a freemium/premium solution based on the user policy.

Deployment of OmniVista Cirrus provides easy to use management and monitoring tools in a network and the ability to manage the network using devices ranging from workstations to smart phones.

MIB information for the OmniVista Cirrus commands is as follows:

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

A summary of the available commands is listed here.

---

**cloud-agent admin-state**  
**cloud-agent discovery-interval**  
**cloud-agent remove-inconsistent-certificate**  
**show cloud-agent status**  
**show cloud-agent vpn status**  
**naas license call-home interval**  
**naas license apply file**  
**show naas license**  
**show naas-agent status**

---

## cloud-agent admin-state

Enables or disables OmniVista Cirrus functionality globally for the switch.

**cloud-agent admin-state** {enable | disable | disable force | restart}

---

### Syntax Definitions

|                      |                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------|
| <b>enable</b>        | Enables OmniVista Cirrus for the switch.                                                    |
| <b>disable</b>       | Disables OmniVista Cirrus for the switch.                                                   |
| <b>disable force</b> | Disables OmniVista Cirrus for the switch and disconnects from the VPN.                      |
| <b>restart</b>       | Restart option implicitly triggers “ <b>disable force</b> ” followed by “ <b>enabled</b> ”. |

### Defaults

By default, OmniVista Cirrus is globally enabled for the switch.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- OmniVista Cirrus is globally enabled for the switch only when the switch boots up without a configuration file [(vc)boot.cfg] or the configuration file size is zero bytes.
- If the switch boots up with a configuration file, the feature is enabled only if the administrative state of OmniVista Cirrus is explicitly enabled using the **cloud-agent admin-state** command. Hence, the default value is disabled in this case.
- The switch must have access to the DHCP server in the customer network with zero configurations on the devices.
- If the OmniVista Cirrus administrative state is disabled at run-time, it will take effect only after a reboot.
- If the OmniVista Cirrus administrative state is enabled at run-time, it will immediately trigger call-home with the activation server, if a connection was not established prior to that.
- When the OmniVista Cirrus administrative state is disabled at run-time while the connection is in progress or established, it will not have any consequences on the switch. If **write memory** is issued, the switch will not call-home even if the switch reboots or has a takeover. However, if the discovery interval timer is running, the next call-home will be terminated.

- The restart option implicitly triggers the administrative states of **disable force** followed by **enabled**. This will enable a user to restart call-home from OmniVista Cirrus.
- If the switch is in an intermediate state (downloading an image from image server, pre-provisioning, write memory, flash syncro, call-home, etc.), the **cloud agent admin state disable force** will display an error message: “*OV Cloud agent is in progress. Please retry after some time.*”

## Examples

```
-> cloud-agent admin-state enable
-> cloud-agent admin-state disable
```

## Release History

Release 8.4.1 R03; command introduced.

Release 8.5R1; **restart** parameter added.

## Related Commands

**cloud-agent discovery-interval** Configures the time interval after which the switch will call-home the activation server, in case of any fatal error.

**show cloud-agent status** Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

## MIB Objects

```
ovCloudAgent
 ovCloudAgentAdminState
```

---

## cloud-agent discovery-interval

Configures the time interval after which the switch will call-home to the activation server, in case of any error.

**cloud-agent discovery-interval** *minutes*

---

### Syntax Definitions

*minutes* The time interval to call-home after an error. The valid range is 2-3600 minutes.

### Defaults

By default, the discovery interval is set to 30 minutes.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Call-home with the activation server will be immediately triggered when OmniVista Cirrus administrative state is enabled at run-time, if a connection was not established prior to that.
- When the OmniVista Cirrus administrative state is disabled at run-time while the connection is in progress or in an established connection, it will not have any consequences on the switch. If **write memory** is issued, the switch will not call-home even if the switch reboots or has a takeover. However, if the discovery interval timer is running, the next call home will be terminated.
- When trying to connect to the openVPN server, if the connection is not established in 90 seconds, the switch will move to an error state and will call home after the expiry of the discovery interval.

### Examples

```
-> cloud-agent discovery-interval 60
-> cloud-agent discovery-interval 90
```

### Release History

Release 8.4.1 R03; command introduced.

## Related Commands

### [cloud-agent admin-state](#)

Enables or disables OmniVista Cirrus functionality globally for the switch.

### [show cloud-agent status](#)

Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

## MIB Objects

ovCloudAgent

    ovCloudAgentDiscoveryInterval

---

## cloud-agent remove-inconsistent-certificate

Removes the certificate received from the OmniVista Activation server on all units in the VC, if the certificate status is inconsistent.

