Configures the OSPF interface cost.

```
ip ospf interface {interface_name} cost cost
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>cost</i>	The interface cost. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>cost</i>	1

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

### Examples

```
-> ip ospf interface vlan-101 cost 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfMetricTable  
  ospfIfMetricIpAddress  
  ospfIfMetricValue
```

---

## ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

```
ip ospf interface {interface_name} poll-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.  
*seconds* The poll interval, in seconds. The valid range is 1–2147483647.

### Defaults

---

parameter	default
<i>seconds</i>	120

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

### Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfPollInterval

---

## ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

```
ip ospf interface {interface_name} priority priority
```

---

### Syntax Definitions

*interface\_name* The name of the interface.  
*priority* The interface priority. The valid range is 0–255.

### Defaults

parameter	default
<i>priority</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

### Examples

```
-> ip ospf interface vlan-101 priority 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfRtrPriority

---

## ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

```
ip ospf interface {interface_name} retrans-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The retransmit interval, in seconds. The valid range 0–3600.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

### Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfRetransInterval

---

## ip ospf interface transit-delay

Configures the OSPF interface transit delay.

```
ip ospf interface {interface_name} transit-delay seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The transit delay, in seconds. The valid range is 0–3600.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfTransitDelay

---

## ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

**ip ospf restart-support {planned-unplanned | planned-only}**

**no ip ospf restart-support**

---

### Syntax Definitions

<b>planned-unplanned</b>	Specifies support for planned and unplanned restarts.
<b>planned-only</b>	This parameter is currently not supported.

### Defaults

Graceful restart is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

### Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

### MIB Objects

```
alaProtocolOspf
  alaOspfRestartSupport
```

---

## ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

**ip ospf restart-interval** [*seconds*]

---

### Syntax Definitions

*seconds*                                      The hitless restart timeout interval. The valid range is 0–1800 seconds.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

### Example

```
-> ip ospf restart-interval 600
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip ospf restart-support](#)                      Administratively enables and disables support for the graceful restart feature on an OSPF router.

[show ip ospf restart](#)                        Displays the OSPF graceful restart related configuration and status.

### MIB Objects

```
alaProtocolOspf  
  alaOspfRestartInterval
```

---

## ip ospf restart-helper admin-state

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

**ip ospf restart-helper [admin-state {enable | disable}]**

---

### Syntax Definitions

<b>enable</b>	Enables the capability of an OSPF router to operate in helper mode.
<b>disable</b>	Disables the capability of an OSPF router to operate in helper mode.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

### Examples

```
-> ip ospf restart-helper admin-state disable
-> ip ospf restart-helper admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip ospf restart-support</a>	Administratively enables and disables support for the graceful restart feature on an OSPF router.
<a href="#">ip ospf restart-helper strict-lsa-checking admin-state</a>	Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

### MIB Objects

```
alaProtocolOspf
  alaOspfRestartHelperSupport
```

---

## ip ospf restart-helper strict-lsa-checking admin-state

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

**ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.
<b>disable</b>	Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

### Examples

```
-> ip ospf restart-helper strict-lsa-checking admin-state disable
-> ip ospf restart-helper strict-lsa-checking admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip ospf restart-support</a>	Administratively enables and disables support for the graceful restart feature on an OSPF router.

## ip ospf restart initiate

Initiates a planned graceful restart.

**ip ospf restart initiate**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration.

### Example

```
-> ip ospf restart initiate
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

### MIB Objects

```

```

---

## show ip ospf

Displays the OSPF status and general configuration parameters.

**show ip ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display the general configuration parameters of the OSPF router.
- See the Related Commands section below to modify the displayed parameters.

### Examples

```
-> show ip ospf
```

```
Router Id                = 10.255.11.242,
OSPF Version Number     = 2,
Admin Status            = Enabled,
Area Border Router?    = No,
AS Border Router Status = Disabled,
Route Redistribution Status = Disabled,
Route Tag               = 0,
SPF Hold Time (in seconds) = 10,
SPF Delay Time (in seconds) = 5,
MTU Checking           = Disabled,
# of Routes            = 0,
# of AS-External LSAs  = 0,
# of self-originated LSAs = 0,
# of LSAs received     = 0,
External LSDB Limit    = -1,
Exit Overflow Interval = 0,
# of SPF calculations done = 0,
# of Incr SPF calculations done = 0,
# of Init State Nbrs   = 0,
# of 2-Way State Nbrs  = 0,
# of Exchange State Nbrs = 0,
# of Full State Nbrs   = 0,
# of attached areas    = 1,
# of Active areas      = 0,
# of Transit areas     = 0,
# of attached NSSAs    = 0
```

*output definitions*

---

<b>Router Id</b>	The unique identification for the router.
<b>OSPF Version Number</b>	The version of OSPF the router is running.
<b>Admin Status</b>	Whether OSPF is currently enabled or disabled on the router.
<b>Area Border Router?</b>	Whether the router status is an area router or not.
<b>AS Border Router Status</b>	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
<b>Route Redistribution Status</b>	Whether route redistribution is enabled or disabled on the router. This is set using the <b>ip ospf default-originate</b> command.
<b>Route Tag</b>	Shows the route tag for this router.
<b>SPF Hold Time</b>	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
<b>SPF Delay Time</b>	Shows the time in seconds between consecutive SPF calculations.
<b>MTU Checking</b>	Shows whether Maximum Transfer Unit checking is enabled or disabled. This is set using the <b>ip ospf mtu-checking</b> command.
<b># of routes</b>	The total number of OSPF routes known to this router.
<b># of AS-External LSAs</b>	The number of external routes learned from outside the router's Autonomous System (AS).
<b># of self-originated LSAs</b>	The number of times a new Link State Advertisement has been sent from this router.
<b># of LSAs received</b>	The number of times a new Link State Advertisement has been received by this router.
<b>External LSDB Limit</b>	The maximum number of entries allowed in the external Link State Database.
<b>Exit Overflow Interval</b>	The number of seconds the router remains in the overflow state before attempting to leave it. This is set using the <b>ip ospf exit-overflow-interval</b> command.
<b># of SPF calculations done</b>	The number of SPF calculations that have occurred.
<b># of Incr SPF calculations done</b>	The number of incremental SPF calculations done.
<b># of Init State Nbrs</b>	The number of neighbors in the initialization state.
<b># of 2-Way State Nbrs</b>	The number of OSPF 2-way state neighbors on this router.
<b># of Exchange State Nbrs</b>	The number of neighbors in the exchange state.
<b># of Full State Nbrs</b>	The number of neighbors in the full state.
<b># of attached areas</b>	The number of areas that are configured on the router.
<b># of Active areas</b>	The number of areas that are active.
<b># of Transit areas</b>	The number of transit areas that are configured on the router.
<b># of attached NSSAs</b>	The number of Not So Stubby Areas that are configured on the router.

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>ip ospf admin-state</b>	Enables or disables the administration of OSPF on the router.
<b>ip ospf mtu-checking</b>	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
<b>ip ospf spf-timer</b>	Configures timers for SPF calculation.
<b>ip ospf default-originate</b>	Enables or disables OSPF redistribution
<b>ip ospf extlsdb-limit</b>	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
<b>ip ospf exit-overflow-interval</b>	This command sets the overflow interval value.
<b>ip ospf route-tag</b>	Configures a tag value for Autonomous System External (ASE) routes created.
<b>ip router router-id</b>	Configures the router ID for the router.

## show ip ospf border-routers

Displays information regarding all or specified border routers.

**show ip ospf border-routers** [*area\_id*] [*router\_id*] [*tos*] [*gateway*]

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<i>tos</i>	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>gateway</i>	The 32-bit IP address of the gateway for the border router being displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

### Examples

```
-> show ip ospf border-routers 10.0.0.0
```

Router Id	Area Id	Gateway	TOS	Metric
10.0.0.0	1.0.0.1	143.209.92.71	1	1

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area ID</b>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>Gateway</b>	The next hop interface on which the border router has been learned.
<b>ToS</b>	The Type of Service. Only ToS value 0 is supported at this time.
<b>Metric</b>	The cost to the border router.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show ip ospf](#) Displays the OSPF status and general configuration parameters.

## MIB Objects

```
alaOspfBdrRouterAreaId  
alaOspfBdrRouterId  
alaOspfBdrRouterTos  
alaOspfBdrRouterMetric
```

---

## show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

```
show ip ospf ext-lsdb [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf ext-lsdb
```

LS Id	Orig Router-Id	SeqNo	Age	Protocol
198.168.100.100	198.168.100.100	10	100	STATIC

#### output definitions

---

<b>LS Id</b>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<b>Orig Router-Id</b>	The router ID of the router that originated the external LSDB.
<b>SeqNo</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
<b>Protocol</b>	The type of protocol, if any.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip ospf extlsdb-limit](#)

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

---

## show ip ospf host

Displays information on the configured OSPF hosts.

**show ip ospf host** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf host 172.22.2.115
```

```

      Host Address      TOS      Metric      Status      AreaId
-----+-----+-----+-----+-----
143.209.92.12         1         0         Up         0.0.0.0

```

### output definitions

<b>Host Address</b>	A 32-bit IP address for a directly attached host. This can be set using the <b>ip ospf host</b> command.
<b>ToS</b>	The Type of Service traffic from the host is labeled as. ToS is set using the <b>ip ospf host</b> command.
<b>Metric</b>	The metric assigned to the host. Metric is set using the <b>ip ospf host</b> command.
<b>Status</b>	Whether the host is enabled or disabled.
<b>AreaId</b>	The area identification for the host's area.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip ospf host](#)

Creates and deletes an OSPF entry for directly attached hosts.

## MIB Objects

---

## show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

```
show ip ospf lsdb [area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>rtr</b>	Specifies router LSAs.
<b>net</b>	Specifies network LSAs.
<b>netsum</b>	Specifies network summary LSAs.
<b>asbrsum</b>	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

### Examples

```
-> show ip ospf lsdb
  Area Id      Type      LS Id      Orig Router-Id  SeqNo      Age
-----+-----+-----+-----+-----+-----
0.0.0.1      OSPF      198.168.100.100  198.168.100.100  1          100
```

#### output definitions

---

<b>Area Id</b>	The area identification for the area to which the record belongs.
<b>Type</b>	The protocol type from where the route was learned.
<b>LS Id</b>	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
<b>Orig Router-Id</b>	The router ID of the router that originated the external LSDB.

*output definitions (continued)*

---

<b>SeqNo</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

---

**Release History**

## show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

```
show ip ospf neighbor [ip_address]
```

---

### Syntax Definitions

*ip\_address* A 32-bit IP address of the neighboring router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf neighbor
```

IP Address	Area Id	Router Id	Vlan	State	Mode
1.1.1.1	255.255.255.255	0.0.0.0	0	Down	Static

### output definitions

<b>IP Address</b>	The IP address of the neighbor.
<b>Area Id</b>	A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System.
<b>Router Id</b>	The unique identification for the neighboring router.
<b>VlanId</b>	The VLAN corresponding to this interface on which the neighbor is reachable.
<b>State</b>	The state of the OSPF neighbor adjacency.
<b>Mode</b>	What type of neighbor, either <b>Dynamic</b> (learned) or <b>Static</b> .

```

-> show ip ospf neighbor 1.1.1.1
Neighbor's IP Address           = 1.1.1.1,
Neighbor's Router Id           = 0.0.0.0,
Neighbor's Area Id             = 255.255.255.255,
Neighbor's DR Address          = 0.0.0.0,
Neighbor's BDR Address         = 0.0.0.0,
Neighbor's Priority             = 1,
Neighbor's State               = Down,
Hello Suppressed ?            = No,
Neighbor's type                = Static,
DR Eligible                   = Yes,
# of State Events              = 0,
Mode                           = Slave,
MD5 Sequence Number           = 0,
Time since Last Hello          = 0 sec,
# of Outstanding LS Requests   = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status          = Not Restarting,
Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

### *output definitions*

---

<b>Neighbor's IP Address</b>	The IP address of the neighbor.
<b>Neighbor's Router Id</b>	The identification number for the selected host's record. It is most often the router's IP address.
<b>Neighbor's Area Id</b>	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
<b>Neighbor's DR Address</b>	The address of the neighbors Designated Router.
<b>Neighbor's BDR Address</b>	The address of the neighbors Backup Designated Router.
<b>Neighbor's Priority</b>	The priority value for this neighbor becoming the DR.
<b>Neighbor's State</b>	The condition of the OSPF neighbor's state machine.
<b>Hello Suppressed</b>	Whether sending hello messages to this neighbor is suppressed.
<b>Neighbor's type</b>	What type of neighbor this is, either dynamic or static.
<b>DR Eligible</b>	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as <b>No</b> . Otherwise, if configured as Eligible (the default), it shows up as <b>Yes</b> .
<b># of State Events</b>	The number of state events restricted for this neighbor and the local router.
<b>Mode</b>	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>MD5 Sequence Number</b>	The sequence number of the MD5 authorization key.
<b>Time since Last Hello</b>	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
<b># of Outstanding LS Requests</b>	The number of Link State requests to this neighbor that have not received a response from this neighbor.
<b># of Outstanding LS Acknowledgements</b>	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.

*output definitions (continued)*

---

<b># of Outstanding LS Retransmissions</b>	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a hitless restart helper for the neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[ip ospf neighbor](#) Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

---

## show ip ospf routes

Displays the OSPF routes known to the router.

**show ip ospf routes** [*ip\_address mask tos gateway*]

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address of the route destination in dotted decimal format.
<i>mask</i>	The IP subnet mask of the route destination.
<i>tos</i>	The Type of Service of the route.
<i>gateway</i>	The next hop IP address for this router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

-> show ip ospf routes

Destination/Mask	Gateway	Metric	Vlan	Type
198.168.100.100	195.5.2.8	0	5	AS-Ext

#### *output definitions*

---

<b>Destination/Mask</b>	The destination address of the route. This can also display the destination IP address mask if it is known.
<b>Gateway</b>	The gateway address of the route.
<b>Metric</b>	The cost of the route.
<b>Vlan</b>	The VLAN number on which the gateway can be routed.
<b>Type</b>	The type of OSPF route.

---

### Release History

Release 7.1.1; command was introduced.

---

## show ip ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPF backbone routers that are not physically contiguous.

```
show ip ospf virtual-link [router_id]
```

---

### Syntax Definitions

*router\_id*                                      The router ID of the remote end of the virtual link that is to be viewed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf virtual-link
```

Transit AreaId	Router-id	State Link / Adjacency	AuthType	OperStatus
1.1.1.1	172.17.1.1	P2P / Full	none	up

#### *output definitions*

---

<b>Transit AreaId</b>	The area identification for the area assigned to the virtual link.
<b>Router-Id</b>	The destination router identification for the virtual link.
<b>State Link</b>	The state of the virtual link with regards to the local router.
<b>State Adjacency</b>	The state of the virtual link adjacency.
<b>AuthType</b>	The type of authorization employed by the virtual link.
<b>OperStatus</b>	Displays whether the virtual link is enabled or disabled.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip ospf virtual-link**           Creates or deletes a virtual link.  
**show ip ospf virtual-neighbor**   Displays OSPF virtual neighbors.

```

---

## show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router through a virtual link rather than a physical one.

**show ip ospf virtual-neighbor** *area\_id* *router\_id*

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.  
*router\_id* The router ID of the remote end of the virtual link that is to be viewed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1
```

AreaId	RouterId	Priority	Events	RxmtQlen	LastHello	State
0.0.0.0	10.0.0.0	1	10	100	323	INIT

### output definitions

---

<b>AreaId</b>	The area identification for the area of which the virtual neighbor is a part.
<b>RouterId</b>	The router identification of the virtual neighbor.
<b>Priority</b>	The number used to determine whether the virtual neighbor will become the designated router for its area.
<b>Events</b>	The number of OSPF control message sent by the neighbor to the router.
<b>RxmtQlen</b>	The length (in number of packets) of the retransmit queue.
<b>LastHello</b>	The last Hello message sent by the neighbor
<b>State</b>	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

---

```

-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254
Neighbor's IP Address           = 2.0.0.254,
Neighbor's Router Id           = 2.0.0.254,
Neighbor's Area Id             = 0.0.0.1,
Neighbor's DR Address          = 2.0.0.1,
Neighbor's BDR Address         = 2.0.0.254,
Neighbor's Priority             = 1,
Neighbor's State               = Full,
Hello Suppressed ?             = No,

Mode = Master,
MD5 Sequence Number           = 0,
Time since Last Hello          = 5 sec,
Last DD I_M_MS                =
# of Outstanding LS Requests   = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status          = Not Restarting,
Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

### *output definitions*

---

<b>Neighbor's IP Address</b>	The IP address of the virtual neighbor.
<b>Neighbor's Router Id</b>	The identification number for the selected host's record. It is most often the router's IP address.
<b>Neighbor's Area Id</b>	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
<b>Neighbor's DR Address</b>	The address of the virtual neighbor's Designated Router.
<b>Neighbor's BDR Address</b>	The address of the virtual neighbor's Backup Designated Router.
<b>Neighbor's Priority</b>	The priority value for this virtual neighbor becoming the DR.
<b>Neighbor's State</b>	The condition of the OSPF virtual neighbor's state machine.
<b>Hello Suppressed</b>	Whether sending hello messages to this virtual neighbor is suppressed.
<b>Neighbor's type</b>	What type of virtual neighbor this is, either dynamic or static.
<b>DR Eligible</b>	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as <b>No</b> . Otherwise, if configured as Eligible (the default), it shows up as <b>Yes</b> .
<b># of State Events</b>	The number of state events restricted for this virtual neighbor and the local router.
<b>Mode</b>	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>MD5 Sequence Number</b>	The sequence number of the MD5 authorization key.
<b>Time since Last Hello</b>	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
<b>Last DD I_M_MS</b>	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

*output definitions (continued)*

---

<b># of Outstanding LS Requests</b>	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
<b># of Outstanding LS Acknowledgements</b>	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
<b># of Outstanding LS Retransmissions</b>	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

## show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

**show ip ospf area** [*area\_id*]

---

### Syntax Definitions

*area\_id*                                      A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

### Examples

-> show ip ospf area

Area Id	AdminStatus	Type	OperStatus
1.1.1.1	disabled	normal	down
0.0.0.1	disabled	normal	down

-> show ip ospf area 0.0.0.0

```

Area Identifier           = 1.1.1.1,
Admin Status             = Disabled,
Operational Status      = Down,
Area Type                = normal,
Area Summary             = Enabled,
Time since last SPF Run  = 00h:00m:27s,
# of Area Border Routers known = 0,
# of AS Border Routers known = 0,
# of LSAs in area       = 0,
# of SPF Calculations done = 0,
# of Incremental SPF Calculations done = 0,
# of Neighbors in Init State = 0,
# of Neighbors in 2-Way State = 0,
# of Neighbors in Exchange State = 0,
# of Neighbors in Full State = 0,
# of Interfaces attached = 0
Attached Interfaces      = vlan-213
  
```

*output definitions*

---

<b>Area Identifier</b>	The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS.
<b>Admin Status</b>	Whether the area is enabled or disabled.
<b>Operational Status</b>	Whether the area is active.
<b>Area Type</b>	The area type. This field will be <b>normal</b> , <b>stub</b> , or <b>NSSA</b> .
<b>Area Summary</b>	Whether Area Summary is enabled or disabled.
<b>Time since last SPF Run</b>	The last time the Shortest Path First calculation was performed.
<b># of Area Border Routers known</b>	The number of Area Border Routers in the area.
<b># of AS Border Routers known</b>	The number of Autonomous System Border Routers in the area.
<b># of LSAs</b>	The total number of Link State Advertisements for the Area.
<b># of SPF Calculations</b>	The number of times the area has calculated the Shortest Path.
<b># of Incremental SPF Calculations</b>	The number of incremental Shortest Path First calculations that have been performed in the area.
<b># of Neighbors in Init State</b>	The number of OSPF neighbors that are in initialization.
<b># of Neighbors in 2-Way State</b>	The number of OSPF 2-way state neighbors in this area.
<b># of Neighbors in Exchange State</b>	The number of OSPF neighbors that are currently establishing their status.
<b># of Neighbors in Full State</b>	The number of OSPF neighbors.
<b># of Interfaces attached</b>	The number of OSPF interfaces.
<b>Attached Interfaces</b>	The names of the OSPF interfaces attached to this area.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip ospf area</b>	Creates or deletes an OSPF area, assigning default metric, cost, and type.
<b>ip ospf area range</b>	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
<b>show ip ospf interface</b>	Displays OSPF interface information.

---

## show ip ospf area range

Displays all or specified route summaries in a given area.

```
show ip ospf area area_id range [{summary | nssa} ip_address ip_mask]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>summary</b>	Specifies that routes are summarized.
<b>nssa</b>	Specifies the Not So Stubby Area (NSSA) routers are summarized.
<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ip ospf area 0.0.0.0 range
```

AreaId	Type	Destination	Advertise
0.0.0.0	Summary	192.168.12.1/24	Matching
0.0.0.0	NSSA	143.209.92.71/24	noMatching

#### *output definitions*

---

<b>AreaId</b>	The area identification for the area range.
<b>Type</b>	The type of area the range is associated with.
<b>Destination</b>	The destination address of the range.
<b>Advertise</b>	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip ospf area range](#)

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

## MIB Objects

```
ospfAreaRangeTable  
  ospfAreaRangeAreaId

  ospfAreaRangeEffect
```

---

## show ip ospf area stub

Displays stub default area metrics, if configured.

**show ip ospf area *area\_id* stub**

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip ospf area 0.0.0.1 stub
```

Area Id	TOS	Metric	MetricType
0.0.0.1	1	1	ospf

### *output definitions*

---

<b>Area Id</b>	The identification number of the stub area.
<b>TOS</b>	The Type of Service assignment.
<b>Metric</b>	The metric assignment of the default router in the stub area.
<b>MetricType</b>	The metric type of the stub area. It will be either <b>ospf</b> , <b>type1</b> , or <b>type2</b> .

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip ospf area](#) Creates or deletes an OSPF area.

**MIB Objects**

```

```

---

## show ip ospf interface

Displays OSPF interface information.

**show ip ospf interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

### Examples

No interface name is specified:

```
-> show ip ospf interface
```

Interface Name	DR Address	Backup DR Address	Admin Status	Oper Status	State
vlan-213	213.10.10.1	213.10.10.254	enabled	up	DR
vlan-215	215.10.10.254	215.10.10.1	enabled	up	BDR

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface.
<b>DR Address</b>	The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See <a href="#">Chapter 5, “VLAN Management Commands,”</a> for more information.)
<b>Backup DR Address</b>	The IP address of the backup designated router.
<b>Vlan</b>	The VLAN to which the interface is assigned.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Oper Status</b>	Whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .

---

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                     = 3,
Interface IP Address        = 100.10.10.2,
Interface IP Mask           = 255.255.255.0,
Admin Status                = Enabled,
Operational Status         = Up,
OSPF Interface State       = BDR,
Interface Type              = Broadcast,
Area Id                     = 0.0.0.2,
Designated Router IP Address = 100.10.10.88,
Designated Router RouterId  = 100.10.10.88,
Backup Designated Router IP Address = 100.10.10.2,
Backup Designated Router RouterId = 192.169.1.2,
MTU (bytes)                 = 1500,
Metric Cost                 = 1,
Priority                     = 1,
Hello Interval (seconds)    = 10,
Transit Delay (seconds)     = 1,
Retrans Interval (seconds)  = 5,
Dead Interval (seconds)     = 40,
Poll Interval (seconds)     = 120,
Link Type                   = Broadcast,
Authentication Type         = md5,
#   Id   Key   Status   StartAccept   StopAccept   StartGen   StopGen
-----+-----+-----+-----+-----+-----+-----+-----
1  1     Set   Enabled     0             0             0           0
# of Events                  = 2,
# of Init State Neighbors    = 0,
# of 2-Way State Neighbors   = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors    = 1
BFD status                   = Disabled,
DR-Only Option for BFD      = Disabled
```

---

**Note.** See the table of the following page for output definitions.

---

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                     = 3,
Interface IP Address        = 100.10.10.2,
Interface IP Mask           = 255.255.255.0,
Admin Status                = Enabled,
Operational Status         = Up,
OSPF Interface State       = DR,
Interface Type              = Broadcast,
Area Id                     = 0.0.0.2,
Designated Router IP Address = 100.10.10.2,
Designated Router RouterId  = 192.169.1.2,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId  = 0.0.0.0,
MTU (bytes)                = 1500,
Metric Cost                 = 1,
Priority                    = 1,
Hello Interval (seconds)   = 10,
Transit Delay (seconds)    = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)    = 40,
Poll Interval (seconds)    = 120,
Link Type                   = Broadcast,
Authentication Type         = simple,
Authentication Key         = Set,
# of Events                 = 3,
# of Init State Neighbors   = 0,
# of Exchange State Neighbors = 0,
# of 2-Way State Neighbors  = 0,
# of Full State Neighbors   = 0
BFD Status                  = Disabled,
DR-Only Option for BFD     = Disabled
```

The following is an example of keychain authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-20-int
Interface IP Name           = vlan-20-int,
VLAN Id                    = 20,
Interface IP Address        = 10.10.20.1,
Interface IP Mask           = 255.255.255.0,
Admin Status                = Enabled,
Operational Status         = Up,
OSPF Interface State       = DR,
Interface Type              = Broadcast,
Area Id                     = 0.0.0.0,
Designated Router IP Address = 10.10.20.1,
Designated Router RouterId  = 10.10.10.1,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes)                = 1500,
Metric Cost                 = 1,
Priority                    = 1,
Hello Interval (seconds)    = 10,
Transit Delay (seconds)     = 1,
Retrans Interval (seconds)  = 5,
Dead Interval (seconds)     = 40,
Poll Interval (seconds)    = 120,
Link Type                   = Broadcast,
Authentication Type         = Keychain(1),
# of Events                 = 2,
# of Init State Neighbors   = 0,
# of 2-Way State Neighbors  = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors   = 0,
# of type-9 LSAs on this interface = 0,
BFD status                  = Disabled,
DR-Only Option for BFD     = Disabled
```

Output fields when an interface name is specified are described below:

#### *output definitions*

---

<b>Interface IP Name</b>	The name of the VLAN to which the interface is assigned.
<b>VLAN Id</b>	The VLAN to which the interface is assigned.
<b>Interface IP Address</b>	The IP address assigned to the interface.
<b>Interface IP Mask</b>	The IP mask associated with the IP address assigned to the interface.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Operational Status</b>	Whether the interface is an active OSPF interface.
<b>OSPF Interface State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .
<b>Interface Type</b>	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
<b>Area Id</b>	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
<b>Designated Router IP Address</b>	The designated router IP address.

*output definitions (continued)*

---

<b>Designated Router RouterId</b>	The identification number of the designated router.
<b>Backup Designated Router IP Address</b>	The IP address of the backup designated router.
<b>Backup Designated Router RouterId</b>	The identification number of the backup designated router.
<b>MTU</b>	The Maximum Transfer Unit (in bytes) for the interface.
<b>Metric Cost</b>	The cost added to routes learned on this interface.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Hello Interval</b>	The number of seconds between hello messages sent out on the interface.
<b>Transit Delay</b>	The estimated number of seconds required to transmit a link state update over this interface.
<b>Retrans Interval</b>	The number of seconds the interface waits before resending hello messages.
<b>Dead Interval</b>	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
<b>Poll Interval</b>	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
<b>Link Type</b>	The IP interface type, either <b>broadcast</b> or <b>non broadcast</b> .
<b>Authentication Type</b>	The type of authentication used by this interface: <b>None</b> , <b>Simple</b> , <b>MD5</b> , or <b>Keychain</b>
<b>#</b>	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)
<b>Id</b>	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
<b>Key</b>	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
<b>Status</b>	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
<b>StartAccept</b>	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
<b>StopAccept</b>	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
<b>StartGen</b>	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
<b>StopGen</b>	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
<b>Authentication Key</b>	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
<b># of Events</b>	The number of interface state machine events.

---

*output definitions (continued)*

---

<b># of Init State Neighbors</b>	The number of OSPF neighbors in the initialization state.
<b># of 2-Way State Neighbors</b>	The number of OSPF 2-way state neighbors on this interface.
<b># of Exchange State Neighbors</b>	The number of OSPF neighbors in the exchange state.
<b># of Full State Neighbors</b>	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.
<b># of type-9 LSAs on this interface</b>	Number of type-9 LSA on this interface. (This field is only displayed for keychain authentication.)
<b>BFD Status</b>	The status of BFD on this interface.
<b>DR-Only Option for BFD</b>	The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip ospf interface</b>	Creates and deletes an OSPF interface.
<b>ip ospf interface auth-key</b>	Configures an OSPF authentication key for simple authentication on an interface.
<b>ip ospf interface dead-interval</b>	Configures the OSPF interface dead interval.
<b>ip ospf interface hello-interval</b>	Configures the OSPF interface hello interval.
<b>ip ospf interface md5</b>	Creates and deletes the OSPF interface MD5 key identification number.
<b>ip ospf interface md5 key</b>	Configures the OSPF key string.
<b>ip ospf interface cost</b>	Configures the OSPF interface cost.
<b>ip ospf interface poll-interval</b>	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
<b>ip ospf interface priority</b>	Configures the OSPF interface priority.
<b>ip ospf interface retrans-interval</b>	Configures the OSPF interface retransmit interval.
<b>ip ospf interface transit-delay</b>	Configures the OSPF interface transit delay.
<b>ip ospf interface auth-type</b>	Sets the OSPF interface authentication type.
<b>ip ospf interface area</b>	Configures an OSPF interface area.
<b>ip ospf interface type</b>	Configures the OSPF interface type.
<b>ip ospf interface admin-state</b>	Enables or disables the administration status on an OSPF interface.

## show ip ospf interface auth-info

Displays authentication information for the interface.

**show ip ospf interface auth-info** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Not specifying an interface name displays all known interfaces for the OSPF router.
- When keychain authentication type is used for the interface, only the keychain ID is displayed. To view the keys associated with the keychain, use the keychain commands. For more information keychain management commands, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.

### Examples

```
-> show ip ospf interface auth-info
```

Interface Name	Key-chain	KeyId	Key	Status	AuthMode
vlan-30-int	1	--	--	Enabled	keychain
vlan-20-int	--	10	Set	Enabled	Keyed-MD5

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface.
<b>Key-chain</b>	The keychain associated with the interface.
<b>KeyId</b>	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
<b>Key</b>	Indicates whether the key has been set or not.
<b>Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>AuthMode</b>	The type of authentication used by this interface.

---

### Release History

Release 8.4.1; command introduced.

**Related Commands****ip ospf interface auth-type**

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

**MIB Objects**

N/A

---

## show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

**show ip ospf restart**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

### Examples

```
-> show ip ospf restart
Restart Support                = Enabled,
Restart Interval (in seconds) = 120,
Restart Status                 = Not Restarting,
Restart Age (in seconds)      = 0,
Last Restart Exit Reason      = None,
Restart Helper Support        = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Mode           = NotHelping
```

### *output definitions*

---

<b>Restart Support</b>	The administrative status of OSPF graceful restart, which can be <b>Enabled</b> or <b>Disabled</b> .
<b>Restart Interval</b>	The configured OSPF hitless restart timeout interval, in seconds. Use the <b>ip ospf restart-interval</b> command to modify this parameter.
<b>Restart Status</b>	The current status of OSPF graceful restart, which can be <b>Not Restarting</b> , <b>Unplanned Restart</b> (after a CMM takeover), or <b>Planned Restart</b> (before CMM takeover).
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF graceful restart interval.
<b>Last Restart Exit Reason</b>	The outcome of the last attempt at a graceful restart. If the value is <b>None</b> , then no restart has yet been attempted. If the value is <b>In Progress</b> , then a restart attempt is currently underway. Other possible values include <b>Completed</b> (successfully completed), <b>Timed Out</b> (timed out), and <b>Topology Changed</b> (aborted due to topology change).

*output definitions (continued)*

---

<b>Restart Helper Support</b>	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be <b>Enabled</b> or <b>Disabled</b> . Use the <b>ip ospf restart-helper admin-state</b> command to modify this parameter.
<b>Restart Helper Strict Checking</b>	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be <b>Enabled</b> or <b>Disabled</b> . Use the <b>ip ospf restart-helper strict-lsa-checking admin-state</b> command to modify this parameter.
<b>Restart Helper Mode</b>	Whether this OSPF router is operating as a helper to a restarting router.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip ospf restart-support</b>	Configures support for the graceful restart feature on an OSPF router.
<b>ip ospf restart initiate</b>	Initiates a planned graceful restart.

**MIB Objects**

---

# 27 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

*Filename:* ALCATEL-IND1-VIRTUALROUTER-MIB.mib  
*Module:* alcatelIND1VirtualRouterMIB

*Filename:* ALCATEL-IND1-OSPF3-MIB.mib  
*Module:* alcatelIND1OSPF3MIB

*Filename:* OSPFV3-MIB.mib  
*Module:* ospfv3MIB

The following is a list of the commands for configuring OSPFv3:

---

<b>Global OSPFv3 Commands</b>	<code>ipv6 load ospf</code> <code>ipv6 ospf admin-state</code> <code>ipv6 ospf host</code> <code>ipv6 ospf mtu-checking</code> <code>ipv6 ospf route-tag</code> <code>ipv6 ospf spf-timer</code> <code>ipv6 ospf virtual-link</code> <code>show ipv6 ospf</code> <code>show ipv6 ospf border-routers</code> <code>show ipv6 ospf host</code> <code>show ipv6 ospf lsdb</code> <code>show ipv6 ospf neighbor</code> <code>show ipv6 ospf routes</code> <code>show ipv6 ospf virtual-link</code>
<b>OSPFv3 Area Commands</b>	<code>ipv6 ospf area</code> <code>ipv6 ospf area area-summary</code> <code>ipv6 ospf area nssa-translator-role</code> <code>ipv6 ospf area nssa-translator-stab-interval</code> <code>show ipv6 ospf area</code>
<b>OSPFv3 Interface Commands</b>	<code>ipv6 ospf interface</code> <code>ipv6 ospf interface admin-state</code> <code>ipv6 ospf interface suppress-link-lsa</code> <code>ipv6 ospf interface type</code> <code>ipv6 ospf neighbor</code> <code>ipv6 ospf interface area</code> <code>ipv6 ospf interface dead-interval</code> <code>ipv6 ospf interface hello-interval</code> <code>ipv6 ospf interface cost</code> <code>ipv6 ospf interface priority</code> <code>ipv6 ospf interface retrans-interval</code> <code>ipv6 ospf interface transit-delay</code> <code>show ipv6 ospf interface</code>
<b>OSPFv3 Graceful Restart Commands</b>	<code>ipv6 ospf restart</code> <code>ipv6 ospf restart initiate</code> <code>ipv6 ospf restart interval</code> <code>ipv6 ospf restart-helper</code> <code>ipv6 ospf restart-helper strict-lsa-check</code> <code>show ipv6 ospf restart</code>

---

## ipv6 load ospf

Loads the OSPFv3 software on the router.

**ipv6 load ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Example

```
-> ipv6 load ospf
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

N/A

### MIB Objects

```
alaVrConfigTable  
  alaVrConfigOspf3Status
```

---

## ipv6 ospf admin-state

Enables or disables the OSPFv3 administrative status for the router.

**ipv6 ospf admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables OSPFv3.
<b>disable</b>	Disables OSPFv3.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

### Examples

```
-> ipv6 ospf admin-state enable
-> ipv6 ospf admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 ospf** Displays OSPFv3 status and general configuration parameters.

### MIB Objects

```
ospfv3GeneralGroup
  ospfv3AdminStat
```

---

## ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

```
ipv6 ospf host ipv6_address [area area_id] [metric metric]
```

```
no ipv6 ospf host ipv6_address area area_id
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IP address of the OSPFv3 host.
<i>area_id</i>	Area to which the host route belongs.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>metric</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

### Examples

```
-> ipv6 ospf host 2001::1/64 metric 10  
-> no ipv6 ospf host 2001::1/64 metric 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf host](#) Displays information on the configured OSPFv3 hosts.

**MIB Objects**

ospfv3HostTable

- ospfv3HostStatus
- ospfv3HostAreaID
- ospfv3HostAddress
- ospfv3HostMetric

---

## ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

**ipv6 ospf mtu-checking**

**no ipv6 ospf mtu-checking**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

### Examples

```
-> ipv6 ospf mtu-checking  
-> no ipv6 ospf mtu-checking
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf](#) Displays the OSPFv3 status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf3  
  alaOspf3MTUCheck
```

---

## ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

**ipv6 ospf route-tag tag**

---

### Syntax Definitions

*tag*   The set tag value. The valid range is 0–2, 147, 483, 647.

### Defaults

parameter	default
<i>tag</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPFv3 router. The tag value allows for quick identification.
- OSPFv3 ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

### Examples

```
-> ipv6 ospf route-tag 2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 ospf**   Displays OSPFv3 status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf3  
  alaOspf3RedistRouteTag
```

---

## ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ipv6 ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

---

### Syntax Definitions

<i>delay_seconds</i>	Specifies time (from 0 to 65535 seconds) between the reception of an OSPFv3 topology change and the start of an SPF calculation.
<i>hold_seconds</i>	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

### Defaults

---

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

### Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ipv6 ospf**

Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**

```
alaProtocolOspf3  
  alaOspf3TimerSpfDelay  
  alaOspf3TimerSpfHold
```

---

## ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

**ipv6 ospf virtual-link area** *area\_id* **router** *router\_id* [**dead-interval** *seconds*] [**hello-interval** *seconds*] [**retrans-interval** *seconds*] [**transit-delay** *seconds*]

**no ipv6 ospf virtual-link area** *area\_id* **router** *router\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>dead-interval</b> <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
<b>hello-interval</b> <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPFv3 hellos sent on this virtual link. The valid range is 1–65535.
<b>retrans-interval</b> <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPFv3 packets. The valid range is 0–3600.
<b>transit-delay</b> <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPFv3 packets over this link. The valid range is 0–3600.

### Defaults

parameter	default
<b>dead-interval</b> <i>seconds</i>	40
<b>hello-interval</b> <i>seconds</i>	10
<b>retrans-interval</b> <i>seconds</i>	5
<b>transit-delay</b> <i>seconds</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a

virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.

- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

## Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show ipv6 ospf virtual-link](#) Displays the virtual link information.

## MIB Objects

```
ospfv3VirtIfTable
  ospfv3VirtIfAreaId
  ospfv3VirtIfNeighbor
  ospfv3VirtIfStatus
  ospfv3VirtIfRtrDeadInterval
  ospfv3VirtIfHelloInterval
  ospfv3VirtIfRetransInterval
  ospfv3VirtIfTransitDelay
```

---

## ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

**ipv6 ospf area** *area\_id* [**type** {**normal** | **stub** [**default-metric** *metric*] | **nssa** [**default-metric** *metric*]}] | [**summarize** [**filter**]

**no ipv6 ospf area** *area\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format or a unique identification number in the range 0 to 4294967295.
<b>normal</b>	Sets the area as a regular OSPFv3 area.
<b>stub</b>	Configures an OSPFv3 area as a stub area.
<b>nssa</b>	Configures an OSPFv3 area as a NSSA (Not-So-Stubby Area).
<i>metric</i>	Defines the metric to be used for default routes injected into the stub or NSSA. The range is 0 to 4294967295.
<b>summarize</b>	Configures the inter-area route summarization. Prefixes that fall within the summary range can be shared with another area through the summary prefix.
<b>filter</b>	Configure to filter the routes specified in the summarization range. These filtered routes are not advertised into another area.

### Defaults

parameter	default
<b>normal</b>   <b>stub</b>   <b>nssa</b>	<b>normal</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- To change the area type, first delete the area, and then recreate it with the new type.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub or NSSA.

### Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub default-metric 15
-> ipv6 ospf area 0.0.0.1 type normal
-> ipv6 ospf area 0.0.0.1 type nssa
-> ipv6 ospf area 0.0.0.1 summarize 2001:1::/64
```

-> no ipv6 ospf area 0.0.0.1

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **nssa** keyword added.

## Related Commands

**show ipv6 ospf area** Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

## MIB Objects

ospfv3AreaTable

- ospfv3ImportAsExtern
- ospfv3AreaSummary
- ospfv3StubMetric
- ospfv3AreaId
- ospfv3AreaImportAsExtern

---

## ipv6 ospf area area-summary

Configures whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs.

```
ipv6 ospf area area_id [area-summary {noareasummary / sendareasummary}]
```

---

### Syntax Definitions

<i>area_id</i>	The area ID configured for a stub or NSSA.
<b>noareasummary</b>	When set to this option, inter-area LSAs will neither originate or propagate into the NSSA. Only a default route will be advertised into the NSSA.
<b>sendareasummary</b>	When set to this option, inter-area LSAs will be summarized and propagated into the NSSA.

### Defaults

parameter	default
noareasummary   sendareasummary	sendareasummary

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ipv6 ospf area 0.0.0.1 area-summary noAreaSummary
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

<a href="#">ipv6 ospf area</a>	Assigns an OSPFv3 interface to a specified area.
<a href="#">show ipv6 ospf area</a>	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

### MIB Objects

ospfv3AreaSummary

---

## ipv6 ospf area nssa-translator-role

Configures whether or not an NSSA border router will unconditionally translate Type-7 LSAs into Type-5 LSAs.

**ipv6 ospf area *area\_id* [nssa-translator-role {always | candidate}]**

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>always</b>	When set to this option, NSSA border router always translates Type-7 LSAs into Type-5 LSAs regardless of the translator state of other NSSA border routers.
<b>candidate</b>	When set to this option, NSSA border router participates in the translator election process.

### Defaults

parameter	default
always   candidate	candidate

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

When translator role is set to **candidate**, NSSA border router invokes a translator election process. The translator is then established by the NSSA border router whose router LSA has the greatest router ID.

### Examples

```
-> ipv6 ospf area 0.0.0.1 nssa-translator role always
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

<a href="#">ipv6 ospf area</a>	Assigns an OSPFv3 interface to a specified area.
<a href="#">show ipv6 ospf area</a>	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

### MIB Objects

ospfv3AreaNssaTranslatorRole

---

## ipv6 ospf area nssa-translator-stab-interval

Configures the duration for which a Type-7 translator will continue in the translator role after another NSSA border router translator has assumed the role.

```
ipv6 ospf area area_id [nssa-translator-stab-interval interval]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>interval</i>	NSSA translator stability interval value in seconds. The range is 0 to 4294967295.

### Defaults

The default value is 40 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ipv6 ospf area 0.0.0.1 nssa-translator-stab-interval 60
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

<a href="#">ipv6 ospf area</a>	Assigns an OSPFv3 interface to a specified area.
<a href="#">show ipv6 ospf area</a>	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

### MIB Objects

```
ospfv3AreaNssaTranslatorStabInterval
```

---

## ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

**ipv6 ospf interface** *interface\_name*

**no ipv6 ospf interface** *interface\_name*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

### Examples

```
-> ipv6 ospf interface vlan-101  
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex
```

---

## ipv6 ospf interface admin-state

Enables or disables the administration status on an OSPFv3 interface.

**ipv6 ospf interface** *interface\_name* **admin-state** {enable | disable}

**no ipv6 ospf interface** *interface\_name*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>enable</b>	Enables the OSPFv3 interface.
<b>disable</b>	Disables the OSPFv3 interface.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

### Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfAdminStat
```

---

## ipv6 ospf interface suppress-link-lsa

Allows to suppress the announcements of the Link State Advertisements (LSAs).

```
ipv6 ospf interface interface_name suppress-link-lsa
```

```
no ipv6 ospf interface interface_name suppress-link-lsa
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of the command to disable LSA suppression.

### Examples

```
-> ipv6 ospf interface vlan-101 suppress-link-lsa  
-> no ipv6 ospf interface vlan-101 suppress-link-lsa
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

[show ipv6 ospf interface](#)              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex

```

---

## ipv6 ospf interface type

Allows to configure the type of OSPFv3 interface.

```
ipv6 ospf interface interface_name type {broadcast | point-to-point | point-to-multipoint | nbma}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>broadcast</b>	The interface is a broadcast interface.
<b>point-to-point</b>	The interface is a point-to-point interface.
<b>point-to-multipoint</b>	The interface is a point-to-multipoint interface.
<b>nbma</b>	The interface is a NBMA interface.

### Defaults

parameter	default
<b>broadcast   point-to-point   point-to-multipoint   nbma</b>	<b>broadcast</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

### Examples

```
-> ipv6 ospf interface vlan-101 type nbma
-> ipv6 ospf interface vlan-101 type point-to-point
-> ipv6 ospf interface vlan-101 type point-to-multipoint
-> ipv6 ospf interface vlan-101 type broadcast
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable
  ospfv3IfStatus
  ospfv3IfType
```

---

## ipv6 ospf neighbor

Allows to configure OSPFv3 neighbor on non-broadcast interface type. The neighbor configuration is required on NBMA and point-to-multipoint interface to run OSPFv3.

**ipv6 ospf neighbor** *nbr\_ipv6\_address* **interface** *interface\_name* {**eligible** | **ineligible**}

**no ipv6 ospf neighbor** *nbr\_ipv6\_address*

---

### Syntax Definitions

<i>nbr_ipv6_address</i>	Link-local address of the neighbor to be linked.
<i>interface_name</i>	The name of the interface on which the neighbor is reachable.
<b>eligible</b>	Indicates the neighbor is eligible to become the designated router.
<b>ineligible</b>	Indicates the neighbor is ineligible to become the designated router.

### Defaults

parameter	default
<b>eligible</b>   <b>ineligible</b>	<b>eligible</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to delete the neighbor configuration.
- The OSPFv3 interface must be configured before configuring the OSPFv3 neighbor.
- This command is not applicable for broadcast interface type and is optional for point-to-point interface type.

### Examples

```
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 eligible
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 ineligible
-> no ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101
```

### Release History

Release 8.1.1; command introduced.

## Related Commands

- show ipv6 ospf interface** Displays the status and statistics of an OSPFv3 interface.
- ipv6 ospf interface admin-state** Allows to configure the type of OSPFv3 interface.

## MIB Objects

```
ospfv3NbrTable  
  ospfv3NbrPriority  
  ospfv3NbmaNbrStatus
```

---

## ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

```
ipv6 ospf interface interface_name area area_id
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>area_id</i>	A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

An interface must be assigned to an area to become operational.

### Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show ipv6 ospf area</a>	Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
<a href="#">show ipv6 ospf interface</a>	Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfAreaId
```

---

## ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

**ipv6 ospf interface** *interface\_name* **dead-interval** *seconds*

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The dead interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multipoint)	120

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

### Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 ospf interface hello-interval](#)

Configures the OSPFv3 interface hello interval.

[show ipv6 ospf interface](#)

Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfRtrDeadInterval
```

---

## ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

**ipv6 ospf interface** *interface\_name* **hello-interval** *seconds*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>seconds</i>	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPFv3 interface.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multipoint)	30

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

### Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ipv6 ospf interface dead-interval</a>	Configures the OSPFv3 interface dead interval.
<a href="#">show ipv6 ospf interface</a>	Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfHelloInterval
```

---

## ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

```
ipv6 ospf interface interface_name cost cost
```

---

### Syntax Definitions

*interface\_name* The name of the interface.  
*cost* The interface cost. The valid range is 0–65535.

### Defaults

parameter	default
<i>cost</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

### Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

ospfv3IfTable  
ospfv3IfIndex  
ospfv3IfMetricValue

---

## ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

**ip ospf interface** *interface\_name* **priority** *priority*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.  
*priority*                                The interface priority. The valid range is 0–255.

### Defaults

parameter	default
<i>priority</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

### Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)                      Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

ospfv3IfTable  
    ospfv3IfIndex  
    ospfv3IfRtrPriority

---

## ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

```
ipv6 ospf interface interface_name retrans-interval interval
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The retransmit interval, in seconds. The valid range 0–3600.

### Defaults

parameter	default
<i>interval</i>	5

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

### Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfRetransInterval
```

---

## ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

```
ipv6 ospf interface interface_name transit-delay delay
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.  
*delay*                                 The transit delay, in seconds. The valid range is 0–3600.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)            Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfTransitDelay
```

---

## show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

**show ipv6 ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display the general configuration parameters of the OSPFv3 router.
- See the Related Commands section below to modify the displayed parameters.

### Examples

```
-> show ipv6 ospf
Status                    = Enabled,
Router ID                 = 30.1.1.2,
# Areas                   = 1,
# Interfaces              = 3,
Area Border Router       = No,
AS Border Router         = No,
External Route Tag       = 0,
SPF Hold (seconds)       = 10,
SPF Delay (seconds)      = 5,
MTU checking              = Enabled,
BFD Status                = Disabled,
# SPF calculations performed = 34,
Last SPF run (seconds ago) = N/A,
# of routes               = 1,
# of AS external LSAs    = 0,
# of neighbors that are in:
  Full state              = 1,
  Loading state          = 0,
  Exchange state         = 0,
  Exstart state          = 0,
  2way state             = 0,
  Init state             = 0,
  Attempt state         = 0,
  Down state             = 0,
Graceful Restart         = Enabled,
Graceful Restart Status  = Restating,
Graceful Restart Helper  = Enabled,
Graceful Restart Helper Status = NotHelping
```

*output definitions*

---

<b>Status</b>	Displays whether OSPFv3 is currently enabled or disabled on the router.
<b>Router Id</b>	The unique identification for the router.
<b># Areas</b>	Number of areas to which the router belongs.
<b># Interface</b>	Number of interfaces participating in OSPFv3.
<b>Area Border Router</b>	Displays whether the router status is an area router or not.
<b>AS Border Router</b>	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
<b>External Route Tag</b>	Displays the route tag for this router.
<b>SPF Hold (seconds)</b>	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
<b>SPF Delay (seconds)</b>	Displays the time in seconds between consecutive SPF calculations.
<b>MTU Checking</b>	Displays whether Maximum Transfer Unit checking is enabled or disabled. This is set using the <b>ipv6 ospf mtu-checking</b> command.
<b>BFD Status</b>	The status of BFD on this interface.
<b># SPF calculations performed</b>	Displays the number of SPF calculation performed.
<b>Last SPF run (seconds ago)</b>	N/A
<b># of routes</b>	The total number of OSPFv3 routes known to this router.
<b># of AS external LSAs</b>	The number of external routes learned from outside the router's Autonomous System (AS).
<b># of neighbors that are in:</b>	
<b>Full state</b>	Displays the number of neighbor routers that are in Full state.
<b>Loading state</b>	Displays the number of neighbor routers that are in Loading state.
<b>Exchange state</b>	Displays the number of neighbor routers that are in Exchange state.
<b>Exstart state</b>	Displays the number of neighbor routers that are in Exstart state.
<b>2way state</b>	Displays the number of neighbor routers that are in 2way state.
<b>Init state</b>	Displays the number of neighbor routers that are in Init state.
<b>Attempt state</b>	Displays the number of neighbor routers that are in Attempt state.
<b>Down state</b>	Displays the number of neighbor routers that are in Down state.
<b>Graceful Restart</b>	Indicates if graceful restart feature is enabled or disabled on an OSPFv3 router.
<b>Graceful Restart Status</b>	Displays the OSPFv3 graceful restart status.
<b>Graceful Restart Helper</b>	Indicates whether the router is acting as a restart helper for the neighbor.
<b>Graceful Restart Helper Status</b>	Displays the OSPFv3 graceful restart helper status.

---

**Release History**

Release 7.1.1; command was introduced.

Release 8.4.1: OSPFv3 graceful restart fields added.

## Related Commands

<b>ipv6 ospf admin-state</b>	Enables or disables the administration of OSPFv3 on the router.
<b>ipv6 ospf mtu-checking</b>	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
<b>ipv6 ospf spf-timer</b>	Configures timers for SPF calculation.
<b>ipv6 ospf route-tag</b>	Configures a tag value for Autonomous System External (ASE) routes created.
<b>ip router router-id</b>	Configures the router ID for the router.

## show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

**show ipv6 ospf border-routers** [**area** *area\_id*] [**router** *router\_id*]

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

### Examples

```
-> show ipv6 ospf border-routers
```

```
Router ID          Area          Metric  Type
-----+-----+-----+-----
6.6.6.6            0.0.0.0        2      INTRA
6.6.6.6            0.0.0.1        2      INTRA
    fe80::2d0:95ff:fee2:6bda -> pseudo1
    fe80::2d0:95ff:fee2:6bda -> pseudo2
```

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area</b>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>Metric</b>	The metric used by the routes.
<b>Type</b>	The type of routes specified (intra or inter).

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[show ipv6 ospf](#)

Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**

N/A

---

## show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

```
show ipv6 ospf host [ipv6_address]
```

---

### Syntax Definitions

*ipv6\_address*                      A 128-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ipv6 ospf host
```

```
Area                      Metric      Address
-----+-----+-----
0.0.0.1                      1          2001::1/64
```

#### *output definitions*

---

<b>Area</b>	A 32-bit IP address for a directly attached host. This can be set using the <b>ipv6 ospf host</b> command.
<b>Metric</b>	The metric assigned to the host. Metric is set using the <b>ipv6 ospf host</b> command.
<b>Address</b>	IPV6 address of the host.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ipv6 ospf host](#)

Creates or deletes an OSPFv3 entry for directly attached hosts.

## MIB Objects

```
ospfv3HostTable  
  ospfv3HostIpAddress  
  ospfv3HostMetric  
  ospfHostStatus  
  ospfv3HostAreaID
```

---

## show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

```
show ipv6 ospf lsdb [area area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>rtr</b>	Specifies router LSAs.
<b>net</b>	Specifies network LSAs.
<b>netsum</b>	Specifies network summary LSAs.
<b>asbrsum</b>	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display the LSDB of the OSPFv3 router. It can be used for OSPFv3 debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

### Examples

```
-> show ipv6 ospf lsdb
```

Area	Type	Link ID	Advertising Rtr	Sequence #	Age
0.0.0.0	Router	0	1.1.1.1	8000020f	1117
0.0.0.0	Router	0	3.3.3.3	80000208	1121
0.0.0.0	Router	0	5.5.5.5	800001f1	1117

```
0.0.0.0          Router      0          30.30.30.30    800000da     1115
```

### *output definitions*

---

<b>Area</b>	The identification of the area to which the router belongs.
<b>Type</b>	The protocol type from where the route was learned.
<b>Link Id</b>	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
<b>Advertising Rtr</b>	The ID of the router that advertises the routes.
<b>Sequence #</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

---

---

## show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

**show ipv6 ospf neighbor** [**router** *ipv4\_address*][**interface** *interface\_name*]

---

### Syntax Definitions

*ipv4\_address*                      A 32-bit router ID of the neighboring router.  
*interface\_name*                    The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPFv3 router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ipv6 ospf neighbor
```

Router ID	Area/Transit Area	State	Interface
1.1.1.1	0.0.0.0	FULL	vlan-2071
3.3.3.3	0.0.0.0	FULL	vlan-2071
5.5.5.5	0.0.0.0	FULL	vlan-2071
23.23.23.23	0.0.0.1	FULL	vlan-2055
23.23.23.23	0.0.0.1	FULL	vlan-2056
24.24.24.24	0.0.0.1	FULL	vlan-2065
24.24.24.24	0.0.0.1	FULL	vlan-2066

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area/Transit Area</b>	The area identifier.
<b>State</b>	The state of the OSPFv3 neighbor adjacency.
<b>Interface</b>	The name of the interface.