**cloud-agent remove-inconsistent-certificate**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- When this command is issued, a warning is generated: *"This command may render the switch incapable of connecting with OV-Cloud if not used with caution. Confirm (Y/N):"*
- If accepted by pressing (Y) and the certificate status is not inconsistent, an error message is displayed: *"Certificate status is Consistent. Cannot delete certificate."* The existing OmniVista Cirrus agent state machine will not be interrupted.

### Examples

```
-> cloud-agent remove-inconsistent-certificate
```

### Release History

Release 8.5R1; command introduced.

**Related Commands****cloud-agent admin-state**

Enables or disables OmniVista Cirrus functionality globally for the switch.

**show cloud-agent status**

Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

**MIB Objects**

ovCloudAgent

ovCloudAgentRemoveInconsistentCertificate

---

## show cloud-agent status

Displays the OmniVista Cirrus status and parameters received from the DHCP and activation server.

### show cloud-agent status

---

#### Syntax Definitions

N/A

#### Defaults

N/A

#### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

#### Usage Guidelines

- The command **show cloud-agent status** will be valid only if call-home is enabled. Else, only the default values, if present, will be displayed.
- DHCP address, DHCP IP address mask, Gateway, Activation URL, Proxy URL, Proxy IP will be displayed based on the DHCP response parameters received.
- DNS server, DNS domain will be displayed with the current DNS configuration in the switch, if call-home is enabled.

#### Examples

```
-> show cloud-agent status
Admin State : Enabled,
Activation Server State : completeOK,
Device State : DeviceManaged,
Error State : None,
Cloud Group : pmrb98earnoc10,
DHCP Address : 135.254.171.88,
DHCP IP Address Mask : 255.255.255.0,

### Usage Guidelines

N/A

### Examples

```
-> show cloud-agent vpn status
VPN status : Connected,
VPN Assigned IP : 10.8.0.4,
VPN DPD time (sec) : 600
```

### output definitions

---

#### VPN Status

Refers to OmniVista Cirrus VPN status. The various VPN states are:

- **Connecting**—OpenVPN's initial state
- **Wait**—Waiting for initial response from server
- **Auth**—Authenticating with server
- **Get Config**—Downloading configuration options from server
- **Assign IP**—Assigning IP address to virtual network interface
- **Add Routes**—Adding routes to system
- **Connected**—Initialization sequence completed
- **Reconnecting**—A restart has occurred
- **Exiting**—A graceful exit is in progress

#### VPN Assigned IP

Displays the VPN server assigned IP for the VPN connection towards the OmniVista Cirrus.

#### VPN DPD time (sec)

Displays the VPN Dead Peer Detection (DPD) time value in seconds.

---

## naas license call-home interval

Configures the time interval for on-demand call-home to ALE License Activation Server instead of waiting for the next call-home interval.

**naas license call-home interval** {*minutes* | **now**}

---

### Syntax Definitions

|                |                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>minutes</i> | The time interval to call-home to ALE License Activation Server. The valid range is 0-1440 minutes.                                                        |
| <b>now</b>     | Specify “ <b>now</b> ” or “ <b>1</b> ” minute interval parameter for the call-home to start immediately without waiting for the already set time interval. |

### Defaults

By default, the call-home interval is set to 30 minutes.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Call-home with the ALE License Activation Server will be immediately triggered, when this command is applied on the switch.
- The call-home to the ALE License Activation Server will be continuous after this command is applied.
- On specifying the **now** parameter or **1** minute interval, call-home starts immediately without waiting for the already set time interval.
- If the call-home interval is set to “0” and device is in CAPEX undecided state, the NaaS call home will be disabled.
- The configured call-home interval can be modified or overridden by the ALE License Activation Server response later.

### Examples

```
-> naas license call-home interval 60
-> naas license call-home interval now
```

### Release History

Release 8.8R1; command introduced.

## Related Commands

### [show naas-agent status](#)

Displays the status and parameters received from the DHCP and ALE License Activation Server.

### [show naas license](#)

Displays all information related to NaaS license received from the ALE License Activation Server.

## MIB Objects

alaNaasConfig

    alaNaasConfigCallhomeInterval

---

## naas license apply file

Activates the NaaS license on the switch.

**naas license apply file\_name**

---

### Syntax Definitions

*file\_name*                      The name of the license file containing the license keys.

### Defaults

NaaS Essential License is the base license enabled by default.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | No   |

### Usage Guidelines

- Installs the license manually in case of no internet connection or to recover the switch from degraded state.
- The NaaS Essential License is the base License enabled by default on the OmniSwitch.

### Examples

```
-> naas license apply file licenseFile.v2c
```

### Release History

Release 8.8R1; command introduced.

# 69 OpenFlow Commands

OpenFlow is a communications interface defined between the control and forwarding layers that is used in a Software Defined Network (SDN). OpenFlow separates the control plane and the data plane in the switch. Traditionally, switches and routers have made decisions on where packets should travel based on rules local to the device. With OpenFlow, only the data plane exists on the switch itself, and all control decisions are communicated to the switch from a central Controller. The OmniSwitch can operate in AOS or OpenFlow mode, including a modified OpenFlow mode known as Hybrid mode.

MIB information for the Web Management commands is as follows:

*Filename:* ALCATEL-IND1-OPENFLOW-MIB.mib  
*Module:* alcatelIND1OpenflowMIB

A summary of the available commands is listed here:

---

|                          |                                                                                                                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

---

## openflow back-off-max

Configures the maximum amount of time to wait between Controller connection attempts.

`openflow back-off-max seconds`

---

### Syntax Definitions

*seconds*                                      The back-off-max value, in seconds. The valid range is from 0 - 60.

### Defaults

| parameter      | default |
|----------------|---------|
| <i>seconds</i> | 60      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | Yes  | No    | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

If set to 0, setting is disabled.

### Examples

```
-> openflow back-off-max 0
-> openflow back-off-max 32
-> openflow back-off-max 60
```

### Release History

Release 7.3.4; command introduced

### Related Commands

## openflow idle-probe-timeout

Configures the idle probe timeout value.

**openflow idle-probe-timeout** *seconds*

---

### Syntax Definitions

*seconds* The idle probe timeout value, in seconds. The valid range is 1 - 60.

### Defaults

| parameter      | default |
|----------------|---------|
| <i>seconds</i> | 15      |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |

### Syntax Definitions

|                                       |                                                                                                                                                                                                                                   |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i>                           | The Logical Switch name (up to 32 characters).                                                                                                                                                                                    |
| <b>probe-time</b> <i>num</i>          | Configures probe-time for a logical switch in the pfc-channel mode which will override the existing global idle-probe-time for sending echo-requests to the OpenFlow Controller. (1-60)                                           |
| <b>failure-detect-time</b> <i>num</i> | Configures the failure-detect-time for a logical switch in the pfc-channel mode for detecting a disconnection to the OpenFlow Controller if there was no echo reply or message from the controller. (1-60)                        |
| <b>tcp-buffer-size</b> <i>num</i>     | Configures the TCP buffer size for socket connection to OpenFlow controllers configured for the logical-switch in the pfc-channel mode (2–32).                                                                                    |
| <b>dpid</b> <i>string</i>             | Configures a unique 8-byte Datapath Identifier (DPID) for a logical switch in pfc-channel mode. Value must be entered in hex format only (starting with 0x) and must be less than 8-bytes.                                        |
| <b>admin-state enable</b>             | Enables the Logical Switch.                                                                                                                                                                                                       |
| <b>admin-state disable</b>            | Disables the Logical Switch.                                                                                                                                                                                                      |
| <b>normal</b>                         | Configures the Logical Switch to run in Normal Mode.                                                                                                                                                                              |
| <b>api</b>                            | Configures the Logical Switch to run in Hybrid (API) Mode. Only one (1) Logical Switch can be configured in Hybrid Mode.                                                                                                          |
| <b>pfc-channel</b>                    | Configures the Logical Switch for NEC pfc-channel mode.                                                                                                                                                                           |
| <b>1.0</b>                            | Configures the Logical Switch to run OpenFlow Version 1.0.                                                                                                                                                                        |
| <b>1.3.1</b>                          | Configures the Logical Switch to run OpenFlow Version 1.3.1.                                                                                                                                                                      |
| <b>learned-mac-update enable</b>      | Enables the forwarding of new source learned MAC addresses to a WLAN controller.                                                                                                                                                  |
| <b>learned-mac-update disable</b>     | Disables the forwarding of new source learned MAC address to a WLAN controller.                                                                                                                                                   |
| <i>vlan_id</i>                        | The Default VLAN for all ports assigned to the Logical Switch. Traffic on this VLAN on these ports will not carry an 802.1q tag. Traffic on all other VLANs on these ports will carry an 802.1q tag. The valid range is 2 - 4093. |
| <b>drop   controller</b>              | Configures whether packets are dropped or sent to the Controller when an OpenFlow Table Miss occurs.                                                                                                                              |

## Defaults

| parameter                                                | default                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------|
| <b>probe-time</b> <i>num</i>                             | 5 seconds                                                                  |
| <b>failure-detect-time</b> <i>num</i>                    | 4 seconds                                                                  |
| <b>tcp-buffer-size</b> <i>num</i>                        | 2 KB                                                                       |
| <b>dpid</b> <i>string</i>                                | Top 16-bit unique index of logical switch and bottom 48 bits of router MAC |
| <b>admin-state</b> <b>enable</b>   <b>disable</b>        | enable                                                                     |
| <b>normal</b>   <b>api</b>                               | normal                                                                     |
| <b>1.0</b>   <b>1.3.1</b>                                | 1.0, 1.3.1                                                                 |
| <b>learned-mac-update</b> <b>enable</b>   <b>disable</b> | disable                                                                    |
| <b>drop</b>   <b>controller</b>                          | drop                                                                       |

## Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | Yes  | No    | Yes  | Yes  | No              | No                                                            | No   |

## Usage Guidelines

- Up to three (3) OpenFlow Logical Switches can be configured on an OmniSwitch.
- Use the **no** form of the command to delete an OpenFlow Logical Switch and all Controller/port configurations for that Logical Switch.
- When a Logical Switch is disabled, all Controllers for that Logical Switch are operationally disabled, and flows added by those Controllers are removed.
- In Normal Mode, the switch operates as per the OpenFlow standards. In Hybrid mode, OpenFlow operates as an interface through which the Controller may add over-ride policies to the switch much like QoS. In Hybrid mode, no traffic is forwarded to the Controller(s) and AOS operates normally.
- OpenFlow versions 1.0 and 1.3.1 are both enabled by default. At least one version must be enabled.
- “vlan” is not valid if the configured mode for the Logical Switch is API. An API Logical Switch implicitly operates on all ports, link aggregates, and VLANs not assigned to other OpenFlow Logical Switches.
- OpenFlow version 1.0 and 1.3.1 use TCP port 6633.
- Enabling learned MAC update only applies if the configured mode for the Logical Switch is API.

## Examples