---

```
-> show ipv6 ospf neighbor router 24.24.24.24
```

Router ID	Area/Transit Area	State	Interface
24.24.24.24	0.0.0.1	FULL	vlan-2070
24.24.24.24	0.0.0.1	FULL	vlan-2073

*output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area/Transit Area</b>	The area identifier.
<b>State</b>	The state of the OSPFv3 neighbor adjacency.
<b>Interface</b>	The name of the interface.

---

```
-> show ipv6 ospf neighbor router 1.1.1.1 interface v14
```

```
Details for Neighbor 1.1.1.1
```

```
State                = FULL,
Type                 = Dynamic,
Interface            = v14,
Neighbor i/f index   = 21,
Priority              = 1,
Address              = fe80::eae7:32ff:fe11:cc69,
Neighbor is reporting DR as = 30.1.1.2,
Neighbor is reporting BDR as = 1.1.1.1,
Neighbor is Master/Slave = Master,
Seconds since last Hello seen = 8,
# of LSAs on retransmit list = 0,
# of LSAs on request list = 0,
# of State Changes   = 6,
Restart Helper Status = NotHelping,
Restart Age          = 0 sec,
Last Restart Helper Exit Reason = None
Neighbor options:
```

```
V6 bit is set
E bit is set
MC bit is not set
N bit is not set
R bit is set
DC bit is not set
```

*output definitions*

---

<b>State</b>	The state of the OSPFv3 neighbor adjacency.
<b>Type</b>	Specifies the type of neighbor.
<b>Interface</b>	The name of the interface.
<b>Neighbor i/f index</b>	The unique value assigned to the neighbor.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Address</b>	The IPv6 address of the host.
<b>Neighbor is reporting DR as</b>	The address of the neighbors designated router.
<b>Neighbor is reporting BDR as</b>	The address of the neighbors Backup Designated Router.
<b>Neighbor is Master/Slave</b>	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>Seconds since last Hello seen</b>	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
<b># of LSAs on retransmit list</b>	The number of Link State updates to the neighbor that need to be retransmitted by the OSPFv3 router.
<b># of LSAs on request list</b>	The number of Link State requests to this neighbor that have not received a response from this neighbor.

*output definitions (continued)*

---

<b># of State Changes</b>	The number of times this OSPFv3 interface has changed its state.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a restart helper for the neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPFv3 restart interval if the router is acting as a restart helper for the neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a restart helper for the neighbor.
<b>Neighbor options</b>	If set: V6 - V6 support R - If clear, a node can participate in OSPFv3 topology distribution without being used to forward transit traffic N - Type 7 LSA support MC - Multicast support E - External routes support DC - Demand circuit support

---

**Release History**

Release 7.1.1; command was introduced.

Release 8.4.1: OSPFv3 graceful restart fields added.

**Related Commands**

**show ipv6 ospf** Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**

```

```

---

## show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

**show ipv6 ospf routes** [**prefix** *ipv6\_address\_prefix*][**gateway** *gateway*]

---

### Syntax Definitions

*ipv6\_address\_prefix*                    The 128-bit IPv6 address of the route destination in hexadecimal format.  
*gateway*                                    The next hop IPv6 address for this router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

```
-> show ipv6 ospf routes
```

Prefix	Path Type	Metric
		1 : 2
::/ 0	INTER	2 : -
fe80::2d0:95ff:fee0:710c -> vlan-2071		
2051::/64	INTRA	2 : -
fe80::2d0:95ff:feac:a59f -> vlan-2055		
fe80::2d0:95ff:feac:a59f -> vlan-2056		
fe80::2d0:95ff:fed7:747e -> vlan-2065		
fe80::2d0:95ff:fed7:747e -> vlan-2066		

#### *output definitions*

---

<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>Path Type</b>	The type of routes specified (intra or inter).
<b>Metric</b>	The cost of the route.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands**[ipv6 ospf admin-state](#)

Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**N/A

---

## show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

**show ipv6 ospf virtual-link** [*router\_id*]

---

### Syntax Definitions

*router\_id*                                      The router ID of the remote end of the virtual link.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 ospf virtual-link
```

Transit Area	Peer Router ID	Intf State	Nbr State	Cost
0.0.0.1	6.6.6.6	P2P	FULL	2

#### *output definitions*

---

<b>Transit Area</b>	The area identification for the area assigned to the virtual link.
<b>Peer Router ID</b>	The destination router identification for the virtual link.
<b>Intf State</b>	The state of the virtual link with regards to the local router.
<b>Nbr State</b>	The state of the virtual link adjacency.
<b>Cost</b>	The cost metric of the route.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands**[ipv6 ospf virtual-link](#)

Creates or deletes a virtual link.

**MIB Objects**

```

  ospfv3VirtIfState
```

---

## show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

```
show ipv6 ospf area [area_id]
```

---

### Syntax Definitions

*area\_id*                      A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPFv3 area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ipv6 ospf area
```

Area ID	Type	Stub Metric	Number of Interfaces
0.0.0.0	Normal	NA	2
0.0.0.1	Stub	1000000	2

Summarization ranges = 0
Import Area Summaries = Enabled
NSSA Translator Role = Candidate
NSSA Translator State = Elected
# NSSA Translator State Changes = 1,
```

### *output definitions*

---

<b>Area Type</b>	The area type. This field will be <b>normal</b> , <b>stub</b> , or <b>NSSA</b> .
<b>Area Stub Metric</b>	Indicates whether the area is enabled or disabled.
<b># Router LSAs</b>	The total number of Link State Advertisements for the Area.
<b># Network LSAs</b>	The total number of inter-area Link State Advertisements.
<b># of SPF calculations</b>	The number of times the area has calculated the Shortest Path.
<b># Interfaces</b>	The number of OSPFv3 interfaces.
<b># Intra-area-prefix LSAs</b>	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
<b># Inter-area-prefix LSAs</b>	The number of inter-area-prefix LSAs. Corresponds to Type 3 summary-LSA of OSPFv3.

*output definitions (continued)*

---

<b># Inter-area-router LSAs</b>	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPFv3.
<b># hosts</b>	The number of directly attached hosts.
<b># ABRs</b>	Number of Area Border Routers in the area.
<b># ASBRs</b>	Number of Autonomous System Border Routers in the area.
<b>Summarization ranges</b>	The range of prefixes summarized in to the area.
<b>Import Area Summaries</b>	Specifies whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs.
<b>NSSA Translator Role</b>	Specifies the NSSA translator role: <b>Candidate</b> or <b>Always</b>
<b>NSSA Translator State</b>	Indicates if and how an NSSA border router is performing NSSA translation ( <b>ipv6 ospf area nssa-translator-role</b> ) of NSSA-LSAs into AS-External-LSAs: Enabled, Elected, Disabled. <b>Enabled</b> indicates that the NSSA border router's translator role has been set to 'always'. <b>Elected</b> indicates that a candidate NSSA border router is translating NSSA-LSAs into AS-External-LSAs. <b>Disabled</b> indicates that a candidate NSSA Border router is not translating NSSA-LSAs into AS-External-LSAs.
<b># NSSA Translator State Changes</b>	Indicates the number of translator state changes that have occurred since the last start-up of the OSPFv3 routing process.

---

**Release History**

Release 7.1.1; command was introduced.  
Release 8.4.1; NSSA related fields added.

**Related Commands**

<b>ipv6 ospf area</b>	Creates or deletes an OSPFv3 area, assigning default metric, cost, and type.
<b>show ipv6 ospf interface</b>	Displays OSPFv3 interface information.

```

---

## show ipv6 ospf interface

Displays OSPFv3 interface information.

**show ipv6 ospf interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

### Examples

-> show ipv6 ospf interface

Name	DR Router ID	BDR Router ID	Admin Status	Oper Status	State
vlan-2071	5.5.5.5	0.0.0.0	Enabled	Up	DR
vlan-2055	7.7.7.7	5.5.5.5	Enabled	Up	BDR
vlan-2056	7.7.7.7	5.5.5.5	Enabled	Up	BDR

#### *output definitions*

---

<b>Name</b>	The name of the interface.
<b>DR Router ID</b>	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See <a href="#">Chapter 5, “VLAN Management Commands,”</a> for more information.)
<b>BDR Router ID</b>	The IP address of the backup designated router.
<b>Vlan</b>	The VLAN to which the interface is assigned.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Oper Status</b>	Indicates whether the interface is an active OSPFv3 interface.
<b>State</b>	The current state of the OSPFv3 interface. It will be <b>DR</b> , <b>BDR</b> , <b>other</b> .

---

```

-> show ipv6 ospf interface vlan-2071
Type                               = BROADCAST,
Admin Status                        = Enabled,
IPv6 Interface Status               = Up,
Oper Status                         = Up,
State                               = DR,
Area                                = 0.0.0.0,
Priority                            = 100,
Cost                                = 1,
Designated Router                   = 3.3.3.3,
Backup Designated Router            = 0.0.0.0,
Hello Interval                      = 1,
Router Dead Interval                = 4,
Retransmit Interval                 = 5,
Transit Delay                       = 1,
Ifindex                             = 17,
IPv6 'ifindex'                     = 2071,
MTU                                 = 1500,
# of attached neighbors              = 0,
Globally reachable prefix #0        = 2071::2/64

```

Output fields when an IP address or interface name is specified are described below:

#### *output definitions*

<b>Type</b>	The OSPFv3 interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
<b>Admin Status</b>	The current administrative status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>IPv6 Interface Status</b>	The current administrative status of the IPv6 interface, either <b>up</b> or <b>down</b> .
<b>Oper Status</b>	Indicates whether the interface is an active OSPFv3 interface.
<b>State</b>	The current state of the OSPFv3 interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .
<b>Area</b>	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Cost</b>	The cost added to routes learned on this interface.
<b>Designated Router</b>	The identification number of the designated router.
<b>Backup Designated Router</b>	The identification number of the backup designated router.
<b>Hello Interval</b>	The number of seconds between hello messages sent out on the interface.
<b>Router Dead Interval</b>	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
<b>Retransmit Interval</b>	The number of seconds the interface waits before resending hello messages.
<b>Transit Delay</b>	The estimated number of seconds required to transmit a link state update over this interface.

*output definitions (continued)*

---

<b>Ifindex</b>	The unique value assigned to an interface.
<b>IPv6 'ifindex'</b>	The unique value assigned to an IPv6 interface.
<b>MTU</b>	The Maximum Transfer Unit (in bytes) for the interface.
<b># of attached neighbors</b>	The number of OSPFv3 neighbors in the initialization state.
<b>Globally reachable prefix #0</b>	A globally unique IPv6 address.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ipv6 ospf interface</b>	Creates and deletes an OSPFv3 interface.
<b>ipv6 ospf interface dead-interval</b>	Configures the OSPFv3 interface dead interval.
<b>ipv6 ospf interface hello-interval</b>	Configures the OSPFv3 interface hello interval.
<b>ipv6 ospf interface cost</b>	Configures the OSPFv3 interface cost.
<b>ipv6 ospf interface priority</b>	Configures the OSPFv3 interface priority.
<b>ipv6 ospf interface retrans-interval</b>	Configures the OSPFv3 interface retransmit interval.
<b>ipv6 ospf interface transit-delay</b>	Configures the OSPFv3 interface transit delay.
<b>ipv6 ospf interface area</b>	Configures an OSPFv3 interface area.
<b>ipv6 ospf interface admin-state</b>	Enables or disables the administration status on an OSPFv3 interface.

```

---

## ipv6 ospf restart

Configures graceful restart feature on an OSPFv3 router.

**ipv6 ospf restart**

---

### Syntax Definitions

N/A

### Defaults

Graceful restart is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPFv3 router.
- The minimum hardware configuration for this command is a dual CMM configuration. The chassis based products (OmniSwitch 9900 and OmniSwitch 10K) running in a standalone or VC-1 mode must have dual CMMs. Stackable switches (OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900) or chassis based switches running with single CMM must have two or more chassis in the VC.
- This command enables both planned and unplanned restarts.

### Examples

```
-> ipv6 ospf restart  
-> no ipv6 ospf restart
```

### Release History

Release 8.4.1; command introduced

### Related Commands

- |   |  |
|---|--|
| <a href="#">show ipv6 ospf restart</a>  | Displays the OSPFv3 graceful restart related configuration and status. |
| <a href="#">show ipv6 ospf</a>          | Displays the OSPFv3 status and general configuration parameters.       |
| <a href="#">show ipv6 ospf neighbor</a> | Displays information on OSPFv3 non-virtual neighbors.                  |

**MIB Objects**

ospfv3RestartSupport  
ospfv3RestartStatus  
ospfv3RestartAge  
ospfv3RestartExitReason  
ospfv3RestartTime

---

## ipv6 ospf restart initiate

Initiates a planned OSPFv3 graceful restart.

**ipv6 ospf restart initiate**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command must be executed before executing the **takeover** or **vctakeover** command.

### Example

```
-> ipv6 ospf restart initiate
```

### Release History

Release 8.4.1; command introduced

### Related Commands

[show ipv6 ospf restart](#) Displays the OSPFv3 graceful restart related configuration and status.

### MIB Objects

alaOspf3RestartInitiate

---

## ipv6 ospf restart interval

Configures the grace period for achieving a graceful OSPFv3 restart.

**ipv6 ospf restart interval** [*seconds*]

---

### Syntax Definitions

*seconds* Restart timeout interval. The valid range is 1–1800 seconds.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Restart interval must be configured based on the databases size, number of neighbors, and number of OSPFv3 areas of the restarting router. If this is configured too low, there is a chance that graceful restart may fail prematurely.

### Example

```
-> ipv6 ospf restart interval 180
-> no ipv6 ospf restart interval
```

### Release History

Release 8.4.1; command introduced

### Related Commands

<a href="#">ipv6 ospf restart</a>	Configures graceful restart feature on an OSPFv3 router.
<a href="#">show ipv6 ospf restart</a>	Displays the OSPFv3 graceful restart related configuration and status.

### MIB Objects

ospfv3RestartInterval

---

## ipv6 ospf restart-helper

This command enables the graceful restart helper functionality.

**ipv6 ospf restart-helper**

---

### Syntax Definitions

N/A

### Defaults

By default, graceful restart helper functionality is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable restart helper functionality.
- A router that has configured as a helper may reject helping or stop helping in the half way if there is any topology change in the OSPFv3 network.
- The graceful restart helper does not have a requirement of having dual CMMs.

### Examples

```
-> ipv6 ospf restart-helper  
-> no ipv6 ospf restart-helper
```

### Release History

Release 8.4.1; command introduced

### Related Commands

<a href="#">ipv6 ospf restart</a>	Configures graceful restart feature on an OSPFv3 router.
<a href="#">ipv6 ospf restart-helper strict-lsa-check</a>	Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
<a href="#">show ipv6 ospf restart</a>	Displays the OSPFv3 graceful restart related configuration and status.

**MIB Objects**

ospfv3VirtNbrRestartHelperExitReason
```

---

## ipv6 ospf restart-helper strict-lsa-check

Enables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

**ipv6 ospf restart-helper strict-lsa-check**

---

### Syntax Definitions

N/A

### Defaults

By default, strict-lsa-checking is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the no form of the command to disable this functionality.
- Disabling this functionality may create sub-optimal or black hole routes during the graceful restart period.
- This functionality does not have a requirement of having dual CMMs.

### Examples

```
-> ipv6 ospf restart-helper strict-lsa-check  
-> no ipv6 ospf restart-helper strict-lsa-check
```

### Release History

Release 8.4.1; command introduced

---

## show ipv6 ospf restart

Displays the OSPFv3 graceful restart related configuration and status.

**show ipv6 ospf restart**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 ospf restart
Restart Support           = Enabled (planned-unplanned),
Restart Status           = Not Restarting,
Restart Interval         = 120,
Restart Age              = 0,
Last Restart Exit Reason = None,
Restart Helper Support   = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Status    = NotHelping,
Time Since Exit Reason Updated = 21:09:58
```

### *output definitions*

---

<b>Restart Support</b>	The administrative status of OSPFv3 graceful restart.
<b>Restart Status</b>	The current status of OSPFv3 graceful restart, which can be <b>Not Restarting</b> , <b>Unplanned Restart</b> (after a CMM takeover), or <b>Planned Restart</b> (before CMM takeover).
<b>Restart Interval</b>	The configured OSPFv3 restart timeout interval, in seconds.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPFv3 graceful restart interval.
<b>Last Restart Exit Reason</b>	The outcome of the last attempt at a graceful restart. If the value is <b>None</b> , then no restart has yet been attempted. If the value is <b>In Progress</b> , then a restart attempt is currently underway. Other possible values include <b>Completed</b> (successfully completed), <b>Timed Out</b> (timed out), and <b>Topology Changed</b> (aborted due to topology change).
<b>Restart Helper Support</b>	The administrative status of the capability of an OSPFv3 router to operate in helper mode in response to a router performing a graceful restart.

*output definitions (continued)*

---

<b>Restart Helper Strict Checking</b>	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a graceful restart helper for the neighbor.
<b>Time Since Exit Reason Updated</b>	The value of system up time on the most recent occasion at which the last restart exit reason was updated.

---

# 28 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP (IPv4 and IPv6) as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (that is, the usable interfaces of the router and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

The OmniSwitch version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

*Filename:* ALCATEL-IND1-VIRTUALROUTER-MIB.mib  
*Module:* alcatelIND1VirtualRouterMIB

*Filename:* ALCATEL-IND1-ISIS-MIB.mib  
*Module:* timetraIsisMIBModule

*Filename:* ISIS-MIB.mib  
*Module:* isisMIB

A summary of the available commands is listed here:

**Global IS-IS Commands**

**ip load isis**  
**ip isis admin-state**  
**ip isis area-id**  
**ip isis level-capability**  
**ip isis auth-check**  
**ip isis auth-type**

## ip load isis

Loads the IS-IS software on the router.

**ip load isis**

---

### Syntax Definitions

N/A

### Defaults

By default, IS-IS is not loaded on the switch.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

### Examples

```
-> ip load isis
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip protocols](#) Displays switch routing protocol information and status.

### MIB Objects

```
alaVrConfigTable  
  alaVrConfigIisisStatus
```

---

## ip isis admin-state

Enables or disables the administrative status of IS-IS on the switch.

```
ip isis admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables IS-IS.
<b>disable</b>	Disables IS-IS.

### Defaults

---

parameter	default
enable / disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

### Examples

```
-> ip isis admin-state enable  
-> ip isis admin-state disable
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```
isisSysTable  
  isisSysAdminState
```

---

## ip isis area-id

Configures the area ID for the switch.

**ip isis area-id** *area address*

**no ip isis area-id** *area address*

---

### Syntax Definitions

*area address* A 1–13 byte variable length integer, which specifies the area address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the area ID.
- The area ID is part of the Network Service Access Point (NSAP) address.
- Other parts of NSAP address (system ID and selector ID) are not configurable. System ID is derived from router ID and selector ID remains always as 00.
- You can configure a maximum of three area addresses.

### Examples

```
-> ip isis area-id 49.0001  
-> no ip isis area-id 49.0001
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```
isisManAreaAddrTable  
isisManAreaAddrExistState
```

---

## ip isis level-capability

Configures the router level of the IS-IS protocol globally.

```
ip isis level-capability {level-1 | level-2 | level-1/2}
```

---

### Syntax Definitions

<b>level-1</b>	Specifies that the router can operate at Level-1 only.
<b>level-2</b>	Specifies that the router can operate at Level-2 only.
<b>level-1/2</b>	Specifies that the router can operate at both Level-1 and Level-2.

### Defaults

---

parameter	default
level-1 / level-2 / level-1/2	level-1/2

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- Configuring the level capability at the IS-IS circuit level is also possible.

### Examples

```
-> ip isis level-capability level-1  
-> ip isis level-capability level-2
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

<a href="#">ip isis vlan level-capability</a>	Configures the IS-IS level on the specified circuit.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

### MIB Objects

```
isisSysTable  
isisSysType
```

---

## ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

**ip isis auth-check {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables authentication check for IS-IS PDUs.
<b>disable</b>	Disables authentication check for IS-IS PDUs.

### Defaults

By default, authentication check is enabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

### Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

### Release History

Release 7.3.3; command was introduced;

### Related Commands

<a href="#">ip isis auth-type</a>	Enables authentication and configures the authentication type of IS-IS protocol globally.
<a href="#">ip isis level auth-type</a>	Enables authentication and configures the authentication types for specific IS-IS levels.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

### MIB Objects

```
vRtrIsisTable
vRtrIsisAuthCheck
```

---

## ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

**ip isis auth-type** {**simple** {**key** *key* | **encrypt-key** *encrypt\_key*} | **md5** {**key** *key* | **encrypt-key** *encrypt\_key*} | **key-chain** *key-chain-id* | **none**}

---

### Syntax Definitions

<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<i>key-chain-id</i>	The configured keychain ID.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
<b>simple / md5   key-chain / none</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt\_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt\_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command configures the authentication type of IS-IS protocol globally. These settings can be overridden at each level.
- By default, the authentication is disabled and no authentication type is configured.
- If a keychain is applied globally, the authentication algorithm of its active key will be used for adjacency formation with all peers. Use **ip isis auth-type none** to remove the keychain from IS-IS adjacency configurations.

## Examples

```
-> ip isis auth-type simple key rachel
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis auth-type key-chain 2
```

## Release History

Release 7.3.3; command was introduced.  
Release 8.4.1; **key-chain** parameter added.

## Related Commands

<a href="#">ip isis level auth-type</a>	Enables authentication and configures the authentication types for specific IS-IS levels.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

## MIB Objects

```
vRtrIisisTable
  vRtrIisisAuthType
  vRtrIisisAuthKey
  vRtrIisisAuthKeyChainId
```

---

## ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

**ip isis csnp-auth**

**no ip isis csnp-auth**

---

### Syntax Definitions

N/A

### Defaults

CSNP authentication check is enabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

### Examples

```
-> ip isis csnp-auth  
-> no ip isis csnp-auth
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

<a href="#">ip isis level csnp-auth</a>	Configures CSNP authentication for specific IS-IS levels.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

### MIB Objects

```

vRtrIsisCsnpAuthentication
```

---

## ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

**ip isis hello-auth**

**no ip isis hello-auth**

---

### Syntax Definitions

N/A

### Defaults

Authentication check of Hello PDUs is enabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

### Examples

```
-> ip isis hello-auth  
-> no ip isis hello-auth
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[ip isis level hello-auth](#) Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```
vRtrIsisTable  
vRtrIsisHelloAuthentication
```

---

## ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

**ip isis psnp-auth**

**no ip isis psnp-auth**

---

### Syntax Definitions

N/A

### Defaults

PSNP authentication check is enabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

### Examples

```
-> ip isis psnp-auth
-> no ip isis psnp-auth
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[ip isis level psnp-auth](#)

Configures the PSNP authentication for specific IS-IS levels.

[show ip isis status](#)

Displays the IS-IS status.

### MIB Objects

```
vRtrIisisTable
vRtrIisisPsnpAuthentication
```

---

## ip isis lsp-lifetime

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

**ip isis lsp-lifetime** *seconds*

**no ip isis lsp-lifetime**

---

### Syntax Definitions

*seconds*    Validity interval in seconds. The valid range is 350–65535.

### Defaults

parameter	default
<i>seconds</i>	1200

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to restore the default value.

### Examples

```
-> ip isis lsp-lifetime 760
-> no ip isis lsp-lifetime
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

- [ip isis vlan lsp-pacing-interval](#) Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
- [show ip isis status](#) Displays the IS-IS status.
- [show ip isis database](#) Displays IS-IS LSP database information of the adjacent routers.

### MIB Objects

```
vRtrIisisTable
vRtrIisisLspLifetime
```

---

## ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

**ip isis lsp-wait** {**max-wait** | **initial-wait** | **second-wait**} *seconds*

**no ip isis lsp-wait** {**max-wait** | **initial-wait** | **second-wait**}

---

### Syntax Definitions

<b>max-wait</b>	Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.
<b>initial-wait</b>	Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.
<b>second-wait</b>	Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.
<i>seconds</i>	Specifies the time interval.

### Defaults

parameter	default
<i>seconds</i> ( <b>max-wait</b> )	5
<i>seconds</i> ( <b>initial-wait</b> )	0
<i>seconds</i> ( <b>second-wait</b> )	1

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

### Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

**ip isis vlan lsp-pacing-interval** Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

**show ip isis status** Displays the IS-IS status.

## MIB Objects

vRtrIrisTable

    vRtrIrisLspInitialWait

    vRtrIrisLspSecondWait

    vRtrIrisLspMaxWait

---

## ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

**ip isis spf-wait** {**max-wait** *seconds* | **initial-wait** *milliseconds*| **second-wait** *milliseconds*}

**no ip isis spf-wait** {**max-wait** | **initial-wait** | **second-wait**}

---

### Syntax Definitions

<b>max-wait</b> <i>seconds</i>	Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds.
<b>initial-wait</b> <i>milliseconds</i>	Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.
<b>second-wait</b> <i>milliseconds</i>	Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

### Defaults

parameter	default
<b>max-wait</b> <i>seconds</i>	10
<b>initial-wait</b> <i>milliseconds</i>	1000
<b>second-wait</b> <i>milliseconds</i>	1000

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

### Examples

```
-> ip isis spf-wait max-wait 25
-> no ip isis spf-wait initial-wait
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

**MIB Objects**`vRtrIisisTable``vRtrIisisSpfWait``vRtrIisisSpfInitialWait``vRtrIisisSpfSecondWait`

---

## ip isis summary-address

Adds or deletes the summary address.

**ip isis summary-address** {*ip\_prefix/mask* | *ip\_prefix* [*/netmask*]} {**level-1** | **level-2** | **level-1/2**}

**no ip isis summary-address** {*ip\_prefix/mask* | *ip\_prefix* [*/netmask*]}

---

### Syntax Definitions

<i>ip_prefix/mask</i>	Specifies the IP prefix in dotted decimal notation and the mask length.
<i>ip_prefix</i>	Specifies the IP prefix in dotted decimal notation.
<i>/netmask</i>	Specifies the subnet mask in dotted decimal notation.
<b>level-1</b>	Specifies the IS-IS level as Level-1.
<b>level-2</b>	Specifies the IS-IS level as Level-2.
<b>level-1/2</b>	Specifies the IS-IS level as Level-1/2.

### Defaults

parameter	default
<b>level-1   level-2   level-1/2</b>	<b>level-1/2</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarized by default.

### Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

**show ip isis summary-address** Displays the IS-IS summary address database.

## MIB Objects

vRtrIsisSummaryTable  
vRtrIsisSummRowStatus

---

## ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

**ip isis overload** [*timeout seconds*]

**no ip isis overload** [*timeout*]

---

### Syntax Definitions

**timeout** *seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

### Defaults

By default, the IS-IS overload state is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

### Examples

```
-> ip isis overload timeout 70
-> no ip isis overload timeout
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

### **ip isis overload-on-boot**

Configures the IS-IS router to be in the overload state during bootup for a specified time period.

### **show ip isis status**

Displays the IS-IS status.

## MIB Objects

isisSysTable

    isisSysSetOverload

vRtrIsisTable

    vRtrIsisOverloadTimeout

---

## ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

**ip isis overload-on-boot** [*timeout seconds*]

**no ip isis overload-on-boot** [*timeout seconds*]

---

### Syntax Definitions

*timeout seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

### Defaults

By default, the IS-IS router will not be in the overload state.

parameter	default
<i>timeout seconds</i>	60

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

### Examples

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

[ip isis overload](#)

Sets the IS-IS router to operate in the overload state.

    vRtrIisisOverloadOnBoot

    vRtrIisisOverloadOnBootTimeout

---

## ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

**ip isis graceful-restart**

**no ip isis graceful-restart**

---

### Syntax Definitions

N/A

### Defaults

Graceful restart is disabled on the router by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

### Examples

```
-> ip isis graceful-restart  
-> no ip isis graceful-restart
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[ip isis graceful-restart helper](#) Configures the helper mode of routers for graceful restart.

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```
vRtrIisisTable  
vRtrIisisGracefulRestart
```

---

## ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

**ip isis graceful-restart helper {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the helper mode on the router.
<b>disable</b>	Disables the helper mode on the router.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

### Examples

```
-> ip isis graceful-restart helper disable
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

<a href="#">ip isis graceful-restart</a>	Configures graceful restart on the router.
<a href="#">show ip isis status</a>	Displays the IS-IS status.

### MIB Objects

```
vRtrIisisTable

```

---

## ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

**ip isis strict-adjacency-check {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the adjacency check configuration on the router.
<b>disable</b>	Disables the adjacency check configuration on the router.

### Defaults

By default, the adjacency check configuration is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

### Examples

```
-> ip isis strict-adjacency-check enable
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

```

vRtrIisisStrictAdjacencyCheck
```

---

## ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

**ip isis level** {1 | 2} **auth-type** {**simple** {**key** *key* | **encrypt-key** *encrypt\_key*} | **md5** {**key** *key* | **encrypt-key** *encrypt\_key*} | **key-chain** *key-chain-id* | **none**}

---

### Syntax Definitions

<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<i>key-chain-id</i>	The configured keychain ID.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
<b>simple / md5   key-chain / none</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the **key** parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt\_key* parameter to configure the password by supplying the encrypted form of the password as the **encrypt-key**. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt\_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- Use **key-chain** parameter to apply a keychain to IS-IS adjacency at the capability level. Use **ip isis level auth-type none** to remove the capability level keychain authentication.
- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis level 2 auth-type simple key rachel
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis level 2 auth-type key-chain 1
-> ip isis level 2 auth-type none
```

## Release History

Release 7.3.3; command was introduced.

Release 8.4.1; **key-chain** parameter added.

## Related Commands

## ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

**ip isis level {1 | 2} hello-auth**

**no ip isis level {1 | 2} hello-auth**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

Authentication check of Level Hello PDUs is enabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

### Examples

```
-> ip isis level 1 hello-auth  
-> no ip isis level 1 hello-auth
```

### Release History

Release 7.3.3; command was introduced.

## ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

**ip isis level {1 | 2} csnp-auth**

**no ip isis level {1 | 2} csnp-auth**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

### Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

### Release History

Release 7.3.3; command was introduced.

## ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

**ip isis level {1 | 2} psnp-auth**

**no ip isis level {1 | 2} psnp-auth**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

### Examples

```
-> ip isis level 1 psnp-auth
-> no ip isis level 1 psnp-auth
```

### Release History

Release 7.3.3; command was introduced.

## ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

**ip isis level {1 | 2} wide-metrics-only**

**no ip isis level {1 | 2} wide-metrics-only**

---

### Syntax Definitions

- |   |                                       |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

### Defaults

By default, wide metrics is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

### Examples

```
-> ip isis level 1 wide-metrics-only  
-> no ip isis level 1 wide-metrics-only
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

## ip isis activate-ipv6|ipv4

Configures the IPv6 or IPv4 routing in IS-IS.

```
ip isis {activate-ipv6 | activate-ipv4}
```

```
no ip isis {activate-ipv6 | activate-ipv4}
```

---

### Syntax Definitions

**activate-ipv6** Enables IPv6 routing in IS-IS.

**activate-ipv4** Enables IPv4 routing in IS-IS.

### Defaults

By default, both IPv4 and IPv6 routing is enabled in IS-IS.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The **no** form of this command disables the IPv4/IPv6 routing in IS-IS.

### Examples

```
-> ip isis activate-ipv6
-> ip isis activate-ipv4
-> no ip isis activate-ipv4
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

## ip isis vlan

Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN. This command enables IS-IS routing on a particular VLAN. This is used to add both the IPv4 and IPv6 interfaces on a particular VLAN to the IS-IS circuit.

```
ip isis vlan vlan_id [address-family {v4 | v6 | v4v6}]
```

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN on which IS-IS is to be enabled.
v4   v6   v4v6	The address family extension. The type of interface (IPv4 or IPv6) is controlled by the address-family extension.

### Defaults

By default, both address families (IPv4 and IPv6) are disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The **no** form of this command disables IPv4/IPv6 IS-IS circuit on a particular VLAN.

### Examples

```
-> ip isis vlan 10
-> ip isis vlan 10 address-family v6
-> no ip isis vlan 10 address-family v6
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

<a href="#">show ip isis vlan</a>	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.
-----------------------------------	---

### MIB Objects

```
vRtrIsisIfTable
  vRtrIsisIfRowStatus
```

---

## ip isis vlan admin-state

Enables or disables IS-IS on an circuit.

```
ip isis vlan vlan_id admin-state {enable / disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN on which IS-IS routing is to be enabled.
<b>enable</b>	Administratively enables IS-IS on the VLAN.
<b>disable</b>	Administratively disables IS-IS on the VLAN.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

### Examples

```
-> ip isis vlan 10 admin-state enable
-> ip isis vlan 10 admin-state disable
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## ip isis vlan interface-type

Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

**ip isis vlan *vlan\_id* interface-type {broadcast | point-to-point}**

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>broadcast</b>	Sets the interface (circuit) type as a broadcast IS-IS interface.
<b>point-to-point</b>	Sets the interface (circuit) type as a point-to-point IS-IS interface.

### Defaults

parameter	default
<b>broadcast   point-to-point</b>	<b>broadcast</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip isis vlan 10 interface-type broadcast
-> ip isis vlan 10 interface-type point-to-point
```

### Release History

Release 7.3.3; command was introduced.

## ip isis vlan csnp-interval

Configures the time interval in seconds to send Complete Sequence Number PDUs (CSNP) PDUs from the specified VLAN circuit.

**ip isis vlan** *vlan\_id* **csnp-interval** *seconds*

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<i>seconds</i>	The time interval in seconds between successive CSNP PDUs sent on an interface after which IS-IS must generate a CSNP PDU on the specified circuit. The valid range is 1–65535.

### Defaults

---

parameter	default
<i>seconds</i>	Broadcast interface: 10 seconds Point-to-Point interface: 5 seconds

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The **no** form of this command reverts the time interval to the default value.

### Examples

```
-> ip isis vlan 10 csnp-interval 10
-> no ip isis vlan 10 csnp-interval
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis status](#) Displays the IS-IS status.

### MIB Objects

vRtrIisisIfCsnpInterval

---

## ip isis vlan hello-auth-type

Configures the authentication settings for the hello protocol at a circuit level.

```
ip isis vlan vlan_id hello-auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | key-chain key-chain-id | none}
```

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security considerations on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<i>key-chain-id</i>	The configured keychain ID.
<b>none</b>	No authentication will be used.

### Defaults

---

parameter	default
<b>simple / md5   key-chain / none</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt\_key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt\_key*. The Configuration snapshot always displays the password in the encrypted form. You must use only this *key* parameter during the CLI configuration.
- If the *encrypt\_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt\_key*.

- Use **key-chain** parameter to apply a keychain at a circuit level. Use **ip isis vlan hello-auth-type none** to remove the circuit level keychain authentication.
- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis vlan 10 hello-auth-type md5 key asddfgfhno
-> ip isis vlan 10 hello-auth-type simple key sdsdff
-> ip isis vlan 100 hello-auth-type key-chain 1
-> ip isis vlan 100 hello-auth-type none
```

## Release History

Release 7.3.3; command was introduced.  
Release 8.4.1; **key-chain** parameter added.

## Related Commands

**ip isis vlan level hello-auth-type** Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

**show ip isis vlan** Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## MIB Objects

```
vRtrIisisIfHelloAuthKey
vRtrIisisIfHelloAuthType
vRtrIisisIfHelloAuthKeyChainId
```

---

## ip isis vlan level-capability

Configures the IS-IS level on the specified circuit.

```
ip isis vlan vlan_id level-capability [level-1 | level-2 | level-1/2]
```

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>level-1</b>	Specifies that the interface can operate at Level-1 only.
<b>level-2</b>	Specifies that the interface can operate at Level-2 only.
<b>level-1/2</b>	Specifies that the interface can operate at both Level-1 and Level-2.

### Defaults

---

parameter	default
level-1   level-2   level-1/2	level-1/2

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

### Examples

```
-> ip isis vlan 10 level-capability level-1  
-> ip isis vlan 10 level-capability level-1/2
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

<a href="#">ip isis level-capability</a>	Configures the router level of the IS-IS protocol globally.
<a href="#">show ip isis vlan</a>	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

### MIB Objects

```

  isisCircLevel
```

---

## ip isis vlan lsp-pacing-interval

Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

**ip isis vlan** *vlan\_id* **lsp-pacing-interval** *milliseconds*

**no ip isis vlan** *vlan\_id* **lsp-pacing-interval**

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<i>milliseconds</i>	The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs.

### Defaults

parameter	default
<i>milliseconds</i>	100

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

### Examples

```
-> ip isis vlan 10 lsp-pacing-interval 1000  
-> no ip isis vlan 10 lsp-pacing-interval
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

### [ip isis lsp-lifetime](#)

Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.

### [ip isis lsp-wait](#)

Configures the time interval between successively generated LSPs.

### [show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## MIB Objects

vRtrIisisIfTable

vRtrIisisIfLspPacingInterval

---

## ip isis vlan passive

Configures the IS-IS circuit as passive.

**ip isis vlan** *vlan\_id* **passive**

**no ip isis vlan** *vlan\_id* **passive**

---

### Syntax Definitions

*vlan\_id*                                    The VLAN ID of a given VLAN.

### Defaults

By default, the interface is not passive.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS PDUs (Protocol Data Unit) and will not transmit IS-IS protocol PDUs.

### Examples

```
-> ip isis vlan 10 passive  
-> no ip isis vlan 10 passive
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[ip isis vlan level passive](#)            Configures the IS-IS circuit as passive at the specified IS-IS level.  
[show ip isis vlan](#)                    Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

### MIB Objects

```

  isisCircPassiveCircuit
```

---

## ip isis vlan retransmit-interval

Configures the minimum time interval between LSP (Link State Packet) retransmissions on a point-to-point interface.

**ip isis vlan** *vlan\_id* **retransmit-interval** *seconds*

**no ip isis vlan** *vlan\_id* **retransmit-interval**

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<i>seconds</i>	The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- The retransmit interval should be greater than the expected round-trip delay between two devices to avoid any needless retransmission of PDUs.

### Examples

```
-> ip isis vlan 10 retransmit-interval 130
-> no ip isis vlan 10 retransmit-interval
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

---

## ip isis vlan level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

**ip isis vlan** *vlan\_id* **level** {1 | 2} **hello-auth-type** {**simple** {**key** *key* / **encrypt-key** *encrypt\_key*} | **md5** {**key** *key* | **encrypt-key** *encrypt\_key*} | **key-chain** *key-chain-id* / **none**}

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
<i>key</i>	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
<i>encrypt_key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
<i>key-chain-id</i>	The configured keychain ID.
<b>none</b>	No authentication will be used.

### Defaults

parameter	default
<b>simple / md5   key-chain / none</b>	<b>none</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt\_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt\_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done at an interface level.
- Use **key-chain** parameter to apply a keychain at the capability level per circuit. Use **ip isis vlan level hello-auth-type none** to remove the capability level keychain authentication per circuit.
- By default, the authentication is disabled and no authentication type is configured.

## Examples

```
-> ip isis vlan 10 level 1 hello-auth-type md5 key xyz123
-> ip isis vlan 10 level 2 hello-auth-type none
-> ip isis vlan 100 level 2 hello-auth-type key-chain 1
-> ip isis vlan 100 level 2 hello-auth-type none
```

## Release History

Release 7.3.3; command was introduced.

Release 8.4.1; **key-chain** parameter added.

## Related Commands

<a href="#">ip isis vlan hello-auth-type</a>	Configures the authentication settings for the hello protocol at a circuit level.
<a href="#">show ip isis vlan</a>	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## MIB Objects

  vRtrIisisIfLevelHelloAuthKey
  vRtrIisisIfLevel
  vRtrIisisIfLevelHelloAuthKeyChainId
```

---

## ip isis vlan level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level on a circuit.

**ip isis vlan** *vlan\_id* level {1 | 2} **hello-interval** *seconds*

**no ip isis vlan** *vlan\_id* level {1 | 2} **hello-interval**

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<i>seconds</i>	The hello interval, in seconds. The valid range is 1–20000.

### Defaults

parameter	default
<i>seconds</i> (designated routers)	3
<i>seconds</i> (non-designated routers)	9

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to restore the default settings.

### Examples

```
-> ip isis vlan 10 level 1 hello-interval 50
-> no isis vlan 10 level 2 hello-interval
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

### MIB Objects

vRtrIisisIfLevelTable  
vRtrIisisIfLevelHelloTimer

---

## ip isis vlan level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

**ip isis vlan** *vlan\_id* level {1 | 2} **hello-multiplier** *number*

**no ip isis vlan** *vlan\_id* level {1 | 2} **hello-multiplier**

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<i>number</i>	The multiplier (2–100) of the hello interval.

### Defaults

parameter	default
<i>number</i>	3

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to restore the default settings.

### Examples

```
-> ip isis vlan 10 level 1 hello-multiplier 10
-> no ip isis vlan 10 level 2 hello-multiplier
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

### MIB Objects

```
isisCircLevelTable
  isisCircLevelHelloMultiplier
```

---

## ip isis vlan level metric

Configures the metric value of the specified IS-IS level of the circuit.

**ip isis vlan** *vlan\_id* level {1 | 2} metric *number*

**no ip isis vlan** *vlan\_id* level {1 | 2} metric

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<i>number</i>	The metric value (1–16777215) assigned for the specified level of the circuit.

### Defaults

---

parameter	default
<i>number</i>	10

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each circuit must have a cost. The costs for each level on a circuit may be different. If the metric is not configured, the default of 10 is used.

### Examples

```
-> ip isis vlan 10 level 1 metric 25
-> no ip isis vlan 10 level 2 metric
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

### [show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## MIB Objects

vRtrIisisIfLevelTable  
vRtrIisisIfLevelAdminMetric

---

## ip isis vlan level passive

Configures the IS-IS circuit as passive at the specified IS-IS level.

**ip isis vlan** *vlan\_id* level {1 | 2} passive

**no ip isis vlan** *vlan\_id* level {1 | 2} passive

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.

### Defaults

By default, the interface level passive configuration is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit at the given level to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol PDUs and will not transmit IS-IS protocol PDUs.

### Examples

```
-> ip isis vlan 10 level 1 passive  
-> no ip isis vlan 10 level 1 passive
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

[ip isis vlan passive](#)

Configures the IS-IS circuit as passive.

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## MIB Objects

```
vRtrIisisIfLevelTable  
  vRtrIisisIfLevelPassive
```

---

## ip isis vlan level priority

Configures the priority of the IS-IS circuit for the designated router election on a multi-access network.

**ip isis vlan** *vlan\_id* level [1 | 2] **priority** *number*

**no ip isis vlan** *vlan\_id* level [1 | 2] **priority**

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID of a given VLAN.
<b>1</b>	Specifies the IS-IS level as Level-1.
<b>2</b>	Specifies the IS-IS level as Level-2.
<i>number</i>	The priority value of the IS-IS circuit at this level. The valid range is 0–127.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	64

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- This priority is included in hello PDUs transmitted by the circuit on a multi-access network.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

### Examples

```
-> ip isis vlan 10 level 1 priority 4
-> ip isis vlan 10 level 2 priority 4
-> no ip isis vlan 10 level 1 priority
```

### Release History

Release 7.3.3; command was introduced.

## Related Commands

### [show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

## MIB Objects

vRtrIisisIfLevelISPriority

---

## ip isis summary-address6

Configures the IPv6 summary address.

```
ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}
```

```
no ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}
```

---

### Syntax Definitions

<i>ipv6_prefix/prefix_length</i>	IPv6 prefix and prefix length.
<i>ipv6_address</i>	IPv6 address.
<b>level-1</b>	Specifies that the routes can be summarized at Level-1 only.
<b>level-2</b>	Specifies that the routes can be summarized at Level-2 only.
<b>level-1/2</b>	Specifies that the routes can be summarized at both Level-1 and Level-2.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to remove an already configured summary address.

### Examples

```
-> ip isis summary-address6 4001::/16 level-1  
-> no ip isis summary-address6 4001::/16
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis summary-address6](#) Displays the IS-IS IPv6 summary address database.

### MIB Objects

```
vRtrIisisInetSummLevel  
vRtrIisisInetSummRowStatus
```

---

## show ip isis adjacency

Displays information about IS-IS adjacent routers.

**show ip isis adjacency** [{system-id *nbr\_sys\_id* | vlan *vlan\_id*] [detail]

---

### Syntax Definitions

*nbr\_sys\_id*                                    The system ID of the neighbor router.  
*vlan\_id*                                        The VLAN ID of a given VLAN.

### Defaults

By default adjacency information for all the neighbor routers are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use *the nbr\_sys\_id* or *vlan\_id* parameter with this command to view the adjacency information for a specific neighbor.

### Examples

```
-> show ip isis adjacency
=====
ISIS Adjacency
=====
System ID           Type      State    Hold    VlanID   MT IDs   Hostname
-----
0000.0000.0001     L1        UP       25      20       0, 2     Router-A
0000.0000.0002     L2        UP       21      30       None     Router-B
-----
Adjacency : 2
=====
```

### output definitions

---

<b>System ID</b>	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
<b>Type</b>	The level ( <b>L1</b> , <b>L2</b> , or <b>L1/L2</b> ) of the adjacent router.
<b>State</b>	The state of the adjacent router ( <b>Up</b> or <b>Down</b> ).
<b>Hold</b>	The Hold time of the adjacent router.
<b>VlanID</b>	The VLAN ID of the adjacent router.
<b>MT IDs</b>	MT IDs sent by MT enabled ISIS neighbour. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbour.

*output definitions*

---

<b>Hostname</b>	The host name of the adjacent router.
<b>Adjacencies</b>	The total number of adjacent routers.

*output definitions*

---

<b>SystemID</b>	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
<b>VLAN</b>	The Vlan ID in which the adjacency is present.
<b>MT IDs</b>	MT IDs sent by MT enabled ISIS neighbor. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbor.
<b>NLPIDs</b>	The IP address families supported by IS-IS neighbor: IPv4 or IPv6
<b>State</b>	The state of the adjacent router ( <b>Up</b> or <b>Down</b> ).
<b>Adj Level</b>	The adjacency level ( <b>L1</b> or <b>L2</b> ) of the router.
<b>Nbr Sys Type</b>	The type of the neighboring router( <b>L1</b> , <b>L2</b> or <b>L1L2</b> )
<b>Hold Time</b>	The Hold time of the adjacent router.

*output definitions*

---

<b>IPv4 Neighbor</b>	The 32-bit IP address of the neighbor.
<b>IPv6 Neighbor</b>	The 32-bit IPv6 address of the neighbor
<b>Restart Support</b>	Indicates if graceful restart is <b>enabled</b> or <b>disabled</b> .
<b>Restart Status</b>	Indicates whether the router is currently helping an adjacent router to restart.
<b>Restart Suppressed</b>	Indicates whether the advertisement of LSPs are suppressed ( <b>enabled</b> ) or not ( <b>disabled</b> ) as per the request of adjacent router.
<b>SNPA</b>	The SNPA address of the adjacent router.
<b>Up Time</b>	Indicates the time period in seconds, during which the router was in the adjacency.
<b>Priority</b>	The priority of the adjacent router.
<b>Host-name</b>	The host name of the adjacent router.
<b>L. CircType</b>	Indicates the level circuit type ( <b>L1</b> , <b>L2</b> or <b>L1L2</b> ) of the adjacent router.
<b>Max Hold</b>	Indicates the maximum Hold time of the adjacent router.

## show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

**show ip isis database** [{*system\_id system\_id* | *lsp\_id lsp\_id*}] [**detail**] [**level** {**1** | **2**}]

---

### Syntax Definitions

<i>system_id</i>	The system ID of the router.
<i>lsp_id</i>	The LSP ID.
<b>detail</b>	Indicates that the output is displayed in a detailed manner.
<b>level</b>	Indicates the IS-IS level, either <b>1</b> or <b>2</b> .

### Defaults

By default, the entire LSP database is displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use *system\_id* or *lsp\_id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

### Examples

```
-> show ip isis database
Legends : P          = The Partition repair bit is set
OV         = The overload bit is set
ATT        = The Attach bit is set
L1         = Specifies a Level 1 IS type

```

*output definitions*

---

<b>LSP ID</b>	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
<b>Sequence</b>	The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs.
<b>Checksum</b>	The checksum value of the LSP.
<b>Lifetime</b>	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
<b>Attributes</b>	The level capability of the router.
<b>LSP Count</b>	The number of LSPs in the Link State Database.

=====

*output definitions*

---

<b>LSP ID</b>	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
<b>Sequence</b>	The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs.
<b>Checksum</b>	The checksum value of the LSP.
<b>Lifetime</b>	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
<b>Version</b>	The version of the IS-IS protocol that has generated the LSP.
<b>Pkt Type</b>	The IS-IS PDU type number derived from the PDU header, which can be <b>18</b> or <b>20</b> . The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type.
<b>Pkt Ver</b>	The version of the IS-IS protocol that has generated the packet.
<b>Attributes</b>	The level capability of the router.
<b>Max Area</b>	The Maximum number of areas supported by the originating router of the LSP.
<b>SysID Len</b>	The length of the system-id as used by the originating router.
<b>Used Len</b>	The length used by the LSP.
<b>Alloc Len</b>	The length allocated for the LSP to be stored.
<b>Area Address</b>	The area ID of the router.
<b>Supp protocols</b>	The network layer protocols that are supported.
<b>IS-Host Name</b>	The host name of the router.
<b>System ID</b>	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
<b>IS Neighbors</b>	The list of reachable IS-IS neighbors.
<b>IPv4 Internal Reach</b>	The list of IS-IS internal routes.
<b>IPv6 Reach</b>	The list of IS-IS IPv6 internal routes.
<b>IP Prefix</b>	The IP address and subnet mask of the destination.
<b>Metrics</b>	The metric value to reach the destination.
<b>IPv4 External Reach</b>	The list of external IS-IS routes.
<b>IPv6 Reach</b>	The list of external IS-IS IPv6 routes.
<b>level-1 LSP Count</b>	The number of Level-1 LSPs.
<b>level-2 LSP Count</b>	The number of Level-2 LSPs.

---

**Release History**

Release 7.3.3; command was introduced.

## Related Commands

- show ip isis hostname** Displays the database of IS-IS host name and its corresponding system ID.
- clear ip isis lsp-database** Clears and resets the IS-IS LSP database information.

### *output definitions*

---

<b>System Id</b>	The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
<b>Admin State</b>	The state of the router ( <b>Up</b> or <b>Down</b> ).
<b>Protocols Enabled</b>	The protocol enabled on the router: IPv4 or IPv6
<b>Last Enabled</b>	The date and time when the router is enabled.
<b>Level Capability</b>	The level capability of the router ( <b>L1</b> , <b>L2</b> , or <b>L1L2</b> ).
<b>Authentication Check</b>	Indicates the status of the authentication ( <b>true</b> or <b>false</b> ).
<b>Authentication Type</b>	The type of authentication ( <b>simple</b> , <b>md5</b> , <b>keychain</b> , <b>none</b> ).
<b>Graceful Restart</b>	Indicates if graceful restart is <b>Enabled</b> or <b>Disabled</b> .
<b>GR helper-mode</b>	Indicates if the helper mode of graceful restart is <b>Enabled</b> or <b>Disabled</b> .
<b>LSP Lifetime</b>	The Lifetime of the LSP (in seconds).
<b>LSP Wait</b>	The Wait time of the LSP (in seconds).
<b>Adjacency Check</b>	The adjacency check configuration on the router
<b>L1 Auth Type</b>	The authentication type ( <b>simple</b> , <b>md5</b> , <b>keychain</b> , <b>none</b> ) for Level-1 adjacency.
<b>L2 Auth Type</b>	The authentication type ( <b>simple</b> , <b>md5</b> , <b>keychain</b> , <b>none</b> ) for Level-2 adjacency.
<b>L1 Wide Metrics-only</b>	Indicates whether wide metrics is <b>Enabled</b> or <b>Disabled</b> for Level-1 adjacency.
<b>L2 Wide Metrics-only</b>	Indicates whether wide metrics is <b>Enabled</b> or <b>Disabled</b> for Level-2 adjacency.
<b>L1 LSDB Overload</b>	Indicates whether LSDB Overload is <b>Enabled</b> or <b>Disabled</b> for Level-1 adjacency.
<b>L2 LSDB Overload</b>	Indicates whether LSDB Overload is <b>Enabled</b> or <b>Disabled</b> for Level-2 adjacency.
<b>L1 LSPs</b>	The number of LSPs for Level-1 adjacency.
<b>L2 LSPs</b>	The number of LSPs for Level-2 adjacency.
<b>Last SPF</b>	The date and duration of the last SPF calculation.
<b>SPF Wait</b>	The Wait time for the SPF calculation.
<b>Hello-Auth Check</b>	Indicates the status of global Hello authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Csnp-Auth Check</b>	Indicates the status of global CSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).

*output definitions (continued)*

---

<b>Psnp-Auth Check</b>	Indicates the status of global PSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L1 Hello-Auth Check</b>	Indicates the status of L1 Hello authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L1 Csnp-Auth Check</b>	Indicates the status of L1 CSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L1 Psnp-Auth Check</b>	Indicates the status of L1 PSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L2 Hello-Auth Check</b>	Indicates the status of L2 Hello authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L2 Csnp-Auth Check</b>	Indicates the status of L2 CSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L2 Psnp-Auth Check</b>	Indicates the status of L2 PSNP authentication check ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Auto-Configuration</b>	Indicates the status of auto-configuration for ISIS. ( <b>Enabled</b> or <b>Disabled</b> )
<b>Area Address</b>	The area address of the router.

**Release History**

Release 7.3.3; command introduced.

Release 7.3.4; added **auto-configuration** to the output definition.

**Related Commands**

[show ip isis statistics](#) Displays statistics for the IS-IS configuration.

**MIB Objects**

---

## show ip isis summary-address

Displays the IS-IS summary address database.

**show ip isis summary-address** [*ip\_address* [/i>mask]]

---

### Syntax Definitions

*ip\_address*                                    The 32-bit IP address.  
*/mask*    The netmask value. The valid range is 1–32.

### Defaults

By default summary address information for all the IP addresses is displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the *ip\_address* parameter with this command to view the summary address information for a specific IP address.