```
-> openflow logical-switch vswitch1
-> openflow logical-switch vswitch1 admin-state enable
-> openflow logical-switch vswitch1 mode normal version 1.0 vlan 5
-> openflow logical-switch vswitchnec mode pfc-channel
-> no openflow logical-switch vswitch1
```

## Release History

Release 7.3.4; command introduced

## openflow logical-switch controller

Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.

**openflow logical-switch name controller** {*ip\_address* | *domain\_name*} [:*port*] [**priority num**] **admin-state** {**enable** | **disable**}

**no openflow logical-switch name controller** {*ip\_address* | *domain\_name*} [:*port*]

---

### Syntax Definitions

|                     |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>name</i>         | The Logical Switch name (up to 32 characters).                                                                  |
| <i>ip_address</i>   | The IP address of Controller.                                                                                   |
| <i>domain_name</i>  | The Fully Qualified Domain Name (FQDN) of the Controller. Specify a domain name up to 255 characters in length. |
| <i>port</i>         | The Controller IP Port (1 - 65535).                                                                             |
| <b>priority num</b> | Configures the priority value for the specified Controller in pfc-channel mode (0-2). 0 = highest, 2 = lowest.  |
| <b>enable</b>       | Enables the connection to the Controller.                                                                       |
| <b>disable</b>      | Disables the connection to the Controller.                                                                      |

### Defaults

| parameter                      | default |
|--------------------------------|---------|
| <i>port</i>                    | 6633    |
| <b>priority num</b>            | 2       |
| <b>enable</b>   <b>disable</b> | enable  |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | Yes  | No    | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

- Use the **no** form of this command to remove a Controller for a Logical Switch.
- Specify either the IPv4 address or the FQDN for the Controller. When an FQDN is specified, the switch will resolve the IP address for that domain.

- If a Logical Switch cannot connect to any of its Controllers, it runs in “Fail Secure Mode”. All flow aging, etc., continues unaffected while the Controllers are disconnected.
- Use the priority parameter to configure the priority for the specified Controller. If Controllers have the same priority, the one configured first will have priority.

## Examples