### Examples

```
-> show ip isis summary-address
=====
ISIS Summary Address
=====
Address                                    Level
-----
1.0.0.0/8                                 L1
2.1.0.0/24                                L1L2
3.1.2.3/32                                L2
-----

Summary Address : 3
```

#### *output definitions*

---

<b>Address</b>	The summary address for a range of IPv4 addresses.
<b>Level</b>	The capability level of the router.
<b>Summary Address</b>	The number of summarized addresses.

---

### Release History

Release 7.3.3; command was introduced.

## Related Commands

**ip isis summary-address** Adds or deletes the summary address.

## MIB Objects

vRtrIsissummaryTable

    vRtrIsisSummPefix

    vRtrIsisSummMask

    vRtrIsisSummLevel

---

## show ip isis vlan

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

**show ip isis vlan** [*vlan\_id*] [**detail**]

---

### Syntax Definitions

*vlan\_id*                                      The VLAN ID.  
**detail**                                        Indicates that the output is displayed in a detailed manner.

### Defaults

By default, the interface information for all the interfaces is displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the *vlan\_id* parameter with this command to view information for a specific VLAN.

### Examples

```
-> show ip isis vlan
=====
ISIS Vlan
=====
Interface   Address-family  Level  VlanID  Oper-state  Admin-state  L1/L2-Metric
-----
ospf        ipv4             L1L2   11      DOWN       UP           10/10
vlan11      ipv6             L1L2   11      DOWN       UP           10/10
-----
Vlans : 2
=====
```

#### *output definitions*

---

<b>Interface</b>	The name of the IS-IS interface.
<b>Address-family</b>	The address family extension: IPv4 or IPv6
<b>Level</b>	The level capability of the interface.
<b>VlanID</b>	The VLAN ID of the interface.
<b>Oper-state</b>	The operational state of the interface ( <b>up</b> or <b>down</b> ).
<b>Admin-state</b>	The administrative state of the interface ( <b>up</b> or <b>down</b> ).
<b>L1/L2 -Metric</b>	The metric value of the router for the corresponding capability level.
<b>Vlans</b>	The total number of VLANs.

---

```

### *output definitions*

<b>VlanId</b>	The VLAN ID.
<b>Level Capability</b>	The level capability of the interface.
<b>Oper State</b>	The operational state of the interface ( <b>up</b> or <b>down</b> ).
<b>Admin State</b>	The administrative state of the interface ( <b>up</b> or <b>down</b> ).
<b>Auth Type</b>	Indicates the authentication type ( <b>simple</b> , <b>MD5</b> , <b>keychain</b> , <b>none</b> ) of the interface.
<b>Address Families</b>	The address family extension: IPv4 or IPv6
<b>Circuit Id</b>	The circuit ID of the interface.
<b>RetransmitInt</b>	Specifies the minimal interval of time, in seconds between retransmission of an LSP on the point-to-point interface.
<b>Type</b>	The type of interface: <b>Broadcast</b> or <b>Pt-to-Pt</b> (point to point).
<b>LSP Pacing Int</b>	The LSP Pacing interval.
<b>Mesh Group</b>	The status of the mesh group ( <b>Active</b> or <b>Inactive</b> ).
<b>CSNP Int</b>	The CSNP interval.

*output definitions (continued)*

---

<b>Level</b>	Indicates the IS-IS level of the neighbor ( <b>L1</b> , <b>L2</b> , or <b>L1L2</b> ).
<b>Adjacencies</b>	The number of adjacencies formed.
<b>Desg IS</b>	The ID of the LAN Designated Intermediate System on this circuit at this level.
<b>Auth Type</b>	Indicates the authentication type ( <b>simple</b> , <b>MD5</b> , <b>keychain</b> , <b>none</b> ) for the specified level.
<b>Metric</b>	The metric value of this circuit for a specific level.
<b>Hello Timer</b>	Indicates the Hello timer value.
<b>Hello Mult</b>	Indicates the Hello multiplier value.
<b>Priority</b>	The priority value of the interface.
<b>Passive</b>	Indicates whether the interface is configured as a passive interface ( <b>Yes</b> or <b>No</b> ).
<b>Vlans</b>	The total number of VLANs.

## show ip isis summary-address6

Displays the IS-IS IPv6 summary address database.

**show ip isis summary-address6** [*ip\_address* [/i>mask]]

---

### Syntax Definitions

*ip\_address*                                    The 32-bit IP address.  
*/mask*    The netmask value. The valid range is 1–32.

### Defaults

By default, summary address information for all the IP addresses is displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the *ip\_address* parameter with this command to view the summary address information for a specific IP address.

### Examples

```
-> show ip isis summary-address6
=====
ISISv6 Summary Address
=====
Address                               Level

```

#### *output definitions*

---

<b>Address</b>	The summary address for a range of IPv6 addresses.
<b>Level</b>	The capability level of the router.
<b>Summary Address</b>	The number of summarized addresses.

---

### Release History

Release 7.3.3; command was introduced.

**Related Commands**

[ip isis summary-address6](#) Configures the IPv6 summary address.

**MIB Objects**

N/A

---

## clear ip isis adjacency

Clears and resets the IS-IS adjacency database information.

```
clear ip isis adjacency [system-id nbr_sys_id]
```

---

### Syntax Definitions

*nbr\_sys\_id*                                      The system ID of the neighbor router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If the *nbr\_sys\_id* parameter is specified, only the entries specific to that system ID are removed from the database.

### Examples

```
-> clear ip isis adjacency system-id 1122.3344.5566
```

### Release History

Release 7.3.3; command was introduced.

### Related Commands

[show ip isis adjacency](#)                      Displays information about IS-IS adjacent routers.

## clear ip isis lsp-database

Clears and resets the IS-IS LSP database information.

```
clear ip isis lsp-database [system-id sys_id]
```

---

### Syntax Definitions

*sys\_id* The system ID of the router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If the *sys\_id* parameter is specified, only the entries specific to that system ID are removed from the database.

### Examples

```
-> clear ip isis lsp-database system-id 000a.1234.2345
```

### Release History

Release 7.3.3; command was introduced..

### Related Commands

[show ip isis database](#) Displays IS-IS LSP database information of the adjacent routers.

  vRtrIisisCSPFPathsNotFound
```

---

## ip isis multi-topology

Enables M-ISIS (multi-topology) capability support for IS-IS. If enabled, IPv6 SPF computation is performed separate from the IPv4 SPF computation.

**ip isis multi-topology**

**no ip isis multi-topology**

---

### Syntax Definitions

N/A

### Defaults

By default, multi-topology is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Changing the multi-topology mode with this command results in internal disabling and re-enabling of the IS-IS protocol with the new mode of operation. This will cause IS-IS adjacencies to be reset.

### Examples

```
-> ip isis multi-topology
-> no ip isis multi-topology
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

<a href="#">show ip isis status</a>	Displays the IS-IS status.
<a href="#">show ip isis adjacency</a>	Displays information about IS-IS adjacent routers.

### MIB Objects

```
vRtrIisisEntry
vRtrIisisMTEnabled
```

---

# 29 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The OmniSwitch implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545.

---

**Note.** In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

---

MIB information for BGP is as follows:

*Filename:* ALCATEL-IND1-VIRTUALROUTER-MIB.mib  
*Module:* alcatelIND1VirtualRouterMIB

*Filename:* ALCATEL-IND1-BGP-MIB.mib  
*Module:* alcatelIND1BGPMIB

*Filename:* BGP4-MIB.mib  
*Module:* bgp

The following table summarizes the available commands:

<b>Global BGP Commands</b>	<ul style="list-style-type: none"> <li>ip load bgp</li> <li>ip bgp admin-state</li> <li>ip bgp autonomous-system</li> <li>ip bgp bestpath as-path ignore</li> <li>ip bgp cluster-id</li> <li>ip bgp default local-preference</li> <li>ip bgp fast-external-failover</li> <li>ip bgp always-compare-med</li> <li>ip bgp bestpath med missing-as-worst</li> <li>ip bgp client-to-client reflection</li> <li>ip bgp as-origin-interval</li> <li>ip bgp synchronization</li> <li>ip bgp confederation identifier</li> <li>ip bgp maximum-paths</li> <li>ip bgp log-neighbor-changes</li> <li>ip bgp dampening</li> <li>ip bgp dampening clear</li> <li>ip bgp asn-format</li> <li>ip bgp unicast</li> <li>show ip bgp</li> <li>show ip bgp statistics</li> <li>show ip bgp dampening</li> <li>show ip bgp dampening-stats</li> <li>show ip bgp path</li> <li>show ip bgp routes</li> </ul>

---

## ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

**ip load bgp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the [ip bgp admin-state](#) to start the BGP protocol.

### Examples

```
-> ip load bgp
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |  |  |
|--|--|
| <a href="#">ip bgp autonomous-system</a> | Configures the Autonomous system number for this BGP router. |
| <a href="#">ip bgp admin-state</a>       | Administratively enables or disables BGP.                    |

### MIB Objects

```

```

---

## ip bgp admin-state

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

**ip bgp admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables BGP.
<b>disable</b>	Disables BGP.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- You must first load the BGP software into running memory using the [ip load bgp](#) command before initiating this command.
- Many BGP commands require that the protocol be disabled ([ip bgp admin-state](#)) before issuing them.

### Examples

```
-> ip bgp admin-state enable
-> ip bgp admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip load bgp](#) Loads the BGP software.

### MIB Objects

```
alaBgpGlobal
  alaBgpProtoStatus
```

---

## ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route's AS path.

**ip bgp autonomous-system** *value*

---

### Syntax Definitions

*value*    The AS number in the asplain, asdot+, or asdot formats.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

### Examples

```
-> ip bgp autonomous-system 64724
```

The following examples show how to configure the local BGP ASN as 65535 in the three different formats:

```
-> ip bgp autonomous-system 65535           (asplain format)
-> ip bgp autonomous-system 0.65535        (asdot+ format)
-> ip bgp autonomous-system 65535         (asdot format)
```

The following examples show how to configure the local BGP ASN as 65538 in the three different formats:

```
-> ip bgp autonomous-system 65538          (asplain format)
-> ip bgp autonomous-system 1.2           (asdot+ format)
-> ip bgp autonomous-system 1.2           (asdot format)
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.3; support for 4-octet ASN was added.

## MIB Objects

alaBgpGlobal  
  alaBgpAutonomousSystemNumber

---

## ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

**ip bgp bestpath as-path ignore**

**no ip bgp bestpath as-path ignore**

---

### Syntax Definitions

N/A

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp bestpath as-path ignore  
-> no ip bgp bestpath as-path ignore
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp aggregate-address as-set** Specifies whether AS path aggregation is to be performed or not.

**ip bgp policy aspath-list** Creates or removes an AS path list.

**ip bgp default local-preference** Configures the default local preference (lpref) value to be used when advertising routes.

## MIB Objects

alaBgpGlobal

alaBgpASPathCompare

---

## ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

**ip bgp cluster-id** *ip\_address*

---

### Syntax Definitions

*ip\_address* 32-bit IP address that is the Cluster ID of the router acting as a route reflector.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

### Examples

```
-> ip bgp cluster-id 1.2.3.4
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp admin-state** Enables and disables BGP.

**ip bgp client-to-client reflection** Enables route reflection and sets this speaker as the route reflector.

**MIB Objects**

alaBgpGlobal  
  alaBgpClusterId

---

## ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

**ip bgp default local-preference** *value*

---

### Syntax Definitions

*value* The default local preference value for this router. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	100

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp default local-preference 200
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp aggregate-address local-preference** Sets the local preference for a BGP aggregate.

**ip bgp network local-preference** Sets the local preference for a BGP network.

## MIB Objects

alaBgpGlobal  
alaBgpDefaultLocalPref

---

## ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

**ip bgp fast-external-failover**

**no ip bgp fast-external-failover**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp fast-external-failover  
-> no ip bgp fast-external-failover
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">ip bgp neighbor clear</a>	Restarts a BGP peer.
<a href="#">ip bgp neighbor auto-restart</a>	Enables or disables BGP peer automatic restart.
<a href="#">ip bgp neighbor timers</a>	Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

**MIB Objects**

alaBgpFastExternalFailOver

---

## ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

**ip bgp always-compare-med**

**no ip bgp always-compare-med**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

### Examples

```
-> ip bgp always-compare-med  
-> no ip bgp always-compare-med
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp bestpath med missing-as-worst](#) Configures the MED parameter when it is missing in a BGP path.

### MIB Objects

```
alaBgpGlobal  
alaBgpMedAlways
```

## ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

**ip bgp bestpath med missing-as-worst**

**no ip bgp bestpath med missing-as-worst**

---

### Syntax Definitions

N/A

### Defaults

By default this command is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst ( $2^{32}-1$ ) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp always-compare-med** Forces BGP to consider MED values from external routes.

### MIB Objects

```
alaBgpGlobal
  alaBgpMissingMed
```

---

## ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

**ip bgp client-to-client reflection**

**no ip bgp client-to-client reflection**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp admin-state** Administratively disables BGP in this router.

**ip bgp neighbor route-reflector-client** Configures a BGP peer to be a client to the this route reflector.

## MIB Objects

alaBgpGlobal  
alaBgpRouteReflection

---

## ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

**ip bgp as-origin-interval** *seconds*

**no ip bgp as-origin-interval**

---

### Syntax Definitions

*seconds* The update interval in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	15

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

### Examples

```
-> ip bgp as-origin-interval 15
-> no ip bgp as-origin-interval
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor advertisement-interval](#) Set the route advertisement interval for external peers.

### MIB Objects

```
alaBgpGlobal
  alaBgpAsOriginInterval
```

---

## ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

**ip bgp synchronization**

**no ip bgp synchronization**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp synchronization
-> no ip bgp synchronization
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ip bgp**

Displays the current global settings for the local BGP speaker.

**MIB Objects**

alaBgpGlobal

---

## ip bgp confederation identifier

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

**ip bgp confederation identifier** *value*

---

### Syntax Definitions

*value* The confederation identification value. The valid range is 0–65535.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Use this command in conjunction with the **ip bgp confederation neighbor** command to specify those peers that are a members of the same confederation as the local BGP speaker.

### Examples

```
-> ip bgp confederation identifier 3
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp autonomous-system** Sets the AS number for this router.
- ip bgp confederation neighbor** Specifies peers that are members of a confederation.

## MIB Objects

alaBgpGlobal  
alaBgpConfedId

---

## ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

**ip bgp maximum-paths**

**no ip bgp maximum-paths**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

### Release History

Release 7.1.1; command was introduced.

```

---

## ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

**ip bgp log-neighbor-changes**

**no ip bgp log-neighbor-changes**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

### Examples

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp admin-state](#)                      Disables BGP within the router.

### MIB Objects

```
alaBgpGlobal
  alaBgpPeerChanges
```

---

## ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

**ip bgp dampening** [**half-life** *half\_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max\_suppress\_time*]

**no ip bgp dampening**

---

### Syntax Definitions

<i>half_life</i>	The half-life duration, in seconds. The valid range is 0–65535.
<i>reuse</i>	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
<i>suppress</i>	The dampening cutoff value. The valid range is 1–9999.
<i>max_suppress_time</i>	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

### Defaults

parameter	value
<i>half_life</i>	300
<i>reuse</i>	200
<i>suppress</i>	300
<i>max_suppress_time</i>	1800

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals.
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

## Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

## Release History

Release 7.1.1; command was introduced.

## ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

**ip bgp dampening clear**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

### Examples

```
-> ip bgp dampening clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp dampening](#) Enables or disables route dampening.

## ip bgp asn-format

Configures the display format to be used when displaying 4-octet ASNs.

```
ip bgp asn-format {asdot | asplain}
```

---

### Syntax Definitions

<b>asdot</b>	A mixture of asplain and asdot+.
<b>asplain</b>	Simple decimal notation.

### Defaults

The default is **asplain**.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command configures the display format to be used when displaying 4-octet ASNs. This configuration changes only the output format. The input format can be in any mode.

### Examples

```
-> ip bgp asn-format asdot
```

### Release History

Release 7.3.3; command was introduced.

---

## ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

**ip bgp aggregate-address** *ip\_address ip\_mask*

[**admin-state** {**enable** | **disable**}]

[**as-set**]

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**summary-only**]

**no ip bgp aggregate-address** *ip\_address ip\_mask*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address to be used as the aggregate address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.
- Only the aggregate is advertised unless aggregate summarization is disabled using the **ip bgp aggregate-address summary-only** command.

## Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0  
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip bgp aggregate-address  
summary-only](#)

Enables or disables aggregate summarization, which suppresses more-specific routes.

## MIB Objects

```
alaBgpAggrAddr  
alaBgpAggrSet  
alaBgpAggrCommunity  
alaBgpAggrLocalPref  
alaBgpAggrMetric  
alaBgpAggrSummarize  
alaBgpAggrMask
```

---

## ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

```
ip bgp aggregate-address ip_address ip_mask admin-state {enable | disable}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for this aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<b>enable</b>	Enables this aggregate route.
<b>disable</b>	Disables this aggregate route.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the [ip bgp asn-format](#) command to configure individual aggregate parameters.
- The [show ip bgp path](#) command displays every aggregate currently defined.

### Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable  
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">ip bgp asn-format</a>	Creates an aggregate route.
<a href="#">show ip bgp path</a>	Displays aggregate routes.

## MIB Objects

```
alaBgpAggrTable  
  alaBgpAggrAddr  
  alaBgpAggrMask
```

---

## ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

**ip bgp aggregate-address** *ip\_address ip\_mask as-set*

**no ip bgp aggregate-address** *ip\_address ip\_mask as-set*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp asn-format** Creates and deletes a BGP aggregate route.

**MIB Objects**

alaBgpAggrTable  
  alaBgpAggrAddr  
  alaBgpAggrMask  
  alaBgpAggrSet

---

## ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

**ip bgp aggregate-address** *ip\_address ip\_mask* **community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

### Defaults

parameter	default
<b>none</b>   <b>no-export</b>   <b>no-advertise</b>   <b>no-export-subconfed</b>   <i>num:num</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the aggregate community string to the default value, set the community string to **none**.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

## Related Commands

## ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

**ip bgp aggregate-address** *ip\_address ip\_mask local-preference value*

**no ip bgp aggregate-address** *ip\_address ip\_mask local-preference value*

---

### Syntax Definitions

<i>ip_address</i>	An IP address for the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The local preference attribute. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the [ip bgp default local-preference](#) command).

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp default local-preference](#) Sets the default local preference value for this AS.

**MIB Objects**

    alaBgpAggrLocalPref

---

## ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

**ip bgp aggregate-address** *ip\_address ip\_mask metric value*

**no ip bgp aggregate-address** *ip\_address ip\_mask metric value*

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The MED attribute. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp bestpath med missing-as-worst** Configures the MED for paths that do not contain a MED value.

**ip bgp always-compare-med** Forces BGP to use the MED for comparison of external routes.

## MIB Objects

```

  alaBgpAggrAddr  
  alaBgpAggrMask  
  alaBgpAggrMetric
```

---

## ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which suppresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

**ip bgp aggregate-address** *ip\_address ip\_mask summary-only*

**no ip bgp aggregate-address** *ip\_address ip\_mask summary-only*

---

### Syntax Definitions

<i>ip_address</i>	IP address for the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

### Release History

## ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
ip bgp network ip_address ip_mask  
    [community string]  
    [local-preference value]  
    [metric metric]  
    [admin-state {enable | disable}]
```

```
no ip bgp network ip_address ip_mask
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network admin-state** command.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0  
-> no ip bgp network 172.22.2.115 255.255.255.0
```

## Release History

Release 7.1.1; command was introduced.

---

## ip bgp network admin-state

Enables or disables a BGP network.

**ip bgp network** *ip\_address ip\_mask* **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<b>enable</b>	Enables this network.
<b>disable</b>	Disables this network.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up to 200 network entries. The **show ip bgp path** command displays every network currently defined.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

**ip bgp network** *ip\_address ip\_mask* **community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the network.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

### Defaults

parameter	default
<b>none</b>   <b>no-export</b>   <b>no-advertise</b>   <b>no-export-subconfed</b>   <i>num:num</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the network community string to the default value, set the community string to **none**.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

## ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ip bgp network** *ip\_address ip\_mask local-preference value*

**no ip bgp network** *ip\_address ip\_mask local-preference value*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The local preference attribute value. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp network** Creates or deletes a BGP network.
- ip bgp default local-preference** Sets the default local preference for this AS.

## MIB Objects

alaBgpNetworkTable  
  alaBgpNetworkAddr  
  alaBgpNetworkMask  
  alaBgpNetworkLocalPref

---

## ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

**ip bgp network** *ip\_address ip\_mask metric value*

**no ip bgp network** *ip\_address ip\_mask metric value*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	A MED attribute value. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip bgp network](#)

Creates or deletes a BGP network.

---

## ip bgp neighbor

Creates or deletes a BGP peer.

**ip bgp neighbor** *ip\_address*

**no ip bgp neighbor** *ip\_address*

---

### Syntax Definitions

*ip\_address*                                32-bit IP address of the new BGP peer.

### Defaults

No peers configured.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- You must still enable a BGP peer after creating it. A BGP peer is enabled using the **ip bgp neighbor admin-state** command.
- Once created, a BGP peer cannot be enabled until it is assigned an autonomous system number using the **ip bgp neighbor remote-as** command.

### Examples

```
-> ip bgp neighbor 172.22.2.115
-> no ip bgp neighbor 172.22.2.115
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip bgp neighbor admin-state</b>	Enable or disable a BGP peer.
<b>ip bgp neighbor remote-as</b>	Configure the AS number for the peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
```

---

## ip bgp neighbor ttl-security

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

```
ip bgp neighbor ip_address ttl-security num
```

```
ip bgp neighbor ip_address no ttl-security
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>num</i>	The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255.

### Defaults

By default GTSM is disabled for communication with the peer.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vice-versa.
- Use the **no** form of this command to disable GTSM.

### Examples

```
-> ip bgp neighbor 172.22.2.115 ttl-security 6  
-> ip bgp neighbor 172.22.2.115 no ttl-security
```

### Release History

Release 8.4.1; command was introduced.

### Related Commands

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerTTLSecurityHops
```

---

## ip bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

**ip bgp neighbor** *ip\_address* [activate-ipv4]

**no ip bgp neighbor** *ip\_address* [activate-ipv4]

---

### Syntax Definitions

*ip\_address*

32-bit IP address of the BGP peer.

**activate-ipv4**

Enable the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

### Defaults

By default, the command is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv4 BGP peer.

### Examples

```
-> ip bgp neighbor 172.22.2.115 activate-ipv4
-> no ip bgp neighbor 172.22.2.115 activate-ipv4
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerActivateIpv4
```

---

## ip bgp neighbor admin-state

Enables or disables a BGP peer.

```
ip bgp neighbor ip_address admin-state {enable | disable}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<b>enable</b>	Enables this peer.
<b>disable</b>	Disables this peer.

### Defaults

---

parameter	default
<b>enable   disable</b>	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable  
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip bgp neighbor</b>	Creates a BGP peer.
<b>show ip bgp neighbors</b>	Displays peer parameters.

### MIB Objects

```
alaBgpPeerTable  
alaBgpPeerAddr
```

---

## ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

**ip bgp neighbor** *ip\_address* **advertisement-interval** *value*

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the neighbor.  
*value* An advertisement time interval in seconds. The valid range is 0–65535.

### Defaults

parameter	default
<i>value</i>	30

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

### Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp neighbors](#) Displays BGP peer main status.

### MIB Objects

alaBgpPeerTable  
    alaBgpPeerAddr  
    bgpPeerMinRouteAdvertisementTinterval

---

## ip bgp neighbor clear

Restarts a BGP peer. The peer will be unavailable during this restart.

**ip bgp neighbor** *ip\_address* **clear**

---

### Syntax Definitions

*ip\_address*                      32-bit IP address of the neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
  - **ip bgp neighbor remote-as**
  - **ip bgp neighbor md5 key**
  - **ip bgp neighbor passive**
  - **ip bgp neighbor ebgp-multihop**
  - **ip bgp neighbor maximum-prefix**
  - **ip bgp neighbor update-source**
  - **ip bgp neighbor next-hop-self**
  - **ip bgp neighbor soft-reconfiguration**
  - **ip bgp neighbor route-reflector-client**
  - **ip bgp confederation neighbor**
  - **ip bgp neighbor remove-private-as**
  - **ip bgp neighbor update-source.**
- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.

### Examples

```
-> ip bgp neighbor 172.22.2.115 clear
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp neighbor auto-restart** Automatically attempts to restart a BGP peer session after a session terminates.

**MIB Objects**

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerRestart

---

## ip bgp neighbor route-reflector-client

Configures this peer as a client to the local route reflector.

**ip bgp neighbor** *ip\_address* **route-reflector-client**

**no ip bgp neighbor** *ip\_address* **route-reflector-client**

---

### Syntax Definitions

*ip\_address*                                  32-bit IP address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove this peer as a client to the local route reflector.
- This command configures this peer as one of the clients to the local route reflector.
- All of the peers configured using this command become part of the client group. The remaining peers are members of the non-client group for the local route reflector.
- When route reflection is configured all of the internal BGP speakers in an autonomous system need not be fully meshed. The route reflector take responsibility for passing internal BGP-learned routes to its peers.

### Examples

```
-> ip bgp neighbor 172.22.2.115 route-reflector-client
-> no ip bgp neighbor 172.22.2.115 route-reflector-client
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp client-to-client reflection](#) Configures the local BGP speaker as a route reflector

### MIB Objects

```
alaBgpPeerTable

```

---

## ip bgp neighbor default-originate

Enables or disables BGP peer default origination.

**ip bgp neighbor *ip\_address* default-originate**

**no ip bgp neighbor *ip\_address* default-originate**

---

### Syntax Definitions

*ip\_address*                                   32-bit IP address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- When this command is enabled, the local BGP speaker advertises itself as a default to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route 0.0.0.0 does not need to exist on the local router.

### Examples

```
-> ip bgp neighbor 172.22.2.115 default-originate  
-> no ip bgp neighbor 172.22.2.115 default-originate
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp neighbor**                           Creates or deletes a BGP peer.

### MIB Objects

```
alaBgpPeerTable  
    alaBgpPeerAddr  
    alaBgpPeerDefaultOriginate
```

---

## ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

**ip bgp neighbor** *ip\_address* **timers** *keepalive holdtime*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for the BGP peer.
<i>keepalive</i>	The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
<i>holdtime</i>	The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

### Defaults

---

parameter	default
<i>keepalive</i>	30
<i>holdtime</i>	90

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

### Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### **ip bgp neighbor conn-retry-interval**

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  bgpPeerHoldTimeConfigured
  bgpPeerKeepAliveConfigured
```

---

## ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

**ip bgp neighbor** *ip\_address* **conn-retry-interval** *seconds*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for the neighbor.
<i>seconds</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>seconds</i>	120

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the [ip bgp neighbor auto-restart](#) command).
- You must restart the peer (using the [ip bgp neighbor clear](#) command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

### Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp neighbor auto-restart** Enable automatic session restart after a session termination.
- ip bgp neighbor clear** Restarts the peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  bgpPeerConnectRetryInterval

---

## ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

**ip bgp neighbor *ip\_address* auto-restart**

---

### Syntax Definitions

*ip\_address*                               32-bit IP address for the neighbor.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

### Examples

```
-> ip bgp neighbor 172.22.2.115 auto-restart  
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp neighbor** Creates a BGP peer.  
**ip bgp neighbor admin-state** Enables a BGP peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerAutoRestart

---

## ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

**ip bgp neighbor** *ip\_address* **maximum-prefix** *maximum* [**warning-only**]

---

### Syntax Definitions

*ip\_address* 32-bit IP address for the BGP peer.  
*maximum* The maximum number of prefixes. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>threshold</i>	5000

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000  
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

### Release History

Release 7.1.1; command was introduced.

  alaBgpPeerAddr

  alaBgpPeerMaxPrefixWarnOnly

  alaBgpPeerMaxPrefix

---

## ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

**ip bgp neighbor** *ip\_address* **md5 key** {*string* | **none**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	The MD5 public key. Maximum character length is 200.
<b>none</b>	Removes the MD5 public key.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>string</i>	no password

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used in snapshot files is as follows:

```
ip bgp neighbor ip_address md5 key-encrypt encrypted_string
```

However, you should not use this syntax to actually set an MD5 password; it will not work.

- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp neighbor clear** Restarts the BGP peer.

**MIB Objects**

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerMD5Key

---

## ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

**ip bgp neighbor** *ip\_address* **ebgp-multihop** [*tth*]

**no ip bgp neighbor** *ip\_address* **ebgp-multihop**

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>tth</i>	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

### Defaults

parameter	default
<i>tth</i>	255

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vice-versa.

### Examples

```
-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp neighbor**

Creates or deletes a BGP peer.

**ip bgp neighbor next-hop-self**

Sets the BGP peer to use next hop processing behavior.

## MIB Objects

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerMultiHop

---

## ip bgp neighbor description

Configures the BGP peer name.

**ip bgp neighbor** *ip\_address* **description** *string*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address of the BGP peer.  
*string*                              Peer name (1–20 characters).

### Defaults

parameter	default
<i>string</i>	peer(ip_address)

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

### Examples

```
-> ip bgp neighbor 172.22.2.115 description "peer for building 3"
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp neighbor**                      Sets the IP address for the peer.

### MIB Objects

alaBgpPeerTable  
    alaBgpPeerAddr  
    alaBgpPeerName

---

## ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

**ip bgp neighbor *ip\_address* next-hop-self**

**no ip bgp neighbor *ip\_address* next-hop-self**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self  
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip bgp neighbor](#)

Creates or deletes a BGP peer.

## MIB Objects

alaBgpPeerTable

  alaBgpPeerAddr

  alaBgpPeerNextHopSelf

---

## ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

**ip bgp neighbor** *ip\_address* **passive**

**no ip bgp neighbor** *ip\_address* **passive**

---

### Syntax Definitions

*ip\_address*                      32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 passive  
-> no ip bgp neighbor 172.22.2.115 passive
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor](#)                      Creates or deletes a BGP peer.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerPassive
```

---

## ip bgp neighbor remote-as

Assigns an AS number to this BGP peer.

**ip bgp neighbor** *ip\_address* **remote-as** *value*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>value</i>	Autonomous system number in the asplain, asdot+, or asdot formats.

### Defaults

---

parameter	default
<i>value</i>	1

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- A BGP peer created with the **ip bgp neighbor** command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

### Examples

```
-> ip bgp neighbor 172.22.2.115 remote-as 100
```

The following examples show how to configure the BGP neighbor ASN as 65535 in the three different formats:

```
-> ip bgp neighbor 2.2.2.2 remote-as 65535           (asplain format)
-> ip bgp neighbor 2.2.2.2 remote-as 0.65535        (asdot+ format)
-> ip bgp neighbor 2.2.2.2 remote-as 65535          (asdot format)
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.3; support for 4-octet ASN was added.

## Related Commands

<b>ip bgp autonomous-system</b>	Set the AS for the local BGP speaker.
<b>ip bgp neighbor</b>	Create a BGP peer.
<b>ip bgp neighbor admin-state enable</b>	Enables a BGP peer.

## MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerAS
```

---

## ip bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

**ip bgp neighbor *ip\_address* remove-private-as**

**no ip bgp neighbor *ip\_address* remove-private-as**

---

### Syntax Definitions

*ip\_address*                                32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 remove-private-as
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**[ip bgp neighbor remote-as](#)**            Configures the AS number for this peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerRemovePrivateAs
```

---

## ip bgp neighbor soft-reconfiguration

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

**ip bgp neighbor *ip\_address* soft-reconfiguration**

**no ip bgp neighbor *ip\_address* soft-reconfiguration**

---

### Syntax Definitions

*ip\_address*                                  32-bit IP address of the BGP peer.

### Default

This command is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ip bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

### Examples

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

---

## ip bgp neighbor stats-clear

Clears the statistics for a peer.

**ip bgp neighbor** *ip\_address* stats-clear

---

### Syntax Definitions

*ip\_address*                            32-bit IP address of the BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ip bgp neighbors statistics](#).

### Examples

```
-> ip bgp neighbor 172.22.2.115 stats-clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp neighbors statistics](#) Displays peer statistics.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerClearCounter
```

---

## ip bgp confederation neighbor

Configures this peer as a member of the same confederation as the local BGP speaker.

**ip bgp confederation neighbor** *ip\_address*

**no ip bgp confederation neighbor** *ip\_address*

---

### Syntax Definitions

*ip\_address*                                  32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp confederation neighbor 172.22.2.115
-> no ip bgp confederation neighbor 172.22.2.115
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp confederation identifier** Sets a confederation identification value for the local BGP speaker (this router).

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerConfedStatus
```

---

## ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

```
ip bgp neighbor ip_address update-source [interface_name]
```

---

### Syntax Definitions

*ip\_address*                                32-bit IP address of the BGP peer.  
*interface\_name*                         The name of the interface.

### Defaults

parameter	default
<i>interface_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the [ip bgp neighbor](#) command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

### Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117  
-> ip bgp neighbor 172.22.5.115 update-source vlan-22  
-> ip bgp neighbor 172.22.5.115 update-source
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip bgp neighbor](#)

Sets the router identification for a BGP peer.

## MIB Objects

  alaBgpPeerAddr

  alaBgpPeerLocalAddr

  alaBgpPeerLocalIntfName

---

## ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

**ip bgp neighbor** *ip\_address* **in-aspathlist** {*string* / **none**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Inbound AS path list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAspathListIn
```

---

## ip bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ip bgp neighbor ip_address in-communitylist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Input community list (0 to 70 characters. This name is case sensitive).
<b>none</b>	Removes this community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The community filter list name (**InboundCommList** in the example below) is created using the **ip bgp policy community-list** command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- To deassign an input community filter list, use this command to assign a value of “**none**.”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-communitylist InboundCommList  
-> ip bgp neighbor 172.22.2.115 in-communitylist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp policy community-list** Creates or deletes a community list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerCommunityListIn
```

---

## ip bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address in-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Input prefix filter list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- To deassign an input prefix filter list, use this command to assign a value of “**none.**”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefixlist InboundPrefix  
-> ip bgp neighbor 172.22.2.115 in-prefixlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefixListIn
```

---

## ip bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

```
ip bgp neighbor ip_address in-prefix6list {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Input prefix6 filter list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this prefix6 list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of “**none**.”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefix6list InboundPrefix6  
-> ip bgp neighbor 172.22.2.115 in-prefix6list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefix6ListIn
```

---

## ip bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

```
ip bgp neighbor ip_address out-aspathlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
none	Removes the AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- To deassign an output AS path filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-aspathlist OutboundASpath
-> ip bgp neighbor 172.22.2.115 out-aspathlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAspathListOut
```

---

## ip bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

```
ip bgp neighbor ip_address out-communitylist {string | none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Outbound community list (0 - 70 characters).
none	Removes the community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- To deassign an output community filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-communitylist OutboundCommlist  
-> ip bgp neighbor 172.22.2.115 out-communitylist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy community-list](#) Creates or deletes a community list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerCommunityListOut
```

---

## ip bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address out-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Output prefix filter list (0 - 70 characters).
<b>none</b>	Removes the prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- To deassign an output prefix filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefixlist OutboundPrefix  
-> ip bgp neighbor 172.22.2.115 out-prefixlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefixListOut
```

---

## ip bgp neighbor out-prefix6list

Assigns an outbound prefix6 filter list to a BGP peer.

```
ip bgp neighbor ip_address out-prefix6list {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Output prefix6 filter list (0 - 70 characters).
<b>none</b>	Removes the prefix6 list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefix6list OutboundPrefix6  
-> ip bgp neighbor 172.22.2.115 out-prefix6list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefix6ListOut
```

---

## ip bgp neighbor route-map

Assigns a policy map (inbound or outbound) to a BGP peer.

```
ip bgp neighbor ip_address route-map {string | none} {in | out}
```

```
no ip bgp neighbor ip_address route-map {in | out}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the peer.
<i>string</i>	Policy map name (0 to 70 characters). This name is case sensitive.
<b>none</b>	Deletes the route map if entered rather than a text string.
<b>in</b>	Designates this route map policy as an inbound policy.
<b>out</b>	Designates this route map policy as an outbound policy.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to deassign an inbound or an outbound policy.
- The policy route map name (**InboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- The policy route map name (**OutboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any outbound routes for the BGP peer must match this route map filter before being advertised or passed to outbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

### Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

[ip bgp policy route-map](#)      Creates or deletes a policy route map.

**MIB Objects**

```
alaBgpPeerTable
  alaBgpPeerRouteMapOut
  alaBgpPeerRouteMapIn
```

---

## ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

**ip bgp neighbor** *ip\_address* **clear soft** {**in** | **out**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<b>in</b>	Applies reconfiguration to the inbound policies.
<b>out</b>	Applies reconfiguration to the outbound policies.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

### Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor soft-reconfiguration](#) Enables or disables BGP peer soft reconfiguration.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerReconfigureInBound
  alaBgpPeerReconfigureOutBound
```

---

## ip bgp policy aspath-list

Creates or removes an AS path list.

**ip bgp policy aspath-list** *name* “*regular\_expression*”

**no ip bgp policy aspath-list** *name* “*regular\_expression*”

---

### Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, for example, “^100 200\$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

### Defaults

No IP BGP peer policy AS path-list exists.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Valid regular expression characters (metacharacters) are shown in the table below. See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

Symbol	Description
^	Matches the beginning of the AS path list.
123	Matches the AS number 123.
.	Matches any single AS number.
?	Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.
+	Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
*	Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
(	Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence.
	Separates AS numbers in an alternation sequence.

Symbol	Description
)	Ends an alternation sequence of AS numbers
[	Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range.
-	Separates the endpoints of a range.
]	Ends a range pair.
\$	Matches the end of the AS path list.
,_	Commas, underscores and spaces are ignored.

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-asmatrix**, **ip bgp neighbor out-asmatrix**, **ipv6 bgp neighbor in-asmatrix**, and **ipv6 bgp neighbor out-asmatrix** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp policy aspath-list** command.

## Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"
-> ip bgp policy aspath-list OutboundAspath "^300 400$"
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-ashpathlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor out-ashpathlist</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
<b>ip bgp policy aspath-list priority</b>	Configures priority for processing regular expressions in an AS path list.
<b>ipv6 bgp neighbor in-ashpathlist</b>	Assigns an inbound AS path list filter to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-ashpathlist</b>	Assigns an outbound AS path filter list to an IPv6 BGP peer.

## MIB Objects

alaBgpAspathMatchListTable  
alaBgpAspathMatchListRowStatus

---

## ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

**ip bgp policy aspath-list** *name* "*regular\_expression*" **action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
<b>permit   deny</b>	permit

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 29-103 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp policy aspath-list](#) command.

### Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" action permit
-> ip bgp policy aspath-list OutboundAspath "^300 400$" action deny
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-ashpathlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor out-ashpathlist</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list</b>	Creates or removes an AS path list.
<b>ip bgp policy aspath-list priority</b>	Configures priority for processing regular expressions in an AS path list.
<b>ipv6 bgp neighbor in-ashpathlist</b>	Assigns an inbound AS path list filter to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-ashpathlist</b>	Assigns an outbound AS path filter list to an IPv6 BGP peer.

## MIB Objects

alaBgpAspathMatchListTable  
alaBgpAspathMatchListAction

---

## ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

**ip bgp policy aspath-list** *name* "*regular\_expression*" **priority** *value*

---

### Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<i>value</i>	A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 29-103 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp policy aspath-list](#) command.

### Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-ashpathlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor out-ashpathlist</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list</b>	Creates or removes an AS path list.
<b>ip bgp policy aspath-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
<b>ipv6 bgp neighbor in-ashpathlist</b>	Assigns an inbound AS path list filter to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-ashpathlist</b>	Assigns an outbound AS path filter list to an IPv6 BGP peer.

## MIB Objects

alaBgpAspathMatchListTable  
alaBgpAspathMatchListPriority

---

## ip bgp policy community-list

Creates or deletes a community list.

**ip bgp policy community-list** *name* {*num:num* / *num.num:num* / *num*}

**no ip bgp policy community-list** *name* {*num:num* / *num.num:num* / *num*}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<i>num:num</i>	The community number, given in the form of the AS number in the asplain format and the community number, separated by a colon.
<i>num.num:num</i>	The community number, given in the form of the AS number in the asdot or asdot+ format and the community number, separated by a colon.

### Defaults

No IP BGP peer policy community-list exists.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist**, **ip bgp neighbor out-communitylist**, **ipv6 bgp neighbor in-communitylist** and **ipv6 bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp policy community-list** command.

### Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> no ip bgp policy community-list CommListAIn 40:40
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with a community string list.
<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.
<b>ipv6 bgp neighbor in-communitylist</b>	Assigns an inbound community list filter to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-communitylist</b>	Assigns an outbound community filter list to an IPv6 BGP peer.

---

## ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
<b>permit   deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- By default, this command allows routes that match the criteria specified in the community list to pass.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

### Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

### Release History

Release 7.1.1; command was introduced.  
 Release 7.3.4; syntax added to **community** string.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.

<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.
<b>ipv6 bgp neighbor in-communitylist</b>	Assigns an inbound community list filter to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-communitylist</b>	Assigns an outbound community filter list to an IPv6 BGP peer.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListAction

---

## ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**match-type** {**exact** | **occur**}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<b>exact</b>	Checks for an exact match of the community string and the community attribute.
<b>occur</b>	Checks for an occurrence of the community string anywhere in the community attribute.

### Defaults

parameter	default
<b>exact</b>   <b>occur</b>	exact

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

### Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.

<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.
<b>ipv6 bgp neighbor in-communitylist</b>	Assigns an inbound community list filter to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-communitylist</b>	Assigns an outbound community filter list to an IPv6 BGP peer.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListType

---

## ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**priority** *value*

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<i>value</i>	Priority value in the range 0 - 255.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

### Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

## Related Commands

<b>ip bgp policy community-list</b>	Creates or deletes a community list.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with community string list.

## MIB Objects

```
alaBgpCommunityMatchListTable  
  alaBgpCommunityMatchListPriority
```

---

## ip bgp policy prefix-list

Creates or deletes a prefix match list.

**ip bgp policy prefix-list** *name ip\_address ip\_mask*

**no ip bgp policy prefix-list** *name ip\_address ip\_mask*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.

### Defaults

No IP BGP policy prefix-list exists.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the [ip bgp neighbor in-prefixlist](#), [ip bgp neighbor out-prefixlist](#), [ipv6 bgp neighbor in-prefixlist](#) and [ipv6 bgp neighbor out-prefixlist](#) commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the [show ip bgp policy prefix-list](#) command.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-prefixlist</b>	Assigns an inbound prefix filter list to a BGP peer.
<b>ip bgp neighbor out-prefixlist</b>	Assigns an outbound prefix filter list to a BGP peer.
<b>ip bgp policy prefix-list action</b>	Configures action to be taken for a prefix list when a match is found.
<b>ip bgp policy prefix-list ge</b>	Configures lower limit on length of prefix to be matched.
<b>ip bgp policy prefix-list le</b>	Configures upper limit on length of prefix to be matched.
<b>ipv6 bgp neighbor in-prefixlist</b>	Assigns an inbound prefix filter list to an IPv6 BGP peer.
<b>ipv6 bgp neighbor out-prefixlist</b>	Assigns an outbound prefix filter list to an IPv6 BGP peer.

## MIB Objects

alaBgpPrefixMatchListTable  
  alaBgpPrefixMatchListRowStatus

---

## ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

```
ip bgp policy prefix-list name ip_address ip_mask action {permit | deny}
```

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

---

parameter	default
<b>permit</b>   <b>deny</b>	permit

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bgp policy prefix-list</a>	Creates or deletes a prefix match list.
<a href="#">ip bgp policy prefix-list ge</a>	Configures lower limit on length of prefix to be matched.
<a href="#">ip bgp policy prefix-list le</a>	Configures upper limit on length of prefix to be matched.

### MIB Objects

```
alaBgpPrefixMatchListTable  
  alaBgpPrefixMatchListAction
```

---

## ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

**ip bgp policy prefix-list** *name ip\_address ip\_mask ge value*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.
<i>value</i>	The lower limit value in the range 0 –32.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the [ip bgp policy prefix-list le](#) command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp policy prefix6-list

Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

```
ip bgp policy prefix6-list pxf_list_name prefix6/pxf_length [action {permit | deny}] [admin-state
{enable | disable}] [ge [{masklength}] [le [{masklength}]
```

```
no ip bgp policy prefix6-list pxf_list_name prefix6/pxf_length [action {permit | deny}] [admin-state
{enable | disable}] [ge [{mask_length}] [le [{mask_length}]
```

---

### Syntax Definitions

<i>pxf_list_name</i>	Prefix list name.
<i>prefix6</i>	Prefix list IPv6 address for the prefix list.
<i>pxf_length</i>	Prefix length. Prefix length should be in the range of 0 to 128.
<i>value</i>	The upper limit value in the range of 0 to 32.
<b>permit</b>   <b>deny</b>	Action to be taken which can be either permit or deny.
<b>enable</b>   <b>disable</b>	Row Status can be either enabled or disabled.
<i>mask_length</i>	Minimum length of the prefix to be matched. The valid range is 0–32.

### Defaults

NA

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- This command creates prefix6 lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefix6list**, **ip bgp neighbor out-prefix6list**, **ipv6 bgp neighbor in-prefix6list** and **ipv6 bgp neighbor out-prefix6list**.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit
-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

  alaBgpPrefix6MatchListLE
```

---

## ip bgp policy route-map

Creates or deletes a policy route map.

**ip bgp policy route-map** *name sequence\_number*

---

### Syntax Definitions

<i>name</i>	Route map name. Case-sensitive.
<i>sequence_number</i>	Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
  1. **ip bgp policy route-map aspath-list**
  2. **ip bgp policy route-map prefix-list**
  3. **ip bgp policy route-map prefix6-list**
  4. **ip bgp policy route-map community-list**
  5. **ip bgp policy route-map match-regexp**
  6. **ip bgp policy route-map match-prefix**
  7. **ip bgp policy route-map match-mask**
  8. **ip bgp policy route-map match-prefix6**
  9. **ip bgp policy route-map match-community**
- The route maps which apply to a specific address family (IPv4 or IPv6) are only applied to routes of the same address family. In other words, the prefix-list filter and match-prefix/match-mask route-maps are only applied to IPv4 routes and are ignored for IPv6 routes. The prefix6-list filter and match-prefix6 route-maps are only applied to IPv6 routes and are ignored for IPv4 routes.

- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
  - **ip bgp policy route-map community**
  - **ip bgp policy route-map community-mode**
  - **ip bgp policy route-map lpref**
  - **ip bgp policy route-map lpref-mode**
  - **ip bgp policy route-map med**
  - **ip bgp policy route-map med-mode**
  - **ip bgp policy route-map origin**
  - **ip bgp policy route-map weight**
- Route maps can be referenced as a filtering mechanism for displaying paths using the **show ip bgp path** command. They are also referenced in filtering inbound and outbound routes for BGP peers using the **ip bgp neighbor route-map** commands.

### Examples

```
-> ip bgp policy route-map routemap1 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp policy route-map action** Configures action to be taken for a route when a match is found.

### MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapRowStatus
```

---

## ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

**ip bgp policy route-map** *name sequence\_number* **action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	A route map name.
<i>sequence_number</i>	A route map sequence number. The valid range is 1–255.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined.

### Defaultst

parameter	default
<b>permit   deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

### Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapAction

---

## ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

**ip bgp policy route-map** *name sequence\_number aspath-list as\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>as_name</i>	The AS path list name or “none”.

### Defaults

parameter	default
<i>as_name</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The **ip bgp policy aspath-list** and **ip bgp policy aspath-list action** commands are used to create and set permit/deny actions for an AS path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1  
-> ip bgp policy route-map routemap1 1 aspath-list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp policy route-map** Creates or deletes a policy route map.

### MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapAsPathMatchListId
```

---

## ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

**ip bgp policy route-map** *name* *sequence\_number* **asprepend** *path*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>path</i>	The AS path to prepend or “none”. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

### Defaults

---

parameter	default
<i>path</i>	none

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none”.

### Examples

```
-> ip bgp policy route-map routemap1 1 asprepend "700 800 900"
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapAsPrepend

---

## ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

**ip bgp policy route-map** *name sequence\_number* **community** [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997.

### Defaults

parameter	default
<b>none</b>   <b>no-export</b>   <b>no-advertise</b>   <b>no-export-subconfed</b>   <i>num:num</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to “**none**”.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

### Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip bgp policy route-map](#)

Creates or deletes a policy route map.

[ip bgp policy route-map  
community-mode](#)

Configures the action to be taken for a community string when a match is found.

## MIB Objects

alaBgpRouteMapTable  
  alaBgpRouteMapCommunity

---

## ip bgp policy route-map community-list

Assigns a community matching list to the route map.

**ip bgp policy route-map** *name* *sequence\_number* **community-list** [*list\_name* / **none**]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>list_name</i>	The community list name.
<b>none</b>	No community list name is specified.

### Defaults

---

parameter	default
<i>list_name</i> / <b>none</b>	none

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to **none**.

### Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
-> ip bgp policy route-map routemap1 1 community-list none
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax **none** added to **community-list** string.

### Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapCommunityMatchListId

---

## ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

**ip bgp policy route-map** *name sequence\_number* **community-mode** {**add** | **replace**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>add</b>	Adds the community string specified in the command <b>ip bgp policy route-map community</b> .
<b>replace</b>	Replaces the community string specified in the command <b>ip bgp policy route-map community</b> .

### Defaults

parameter	default
add   replace	add

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

### Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip bgp policy route-map</b>	Creates or deletes a policy route map.
<b>ip bgp policy route-map community</b>	Configures the action to be taken on the community attribute when a match is found.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapSetComunityMode

---

## ip bgp policy route-map lpref

Configures the local preference value for the route map.

**ip bgp policy route-map** *name sequence\_number lpref value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The local preference value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used in conjunction with [ip bgp policy route-map lpref-mode](#). The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

### Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bgp policy route-map</a>	Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapLocalPref

---

## ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

**ip bgp policy route-map** *name sequence\_number* **lpref-mode** {**none** | **inc** | **dec** | **rep**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Do not set the local preference attribute.
<b>inc</b>	Increment the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no local preference attribute is found in the matching route.
<b>dec</b>	Decrement the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no local preference attribute is found in the matching route.
<b>rep</b>	Replace the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command even if no local preference attribute is found in the matching route.

### Defaults

parameter	default
<b>none</b>   <b>inc</b>   <b>dec</b>   <b>rep</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

### Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

**ip bgp policy route-map** *name sequence\_number match-community* [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Removes the community match from the route-map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes matching the community restricting advertisement to any peer.
<b>no-export-subconfed</b>	Routes matching the community restricting advertisement to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

parameter	default
<b>none</b>   <b>no-export</b>   <b>no-advertise</b>   <b>no-export-subconfed</b>   <i>num:num</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command allows a matching community string primitive to be placed directly in the route map.
- By default, no community string is specified. The default behavior can be reset by changing the value to **none**.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

### Release History

Release 7.1.1; command was introduced.

---

## ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

**ip bgp policy route-map** *name* *sequence\_number* **match-mask** *ip\_address*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching mask or “none”.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-prefix](#) command.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

### Release History

Release 7.1.1; command was introduced.

---

## ip bgp policy route-map match-prefix

Configures a matching prefix primitive in the route map.

```
ip bgp policy route-map name sequence_number match-prefix ip_address
```

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching prefix.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-mask](#) command.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0  
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

alaBgpRouteMapMatchPrefix

---

## ip bgp policy route-map match-prefix6

Configures a matching prefix6 primitive in the route map.

```
ip bgp policy route-map name sequence_number match-prefix6 ipv6_address/mask_length
```

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ipv6_address/mask_length</i>	The 128-bit IPv6 address of the matching prefix. The length in bits of the IPv6 prefix to be matched in the Route Map.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command allows a matching prefix6 primitive to be placed directly in the route map. By default, no prefix6 primitive is assigned to the route map. The default behavior can be reset by changing the value to “none”.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix6 2001:1218:103::/64
-> ip bgp policy route-map routemap1 1 match-prefix6 none
```

### Release History

Release 7.3.4; command introduced.

### Related Commands

  alaBgpRouteMapMatchMaskLength6
```

---

## ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

```
ip bgp policy route-map name sequence_number match-regexp "regular_expression"
```

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>regular_expression</i>	Regular expression or “none”. The regular expression must be enclosed by quotation marks.

### Defaults

---

parameter	default
<i>regular_expression</i>	none

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in [ip bgp policy aspath-list](#) on page 29-103.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to “none”.
- See the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

---

## ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

**ip bgp policy route-map** *name sequence\_number med value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The MED value. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med-mode](#) command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

alaBgpRouteMapMed

---

## ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

**ip bgp policy route-map** *name sequence\_number med-mode* {**none** | **inc** | **dec** | **rep**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The MED value. The valid range is 0–4294967295.
<b>none</b>	Do not set the MED.
<b>inc</b>	Increment the MED in the matching route by the value specified in the <a href="#">ip bgp policy route-map med</a> command. No action is taken if no MED is found in the matching route.
<b>dec</b>	Decrement the MED in the matching route by the value specified in the <a href="#">ip bgp policy route-map med</a> command. No action is taken if no MED is found in the matching route.
<b>rep</b>	Replace the MED in the matching route by the value specified in the <a href="#">ip bgp policy route-map med</a> command even if no MED is found in the matching route.

### Defaults

parameter	default
<b>none</b>   <b>inc</b>   <b>dec</b>   <b>rep</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med](#). The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

**ip bgp policy route-map** *name sequence\_number* **origin** {**igp** | **egp** | **incomplete** | **none**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>igp</b>	Sets the origin attribute to remote internal BGP (IGP).
<b>egp</b>	Sets the origin attribute to local external BGP (EGP).
<b>incomplete</b>	Sets the origin attribute to incomplete, meaning the origin is unknown.
<b>none</b>	Sets the origin attribute to “none”.

### Defaults

parameter	default
<b>igp</b>   <b>egp</b>   <b>incomplete</b>   <b>none</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “**none**”.

### Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [ip bgp policy route-map origin](#) Configures action to take on origin attribute when a match is found.
- [ip bgp policy route-map](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapOrigin

---

## ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

**ip bgp policy route-map** *name* *sequence\_number* **prefix-list** *prefix\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>prefix_name</i>	The prefix list name or “none”.

### Defaults

parameter	default
<i>prefix_name</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.
- The [ip bgp policy prefix-list](#), [ip bgp policy prefix-list action](#), [ip bgp policy prefix-list ge](#), and [ip bgp policy prefix-list le](#) commands are used to create and set permit/deny actions for a prefix path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bgp policy prefix-list</a>	Assigns a prefix matching list to the route map.
<a href="#">ip bgp policy prefix-list action</a>	Configures action to be taken for a prefix list when a match is found.
<a href="#">ip bgp policy route-map</a>	Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapPrefixMatchListId

---

## ip bgp policy route-map prefix6-list

Assigns a prefix6 matching list to the route map, which identifies the matching criteria list of IPv6 prefixes.

**ip bgp policy route-map** *name* *sequence\_number* **prefix6-list** *prefix6\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>prefix_name</i>	The prefix6 list name or “none”.

### Defaults

parameter	default
<i>prefix6_name</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix6-list policy name is created using the [ip bgp policy prefix6-list](#) command.
- By default, no prefix6 list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.

### Examples

```
-> ip bgp policy route-map routemap1 1 prefix6-list listB
-> ip bgp policy route-map routemap1 1 prefix6-list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

**ip bgp policy route-map** *name sequence\_number weight value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The weight value. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

### Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapWeight

---

## ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

```
ip bgp policy route-map name sequence_number community-strip community_list
```

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>community_list</i>	The community list name.

### Defaults

No IP BGP policy route-map community list exists.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

### Examples

```
-> ip bgp policy route-map routemap1 1 community_strip communitylist
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

### MIB Objects

```

---

## show ip bgp

Displays the current global settings for the local BGP speaker.

**show ip bgp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

### Examples

```
-> show ip bgp
Admin Status                = disabled,
Operational Status         = up,
Autonomous system Number   = 1,
BGP Router Id              = 111.1.1.1,
Confederation Identifier    = 0,
IGP Synchronization Status = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference   = 100,
Route Reflection           = disabled,
Cluster Id                 = 0.0.0.0,
Missing MED Status        = Best,
Aspath Comparison          = enabled,
Always Compare MED         = disabled,
Fast External Fail Over    = disabled,
Log Neighbor Changes       = disabled,
Multiple path              = disabled,
Graceful Restart           = enabled,
Graceful Restart Status    = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast               = enabled,
IPv6 Unicast               = disabled,
BFD Status                 = disabled,
ASN Output Format           = asplain
```

*output definitions*

---

<b>Admin Status</b>	Indicates whether the BGP protocol has been enabled or disabled through the <b>ip bgp admin-state</b> command.
<b>Operational Status</b>	Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.
<b>Autonomous system Number</b>	The AS assigned to the local BGP speaker through the <b>ip bgp autonomous-system</b> command.
<b>BGP Router Id</b>	The IP address for the local BGP speaker.
<b>Confederation Id</b>	Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the <b>ip bgp confederation identifier</b> command.
<b>IGP Synchronization Status</b>	Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). Configured through the <b>ip bgp synchronization</b> command.
<b>Minimum AS origin interval</b>	The frequency, in seconds, at which routes local to the autonomous system are advertised. Configured through the <b>ip bgp as-origin-interval</b> command.
<b>Default Local Preference</b>	The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the <b>ip bgp default local-preference</b> command.
<b>Route Reflection</b>	Indicates whether the local BGP speaker is acting as a route reflector for its AS. Configured through the <b>ip bgp client-to-client reflection</b> command.
<b>Cluster Id</b>	The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. Configured through the <b>ip bgp cluster-id</b> command.
<b>Missing MED Status</b>	Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value ( $2^{32}-1$ ) or the best possible value (0). This value is set using the <b>ip bgp bestpath med missing-as-worst</b> command. By default, missing MED values are treated as <b>best</b> .
<b>Aspath Comparison</b>	Indicates whether the AS path will be in used in determining the best route. Configured through the <b>ip bgp bestpath as-path ignore</b> command.
<b>Always Compare MED</b>	Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. Configured through the <b>ip bgp always-compare-med</b> command.
<b>Fast External Fail Over</b>	Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. Configured through the <b>ip bgp fast-external-failover</b> command.
<b>Log Neighbor Changes</b>	Indicates whether logging of peer state changes is enabled or disabled. Configured through the <b>ip bgp log-neighbor-changes</b> command.
<b>Multi path</b>	Indicates whether support for multiple equal cost paths is enabled or disabled. Configured through the <b>ip bgp maximum-paths</b> command.

*output definitions (continued)*

---

<b>Graceful Restart</b>	Indicates whether graceful restart is enabled or disabled.
<b>Graceful Restart Status</b>	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
<b>Configured Graceful Restart Interval</b>	Indicates the timer for achieving a graceful restart.
<b>IPv4 Unicast</b>	Indicates whether IPv4 unicast is enabled or disabled.
<b>IPv6 Unicast</b>	Indicates whether IPv6 unicast is enabled or disabled.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip bgp unicast</b>	Enables or disables unicast IPv4 updates for the BGP routing process.
<b>ipv6 bgp unicast</b>	Enables or disables unicast IPv6 updates for the BGP routing process
<b>show ip bgp statistics</b>	Displays BGP global statistics.

## show ip bgp statistics

Displays BGP global statistics.

**show ip bgp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

### Examples

```
-> show ip bgp statistics
# of Active Prefixes Known           = 0,
# of EBGP Neighbors in Established State = 0,
# of IBGP Neighbors in Established State = 0,
# of Feasible Paths                  = 0,
# of Dampened Paths                  = 0,
# of Unsynchronized Paths            = 0,
# of Policy unfeasible paths         = 0,
Total Number of Paths                = 0
```

#### *output definitions*

---

<b># of Active Prefixes Known</b>	The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.
<b># of EBGP Neighbors in Established State</b>	The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.
<b># of IBGP Neighbors in Established State</b>	The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to.
<b># of Feasible Paths</b>	The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol.
<b># of Dampened Paths</b>	The number of route paths that are not active because they have violated dampening parameters.
<b># of Unsynchronized Paths</b>	The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol.

*output definitions (continued)*

---

<b># of Unfeasible Paths</b>	The number of route paths that are not active because they are not permitted based on a configured BGP policy.
<b>Total Number of Paths</b>	The total number of paths known to the speaker, active or not.

---

**Release History**

Release 7.1.1; command was introduced.

## show ip bgp dampening

Displays the BGP route dampening settings.

**show ip bgp dampening**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

### Examples

```
-> show ip bgp dampening
Admin Status           = disabled,
Half life value (seconds) = 300,
Reuse value            = 200
Suppress value         = 300,
Max suppress time (seconds) = 1800,
```

### *output definitions*

---

<b>Admin Status</b>	Indicates whether route dampening is enabled or disabled. This value is configured through the <b>ip bgp dampening</b> command.
<b>Half life value</b>	The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the <b>ip bgp dampening</b> command.
<b>Reuse value</b>	The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the <b>ip bgp dampening</b> command.
<b>Suppress value</b>	The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the <b>ip bgp dampening</b> command.
<b>Max Suppress time</b>	The maximum time (in seconds) that a route will be suppressed. This value is configured through the <b>ip bgp dampening</b> command.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip bgp dampening](#)

Enables or disables BGP route dampening or the suppression of unstable routes.

## MIB Objects

```

---

## show ip bgp dampening-stats

Displays BGP dampening statistics.

```
show ip bgp dampening-stats [ip_address ip_mask] [peer_address]
```

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
<i>peer_address</i>	A 32-bit IP address of peer (neighbor).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

### Examples

```
-> show ip bgp dampening-stats
```

Network	Mask	From	Flaps	Duration	FOM
-----+-----+-----+-----+-----+-----					
155.132.44.73	255.255.255.255	192.40.4.121	8	00h:00m:35s	175

#### output definitions

---

<b>Network</b>	The IP address for the local BGP speaker that is responsible for route dampening in this router.
<b>Mask</b>	The mask for the local BGP speaker that is responsible for route dampening in this router.
<b>From</b>	The IP address for the route that is flapping.
<b>Flaps</b>	The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.
<b>Duration</b>	The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.
<b>FOM</b>	The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in <a href="#">ip bgp dampening</a> ), then this route will no longer be advertised.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[ip bgp dampening](#) Enables and disables route dampening.

**MIB Objects**

N/A

---

## show ip bgp path

Displays BGP paths.

### show ip bgp path

[**ip-addr** *ip\_address ip\_mask*]  
[**aspath-list** *aspathlist\_name*]  
[**community-list** *community\_list\_name*]  
[**prefix-list** *prefix\_name*]  
[**route-map** *routemap\_name*]  
[**cidr-only**]  
[**community** *community\_number*]  
[**neighbor-rcv** *rcv\_peer\_address*]  
[**neighbor-adv** *adv\_peer\_addr*]  
[**regexp** “*regular\_expression*”]  
[**best**]  
[**detail**]

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address of the path.
<i>ip_mask</i>	A 32-bit subnet mask of the path.
<i>aspathlist_name</i>	AS path on which to filter.
<i>community_list_name</i>	Community name on which to filter.
<i>prefix_name</i>	Prefix on which to filter.
<i>routemap_name</i>	Route map on which to filter.
<b>cidr-only</b>	Filter out everything except CIDR routes.
<i>community_number</i>	Community number on which to filter.
<i>rcv_peer_address</i>	Filter all except paths received from this path.
<i>adv_peer_addr</i>	Filter all except paths sent to this path.
<i>regular_expression</i>	Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, “\$100”.
<b>best</b>	Show only the best path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

## Usage Guidelines

- The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.
- ‘Detail’ option displays the AS Path details for a specific route.

## Examples

```
-> show ip bgp path
Legends: Sta      = Path state
         >        = best, F = feasible
         P        = policy changing, U = un-synchronized
         D        = dampened, N = none
         Nbr      = Neighbor
         (O)      = Path Origin (? = incomplete, i = igp, e = egp)
         degPref  = degree of preference
```

>	197.169.3.0/32	21.20.20.2	21.20.20.2	140	65536, i

### output definitions

<b>Sta</b>	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
<b>Network</b>	The IP address for this route path. This is the destination of the route.
<b>Mask</b>	The mask for this route path.
<b>Nbr address</b>	The IP or IPv6 address of the BGP peer that is advertising this path.
<b>Next Hop</b>	The next hop along the route path.

*output definitions (continued)*

---

<b>(0)</b>	The origin attribute of this route path. A question mark (?) indicates incomplete, and <b>i</b> indicates IGP, and an <b>e</b> indicates EGP.
<b>degPref</b>	The local preference value assigned to this route path.

---

```
-> show ip bgp path ip-addr 192.40.6.72 255.255.255.248
BGP Path parameters
Path address = 192.40.6.72
Path mask    = 255.255.255.248
Path protocol = ebgp
Path peer    = 192.40.4.29
  Path nextHop      = 192.40.4.29,
  Path origin       = igp,
  Path local preference = -1,
  Path state        = active,
  Path weight       = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=2] : 3 2 ,
  Path MED          = -1,
  Path atomic       = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community    = <none>,
  Path unknown attribute = <none>
```

*output definitions*

---

<b>Path address</b>	The IP address for route path.
<b>Path mask</b>	The mask for this route path.
<b>Path protocol</b>	The protocol from which this route path was learned. Possible values for this field are as follows: <b>local</b> , <b>static</b> , <b>directhost</b> , <b>rip</b> , <b>ospf</b> , <b>isis</b> , <b>ibgp</b> , <b>ebgp</b> , and <b>other</b> .
<b>Path peer</b>	The IP address of the peer that is advertising this route path.
<b>Path nextHop</b>	The next hop along the route path.
<b>Path origin</b>	The BGP origin attribute. Possible values will be <b>igp</b> , <b>egp</b> , <b>incomplete</b> , and <b>none</b> . The origin attribute is considered during the route decision process.
<b>Path local preference</b>	The local preference value for this route as received in an UPDATE message. A negative value (for example, the <b>-1</b> in the above display) indicates that the local preference value is missing for this route path.
<b>Path state</b>	Path state indicates the state of the path. The possible states are <b>best</b> , <b>feasible</b> , <b>policy-wait</b> , <b>un-synchronized</b> , <b>dampened</b> , or <b>none</b> . When path state is <b>none</b> , it indicates that there are no paths to this prefix and the route is being purged from the system.
<b>Path weight</b>	The path weight as assigned through inbound and outbound policies.
<b>Path preference degree</b>	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <b>ip bgp default local-preference</b> ).

*output definitions (continued)*

---

<b>Path autonomous systems</b>	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
<b>Path MED</b>	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <b>-1</b> in the above display) indicates that the MED value is missing for this route path.
<b>Path atomic</b>	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <b>yes</b> ), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
<b>Path AS aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates this is not an aggregate route.
<b>Path IPaddr aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates that this is not an aggregate route.
<b>Path community</b>	Indicates the community to which this route path belongs, if applicable. A value of <b>&lt;none&gt;</b> indicates that this route does not belong to a community.
<b>Path unknown attribute</b>	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

## show ip bgp routes

Displays BGP route details.

**show ip bgp routes** [*ip\_address ip\_mask*]

---

### Syntax Definitions

*ip\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays all the routes in the routing table with details.

### Examples

-> show ip bgp routes

Legends: ECL = EBGp change list, ICC = IBGP client change list

ICL = IBGP change list, LCL = local change list

AGG = Aggregation, AGC = Aggregation contribution

AGL = Aggregation list, GDL = Deletion list

AGW = Aggregation waiting, AGH = Aggregation hidden

DMP = Dampening, ACT = Active route

Address	Mask	ECL	ICC	ICL	LCL	AGG	AGC	AGL	AGW	AGH	GDL	DMP	ACT
192.40.4.0	255.255.255.0	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.0	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.8	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes

192.40.6.144	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes

### output definitions

---

<b>Address</b>	The route destination network address.
<b>Mask</b>	The route destination network mask.
<b>ECL</b>	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
<b>ICC</b>	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

---

*output definitions (continued)*

---

<b>ICL</b>	Internal BGP change list. When Yes, this route has changes that need to be advertised.
<b>LCL</b>	Local change list. When Yes, this route is local.
<b>AGG</b>	Aggregation. When Yes, this route is an aggregate route.
<b>AGC</b>	Aggregation contribution. When Yes, this route is part of an aggregate route.
<b>AGL</b>	Aggregation list. When Yes, this route is placed on an aggregate list.
<b>AGW</b>	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
<b>AGH</b>	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
<b>GDL</b>	Deletion list. When Yes, this route will be deleted.
<b>DMP</b>	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
<b>ACT</b>	Active route. When Yes, the route is active.

## show ip bgp aggregate-address

Displays aggregate route status.

**show ip bgp aggregate-address** [*ip\_address ip mask*]

---

### Syntax Definitions

*ip\_address* A 32-bit IP address of the aggregate address.

*ip\_mask* A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

### Examples

```
-> show ip bgp aggregate-address
Network          Mask          Summarize As-Set  Admin state Oper state
-----+-----+-----+-----+-----+-----
155.132.44.73   255.255.255.255 disabled  disabled disabled  not_active
192.40.6.0      255.255.255.255 disabled  disabled disabled  not_active
```

```
-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address      = 192.40.6.0,
Aggregate mask         = 255.255.255.255,
Aggregate admin state  = disabled,
Aggregate oper state   = not_active,
Aggregate as-set       = disabled,
Aggregate summarize    = disabled,
Aggregate metric       = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

#### *output definitions*

---

<b>Network or Aggregate address</b>	The IP address for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address</a> command.
<b>Mask or Aggregate mask</b>	The mask for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address</a> command.
<b>Summarize or Aggregate summarize</b>	Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address summary-only</a> command.

*output definitions (continued)*

---

<b>As-Set</b> or <b>Aggregate as-set</b>	Indicates whether AS path aggregate is enabled or disabled. This value is configured through the <b>ip bgp aggregate-address as-set</b> command.
<b>Admin State</b> or <b>Aggregate admin state</b>	Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the <b>ip bgp aggregate-address admin-state</b> command.
<b>Oper State</b> or <b>Aggregate oper state</b>	Indicates whether this aggregate route is operational and participating in BGP message exchanges.
<b>Aggregate metric</b>	The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the <b>ip bgp aggregate-address metric</b> command.
<b>Aggregate local preference</b>	The local preference value for this aggregate route. This value is configured through the <b>ip bgp aggregate-address local-preference</b> command.
<b>Aggregate community string</b>	The community string value for this aggregate route. This value is configured through the <b>ip bgp aggregate-address community</b> command.

---

**Release History**

## show ip bgp network

Displays currently defined network configurations.

**show ip bgp network** [*ip\_address ip\_mask*]

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays all the configured networks, or a single network.

### Examples

```
-> show ip bgp network
Network      Mask                Admin state Oper state
-----+-----+-----+-----
155.132.1.2  255.255.255.255 disabled  not_active
155.132.1.3  255.255.255.255 disabled  not_active
```

```
-> show ip bgp network 155.132.1.2 255.255.255.255
Network address      = 155.132.1.2,
Network mask         = 255.255.255.255,
Network admin state  = disabled,
Network oper state   = not_active,
Network metric       = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

### output definitions

---

<b>Network</b> or <b>Network address</b>	The IP address configured for this local BGP network. This value is configured through the <b>ip bgp network</b> command.
<b>Mask</b> or <b>Network mask</b>	The mask configured for this local BGP network. This value is configured through the <b>ip bgp network</b> command.
<b>Admin state</b> or <b>Network admin state</b>	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <b>ip bgp network admin-state</b> command.

*output definitions (continued)*

---

<b>Oper state or Network oper state</b>	Indicates whether this BGP local network is operationally active or inactive.
<b>Network metric</b>	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <b>ip bgp network metric</b> command.
<b>Network local preference</b>	The local preference value for this local BGP network. This value is configured through the <b>ip bgp network local-preference</b> command.
<b>Network community string</b>	The community string value for this local BGP network. This value is configured through the <b>ip bgp network community</b> command.

---

**Release History**

## show ip bgp neighbors

Displays the configured IPv4 BGP peers.

**show ip bgp neighbors** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

There are two output options for this command. If you specify `show ip bgp peer` without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

### Examples

```
-> show ip bgp neighbors
Legends:Nbr = Neighbor
```

```
      As = Autonomous System
Nbr address      As      Admin state Oper state      BgpId      Up/Down
-----+-----+-----+-----+-----+-----
192.40.4.29      3      enabled    estab           192.40.4.29 00h:14m:48s
192.40.4.121     5      disabled   idle            0.0.0.0     00h:00m:00s
```

#### *output definitions*

---

<b>Nbr address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ip bgp neighbor admin-state</b> command.
<b>Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>BgpId</b>	The unique BGP identifier of the peer. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b>Up/Down</b>	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.

---

```

-> show ip bgp neighbors 0.0.0.1
Neighbor address                = 0.0.0.1,
Neighbor autonomous system      = 1,
Neighbor Admin state            = enabled,
Neighbor Oper state             = connect,
Neighbor passive status         = disabled,
Neighbor name                    = peer(0.0.0.1),
Neighbor local address          = vlan-215,
Neighbor EBGP multiHop          = enabled,
Neighbor next hop self          = disabled,
Neighbor TTL security           = 6,
Neighbor Route Refresh          = enabled,
Neighbor Ipv4 unicast           = enabled,
Neighbor Ipv4 multicast         = disabled,
Neighbor type                   = internal,
Neighbor auto-restart           = enabled,
Neighbor route-reflector-client = disabled,
Neighbor confederation status   = disabled,
Neighbor remove private AS      = disabled,
Neighbor default originate      = disabled,
Neighbor maximum prefixes       = 5000,
Neighbor max prefixes warning   = enabled,
# of prefixes received          = 0,
Neighbor MD5 key                 = <none>,
Neighbor local port             = 0,
Neighbor TCP window size        = 32768
Graceful Restart State          = None,

BFD Status                      = disabled,
Activate IPv4 unicast           = enabled

```

### *output definitions*

<b>Neighbor address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>Neighbor autonomous system</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ip bgp neighbor admin-state</b> command.
<b>Neighbor Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>Neighbor passive status</b>	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). This value is configured through the <b>ip bgp neighbor passive</b> command.
<b>Neighbor name</b>	The name assigned to this peer through the <b>ip bgp neighbor description</b> command.
<b>Neighbor local address</b>	The interface assigned to this peer. This value is configured through the <b>ip bgp neighbor update-source</b> command.

*output definitions (continued)*

<b>Neighbor EBGP multihop</b>	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the <b>ip bgp neighbor ebgp-multihop</b> command.
<b>Neighbor next hop self</b>	Indicates whether this peer is using next hop processing. This value is configured through the <b>ip bgp neighbor next-hop-self</b> command.
<b>Neighbor TTL security</b>	Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none.
<b>Neighbor Route Refresh</b>	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
<b>Neighbor Ipv4 unicast</b>	Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.
<b>Neighbor Ipv4 multicast</b>	Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.
<b>Neighbor type</b>	Indicates whether this peer is internal or external to the router.
<b>Neighbor auto-restart</b>	Indicates whether peer auto-restart is enabled or disabled. This value is configured through the <b>ip bgp neighbor auto-restart</b> command.
<b>Neighbor route-reflector-client</b>	Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the <b>ip bgp neighbor route-reflector-client</b> command.
<b>Neighbor confederation status</b>	Indicates whether this peer is a member of a BGP confederation. This value is configured through the <b>ip bgp confederation neighbor</b> command.
<b>Neighbor remove private AS</b>	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the <b>ip bgp neighbor remove-private-as</b> command.
<b>Neighbor default originate</b>	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the <b>ip bgp neighbor default-originate</b> command.
<b>Neighbor maximum prefixes</b>	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the <b>ip bgp neighbor maximum-prefix</b> command.
<b>Neighbor max prefixes warning</b>	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b># of prefixes received</b>	Displays the total number of prefixes received by this neighbor.
<b>Neighbor MD5 key [32- 47]</b>	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the <b>ip bgp neighbor md5 key</b> command.

*output definitions (continued)*

---

<b>Neighbor local port</b>	The TCP port used for the session with this peer.
<b>Neighbor TCP window size</b>	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
<b>Graceful Restart State</b>	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
<b>Advertised Restart Interval</b>	Indicates the restart interval in seconds.
<b>Forwarding State during restart</b>	Indicates whether the peer has preserved the forwarding state during the graceful restart.
<b>Activate IPv6 unicast</b>	Indicates if the IPv6 unicast updates are enabled or not. Options include <b>enabled</b> or <b>disabled</b> .
<b>Configured IPv6 NextHop Address</b>	Specifies the IPv6 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv6-nexthop</b> command.
<b>Neighbor Ipv6 unicast</b>	Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.
<b>BFD Status</b>	Indicates if BFD is enabled or disabled for this peer.
<b>Activate IPv4 unicast</b>	Indicates if the IPv4 unicast updates are enabled or not for this peer.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.4; BFD Status and Activate IPv4 unicast output fields added.

Release 8.4.1; 'Neighbor TTL security' output field added.

**Related Commands**

<b>ip bgp neighbor</b>	Creates or deletes a BGP peer.
<b>ip bgp neighbor ttl-security</b>	Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer.

## show ip bgp neighbors policy

Displays BGP peer policy information.

```
show ip bgp neighbors policy [ip_address]
```

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific peer.

### Examples

```
-> show ip bgp neighbors policy
Neighbor address = 0.0.0.0,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
Neighbor address = 0.0.0.1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,

  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

*output definitions*

---

<b>Neighbor autonomous system</b>	The AS to which the peer is assigned. This can be assigned by using the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor output policy map name</b>	The outbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor input policy map name</b>	The inbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor output aspath-list name</b>	The outbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-aspathlist</b> command.
<b>Neighbor input aspath-list name</b>	The inbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-aspathlist</b> command.
<b>Neighbor output prefix-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.
<b>Neighbor input prefix-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefixlist</b> command.
<b>Neighbor output community-list name</b>	The outbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-communitylist</b> command.
<b>Neighbor input community-list name</b>	The inbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-communitylist</b> command.
<b>Neighbor soft reconfiguration</b>	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the <b>ip bgp neighbor soft-reconfiguration</b> command.
<b>Neighbor output prefix6-list name</b>	The outbound prefix6 list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefix6list</b> command.
<b>Neighbor input prefix6-list name</b>	The inbound prefix6 list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefix6list</b> command.

## show ip bgp neighbors timer

Displays BGP peer timer statistics.

**show ip bgp neighbors timer** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

### Examples

```
-> show ip bgp neighbors timer
```

```
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
```

Nbr address	As	Hold	Hold(C)	RtAdv	Retry	Kalive	Ka(C)
192.40.4.29	3	90	90	30	120	30	30
192.40.4.121	5	0	90	30	120	0	30

#### *output definitions*

---

<b>Nbr address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Hold</b>	The current count for the holdtime value.
<b>Hold(C)</b>	The holdtime value configured through the <b>ip bgp neighbor timers</b> command.
<b>RtAdv</b>	The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the <b>ip bgp neighbor advertisement-interval</b> command.
<b>Retry</b>	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured through the <b>ip bgp neighbor timers</b> command.

*output definitions (continued)*

---

<b>Kalive</b>	The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
<b>Ka(C)</b>	The keepalive interval as configured through the <b>ip bgp neighbor timers</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show ip bgp neighbors** Displays BGP peer main status.

**MIB Objects**

## show ip bgp neighbors statistics

Displays BGP peer message statistics.

**show ip bgp neighbors statistics** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

### Examples

```
-> show ip bgp neighbors statistics
```

```
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
         RUPDS = number of Update messages received,
         SUPDS = number of Update messages sent,
         RNOFY = number of Notify messages received,
         SNOFY = number of Notify messages sent
         RPFXS = number of prefixes received
         UPTNS = number of UP transitions
         DNTNS = number of DOWN transitions
```

Nbr	address	As	RMSGS	SMSGS	RUPDS	SUPDS	RNOFY	SNOFY	RPFXS	UPTNS	DNTNS
192.40.4.29	3	110	123	5	0	0	1	8	2	2	
192.40.4.121	5	0	0	0	0	0	0	0	0	0	

### output definitions

---

<b>Nbr address</b>	The IP address for this peer. This value is configured through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. This value is configured through the <b>ip bgp neighbor remote-as</b> command.
<b>RMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b>SMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

*output definitions (continued)*

---

<b>RUPDS</b>	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>SUPDS</b>	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>RNOFY</b>	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>SNOFY</b>	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>RPFXS</b>	The number of unique route prefixes received by this peer.
<b>UPTNS</b>	The number of times this peer has come up, operationally.
<b>DNTNS</b>	Number of times this peer has gone down, operationally.

---

```

-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address                = 0.0.0.1,
# of UP transitions              = 0,
Time of last UP transition      = 00h:00m:00s,
# of DOWN transitions           = 0,
Time of last DOWN transition    = 00h:00m:00s,
Last DOWN reason                = none,
# of msgs rcvd                  = 0,
# of Update msgs rcvd          = 0,
# of prefixes rcvd              = 0,
# of Route Refresh msgs rcvd   = 0,
# of Notification msgs rcvd    = 0,
Last rcvd Notification reason   = none [none]
Time last msg was rcvd         = 00h:00m:00s,
# of msgs sent                  = 0,
# of Update msgs sent           = 0,
# of Route Refresh msgs sent    = 0,
# of Notification msgs sent     = 0,
Last sent Notification reason   = none [none]
Time last msg was sent         = 00h:00m:00s,

```

*output definitions*

---

<b>Neighbor address</b>	The IP address for this peer. This value is configured through the <b>ip bgp neighbor</b> command.
<b># of UP transitions</b>	The number of times this peer has come up, operationally.
<b>Time of last UP transition</b>	The duration that this peer has been up.
<b># of DOWN transitions</b>	Number of times this peer has gone down, operationally.
<b>Time of last DOWN transition</b>	The duration since this peer last went down.

*output definitions (continued)*

---

<b>Last DOWN reason</b>	Provides a message as the last reason why a peer went down. The possible reasons for going down are:  user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
<b># of msgs rcvd</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.
<b># of Update msgs rcvd</b>	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of prefixes rcvd</b>	The number of unique route prefixes received by this peer.
<b># of Route Refresh msgs rcvd</b>	The number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
<b># of Notification msgs rcvd</b>	The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last rcvd Notification reason</b>	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> <li>message header error - synchronization loss</li> <li>message header error - bad length</li> <li>message header error - bad type</li> <li>open message error - unsupported version</li> <li>open message error - bad peer autonomous system</li> <li>open message error - bad peer bgp id</li> <li>open message error - unsupported option</li> <li>open message error - authentication failure</li> <li>open message error - unacceptable hold time</li> <li>open message error - unsupported capability</li> <li>update message error - malformed attribute</li> <li>update message error - unknown attribute</li> <li>update message error - missing wellknown attribute</li> <li>update message error - attribute flags error</li> <li>update message error - attribute length error</li> <li>update message error - invalid origin</li> <li>update message error - as loop</li> <li>update message error - invalid nexthop</li> <li>update message error - optional attribute error</li> <li>update message error - invalid network</li> <li>update message error - malformed aspath</li> <li>cease - maximum number of prefixes reached</li> <li>cease - administrative shutdown</li> <li>cease - peer de-configured</li> <li>cease- administrative reset</li> <li>cease- connection rejected</li> <li>cease - other configuration change</li> <li>cease - connection collision resolution</li> <li>cease - out of resources</li> <li>hold time out - none</li> <li>fsm error - none</li> <li>none - none</li> </ul>
<b>Time last msg was rcvd</b>	The duration since a message was received from this peer.
<b># of msgd sent</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
<b># of Update msgd sent</b>	The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of Route Refresh msgd sent</b>	The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
<b># of Notification msgd sent</b>	The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last sent Notification reason</b>	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the <b>Peer last received notification reason</b> field above.
<b>Time last msg was sent</b>	The duration since a message was sent to this peer.

## show ip bgp policy aspath-list

Displays AS path list parameters.

```
show ip bgp policy aspath-list [name] ["regular_expression"]
```

---

### Syntax Definitions

<i>name</i>	An AS path name.
<i>regular_expression</i>	A regular expression. The regular expression must be enclosed by quotation marks.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the [ip bgp policy aspath-list](#) command on page 29-103.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

### Examples

```
-> show ip bgp policy aspath-list
Aspath List Name      Aspath regular expression
-----+-----
aspl1                  (500 | 400) ? 300$
aspl2                  (500 | 400)
```

```
-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp   = (500 | 400) ? 300$
  Admin state   = disabled,
  Priority       = 1,
  Action        = deny,
  Primary index = 0,
```

#### output definitions

---

<b>Aspath List name</b>	The name of the AS path list. This is defined using the <a href="#">ip bgp policy aspath-list</a> command.
<b>Aspath regular expression</b>	The regular expression that defines the AS path list. This is defined using the <a href="#">ip bgp policy aspath-list</a> command.

*output definitions (continued)*

---

<b>Admin state</b>	The administration state of the AS path policy. It is either enable or disable.
<b>Priority</b>	The AS path list priority. This is defined using the <b>ip bgp policy aspath-list priority</b> command.
<b>Action</b>	The AS path list action, either permit or deny. This is defined using the <b>ip bgp policy aspath-list action</b> command.
<b>Primary index</b>	The instance identifier for the AS path list. This value is not configurable.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp policy aspath-list**            Creates or removes an AS path list.

**MIB Objects**

```
alabgpMIBAspathListGroup

```

---

## show ip bgp policy community-list

Displays community list parameters.

**show ip bgp policy community-list** [*name*] [*string*]

---

### Syntax Definitions

<i>name</i>	Community name.
<i>string</i>	A regular expression. The regular expression must be enclosed by quotation marks.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

### Examples

```
-> show ip bgp policy community-list
Community list name      Community string
-----+-----
adfasdf                  0:0
```

```
-> show ip bgp policy community-list com11
Community List name = com11
Community string    = 600:1
  Admin state       = disabled,
  Match type        = exact,
  Priority           = 1,
  Action            = deny,
  Primary index     = 0
```

### output definitions

---

<b>Community List name</b>	The community list name. This is defined using the <a href="#">ip bgp policy community-list</a> command.
<b>Community string</b>	The community list definition. This is defined using the <a href="#">ip bgp policy community-list</a> command.
<b>Admin state</b>	The administration state of the community list policy, either enabled or disabled.
<b>Match type</b>	The match type of the community list. This is defined using the <a href="#">ip bgp policy community-list match-type</a> command.

*output definitions (continued)*

---

<b>Priority</b>	The community list priority. This is defined using the <b>ip bgp policy community-list priority</b> command.
<b>Action</b>	The community list action. This is defined using the <b>ip bgp policy community-list action</b> command.
<b>Primary index</b>	The instance identifier for the community list. This value is not configurable.

```

---

## show ip bgp policy prefix-list

Displays prefix list parameters.

```
show ip bgp policy prefix-list [name] [ip_address ip_mask]
```

---

### Syntax Definitions

<i>name</i>	A prefix list name.
<i>ip_address</i>	A prefix list IP address.
<i>ip_mask</i>	An IP address mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

### Examples

```
-> show ip bgp policy prefix-list
Prefix List name      Prefix address  Prefix mask
-----+-----+-----
pfxl1                 155.132.33.0   255.255.255.0
pfxl2                 155.148.32.0   255.255.255.0
```

```
-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask             = 255.255.255.0
Admin state     = disabled,
Match Mask >= (GE) = 0,
Match Mask <= (LE) = 0,
Action          = deny
```

### output definitions

---

<b>Prefix List name</b>	The name of the prefix list. This is defined using the <a href="#">ip bgp policy prefix-list</a> command.
<b>Address</b>	The IP address of the prefix list. This is defined using the <a href="#">ip bgp policy prefix-list</a> command.
<b>Mask</b>	The mask of the prefix list. This is defined using the <a href="#">ip bgp policy prefix-list</a> command.
<b>Admin state</b>	The administrative state of the prefix list, either enabled or disabled.

*output definitions (continued)*

---

<b>Match Mask &gt;= (GE)</b>	The GE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list ge</b> command.
<b>Match Mask &lt;= (LE)</b>	The LE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list le</b> command.
<b>Action</b>	The action of the prefix list. This is defined using the <b>ip bgp policy prefix-list action</b> command.

---

```

---

## show ip bgp policy prefix6-list

Displays prefix6 list parameters.

**show ip bgp policy prefix6-list** [*name*] [*ipv6\_address/prefixLength*]

---

### Syntax Definitions

<i>name</i>	A prefix6 list name.
<i>ip_address</i>	A prefix6 list IPv6 address.
<i>prefixLength</i>	A prefix6 list prefix length.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays the list of prefix6-list policies configured for the speaker, or a specific list determined by the list name or IPv6 address.

### Examples

```
-> show ip bgp policy prefix6-list
Prefix6 List name      Prefix6 address/Prefix length
-----+-----
p62                   ::/0
p63                   4001:1::/32
```

```
-> show ip bgp policy prefix6-list p63
Prefix6 List name = p63
Prefix           = 4001:1::
Prefix Length    = 32
Admin state      = enabled,
Match MaskLength >= (GE) = 32,
Match MaskLength <= (LE) = 0,
Action           = permit
```

#### output definitions

---

<b>Prefix6 List name</b>	The name of the prefix6 list. This is defined using the <b>ip bgp policy prefix6-list</b> command.
<b>Prefix</b>	The IPv6 address of the prefix6 list. This is defined using the <b>ip bgp policy prefix6-list</b> command.
<b>Prefix Length</b>	The prefix length of the prefix6 list. This is defined using the <b>ip bgp policy prefix6-list</b> command.
<b>Admin state</b>	The administrative state of the prefix6 list, either enabled or disabled.

*output definitions (continued)*

---

<b>Match MaskLength &gt;= (GE)</b>	The GE match masklength of the prefix6 list. This is defined using the <a href="#">ip bgp policy prefix6-list</a> command.
<b>Match MaskLength &lt;= (LE)</b>	The LE match masklength of the prefix6 list. This is defined using the <a href="#">ip bgp policy prefix6-list</a> command
<b>Action</b>	The action of the prefix6 list. This is defined using the <a href="#">ip bgp policy prefix6-list</a> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[ip bgp policy prefix6-list](#)      Creates or deletes a prefix6 match list.

**MIB Objects**

```

```

---

## show ip bgp policy route-map

Displays policy route map parameters.

**show ip bgp policy route-map** [*name*] [*sequence\_number*]

---

### Syntax Definitions

*name*                                      Route map name.  
*sequence\_number*                        A sequence number. The valid range is 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

### Examples

```
-> show ip bgp policy route-map
RouteMap name      Instance
-----+-----
rmap1              1
rmap1              2
rmap2              1
```

```
-> show ip bgp policy route-map rmap1
RouteMap name      = rmap1
RouteMap instance = 1
  Admin state      = disabled,
  Local pref (mode/value) = <none> / 0,
  Route map action = permit,
  Origin           = <none>,
  MED (mode/value) = <none> / 0,
  Weight          = 0,
  Aspath-List name = aspl1,
  Aspath prepend  = <none>,
  Aspath match primitive = 500 .* 400$,
  Prefix-List name = <none>,
  Prefix match primitive = 0.0.0.0 0.0.0.0,
  Prefix6-List name = <none>,
  Prefix6 match primitive = ::/0,
  Prefix6-List name = <none>,
  Prefix6 match primitive = ::/0,
  Community-List name = coml2,
  Community match primitive = <none>,
  Community string [mode] = [Additive]
```

*output definitions*

---

<b>RouteMap name</b>	The name of the route map policy. This is determined using the <b>ip bgp policy prefix6-list</b> command.
<b>RouteMap instance</b>	The instance of the route map policy. This is determined using the <b>ip bgp policy prefix6-list</b> command.
<b>Admin state</b>	The administrative state of the route map policy, either enabled or disabled.
<b>Local pref (mode/value)</b>	The local preference of the route map policy. This is determined using the <b>ip bgp policy route-map lpref</b> command.
<b>Route map action</b>	The action of the route map policy. This is determined using the <b>ip bgp policy route-map action</b> command.
<b>Origin</b>	The origin of the route map policy. This is determined using the <b>ip bgp policy route-map origin</b> command.
<b>MED (mode/value)</b>	The MED of the route map policy. This is determined using the <b>ip bgp policy route-map med</b> command.
<b>Weight</b>	The weight of the route map policy. This is determined using the <b>ip bgp policy route-map weight</b> command.
<b>Aspath-List name</b>	The name of the AS path list attached to this route map. This is set using the <b>show ip bgp policy aspath-list</b> command.
<b>Aspath prepend</b>	The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done).
<b>Aspath match primitive</b>	The regular expression used to match AS Path for this route map.
<b>Prefix-List name</b>	The name of the prefix list attached to this route map. This is set using the <b>show ip bgp policy prefix-list</b> command.
<b>Prefix match primitive</b>	The prefix to match for this route map.
<b>Prefix6-List name</b>	The name of the prefix6 list attached to this route map.
<b>Prefix6 match primitive</b>	The prefix6 to match for this route map.
<b>Community-List name</b>	The name of the community list attached to this route map. This is set using the <b>show ip bgp policy community-list</b> command.
<b>Community match primitive</b>	The community string to match for this route map.
<b>Community string [mode]</b>	The name of the community mode attached to this route map. This is set using the <b>ip bgp policy route-map community-mode</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.4; Prefix6-List name and Prefix6 match primitive output fields added.

## ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

**ip bgp graceful-restart**

**no ip bgp graceful-restart**

---

### Syntax Definitions

N/A

### Defaults

Graceful restart is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

### Examples

```
-> ip bgp graceful restart  
-> no ip bgp graceful restart
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip bgp** Displays the current global settings for the local BGP speaker.

### MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart  
  alaBgpRestartInterval
```

---

## ip bgp graceful-restart restart-interval

Configures the grace period for achieving a graceful BGP restart.

**ip bgp graceful-restart restart-interval** [*seconds*]

---

### Syntax Definitions

*seconds* The hitless restart timeout interval, in seconds. The valid range is 1–3600.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

### Examples

```
-> ip bgp graceful-restart restart-interval 600
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

```

---

## ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

**ip bgp unicast**

**no ip bgp unicast**

---

### Syntax Definitions

N/A

### Defaults

By default, BGP IPv4 advertisements are enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogeneous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

### Examples

```
-> ip bgp unicast  
-> no ip bgp unicast
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ipv6 bgp unicast</a>	Enables or disables unicast IPv6 updates for the BGP routing process.
<a href="#">show ip bgp</a>	Displays the current global settings for the local BGP speaker.

```

---

## ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

**ipv6 bgp unicast**

**no ipv6 bgp unicast**

---

### Syntax Definitions

N/A

### Defaults

By default, IPv6 BGP advertisements are disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

### Examples

```
-> ipv6 bgp unicast
-> no ipv6 bgp unicast
```

## ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

**ip bgp neighbor** *ip\_address* **activate-ipv6**

**no ip bgp neighbor** *ip\_address* **activate-ipv6**

---

### Syntax Definitions

*ip\_address*                                      The 32-bit IPv4 address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

### Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp neighbors](#)                      Displays BGP peer main status.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerIpv6Unicast
```

---

## ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

```
ip bgp neighbor ip_address ipv6-nexthop ipv6_address
```

---

### Syntax Definitions

<i>ip_address</i>	The 32-bit IPv4 address of the neighbor.
<i>ipv6_address</i>	A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

### Defaults

By default, the IPv6 next hop value is set to all zeros.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

### Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1  
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerIpv6NextHop
```

---

## show ipv6 bgp path

Displays the known IPv6 BGP paths for all the routes or a specific route.

**show ipv6 bgp path** [**ipv6-addr** *ipv6\_address/prefix\_length*] [**detail**]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.  
*/prefix\_length*                    The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, IPv6 BGP paths for all the routes will be displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the *ipv6\_address/prefix\_length* parameter to display the IPv6 BGP paths for a specified route.
- ‘Detail’ option when used displays the AS Path details of each route.

### Examples

```
-> show ipv6 bgp path
Legends: Sta      = Path state
         >       = best, F = feasible, S = stale
         U       = un-synchronized
         Nbr     = Neighbor
         (O)    = Path Origin (? = incomplete, i = igp, e = egp)
         degPref = degree of preference

Sta Prefix                               Nbr Address                               (O) degPref

>	4001:1:0:3::/64	2101::51	140	65536, i

**output definitions**

<b>Sta</b>	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>Nbr Address</b>	The IP or IPv6 address of the BGP peer that advertises this path.
<b>(O)</b>	The origin attribute of this route path. A question mark (?) indicates incomplete, and <b>i</b> indicates IGP, and an <b>e</b> indicates EGP.
<b>degPref</b>	The local preference value assigned to this route path.

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
```

```
BGP Path parameters
```

```
Path address      = 2020:100:200:1::
Path Length       = 64
Path protocol     = ibgp
Path neighbor     = peer(2001:100:3:4::1)
  Path nextHop    = 2001:100:3:4::1,
  Path origin     = igp,
  Path local preference = 100,
  Path state      = active,
  Path weight     = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED        = <none>,
  Path atomic     = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community  = <none>,
  Path Originator Id = <none>,
  Path Cluster List = <none>,
  Path unknown attribute = <none>
```

**output definitions**

<b>Path address</b>	The IPv6 address for route path.
<b>Path Length</b>	The prefix length of the IPv6 path.
<b>Path protocol</b>	The protocol from which this route path was learned. Possible values for this field are as follows: <b>local</b> , <b>static</b> , <b>directhost</b> , <b>rip</b> , <b>ospf</b> , <b>isis</b> , <b>ibgp</b> , <b>ebgp</b> , and <b>other</b> .
<b>Path neighbor</b>	The IPv6 address of the BGP peer.
<b>Path nextHop</b>	The next hop along the route path.
<b>Path origin</b>	The BGP origin attribute. Possible values will be <b>igp</b> , <b>egp</b> , <b>incomplete</b> , and <b>none</b> . The origin attribute is considered during the route decision process.

*output definitions (continued)*

---

<b>Path local preference</b>	The local preference value for this route as received in an UPDATE message. A negative value (for example, the <b>-1</b> in the above display) indicates that the local preference value is missing for this route path.
<b>Path state</b>	Indicates the state of the path. The possible states are <b>best</b> , <b>feasible</b> , <b>policy-wait</b> , <b>un-synchronized</b> , <b>dampened</b> , or <b>none</b> . When path state is <b>none</b> , it indicates that there are no paths to this prefix and the route is being purged from the system.
<b>Path weight</b>	The path weight as assigned through inbound and outbound policies.
<b>Path preference degree</b>	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <b>ip bgp default local-preference</b> ).
<b>Path autonomous systems</b>	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
<b>Path MED</b>	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <b>-1</b> in the above display) indicates that the MED value is missing for this route path.
<b>Path atomic</b>	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <b>yes</b> ), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
<b>Path AS aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates this is not an aggregate route.
<b>Path IPaddr aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates that this is not an aggregate route.
<b>Path community</b>	Indicates the community to which this route path belongs, if applicable. A value of <b>&lt;none&gt;</b> indicates that this route does not belong to a community.
<b>Path Originator Id</b>	The Router Id of the BGP4 speaker that performed route reflection
<b>Path Cluster List</b>	Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.
<b>Path unknown attribute</b>	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

2525:2525:5::/48	No	No	No	No	No	No	No	No	No	No	No	Yes

### output definitions

---

<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>ECL</b>	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
<b>ICC</b>	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

*output definitions (continued)*

---

<b>ICL</b>	Internal BGP change list. When Yes, this route has changes that need to be advertised.
<b>LCL</b>	Local change list. When Yes, this route is local.
<b>AGG</b>	Aggregation. When Yes, this route is an aggregate route.
<b>AGC</b>	Aggregation contribution. When Yes, this route is part of an aggregate route.
<b>AGL</b>	Aggregation list. When Yes, this route is placed on an aggregate list.
<b>AGW</b>	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
<b>AGH</b>	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
<b>GDL</b>	Deletion list. When Yes, this route will be deleted.
<b>DMP</b>	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
<b>ACT</b>	Active route. When Yes, the route is active.

## ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

**ipv6 bgp network** *ipv6\_address/prefix\_length*

**no ipv6 bgp network** *ipv6\_address/prefix\_length*

---

### Syntax Definitions

*ipv6\_address*

The 128-bit IPv6 address.

*/prefix\_length*

The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

### Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ipv6 bgp network admin-state** Enables or disables a BGP network.

**show ipv6 bgp network** Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

### MIB Objects

alaBgpNetwork6Table

alaBgpNetwork6Addr

alaBgpNetwork6MaskLen

---

## ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num* | *num:num*}]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128
<b>none</b>	Removes a prefix from a community.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num</i>	The community attribute number.
<i>num:num</i>	Community attribute in the AS:NN format. AS indicates the autonomous system and NN indicates the community number.

### Defaults

By default, a route is not assigned to a community.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

### Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

## Related Commands

### [ipv6 bgp network](#)

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

## MIB Objects

alaBgpNetwork6Table

  alaBgpNetwork6Addr

  alaBgpNetwork6MaskLen

  alaBgpNetwork6Community

---

## ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**local-preference** *num*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The local preference attribute value. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>num</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

### Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ipv6 bgp network</a>	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers

**MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6LocalPref
```

---

## ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

```
ipv6 bgp network ipv6_address/prefix_length [metric num]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The MED attribute value. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>num</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

### Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as a IPv6 BGP network to other BGP peers.
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

**MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6Metric
```

---

## ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**admin-state** {**enable** | **disable**}]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<b>enable</b>	Enables the BGP network.
<b>disable</b>	Disables the BGP network.

### Defaults

By default, the BGP network is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

### Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 bgp network** Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

### MIB Objects

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6RowStatus
```

---

## show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

**show ipv6 bgp network** [*ipv6\_address/prefix\_length*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, all IPv6 BGP networks and their status will be displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the *ipv6\_address/prefix\_length* parameter to display the status of a specific IPv6 BGP network.

### Examples

```
show ipv6 bgp network
Network
-----+-----+-----
2525:500:600::/64          enabled    active
```

```
show ipv6 bgp network 2525:500:600::/64
Network address           = 2525:500:600::/64,
Network admin state      = enabled,
Network oper state       = active,
Network metric           = 0,
Network local preference = 0,
Network community string = <none>
```

### output definitions

---

<b>Network</b> or <b>Network address</b>	The IPv6 address configured for this local BGP network. This value is configured through the <b>ipv6 bgp network</b> command.
<b>Admin state</b> or <b>Network admin state</b>	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <b>ipv6 bgp network admin-state</b> command.
<b>Oper state</b> or <b>Network oper state</b>	Indicates whether this BGP local network is operationally active or inactive.

*output definitions (continued)*

---

<b>Network metric</b>	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <b>ipv6 bgp network metric</b> command.
<b>Network local preference</b>	The local preference value for this local BGP network. This value is configured through the <b>ipv6 bgp network local-preference</b> command.
<b>Network community string</b>	The community string value for this local BGP network. This value is configured through the <b>ipv6 bgp network community</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**ipv6 bgp network** .Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

**MIB Objects**

```
alaBgpNetwork6Table
  alaBgpNetwork6Addr
  alaBgpNetwork6MaskLen
  alaBgpNetwork6State

```

---

## ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address*

**no ipv6 bgp neighbor** *ipv6\_address*

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the new BGP peer.

### Defaults

By default, no BGP peers are configured in the BGP network.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor admin-state** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

### Examples

```
-> ipv6 bgp neighbor 2001::1  
-> no ipv6 bgp neighbor 2001::1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ipv6 bgp neighbor admin-state** Enables or disables the BGP peer status.

**ipv6 bgp neighbor remote-as** Assigns an AS number to the BGP peer.

## MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6Addr

---

## ipv6 bgp neighbor ttl-security

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

**ipv6 bgp neighbor *ipv6\_address* ttl-security *num***

**ipv6 bgp neighbor *ipv6\_address* no ttl-security**

---

### Syntax Definitions

*ipv6\_address*

The 128-bit IPv6 address of the BGP peer.

*num*

The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255.

### Defaults

By default GTSM is disabled for communication with the peer.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vice-versa.
- Use the **no** form of this command to disable GTSM.

### Examples

```
-> ipv6 bgp neighbor 2001::1 ttl-security 6
-> ipv6 bgp neighbor 2001::1 no ttl-security
```

### Release History

Release 8.4.1; command was introduced.

### Related Commands

**show ipv6 bgp neighbors** Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6TTLSecurityHops
```

---

## ipv6 bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

**ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv4**]

**no ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv4**]

---

### Syntax Definitions

*ipv6\_address*

The 128-bit IPv6 address of the new BGP peer.

**activate-ipv4**

Enable the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

### Defaults

By default, the command is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv6 BGP peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 activate-ipv4
-> no ipv6 bgp neighbor 2001::1 activate-ipv4
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ipv6 bgp neighbor](#)

Creates or deletes a BGP peer relationship using IPv6 addresses.

### MIB Objects

alaBgpPeer6Table

  alaBgpPeer6Addr

  alaBgpPeer6ActivateIpv4

---

## ipv6 bgp neighbor activate-ipv6

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv6**]

**no ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv6**]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

### Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)              Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6ActivateIpv6
```

---

## ipv6 bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv6-nexthop ipv6_address]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the next hop router.

### Defaults

By default, the IPv6 next hop address is set to all zeros.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

### Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24  
-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeerIpv6NextHop
```

---

## ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address* [**admin-state** {**enable** | **disable**}]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the new BGP peer.
<b>enable</b>	Enables the BGP peer.
<b>disable</b>	Disables the BGP peer.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the [ipv6 bgp neighbor](#) command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ipv6 bgp neighbor 2001::1 admin-state enable
-> ipv6 bgp neighbor 2001::1 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6RowStatus
```

---

## ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer. The peer will be unavailable during this restart.

**ipv6 bgp neighbor *ipv6\_address* clear**

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
  - **ipv6 bgp neighbor remote-as**
  - **ipv6 bgp neighbor md5 key**
  - **ipv6 bgp neighbor passive**
  - **ipv6 bgp neighbor ebgp-multihop**
  - **ipv6 bgp neighbor maximum-prefix**
  - **ipv6 bgp neighbor update-source**
  - **ipv6 bgp neighbor next-hop-self**
  - **ipv6 bgp neighbor soft-reconfiguration**
  - **ipv6 bgp neighbor route-reflector-client**
  - **ip bgp confederation neighbor6**
  - **ipv6 bgp neighbor remove-private-as**
  - **ipv6 bgp neighbor update-source-address**
- You do not need to issue the **ipv6 bgp neighbor clear** command after issuing any of the above commands.

### Examples

```
-> ipv6 bgp neighbor 2001::1 clear
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**ipv6 bgp neighbor auto-restart** Automatically attempts to restart a BGP peer session after a session terminates.

## MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6Restart

---

## ipv6 bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this IPv6 peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

**ipv6 bgp neighbor *ipv6\_address* auto-restart**

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the neighbor.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

### Examples

```
-> ipv6 bgp neighbor 2001::1 auto-restart  
-> no ipv6 bgp neighbor 2001::1 auto-restart
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

- ipv6 bgp neighbor** Creates or deletes a BGP peer relationship using IPv6 addresses.
- ipv6 bgp neighbor admin-state** Enables or disables the BGP peer status.

## MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6AutoRestart

---

## ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

```
ipv6 bgp neighbor ipv6_address [remote-as value]
```

---

### Syntax Definitions

*ipv6\_address* The 128-bit IPv6 address of the BGP peer.

*value* Autonomous system number in the asplain, asdot+, or asdot formats.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; modified the command.

### Related Commands

**ip bgp autonomous-system** Sets the AS for the local BGP speaker.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6AS
```

---

## ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

```
ipv6 bgp neighbor ipv6_address [timers num num]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>num</i>	The KEEPALIVE message interval in seconds.
<i>num</i>	The hold time interval in seconds.

### Defaults

parameter	default
<i>num</i> (keepalive)	30 seconds
<i>num</i> (holdtime)	90 seconds

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

### Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ipv6 bgp neighbor conn-retry-interval](#) The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

## MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6HoldTime  
  alaBgpPeer6KeepAlive
```

---

## ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

```
ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

```
no ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the BGP peer.  
*num*                                      The number of prefixes. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>num</i>	5000

By default, **warning-only** is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only  
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

### Release History

Release 7.1.1; command was introduced.

  alaBgpPeer6MaxPrefixWarnOnly

---

## ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

```
ipv6 bgp neighbor ipv6_address [next-hop-self]
```

```
no ipv6 bgp neighbor ipv6_address [next-hop-self]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the BGP peer.

### Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self  
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6NextHopSelf
```

---

## ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

**ipv6 bgp neighbor** *ipv6\_address* [**conn-retry-interval** *num*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP neighbor.
<i>num</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>num</i>	120

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

### Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ConnRetryInterval
```

---

## ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

```
ipv6 bgp neighbor ipv6_address [default-originate]
```

```
no ipv6 bgp neighbor ipv6_address [default-originate]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the neighbor.

### Defaults

This **default-originate** parameter is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

### Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate  
-> no ipv6 bgp neighbor 2001::1 default-originate
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6DefaultOriginate
```

---

## ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

**ipv6 bgp neighbor** *ipv6\_address* [**update-source** *interface\_name*]

**no ipv6 bgp neighbor** *ipv6\_address* [**update-source** *interface\_name*]

---

### Syntax Definitions

*ipv6\_address*

The 128-bit IPv6 address for the BGP peer.