```
-> openflow logical-switch vswitch1 controller 1.2.3.4
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 admin-state disable
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 priority 1
-> openflow logical-switch vswitchnec controller opendaylight.abc.com
-> openflow logical-switch vswitchnec controller opendaylight.abc.com:6635
-> openflow logical-switch vswitchnec controller opendaylight.abc.com:6635 disable
-> openflow logical-switch vswitchnec controller opendaylight.abc.com priority 1
-> no openflow logical-switch vswitch1 controller 1.2.3.4
-> no openflow logical-switch vswitchnec controller opendaylight.abc.com
```

## Release History

Release 7.3.4; command introduced.

Release 8.5R1; *domain\_name* parameter option added.

## Related Commands

**show openflow logical-switch** Displays information about all of the configured OpenFlow Logical Switches.

## MIB Objects

 alaOpenflowControllerAdminState
 alaOpenflowControllerPriority
```

---

## openflow logical-switch interfaces

Configures a range of interfaces to/from a Logical Switch.

```
openflow logical-switch name interfaces {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2] |
[type {trunk | access}] | [native-vlan vlan] | [vlan-tag vlan[-vlan2]]}
```

```
no openflow logical-switch name interfaces {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]}
```

---

|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i>                                   | The Logical Switch name (up to 32 characters).                                                                                                                                                                       |
| <i>chassis/slot/port</i> [- <i>port2</i> ]    | The chassis ID, slot, and port number.                                                                                                                                                                               |
| <i>agg_id</i> [- <i>agg_id2</i> ]             | The link aggregate ID number.                                                                                                                                                                                        |
| <b>trunk</b>                                  | Configures the interface type as trunk.                                                                                                                                                                              |
| <b>access</b>                                 | Configures the interface type as access.                                                                                                                                                                             |
| <b>native-vlan</b> <i>vlan</i>                | The default VLAN for an interface in the logical switch. Traffic on this port will be untagged for the native VLAN. Traffic on all other VLANs on this port will be tagged. (2-4093)                                 |
| <b>vlan-tag</b> <i>vlan</i> [- <i>vlan2</i> ] | The list of allowed tagged VLANs for an interface. Traffic on these allowed VLAN(s) of the ports and Untagged traffic will not carry an 802.1q tag. Traffic on all other VLANs on the port will be dropped. (2-4093) |

### Defaults

| parameter | default |
|-----------|---------|
| type      | access  |

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| No   | No   | No   | No    | Yes  | No    | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

The **native-vlan** and **vlan-tag** parameters are valid only if the logical switch mode is pfc-channel.

### Examples

```
-> openflow logical-switch vswitch1 interfaces port 1/1/1
-> no openflow logical-switch vswitch1 interfaces port 1/1/1
-> openflow logical-switch vswitch2 interfaces linkagg 5
```

```
-> no openflow logical-switch vswitch2 interfaces linkagg 5
-> openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> no openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> openflow logical-switch vswitchnec interfaces port 1/1/20 type trunk
-> openflow logical-switch vswitchnec interfaces port 1/1/20 native-vlan 3
-> openflow logical-switch vswitchnec interfaces port 1/1/20 vlan-tag 4-5
```

### Syntax Definitions

|                    |                                                  |
|--------------------|--------------------------------------------------|
| <b>name</b>        | The Logical Switch name (up to 32 characters).   |
| <b>controllers</b> | The controllers assigned to this logical switch. |
| <b>interfaces</b>  | The interfaces assigned to this logical switch.  |
| <b>details</b>     | The details of the logical switch.               |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| No   | No   | No   | No    | Yes  | No    | Yes  | Yes  | No              | No                                                            | No   |

### Usage Guidelines

- Enter a Logical Switch name to display only information about a specific Logical Switch.
- The DPID, TCP-Buffer-Size, Probe-Time, and Failure-Detect-Time are only applicable for a logical switch in PFC mode.

### Examples

```
-> show openflow logical-switch
 Admin
Logical Switch State Mode Versions VLAN Learn MAC Ctrlrs Intf Flows
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
vswitch1 Ena Norm 1.0 1 Dis Dis 1 4 0
vswitch2 Dis Norm 1.0, 1.3.1 5 Dis Dis 3 4 2
vswitchnec Ena PFC 1.0, 1.3.1 N/A Dis Dis 1 0 0
```

# 70 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

*Filename:* ALCATEL-IND1-SYSTEM.mib  
*Module:* alcatelIND1SystemMIB

A summary of the available commands is listed here.