*interface\_name*

The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

### Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6  
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

[ipv6 interface](#) Configures an IPv6 interface on a VLAN or IPv6 tunnel.

### MIB Objects

  alaBgpPeer6Addr

  alaBgpPeer6LocalIntfName

---

## ipv6 bgp neighbor ipv4-nextHop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv4-nextHop ip_address]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>ip_address</i>	The 32-bit IP address of the next hop.

### Defaults

By default, the IPv4 next hop value is set to all zeros.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

### Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nextHop 172.22.2.115
-> ipv6 bgp neighbor 2004::1 ipv4-nextHop 0.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) .Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6Ipv4NextHop
```

---

## ipv6 bgp neighbor advertisement-interval

Configures the time interval for updates between external IPv6 BGP peers.

```
ipv6 bgp neighbor ipv6_address advertisement-interval value
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the neighbor.
<i>value</i>	An advertisement time interval in seconds. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>value</i>	30

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external IPv6 BGP peers.

### Examples

```
-> ipv6 bgp neighbor 2001::1 advertisement-interval 60
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) .Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6MinRouteAdvertisementInterval
```

---

## ipv6 bgp neighbor description

Configures the IPv6 BGP Peer name.

**ipv6 bgp neighbor** *ipv6\_address* **description** *string*

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the neighbor.  
*string*                                Peer name (1 - 20 characters).

### Defaults

parameter	default
<i>string</i>	peer (ipv6_address)

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The peer name is a text identifier that, by default, follows the format "peer(ipv6-address)" where ipv6-address is the IPv6 address of the BGP peer. For example, the default name of an IPv6 BGP peer at address 2001::1 would be "peer(2001::1)".
- A peer name with embedded spaces must be enclosed in quotation marks.

### Examples

```
-> ipv6 bgp neighbor 2001::1 description "peer6 for building 3"
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ipv6 bgp neighbor](#)                      Creates or deletes a BGP peer relationship using IPv6 addresses.

### MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6Name

---

## ipv6 bgp neighbor ebgp-multihop

Allows external IPv6 BGP peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the IPv6 BGP peers to speak to each other despite the non-BGP router that sits between them.

**ipv6 bgp neighbor** *ipv6\_address* **ebgp-multihop** [*ttl*]

**no ipv6 bgp neighbor** *ipv6\_address* **ebgp-multihop**

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>ttl</i>	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

### Defaults

parameter	default
<i>ttl</i>	255

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external IPv6 BGP peer is on a directly connected subnet. This command allows you to configure an external IPv6 BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vice-versa.

### Examples

```
-> ipv6 bgp neighbor 2001::1 ebgp-multihop
-> ipv6 bgp neighbor 2001::1 ebg-multihop 50
-> no ipv6 bgp neighbor 2001::1 ebgp-multihop
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**ipv6 bgp neighbor** Creates or deletes a BGP peer relationship using IPv6 addresses.

**ipv6 bgp neighbor next-hop-self** Configures router to advertise its peering address as the next hop address for the specified neighbor.

## MIB Objects

alaBgpPeer6Table

alaBgpPeer6Addr

alaBgpPeer6MultiHop

---

## ipv6 bgp neighbor update-source-address

Configures the local IPv6 address from which a BGP peer will be connected if the peer is configured with its link-local address. This local IPv6 address can be configured for internal and external BGP peers.

```
ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

```
no ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Defaults

By default, the update-source-address value is set to all zeros.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The default is restored by using the **no** form of the command or by entering an all-zero address.

### Examples

```
-> ipv6 bgp neighbor 2001::1 update-source-address 2401::1  
-> no ipv6 bgp neighbor 2001::1 update-source-address
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ipv6 bgp neighbor update-source](#)      Configures the local IPv6 interface from which a BGP peer will be connected.

[show ipv6 bgp neighbors](#)            Displays the configured IPv6 BGP peers.

### MIB Objects

alaBgpPeer6Table  
  alaBgPeer6LocalAddr

---

## ipv6 bgp neighbor passive

Configures the local IPv6 BGP speaker to wait for this IPv6 BGP peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

**ipv6 bgp neighbor *ipv6\_address* passive**

**no ipv6 bgp neighbor *ipv6\_address* passive**

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default, BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::1 passive
-> no ipv6 bgp neighbor 2001::1 passive
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

**ipv6 bgp neighbor**                      Creates or deletes a BGP peer relationship using IPv6 addresses.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6Passive
```

---

## ipv6 bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

**ipv6 bgp neighbor** *ipv6\_address* **remove-private-as**

**no ipv6 bgp neighbor** *ipv6\_address* **remove-private-as**

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default, all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they are intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::1 remove-private-as  
-> no ipv6 bgp neighbor 2001::1 remove-private-as
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ipv6 bgp neighbor remote-as](#)      Assigns an AS number to the BGP peer.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6RemovePrivateAs
```

## ipv6 bgp neighbor soft-reconfiguration

Enables or disables IPv6 BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

**ipv6 bgp neighbor *ipv6\_address* soft-reconfiguration**

**no ipv6 bgp neighbor *ipv6\_address* soft-reconfiguration**

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Default

This command is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ipv6 bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 soft-reconfiguration  
-> no ipv6 bgp neighbor 2001::1 soft-reconfiguration
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**ipv6 bgp neighbor clear**

Restarts the IPv6 BGP peer.

**ipv6 bgp neighbor clear soft**

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

## MIB Objects

    alaBgpPeer6Addr

    alaBgpPeer6SoftReconfig

---

## ipv6 bgp neighbor stats-clear

Clears the statistics for a peer.

**ipv6 bgp neighbor *ipv6\_address* stats-clear**

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ipv6 bgp neighbors statistics](#).

### Examples

```
-> ipv6 bgp neighbor 2001::2 stats-clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors statistics](#) Displays the neighbor statistics of the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ClearCounter
```

---

## ip bgp confederation neighbor6

Configures this IPv6 BGP peer as a member of the same confederation as the local BGP speaker.

**ip bgp confederation neighbor6** *ipv6\_address*

**no ip bgp confederation neighbor6** *ipv6\_address*

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.

### Examples

```
-> ip bgp confederation neighbor6 2001::1
-> no ip bgp confederation neighbor6 2001::1
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

**ip bgp confederation identifier** Sets a confederation identification value for the local BGP speaker (this router).

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeerAddr
  alaBgPeer6ConfedStatus
```

---

## ipv6 bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-aspathlist {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Inbound AS path list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to an inbound policy.
- Use **none** to deassign an AS path filter list from this peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 in-aspathlist InBoundASpath  
-> ipv6 bgp neighbor 2001::1 in-aspathlist none
```

### Release History

Release 7.3.4; command introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6ASpathListIn
```

---

## ipv6 bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-communitylist {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Input community list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input community filter list from this peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 in-communitylist InboundCommlist  
-> ipv6 bgp neighbor 2001::1 in-communitylist none
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ip bgp policy community-list](#) Creates or deletes a community list.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6CommunityListIn
```

---

## ipv6 bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Input prefix filter list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes the prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound IPv4 routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input prefix filter list from this peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 in-prefixlist InboundPrefix  
-> ipv6 bgp neighbor 2001::1 in-prefixlist none
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6PrefixListIn
```

---

## ipv6 bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefix6list {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Input prefix6 filter list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes the prefix6 list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of “**none**.”

### Examples

```
-> ipv6 bgp neighbor 2001::2 in-prefix6list InboundPrefix6  
-> ipv6 bgp neighbor 2001::2 in-prefix6list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Prefix6ListIn
```

---

## ipv6 bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-aspathlist {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
<b>none</b>	Removes the AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- Use **none** to deassign an output AS path filter list from this peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 out-aspathlist OutboundASpath  
-> ipv6 bgp neighbor 2001::1 out-aspathlist none
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6AspathListOut
```

---

## ipv6 bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-communitylist {string | none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
none	Removes the community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- Use **none** to deassign an output community filter list from this peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 out-communitylist OutboundCommlist  
-> ipv6 bgp neighbor 2001::1 out-communitylist none
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ip bgp policy community-list](#) Creates or deletes a community list.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6CommunityListOut
```

---

## ipv6 bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound prefix filter list (0 - 70 characters).
<b>none</b>	Removes the prefix filter list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to an outbound policy.
- Use **none** to deassign an output prefix filter list from this peer.

### Examples

```
-> ipv6 bgp neighbor 2001::1 out-prefixlist OutboundPrefix  
-> ipv6 bgp neighbor 2001::1 out-prefixlist none
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6PrefixListOut
```

---

## ipv6 bgp neighbor out-prefix6list

Assigns an outbound prefix6 filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-prefix6list {string / none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the BGP peer.
<i>string</i>	Outbound prefix6 filter list (0 - 70 characters).
<b>none</b>	Removes the prefix6 filter list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ipv6 bgp neighbor 2001::2 out-prefix6list OutboundPrefix6  
-> ipv6 bgp neighbor 2001::2 out-prefix6list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Prefix6ListOut
```

---

## ipv6 bgp neighbor route-map

Assigns a policy map to an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address route-map {string | none} {in | out}
```

```
no ipv6 bgp neighbor ipv6_address route-map {in | out}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the peer.
<i>string</i>	Policy map name (0 to 70 characters). This name is case sensitive.
<b>none</b>	Deletes the route map if entered rather than a text string.
<b>in</b>	Designates this route map policy as an inbound policy.
<b>out</b>	Designates this route map policy as an outbound policy.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to deassign a policy map.
- The policy route map name (**InboundRoute** and **OutboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any routes from the BGP peer must match this route map filter before being accepted or passed to a policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

### Examples

```
-> ipv6 bgp neighbor 2001::1 route-map InboundRoute in
-> ipv6 bgp neighbor 2001::1 route-map OutboundRoute out
-> ipv6 bgp neighbor 2001::1 route-map none in
-> no ipv6 bgp neighbor 2001::1 route-map in
```

### Release History

Release 7.3.4; command introduced.

**Related Commands**

[ip bgp policy route-map](#)      Creates or deletes a policy route map.

**MIB Objects**

```
alaBgpPeer6Table  
  alaBgpPeer6RouteMapIn  
  alaBgpPeer6RouteMapOut
```

---

## ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address clear soft {in | out}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<b>in</b>	Applies reconfiguration to the inbound policies.
<b>out</b>	Applies reconfiguration to the outbound policies.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

### Examples

```
-> ipv6 bgp neighbor 2001::1 clear soft in  
-> ipv6 bgp neighbor 2001::1 clear soft out
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 bgp neighbor soft-reconfiguration](#) Enables or disables IPv6 BGP peer soft reconfiguration.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6ReconfigureInBound  
  alaBgpPeer6ReconfigureOutBound
```

---

## ipv6 bgp neighbor route-reflector-client

Configures this IPv6 BGP peer as one of the clients to the local route reflector.

```
ipv6 bgp neighbor ipv6_address route-reflector-client
```

```
no ipv6 bgp neighbor ipv6_address route-reflector-client
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the BGP peer.

### Defaults

By default, the command is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the no form of this command to disable IPv6 BGP peer as a client to the local route reflector.
- The IPv6 BGP peers configured using this command become part of the client group. The remaining peers become the members of the non-client group for the local route reflector.
- When IPv6 BGP Peer is configured as route reflector client, all internal BGP speakers in an autonomous system need not be fully meshed. Instead, this route reflector takes the responsibility for passing internal BGP-learned routes to its peers.

### Examples

```
-> ipv6 bgp neighbor 2001::1 route-reflector-client  
-> no ipv6 bgp neighbor 2001::1 route-reflector-client
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)    .Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ClientStatus
```

---

## ipv6 bgp neighbor md5 key

Configures an encrypted MD5 signature for TCP sessions with this IPv6 peer.

```
ipv6 bgp neighbor ipv6_address md5 key {string | none}
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>string</i>	The MD5 public key. The maximum character length is 80.
none	Remove the password and disable authentication.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The password you specified in this command is encrypted before it appears in a saved snapshot file. However, if you view this command in a snapshot file or **boot.cfg** file, the command is displayed in a different syntax as given below:

```
ipv6 bgp neighbor ipv6_address md5 key-encrypt encrypted_string
```

---

**Note.** This MD5 password will not work, if this syntax is used to set it.

---

### Examples

```
-> ipv6 bgp neighbor 2001::1 md5 key openpeer2  
-> ipv6 bgp neighbor 2001::1 md5 key none
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[ipv6 bgp neighbor](#) Creates or deletes a BGP peer relationship using IPv6 addresses.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6MD5Key
```

---

## show ipv6 bgp neighbors

Displays the configured IPv6 BGP peers.

**show ipv6 bgp neighbors** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the BGP neighbor.

### Defaults

By default, all the configured IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the *ipv6\_address* parameter to display the details of a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors
```

```
Legends: Nbr = Neighbor
```

```
      As = Autonomous System
```

Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast     = advertised,
Activate IPv4 unicast     = enabled

```

### *output definitions*

<b>Nbr address or Neighbor address</b>	The IPv6 address for this BGP peer. Assign this address through the <b>ipv6 bgp neighbor</b> command.
<b>As or Neighbor autonomous system</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ipv6 bgp neighbor remote-as</b> command.
<b>Admin state or Neighbor Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ipv6 bgp neighbor admin-state</b> command.
<b>Oper state or Neighbor Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>BGP Id</b>	The unique BGP identifier of the peer.
<b>Up/Down</b>	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
<b>Neighbor passive status</b>	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session).
<b>Neighbor name</b>	The name assigned to this peer.
<b>Neighbor local address</b>	The interface assigned to this peer. This value is configured through the <b>ipv6 bgp neighbor update-source</b> command.
<b>Neighbor EBGp multiHop</b>	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.
<b>Neighbor next hop self</b>	Indicates whether this peer is using next hop processing. This value is configured through the <b>ipv6 bgp neighbor next-hop-self</b> command.
<b>Neighbor TTL security</b>	Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none.
<b>Neighbor Route Refresh</b>	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
<b>Neighbor Ipv4 unicast</b>	Indicates whether this peer is multiprotocol IPv4 unicast capable.
<b>Neighbor Ipv4 multicast</b>	Indicates whether this peer is multiprotocol IPv4 multicast capable.
<b>Neighbor type</b>	Indicates whether this peer is internal or external to the AS.

*output definitions (continued)*

---

<b>Neighbor auto-restart</b>	Indicates whether peer auto-restart is enabled or disabled.
<b>Neighbor route-reflector-client</b>	Indicates whether this peer is a client to the local route reflector, if configured.
<b>Neighbor confederation status</b>	Indicates whether this peer is a member of a BGP confederation.
<b>Neighbor remove private AS</b>	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.
<b>Neighbor default originate</b>	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the <b>ipv6 bgp neighbor default-originate</b> command.
<b>Neighbor maximum prefixes</b>	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the <b>ipv6 bgp neighbor maximum-prefix</b> command.
<b>Neighbor max prefixes warning</b>	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the <b>ipv6 bgp neighbor update-source</b> command.
<b># of prefixes received</b>	Displays the total number of prefixes received by this neighbor.
<b>Neighbor MD5 key</b>	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.
<b>Neighbor local port</b>	The TCP port used for the session with this peer.
<b>Neighbor TCP window size</b>	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
<b>Graceful Restart State</b>	Indicates the graceful restart state. This feature does not support IPv6 prefixes.
<b>Advertised Restart Interval</b>	Indicates the restart interval in seconds.
<b>Forwarding State during restart</b>	Indicates whether the peer has preserved the forwarding state during the graceful restart.
<b>Activate IPv6 unicast</b>	Indicates whether or not IPv6 unicast advertisements are enabled. Options include <b>enabled</b> or <b>disabled</b> .
<b>Configured IPv4 NextHop Address</b>	Specifies the IPv4 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv4-nexthop</b> command.
<b>Configured IPv6 NextHop Address</b>	Specifies the IPv6 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv6-nexthop</b> command.
<b>Neighbor Ipv6 unicast</b>	Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include <b>enabled</b> or <b>disabled</b> .
<b>Activate IPv4 unicast</b>	Indicates whether or not IPv4 unicast capability is advertised between the peers. Options include <b>enabled</b> or <b>disabled</b> .

---

**Release History**

Release 7.1.1; command was introduced.  
 Release 7.3.4; 'Activate IPv4 unicast' output field added.  
 Release 8.4.1; 'Neighbor TTL security' output field added.

## show ipv6 bgp neighbors statistics

Displays the neighbor statistics of the configured IPv6 BGP peers.

**show ipv6 bgp neighbors statistics** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the *ipv6\_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors statistics
```

```
Legends: Nbr    = Neighbor
```

```
      As        = Autonomous System
```

```
      RMSGs    = # of received messages
```

```
      SMSGS    = # of sent messages
```

```
      RUPDS    = # of Update messages received
```

```
      SUPDS    = # of Update messages sent
```

```
      RNOFY    = # of Notify messages received
```

```
      SNOFY    = # of Notify messages sent
```

```
      RPFXS    = # of prefixes received
```

```
      UPTNS    = # of UP transitions
```

```
      DNTNS    = # of DOWN transitions
```

```
Nbr address                      As        RMSGs SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1                    30       225    260    2       3       0       0       10       1       1
```

### output definitions

<b>Nbr address</b>	The IPv6 address for this peer. This value is configured using the <b>ipv6 bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. This value is configured using the <b>ipv6 bgp neighbor remote-as</b> command.
<b>RMSGs</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b>SMSGs</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

*output definitions (continued)*

---

<b>RUPDS</b>	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>SUPDS</b>	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>RNOFY</b>	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>SNOFY</b>	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>RPFXS</b>	Number of unique route prefixes received by this peer.
<b>UPTNS</b>	Number of times this peer has come up, operationally.
<b>DNTNS</b>	Number of times this peer has gone down, operationally.

---

```

-> show ipv6 bgp neighbors statistics 2001:100:3:4::1
Neighbor address           = 2001:100:3:4::1,
# of UP transitions        = 1,
Time of last UP transition = 01h:50m:36s,
# of DOWN transitions      = 1,
Time of last DOWN transition = 00h:00m:00s,
Last DOWN reason          = none,
# of msgs rcvd            = 226,
# of Update msgs rcvd     = 2,
# of prefixes rcvd        = 10,
# of Route Refresh msgs rcvd = 0,
# of Notification msgs rcvd = 0,
Last rcvd Notification reason = none [none]
Time last msg was rcvd     = 00h:00m:04s,
# of msgs sent            = 260,
# of Update msgs sent      = 3,
# of Route Refresh msgs sent = 0
# of Notification msgs sent = 0,
Last sent Notification reason = none [none]
Time last msg was sent     = 00h:00m:18s,

```

*output definitions*

---

<b>Neighbor address</b>	The IPv6 address for this peer. This value is configured using the <b>ipv6 bgp neighbor</b> command.
<b># of UP transitions</b>	Number of times this peer has come up, operationally.
<b>Time of last UP transition</b>	The duration that this peer has been up.
<b># of DOWN transitions</b>	Number of times this peer has gone down, operationally.
<b>Time of last DOWN transition</b>	The duration since this peer last went down.

*output definitions (continued)*

---

<b>Last DOWN reason</b>	Provides a message as the last reason why a peer went down. The possible reasons for going down are:  user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
<b># of msgs rcvd</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b># of Update msgs rcvd</b>	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of prefixes rcvd</b>	Number of unique route prefixes received by this peer.
<b># of Route Refresh msgs rcvd</b>	Number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
<b># of Notification msgs rcvd</b>	Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last rcvd Notification reason</b>	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> <li>message header error - synchronization loss</li> <li>message header error - bad length</li> <li>message header error - bad type</li> <li>open message error - unsupported version</li> <li>open message error - bad peer autonomous system</li> <li>open message error - bad peer bgp id</li> <li>open message error - unsupported option</li> <li>open message error - authentication failure</li> <li>open message error - unacceptable hold time</li> <li>open message error - unsupported capability</li> <li>update message error - malformed attribute</li> <li>update message error - unknown attribute</li> <li>update message error - missing wellknown attribute</li> <li>update message error - attribute flags error</li> <li>update message error - attribute length error</li> <li>update message error - invalid origin</li> <li>update message error - as loop</li> <li>update message error - invalid nexthop</li> <li>update message error - optional attribute error</li> <li>update message error - invalid network</li> <li>update message error - malformed aspath</li> <li>cease - maximum number of prefixes reached</li> <li>cease - administrative shutdown</li> <li>cease - peer de-configured</li> <li>cease- administrative reset</li> <li>cease- connection rejected</li> <li>cease - other configuration change</li> <li>cease - connection collision resolution</li> <li>cease - out of resources</li> <li>hold time out - none</li> <li>fsm error - none</li> <li>none - none</li> </ul>
<b>Time last msg was rcvd</b>	The duration since a message was received from this peer.
<b># of msgsd sent</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
<b># of Update msgsd sent</b>	Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of Route Refresh msgsd sent</b>	Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
<b># of Notification msgsd sent</b>	Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last sent Notification reason</b>	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the <b>Peer last received notification reason</b> field above.
<b>Time last msg was sent</b>	The duration since a message was sent to this peer.

## show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

```
show ipv6 bgp neighbors policy ipv6_address
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv6 peer.

### Examples

```
-> show ipv6 bgp neighbors policy
Neighbor address = 2001::1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

#### *output definitions*

---

<b>Neighbor autonomous system</b>	The AS to which the peer is assigned. This can be assigned by using the <a href="#">ipv6 bgp neighbor remote-as</a> command.
<b>Neighbor output policy map name</b>	The outbound route map policy for the peer. This can be assigned by using the <a href="#">ipv6 bgp neighbor route-map</a> command.
<b>Neighbor input policy map name</b>	The inbound route map policy for the peer. This can be assigned by using the <a href="#">ipv6 bgp neighbor route-map</a> command.
<b>Neighbor output aspath-list name</b>	The outbound AS path list policy for the peer. This can be assigned by using the <a href="#">ipv6 bgp neighbor out-aspathlist</a> command.

*output definitions (continued)*

---

<b>Neighbor input aspath-list name</b>	The inbound AS path list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor in-<a href="#">aspathlist</a></b> command.
<b>Neighbor output prefix-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor out-<a href="#">prefixlist</a></b> command.
<b>Neighbor input prefix-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor in-<a href="#">prefixlist</a></b> command.
<b>Neighbor output community-list name</b>	The outbound community list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor out-<a href="#">communitylist</a></b> command.
<b>Neighbor input community-list name</b>	The inbound community list policy for the peer. This can be assigned by using the <b>ipv6 bgp neighbor in-<a href="#">communitylist</a></b> command.
<b>Neighbor soft reconfiguration</b>	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the <b>ipv6 bgp neighbor soft-<a href="#">reconfiguration</a></b> command.
<b>Neighbor output prefix6-list name</b>	The outbound prefix6-list policy for the peer. This is configured using the <b>ipv6 bgp neighbor out-<a href="#">prefix6list</a></b> command.
<b>Neighbor input prefix6-list name</b>	The inbound prefix6-list policy for the peer. This is configured using the <b>ipv6 bgp neighbor in-<a href="#">prefix6list</a></b> command.

## show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

**show ipv6 bgp neighbors timers** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the *ipv6\_address* parameter to display the timer value for a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors timers
```

```
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
```

Nbr	address	As	Hold	Hold(C)	RtAdv	Retry	Kalive	Ka(C)
-----	-----	-----	-----	-----	-----	-----	-----	-----
	2001:100:3:4::1	30	90	90	30	120	30	30

### output definitions

---

<b>Nbr address</b>	The IPv6 address for this BGP peer. Assign this address using the <b>ipv6 bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned using the <b>ipv6 bgp neighbor remote-as</b> command.
<b>Hold</b>	The actual negotiated hold time value.
<b>Hold (C)</b>	The hold time value. This value is configured using the <b>ipv6 bgp neighbor timers</b> command.
<b>RtAdv</b>	The route advertisement interval, in seconds, for updates between external BGP peers.
<b>Retry</b>	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured using the <b>ipv6 bgp neighbor timers</b> command.

*output definitions (continued)*

---

<b>Kalive</b>	The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
<b>Ka (C)</b>	The KEEPALIVE interval as configured using the <a href="#">ipv6 bgp neighbor timers</a> command.

---

# 30 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

*Filename*   ALCATEL-IND1-SLB-MIB.mib  
*Module:*    alcatelIND1SLBMIB

A summary of available commands is listed here:

<b>Global SLB Commands</b>	<code>ip slb admin-state</code> <code>ip slb reset statistics</code> <code>show ip slb</code>
<b>SLB Cluster Commands</b>	<code>ip slb cluster</code> <code>ip slb cluster admin-state</code> <code>ip slb cluster ping period</code> <code>ip slb cluster ping timeout</code> <code>ip slb cluster ping retries</code> <code>ip slb cluster probe</code> <code>show ip slb clusters</code> <code>show ip slb cluster</code>
<b>SLB Server Commands</b>	<code>ip slb server ip cluster</code> <code>ip slb server ip cluster probe</code> <code>show ip slb cluster server</code> <code>show ip slb servers</code>
<b>SLB Probe Commands</b>	<code>ip slb probe</code> <code>ip slb probe timeout</code> <code>ip slb probe period</code> <code>ip slb probe port</code> <code>ip slb probe retries</code> <code>ip slb probe username</code> <code>ip slb probe password</code> <code>ip slb probe url</code> <code>ip slb probe status</code> <code>ip slb probe send</code> <code>ip slb probe expect</code> <code>show ip slb probes</code>

## ip slb admin-state

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

**ip slb admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the administrative status for Server Load Balancing on a switch.
<b>disable</b>	Disables the administrative status for Server Load Balancing on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

### Examples

```
-> ip slb admin-state enable
-> ip slb admin-state disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">show ip slb</a>	Displays the status of Server Load Balancing on a switch.
<a href="#">ip slb cluster</a>	Configures a Server Load Balancing cluster on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

```
slbFeatureGroup
  slbAdminStatus
```

---

## ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

**ip slb reset statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

### Examples

```
-> ip slb reset statistics
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**show ip slb clusters** Displays the status and configuration of all Server Load Balancing clusters on a switch.

**show ip slb cluster** Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

### MIB Objects

```
slbFeatureGroup  
  slbResetStatistics
```

---

## ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

**ip slb cluster** *name* {**vip** *ip\_address* / **condition** *string*} [**I3** | **I2**]

**no ip slb cluster** *name*

---

### Syntax Definitions

<i>name</i>	The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”).
<i>ip_address</i>	The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.
<i>string</i>	The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.
<b>I3</b>	Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.
<b>I2</b>	Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the <b>condition</b> parameter.

### Defaults

parameter	default
<b>I3</b>   <b>I2</b>	<b>I3</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers. In addition, do not specify a VIP address that is already in use by an MCLAG VIP interface. The SLB VIP and MCLAG VIP both provide a common IP address but for different entities and should not share the same IP address.
- Specifying the **I3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin-state** command to enable this feature.

---

**Note.** It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

---

## Examples

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond 12
-> ip slb cluster cluster_2 condition slb_cond 13
-> no ip slb cluster hr_servers
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb admin-state</b>	Enables or disables Server Load Balancing on a switch.
<b>ip slb server ip cluster</b>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

slbClusterTable
  slbClusterName
  slbClusterVIP
  slbClusterRowStatus
  slbClusterPackets
  slbClusterCondition
  slbClusterType
```

---

## ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

```
ip slb cluster cluster_name admin-state {enable | disable}
```

---

### Syntax Definitions

<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
<b>enable</b>	Administratively enables a Server Load Balancing cluster on a switch.
<b>disable</b>	Administratively disables a Server Load Balancing cluster on a switch.

### Defaults

By default, a cluster is administratively enabled when the cluster is created.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

### Examples

```
-> ip slb cluster hr_servers admin-state enable
-> ip slb cluster "mail servers" admin-state disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

```
slbClusterTable
  slbClusterAdminStatus
```

---

## ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing (SLB) cluster.

**ip slb cluster** *cluster\_name* **ping period** *seconds*

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>seconds</i>	The number of seconds for the ping period. Specifying 0 (zero) disables the ping.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the [ip slb cluster ping timeout](#) command to modify the ping timeout value.

### Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb cluster ping timeout</b>	Modifies the ping timeout value.
<b>ip slb cluster ping retries</b>	Modifies the number of ping retries.

## MIB Objects

```
slbClusterTable  
  slbClusterPingPeriod
```

---

## ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

**ip slb cluster** *cluster\_name* **ping timeout** *milliseconds*

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>milliseconds</i>	The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

### Defaults

---

parameter	default
<i>milliseconds</i>	3000

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the [ip slb cluster ping period](#) command to modify the ping period value.

### Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb cluster ping period</b>	Modifies the ping period value.
<b>ip slb cluster ping retries</b>	Modifies the number of ping retries.

## MIB Objects

slbClusterTable  
slbClusterPingTimeout

---

## ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

**ip slb cluster** *cluster\_name* **ping retries** *count*

---

### Syntax Definitions

*cluster\_name*                      The name of the Server Load Balancing cluster.  
*count*                                The number of ping retries.

### Defaults

parameter	default
<i>count</i>	3

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**show ip slb clusters**                Displays the status and configuration of all Server Load Balancing clusters on a switch.

**show ip slb cluster**                Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

**ip slb cluster ping timeout**       Modifies the ping timeout value.

### MIB Objects

slbClusterTable  
 slbClusterPingRetries

---

## ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name probe probe_name
```

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>probe_name</i>	The name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

### Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">ip slb probe</a>	Configures and deletes SLB probes.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

```
slbClusterTable  
  slbClusterProbeName
```

---

## ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

**ip slb server ip** *ip\_address* **cluster** *cluster\_name* [**admin-state** {**enable** | **disable**}] [**weight** *weight*]

**no ip slb server ip** *ip\_address* **cluster** *cluster\_name*

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
<b>enable</b>	Enables a server.
<b>disable</b>	Disables a server.
<i>weight</i>	Specifies the weight of the server.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>
<b>weight</b>	<b>1</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a physical server from a Server Load Balancing cluster.
- Use the **weight** parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.
- A higher weight value indicates that the server can accept more network traffic.

### Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable
weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers
```

## Release History

```

---

## ip slb server ip cluster probe

Configures a probe for a Server Load Balancing (SLB) server.

```
ip slb server ip ip_address cluster cluster_name probe probe_name
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of the Server Load Balancing cluster.
<i>probe_name</i>	The name of the Server Load Balancing probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

### Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers probe p_http
```

### Release History

Release 7.1.1; command introduced.

```

---

## ip slb probe

Configures a Server Load Balancing (SLB) probe used to check the health of servers or clusters.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
```

```
no ip slb probe probe_name
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to delete an SLB probe.

### Examples

```
-> ip slb probe mail_server_probe smtp  
-> no ip slb probe mail_server_probe
```

### Release History

Release 7.1.1; command introduced.

## ip slb probe port

Configures the TCP/UDP port on which the Server Load Balancing (SLB) probe is sent.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
port port_number
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>port_number</i>	Specifies the TDP/UDP port number.

### Defaults

parameter	default
<i>port_number</i>	0

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mis_server udp port 200
```

### Release History

Release 7.1.1; command introduced.

---

## ip slb probe password

Configures a password that is sent to a server as credentials for an HTTP GET to verify the health of the server.

```
ip slb probe probe_name {http | https} password password
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>password</i>	Specifies the password.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The password is encrypted in the configuration file so that it is not readable.

### Examples

```
-> ip slb probe web_server http password h1f45xc
```

### Release History

Release 7.1.1; command introduced.

## show ip slb

Displays the status of Server Load Balancing on a switch.

**show ip slb**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip slb
```

```
Admin status           : Enabled,  
Operational status    : In Service,  
Number of clusters    = 3
```

Output fields are described here:

#### *output definitions*

---

<b>Admin status</b>	The current administrative status of Server Load Balancing (SLB) on this switch ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational status</b>	The current operational status of Server Load Balancing (SLB) on this switch, which is either <b>In service</b> (at least one SLB cluster is in service) or <b>Out of service</b> (all SLB clusters are out of service).
<b>Number of clusters</b>	The total number of Server Load Balancing (SLB) clusters on this switch.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">show ip slb servers</a>	Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.
<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">show ip slb cluster server</a>	Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster.

## MIB Objects

```
slbFeature  
  slbAdminStatus  
  slbOperStatus  
  slbClustersCount
```

---

## show ip slb clusters

Displays the status and basic configuration for all Server Load Balancing (SLB) clusters on a switch. This command also displays traffic statistics for QoS policy condition clusters.

**show ip slb clusters [statistics]**

---

### Syntax Definitions

**statistics** Displays SLB statistics for QoS policy condition clusters.

### Defaults

By default, the status and basic configuration for all clusters is displayed; statistics are not shown.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to clusters because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below.

### Examples

```
-> show ip slb clusters
```

Cluster Name	VIP/COND	Admin Status	Operational Status	# Srv	% Avail
WorldWideWeb	128.241.130.204	Enabled	In Service	3	95
Intranet	128.241.130.205	Enabled	In Service	2	100
FileTransfer	128.241.130.206	Enabled	Out of Service	2	50

Output fields are described here:

#### *output definitions*

---

<b>Cluster Name</b>	The name of the SLB cluster.
<b>VIP/COND</b>	The virtual IP (VIP) address or the policy condition name for the SLB cluster.
<b>Admin Status</b>	The administrative status of the SLB cluster ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational Status</b>	The operational status of the SLB cluster; <b>In Service</b> (at least one physical server is operational in the cluster) or <b>Out of Service</b> .
<b># Srv</b>	The total number of physical servers that belong to the SLB cluster.
<b>% Avail</b>	The percentage of time that the physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.

---

```
-> show ip slb clusters statistics
```

Cluster Name	Admin Status	Operational Status	Count
Cluster1	Enabled	In Service	4 Servers
Cluster2	Enabled	In Service	4 Servers
Dst IP 101.113.113.1/255.255.255.255			4503911
Src IP 202.202.1.0/255.255.255.0			6527831
Src Port 2/49			

### output definitions

<b>Cluster Name</b>	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
<b>Admin Status</b>	The administrative state of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational Status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Count</b>	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.
<b>Dst</b>	The destination Virtual IP address assigned to the cluster.
<b>Src</b>	Source IP address assigned to the cluster.
<b>Src Port</b>	Source slot and port number of the SLB cluster.

## show ip slb cluster

Displays detailed statistics and configuration information and operational status for a single Server Load Balancing (SLB) cluster. This command also displays traffic statistics for single QoS policy condition cluster.

**show ip slb cluster** *name* [*statistics*]

---

### Syntax Definitions

*name* Specifies the name of the SLB cluster.  
*statistics* Displays SLB statistics for the specified cluster.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to the cluster because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below:

### Examples

```
-> show ip slb cluster Intranet
```

```
Cluster Intranet
VIP                : 128.241.130.204,
Type               : L3
Admin status       : Enabled,
Operational status : In Service,
Ping period (seconds) = 60,
Ping timeout (milliseconds) = 3000,
Ping retries       : 3,
Probe              : None,
Number of packets  : 25346,
Number of servers  : 3
  Server 128.241.130.107
    Admin status = Enabled, Operational status = In Service,
    Weight = 4, Availability (%) = 0
  Server 128.241.130.117
    Admin status = Enabled, Operational status = Discovery,
    Weight = 6, Availability (%) = 0
  Server 128.241.130.127
    Admin status = Enabled, Operational status = Discovery,
    Weight = 1, Availability (%) = 0
```

*output definitions*

---

<b>Cluster</b>	The name of this Server Load Balancing (SLB) cluster.
<b>VIP</b>	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
<b>Type</b>	The classifier for the hypothetical packet, which can be <b>L2</b> or <b>L3</b> .
<b>Admin status</b>	The current administrative status of this Server Load Balancing (SLB) cluster ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational status</b>	The current operational status of this Server Load Balancing (SLB) cluster, which is <b>In Service</b> (at least one physical server is operational in the cluster) or <b>Out of Service</b> .
<b>Ping period (seconds)</b>	The ping period (in seconds) used by this Server Load Balancing (SLB) cluster to check the health of physical servers.
<b>Ping timeout (milliseconds)</b>	The timeout (in milliseconds) used by this Server Load Balancing (SLB) cluster to wait for ping answers from physical servers.
<b>Ping retries</b>	The number of ping retries that this Server Load Balancing (SLB) cluster executes before switching the status to <b>No answer</b> .
<b>Probe</b>	The probe configured for this cluster.
<b>Number of packets</b>	The number of packets balanced for this Server Load Balancing (SLB) cluster.
<b>Number of servers</b>	The total number of physical servers that belong to this Server Load Balancing (SLB) cluster.
<b>Server</b>	The IP address for this physical server.
<b>Admin Status</b>	The administrative state of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational Status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Availability (%)</b>	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.

---

```
-> show ip slb cluster Intranet statistics
```

Cluster Name	Admin Status	Operational Status	Count
Intranet	Enabled	In Service	3 Servers
Src IP 15.2.3.2/255.255.255.255			195
Src Port 1/4			

### output definitions

<b>Cluster Name</b>	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
<b>Admin status</b>	The current administrative status of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Oper status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Count</b>	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.

## show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

**show ip slb cluster** *name* **server** *ip\_address*

---

### Syntax Definitions

*name* Specifies the name of the SLB cluster.  
*ip\_address* Specifies the IP address for the physical server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Specifying a value for the *name* and *ip\_address* parameters is required.

### Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster c11
  VIP 128.220.40.205
  Server 128.220.40.4
    Admin status           : Enabled,
    Oper status            : In Service,
    Probe                  = phttp,
    Availability time (%)  = 95,
    Ping failures          = 0,
    Last ping round trip time (milliseconds) = 20,
    Probe status           = ,
```

Output fields are described here:

#### *output definitions*

## show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

**show ip slb probes** [*probe\_name*]

---

### Syntax Definitions

*probe\_name* Specifies the name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes are displayed.

### Examples

No probe name is specified:

```
-> show ip slb probes
```

Probe Name	Period	Retries	Timeout	Method
web_server	60000	3	12000	HTTP
mail_server	60000	3	3000	SMTP
mis_servers	3600000	5	24000	Ping

Output fields are described here:

#### *output definitions*

---

<b>Probe Name</b>	The user-specified name of the probe.
<b>Period</b>	The period (in seconds) to check the health of servers.
<b>Retries</b>	The number of probe retries before deciding that a server is out of service.
<b>Timeout</b>	The timeout (in seconds) used to wait for probe answers.
<b>Method</b>	The type of probe.

---

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server
```

```
Probe mail_server
  Type                = SMTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries             = 3,
  Port                = 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp
```

```
Probe phttp
  Type                = HTTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries             = 3,
  Port                = 0,
  Username            = ,
  Password            = ,
  Expect              = ,
  Status              = 200,
  URL                 = /,
```

Output fields are described here:

### *output definitions*

---

<b>Probe</b>	The user-specified name of the probe.
<b>Type</b>	The type of probe.
<b>Period</b>	The period (in seconds) to check the health of servers.
<b>Timeout</b>	The timeout (in seconds) used to wait for probe answers.
<b>Retries</b>	The number of probe retries before deciding that a server is out of service.
<b>Port</b>	The TCP/UDP port on which the probe is sent.
<b>Username</b>	The configured user name sent to a server as credentials for an HTTP GET operation for the probe.
<b>Password</b>	The configured password for the probe.
<b>Expect</b>	The configured ASCII string used to compare a response from a server to verify the health of the server.
<b>Status</b>	The expected status returned from an HTTP GET to verify the health of a server.
<b>URL</b>	The configured URL sent to a server for an HTTP GET to verify the health of the server.

---

# 31 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

The OmniSwitch IPMS software is compatible with the following RFCs:

- RFC 1112 — Host Extensions for IP Multicasting
- RFC 2236 — Internet Group Management Protocol, Version 2
- RFC 2933 — Internet Group Management Protocol MIB
- RFC 3376 — Internet Group Management Protocol, Version 3

The OmniSwitch IPv6MS software is compatible with the following RFCs:

- RFC 2710 — Multicast Listener Discovery for IPv6
- RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
- RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS and IPv6MS commands is as follows:

*Filename:* ALCATEL-IND1-IPMS-MIB.mib  
*Module:* alcatelIND1IpmsMIB

The following table summarizes the available IP and IPv6 multicast commands:

<b>ip multicast admin-state</b>	<b>ipv6 multicast admin-state</b>
<b>ip multicast flood-unknown</b>	<b>ipv6 multicast flood-unknown</b>
<b>ip multicast version</b>	<b>ipv6 multicast version</b>
<b>ip multicast port max-group</b>	<b>ipv6 multicast port max-group</b>

<b>show ip multicast profile</b>	<b>show ipv6 multicast profile</b>

## ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **admin-state** [**enable** | **disable**]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **admin-state**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>service_id</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767.
<b>enable</b>	Enable IP Multicast Switching and Routing.
<b>disable</b>	Disable IP Multicast Switching and Routing.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The configuration of an IPv4 multicast routing protocol on an IP interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.
- If there is no IP Multicast routing protocol already running on the switch, then the **ip multicast admin-state** command alone controls IPMS operations.
- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If IPMS is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

---

**Note.** Globally enabling or disabling the IPMS status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPMS must be explicitly enabled or disabled for each SPB service.

---

- Use the **no** form of this command to restore the IP Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

## Examples

```
-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> no ip multicast admin-state
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 3-5 admin-state disable
-> no ip multicast vlan 2 admin-state
-> no ip multicast vlan 3-5 admin-state
-> ip multicast service 10 admin-state enable
-> ip multicast service 11-15 admin-state disable
-> no ip multicast service 10 admin-state
-> no ip multicast service 11-15 admin-state
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigStatus
```

---

## ip multicast flood-unknown

Enables or disables the flooding unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **flood-unknown** [**enable** | **disable**]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **flood-unknown**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable flooding of unknown traffic until it is learned.
<b>disable</b>	Disable flooding of unknown traffic.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- If the flooding of unknown traffic is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- When IPv4 multicast snooping is used with services on an OmniSwitch 6860 and OmniSwitch 6900, the flood unknown behavior is unconditionally enforced for all snooping services.
- IPv4 multicast snooping does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled.
- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the **no** form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system or the specified VLAN.

## Examples

```
-> ip multicast flood-unknown enable
-> ip multicast flood-unknown disable
-> no ip multicast flood-unknown
-> ip multicast vlan 100 flood-unknown enable
-> ip multicast vlan 101-105 flood-unknown enable
-> ip multicast vlan 100 flood-unknown disable
-> no ip multicast vlan 100 flood-unknown
-> no ip multicast vlan 101-105 flood-unknown
-> ip multicast service 10 flood-unknown enable
-> ip multicast service 11-15 flood-unknown enable
-> ip multicast service 10 flood-unknown disable
-> no ip multicast service 10 flood-unknown
-> no ip multicast service 11-15 flood-unknown
```

## Release History

Release 8.3.1; command introduced.

Release 8.4.1.R02; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```

  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigFloodUnknown
```

---

## ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **version** [*version*]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **version**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>version</i>	Default IGMP protocol version to run. Valid range is 1–3.

### Defaults

parameter	default
<i>version</i>	2

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs or SPB services.
- If the default IGMP protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- Use the **no** form of this command to restore the IGMP multicast version back to the default value (version 2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip multicast version 0).

### Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> no ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 3-5 version 3
-> ip multicast vlan 2 version 0
-> no ip multicast vlan 2 version
-> no ip multicast vlan 3-5 version
-> ip multicast service 2 version 3
-> ip multicast service 3-5 version 3
```

```
-> ip multicast service 2 version 0
-> no ip multicast service 2 version
-> no ip multicast service 3-5 version
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```

  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigVersion
```

---

## ip multicast port max-group

Configures the maximum group limit learned per port or per Service Access Point (SAP) port. The group limit is applicable to all VLAN instances associated with the specified port or all Shortest Path Bridging (SPB) service instances associated with the specified SAP port.

**ip multicast** {**port** *chassis/slot/port* | **sap port** *sap\_id*} **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).
<i>num</i>	The maximum IGMP group count. Valid range is 0–4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group.

### Defaults

By default, the maximum group limit is set to zero.

parameter	defaults
<b>action</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
  - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
  - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast sap port 1/1/23:10 max-group 10 action drop, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is

tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

- IGMP zapping must be enabled when the maximum group limit is enabled and the action is set to drop.
- Configuring a maximum group limit is allowed even when the IP multicast status is disabled.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

## Examples

```
-> ip multicast port 1/1/12 max-group 10 action drop
-> ip multicast port 1/1/14 max-group 20 action replace
-> ip multicast port 1/1/14 max-group

-> ip multicast sap port 1/1/23:10 max-group 10 action drop
-> ip multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ip multicast sap port 1/1/16:20.200 max-group
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.4.1; **sap port** parameter added.

## ip multicast max-group

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>num</i>	The maximum IGMP group count. Valid range is 0–4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the maximum group limit is set to zero.

parameter	defaults
<b>action</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- If an SPB service is specified, this command configures the maximum group limit learned per SAP port on a service. The limit is applied to each SAP port that is a member of the given SPB service.
- Configuring a maximum group value will have no effect on existing group memberships until the memberships are refreshed on the port/VLAN or SAP port/SPB service instance
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a VLAN or SPB service will override the global configuration.

- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is to drop incoming membership requests.

## Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 20 max-group action drop
-> ip multicast vlan 11-15 max-group 10 action replace
-> ip multicast vlan 10 max-group
-> ip multicast vlan 11-15 max-group
-> ip multicast service 5 max-group 10 action drop
-> ip multicast service 20 max-group action drop
-> ip multicast service 10-15 max-group 10 action replace
-> ip multicast service 5 max-group
-> ip multicast service 10-15 max-group
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## ip multicast static-neighbor

Creates a static IGMP neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

**ip multicast static-neighbor vlan** *vlan\_id* {**port** *chassis/slot/port* | **linkagg** *agg\_id*}

**ip multicast static-neighbor service** *service\_id* **sap** {**port** | **linkagg**} {*sap\_id*}

**no ip multicast static-neighbor vlan** *vlan\_id* {**port** *chassis/slot/port* | **linkagg** *agg\_id*}

**no ip multicast static-neighbor service** *service\_id* **sap** {**port** | **linkagg**} {*sap\_id*}

---

### Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static IGMP neighbor.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static IGMP neighbor.
<i>agg_id</i>	The link aggregate ID number to configure as a static IGMP neighbor.
<i>service_id</i>	SPB service ID to include as a static IGMP neighbor. The valid range is 1–32767.
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic *and* IPv4 multicast traffic.
- To create an IGMP static neighbor entry on a link aggregate, use the **linkagg** parameter (for example, **ip multicast static-neighbor vlan 2 linkagg 7** or **ip multicast static-neighbor service 10 sap linkagg 10:100**).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast static-neighbor service 10 sap port 1/1/23:10**, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

## Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1/5
-> no ip multicast static-neighbor vlan 4 port 1/1/5
-> ip multicast static-neighbor vlan 4 linkagg 7
-> no ip multicast static-neighbor vlan 4 linkagg 7

-> ip multicast static-neighbor service 10 sap port 1/1/2:100
-> no ip multicast static-neighbor service 10 sap port 1/1/2:100
-> ip multicast static-neighbor service 10 sap linkagg 10:100
-> no ip multicast static-neighbor service 10 sap linkagg 10:100
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **linkagg** parameter was introduced.

Release 8.4.1; **service** and **sap** parameters added.

## Related Commands

**show ip multicast neighbor** Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

## MIB Objects

```
alaIpmsStaticNeighborTable
  alaIpmsStaticNeighborConfigType
  alaIpmsStaticNeighborAddressType
  alaIpmsStaticNeighborValue
  alaIpmsStaticNeighborIfIndex
  alaIpmsStaticNeighborSubValue
  alaIpmsStaticNeighborRowStatus
```

---

## ip multicast static-querier

Creates a static IGMP querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

```
ip multicast static-querier vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
ip multicast static-querier service service_id sap {port | linkagg} {sap_id}
```

```
no ip multicast static-querier vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
no ip multicast static-querier service service_id sap {port | linkagg} {sap_id}
```

---

### Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static IGMP querier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static IGMP querier.
<i>agg_id</i>	The link aggregate ID number to configure as a static IGMP querier.
<i>service_id</i>	SPB service ID to include as a static IGMP querier. The valid range is 1–32767.
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic.
- To create an IGMP static querier entry on a link aggregate, use the **linkagg** parameter (for example, **ip multicast static-querier vlan 2 linkagg 7** or **ip multicast static-querier service 10 sap linkagg 10:100**).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast static-querier service 10 sap port 1/1/23:10**, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

## Examples

```
-> ip multicast static-querier vlan 4 port 1/1/2
-> no ip multicast static-querier vlan 4 port 1/1/2
-> ip multicast static-querier vlan 4 linkagg 7
-> no ip multicast static-querier vlan 4 linkagg 7

-> ip multicast static-querier service 10 sap port 1/1/2:100
-> no ip multicast static-querier service 10 sap port 1/1/2:100
-> ip multicast static-querier service 10 sap linkagg 10:100
-> no ip multicast static-querier service 10 sap linkagg 10:100
```

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.1; **linkagg** parameter was added.  
Release 8.4.1; **service** and **sap** parameters added.

## Related Commands

**show ip multicast querier** Displays the IGMP querier table entries of IP Multicast Switching and Routing.

## MIB Objects

```
alaIpmsStaticQuerierTable
  alaIpmsStaticQuerierConfigType
  alaIpmsStaticQuerierAddressType
  alaIpmsStaticQuerierValue
  alaIpmsStaticQuerierIfIndex
  alaIpmsStaticQuerierSubValue
  alaIpmsStaticQuerierRowStatus
```

---

## ip multicast static-group

Creates a static IGMP group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

```
ip multicast static-group ip_address vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
ip multicast static-group ip_address service service_id sap {port | linkagg} {sap_id}
```

```
no ip multicast static-group ip_address vlan vlan_id {port chassis/slot/port | linkagg agg_id}
```

```
no ip multicast static-group ip_address service service_id sap {port | linkagg} {sap_id}
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the multicast group.
<i>vlan_id</i>	VLAN to include as a static IGMP group.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static IGMP group.
<i>agg_id</i>	The link aggregate ID number to configure as a static IGMP group.
<i>service_id</i>	SPB service ID to include as a static IGMP group. The valid range is 1–32767.
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- To create an IGMP static group entry on a link aggregate, use the **linkagg** parameter (for example, `ip multicast static-group 225.0.0.1 vlan 2 linkagg 7` or `ip multicast static-group 225.0.0.1 service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ip multicast static-querier service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

## Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
-> no ip multicast static-group 225.11.11.11 vlan 4 linkagg 7

-> ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> no ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
-> no ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
```

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.1; **linkagg** parameter was added.  
Release 8.4.1; **service** and **sap** parameters added.

## Related Commands

**show ip multicast group** Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

## MIB Objects

```
alaIgmStaticMemberTable
  alaIpmsStaticMemberConfigType
  alaIpmsStaticMemberAddressType
  alaIpmsStaticMemberValue
  alaIpmsStaticMemberIfIndex
  alaIpmsStaticMemberSubValue
  alaIpmsStaticMemberGroupAddress
  alaIpmsStaticMemberRowStatus
```

---

## ip multicast query-interval

Sets the IGMP query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*] **query-interval** [*seconds*]

**no ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*] **query-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	IGMP query interval in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	125

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP query interval to use.
- Use the **no** form of this command to restore the IGMP query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast query-interval 0**).

### Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> no ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
-> ip multicast vlan 3-5 query-interval 100
-> ip multicast vlan 2 query-interval 0
```

```
-> no ip multicast vlan 2 query-interval
-> no ip multicast vlan 3-5 query-interval
-> ip multicast service 2 query-interval 100
-> ip multicast service 3-5 query-interval 100
-> ip multicast service 2 query-interval 0
-> no ip multicast service 2 query-interval
-> no ip multicast service 3-5 query-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

---

## ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **last-member-query-interval** [*tenths\_of\_seconds*]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **last-member-query-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>tenths_of_seconds</i>	IGMP last member query interval in tenths of seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>tenths_of_seconds</i>	10

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- Use the **no** form of this command to restore the IGMP last member query interval back to the default value (10 tenth-of-seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast last-member-query-interval 0**).

### Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> no ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
-> ip multicast vlan 3-5 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
```

```
-> no ip multicast vlan 2 last-member-query-interval
-> no ip multicast vlan 3-5 last-member-query-interval
-> ip multicast service 2 last-member-query-interval 22
-> ip multicast service 3-5 last-member-query-interval 22
-> ip multicast service 2 last-member-query-interval 0
-> no ip multicast service 2 last-member-query-interval
-> no ip multicast service 3-5 last-member-query-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ip multicast](#)

  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigLastMemberQueryInterval
```

---

## ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id*] **query-response-interval** [*tenths\_of\_seconds*]

**no ip multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id*] **query-response-interval**

---

### Syntax Definitions

<i>vlan_id[-vlan_id2]</i>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id[-service_id2]</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>tenths_of_seconds</i>	IGMP query response interval in tenths of seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>tenths_of_seconds</i>	100

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- Use the **no** form of this command to restore the IGMP query response interval back to the default value (100 tenths-of-seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast query-response-interval 0**).

### Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> no ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 3-5 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
-> no ip multicast vlan 2 query-response-interval
-> no ip multicast vlan 3-5 query-response-interval
```

```
-> ip multicast service 2 query-response-interval 300
-> ip multicast service 3-5 query-response-interval 300
-> ip multicast service 2 query-response-interval 0
-> no ip multicast service 2 query-response-interval
-> no ip multicast service 3-5 query-response-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

```

---

## ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **unsolicited-report-interval** [*seconds*]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **unsolicited-report-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>vlan_id</i>	VLAN on which to apply the configuration.
<i>service_id</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767.
<i>seconds</i>	IGMP unsolicited report interval in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- Use the **no** form of this command to restore the IGMP unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast unsolicited-report-interval 0**).

### Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> no ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
```

```
-> ip multicast vlan 3-5 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
-> no ip multicast vlan 2 unsolicited-report-interval
-> no ip multicast vlan 3-5 unsolicited-report-interval
-> ip multicast service 2 unsolicited-report-interval 300
-> ip multicast service 3-5 unsolicited-report-interval 300
-> ip multicast service 2 unsolicited-report-interval 0
-> no ip multicast service 2 unsolicited-report-interval
-> no ip multicast service 3-5 unsolicited-report-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **router-timeout** [*seconds*]

**no ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **router-timeout**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	IGMP router timeout in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the IGMP router timeout back to the default value (90 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast router-timeout 0**).

### Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> no ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 3-5 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> no ip multicast vlan 2 router-timeout
-> no ip multicast vlan 3-5 router-timeout
-> ip multicast service 2 router-timeout 100
-> ip multicast service 3-5 router-timeout 100
-> ip multicast service 2 router-timeout 0
-> no ip multicast service 2 router-timeout
```

-> no ip multicast service 3-5 router-timeout

## Release History

Release 7.1.1; command was introduced.  
Release 8.4.1.R02; **service** parameter added.

## ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **source-timeout** [*seconds*]

**no ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **source-timeout**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	IGMP source timeout in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the IGMP source timeout back to the default value (30 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast source-timeout 0**).

### Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> no ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 3-5 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> no ip multicast vlan 2 source-timeout
-> no ip multicast vlan 3-5 source-timeout 100
-> ip multicast service 2 source-timeout 100
-> ip multicast service 3-5 source-timeout 100
-> ip multicast service 2 source-timeout 0
-> no ip multicast service 2 source-timeout
```

-> no ip multicast service 3-5 source-timeout

## Release History

---

## ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [vlan *vlan\_id*[-*vlan\_id2*]] **querying** {**enable** | **disable**} [**static-source-ip** *ip\_address*]

**no ip multicast** [vlan *vlan\_id*[-*vlan\_id2*]] **querying** [**static-source-ip**]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<b>enable</b>	Enable IGMP querying.
<b>disable</b>	Disable IGMP querying.
<i>ip_address</i>	A static source IPv4 address to use for IGMP querying. <i>This parameter is currently not supported.</i>

### Defaults

parameter	default
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- Use the **no** form of this command to restore the IGMP querying status to the default value (disabled) on the system or the specified VLAN.

### Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> no ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 3-5 querying disable
-> no ip multicast vlan 2 querying
-> no ip multicast vlan 3-5 querying
```

## Release History

Release 7.1.1; command was introduced.

Release 8.3.1.R02; **static-source-ip** parameter added.

## Related Commands

### [show ip multicast](#)

  alaIpmsConfigQueryingStaticSourceAddress
```

---

## ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **robustness** [*robustness*]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **robustness**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>robustness</i>	IGMP robustness variable. Valid range is 1–7.

### Defaults

parameter	default
<i>robustness</i>	2

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs or SPB services.
- If the IGMP robustness variable is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP robustness variable to use.
- Use the **no** form of this command to restore the IGMP robustness variable back to the default value (2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip multicast robustness 0).

### Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> no ip multicast robustness
-> ip multicast vlan 2 robustness 3
-> ip multicast vlan 3-5 robustness 3
-> ip multicast vlan 2 robustness 0
```

```
-> no ip multicast vlan 2 robustness
-> no ip multicast vlan 3-5 robustness
-> ip multicast service 2 robustness 3
-> ip multicast service 3-5 robustness 3
-> ip multicast service 2 robustness 0
-> no ip multicast service 2 robustness
-> no ip multicast service 3-5 robustness
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigRobustness
```

---

## ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id[-service\_id2]*] **spoofing** {**enable** | **disable**}

**no ip multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id[-service\_id2]*] **spoofing**

---

### Syntax Definitions

<i>vlan_id[-vlan_id2]</i>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id[-service_id2]</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable IGMP spoofing.
<b>disable</b>	Disable IGMP spoofing.

### Defaults

parameter	default
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing configuration and return the specified VLAN, SPB service, or system to the default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- By default, the source IP address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IP address using the **ip multicast spoofing static-source-ip** command to overcome the need for an IP interface. If configured, the static source IP is always used for spoofing, regardless of the IP interface address or administrative state.

### Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> no ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
-> ip multicast vlan 3-5 spoofing disable
-> no ip multicast vlan 2 spoofing
```

```
-> no ip multicast vlan 3-5 spoofing
-> ip multicast service 2 spoofing enable
-> ip multicast service 3-5 spoofing disable
-> no ip multicast service 2 spoofing
-> no ip multicast service 3-5 spoofing
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.4.1.R02; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigSpoofing
```

---

## ip multicast spoofing static-source-ip

Configures an IGMP static spoofing address on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] spoofing static-source-ip  
ip_address
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] spoofing static-source-ip
```

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>ip_address</i>	A static source IPv4 address to use for spoofing.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a static source IP address.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- By default, a source IP address is not specified when spoofing is enabled. As a result, the switch will automatically use the address of the IP interface associated with the LAN. If there is no IP interface address to use, the switch will then use the Loopback0 interface address associated with the current VRF instance.
- Use this command to optionally configure a static source IP address to overcome the need for an IP interface. If configured, the static source IP is always used for spoofing, regardless of the IP interface address or administrative state.

### Examples

```
-> ip multicast spoofing static-source-ip 10.2.2.1  
-> no ip multicast spoofing static-source-ip  
-> ip multicast vlan 2 spoofing static-source-ip 10.2.2.1  
-> ip multicast vlan 3-5 spoofing static-source-ip 10.2.2.1  
-> no ip multicast vlan 2 spoofing static-source-ip  
-> no ip multicast vlan 3-5 spoofing static-source-ip  
-> ip multicast service 2 spoofing static-source-ip 11.2.2.1  
-> no ip multicast service 2 spoofing static-source-ip  
-> ip multicast service 3-5 spoofing static-source-ip 11.2.2.1
```

-> no ip multicast service 3-5 spoofing static-source-ip

## Release History

Release 8.3.1.R02; command was added.

---

## ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*] zapping [{enable | disable}]**

**no ip multicast [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] zapping**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable IGMP zapping.
<b>disable</b>	Disable IGMP zapping.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- Use the **no** form of this command to restore the IGMP zapping status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> no ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 3-5 zapping disable
-> no ip multicast vlan 2 zapping
-> no ip multicast vlan 3-5 zapping
-> ip multicast service 2 zapping enable
-> ip multicast service 3-5 zapping disable
-> no ip multicast service 2 zapping
-> no ip multicast service 3-5 zapping
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

  alaIpmsConfigZapping
```

---

## ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id[-service\_id2]*] **querier-forwarding** [**enable** | **disable**]

**no ip multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id[-service\_id2]*] **querier-forwarding**

---

### Syntax Definitions

<i>vlan_id[-vlan_id2]</i>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id[-service_id2]</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable IGMP querier forwarding.
<b>disable</b>	Disable IGMP querier forwarding.

### Defaults

parameter	default
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the IGMP querier forwarding is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.
- Use the **no** form of this command to restore the IGMP querier forwarding status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> no ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 3-5 querier-forwarding disable
-> no ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 3-5 querier-forwarding
-> ip multicast service 2 querier-forwarding enable
-> ip multicast service 3-5 querier-forwarding disable
-> no ip multicast service 2 querier-forwarding
-> no ip multicast service 3-5 querier-forwarding
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

alaIpmsConfigTable

    alaIpmsConfigType

    alaIpmsConfigAddressType

    alaIpmsConfigValue

    alaIpmsConfigQuerierForwarding

---

## ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **proxying** [**enable** | **disable**]

**no ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **proxying**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable IGMP proxying.
<b>disable</b>	Disable IGMP proxying.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- Proxy reported IGMP packets are sent using the source MAC address of the proxying switch. Unless the spoofing feature is used, proxy reported IGMP packets will be sent using 0.0.0.0 for the IPv4 source address.
- Use the **no** form of this command to restore the IGMP proxying status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> no ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 3-5 proxying disable
-> no ip multicast vlan 2 proxying
-> no ip multicast vlan 3-5 proxying
-> ip multicast service 2 proxying enable
```

```
-> ip multicast service 3-5 proxying disable
-> no ip multicast service 2 proxying
-> no ip multicast service 3-5 proxying
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigProxying
```

---

## ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host Reports and Leave messages are sent.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **helper-address** *ip\_address*

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **helper-address**

---

### Syntax Definitions

*vlan\_id*[-*vlan\_id2*]                      VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.

*ip\_address*                                      The IP address of the relay host.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- An operational IPv4 interface is required for the receiving LAN before any IGMP Reports and Leave messages can be relayed.
- Configuring a destination IP helper address is supported only in the VLAN domain; the service domain is not supported.
- Use the **no** form of this command to restore the IPMS reporting feature back to the default value (IP address 0.0.0.0) on the system. When the IP address is set to 0.0.0.0, the IPMS reporting feature is disabled.

### Examples

```
-> ip multicast helper-address 10.1.1.198
-> no ip multicast helper-address
-> ip multicast vlan 2 helper-address 10.1.1.198
-> ip multicast vlan 3-5 helper-address 10.1.1.198
-> no ip multicast vlan 2 helper-address
-> no ip multicast vlan 3-5 helper-address
```

### Release History

Release 7.1.1; command was introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## ip multicast zero-based-query

Configures the use of an all-zero source IPv4 address for IGMP query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **zero-based-query** [**enable** | **disable**]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **zero-based-query**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable IGMP zero-based querying.
<b>disable</b>	Disable IGMP zero-based querying.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The IGMP zero-based query status set for a specific VLAN or SPB service overrides the zero-based query status set for the system.
- Use the **no** form of this command to restore the IGMP zero-based query status back to the default value (enabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ip multicast zero-based-query enable
-> ip multicast zero-based-query disable
-> no ip multicast zero-based-query
-> ip multicast vlan 2 zero-based-query enable
-> ip multicast vlan 3-5 zero-based-query disable
-> no ip multicast vlan 2 zero-based-query
-> no ip multicast vlan 3-5 zero-based-query
-> ip multicast service 10 zero-based-query enable
-> ip multicast service 10-15 zero-based-query disable
-> no ip multicast service 10 zero-based-query
-> no ip multicast service 10-15 zero-based-query disable
```

## Release History

    alaIpmsConfigZeroBasedQuery

---

## ip multicast forward-mode

Configures the Layer 2 forwarding mode for IPv4 Multicast Switching (does not apply to IPv4 Multicast Routing). The forwarding mode is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] forward-mode {asm | ssm | mac | auto}
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] forward-mode
```

---

### Syntax Definitions

<code>vlan_id[-vlan_id2]</code>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<code>service_id[-service_id2]</code>	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>asm</b>	Sets the IPMS forwarding mode to ASM (the bridge lookup is based on the packet group destination IP address). <i>This parameter is supported only in the VLAN domain; service domain is not supported.</i>
<b>ssm</b>	Sets the IPMS forwarding mode to SSM (the bridge lookup is based on the packet source IP as well as the group destination IP). <i>This parameter is supported only in the VLAN domain; service domain is not supported.</i>
<b>mac</b>	Sets the IPMS forwarding mode to MAC address (the bridge lookup is based on the MAC destination address).
<b>auto</b>	Automatically determines the IPMS forwarding mode based on the current IGMP protocol version and the existing protocol state.

### Defaults

By default, the forwarding mode is set to automatic.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The forwarding mode set for a specific VLAN or SPB service overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
  - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
  - Multicast routing is not supported on the OmniSwitch 6560.
  - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.

- Use the **no** form of this command to restore the Layer 2 forwarding mode back to the default value (automatic) on the system or the specified VLAN or SPB service.

## Examples

```
-> ip multicast forward-mode auto
-> ip multicast forward-mode asm
-> ip multicast forward-mode ssm
-> ip multicast forward-mode mac
-> no ip multicast forward-mode
-> ip multicast vlan 100 forward-mode auto
-> ip multicast vlan 101-104 forward-mode asm
-> ip multicast vlan 100 forward-mode ssm
-> ip multicast vlan 101-104 forward-mode mac
-> no ip multicast vlan 100 forward-mode
-> no ip multicast vlan 101-104 forward-mode
-> ip multicast service 10 forward-mode mac
-> ip multicast service 11-15 forward-mode mac
-> no ip multicast service 10 forward-mode
-> no ip multicast service 11-15 forward-mode
```

## Release History

## ip multicast update-delay-interval

Sets the amount of time to delay IPv4 multicast forwarding updates on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ip multicast [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] update-delay-interval *milliseconds***

**no ip multicast [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] update-delay-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>milliseconds</i>	The number of milliseconds to defer forwarding updates. Valid range is 0–10000.

### Defaults

By default, the forwarding update delay interval is set to zero.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the forwarding update delay interval back to the default value (zero) on the system or the specified VLAN or SPB service.

### Examples

```
-> ip multicast update-delay-interval 10
-> no ip multicast update-delay-interval
-> ip multicast vlan 100 update-delay-interval 20
-> ip multicast vlan 101-105 update-delay-interval 20
-> no ip multicast vlan 100 update-delay-interval
-> no ip multicast vlan 101-105 update-delay-interval
-> ip multicast service 20 update-delay-interval 20
-> ip multicast service 21-25 update-delay-interval 20
-> no ip multicast service 20 update-delay-interval
-> no ip multicast service 21-25 update-delay-interval
```

## Release History

Release 8.3.1; command was introduced.  
Release 8.4.1.R02; **service** parameter added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigUpdateDelayInterval
```

---

## ip multicast fast-join

Configures whether or not IP Multicast Switching will automatically create the forwarding entries in hardware as soon as the IGMP memberships are learned on the specified VLAN, Shortest Path Bridging (SPB) service or globally if no VLAN or SPB service is specified.

**ip multicast** [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] **fast-join** [enable | disable]

**no ip multicast** [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] **fast-join**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. <i>This parameter is currently not supported.</i>
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable the IGMP fast join functionality.
<b>disable</b>	Disable the IGMP fast join functionality.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command applies only to IPv4 Multicast Switching. If IP Multicast Routing is enabled, then the routing configuration will override the fast join setting.
- When the IP Multicast Switching fast join functionality is enabled, convergence of multicast traffic may occur faster because the forwarding entries are already created before the actual multicast traffic is received.
- When the IP Multicast Switching fast join functionality is disabled (the default), forwarding entries are not created in the hardware until the multicast traffic reaches the switch.
- If the IP Multicast Switching fast join is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the IP Multicast Switching fast join setting back to the default value (disabled) on the system or the specified VLAN or SPB service.

### Examples

```
-> ip multicast fast-join enable
-> ip multicast fast-join disable
-> no ip multicast fast-join
-> ip multicast service 10 fast-join enable
```

```
-> ip multicast service 11-15 fast-join disable
-> no ip multicast service 10 fast-join
-> no ip multicast service 11-15 fast-join
```

## Release History

Release 8.3.1.R02; command introduced.

Release 8.4.1.R02; **vlan** and **service** parameters added.

## Related Commands

### [show ip multicast](#)

Displays the IP Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```

  alaIpmsConfigFastJoin
```

---

## ip multicast host-list

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

```
ip multicast host-list host_list_name ip_address [ip_address]
```

```
no ip multicast host-list host_list_name [ip_address]
```

---

### Syntax Definitions

*host\_list\_name*

A name to assign to the host list (up to 20 characters).

*ip\_address*

The IP address to add to the host list. Multiple IP addresses can be entered on the same command line.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the **no** form of this command to remove an IP address from the list or remove the entire list from the switch configuration.
- When the entire list is removed, any configuration associated with the list is also removed.

### Examples

```
-> ip multicast host-list group-map1 10.1.1.198
-> ip multicast host-list ssm-map1 20.0.0.1
-> ip multicast host-list ssm-map2 30.0.0.1 30.0.0.2 30.0.0.3
-> no ip multicast host-list ssm-map2 30.0.0.2
-> no ip multicast host-list group-map1
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

**show ip multicast host-list** Displays the IP multicast host address list configuration for the switch.

### MIB Objects

alaIpmsHostListTable

  alaIpmsHostListName

  alaIpmsHostListAddressType

  alaIpmsHostListAddress

---

## ip multicast ssm-map

Configures the translation of Any Source Multicast (ASM) group memberships into Source Specific Multicast (SSM) group memberships on the specified VLAN or on the system if no VLAN is specified.

```
ip multicast [vlan vlan_id] ssm-map {group_address/prefixLen host_list_name | admin-state {enable | disable}}
```

```
no ip multicast [vlan vlan_id] ssm-map group_address/prefixLen
```

---

### Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the mapping configuration.
<i>group_address</i> [/ <i>prefixLen</i> ]	The multicast group address/prefix length to map to the host list. If no prefix length is specified, then the a default length of 32 is used.
<i>host_list_name</i>	The name of a host list to use for SSM mapping.
<b>enable</b>	Enables the SSM mapping.
<b>disable</b>	Disables the SSM mapping.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the **no** form of this command to remove the SSM mapping configuration from the system or the specified VLAN.
- If an SSM mapping is already enabled on the system, then the VLAN configuration will override the system's configuration.

### Examples

```
-> ip multicast ssm-map 229.10.10.10 hostList1
-> ip multicast ssm-map admin-state enable
-> ip multicast vlan 200 ssm-map 225.11.11.11 hostList2
-> ip multicast vlan 200 ssm-map admin-state enable
-> no ip multicast ssm-map 229.10.10.10
```

### Release History

Release 8.3.1.R02; command was introduced.

## Related Commands

<b>show ip multicast ssm-map</b>	Displays the SSM mapping configuration.
<b>show ip multicast</b>	Displays the IP Multicast Switching and Routing status and general configuration parameters, such as the SSM mapping setting.

## MIB Objects

```

  alaIpmsSsmMapConfigType  
  alaIpmsSsmMapConfigAddressType  
  alaIpmsSsmMapConfigValue  
  alaIpmsSsmMapGroupAddress  
  alaIpmsSsmMapGroupPrefixLength  
  alaIpmsSsmMapSourceListName
```

---

## ip multicast initial-packet-buffer admin-state

Enables or disables initial packet buffering for IPv4 multicast flows on the specified VLAN or globally on the switch.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<b>enable</b>	Enable the initial packet buffering globally on the switch.
<b>disable</b>	Disable the initial packet buffering globally on the switch.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When enabled, the following configuration is used for initial packet buffering on new multicast flows:
  - The maximum number of initial packets buffered per IPv4 multicast flow. Use the **ip multicast initial-packet-buffer max-packet** command to set this value.
  - The maximum number of IPv4 multicast flows that can be buffered. Use the **ip multicast initial-packet-buffer max-flow** command to set this value.
  - The maximum amount of time buffered packets are held if they are not sent out. Use the **ip multicast initial-packet-buffer timeout** command to set this value.
  - The minimum amount of time packets are held before delivery begins. Use the **ip multicast initial-packet-buffer min-delay** command to set this value.
- Configuring the status for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ip multicast initial-packet-buffer admin-state disable
-> ip multicast vlan 2 initial-packet-buffer admin-state enable
-> ip multicast vlan 3-5 initial-packet-buffer admin-state enable
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

### `show ip multicast`

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

## MIB Objects

  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBuffer
```

---

## ip multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv4 multicast flow on the specified VLAN or globally on the switch.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer max-packet** [*num*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>num</i>	The maximum number of packets allowed to buffer per IPv4 multicast flow. Valid range is 1–10.

### Defaults

---

parameter	default
<i>num</i>	4

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ip multicast initial-packet-buffer max-packet 4
-> ip multicast vlan 2 initial-packet-buffer max-packet 10
-> ip multicast vlan 3-5 initial-packet-buffer max-packet 10
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

**ip multicast initial-packet-buffer admin-state**

Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.

**show ip multicast**

---

## ip multicast initial-packet-buffer max-flow

Configures the maximum number of IPv4 multicast flows that can be buffered on the specified VLAN or globally on the switch.

```
ip multicast [vlan vlan_id[-vlan_id2]] initial-packet-buffer max-flow [num]
```

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>num</i>	The maximum number of IPv4 multicast flows allowed for initial packet buffering. Valid range is 1–32.

### Defaults

---

parameter	default
<i>num</i>	32

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ip multicast initial-packet-buffer max-flow 32
-> ip multicast vlan 2 initial-packet-buffer max-flow 32
-> ip multicast vlan 3-5 initial-packet-buffer max-flow 32
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

**ip multicast initial-packet-buffer admin-state**

Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.

**show ip multicast**

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

## MIB Objects

alaIpmsConfigTable

    alaIpmsConfigType

    alaIpmsConfigAddressType

    alaIpmsConfigValue

    alaIpmsConfigInitialPacketBufferMaxFlow

---

## ip multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv4 initial multicast packets on the specified VLAN or globally on the switch.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer timeout** [*seconds*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>seconds</i>	The timeout value for the initial buffered IPv4 multicast packets in seconds. Valid range is 1–10.

### Defaults

---

parameter	default
<i>seconds</i>	10

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ip multicast initial-packet-buffer timeout 2
-> ip multicast vlan 2 initial-packet-buffer timeout 5
-> ip multicast vlan 3-5 initial-packet-buffer timeout t
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

**ip multicast initial-packet-buffer admin-state**

Enables or disables the initial packet buffering feature globally on the switch, for IPv4 multicast flows.

**show ip multicast**

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

## MIB Objects

    alaIpmsConfigValue

    alaIpmsConfigInitialPacketBufferTimeout

---

## ip multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet on the specified VLAN or globally on the switch.

**ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer min-delay** [*milliseconds*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>milliseconds</i>	The minimum delay value to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Valid range is 0–1000.

### Defaults

---

parameter	default
<i>milliseconds</i>	0

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

---

**Note.** This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

---

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ip multicast initial-packet-buffer min-delay 200
-> ip multicast vlan 2 initial-packet-buffer min-delay 200
-> ip multicast vlan 3-5 initial-packet-buffer min-delay 200
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

**ip multicast initial-packet-buffer admin-state**

Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.

**show ip multicast**

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

## MIB Objects

    alaIpmsConfigType

    alaIpmsConfigAddressType

    alaIpmsConfigValue

    alaIpmsConfigInitialPacketBufferMinDelay

---

## ip multicast display-interface-names

Sets the display output of the **show** commands listed below. When enabled, the display outputs for these commands will show the IP interface name for each VLAN associated with the IP multicast table entry.

**ip multicast display-interface-names**

**no ip multicast display-interface-names**

---

### Syntax Definitions

N/A

### Defaults

By default, this function is disabled. The display format is set to include the VLANs that are associated with the IP multicast source and forward flows.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to revert back to displaying the VLAN name.
- If there are any VLANs that are not configured with an IP interface or the IP interface is disabled, the output display will still include the VLAN when this function is enabled.
- This command may be helpful when reviewing output from multicast snooping commands and comparing state in multicast routing, which only interacts with IP interfaces.
- Enabling the display interface names option applies to the following **show** commands:

```
show ip multicast forward
show ip multicast neighbor
show ip multicast querier
show ip multicast group
show ip multicast source
show ip multicast tunnel
```

- The command examples provided display the **show ip multicast source** output after the display interface name function is turned on (enabled) and off (disabled).

### Examples

```
-> ip multicast display-interface-name
-> show ip multicast source
```

alaIpmsGlobalConfigTable
  alaIpmsGlobalConfigAddressType
  alaIpmsGlobalConfigDisplayInterfaceNames

```

## ip multicast inherit-default-vrf-config

Configures whether or not the global IPMS configuration defined in the default VRF instance is applied to all VRF instances.

**ip multicast inherit-default-vrf-config**

**no ip multicast inherit-default-vrf-config**

---

### Syntax Definitions

N/A

### Defaults

By default, the global IPMS configuration defined in the default VRF instance is applied to all VRF instances on the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMS configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled (the default), additional VRF instances will inherit the global IPMS configuration defined in the default VRF instance.
- A global IPMS configuration defined for a specific non-default VRF instance takes precedence over the global IPMS configuration defined for the default VRF.
- Note that any per-VLAN IPMS configuration defined in a non-default VRF instance will show up as part of the default VRF instance in the configuration snapshot file. However, the functionality is still applied within the context of VRF instance in which the per-VLAN configuration was originally defined.

### Examples

```
-> ip multicast inherit-default-vrf-config
-> no ip multicast inherit-default-vrf-config
```

### Release History

Release 8.3.1; command introduced.

## Related Commands

### **show ip multicast**

---

## ip multicast profile

Defines an IPMS profile that is used to apply a pre-defined configuration to the global IPMS instance (all VLAN and service instances) or to a specific VLAN or service instance. Using a configuration profile to configure IPMS functionality avoids having to configure each IPMS parameter with a separate CLI command.

This section describes the base command (**ip multicast profile**) along with optional command keywords that are used to configure IPMS parameter values that are applied when the profile is assigned to an IPMS instance. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the profile.

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance. The default profile cannot be deleted, but the profile parameter values are configurable through this command.

**ip multicast profile** *profile\_name*

[**admin-state** {enable | disable}]  
 [**flood-unknown** {enable | disable}]  
 [**version** *version*]  
 [**robustness** *robustness*]  
 [**querying** {enable | disable}]  
 [**query-interval** [*seconds*]]  
 [**query-response-interval** [*tenths-of-seconds*]]  
 [**last-member-query-interval** [*tenths-of-seconds*]]  
 [**unsolicited-report-interval** [*seconds*]]  
 [**proxying** {enable | disable}]  
 [**spoofing** {enable | disable}]  
 [**spoofing static-source-ip** *ip\_address*]  
 [**zapping** {enable | disable}]  
 [**querier-forwarding** {enable | disable}]  
 [**router-timeout** [*seconds*]]  
 [**source-timeout** [*seconds*]]  
 [**max-group** [*num*] [**action** {none | drop | replace}]]  
 [**helper-address** [*ip\_address*]]  
 [**zero-based-query** {enable | disable}]  
 [**forward-mode** {asm | ssm | mac | auto}]  
 [**update-delay-interval** *milliseconds*]  
 [**fast-join** {enable | disable}]  
 [**initial-packet-buffer admin-state** {enable | disable}]  
 [**initial-packet-buffer max-flow** [*num*]]  
 [**initial-packet-buffer max-packet** [*num*]]  
 [**initial-packet-buffer timeout** [*seconds*]]  
 [**initial-packet-buffer min-delay** [*milliseconds*]]

**no ip multicast profile** *profile\_name* [**admin-state** | **flood-unknown** | **version** | **robustness** | ...]

## Syntax Definitions

*profile\_name* The name to associate with the IPMS profile.

## Defaults

N/A

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Use the **no** form of this command to remove an IPMS profile from the switch configuration.
- To change the value of a specific profile parameter, specify the parameter keyword with this command. For example, **no ip multicast profile ipms-1 admin-state**, **ip multicast profile ipms-1 query-interval 100**, or **ip multicast profile ipms-1 querying enable**. The new parameter values are applied to all IPMS instances to which the profile is assigned.
- The profile name must already exist in the switch configuration before parameter values can be modified. Use this command to create the profile first, then configure the profile parameter values.
- For more information about specific profile parameter values, refer to the following explicit IPMS configuration commands for each profile parameter:

Port Template Parameter	Explicit Port Configuration Command
[admin-state {enable   disable}]	<b>ip multicast admin-state</b>
[flood-unknown {enable   disable}]	<b>ip multicast flood-unknown</b>
[version <i>version</i> ]	<b>ip multicast version</b>
[robustness <i>robustness</i> ]	<b>ip multicast robustness</b>
[querying {enable   disable}]	<b>ip multicast querying</b>
[query-interval [ <i>seconds</i> ]]	<b>ip multicast query-interval</b>
[query-response-interval [ <i>tenths-of-seconds</i> ]]	<b>ip multicast query-response-interval</b>
[last-member-query-interval [ <i>tenths-of-seconds</i> ]]	<b>ip multicast last-member-query-interval</b>
[unsolicited-report-interval [ <i>seconds</i> ]]	<b>ip multicast unsolicited-report-interval</b>
[proxying {enable   disable}]	<b>ip multicast proxying</b>
[spoofing {enable   disable}]	<b>ip multicast spoofing</b>
[spoofing static-source-ip <i>ip_address</i> ]	<b>ip multicast spoofing static-source-ip</b>
[zapping {enable   disable}]	<b>ip multicast zapping</b>
[querier-forwarding {enable   disable}]	<b>ip multicast querier-forwarding</b>
[router-timeout [ <i>seconds</i> ]]	<b>ip multicast router-timeout</b>
[source-timeout [ <i>seconds</i> ]]	<b>ip multicast source-timeout</b>
[max-group [ <i>num</i> ] [action {none   drop   replace}]]	<b>ip multicast max-group</b>

Port Template Parameter	Explicit Port Configuration Command
[ <b>helper-address</b> [ <i>ip_address</i> ]]	<b>ip multicast helper-address</b>
[ <b>zero-based-query</b> {enable   disable}]	<b>ip multicast zero-based-query</b>
[ <b>forward-mode</b> {asm   ssm   mac   auto}]	<b>ip multicast forward-mode</b>
[ <b>update-delay-interval</b> <i>milliseconds</i> ]	<b>ip multicast update-delay-interval</b>
[ <b>fast-join</b> {enable   disable}]	<b>ip multicast fast-join</b>
[ <b>initial-packet-buffer admin-state</b> {enable   disable}]	<b>ip multicast initial-packet-buffer admin-state</b>
[ <b>initial-packet-buffer max-flow</b> [ <i>num</i> ]]	<b>ip multicast initial-packet-buffer max-flow</b>
[ <b>initial-packet-buffer max-packet</b> [ <i>num</i> ]]	<b>ip multicast initial-packet-buffer max-packet</b>
[ <b>initial-packet-buffer timeout</b> [ <i>seconds</i> ]]	<b>ip multicast initial-packet-buffer timeout</b>
[ <b>initial-packet-buffer min-delay</b> [ <i>milliseconds</i> ]]	<b>ip multicast initial-packet-buffer min-delay</b>

## Examples

```

-> ip multicast profile "IGMPv3 with Zapping"
-> ip multicast profile "IGMPv3 with Zapping" admin-state enable
-> ip multicast profile "IGMPv3 with Zapping" zapping enable version 3
-> ip multicast profile "IGMPv3 with Zapping" fast-join enable proxying enable
-> no ip multicast profile "IGMPv3 with Zapping" proxying
-> no ip multicast profile "IGMPv3 with Zapping"

```

## Release History

Release 8.4.1.R02; command was introduced.

## Related Commands

- ip multicast apply-profile** Assigns an IPMS configuration profile globally for the switch or to a specific VLAN or service instance.
- show ip multicast** Displays the profile assignment for the IPMS instance.
- show ip multicast profile** Displays the IPMS profile configuration.

## MIB Objects

```

  alaIpmsProfileAddressType
  alaIpmsProfileName
  alaIpmsProfileIndex
  alaIpmsProfileRowStatus
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigProfileName

```

## ip multicast apply-profile

Assigns the name of an existing IPMS configuration profile to the global IPMS instance (all VLANs and services) or to a specific VLAN or Shortest Path Bridging (SPB) service instance. An IPMS configuration profile defines parameter options that are applied to the IPMS instance to which the profile is assigned.

**ip multicast** [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] **apply-profile** *profile\_name*

**no ip multicast** [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] **apply-profile**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>profile_name</i>	The name to associate with the IPMS profile.

### Defaults

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to revert the profile assignment back to the “default” profile.
- Specify a range of VLANs (**vlan 20-25**) or a range of SPB services (**service 10-15**) to apply the specified profile to multiple VLANs or services with one CLI command.
- The specified profile name must already exist in the switch configuration.

### Examples

```
-> ip multicast apply-profile "IGMPv3 with Zapping"
-> ip multicast vlan 20 apply-profile "IGMPv3 with Zapping"
-> ip multicast vlan 20-25 apply-profile "IGMPv3 with Zapping"
-> ip multicast service 10 apply-profile "IGMPv3 with Zapping"
-> ip multicast service 10-15 apply-profile "IGMPv3 with Zapping"
-> no ip multicast apply-profile
-> no ip multicast vlan 20 apply-profile
-> no ip multicast vlan 20-15 apply-profile
-> no ip multicast service 10 apply-profile
-> no ip multicast service 10-15 apply-profile
```

### Release History

Release 8.4.1.R02; command was introduced.

## Related Commands

<b>ip multicast profile</b>	Defines an IPMS profile that is used to apply a pre-defined IPMS configuration.
<b>show ip multicast</b>	Displays the profile assignment for the IPMS instance.
<b>show ip multicast profile</b>	Displays the IPMS profile configuration.

  alaIpmsProfileName
  alaIpmsProfileIndex
  alaIpmsProfileRowStatus
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigProfileName
```

---

## ipv6 multicast admin-state

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **admin-state** [**enable** | **disable**]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **admin-state**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable IPv6 Multicast Switching and Routing.
<b>disable</b>	Disable IPv6 Multicast Switching and Routing.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The configuration of an IPv6 multicast routing protocol on an IPv6 interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.
- If there is no IPv6 Multicast routing protocol already running on the switch, then the **ipv6 multicast admin-state** command alone controls IPMS operations.
- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

---

**Note.** Globally enabling or disabling the IPv6 Multicast Switching and Routing status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPv6 Multicast Switching and Routing must be explicitly enabled or disabled for each SPB service.

---

- Use the **no** form of this command to restore the IPv6 Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

## Examples

```
-> ipv6 multicast admin-state enable
-> ipv6 multicast admin-state disable
-> no ipv6 multicast admin-state
-> ipv6 multicast vlan 2 admin-state enable
-> ipv6 multicast vlan 3-5 admin-state disable
-> no ipv6 multicast vlan 2 admin-state
-> no ipv6 multicast vlan 3-5 admin-state
-> ipv6 multicast service 10 admin-state enable
-> ipv6 multicast service 11-15 admin-state disable
-> no ipv6 multicast service 10 admin-state
-> no ipv6 multicast service 11-15 admin-state
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ipv6 multicast](#)

Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigStatus
```

---

## ipv6 multicast flood-unknown

Enables or disables the flooding of initial unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **flood-unknown** [**enable** | **disable**]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **flood-unknown**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable flooding of unknown traffic until it is learned.
<b>disable</b>	Disable flooding of unknown traffic.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- When this command is used with any VLAN on an OmniSwitch 6860 and OmniSwitch 6900, the flood unknown behavior is enforced globally across all VLANs. The IPv4 multicast version of this command (**ip multicast flood-unknown**), however, enforces the flood unknown behavior at the VLAN level.
- When IPv6 multicast snooping is used with services on an OmniSwitch 6860 and OmniSwitch 6900, the flood unknown behavior is unconditionally enforced for all snooping services.
- On an OmniSwitch 9900 and OmniSwitch 6560, IPv6 multicast snooping does not snoop ff02::/120 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled.
- On an OmniSwitch 6900, OmniSwitch 6860, and OmniSwitch 6865, IPv6 multicast snooping does not snoop ff02::/64 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled.

- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the **no** form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system.

## Examples

```
-> ipv6 multicast flood-unknown enable
-> ipv6 multicast flood-unknown disable
-> no ipv6 multicast flood-unknown
-> ipv6 multicast vlan 100 flood-unknown enable
-> ipv6 multicast vlan 101-105 flood-unknown enable
-> ipv6 multicast vlan 100 flood-unknown disable
-> no ipv6 multicast vlan 100 flood-unknown
-> no ipv6 multicast vlan 101-105 flood-unknown
-> ipv6 multicast service 10 flood-unknown enable
-> ipv6 multicast service 11-15 flood-unknown enable
-> ipv6 multicast service 10 flood-unknown disable
-> no ipv6 multicast service 10 flood-unknown
-> no ipv6 multicast service 11-15 flood-unknown
```

## Release History

Release 8.3.1; command introduced.

Release 8.4.1.R02; **vlan** and **service** parameter added.

## Related Commands

### [show ipv6 multicast](#)

Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

```
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigFloodUnknown
```

---

## ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **version** [*version*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **version**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>version</i>	Default MLD protocol version to run. Valid entries are 1 or 2.

### Defaults

parameter	default
<i>version</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs. or SPB services.
- If the default MLD protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- Use the **no** form of this command to restore the MLD multicast version back to the default value (version 1) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ipv6 multicast version 0).

### Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> no ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 3-5 version 2
-> ipv6 multicast vlan 2 version 0
-> no ipv6 multicast vlan 2 version
-> no ipv6 multicast vlan 3-5 version
-> ipv6 multicast service 2 version 3
-> ipv6 multicast service 3-5 version 3
```

```
-> ipv6 multicast service 2 version 0
-> no ipv6 multicast service 2 version
-> no ipv6 multicast service 3-5 version
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

## MIB Objects

  alaIpmsConfigVersion
```

---

## ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances or all SPB service instances of the port.

**ipv6 multicast** [**port** *chassis/slot/port* | **sap port** *sap\_id*] **max-group** [*num*] [**action** {*none* | *drop* | *replace*}]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).
<i>num</i>	The maximum MLD group count. Valid range is 0–4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
<b>Action</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
  - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
  - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
- The configuration is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast sap port 1/1/23:10 max-group 10 action drop, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is

tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

- The maximum group configuration on a port will override the VLAN, SPB service, or global configuration.
- MLD zapping must be enabled when the maximum group limit is enabled and the action is dropped.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

## Examples

```
-> ipv6 multicast port 1/1/12 max-group 10 action drop
-> ipv6 multicast port 1/1/14 max-group action replace
-> ipv6 multicast port 1/1/14 max-group
-> ipv6 multicast sap port 1/1/23:10 max-group 10 action drop
-> ipv6 multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ipv6 multicast sap port 1/1/16:20.200 max-group
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **sap port** parameter added.

## Related Commands

- |                                 |  |
|---------------------------------|--|
| <b>show ipv6 multicast</b>      | Displays the IPv6 Multicast Switching and Routing status and general configuration parameters. |
| <b>show ipv6 multicast port</b> | Displays the maximum group configuration for VLAN ports or SPB service SAP ports.              |

## MIB Objects

  alaIpmsIntfConfigType
  alaIpmsIntfAddressType
  alaIpmsIntfMaxGroupLimit
  alaIpmsIntfMaxGroupExceedAction
```

---

## ipv6 multicast max-group

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>num</i>	The maximum MLD group count. Valid range is 0–4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
<b>action</b>	<b>none</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- If an SPB service is specified, this command configures the maximum group limit learned per port on an SPB service. The limit is applied to each port that is a member of the given SPB service.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN or port/SPB service instance
- The configuration of a maximum group limit is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.

- The maximum group configuration on a VLAN or SPB service will override the global configuration.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
  - Group limit configured for a port or an SPB SAP port.
  - Group limit configured for a specific VLAN or SPB service.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
  - Group limit configured for a VLAN or SPB service within a specific VRF context.
  - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

## Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 20 max-group action drop
-> ipv6 multicast vlan 11-15 max-group 10 action replace
-> ipv6 multicast service 5 max-group 10 action drop
-> ipv6 multicast service 20 max-group action drop
-> ipv6 multicast service 10-15 max-group 10 action replace
-> ipv6 multicast service 5 max-group
-> ipv6 multicast service 10-15 max-group
```

## Release History

---

## ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

**ipv6 multicast static-neighbor** *vlan* *vlan\_id* {**port** *chassis/slot/port* | **linkagg** *agg\_id*}

**ipv6 multicast static-neighbor** *service* *service\_id* **sap** {**port** | **linkagg**} {*sap\_id*}

**no ipv6 multicast static-neighbor** *vlan* *vlan\_id* {**port** *chassis/slot/port* | **linkagg** *agg\_id*}

**no ipv6 multicast static-neighbor** *service* *service\_id* **sap** {**port** | **linkagg**} {*sap\_id*}

---

### Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static MLD neighbor.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static MLD neighbor.
<i>agg_id</i>	The link aggregate to configure as a static MLD neighbor.
<i>service_id</i>	SPB service ID to include as a static MLD neighbor. The valid range is 1–32767.
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the MLD traffic *and* IPv6 multicast traffic.
- To create an MLD static neighbor entry on a link aggregate, use the **linkagg** parameter (for example, `ipv6 multicast static-neighbor vlan 2 linkagg 7` or `ipv6 multicast static-neighbor service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ipv6 multicast static-neighbor service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

## Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1
-> ipv6 multicast static-neighbor vlan 4 port 7
-> no ipv6 multicast static-neighbor vlan 4 port 7

-> ipv6 multicast static-neighbor service 10 sap port 1/1/2:100
-> no ipv6 multicast static-neighbor service 10 sap port 1/1/2:100
-> ipv6 multicast static-neighbor service 10 sap linkagg 10:100
-> no ipv6 multicast static-neighbor service 10 sap linkagg 10:100
```

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.1; **linkagg** parameter was added.  
Release 8.4.1; **service** and **sap** parameters added.

## Related Commands

**show ipv6 multicast neighbor** Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

```

---

## ipv6 multicast static-querier

Creates a static MLD querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

**ipv6 multicast static-querier** **vlan** *vlan\_id* **{port chassis/slot/port | linkagg agg\_id}**

**ipv6 multicast static-querier** **service** *service\_id* **sap {port | linkagg} {sap\_id}**

**no ipv6 multicast static-querier** **vlan** *vlan\_id* **{port chassis/slot/port | linkagg agg\_id}**

**no ipv6 multicast static-querier** **service** *service\_id* **sap {port | linkagg} {sap\_id}**

---

### Syntax Definitions

<i>vlan_id</i>	VLAN to include as a static MLD querier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static MLD querier.
<i>agg_id</i>	The link aggregate to configure as a static MLD querier.
<i>service_id</i>	SPB service ID to include as a static MLD querier. The valid range is 1–32767.
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the MLD traffic.
- To create an MLD static querier entry on a link aggregate, use the **linkagg** parameter (for example, `ipv6 multicast static-querier vlan 2 linkagg 7` or `ipv6 multicast static-querier service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ipv6 multicast static-neighbor service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

## Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1
-> ipv6 multicast static-querier vlan 4 port 7
-> no ipv6 multicast static-querier vlan 4 port 7

-> ipv6 multicast static-querier service 10 sap port 1/1/2:100
-> no ipv6 multicast static-querier service 10 sap port 1/1/2:100
-> ipv6 multicast static-querier service 10 sap linkagg 10:100
-> no ipv6 multicast static-querier service 10 sap linkagg 10:100
```

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.1; **linkagg** parameter was added.  
Release 8.4.1; **service** and **sap** parameters added.

## Related Commands

  alaIpmsStaticQuerierValue
  alaIpmsStaticQuerierIfIndex
  alaIpmsStaticQuerierSubValue
  alaIpmsStaticQuerierRowStatus
```

---

## ipv6 multicast static-group

Creates a static MLD group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

**ipv6 multicast static-group** *ipv6\_address* **vlan** *vlan\_id* **{port chassis/slot/port | linkagg agg\_id}**

**ipv6 multicast static-group** *ipv6\_address* **service** *service\_id* **sap {port / linkagg} {sap\_id}**

**no ipv6 multicast static-group** *ipv6\_address* **vlan** *vlan\_id* **{port chassis/slot/port | linkagg agg\_id}**

**no ipv6 multicast static-group** *ipv6\_address* **service** *service\_id* **sap {port / linkagg} {sap\_id}**

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 multicast group address.
<i>vlan_id</i>	VLAN to include as a static MLD group.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number to configure as a static MLD group.
<i>agg_id</i>	The link aggregate to configure as a static MLD group.
<i>service_id</i>	SPB service ID to include as a static MLD group. The valid range is 1–32767.
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive MLD traffic addressed to the specified IP multicast group address.
- To create an MLD static group entry on a link aggregate, use the **linkagg** parameter (for example, `ipv6 multicast static-group 225.0.0.1 vlan 2 linkagg 7` or `ipv6 multicast static-group 225.0.0.1 service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ipv6 multicast static-querier service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is

tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

## Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 port 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 7

-> ipv6 multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> no ipv6 multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> ipv6 multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
-> no ipv6 multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
```

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.1; **linkagg** parameter was added.  
Release 8.4.1; **service** and **sap** parameters added.

## Related Commands

**show ipv6 multicast group** Displays the MLD group membership table entries of IPv6 Multicast Switching and Routing for the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

  alaIpmsStaticMemberRowStatus
```

---

## ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*] **query-interval** [*seconds*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*] **query-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	MLD query interval in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	125

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs or SPB services.
- If the MLD query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD query interval to use.
- Use the **no** form of this command to restore the MLD query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast query-interval 0**).

### Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> no ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
-> ipv6 multicast vlan 3-5 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
```

```
-> no ipv6 multicast vlan 2 query-interval
-> no ipv6 multicast vlan 3-5 query-interval
-> ipv6 multicast service 2 query-interval 100
-> ipv6 multicast service 3-5 query-interval 100
-> ipv6 multicast service 2 query-interval 0
-> no ipv6 multicast service 2 query-interval
-> no ipv6 multicast service 3-5 query-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

### [show ipv6 multicast](#)

  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigQueryInterval
```

---

## ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **last-member-query-interval** [*milliseconds*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **last-member-query-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>milliseconds</i>	MLD last member query interval in milliseconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>milliseconds</i>	1000

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- Use the **no** form of this command to restore the MLD last member query interval back to the default value (1000 milliseconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast last-member-query-interval 0**).

### Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> no ipv6 multicast last-member-query-interval
-> ipv6 multicast vlan 4 last-member-query-interval 2200
-> ipv6 multicast vlan 3-5 last-member-query-interval 2200
```

```
-> ipv6 multicast vlan 4 last-member-query-interval 0
-> no ipv6 multicast vlan 4 last-member-query-interval
-> no ipv6 multicast vlan 3-5 last-member-query-interval
-> ipv6 multicast service 2 last-member-query-interval 2200
-> ipv6 multicast service 3-5 last-member-query-interval 2200
-> ipv6 multicast service 2 last-member-query-interval 0
-> no ipv6 multicast service 2 last-member-query-interval
-> no ipv6 multicast service 3-5 last-member-query-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

```

---

## ipv6 multicast query-response-interval

Sets the MLD query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*] **query-response-interval** [*milliseconds*]

**no ip multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*] **query-response-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>milliseconds</i>	MLD query response interval in milliseconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>milliseconds</i>	10000

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query response interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD query response interval refers to the time period to reply to an MLD query message.
- Use the **no** form of this command to restore the MLD query response interval back to the default value (10000 milliseconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast query-response-interval 0**).

### Examples

```
-> ipv6 multicast query-response-interval 20000
-> ipv6 multicast query-response-interval 0
-> no ipv6 multicast query-response-interval
-> ipv6 multicast vlan 2 query-response-interval 20000
-> ipv6 multicast vlan 3-5 query-response-interval 20000
-> ipv6 multicast vlan 2 query-response-interval 0
-> no ipv6 multicast vlan 2 query-response-interval
-> no ipv6 multicast vlan 3-5 query-response-interval
-> ipv6 multicast service 2 query-response-interval 300
```

```
-> ipv6 multicast service 3-5 query-response-interval 300
-> ipv6 multicast service 2 query-response-interval 0
-> no ipv6 multicast service 2 query-response-interval
-> no ipv6 multicast service 3-5 query-response-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

---

## ipv6 multicast unsolicited-report-interval

Sets the value of the MLD unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **unsolicited-report-interval** [*seconds*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **unsolicited-report-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	MLD unsolicited report interval in seconds. Valid range is 1–65535, where 0 represents the default setting.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- Use the **no** form of this command to restore the MLD unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast unsolicited-report-interval 0**).

### Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> no ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
-> ipv6 multicast vlan 3-5 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
```

```
-> no ipv6 multicast vlan 2 unsolicited-report-interval
-> no ipv6 multicast vlan 3-5 unsolicited-report-interval
-> ipv6 multicast service 2 unsolicited-report-interval 300
-> ipv6 multicast service 3-5 unsolicited-report-interval 300
-> ipv6 multicast service 2 unsolicited-report-interval 0
-> no ipv6 multicast service 2 unsolicited-report-interval
-> no ipv6 multicast service 3-5 unsolicited-report-interval
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

## ipv6 multicast router-timeout

Configures the expiry time of IPv6 multicast routers on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **router-timeout** [*seconds*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **router-timeout**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	MLD router timeout in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD router timeout on the system and/or the specified VLANs. apply this configuration.
- If the MLD router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the MLD router timeout back to the default value (90 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast router-timeout 0**).

### Examples

```
-> ipv6 multicast router-timeout 100
-> ipv6 multicast router-timeout 0
-> no ipv6 multicast router-timeout
-> ipv6 multicast vlan 2 router-timeout 100
-> ipv6 multicast vlan 3-5 router-timeout 100
-> ipv6 multicast vlan 2 router-timeout 0
-> no ipv6 multicast vlan 2 router-timeout
-> no ipv6 multicast vlan 3-5 router-timeout
-> ipv6 multicast service 2 router-timeout 100
-> ipv6 multicast service 3-5 router-timeout 100
-> ipv6 multicast service 2 router-timeout 0
-> no ipv6 multicast service 2 router-timeout
```

-> no ipv6 multicast servicee 3-5 router-timeout

## Release History

## ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **source-timeout** [*seconds*]

**no ip multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **source-timeout**

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>seconds</i>	MLD source timeout in seconds. Valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the MLD source timeout back to the default value (30 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast source-timeout 0**).

### Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> no ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 3-5 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> no ipv6 multicast vlan 2 source-timeout
-> no ipv6 multicast vlan 3-5 source-timeout 100
-> ipv6 multicast service 2 source-timeout 100
-> ipv6 multicast service 3-5 source-timeout 100
-> ipv6 multicast service 2 source-timeout 0
-> no ipv6 multicast service 2 source-timeout
-> no ipv6 multicast service 3-5 source-timeout
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.4.1.R02; service parameter added.

## ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [vlan *vlan\_id*[-*vlan\_id2*]] **querying** [{enable | disable}] [static-source-ip *ipv6\_address*]

**no ipv6 multicast** [vlan *vlan\_id*[-*vlan\_id2*]] **querying** [static-source-ip]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<b>enable</b>	Enable MLD querying.
<b>disable</b>	Disable MLD querying.
<i>ipv6_address</i>	A static source IPv6 address to use for MLD querying. <i>This parameter is currently not supported.</i>

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- Use the **no** form of this command to restore the MLD querying status to the default value (disabled) on the system or the specified VLAN.

### Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> no ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 3-5 querying disable
-> no ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 3-5 querying
```

## Release History

Release 7.1.1; command was introduced.

Release 8.3.1.R02; **static-source-ip** parameter added.

## ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **robustness** [*robustness*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **robustness**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>robustness</i>	MLD robustness variable. Valid range is 1–7.

### Defaults

parameter	default
<i>robustness</i>	2

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs or SPB services.
- If the MLD robustness variable is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD robustness variable to use.
- Use the **no** form of this command to restore the MLD robustness variable back to the default value (2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast robustness 0**).

### Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> no ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
-> ipv6 multicast vlan 3-5 robustness 3
-> ipv6 multicast vlan 2 robustness 0
```

```
-> no ipv6 multicast vlan 2 robustness
-> no ipv6 multicast vlan 3-5 robustness
-> ipv6 multicast service 2 robustness 3
-> ipv6 multicast service 3-5 robustness 3
-> ipv6 multicast service 2 robustness 0
-> ipv6 multicast service 2 robustness
-> no ipv6 multicast service 3-5 robustness
```

## Release History

## ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [*vlan vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **spoofing** {**enable** | **disable**}

**no ipv6 multicast** [*vlan vlan\_id*[-*vlan\_id2*] | **service** *service\_id*] **spoofing**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable MLD spoofing.
<b>disable</b>	Disable MLD spoofing.

### Defaults

parameter	defaults
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the MLD spoofing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IPv6 address with the system's MAC and IPv6 address when proxying aggregated MLD group membership information.
- By default, the source IPv6 address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IPv6 address to overcome the need for an IPv6 interface. If configured, the static source IPv6 is always used for spoofing, regardless of the IPv6 interface address or administrative state.
- Use the **no** form of this command to remove an MLD spoofing configuration and return the specified VLAN, SPB service, or system to the default behavior.

### Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> no ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
-> ipv6 multicast vlan 3-5 spoofing disable
-> no ipv6 multicast vlan 2 spoofing
```

```
-> no ipv6 multicast vlan 3-5 spoofing
-> ipv6 multicast service 2 spoofing enable
-> ipv6 multicast service 3-5 spoofing disable
-> no ipv6 multicast service 2 spoofing
-> no ipv6 multicast service 3-5 spoofing
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.4.1.R02; **service** parameter added.

```

---

## ipv6 multicast spoofing static-source-ip

Enables or disables MLD static spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **spoofing static-source-ip** *ipv6\_address*

**no ipv6 multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | *service* *service\_id*[-*service\_id2*]] **spoofing static-source-ip**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>ipv6_address</i>	A static source IPv6 address to use for spoofing.

### Defaults

parameter	defaults
enable / disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a static source IP address.
- MLD spoofing refers to replacing a client's MAC and IPv6 address with the system's MAC and IPv6 address when proxying aggregated MLD group membership information.
- By default, the source IPv6 address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IPv6 address to overcome the need for an IPv6 interface. If configured, the static source IPv6 is always used for spoofing, regardless of the IPv6 interface address or administrative state.

### Examples

```
-> ipv6 multicast spoofing static-source-ip 3333::1
-> no ipv6 ip multicast spoofing static-source-ip
-> ipv6 multicast vlan 2 spoofing static-source-ip 3333::1
-> ipv6 multicast vlan 3-5 spoofing static-source-ip 3333::1
-> no ipv6 ip multicast vlan 2 spoofing static-source-ip
-> no ipv6 multicast vlan 3-5 spoofing static-source-ip
-> ipv6 multicast service 2 spoofing static-source-ip 3333::1
-> no ipv6 multicast service 2 spoofing static-source-ip
-> ipv6 multicast service 3-5 spoofing static-source-ip 3333::1
-> no ipv6 multicast service 3-5 spoofing static-source-ip
```

## Release History

Release 8.3.1.R02; command was added.

Release 8.4.1.R02; **service** parameter added.

---

## ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **zapping** [**enable** | **disable**]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **zapping**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable MLD zapping.
<b>disable</b>	Disable MLD zapping.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- Use the **no** form of this command to restore the MLD zapping status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> no ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 3-5 zapping disable
-> no ipv6 multicast vlan 2 zapping
-> no ipv6 multicast vlan 3-5 zapping
-> ipv6 multicast service 2 zapping enable
-> ipv6 multicast service 3-5 zapping disable
-> no ipv6 multicast service 2 zapping
-> no ip multicast service 3-5 zapping
```

## Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

```

---

## ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [*vlan vlan\_id[-vlan\_id2]* | **service** *service\_id[-service\_id2]*] **querier-forwarding** [**enable** | **disable**]

**no ipv6 multicast** [*vlan vlan\_id[-vlan\_id2]* | **service** *service\_id[-service\_id2]*] **querier-forwarding**

---

### Syntax Definitions

<i>vlan_id[-vlan_id2]</i>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id[-service_id2]</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable MLD querier forwarding.
<b>disable</b>	Disable MLD querier forwarding.

### Defaults

parameter	default
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the MLD querier forwarding is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.
- Use the **no** form of this command to restore the MLD querier forwarding status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> no ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 3-5 querier-forwarding disable
-> no ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 3-5 querier-forwarding
-> ipv6 multicast service 2 querier-forwarding enable
-> ipv6 multicast service 3-5 querier-forwarding disable
-> no ipv6 multicast service 2 querier-forwarding
-> no ip multicast service 3-5 querier-forwarding
```

## Release History

## ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **proxying** [**enable** | **disable**]

**no ipv6 multicast** [*vlan* *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **proxying**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable MLD proxying.
<b>disable</b>	Disable MLD proxying.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- Proxy reported MLD packets are sent using the source MAC address of the proxying switch. Unless the spoofing feature is used, proxy reported MLD packets will be sent using “:::” for the IPv6 source address.
- Use the **no** form of this command to restore the MLD proxying status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> no ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 3-5 proxying disable
-> no ipv6 multicast vlan 2 proxying
-> no ipv6 multicast vlan 3-5 proxying
-> ipv6 multicast service 2 proxying enable
```

```
-> ipv6 multicast service 3-5 proxying disable
-> no ipv6 multicast service 2 proxying
-> no ip multicast service 3-5 proxying
```

## Release History

```

---

## ipv6 multicast helper-address

Specifies the destination IPv6 address of a relay host where MLD host Reports and Leave messages are sent.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] **helper-address** [*ipv6\_address*]

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] **helper-address**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>ipv6_address</i>	The IPv6 address of the relay host.