---

[ip domain-lookup](#)  
[ip name-server](#)  
[ipv6 name-server](#)  
[ip domain-name](#)  
[show dns](#)

---

## ip domain-lookup

Enables or disables the DNS resolver.

**ip domain-lookup**

**no ip domain-lookup**

---

### Syntax Definitions

N/A

### Defaults

By default, the DNS resolver is disabled.

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |

### Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

### Examples

```
-> ip domain-lookup
-> no ip domain-lookup
```

### Release History

Release 7.1.1; command was introduced.

## MIB Objects

systemDNS

systemDNSEnableDnsResolver

---

## ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

```
ip name-server server_address1 [server_address2 [server_address3]]
```

---

### Syntax Definitions

|                        |                                                                                                                                                                                                                              |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>server_address1</i> | The IP address of the primary DNS server to query for host lookup. This is the only address that is required.                                                                                                                |
| <i>server_address2</i> | The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional. |
| <i>server_address3</i> | The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.   |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|
| 6360 | 6465 | 6560 | 6570M | 6860 | 6860N | 6865 | 6900 | 6900<br>V72/C32 | 6900<br>X48C6/T48C6/<br>X48C4E/V48C8/<br>C32E/T24C2/<br>X24C2 | 9900 |
| Yes  | Yes  | Yes  | Yes   | Yes  | Yes   | Yes  | Yes  | Yes             | Yes                                                           | Yes  |

### Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

### Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1
-> ip name-server 10.255.11.66
```

### Release History

  systemDNSNsAddr1

  systemDNSNsAddr2

  systemDNSNsAddr3

---

## ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

```
ipv6 name-server server_ipv6_address1 [server_ipv6_address2 [server_ipv6_address3]]
```

---

### Syntax Definitions

|                             |                                                                                                                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>server_ipv6_address1</i> | The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.                                                                                                             |
| <i>server_ipv6_address2</i> | The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.         |
| <i>server_ipv6_address3</i> | The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional. |

### Defaults

N/A

### Platforms Supported

This command is supported on the following OmniSwitch platforms:

|      |      |      |       |      |       |      |      |                 |                                                               |      |
|------|------|------|-------|------|-------|------|------|-----------------|---------------------------------------------------------------|------|

# A Software License and Copyright Statements

This appendix contains ALE USA, Inc. and third-party software vendor license and copyright statements.

## ALE USA, Inc. License Agreement

### ALE USA, INC. SOFTWARE LICENSE AGREEMENT

---

**IMPORTANT.** Please read the terms and conditions of this license agreement carefully before opening this package.

---

**By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.**

1. **License Grant.** This is a license, not a sales agreement, between you (the “Licensee”) and ALE USA, Inc. ALE USA, Inc. hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the “Licensed Files”) and the accompanying user documentation (collectively the “Licensed Materials”), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee’s system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that ALE USA, Inc. products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **ALE USA, Inc.’s Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of ALE USA, Inc. and its licensors (herein “its licensors”), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with ALE USA, Inc. and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** ALE USA, Inc. considers the Licensed Files to contain valuable trade secrets of ALE USA, Inc., the unauthorized disclosure of which could cause irreparable harm to ALE USA, Inc.. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold ALE USA, Inc. harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation ALE USA, Inc.'s reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** ALE USA, Inc. warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. ALE USA, Inc. further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to ALE USA, Inc. for either replacement or, if so elected by ALE USA, Inc., refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALE USA, INC. AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** ALE USA, Inc.'s cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to ALE USA, Inc. for the Licensed Materials. IN NO EVENT SHALL ALE USA, INC. BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALE USA, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between ALE USA, Inc. and Licensee, if any, ALE USA, Inc. is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and ALE USA, Inc. has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to ALE USA, Inc. and certifying to ALE USA, Inc. in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. ALE USA, Inc. may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by

ALE USA, Inc., Licensee agrees to return to ALE USA, Inc. or destroy the Licensed Materials and all copies and portions thereof.

**10. Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

**11. Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

**12. No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

**13. Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with ALE USA, Inc.'s reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

**14. Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to ALE USA, Inc. by certain third party licensors. Some third party licensors are third party beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "[Third Party Licenses and Notices](#)" on page -4 for the third party license and notice terms.

## Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains, are contained in files within the software itself located at: **/flash/foss**.

Also, if needed, we provide all FOSS (Free and Open Source Software) source code used in this release at the following URL: <https://github.com/Alcatel-LucentEnterpriseData>.