### Defaults

By default, no destination IPv6 address is set.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- After the destination IPv6 address is specified, the IPMS reporting feature is enabled.
- An operational IPv6 interface is required for the receiving LAN before any MLD Reports and Leave messages can be relayed.
- Configuring a destination IPv6 helper address is supported only in the VLAN domain; the service domain is not supported.
- Use the **no** form of this command to restore the IPMS reporting feature back to the default value (no IPv6 helper address) on the system. When there is no IPv6 helper address set, the IPMS reporting feature is disabled.

### Examples

```
-> ipv6 multicast helper-address 3333::2
-> no ipv6 multicast helper-address
-> ipv6 multicast vlan 2 helper-address 3333::2
-> ipv6 multicast vlan 3-5 helper-address 3333::2
-> no ipv6 multicast vlan 2 helper-address
-> no ipv6 multicast vlan 3-5 helper-address
```

### Release History

Release 8.4.1; command was introduced.

---

## ipv6 multicast zero-based-query

Configures the use of an all-zero source IPv6 address for MLD query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

**ipv6 multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id[-service\_id2]*] **zero-based-query** [**enable** | **disable**]

**no ipv6 multicast** [*vlan vlan\_id[-vlan\_id2]* | *service service\_id[-service\_id2]*] **zero-based-query**

---

### Syntax Definitions

<i>vlan_id[-vlan_id2]</i>	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id[-service_id2]</i>	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable MLD zero-based querying.
<b>disable</b>	Disable MLD zero-based querying.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The MLD zero-based query status set for a specific VLAN or SPB service overrides the zero-based query status set for the system.
- Use the **no** form of this command to restore the MLD zero-based query status back to the default value (enabled) on the system, the specified VLAN, or the specified SPB service.

### Examples

```
-> ipv6 multicast zero-based-query enable
-> ipv6 multicast zero-based-query disable
-> no ipv6 multicast zero-based-query
-> ipv6 multicast vlan 2 zero-based-query enable
-> ipv6 multicast vlan 3-5 zero-based-query disable
-> no ipv6 multicast vlan 2 zero-based-query
-> no ipv6 multicast vlan 3-5 zero-based-query
-> ipv6 multicast service 10 zero-based-query enable
-> ipv6 multicast service 11-15 zero-based-query disable
-> no ipv6 multicast service 10 zero-based-query
-> no ipv6 multicast service 11-15 zero-based-query disable
```

## Release History

Release 8.3.1; command introduced.

Release 8.4.1; **service** parameter added.

## Related Commands

    alaIpmsConfigZeroBasedQuery

---

## ipv6 multicast forward-mode

Configures the Layer 2 forwarding mode for IPv6 Multicast Switching (does not apply to IPv6 Multicast Routing). The forwarding mode is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **forward-mode** {**asm** | **ssm** | **mac** | **auto**}

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **forward-mode**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>asm</b>	Sets the IPMSv6 forwarding mode to ASM (the bridge lookup is based on the packet group destination IPv6 address).
<b>ssm</b>	Sets the IPMSv6 forwarding mode to SSM (the bridge lookup is based on the packet source IPv6 as well as the group destination IPv6).
<b>mac</b>	Sets the IPMSv6 forwarding mode to MAC address (the bridge lookup is based on the MAC destination address).
<b>auto</b>	Automatically determines the IPMSv6 forwarding mode based on the current MLD protocol version and the existing protocol state.

### Defaults

By default, the forwarding mode is set to automatic.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The forwarding mode set for a specific VLAN or SPB service overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
  - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
  - Multicast routing is not supported on the OmniSwitch 6560.
  - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.
- Use the **no** form of this command to restore the Layer 2 forwarding mode back to the default value (automatic) on the system, the specified VLAN or SPB service.

## Examples

```
-> ipv6 multicast forward-mode auto
-> ipv6 multicast forward-mode asm
-> ipv6 multicast forward-mode ssm
-> ipv6 multicast forward-mode mac
-> no ipv6 multicast forward-mode
-> ipv6 multicast vlan 100 forward-mode auto
-> ipv6 multicast vlan 101-104 forward-mode asm
-> ipv6 multicast vlan 100 forward-mode ssm
-> ipv6 multicast vlan 101-104 forward-mode mac
-> no ipv6 multicast vlan 100 forward-mode
-> no ipv6 multicast vlan 101-104 forward-mode
-> ipv6 multicast service 10 forward-mode mac
-> ipv6 multicast service 11-15 forward-mode mac
-> no ipv6 multicast service 10 forward-mode
-> no ipv6 multicast service 11-15 forward-mode
```

## Release History

## ipv6 multicast update-delay-interval

Sets the amount of time to delay IPv6 multicast forwarding updates on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **update-delay-interval** *milliseconds*

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **update-delay-interval**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>milliseconds</i>	The number of milliseconds to defer forwarding updates. Valid range is 0–10000.

### Defaults

By default, the forwarding update delay interval is set to zero.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the forwarding update delay interval back to the default value (zero) on the system or the specified VLAN or SPB service.

### Examples

```
-> ipv6 multicast update-delay-interval 10
-> no ipv6 multicast update-delay-interval
-> ipv6 multicast vlan 100 update-delay-interval 20
-> ipv6 multicast vlan 101-105 update-delay-interval 20
-> no ipv6 multicast vlan 100 update-delay-interval 20
-> no ipv6 multicast vlan 101-105 update-delay-interval
-> ipv6 multicast service 20 update-delay-interval 20
-> ipv6 multicast service 21-25 update-delay-interval 20
-> no ipv6 multicast service 20 update-delay-interval
-> no ipv6 multicast service 21-25 update-delay-interval
```

## Release History

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigUpdateDelayInterval
```

---

## ipv6 multicast fast-join

Configures whether or not IPv6 Multicast Switching will automatically create the forwarding entries in hardware as soon as the MLD memberships are learned on the specified VLAN, Shortest Path Bridging (SPB) service or globally if no VLAN or SPB service is specified.

**ipv6 multicast** [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] **fast-join** [enable | disable]

**no ipv6 multicast** [vlan *vlan\_id*[-*vlan\_id2*] | service *service\_id*[-*service\_id2*]] **fast-join**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. <i>This parameter is currently not supported.</i>
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<b>enable</b>	Enable the MLD fast join functionality.
<b>disable</b>	Disable the MLD fast join functionality.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command applies only to IPv6 Multicast Switching. If IPv6 Multicast Routing is enabled, then the routing configuration will override the fast join setting.
- When the IPv6 Multicast Switching fast join functionality is enabled, convergence of multicast traffic may occur faster because the forwarding entries are already created before the actual multicast traffic is received.
- When the IPv6 Multicast Switching fast join functionality is disabled (the default), forwarding entries are not created in the hardware until the multicast traffic reaches the switch.
- If the IPv6 Multicast Switching fast join is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the IPv6 Multicast Switching fast join setting back to the default value (disabled) on the system or the specified VLAN or SPB service.

### Examples

```
-> ipv6 multicast fast-join enable
-> ipv6 multicast fast-join disable
-> no ipv6 multicast fast-join
-> ip multicast service 10 fast-join enable
```

```
-> ip multicast service 11-15 fast-join disable
-> no ip multicast service 10 fast-join
-> no ip multicast service 11-15 fast-join
```

## Release History

Release 8.3.1.R02; command introduced.

Release 8.4.1.R02; **vlan** and **service** parameters added.

## Related Commands

### [show ip multicast](#)

Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

---

## ipv6 multicast host-list

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

**ipv6 multicast host-list** *host\_list\_name* *ipv6\_address* [*ipv6\_address*]

**no ipv6 multicast host-list** *host\_list\_name* [*ipv6\_address*]

---

### Syntax Definitions

*host\_list\_name*

A name to assign to the host list (up to 20 characters).

*ipv6\_address*

The IPv6 address to add to the host list. Multiple IPv6 addresses can be entered on the same command line.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the **no** form of this command to remove an IPv6 address from the list or remove the entire list from the switch configuration.
- When the entire list is removed, any configuration associated with the list is also removed.

### Examples

```
-> ipv6 multicast host-list group-map1 4444::2
-> ipv6 multicast host-list ssm-map1 4444::3
-> ipv6 multicast host-list ssm-map2 3333::2 3333::3 3333::4
-> no ipv6 multicast host-list ssm-map2 3333::3
-> no ipv6 multicast host-list group-map1
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

**show ipv6 multicast host-list** Displays the IPv6 multicast host address list configuration.

### MIB Objects

alaIpmsHostListTable

  alaIpmsHostListName

  alaIpmsHostListAddressType

  alaIpmsHostListAddress

---

## ipv6 multicast ssm-map

Configures the translation of Any Source Multicast (ASM) group memberships into Source Specific Multicast (SSM) group memberships on the specified VLAN or on the system if no VLAN is specified.

```
ipv6 multicast [vlan vlan_id] ssm-map {group_address[/prefixLen] host_list_name | admin-state {enable | disable}}
```

```
no ipv6 multicast ssm-map group_address[/prefixLen]
```

---

### Syntax Definitions

<i>vlan_id</i>	VLAN on which to apply the mapping configuration.
<i>group_address[/prefixLen]</i>	The multicast group address/prefix length to map to the host list. If no prefix length is specified, then the a default length of 128 is used.
<i>host_list_name</i>	The name of a host list to use for SSM mapping.
<b>enable</b>	Enables the SSM mapping.
<b>disable</b>	Disables the SSM mapping.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the **no** form of this command to remove the SSM mapping configuration.
- If an SSM mapping is already enabled on the system, then the VLAN configuration will override the system's configuration.

### Examples

```
-> ipv6 multicast ssm-map ff05::5 hostList1
-> ipv6 multicast ssm-map admin-state enable
-> ipv6 multicast vlan 200 ssm-map ff05::6 hostList2
-> ipv6 multicast vlan 200 ssm-map admin-state enable
-> no ipv6 multicast ssm-map ff05::5
```

### Release History

Release 8.3.1.R02; command was introduced.

## Related Commands

- show ipv6 multicast ssm-map** Displays the SSM mapping configuration.

  alaIpmsSsmMapGroupAddress  
  alaIpmsSsmMapGroupPrefixLength  
  alaIpmsSsmMapSourceListName

---

## ipv6 multicast initial-packet-buffer admin-state

Enables or disables initial packet buffering for IPv6 multicast flows on the specified VLAN or globally on the switch.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<b>enable</b>	Enable the initial packet buffering globally on the switch for IPv6 multicast flow.
<b>disable</b>	Disable the initial packet buffering globally on the switch for IPv6 multicast flow.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When enabled, the following configuration is used for initial packet buffering on new multicast flows:
  - The maximum number of initial packets buffered per IPv6 multicast flow. Use the **ipv6 multicast initial-packet-buffer max-packet** command to set this value.
  - The maximum number of IPv6 multicast flows that can be buffered. Use the **ipv6 multicast initial-packet-buffer max-flow** command to set this value.
  - The maximum amount of time buffered packets are held if they are not sent out. Use the **ipv6 multicast initial-packet-buffer timeout** command to set this value.
  - The minimum amount of time packets are held before delivery begins. Use the **ipv6 multicast initial-packet-buffer min-delay** command to set this value.
- Configuring the status for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ipv6 multicast initial-packet-buffer admin-state disable
-> ipv6 multicast initial-packet-buffer admin-state enable
-> ipv6 multicast vlan 2 initial-packet-buffer admin-state enable
-> ipv6 multicast vlan 3-5 initial-packet-buffer admin-state enable
```

## Release History

Release 8.2.1; command introduced.

Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

### **show ipv6 multicast**

Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

## MIB Objects

    alaIpmsConfigValue

    alaIpmsConfigInitialPacketBuffer

---

## ipv6 multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv6 multicast flow on the specified VLAN or globally on the switch.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer max-packet** [*num*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>num</i>	The maximum number of packets allowed to buffer per IPv6 multicast flow. Valid range is 1 to 10.

### Defaults

---

parameter	default
<i>num</i>	4

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ipv6 multicast initial-packet-buffer max-packet 4
-> ipv6 multicast vlan 2 initial-packet-buffer max-packet 10
-> ipv6 multicast vlan 3-5 initial-packet-buffer max-packet 10
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

<b>ipv6 multicast initial-packet-buffer admin-state</b>	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
<b>show ipv6 multicast</b>	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

## MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferMaxPacket
```

---

## ipv6 multicast initial-packet-buffer max-flow

Configures the maximum number of IPv6 multicast flows that can be buffered on the specified VLAN or globally on the switch.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer max-flow** [*num*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>num</i>	The maximum number of IPv6 multicast flows allowed for initial packet buffering. Valid range is 1 to 32.

### Defaults

---

parameter	default
<i>num</i>	32

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ipv6 multicast initial-packet-buffer max-flow 32
-> ipv6 multicast vlan 2 initial-packet-buffer max-flow 32
-> ipv6 multicast vlan 3-5 initial-packet-buffer max-flow 32
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

**ipv6 multicast initial-packet-buffer admin-state**

Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.

**show ip multicast**

Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

## MIB Objects

alaIpmsConfigTable

    alaIpmsConfigType

    alaIpmsConfigAddressType

    alaIpmsConfigValue

    alaIpmsConfigInitialPacketBufferMaxFlow

---

## ipv6 multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv6 initial multicast packets on the specified VLAN or globally on the switch.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer timeout** [*seconds*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>seconds</i>	The timeout value for the initial buffered IPv6 multicast packets in seconds. Valid range is 1 to 10.

### Defaults

---

parameter	default
<i>seconds</i>	10

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ipv6 multicast initial-packet-buffer timeout 2
-> ipv6 multicast vlan 2 initial-packet-buffer timeout 5
-> ipv6 multicast vlan 3-5 initial-packet-buffer timeout t
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

<b>ipv6 multicast initial-packet-buffer admin-state</b>	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
<b>show ip multicast</b>	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

## MIB Objects

```
alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferTimeout
```

---

## ipv6 multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet on the specified VLAN or globally on the switch.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*]] **initial-packet-buffer min-delay** [*milliseconds*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>milliseconds</i>	The minimum delay value to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Valid range is 0 to 1000.

### Defaults

---

parameter	default
<i>milliseconds</i>	0

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

---

**Note.** This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

---

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

### Examples

```
-> ipv6 multicast initial-packet-buffer min-delay 200
-> ipv6 multicast vlan 2 initial-packet-buffer min-delay 200
-> ipv6 multicast vlan 3-5 initial-packet-buffer min-delay 200
```

### Release History

Release 8.2.1; command introduced.  
Release 8.4.1.R02; **vlan** parameter added.

## Related Commands

<b>ipv6 multicast initial-packet-buffer admin-state</b>	Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows.
<b>show ip multicast</b>	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

## MIB Objects

alaIpmsConfigTable  
  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferMinDelay
```

---

## ipv6 multicast display-interface-names

Sets the display output of the **show** commands listed below. When enabled, the display outputs for these commands will show the IPv6 interface name for each VLAN associated with the IPv6 multicast table entry.

**ipv6 multicast display-interface-names**

**no ipv6 multicast display-interface-names**

---

### Syntax Definitions

N/A

### Defaults

By default, this function is disabled. The display format is set to include the VLANs that are associated with the IPv6 multicast source and forward flows.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to revert back to displaying the VLAN name.
- If there are any VLANs that are not configured with an IPv6 interface or the IPv6 interface is disabled, the output display will still include the VLAN when this function is enabled.
- This command may be helpful when reviewing output from multicast snooping commands and comparing state in multicast routing, which only interacts with IPv6 interfaces.
- Enabling the display interface names option applies to the following **show** commands:

**show ipv6 multicast forward**

**show ipv6 multicast neighbor**

**show ipv6 multicast querier**

**show ipv6 multicast group**

**show ipv6 multicast source**

**show ipv6 multicast tunnel**

- The command examples provided display the **show ipv6 multicast source** output after the display interface name function is turned on (enabled) and off (disabled).

## Examples

```
-> ipv6 multicast display-interface-name
```

```
-> show ipv6 multicast source
```

Total 4 Sources

Group Address	Host Address	Source		Ingress	
		Tunnel Address	VLAN	Port	
ff05::5	4444::2	::	VL-21		2/1
ff05::6	4444::2	::	VL-21		2/1
ff06::1	::	::	VL-20		3/1
ff06::1	::	::	VL-20		3/1

```
-> no ip multicast display-interface-name
```

```
-> show ipv6 multicast source
```

Total 4 Sources

Group Address	Host Address	Source		Ingress	
		Tunnel Address	VLAN	Port	
ff05::5	4444::2	::	21		2/1
ff05::6	4444::2	::	21		2/1
ff06::1	::	::	20		3/1
ff06::1	::	::	20		3/1

## Release History

Release 8.3.1.R02; command was introduced.

## Related Commands

- show ipv6 multicast source** Displays the IPv6 Multicast Switching and Routing source table entries.
- show ipv6 multicast forward** Displays the IPv6 Multicast Switching and Routing forwarding table entries.

## MIB Objects

```
alaIpmsGlobalConfigTable
  alaIpmsGlobalConfigAddressType
  alaIpmsGlobalConfigDisplayInterfaceNames
```

---

## ipv6 multicast inherit-default-vrf-config

Configures whether or not the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances.

**ipv6 multicast inherit-default-vrf-config**

**no ipv6 multicast inherit-default-vrf-config**

---

### Syntax Definitions

N/A

### Defaults

By default, the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances on the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMSv6 configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled, additional VRF instances will inherit the global IPMSv6 configuration defined in the default VRF instance.
- A global IPMSv6 configuration defined for a specific non-default VRF instance takes precedence over the global IPMSv6 configuration defined for the default VRF.

### Examples

```
-> ipv6 multicast inherit-default-vrf-config  
-> no ipv6 multicast inherit-default-vrf-config
```

### Release History

Release 8.3.1; command introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

## ipv6 multicast profile

Defines an IPMS profile that is used to apply a pre-defined configuration to the global IPMS instance (all VLAN and service instances) or to a specific VLAN or service instance. Using a configuration profile to configure IPMS functionality avoids having to configure each IPMS parameter with a separate CLI command.

This section describes the base command (**ipv6 multicast profile**) along with optional command keywords that are used to configure IPMS parameter values that are applied when the profile is assigned to an IPMS instance. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the profile.

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance. The default profile cannot be deleted, but the profile parameter values are configurable through this command.

```

ipv6 multicast profile profile_name
  [admin-state {enable | disable}]
  [flood-unknown {enable | disable}]
  [version version]
  [robustness robustness]
  [querying {enable | disable}]
  [query-interval [seconds]]
  [query-response-interval [milliseconds]]
  [last-member-query-interval [milliseconds]]
  [unsolicited-report-interval [seconds]]
  [proxying {enable | disable}]
  [spoofing {enable | disable}]
  [spoofing static-source-ip ipv6_address]
  [zapping {enable | disable}]
  [querier-forwarding {enable | disable}]
  [router-timeout [seconds]]
  [source-timeout [seconds]]
  [max-group [num] [action {none | drop | replace}]]
  [helper-address [ipv6_address]]
  [zero-based-query {enable | disable}]
  [forward-mode {asm | ssm | mac | auto}]
  [update-delay-interval milliseconds]
  [fast-join {enable | disable}]
  [initial-packet-buffer admin-state {enable | disable}]
  [initial-packet-buffer max-flow [num]]
  [initial-packet-buffer max-packet [num]]
  [initial-packet-buffer timeout [seconds]]
  [initial-packet-buffer min-delay [milliseconds]]

```

```

no ipv6 multicast profile profile_name [admin-state | flood-unknown | version | robustness | ...]

```

## Syntax Definitions

*profile\_name*                      The name to associate with the IPMS profile.

## Defaults

N/A

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Use the **no** form of this command to remove an IPMS profile from the switch configuration.
- To change the value of a specific profile parameter, specify the parameter keyword with this command. For example, **no ipv6 multicast profile ipms-1 admin-state**, **ipv6 multicast profile ipms-1 query-interval 100**, or **ipv6 multicast profile ipms-1 querying enable**. The new parameter values are applied to all IPMS instances to which the profile is assigned.
- The profile name must already exist in the switch configuration before parameter values can be modified. Use this command to create the profile first, then configure the profile parameter values.
- For more information about specific profile parameter values, refer to the following explicit IPMS configuration commands for each profile parameter:

Port Template Parameter	Explicit Port Configuration Command
[admin-state {enable   disable}]	<b>ipv6 multicast admin-state</b>
[flood-unknown {enable   disable}]	<b>ipv6 multicast flood-unknown</b>
[version <i>version</i> ]	<b>ipv6 multicast version</b>
[robustness <i>robustness</i> ]	<b>ipv6 multicast robustness</b>
[querying {enable   disable}]	<b>ipv6 multicast querying</b>
[query-interval [ <i>seconds</i> ]]	<b>ipv6 multicast query-interval</b>
[query-response-interval [ <i>milliseconds</i> ]]	<b>ipv6 multicast query-response-interval</b>
[last-member-query-interval [ <i>milliseconds</i> ]]	<b>ipv6 multicast last-member-query-interval</b>
[unsolicited-report-interval [ <i>seconds</i> ]]	<b>ipv6 multicast unsolicited-report-interval</b>
[proxying {enable   disable}]	<b>ipv6 multicast proxying</b>
[spoofing {enable   disable}]	<b>ipv6 multicast spoofing</b>
[spoofing static-source-ip <i>ipv6_address</i> ]	<b>ipv6 multicast spoofing static-source-ip</b>
[zapping {enable   disable}]	<b>ipv6 multicast zapping</b>
[querier-forwarding {enable   disable}]	<b>ipv6 multicast querier-forwarding</b>
[router-timeout [ <i>seconds</i> ]]	<b>ipv6 multicast router-timeout</b>
[source-timeout [ <i>seconds</i> ]]	<b>ipv6 multicast source-timeout</b>
[max-group [ <i>num</i> ] [action {none   drop   replace}]]	<b>ipv6 multicast max-group</b>

Port Template Parameter	Explicit Port Configuration Command
[ <b>helper-address</b> [ <i>ipv6_address</i> ]]	<b>ipv6 multicast helper-address</b>
[ <b>zero-based-query</b> {enable   disable}]	<b>ipv6 multicast zero-based-query</b>
[ <b>forward-mode</b> {asm   ssm   mac   auto}]	<b>ipv6 multicast forward-mode</b>
[ <b>update-delay-interval</b> <i>milliseconds</i> ]	<b>ipv6 multicast update-delay-interval</b>
[ <b>fast-join</b> {enable   disable}]	<b>ipv6 multicast fast-join</b>
[ <b>initial-packet-buffer admin-state</b> {enable   disable}]	<b>ipv6 multicast initial-packet-buffer admin-state</b>
[ <b>initial-packet-buffer max-flow</b> [ <i>num</i> ]]	<b>ipv6 multicast initial-packet-buffer max-flow</b>
[ <b>initial-packet-buffer max-packet</b> [ <i>num</i> ]]	<b>ipv6 multicast initial-packet-buffer max-packet</b>
[ <b>initial-packet-buffer timeout</b> [ <i>seconds</i> ]]	<b>ipv6 multicast initial-packet-buffer timeout</b>
[ <b>initial-packet-buffer min-delay</b> [ <i>milliseconds</i> ]]	<b>ipv6 multicast initial-packet-buffer min-delay</b>

## Examples

```

-> ipv6 multicast profile "MLDv2 with Zapping"
-> ipv6 multicast profile "MLDv2 with Zapping" admin-state enable
-> ipv6 multicast profile "MLDv2 with Zapping" zapping enable version 2
-> ipv6 multicast profile "MLDv2 with Zapping" fast-join enable proxying enable
-> no ipv6 multicast profile "MLDv2 with Zapping" proxying
-> no ipv6 multicast profile "MLDv2 with Zapping"

```

## Release History

Release 8.4.1.R02; command was introduced.

## Related Commands

<b>ipv6 multicast apply-profile</b>	Assigns an IPMS configuration profile globally for the switch or to a specific VLAN or service instance.
<b>show ipv6 multicast</b>	Displays the profile assignment for the IPMS instance.
<b>show ipv6 multicast profile</b>	Displays the IPMS profile configuration.

---

## ipv6 multicast apply-profile

Assigns the name of an existing IPMS configuration profile to the global IPMS instance (all VLANs and services) or to a specific VLAN or Shortest Path Bridging (SPB) service instance. An IPMS configuration profile defines parameter options that are applied to the IPMS instance to which the profile is assigned.

**ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **apply-profile** *profile\_name*

**no ipv6 multicast** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** *service\_id*[-*service\_id2*]] **apply-profile**

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.
<i>service_id</i> [- <i>service_id2</i> ]	SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs.
<i>profile_name</i>	The name to associate with the IPMS profile.

### Defaults

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to revert the profile assignment back to the “default” profile.
- Specify a range of VLANs (**vlan 20-25**) or a range of SPB services (**service 10-15**) to apply the specified profile to multiple VLANs or services with one CLI command.
- The specified profile name must already exist in the switch configuration.

### Examples

```
-> ipv6 multicast apply-profile "MLDv2 with Zapping"  
-> ipv6 multicast vlan 20 apply-profile "MLDv2 with Zapping"  
-> ipv6 multicast vlan 20-25 apply-profile "MLDv2 with Zapping"  
-> ipv6 multicast service 10 apply-profile "MLDv2 with Zapping"  
-> ipv6 multicast service 10-15 apply-profile "MLDv2 with Zapping"  
-> no ipv6 multicast apply-profile  
-> no ipv6 multicast vlan 20 apply-profile  
-> no ipv6 multicast vlan 20-15 apply-profile  
-> no ipv6 multicast service 10 apply-profile  
-> no ipv6 multicast service 10-15 apply-profile
```

### Release History

Release 8.4.1.R02; command was introduced.

---

## show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**show ip multicast** [*vlan vlan\_id* | *service service\_id*]

---

### Syntax Definitions

*vlan\_id* VLAN ID number (1–4094).  
*service\_id* SPB service ID number (1–32767).

### Defaults

By default the status and general configuration parameters for the system are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify a VLAN ID to display the configuration information for a specific VLAN.
- Specify an SPB service ID to display the configuration information for a specific SPB service.

### Examples

```
-> show ip multicast

```

**output definitions**

<b>Profile</b>	The name of a predefined IPMS configuration profile that is assigned to this instance. Configured through the <b>ip multicast profile</b> command.
<b>Status</b>	Whether IP Multicast Switching and Routing is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ip multicast admin-state</b> command.
<b>Flood Unknown</b>	Whether the flooding of initial unknown multicast traffic is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ip multicast flood-unknown</b> command.
<b>Version</b>	Displays the default IGMP version, which can be <b>1</b> , <b>2</b> or <b>3</b> . Configured through the <b>ip multicast version</b> command.
<b>Robustness</b>	Displays the IGMP robustness value, ranging from <b>1</b> to <b>7</b> . (The default value is 2). Configured through the <b>ip multicast robustness</b> command.
<b>Querying</b>	Whether IGMP querying is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ip multicast querying</b> command.
<b>Query Interval (seconds)</b>	Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). Configured through the <b>ip multicast query-interval</b> command.
<b>Query Response Interval (tenths of seconds)</b>	Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). Configured through the <b>ip multicast query-response-interval</b> command.
<b>Last Member Query Interval (tenths of seconds)</b>	Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the <b>ip multicast last-member-query-interval</b> command.
<b>Unsolicited Report Interval (seconds)</b>	Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). Configured through the <b>ip multicast unsolicited-report-interval</b> command.
<b>Proxying</b>	Whether IGMP proxying on the system is <b>enabled</b> or <b>disabled</b> (the default status). Configured through the <b>ip multicast proxying</b> command.

*output definitions*

---

<b>Spoofing</b>	Whether IGMP spoofing on the system is <b>enabled</b> or <b>disabled</b> (the default status). Configured through the <b>ip multicast spoofing</b> command.
<b>Zapping</b>	Whether IGMP zapping on the system is <b>enabled</b> or <b>disabled</b> (the default status). Configured through the <b>ip multicast zapping</b> command.
<b>Querier Forwarding</b>	Whether IGMP querier forwarding on the system is <b>enabled</b> or <b>disabled</b> (the default status). Configured through the <b>ip multicast querier-forwarding</b> command.
<b>Router Timeout (seconds)</b>	Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) Configured through the <b>ip multicast router-timeout</b> command.
<b>Source Timeout (seconds)</b>	Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) Configured through the <b>ip multicast source-timeout</b> command.
<b>Max-group</b>	Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0, which means no limit is imposed). Configured through the <b>ip multicast max-group</b> command.
<b>Max-group action</b>	Displays the action taken when the maximum group limit has been exceeded ( <b>none</b> , <b>drop</b> or <b>replace</b> ). Configured through the <b>ip multicast max-group</b> command.
<b>Helper-address</b>	Displays the destination IP address of a relay host, where IGMP host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) Configured through the <b>ip multicast helper-address</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i>
<b>Static Querier Address</b>	The Static Source IP Address to be used when querying. (The default value of 0.0.0.0 indicates that this is not configured.) <i>This function is currently not supported.</i>
<b>Static Spoofing Address</b>	The Static Source IP Address to be used when spoofing. (The default value of 0.0.0.0 indicates that this is not configured.) Configured through the <b>ip multicast spoofing static-source-ip</b> command.
<b>Zero-based Query</b>	Whether Zero-based Querying is <b>disabled</b> or <b>enabled</b> (the default status). Configured through the <b>ip multicast zero-based-query</b> command.
<b>Forward Mode</b>	Displays the current IPv4 Forwarding mode ( <b>asm</b> , <b>ssm</b> , <b>mac</b> , or <b>auto</b> ). Configured through the <b>ip multicast forward-mode</b> command.
<b>Update Delay Interval (milliseconds)</b>	Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the <b>ip multicast update-delay-interval</b> command.
<b>SSM Mapping</b>	Whether Source Specific Multicast (SSM) mapping is <b>enabled</b> or <b>disabled</b> (the default). When enabled, Any Source Multicast (ASM) group memberships are translated into SSM group memberships. Configured through the <b>ip multicast ssm-map</b> command. <i>This function is currently not supported.</i>

*output definitions*

---

<b>Fast Join</b>	Whether the IP Multicast Switching fast join functionality is <b>enabled</b> or <b>disabled</b> (the default). When enabled, forwarding entries are automatically created in hardware as soon as IGMP memberships are learned instead of waiting for the multicast traffic to reach the switch. Configured through the <b>ip multicast fast-join</b> command.
<b>Initial Packet Buffering</b>	The current state of Initial Packet Buffering, which can be <b>enabled</b> or <b>disabled</b> (the default status). Configured through the <b>ip multicast initial-packet-buffer admin-state</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i>
<b>Max Flows</b>	The maximum number of IPv4 multicast flows buffered for initial packet. Configured through the <b>ip multicast initial-packet-buffer max-flow</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i>
<b>Max Packets Per Flow</b>	The maximum number of initial packets buffered per IPv4 multicast flow. Configured through the <b>ip multicast initial-packet-buffer max-packet</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i>
<b>Buffer Timeout (seconds)</b>	The timeout value for the initial buffered IPv4 multicast packets. Configured through the <b>ip multicast initial-packet-buffer timeout</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i>
<b>Min Delay (milliseconds)</b>	The minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Configured through the <b>ip multicast initial-packet-buffer min-delay</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i>

---

**Release History**

Release 7.1.1; command was introduced.

Release 8.3.1; display fields added.

Release 8.4.1; **service** parameter added.

**Related Commands**

**ip multicast admin-state** Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

## show ip multicast port

Displays the maximum group configuration applicable for the specified port or the specified Service Access Point (SAP) port. The current number of groups learned on a port, port/VLAN, SAP port, or SAP port/Shortest Path Bridging (SPB) service instance will also be displayed.

```
show ip multicast {port [chassis/slot/port] | sap port [sap_id]}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify a port number to display the configuration information for a specific switch port.
- Specify a SAP ID to display the configuration information for a specific SAP port.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

### Examples

```
-> show ip multicast port
```

```
Legends: Port Max-group      = Max-group limit on the port
          Port Action        = Max-group action on the port
          Port-VLAN Max-group = Active Max-group limit on the Port-Vlan instance
          Port-VLAN Action   = Active Max-group action on the Port-Vlan instance
```

```
Total 2 Port-Vlan Pairs
```

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/1/13	1036	0	0	none	0	none
1/1/52	1	0	0	none	0	none

```
-> show ip multicast port 1/1/52
```

Legends: Port Max-group = Max-group limit on the port  
 Port Action = Max-group action on the port  
 Port-VLAN Max-group = Active Max-group limit on the Port-Vlan instance  
 Port-VLAN Action = Active Max-group action on the Port-Vlan instance

Total 1 Port-Vlan Pairs

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/1/52	1	0	0	none	0	none

### output definitions

<b>Port</b>	The chassis, slot, and port number of the IP multicast port.
<b>VLAN</b>	The VLAN associated with the IP multicast port.
<b>Current Groups</b>	The current group associated with the IP Current groups.
<b>Port Max-group</b>	The maximum group count allowed on the port. This limit is applicable on the given port for all VLAN instances of the port.
<b>Port Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none</b> , <b>drop</b> , or <b>replace</b> ).
<b>Port-VLAN Max-group</b>	The maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified. This limit is applied to each port that is a member of the given VLAN and the specified action is taken when the limit is exceeded.
<b>Port-VLAN Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none</b> , <b>drop</b> , or <b>replace</b> ).

```
-> show ip multicast sap port
```

Legends: Id Max-group = Max-group limit on the SAP/SDP port  
 Id Action = Max-group action on the SAP/SDP port  
 Id-Svc Max-group = Active Max-group limit on the SAP-Service or SDP-Service instance  
 Id-Svc Action = Active Max-group action on the SAP-Service or SDP-Service instance

Total 2 Id-Svc Pairs

Interface	Svc	Current Groups	Id Max-group	Id Action	Id-Svc Max-group	Id-Svc Action
sap:1/1/5:100	20	0	0	none	0	none
sap:1/1/23:200	30	0	0	none	0	none

```
-> show ip multicast sap port 1/1/23:200
```

Legends: Id Max-group = Max-group limit on the SAP/SDP port  
 Id Action = Max-group action on the SAP/SDP port  
 Id-Svc Max-group = Active Max-group limit on the SAP-Service or SDP-Service instance  
 Id-Svc Action = Active Max-group action on the SAP-Service or SDP-Service instance

Total 1 Id-Svc Pairs

Interface	Svc	Current Groups	Id Max-group	Id Action	Id-Svc Max-group	Id-Svc Action
sap:1/1/23:200	30	0	0	none	0	none

### output definitions

<b>Interface</b>	The SAP (chassis/slot/port:encapsulation) that serves as the virtual port for the Shortest Path Bridging (SPB) service.
<b>Svc</b>	The SPB service ID number that is associated with the SAP.
<b>Current Groups</b>	The current group associated with the IP Current groups.
<b>Id Max-group</b>	The maximum group count allowed on the SAP port. This limit is applicable on the given port for all service instances of the port.
<b>Id Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none</b> , <b>drop</b> , or <b>replace</b> ).
<b>Id-Svc Max-group</b>	The maximum group limit learned per SAP port for the specified SPB service or on the system if no service is specified. This limit is applied to each SAP port that is a member of the given service and the specified action is taken when the limit is exceeded.
<b>Id-Svc Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none</b> , <b>drop</b> , or <b>replace</b> ).

### Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **sap port** parameter added.

### Related Commands

<b>ip multicast port max-group</b>	Configures the maximum group limit learned per port.
<b>ip multicast port max-group</b>	Configures the maximum group limit learned per port for the specified VLAN, SPB service, or on the system if no VLAN or SPB service is specified.

### MIB Objects

  alaIpmsIntfStatsAddressType
  alaIpmsIntfStatsValue
  alaIpmsIntfStatsCurrentGroupCount
  alaIpmsIntfStatsMaxGroupLimit
  alaIpmsIntfStatsMaxGroupExceedAction

```

## show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

```
show ip multicast forward [ip_address] [vlan [vlan_id[-vlan_id2]] | service [service_id[-service_id2]]
[all-vrf]
```

---

### Syntax Definitions

<i>ip_address</i>	IP multicast group address.
<b>vlan</b> [vlan_id[-vlan_id2]]	Display forwarding table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [service_id[-service_id2]]	Display forwarding table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<b>all-vrf</b>	Display forwarding table entries for all of the VRF instances.

### Defaults

By default, forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the *ip\_address* parameter to display forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.
- Forwarding entries are derived by applying the state from the source table to the state in the group, neighbor, and querier tables.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” and “Egress Vlan/Service” fields instead of the VLAN ID or service ID.

### Examples

```
-> show ip multicast forward
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress	Egress	Interface
			Vlan/Service	Vlan/Service	
225.0.1.0	21.20.20.2	0.0.0.0	vlan 20	vlan 20	1/1/2
225.0.1.0	21.20.20.2	0.0.0.0	service 10	service 10	sdp:32776

```

225.0.1.1      21.20.20.2    0.0.0.0      vlan 20      vlan 20      1/1/2
225.0.1.1      21.20.20.2    0.0.0.0      service 10   service 10   sdp:32776
225.0.1.2      21.20.20.2    0.0.0.0      vlan 20      vlan 21      1/1/2
225.0.1.2      21.20.20.2    0.0.0.0      service 10   service 10   sap:1/5:10

```

```
-> show ip multicast forward service
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress	Egress	Interface
			Vlan/Service	Vlan/Service	
225.0.1.0	21.20.20.2	0.0.0.0	service 10	service 10	sdp:32776
225.0.1.1	21.20.20.2	0.0.0.0	service 10	service 10	sdp:32776
225.0.1.2	21.20.20.2	0.0.0.0	service 10	service 10	sap:1/5:10

```
-> show ip multicast forward vlan
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress	Egress	Interface
			Vlan/Service	Vlan/Service	
225.0.1.0	21.20.20.2	0.0.0.0	vlan 20	vlan 20	1/1/2
225.0.1.1	21.20.20.2	0.0.0.0	vlan 20	vlan 20	1/1/2
225.0.1.2	21.20.20.2	0.0.0.0	vlan 20	vlan 21	1/1/2

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
```

```
-> show ip multicast forward vlan
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress	Egress	Interface
			Vlan/Service	Vlan/Service	
225.0.1.0	21.20.20.2	0.0.0.0	VlanToLab	VlanToLab	1/1/2
225.0.1.1	21.20.20.2	0.0.0.0	VlanToLab	VlanToLab	1/1/2
225.0.1.2	21.20.20.2	0.0.0.0	VlanToLab	VlanToCore	1/1/2

### *output definitions*

<b>Group Address</b>	IP group address of the IP multicast forward.
<b>Host Address</b>	IP host address of the IP multicast forward.
<b>Tunnel Address</b>	IP source tunnel address of the IP multicast forward.
<b>Ingress Vlan/Service</b>	The ingress VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast forward. If the global display interface names option is enabled, then the ingress interface name associated with the IP multicast forward is displayed.
<b>Egress Vlan/Service</b>	The egress VLAN or SPB service ID associated with the IP multicast forward. If the global display interface names option is enabled, then the egress interface name associated with the IP multicast forward is displayed. The egress interface (port) will also be included in the forward entry with both output formats.
<b>Interface</b>	The VLAN port or SPB virtual port of the IP multicast forward.

## Release History

Release 7.1.1; command was introduced.  
Release 8.3.1; **all-vrf** parameter added.  
Release 8.4.1; **domain** parameter added.  
Release 8.4.1.R02; **domain** parameter deprecated.

## Related Commands

**ip multicast static-group**      Creates a static IGMP group entry on a specified port on a specified VLAN.

## MIB Objects

```

## show ip multicast neighbor

Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

**show ip multicast neighbor** [**vlan** [*vlan\_id*[-*vlan\_id2*]] | **service** [*service\_id*[-*service\_id2*]]] [**all-vrf**]

---

### Syntax Definitions

- vlan** [*vlan\_id*[-*vlan\_id2*]] Display IGMP neighbor table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
- service** [*service\_id*[-*service\_id2*]] Display IGMP neighbor table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
- all-vrf** Display IGMP neighbor table entries for all of the VRF instances.

### Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **all-vrf** parameter option to display the neighbor table entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

### Examples

```
-> show ip multicast neighbor
```

```
Total 12 Neighbors
```

## show ip multicast querier

Displays the IGMP querier table entries of IP Multicast Switching and Routing.

**show ip multicast querier** [vlan [vlan\_id[-vlan\_id2] | service [service\_id[-service\_id2]]] [all-vrf]

---

### Syntax Definitions

- vlan** [vlan\_id[-vlan\_id2] Display IGMP querier table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
- service** [service\_id[-service\_id2] Display IGMP querier table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
- all-vrf** Display IGMP querier table entries for all of the VRF instances.

### Defaults

By default, only IGMP querier entries specific to the current VRF instance are displayed

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **all-vrf** parameter option to display the IGMP querier table entries that exist in all of the VRF instances on the switch.
- Interfaces with queriers receive all IGMP traffic, and if querier forwarding is enabled, these interfaces will also receive all IPv4 multicast traffic.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

### Examples

```
-> show ip multicast querier
```

```
Total 10 Queriers
```

Host Address	Vlan/Service	Interface	Static	Count	Life
172.1.254.96	vlan 1001	0/1	no	3	213

## show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

**show ip multicast group** [*ip\_address*] [**vlan** [*vlan\_id*[-*vlan\_id2*] | **service** [*service\_id*[-*service\_id2*]]] [**all-vrf**]

---

### Syntax Definitions

<i>ip_address</i>	IP multicast group address.
<b>vlan</b> [ <i>vlan_id</i> [- <i>vlan_id2</i> ]	Display group membership entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [ <i>service_id</i> [- <i>service_id2</i> ]	Display group membership entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<b>all-vrf</b>	Display group membership entries for all of the VRF instances.

### Defaults

By default, all IP multicast groups are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the *ip\_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IGMP group membership table entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

### Examples

```
-> show ip multicast group
```

```
Total 8 Groups
```

225.0.1.4	0.0.0.0	VlanToDist	1/1/1	exclude	yes	0	0

### output definitions

<b>Group Address</b>	IP address of the IP multicast group.
<b>Source Address</b>	IP address of the IP multicast source.
<b>Vlan/Service</b>	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv4 multicast group. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast group is displayed.
<b>Interface</b>	The VLAN port or the SPB virtual port on which the group membership was learned.
<b>Mode</b>	IGMP source filter mode.

*output definitions*

---

<b>Static</b>	Whether it is a static multicast group or not.
<b>Count</b>	Number of IGMP membership requests made.
<b>Life</b>	Life time of the IGMP group membership.

---

**Release History**

Release 7.1.1; command was introduced

Release 8.3.1; **all-vrf** parameter added.

Release 8.4.1; **domain** parameter added.

Release 8.4.1.R02; **domain** parameter deprecated.

**Related Commands.**

**ip multicast static-group** Creates a static IGMP group entry on a specified port for the specified VLAN or on the specified SPB virtual port for the specified SPB service.

---

## show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

**show ip multicast source** [*ip\_address*] [**vlan** [*vlan\_id*[-*vlan\_id2*] | **service** [*service\_id*[-*service\_id2*] [**all-vrf**]

---

### Syntax Definitions

<i>ip_address</i>	IP multicast group address.
<b>vlan</b> [ <i>vlan_id</i> [- <i>vlan_id2</i> ]	Displays source table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [ <i>service_id</i> [- <i>service_id2</i> ]	Displays source table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<b>all-vrf</b>	Display source table entries for all of the VRF instances.

### Defaults

By default, all source table entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the *ip\_address* parameter to display source entries for a specific multicast group.
- In the service domain, only the first flow that is used to learn the source is displayed. Use the **extended** parameter to display other possible multicast IP addresses matching the same multicast MAC address. In this case, an asterisk (\*) in the “Host Address” field represents the other multicast IP addresses.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” field instead of the VLAN ID or service ID.

### Examples

```
-> show ip multicast source
```

```
Total 10 Sources
```

Group Address	Host Address	Source		Ingress
		Tunnel	Address	Vlan/Service
225.0.1.0	21.20.20.2	0.0.0.0		vlan 21
225.0.1.0	21.20.20.2	0.0.0.0		service 20

```

225.0.1.1      21.20.20.2      0.0.0.0      vlan 21
225.0.1.1      21.20.20.2      0.0.0.0      service 20
225.0.1.2      21.20.20.2      0.0.0.0      vlan 21
225.0.1.2      21.20.20.2      0.0.0.0      service 20
225.0.1.3      21.20.20.2      0.0.0.0      vlan 21
225.0.1.3      21.20.20.2      0.0.0.0      service 20
225.0.1.4      21.20.20.2      0.0.0.0      vlan 21
225.0.1.4      21.20.20.2      0.0.0.0      service 20

```

```
-> show ip multicast source 225.0.1.2
```

Total 2 Sources

Group Address	Host Address	Source		Ingress
		Tunnel Address		Vlan/Service
225.0.1.2	21.20.20.2	0.0.0.0		vlan 21
225.0.1.2	21.20.20.2	0.0.0.0		service 20

```
-> show ip multicast source service
```

Total 5 Sources

Group Address	Host Address	Source		Ingress
		Tunnel Address		Vlan/Service
225.0.1.0	21.20.20.2	0.0.0.0		20

## show ip multicast tunnel

Displays the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

**show ip multicast tunnel** [*ip\_address*] [**vlan** | **service**] [**all-vrf**]

---

### Syntax Definitions

<i>ip_address</i>	IP multicast group address.
<b>vlan</b>	Displays tunneling table entries for the VLAN domain.
<b>service</b>	Displays tunneling table entries for the service domain.
<b>all-vrf</b>	Display the tunneling table entries for all of the VRF instances.

### Defaults

By default, all tunnel entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the *ip\_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IP multicast tunnel entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” field instead of the VLAN ID or service ID.

### Examples

```
-> show ip multicast tunnel
```

```
Total 3 Tunnels
```

Group Address	Host Address	Destination Tunnel Address	Ingress Vlan/Service
225.0.1.0	21.20.20.2	10.10.10.51	vlan 20
225.0.1.1	21.20.20.2	10.10.10.51	vlan 20
225.0.1.2	21.20.20.2	10.10.10.51	vlan 20

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
```

```
-> show ip multicast tunnel
```

```
Total 3 Tunnels
```

Group Address	Host Address	Destination Tunnel Address	Ingress Vlan/Service
225.0.1.0	21.20.20.2	10.10.10.51	vlan 20
225.0.1.1	21.20.20.2	10.10.10.51	vlan 20
225.0.1.2	21.20.20.2	10.10.10.51	vlan 20

225.0.1.0	21.20.20.2	10.10.10.51	VlanToLab
225.0.1.1	21.20.20.2	10.10.10.51	VlanToLab
225.0.1.2	21.20.20.2	10.10.10.51	VlanToLab

**output definitions**

---

<b>Group Address</b>	IP group address of the IP multicast tunnel.
<b>Host Address</b>	IP host address of the IP multicast tunnel.
<b>Destination Tunnel Address</b>	IP source tunnel address of the IP multicast tunnel.
<b>Ingress Vlan/Service</b>	VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast tunnel. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast tunnel is displayed.

---

## show ip multicast host-list

Displays the IP multicast host address list configuration for the switch.

```
show ip multicast host-list [host_list_name]
```

---

### Syntax Definitions

*host\_list\_name*                      The name of an existing IP multicast host list.

### Defaults

By default, all host lists configured on the switch are displayed.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Use the *host\_list\_name* parameter to display information for a specific host list.

### Examples

```
-> show ip multicast host-list
```

```
Total 2 Lists
```

Host List Name	Addresses
group-map1	10.2.2.1 10.2.2.3 10.2.2.4 10.2.2.5
ssm-map1	20.2.2.1 20.2.2.2 20.2.2.3

```
-> show ip multicast host-list ssm-map1
```

Host List Name	Addresses
ssm-map1	20.2.2.1 20.2.2.2 20.2.2.3

### Release History

Release 8.3.1.R02; command introduced.

## Related Commands

### [ip multicast host-list](#)

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

## MIB Objects

```
alaIpmsHostListTable  
  alaIpmsHostListName  
  alaIpmsHostListAddressType  
  alaIpmsHostListAddress
```

---

## show ip multicast ssm-map

Displays the Source Specific Multicast (SSM) mapping configuration for the switch.

```
show ip multicast ssm-map [vlan vlan_id]
```

---

### Syntax Definitions

*vlan\_id* VLAN for which to display the configuration.

### Defaults

By default, all SSM mappings configured on the switch are displayed.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

### Examples

```
-> show ip multicast ssm-map
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
global 0    225.20.1.1/32       h-list1
vlan   200  229.30.1.1/32       h-list2

-> show ip multicast ssm-map vlan 200
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
vlan   200  229.30.1.1/32       h-list2
```

### Release History

Release 8.3.1.R02; command introduced.

### Related Commands

[ip multicast ssm-map](#) Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

**MIB Objects**

```
alaIpmsSsmMapTable  
  alaIpmsSsmMapConfigType  
  alaIpmsSsmMapConfigAddressType  
  alaIpmsSsmMapConfigValue  
  alaIpmsSsmMapGroupAddress  
  alaIpmsSsmMapGroupPrefixLength  
  alaIpmsSsmMapSourceListName
```

---

## show ip multicast bridge

Displays the IP multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

**show ip multicast bridge** [**vlan** [*vlan\_id*[-*vlan\_id2*] | **service** [*service\_id*[-*service\_id2*] | *ip\_address* | *mac\_address*] [**all-vrf**]

---

### Syntax Definitions

<b>vlan</b> [ <i>vlan_id</i> [- <i>vlan_id2</i> ]	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [ <i>service_id</i> [- <i>service_id2</i> ]	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<i>ip_address</i>	IP multicast group address.
<i>mac_address</i>	Group MAC address.
<b>all-vrf</b>	Display bridge table entries for all of the VRF instances.

### Defaults

By default, all bridge table entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use one of the optional parameters (*vlan\_id*, *service\_id*, *ip\_address*, *mac\_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
  - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

### Examples

```
-> show ip multicast bridge
```

```
Total 2 Bridge Entries
```

Vlan/Service	Type	Group Address	Host Address	Action	UpTime
vlan 1	asm	224.1.1.3		forwarding	00d:00h:00m
vlan 10	mac	01-00-5e-09-08-07		forwarding	00d:00h:00m

```
-> show ip multicast bridge vlan 10
```

```
Total 1 Bridge Entries
```

Vlan/Service	Type	Group Address	Host Address	Action	UpTime
vlan 10	mac	01-00-5e-09-08-07		forwarding	00d:00h:00m

### output definitions

<b>Vlan/Service</b>	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
<b>Type</b>	The bridge entry type ( <b>asm</b> , <b>ssm</b> , <b>mac</b> ). Configured through the <b>ip multicast forward-mode</b> command.
<b>Group Address</b>	If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address.
<b>Host Address</b>	The source IP host address (only applies to SSM bridge entries, otherwise this field is blank).
<b>Action</b>	The current action taken for the bridge entry ( <b>forwarding</b> or <b>filtering</b> ).
<b>UpTime</b>	The amount of time that has elapsed since the bridge entry was created.

### Release History

Release 8.3.1; command introduced.  
 Release 8.4.1.R02: **service** parameter added.

### Related Commands

**show ip multicast bridge-forward** Displays the forwarding state of the IP multicast bridge table entries.

### MIB Objects

```
alaIpmsBridgeTable
  alaIpmsBridgeConfigType
  alaIpmsBridgeAddressType
  alaIpmsBridgeValue
  alaIpmsBridgeType
  alaIpmsBridgeGroupAddress
  alaIpmsBridgeHostAddress
  alaIpmsBridgeUpTime
  alaIpmsBridgeAction
```

## show ip multicast bridge-forward

Displays the forwarding state of the IP multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ip multicast bridge-forward [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2] | ip_address | mac_address] [all-vrf]
```

---

### Syntax Definitions

<b>vlan</b> [vlan_id[-vlan_id2]	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [service_id[-service_id2]	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<i>ip_address</i>	IP multicast group address.
<i>mac_address</i>	Group MAC address.
<b>all-vrf</b>	Display bridge table entries for all of the VRF instances.

### Defaults

By default, all bridge table entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use one of the optional parameters (*vlan\_id*, *service\_id*, *ip\_address*, *mac\_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
  - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

### Examples

```
-> show ip multicast bridge-forward
```

```
Total 2 Bridge Entries
```

Vlan/Service	Type	Group Address	Host Address	Next Interface	UpTime
vlan 1	asm	224.1.1.3		1/4/12	00h:00m:01s
vlan 10	mac	01-00-5e-09-08-07		1/4/12	00h:00m:05s

```
-> show ip multicast bridge-forward vlan 10
```

```
Total 1 Bridge Entries
```

Vlan/Service	Type	Group Address	Host Address	Next Interface	UpTime
vlan 10	mac	01-00-5e-09-08-07		1/4/12	00h:00m:05s

### output definitions

<b>Vlan/Service</b>	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
<b>Type</b>	The bridge entry type ( <b>asm</b> , <b>ssm</b> , <b>mac</b> ). Configured through the <b>ip multicast forward-mode</b> command.
<b>Group Address</b>	If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address.
<b>Host Address</b>	The source IP host address (only applies to SSM bridge entries, otherwise this field is blank).
<b>Next Interface</b>	The destination interface for the bridge forwarding entry.
<b>UpTime</b>	The amount of time that has elapsed since the bridge forward entry was created.

### Release History

Release 8.3.1; command introduced.  
 Release 8.4.1.R02: **service** parameter added.

### Related Commands

**show ip multicast bridge** Displays the IP multicast bridge table entries.

### MIB Objects

```
alaIpmsBridgeForwardTable
  alaIpmsBridgeForwardConfigType,
  alaIpmsBridgeForwardAddressType,
  alaIpmsBridgeForwardValue,
  alaIpmsBridgeForwardType,

```

## show ip multicast bidir-forward

Displays the IP multicast Bidirectional Protocol Independent Multicast (BIDIR-PIM) forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

**show ip multicast bidir-forward** [*ip\_address*] [**all-vrf**]

---

### Syntax Definitions

*ip\_address* IP multicast group address.

**all-vrf** Display forwarding table entries for all of the virtual routing and forwarding (VRF) instances.

### Defaults

By default, BIDIR-PIM forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900

### Usage Guidelines

- Use the *ip\_address* parameter to display BIDIR-PIM forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the BIDIR-PIM forwarding table entries that exist in all of the VRF instances on the switch.

### Examples

```
-> vrf vrf-1 show ip multicast bidir-forward
```

```
VRF:vrf-1 Total 2 Forwards
```

Group Address	Egress	
	Vlan/Service	Interface
225.0.1.0	vlan 30	1/2/1
	vlan 30	1/2/2

```
-> show ip multicast bidir-forward all-vrf
```

```
VRF:default Total 3 Forwards
```

Group Address	Egress	
	Vlan/Service	Interface
225.0.1.0	vlan 20	1/1/1
	vlan 20	1/1/2
225.0.1.1	vlan 21	1/1/2

VRF:vrf-1 Total 2 Forwards

Group Address	Egress	
	Vlan/Service	Interface
225.0.1.0	vlan 30	1/2/1
	vlan 30	1/2/2

### output definitions

<b>VRF</b>	The VRF instance for the BIDIR route.
<b>Group Address</b>	IP group address for the BIDIR route.
<b>Egress VLAN/Service</b>	The destination VLAN or Shortest Path Bridging (SPB) service for the BIDIR route.
<b>Interface</b>	Destination VLAN port or SPB virtual port for the BIDIR route.

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

**show ip multicast bridge-forward** Displays the forwarding state of the IP multicast bridge table entries.

### MIB Objects

## show ip multicast profile

Displays a list of available IPMS configuration profiles or the parameter settings for a specific profile.

**show ip multicast profile** [*profile\_name*]

---

### Syntax Definitions

*profile\_name*                      The name of an existing IPMS profile.

### Defaults

By default, a list of available profiles is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The specified profile name must already exist in the switch configuration.

### Examples

```
-> show ip multicast profile
```

```
Total 2 Profiles
```

```
Profile Name
```

```
-----
```

```
default
```

```
IGMPv3 with Zapping
```

```
-> show ip multicast profile "IGMPv3 with Zapping"
```

## show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

**show ipv6 multicast** [**vlan** *vlan\_id* | **service** *service\_id*]

---

### Syntax Definitions

*vlan\_id* VLAN for which to display the configuration.  
*service\_id* SPB service ID number (1–32767).

### Defaults

By default, the status and general configuration parameters for the system are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Specify a VLAN ID to display the configuration information for a specific VLAN.
- Specify an SPB service ID to display the configuration information for a specific SPB service.

### Examples

```
-> show ipv6 multicast
```

```
Profile                = default,

```

### *output definitions*

<b>Profile</b>	The name of a predefined IPMS configuration profile that is assigned to this instance. Configured through the <b>ipv6 multicast profile</b> command.
<b>Status</b>	Whether the IPv6 Multicast Switching and Routing is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast admin-state</b> command.
<b>Flood Unknown</b>	Whether the flooding of initial unknown multicast traffic is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast flood-unknown</b> command.
<b>Version</b>	Displays the default MLD version, which can be <b>1</b> or <b>2</b> . Configured through the <b>ipv6 multicast version</b> command.
<b>Robustness</b>	Displays the MLD robustness value, ranging from <b>1</b> to <b>7</b> . (The default value is 2). Configured through the <b>ipv6 multicast robustness</b> command.
<b>Querying</b>	Whether MLD querying is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast querying</b> command.
<b>Query Interval (seconds)</b>	Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). Configured through the <b>ipv6 multicast query-interval</b> command.
<b>Query Response Interval (milliseconds)</b>	Displays the time (in milliseconds) taken to reply to an MLD query message. (The default value is 100 tenths-of-seconds). Configured through the <b>ipv6 multicast query-response-interval</b> command.
<b>Last Member Query Interval (milliseconds)</b>	Displays the time (in milliseconds) taken to reply to an MLD query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the <b>ipv6 multicast last-member-query-interval</b> command.
<b>Unsolicited Report Interval (seconds)</b>	Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). Configured through the <b>ipv6 multicast unsolicited-report-interval</b> command.
<b>Proxying</b>	Whether MLD proxying on the system is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast proxying</b> command.

*output definitions*

---

<b>Spoofing</b>	Whether MLD spoofing on the system is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast spoofing</b> command.
<b>Zapping</b>	Whether MLD zapping on the system is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast zapping</b> command.
<b>Querier Forwarding</b>	Whether MLD querier forwarding on the system is <b>Enabled</b> or <b>Disabled</b> (the default status). Configured through the <b>ipv6 multicast querier-forwarding</b> command.
<b>Router Timeout (seconds)</b>	Displays the MLD router timeout in seconds. (The default value is 90 seconds.) Configured through the <b>ipv6 multicast router-timeout</b> command.
<b>Source Timeout (seconds)</b>	Displays the MLD source timeout in seconds. (The default value is 30 seconds.) Configured through the <b>ipv6 multicast source-timeout</b> command.
<b>Max-group</b>	Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0 which means no limit is imposed). Configured through the <b>ipv6 multicast max-group</b> command.
<b>Max-group action</b>	Displays the action taken when the maximum group limit has been exceeded, which can be <b>none</b> , <b>drop</b> or <b>replace</b> . Configured through the <b>ipv6 multicast max-group</b> command.
<b>Helper-address</b>	Displays the destination IPv6 address of a relay host, where MLD host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) <i>This function is supported only in the VLAN domain; service domain is not supported.</i>
<b>Static Querier Address</b>	The Static Source IPv6 Address to be used when querying. (The default value of “::” indicates that this is not configured.) <i>This function is currently not supported.</i>
<b>Static Spoofing Address</b>	The Static Source IPv6 Address to be used when spoofing. (The default value of “::” indicates that this is not configured.) Configured through the <b>ipv6 multicast spoofing static-source-ip</b> command.
<b>Zero-based Query</b>	The current state of Zero-based Querying, which can be <b>disabled</b> or <b>enabled</b> (the default status). Configured through the <b>ipv6 multicast zero-based-query</b> command.
<b>Forward Mode</b>	Displays the current IPv6 Forwarding mode ( <b>asm</b> , <b>ssm</b> , <b>mac</b> , or <b>auto</b> ). Configured through the <b>ipv6 multicast forward-mode</b> command.
<b>Update Delay Interval (milliseconds)</b>	Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the <b>ipv6 multicast update-delay-interval</b> command.
<b>SSM Mapping</b>	Whether Source Specific Multicast (SSM) mapping is <b>enabled</b> or <b>disabled</b> (the default). When enabled, Any Source Multicast (ASM) group memberships are translated into SSM group memberships. Configured through the <b>ipv6 multicast ssm-map</b> command. <i>This function is currently not supported.</i>

---

*output definitions*

---

<b>Fast Join</b>	Whether the IP Multicast Switching fast join functionality is <b>enabled</b> or <b>disabled</b> (the default). When enabled, forwarding entries are automatically created in hardware as soon as group memberships are learned instead of waiting for the multicast traffic to reach the switch. Configured through the <b>ipv6 multicast fast-join</b> command.
<b>Initial Packet Buffering</b>	Whether Initial Packet Buffering is <b>enabled</b> or <b>disabled</b> (the default status). Configured through the <b>ipv6 multicast initial-packet-buffer admin-state</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i>
<b>Max Flows</b>	The maximum number of IPv6 multicast flows buffered for initial packet. Configured through the <b>ipv6 multicast initial-packet-buffer max-flow</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i>
<b>Max Packets Per Flow</b>	The maximum number of initial packets buffered per IPv6 multicast flow. Configured through the <b>ipv6 multicast initial-packet-buffer max-packet</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i>
<b>Buffer Timeout (seconds)</b>	The timeout value for the initial buffered IPv6 multicast packets. Configured through the <b>ipv6 multicast initial-packet-buffer timeout</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i>
<b>Min Delay (milliseconds)</b>	The minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Configured through the <b>ipv6 multicast initial-packet-buffer min-delay</b> command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i>

## show ipv6 multicast port

Displays the maximum group configuration applicable for the specified port or the specified Service Access Point (SAP) port. The current number of groups learned on a port, port/VLAN, SAP port, or SAP port/Shortest Path Bridging (SPB) service instance will also be displayed.

```
show ipv6 multicast {port [chassis/slot/port] | sap port [sap_id]}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>sap_id</i>	The SAP ID (chassis/slot/port:encapsulation).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Specify a port number to display the configuration information for a specific port.
- Specify a SAP ID to display the configuration information for a specific SAP port.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

### Examples

```
-> show ipv6 multicast port
```

```
Legends: Port Max-group      = Max-group limit on the port
          Port Action        = Max-group action on the port
          Port-VLAN Max-group = Active Max-group limit on the Port-Vlan instance
          Port-VLAN Action   = Active Max-group action on the Port-Vlan instance
```

```
Total 22 Port-Vlan Pairs
```

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/5/43	1001	0	0	none	0	none
1/6/23	1002	0	0	none	0	none

```
-> show ipv6 multicast port 1/6/23
```

Legends: Port Max-group = Max-group limit on the port  
 Port Action = Max-group action on the port  
 Port-VLAN Max-group = Active Max-group limit on the Port-Vlan instance  
 Port-VLAN Action = Active Max-group action on the Port-Vlan instance

Total 22 Port-Vlan Pairs

Port	VLAN	Current Groups	Port Max-group	Port Action	Port-VLAN Max-group	Port-VLAN Action
1/6/23	1001	0	0	none	0	none

### output definitions

---

<b>Port</b>	The slot and port number of the IP multicast port.
<b>VLAN</b>	The VLAN associated with the IP multicast port.
<b>Current Groups</b>	The current group associated with the IP Current groups.
<b>Port Max-group</b>	The maximum group count allowed on the port. This limit is applicable on the given port for all VLAN instances of the port.
<b>Port Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none, drop, or replace</b> ).
<b>Port-VLAN Max-group</b>	The maximum group limit learned per port for the specified VLAN or on the system if no VLAN is specified. This limit is applied to each port that is a member of the given VLAN and the specified action is taken when the limit is exceeded.
<b>Port-VLAN Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none, drop, or replace</b> ).

---

```
-> show ipv6 multicast sap port
```

Legends: Id Max-group = Max-group limit on the SAP/SDP port  
 Id Action = Max-group action on the SAP/SDP port  
 Id-Svc Max-group = Active Max-group limit on the SAP-Service or SDP-Service instance  
 Id-Svc Action = Active Max-group action on the SAP-Service or SDP-Service instance

Total 2 Id-Svc Pairs

Interface	Svc	Current Groups	Id Max-group	Id Action	Id-Svc Max-group	Id-Svc Action
sap:1/1/5:100	20	0	0	none	0	none
sap:1/1/23:200	30	0	0	none	0	none

```
-> show ipv6 multicast sap port 1/1/23:200
```

Legends: Id Max-group = Max-group limit on the SAP/SDP port  
 Id Action = Max-group action on the SAP/SDP port  
 Id-Svc Max-group = Active Max-group limit on the SAP-Service or SDP-Service instance  
 Id-Svc Action = Active Max-group action on the SAP-Service or SDP-Service instance

Total 1 Id-Svc Pairs

Interface	Svc	Current Groups	Id Max-group	Id Action	Id-Svc Max-group	Id-Svc Action
sap:1/1/23:200	30	0	0	none	0	none

### output definitions

<b>Interface</b>	The SAP (chassis/slot/port:encapsulation) that serves as the virtual port for the Shortest Path Bridging (SPB) service.
<b>Svc</b>	The SPB service ID number that is associated with the SAP.
<b>Current Groups</b>	The current group associated with the IP Current groups.
<b>Id Max-group</b>	The maximum group count allowed on the SAP port. This limit is applicable on the given port for all service instances of the port.
<b>Id Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none</b> , <b>drop</b> , or <b>replace</b> ).
<b>Id-Svc Max-group</b>	The maximum group limit learned per SAP port for the specified SPB service or on the system if no service is specified. This limit is applied to each SAP port that is a member of the given service and the specified action is taken when the limit is exceeded.
<b>Id-Svc Action</b>	The action to be taken when the group membership limit is exceeded ( <b>none</b> , <b>drop</b> , or <b>replace</b> ).

### Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **sap port** parameter added.

### Related Commands

  alaIpmsIntfStatsMaxGroupExceedAction

```

## show ipv6 multicast forward

Display the IPv6 Multicast Switching and Routing forwarding table entries for the specified IPv6 multicast group address or all entries if no IPv6 multicast address is specified.

```
show ipv6 multicast forward [ipv6_address] [vlan | service]] [all-vrf]
```

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 multicast group address.
<b>vlan</b>	Display forwarding table entries for the VLAN domain.
<b>service</b>	Display forwarding table entries for the service domain.
<b>all-vrf</b>	Display forwarding table entries for all of the VRF instances.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the *ip6\_address* parameter to display forwarding entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.

### Examples

```
-> show ipv6 multicast forward
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
ff05::6	4444::2	::	20	2/1	20	1/2
ff05::7	4444::2	::	20	2/1	20	1/2
ff06::1	::	::	100	2/1	21	1/2

```
-> show ipv6 multicast forward ff05::6
```

```
Total 1 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
ff05::6	4444::2	::	1	2/1	1	2/23

```
-> show ipv6 multicast forward vlan
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port

ff05::7	4444::2	::	20	2/1	20	1/2
ff06::1	::	::	100	2/1	21	1/2

### output definitions

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast forward.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast forward.
<b>Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast forward.
<b>VLAN</b>	VLAN associated with the IPv6 multicast forward.
<b>Port</b>	The slot and port number of the IPv6 multicast forward.

---

```
-> show ipv6 multicast forward service
```

```
Total 3 Forwards
```

Group Address	Host Address	Tunnel Address	Service	Ingress		Egress	
				Interface	Service Interface	Service Interface	Interface
ff05::6	4444::2	::	1	sap:1/5:10	1	sdp:32776	
ff05::7	4444::2	::	1	sap:1/5:20	1	sdp:32776	
ff06::1	::	::	1	sdp:32776	1	sap:1/5:1	

### output definitions

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast forward.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast forward.
<b>Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast forward.
<b>Service</b>	The Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast forward.
<b>Interface</b>	The SPB virtual port of the IPv6 multicast forward.

---

## Release History

Release 7.1.1; command was introduced.  
 Release 8.3.1; **all-vrf** parameter added.  
 Release 8.4.1; **domain** parameter added.  
 Release 8.4.1.R02; **domain** parameter deprecated.

## Related Commands

**ipv6 multicast static-group** Creates a static MLD group entry on a specified port on a specified VLAN.

**MIB Objects**

```

  alaIpmsForwardNextType
```

---

## show ipv6 multicast neighbor

Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

**show ipv6 multicast neighbor** [vlan | service] [all-vrf]

---

### Syntax Definitions

<b>vlan</b>	Display MLD neighbor table entries for the VLAN domain.
<b>service</b>	Display MLD neighbor table entries for the service domain.
<b>all-vrf</b>	Display MLD neighbor table entries for all of the VRF instances.

### Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **all-vrf** parameter option to display the IPv6 neighbor table entries that exist in all of the VRF instances on the switch.

### Examples

```
-> show ipv6 multicast neighbor vlan
```

```
Total 2 Neighbors
```

Host Address	VLAN	Port	Static	Count	Life
fe80::2a0:ccff:fed3:2853	1	2/1	no	1	6
::	1	2/13	yes	0	0

### *output definitions*

---

<b>Host Address</b>	The IPv6 address of the IPv6 multicast neighbor.
<b>VLAN</b>	The VLAN associated with the IPv6 multicast neighbor.
<b>Port</b>	The slot and port number of the IPv6 multicast neighbor.
<b>Static</b>	Whether it is a static MLD neighbor or not.
<b>Count</b>	Displays the count of the IPv6 multicast neighbor.
<b>Life</b>	The life time of the IPv6 multicast neighbor.

---

```
-> show ipv6 multicast neighbor service
```

```
Total 2 Queriers
```

Host Address	Service	Interface	Static	Count	Life
fe80::2a0:ccff:fed3:2853	1	SAP:1/5:10	no	5520	172
::	1	SAP:1/5:20	no	5520	172

### output definitions

<b>Host Address</b>	The IPv6 address of the IPv6 multicast querier.
<b>Service</b>	The Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast querier.
<b>Interface</b>	The SPB virtual port of the IPv6 multicast querier.
<b>Static</b>	Whether it is a static MLD neighbor or not.
<b>Count</b>	Displays the count of the IPv6 multicast querier.
<b>Life</b>	The life time of the IPv6 multicast querier.

## show ipv6 multicast querier

Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

**show ipv6 multicast querier** [**vlan** | **service**] [**all-vrf**]

---

### Syntax Definitions

<b>vlan</b>	Display group membership entries for the VLAN domain.
<b>service</b>	Display group membership entries for the service domain.
<b>all-vrf</b>	Display querier table entries for all of the VRF instances.

### Defaults

By default, only MLD querier entries specific to the current VRF instance are displayed

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **all-vrf** parameter option to display the MLD querier table entries that exist in all of the VRF instances on the switch.

### Examples

```
-> show ipv6 multicast querier vlan
```

```
Total 2 Queriers
```

Host Address	VLAN	Port	Static	Count	Life
fe80::2a0:ccff:fed3:2853	1	2/1	no	1	6
::	1	2/13	yes	0	0

### output definitions

---

<b>Host Address</b>	The IPv6 address of the IPv6 multicast querier.
<b>VLAN</b>	The VLAN associated with the IPv6 multicast querier.
<b>Port</b>	The slot and port number of the IPv6 multicast querier.
<b>Static</b>	Whether it is a static MLD neighbor or not.
<b>Count</b>	Displays the count of the IPv6 multicast querier.
<b>Life</b>	The life time of the IPv6 multicast querier.

---

```
-> show ipv6 multicast querier service
```

```
Total 2 Queriers
```

Host Address	Service	Interface	Static	Count	Life
fe80::2a0:ccff:fed3:2853	1	SAP:1/5:10	no	5520	172
::	1	SAP:1/5:20	no	5520	172

### output definitions

<b>Host Address</b>	The IPv6 address of the IPv6 multicast querier.
<b>Service</b>	The Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast querier.
<b>Interface</b>	The SPB virtual port of the IPv6 multicast querier.
<b>Static</b>	Whether it is a static MLD neighbor or not.
<b>Count</b>	Displays the count of the IPv6 multicast querier.
<b>Life</b>	The life time of the IPv6 multicast querier.

### Release History

Release 7.1.1; command was introduced  
 Release 8.3.1; **all-vrf** parameter added.  
 Release 8.4.1; **domain** parameter added.  
 Release 8.4.2.R02; **domain** parameter deprecated.

### Related Commands

**ipv6 multicast static-querier** Creates a static MLD querier entry on a specified port on a specified VLAN.

### MIB Objects

```
alaIpmsQuerierTable
  alaIpmsQuerierConfigType
  alaIpmsQuerierAddressType
  alaIpmsQuerierValue
  alaIpmsQuerierIfIndex
  alaIpmsQuerierHostAddress
  alaIpmsQuerierCount
  alaIpmsQuerierTimeout
  alaIpmsQuerierUpTime
alaIpmsStaticQuerierTable
  alaIpmsStaticQuerierConfigType
  alaIpmsStaticQuerierAddressType
  alaIpmsStaticQuerierValue
  alaIpmsStaticQuerierIfIndex
  alaIpmsStaticQuerierRowStatus
```

## show ipv6 multicast group

Displays the MLD group membership table entries of IPv6 Multicast Switching and Routing for the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

**show ipv6 multicast group** [*ipv6\_ddress*] [**vlan** | **service**] [**all-vrf**]

---

### Syntax Definitions

<i>ipv6_ddress</i>	IPv6 multicast group address.
<b>vlan</b>	Display group membership entries for the VLAN domain.
<b>service</b>	Display group membership entries for the service domain.
<b>all-vrf</b>	Display group membership entries for all of the VRF instances.

### Defaults

By default, all IPv6 multicast groups are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the *ipv6\_ddress* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD group membership table entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

### Examples

```
-> show ipv6 multicast group ff05::5
```

Group Address	Source Address	Vlan/Service	Interface	Mode	Static	Count	Life
ff05::5	::	vlan 21	1/1/19	exclude	no	1	145
ff05::5	::	service 20	SAP:1/5:10	exclude	no	5520	172

```
-> show ipv6 multicast group service
```

Total 3 Groups

Group Address	Source Address	Vlan/Service	Interface	Mode	Static	Count	Life
ff05::5	::	service 20	SAP:1/5:10	exclude	no	5520	172
ff05::6	::	service 20	SAP:1/5:20	exclude	no	5520	172
ff05::7	::	service 20	sdp:32776	exclude	no	5520	172

```
-> show ipv6 multicast group vlan
```

```
Total 3 Groups
```

Group Address	Source Address	Vlan/Service	Interface	Mode	Static	Count	Life
ff05::5	::	vlan 21	1/1/19	exclude	no	100	145
ff05::6	::	vlan 21	1/1/19	exclude	no	100	145
ff05::7	::	vlan 21	1/1/19	exclude	no	101	145
ff05::8	::	vlan 100	1/1/20	exclude	yes	0	0
ff05::9	::	vlan 101	1/1/21	exclude	yes	0	0

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
```

```
-> show ipv6 multicast group vlan
```

```
Total 3 Groups
```

Group Address	Source Address	Vlan/Service	Interface	Mode	Static	Count	Life
ff05::5	::	VlanToLab	1/1/19	exclude	no	100	145
ff05::6	::	VlanToLab	1/1/19	exclude	no	100	145
ff05::7	::	VlanToLab	1/1/19	exclude	no	101	145
ff05::8	::	VlanToCore	1/1/20	exclude	yes	0	0
ff05::9	::	VlanToDist	1/1/21	exclude	yes	0	0

### output definitions

<b>Group Address</b>	IPv6 address of the IPv6 multicast group.
<b>Source Address</b>	IPv6 address of the IPv6 multicast source.
<b>Vlan/Service</b>	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast group. If the global display interface names option is enabled, then the IPv6 interface name associated with the IPv6 multicast group is displayed.
<b>Interface</b>	The VLAN port or the SPB virtual port on which the group membership was learned.
<b>Mode</b>	MLD source filter mode.
<b>Static</b>	Whether it is a static MLD group or not.
<b>Count</b>	Number of MLD membership requests made.
<b>Life</b>	Life time of the MLD group membership.

### Release History

Release 7.1.1; command was introduced

Release 8.3.1; **all-vrf** parameter added.

Release 8.4.1; **domain** parameter added.

Release 8.4.2.R02; **domain** parameter deprecated.

## Related Commands

### **ipv6 multicast static-group**

Creates a static MLD group entry on a specified port for the specified VLAN or on the specified SPB virtual port for the specified SPB service.

## show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

**show ipv6 multicast source** [*ipv6\_address*] [**vlan** | **service**] [**all-vrf**]

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 multicast group address.
<b>vlan</b>	Displays source table entries for the VLAN domain.
<b>service</b>	Displays source table entries for the service domain.
<b>all-vrf</b>	Displays source table entries for all of the VRF instances.

### Defaults

By default, all source table entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the *ipv6\_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD source table entries that exist in all of the VRF instances on the switch.

### Examples

```
-> show ipv6 multicast source
```

```
Total 4 Sources
```

Group Address	Host Address	Source		Ingress	
		Tunnel Address	VLAN	Port	
ff05::5	4444::2	::	21		*
ff05::6	4444::2	::	21		*
ff06::1	::	::	20		*
ff06::1	::	::	20		*

```
-> show ipv6 multicast source ff05::6
```

```
Total 1 Sources
```

Group Address	Host Address	Source		Ingress	
		Tunnel Address	VLAN	Port	
ff05::6	4444::2	::	21		*

```
-> show ipv6 multicast source vlan
```

```
Total 1 Sources
```

Group Address	Host Address	Source		Ingress	
		Tunnel Address	VLAN	Port	
ff05::6	4444::2	::	1	*	

### *output definitions*

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast source.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast source.
<b>Source Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast source.
<b>Ingress VLAN</b>	VLAN associated with the IPv6 multicast source.
<b>Ingress Port</b>	The slot and port number of the IPv6 multicast source.

---

```
-> show ipv6 multicast source service
```

```
Total 4 Sources
```

Group Address	Host Address	Source		Ingress	
		Tunnel Address	Service	Interface	
ff05::6	4444::2	::	1	*	
ff05::7	4444::2	::	1	*	
ff06::1	::	::	1	*	
ff06::2	::	::	1	*	

### *output definitions*

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast source.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast source.
<b>Source Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast source.
<b>Ingress Service</b>	The Shortest Path Bridging (SPB) service ID number associated with the IPv6 multicast source.
<b>Ingress Interface</b>	The SPB virtual port number of the IPv6 multicast source.

---

## Release History

Release 7.1.1; command was introduced.  
 Release 8.3.1; **all-vrf** parameter added.  
 Release 8.4.1; **domain** parameter added.  
 Release 8.4.2.R02; **domain** parameter deprecated.

## Related Commands

### **show ipv6 multicast tunnel**

Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

## MIB Objects

```
alaIpmsSourceTable  
  alaIpmsSourceConfigType  
  alaIpmsSourceAddressType

## show ipv6 multicast tunnel

Displays the IPv6 Multicast Switching and Routing tunneling table entries matching the specified IPv6 multicast group address, or all entries if no IPv6 multicast address is specified.

**show ipv6 multicast tunnel** [*ipv6\_address*] [**vlan** | **service**] [**all-vrf**]

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 multicast group address.
<b>vlan</b>	Displays source table entries for the VLAN domain.
<b>service</b>	Displays source table entries for the service domain.
<b>all-vrf</b>	Display the IPv6 tunneling table entries for all of the VRF instances.

### Defaults

By default, all IPv6 tunnel entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the *ip\_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IPv6 multicast tunnel entries that exist in all of the VRF instances on the switch.

### Examples

```
-> show ipv6 multicast tunnel
```

```
Total 2 Tunnels
```

Group Address	Host Address	Destination Tunnel Address	Ingress Vlan/Service
ff05::6	4444::2	5555::3	vlan 21
ff05::7	4444::2	5555::3	vlan 21

#### *output definitions*

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast tunnel.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast tunnel.
<b>Destination Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast tunnel.
<b>Ingress Vlan/Service</b>	VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast tunnel. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast tunnel is displayed.

---

## Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

Release 8.4.1.R02; **vlan** and **service** parameters added.

## Related Commands

**show ipv6 multicast source** Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified

## MIB Objects

```

---

## show ipv6 multicast host-list

Displays the IPv6 multicast host address list configuration for the switch.

```
show ipv6 multicast host-list [host_list_name]
```

---

### Syntax Definitions

*host\_list\_name*                      The name of an existing IPv6 multicast host list.

### Defaults

By default, all host lists configured on the switch are displayed.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Use the *host\_list\_name* parameter to display information for a specific host list.

### Examples

```
-> show ipv6 multicast host-list
```

```
Total 2 Lists
```

Host List Name	Addresses
group-map1	3333::2 3333::3 3333::4
ssm-map1	4444::2 4444::3 4444::4

```
-> show ipv6 multicast host-list ssm-map1
```

Host List Name	Addresses
ssm-map1	4444::2 4444::3 4444::4

### Release History

Release 8.3.1.R02; command introduced.

## Related Commands

### [ipv6 multicast host-list](#)

Configures a list of host IPv6 addresses that is used for IPv6 multicast group maps and SSM maps.

## MIB Objects

```
alaIpmsHostListTable  
  alaIpmsHostListName  
  alaIpmsHostListAddressType  
  alaIpmsHostListAddress
```

---

## show ipv6 multicast ssm-map

Displays the IPv6 Source Specific Multicast (SSM) mapping configuration for the switch.

```
show ipv6 multicast ssm-map [vlan vlan_id]
```

---

### Syntax Definitions

*vlan\_id* VLAN for which to display the configuration.

### Defaults

By default, all IPv6 multicast SSM mappings configured on the switch are displayed.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

### Examples

```
-> show ipv6 multicast ssm-map
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
global 0    ff05::5/128        h-list1
vlan   200  ff05::6/128        h-list2

-> show ipv6 multicast ssm-map vlan 200
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
vlan   200  ff05::6/128        h-list2
```

### Release History

Release 8.3.1.R02; command introduced.

### Related Commands

[ipv6 multicast ssm-map](#) Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

**MIB Objects**

```
alaIpmsSsmMapTable  
  alaIpmsSsmMapConfigType  
  alaIpmsSsmMapConfigAddressType  
  alaIpmsSsmMapConfigValue  
  alaIpmsSsmMapGroupAddress  
  alaIpmsSsmMapGroupPrefixLength  
  alaIpmsSsmMapSourceListName
```

---

## show ipv6 multicast bridge

Displays the IPv6 multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

**show ipv6 multicast bridge** [**vlan** *vlan\_id*[-*vlan\_id2*] | **service** [*service\_id*[-*service\_id2*] | *ipv6\_address* | *mac\_address*] [**all-vrf**]

---

### Syntax Definitions

<b>vlan</b> [ <i>vlan_id</i> [- <i>vlan_id2</i> ]	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [ <i>service_id</i> [- <i>service_id2</i> ]	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<i>ipv6_address</i>	IPv6 multicast group address.
<i>mac_address</i>	Group MAC address.
<b>all-vrf</b>	Display bridge table entries for all of the VRF instances.

### Defaults

By default, all bridge table entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use one of the optional parameters (*vlan\_id*, *service-id*, *ipv6\_address*, *mac\_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
  - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

### Examples

```
-> show ipv6 multicast bridge vlan 130
```

```
Total 2 Bridge Entries
```

Vlan/Service	Type	Group Address	Host Address	Action	UpTime
vlan 130	asm	ff05::6		forwarding	00h:00m:04s
service 10	mac	33-33-00-01-01-01		flooding	00h:00m:05s

*output definitions*

---

<b>Vlan/Service</b>	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
<b>Type</b>	The bridge type for the IPv6 multicast bridge entry ( <b>asm</b> , <b>ssm</b> , <b>mac</b> ). Configured through the <b>ipv6 multicast forward-mode</b> command.
<b>Group Address</b>	If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address.
<b>Host Address</b>	The source IPv6 host address (only applies to SSM bridge entries, otherwise this field is blank).
<b>Action</b>	The current action taken for the bridge entry ( <b>forwarding</b> or <b>filtering</b> ).
<b>UpTime</b>	The amount of time that has elapsed since the bridge entry was created.

---

**Release History**

Release 8.3.1; command introduced.  
 Release 8.4.1.R02; **service** parameter added.

**Related Commands**

**show ipv6 multicast bridge-forward** Displays the forwarding state of the IPv6 multicast bridge table entries.

**MIB Objects**

```
alaIpmsBridgeTable
  alaIpmsBridgeConfigType
  alaIpmsBridgeAddressType
  alaIpmsBridgeValue
  alaIpmsBridgeType
  alaIpmsBridgeGroupAddress
  alaIpmsBridgeHostAddress
  alaIpmsBridgeUpTime
  alaIpmsBridgeAction
```

---

## show ipv6 multicast bridge-forward

Displays the forwarding state of the IPv6 multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ipv6 multicast bridge-forward [vlan vlan_id[-vlan_id2] | service [service_id[-service_id2] |
ipv6_address | mac_address] [all-vrf]
```

---

### Syntax Definitions

<b>vlan</b> [ <i>vlan_id</i> [- <i>vlan_id2</i> ]	Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
<b>service</b> [ <i>service_id</i> [- <i>service_id2</i> ]	Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs.
<i>ipv6_address</i>	IPv6 multicast group address.
<i>mac_address</i>	Group MAC address.
<b>all-vrf</b>	Display bridge table entries for all of the VRF instances.

### Defaults

By default, all bridge table entries are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use one of the optional parameters (*vlan\_id*, *service\_id*, *ipv6\_address*, *mac\_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
  - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
  - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

### Examples

```
-> show ipv6 multicast bridge-forward vlan 130
```

```
Total 2 Bridge Forwarding Entries
```

Vlan/Service	Type	Group Address	Host Address	Next Interface	UpTime
vlan 1	asm-partial	::1.1.2.3		1/4/12	00h:00m:10s
vlan 130	asm	33-33-ff-ff-ff-ff		1/4/12	00h:00m:07s

```
-> ipv6 multicast vlan 130 forward-mode mac
-> show ipv6 multicast bridge-forward vlan 130
```

Total 1 Bridge Forwarding Entries

Vlan/Service	Type	Group Address	Host Address	Next Interface	UpTime
vlan 130	mac	33-33-ff-ff-ff-ff		1/3/25	00h:00m:07s

### output definitions

<b>Vlan/Service</b>	The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry.
<b>Type</b>	The bridge entry type ( <b>asm</b> , <b>ssm</b> , <b>mac</b> ). Configured through the <b>ipv6 multicast forward-mode</b> command.
<b>Group Address</b>	If the bridge entry type is ASM or SSM, this field displays the destination IPv6 group address; if the bridge entry type is MAC, this field displays the destination MAC address.
<b>Host Address</b>	The source IPv6 host address (only applies to SSM bridge entries, otherwise this field is blank).
<b>Next Interface</b>	The destination interface for the bridge forwarding entry.
<b>UpTime</b>	The amount of time that has elapsed since the bridge forward entry was created.

### Release History

Release 8.3.1; command introduced.  
Release 8.4.1.R02; **service** parameter added.

### Related Commands

**show ipv6 multicast bridge** Displays the IPv6 multicast bridge table entries.

### MIB Objects

```
alaIpmsBridgeForwardTable
  alaIpmsBridgeForwardConfigType,
  alaIpmsBridgeForwardAddressType,
  alaIpmsBridgeForwardValue,
  alaIpmsBridgeForwardType,
  alaIpmsBridgeForwardGroupAddress,
  alaIpmsBridgeForwardHostAddress,
  alaIpmsBridgeForwardNextIfIndex,
  alaIpmsBridgeForwardNextSubValue
  alaIpmsBridgeForwardUpTime
```

## show ipv6 multicast bidir-forward

Displays the IPv6 multicast Bidirectional Protocol Independent Multicast (BIDIR-PIM) forwarding table entries for the specified IPv6 multicast group address or all the entries if no IPv6 multicast group address is specified.

**show ipv6 multicast bidir-forward** [*ipv6\_address*] [**all-vrf**]

---

### Syntax Definitions

*ipv6\_address* IPv6 multicast group address.  
**all-vrf** Display forwarding table entries for all of the VRF instances.

### Defaults

By default, BIDIR-PIM forwarding entries for all of the IPv6 multicast groups are displayed for the current VRF instance.

### Platforms Supported

OmniSwitch 9900

### Usage Guidelines

- Use the *ipv6\_address* parameter to display BIDIR-PIM forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the BIDIR-PIM forwarding table entries that exist in all of the VRF instances on the switch.

### Examples

```
-> show ipv6 multicast bidir-forward
```

```
Total 3 Forwards
      Egress
Group Address  VLAN  Port
-----+-----+-----
ff05::6       20    1/1
ff05::7       20    1/2
ff05::8       21    1/2
```

#### *output definitions*

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast forward.
<b>VLAN</b>	VLAN associated with the IPv6 multicast forward.
<b>Port</b>	The slot and port number of the IPv6 multicast forward.

---

### Release History

Release 8.3.1.R02; command was introduced.

## Related Commands

**show ipv6 multicast bridge-forward** Displays the forwarding state of the IPv6 multicast bridge table entries.

## MIB Objects

```
alaIpmsForwardTable  
  alaIpmsForwardConfigType  
  alaIpmsForwardAddressType  
  alaIpmsForwardValue

  alaIpmsForwardOrigAddress  
  alaIpmsForwardType  
  alaIpmsForwardNextConfigType  
  alaIpmsForwardNextValue  
  alaIpmsForwardNextIfIndex  
  alaIpmsForwardNextType
```

---

## show ipv6 multicast profile

Displays a list of available IPMS configuration profiles or the parameter settings for a specific profile.

**show ipv6 multicast profile** [*profile\_name*]

---

### Syntax Definitions

*profile\_name*                      The name of an existing IPMS profile.

### Defaults

By default, a list of available profiles is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The specified profile name must already exist in the switch configuration.

### Examples

```
-> show ipv6 multicast profile
```

```
Total 2 Profiles
```

```
Profile Name
```

```
-----
```

```
default
```

```
IGMPv3 with Zapping
```

```
-> show ip multicast profile "IGMPv3 with Zapping"
```

# 32 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the DVMRP commands is as follows:

*Filename:* ALCATEL-IND1-VIRTUALROUTER-MIB.mib  
*Module:* alcatelIND1VirtualRouterMIB

*Filename:* ALCATEL-IND1-DVMRP-MIB.mib  
*Module:* alcatelIND1DVMRPMIB

*Filename:* DVMRP-STD-MIB.mib  
*Module:* dvmrpStdMIB

A summary of the available commands is listed here:

---

**ip load dvmrp**  
**ip dvmrp admin-state**  
**ip dvmrp flash-interval**  
**ip dvmrp graft-timeout**  
**ip dvmrp interface**  
**ip dvmrp interface metric**  
**ip dvmrp interface mbr-default-information**  
**ip dvmrp neighbor-interval**  
**ip dvmrp neighbor-timeout**  
**ip dvmrp prune-lifetime**  
**ip dvmrp prune-timeout**  
**ip dvmrp report-interval**  
**ip dvmrp route-holddown**  
**ip dvmrp route-timeout**  
**ip dvmrp subord-default**  
**show ip dvmrp**  
**show ip dvmrp interface**  
**show ip dvmrp neighbor**  
**show ip dvmrp nexthop**  
**show ip dvmrp prune**  
**show ip dvmrp route**  
**show ip dvmrp tunnel**

---

## ip load dvmrp

Dynamically loads DVMRP to memory.

**ip load dvmrp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the [ip dvmrp admin-state command on page 32-3](#).

### Examples

```
-> ip load dvmrp
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip dvmrp admin-state](#) Globally enables or disables DVMRP protocol on the switch.

### MIB Objects

```
alaVrConfigTable  
  alaVrConfigDvmrpStatus
```

---

## ip dvmrp admin-state

Globally enables or disables DVMRP protocol on the switch.

**ip dvmrp admin-state** {enable | disable}

---

### Syntax Definitions

**enable** Administratively enables DVMRP on the switch.  
**disable** Administratively disables DVMRP on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the [ip load dvmrp command on page 32-2](#).
- To enable or disable DVMRP for a particular interface, refer to the [ip dvmrp interface command on page 32-6](#).

### Examples

```
-> ip dvmrp admin-state enable  
-> ip dvmrp admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.  
[ip load dvmrp](#) Dynamically loads DVMRP to memory.  
[show ip dvmrp](#) Displays global DVMRP parameters, including current status.

### MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpAdminStatus
```

---

## ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

**ip dvmrp flash-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the interval value, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

### Examples

```
-> ip dvmrp flash-interval 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

### MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpFlashUpdateInterval
```

---

## ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

**ip dvmrp graft-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the graft message retransmission value, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp graft-timeout 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpGraftRetransmission

---

## ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

**ip dvmrp interface** {*interface\_name*}

**no ip dvmrp interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to delete an interface.

### Examples

```
-> ip dvmrp interface vlan-10
-> no ip dvmrp interface vlan-10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp admin-state</a>	Globally enables or disables the DVMRP protocol on the switch.
<a href="#">ip dvmrp interface metric</a>	Configures the distance metric for an interface, which is used to calculate distance vectors.
<a href="#">show ip dvmrp interface</a>	Displays information for all multicast-capable interfaces.

### MIB Objects

dvmrpInterfaceTable  
    dvmrpInterfaceLocalAddress  
    dvmrpInterfaceStatus

---

## ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

**ip dvmrp interface** *interface\_name* **metric value**

---

### Syntax Definitions

*interface\_name*                      The name of the interface.  
*value*                                      Specifies the metric value (1–31).

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

### Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip dvmrp interface](#)                      Enables or disables the DVMRP protocol on a specified interface.  
[show ip dvmrp interface](#)                Displays the DVMRP interface table.

### MIB Objects

dvmrpInterfaceTable  
  dvmrpInterfaceLocalAddress  
  dvmrpInterfaceMetric

---

## ip dvmrp interface mbr-default-information

Configures a DVMRP interface to advertise the default route for the interface. This command only applies when the local switch is operating in the Multicast Border Router (MBR) mode.

**ip dvmrp interface** *interface\_name* **mbr-default-information** {**enable** | **disable**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>enable</b>	Enables advertisement of the default route on the specified interface.
<b>disable</b>	Disables advertisement of the default route on the specified interface.

### Defaults

By default, advertising the default route is disabled.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Advertising a default route on the DVMRP interface provides a method for ensuring that sources inside the PIM domain can reach all routers inside the DVMRP domain.
- Make sure that the default route is not advertised on the MBONE.

### Examples

```
-> ip dvmrp interface mbr-default-information enable
-> ip dvmrp interface mbr-default-information disable
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

<a href="#">ip dvmrp interface</a>	Enables or disables the DVMRP protocol on a specified interface.
<a href="#">show ip dvmrp interface</a>	Displays the DVMRP interface table.

### MIB Objects

```
alaDvmrpIfAugTable
  alaDvmrpIfMbrDefaultInfoStatus
```

---

## ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

**ip dvmrp neighbor-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the probe interval time, in seconds (5–30).

### Defaults

parameter	default
<i>seconds</i>	10

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp neighbor-interval 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [ip dvmrp neighbor-timeout](#) Configures the neighbor timeout.
- [show ip dvmrp neighbor](#) Displays the DVMRP neighbor table.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpNeighborProbeInterval

---

## ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

**ip dvmrp neighbor-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the neighbor timeout, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	35

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp neighbor-timeout 35
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp neighbor-interval</a>	Configures the neighbor probe interval time.
<a href="#">show ip dvmrp neighbor</a>	Displays the DVMRP neighbor table.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpNeighborTimeout

---

## ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

**ip dvmrp prune-lifetime** *seconds*

---

### Syntax Definitions

*seconds* Specifies the prune lifetime, in seconds (180–86400).

### Defaults

parameter	default
<i>seconds</i>	7200

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp prune-lifetime 7200
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp prune-timeout</a>	Configures the prune packet retransmission value.
<a href="#">show ip dvmrp prune</a>	Displays DVMRP prune entries, including the router's upstream prune state.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpPruneLifetime

---

## ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

**ip dvmrp prune-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies retransmission time, in seconds (30–86400).

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp prune-timeout 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [ip dvmrp prune-lifetime](#) Indicates the length of time a prune will be in effect.
- [show ip dvmrp prune](#) Displays DVMRP prune entries, including the router's upstream prune state.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpPruneRetransmission

---

## ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

**ip dvmrp report-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the report interval, in seconds (10–2000).

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp report-interval 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip dvmrp route](#) Displays the DVMRP routes that are being advertised to other routers.

[show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteReportInterval

---

## ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

**ip dvmrp route-holddown** *seconds*

---

### Syntax Definitions

*seconds* Specifies the holddown time, in seconds (1–86400).

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp route-holddown 120
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp route-timeout</a>	Configures the route expiration timeout value.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.
<a href="#">show ip dvmrp route</a>	Displays the DVMRP routes that are being advertised to other routers.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteHoldDown

---

## ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

**ip dvmrp route-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the timeout value, in seconds (20–4000).

### Defaults

parameter	default
<i>seconds</i>	140

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp route-timeout 140
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip dvmrp route-holddown](#) Configures the time during which DVMRP routes are kept in a hold down state.

[show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteExpirationTimeout

---

## ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

**ip dvmrp subord-default {true | false}**

---

### Syntax Definitions

<b>true</b>	DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery.
<b>false</b>	DVMRP neighbors are <i>not</i> assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency.

### Defaults

---

parameter	default
true   false	true

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a subordinate be changed to false.
- To view the current subordinate neighbor status, use the [show ip dvmrp](#) command. For more information, refer to [page 32-18](#).

### Examples

```
-> ip dvmrp subord-default false
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ip dvmrp**

Displays the global DVMRP parameters.

**MIB Objects**

alaDvmrpGlobalConfig

    alaDvmrpInitNbrASSubord

---

## show ip dvmrp

Displays the global DVMRP parameters configuration.

**show ip dvmrp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip dvmrp
DVMRP Admin Status          = enabled,
Flash Interval               = 5,
Graft Timeout                = 5,
Neighbor Interval           = 10,
Neighbor Timeout             = 35,
Prune Lifetime               = 7200,
Prune Timeout                = 30,
Report Interval              = 60,
Route Holddown               = 120,
Route Timeout                = 140,
Subord Default                = true,
BFD status                    = disabled,
MBR Operational Status       = enabled,

Number of Routes              = 3,
Number of Reachable Routes    = 3
```

### *output definitions*

---

#### **DVMRP Admin Status**

The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, use the **ip dvmrp admin-state** command.

#### **Flash Interval**

The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

*output definitions (continued)*

---

<b>Graft Timeout</b>	The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Valid range from 5–86400. The default value is 5.
<b>Neighbor Interval</b>	The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Valid range from 5–30. The default value is 10.
<b>Neighbor Timeout</b>	The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Valid range from 5–86400. The default value is 35.
<b>Prune Lifetime</b>	The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Valid range from 180–86400. The default value is 7200.
<b>Prune Timeout</b>	The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Valid range from 30–86400. The default value is 30.
<b>Report Interval</b>	The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Valid range from 10–2000. The default value is 60.
<b>Route Holddown</b>	The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Valid range from 1–120. The default value is 120.
<b>Route Timeout</b>	The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Valid range from 20–4000. The default value is 140.
<b>Subord Default</b>	Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, use the <b>ip dvmrp subord-default</b> command. Options include <b>true</b> and <b>false</b> . The default value is true.
<b>BFD Status</b>	Not supported in the current release.
<b>MBR Operational Status</b>	Indicates whether or not DVMRP interaction with PIM is <b>enabled</b> or <b>disabled</b> on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

*output definitions (continued)*

---

<b>Number of Routes</b>	The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes.
<b>Number of Reachable Routes</b>	The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR Operational Status** field added.

**Related Commands**

<b>ip dvmrp admin-state</b>	Globally enables or disables DVMRP protocol on the switch.
<b>ip dvmrp flash-interval</b>	Configures the minimum flash update interval value.
<b>ip dvmrp graft-timeout</b>	Configures the graft message retransmission value.
<b>ip dvmrp neighbor-timeout</b>	Configures the neighbor timeout.
<b>ip dvmrp prune-lifetime</b>	Indicates the length of time a prune will be in effect.
<b>ip dvmrp prune-timeout</b>	Configures the prune packet retransmission value.
<b>ip dvmrp report-interval</b>	Configures the route report interval.
<b>ip dvmrp route-holddown</b>	Configures the time during which DVMRP routes are kept in a hold down state.
<b>ip dvmrp route-timeout</b>	Configures the route expiration timeout value.
<b>ip dvmrp subord-default</b>	Configures the neighbor probe interval time.

## show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

**show ip dvmrp interface** [*ip\_address* | *interface\_name* | **enabled** | **disabled**]

---

### Syntax Definitions

<i>ip_address</i>	Specifies a particular interface IP address.
<i>interface_name</i>	The name of the interface.
<b>enabled</b>	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>enabled</i> .
<b>disabled</b>	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>disabled</i> .

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as **enabled** in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

### Examples

```
-> show ip dvmrp interface
```

```
Total 4 Interfaces
```

Interface Name	Vlan	Metric	Admin-Status	Oper-Status	BFD-Status	MBR-Default
vlan-4	4	1	Disabled	Disabled	Disabled	Disabled
vlan-6	6	1	Enabled	Enabled	Disabled	Enabled

```
-> show ip dvmrp interface enabled
```

```
Total 1 Interfaces
```

Interface Name	Vlan	Metric	Admin-Status	Oper-Status	BFD-Status	MBR-Default
vlan-6	6	1	Enabled	Enabled	Disabled	Enabled

### output definitions

<b>Interface Name</b>	The name of the interface.
<b>Vlan</b>	The associated VLAN ID.
<b>Tunnel</b>	Indicates whether there is a DVMRP tunnel currently configured on the interface.
<b>Metric</b>	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
<b>Admin-Status</b>	The current administrative status of the corresponding interface. Options include <b>Enabled</b> or <b>Disabled</b> . An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the <a href="#">ip dvmrp interface</a> command.
<b>Oper-Status</b>	The current operational status of the corresponding multicast-capable interface. Options include <b>Enabled</b> or <b>Disabled</b> . For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the <a href="#">ip dvmrp admin-state</a> command.
<b>BFD-Status</b>	Not supported in the current release.
<b>MBR-Default</b>	Whether or not the DVMRP interface will advertise a default route when the interface is configured on a Multicast Border Router. Options include <b>Enabled</b> or <b>Disabled</b> . Configured through the <a href="#">ip dvmrp interface mbr-default-information</a> command.

### Release History

Release 7.1.1; command was introduced.  
Release 7.3.2; **MBR-Default** field added.

### Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.

### MIB Objects

```
dvmrpInterfaceGroup
  dvmrpInterfaceLocalAddress
  dvmrpInterfaceMetric
  dvmrpInterfaceStatus
alaDvmrpIfAugTable
  alaDvmrpIfMbrDefaultInfoStatus
```

## show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

**show ip dvmrp neighbor** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* Specifies a particular IP address for a neighboring DVMRP router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

### Examples

-> show ip dvmrp neighbor

Neighbor Address	Intf Name	Uptime	Expires	GenID	Vers	State
143.209.92.214	vlan-2	00h:09m:12s	00h:00m:06s	546947509	3.255	active

#### *output definitions*

---

<b>Neighbor Address</b>	The 32-bit IP address of the DVMRP neighbor's router interface.
<b>Intf Name</b>	The interface name of the neighbor's router.
<b>Uptime</b>	The amount of time the neighbor has been running, displayed in hours, minutes, and seconds.
<b>Expires</b>	The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds.
<b>GenID</b>	The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent.
<b>Version</b>	The DVMRP version number for the neighbor.
<b>State</b>	The current state of the DVMRP neighbor. Options include <b>active</b> and <b>down</b> .

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip dvmrp neighbor-interval** Configures the neighbor probe interval time.  
**ip dvmrp neighbor-timeout** Configures the neighbor timeout.

## MIB Objects

```
dvmrpNeighborTable  
  dvmrpNeighborAddress  
  dvmrpNeighborIfIndex  
  dvmrpNeighborUpTime  
  dvmrpNeighborExpiryTime  
  dvmrpNeighborGenerationId  
  dvmrpNeighborMajorVersion  
  dvmrpNeighborMinorVersion  
  dvmrpNeighborState
```

---

## show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

**show ip dvmrp nexthop** [*ip\_address ip\_mask*]

---

### Syntax Definitions

<i>ip_address</i>	Specifies a source IP address for which DVMRP next hop entries will be displayed.
<i>ip_mask</i>	Specifies a source IP mask for which DVMRP next hop entries will be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

### Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0
```

Src Address/Mask	Interface Name	Vlan	Hop Type
172.22.2.115/24	vlan-2	2	branch

#### *output definitions*

---

<b>Src Address/Mask</b>	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
<b>Interface Name</b>	The name of the interface.
<b>Vlan</b>	The associated VLAN ID.
<b>Hop Type</b>	The hop type of the associated entry. Options include <b>leaf</b> or <b>branch</b> . If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as <b>branch</b> .

---

---

## show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

**show ip dvmrp prune** [*group\_address source\_address source\_mask*]

---

### Syntax Definitions

<i>group_address</i>	Specifies a pruned group address.
<i>source_address</i>	Specifies a source IP address.
<i>source_mask</i>	Specifies a source IP mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

### Examples

```
-> show ip dvmrp prune
```

```
Group Address      Source Address/Mask  Expires
-----+-----+-----
225.0.0.4          143.209.92.14/24    00h:00m:30s
```

#### *output definitions*

---

<b>Group Address</b>	The 32-bit multicast group address.
<b>Source Address/Mask</b>	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
<b>Expires</b>	The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip dvmrp prune-lifetime](#)

Indicates the length of time a prune will be in effect.

[ip dvmrp prune-timeout](#)

Configures the prune packet retransmission value.

## MIB Objects

dvmrpPruneTable

    dvmrpPruneGroup

    dvmrpPruneSource

    dvmrpPruneSourceMask

    dvmrpPruneExpiryTime

---

## show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

**show ip dvmrp route** [*ip\_address ip\_mask*]

---

### Syntax Definitions

*ip\_address*                      The 32-bit source IP address representing route(s).  
*ip\_mask*                            A 32-bit number that determines the subnet mask for the IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

### Examples

```
-> show ip dvmrp route
Legends:  Flags:  L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid
          Address/Mask      Gateway      Metric      Age          Expires      Flags
-----+-----+-----+-----+-----+-----
          11.0.0.0/8         55.0.0.5    2           00h:13m:14s  02m:07s     R
          22.0.0.0/8         44.0.0.4    2           00h:33m:14s  02m:15s     R
          44.0.0.0/8         -           1           05h:24m:59s  -           L
          55.0.0.0/8         -           1           05h:24m:59s  -           L
          66.0.0.0/8         44.0.0.4    2           00h:03m:11s  02m:15s     R
```

#### *output definitions*

---

<b>Address/Mask</b>	The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24, etc.
<b>Gateway</b>	The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes.
<b>Metric</b>	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
<b>Age</b>	The current age of the DVMRP route, displayed in hours, minutes, and seconds.

*output definitions (continued)*

---

<b>Expires</b>	The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes.
<b>Flags</b>	The flag type of a particular DVMRP route. Options include <b>L</b> (Local), <b>R</b> (Remote), <b>F</b> (Flash), <b>H</b> (Holddown), and <b>I</b> (Invalid).

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">ip dvmrp report-interval</a>	Configures the route report interval.
<a href="#">ip dvmrp route-holddown</a>	Configures the time during which DVMRP routes are kept in a hold down state.
<a href="#">ip dvmrp route-timeout</a>	Configures the route expiration timeout value.

**MIB Objects**

```
dvmrpRouteTable
  dvmrpRouteSource
  dvmrpRouteSourceMask
  dvmrpRouteMetric
  dvmrpRouteExpiryTime
  dvmrpRouteUpTime
```

---

## show ip dvmrp tunnel

Displays DVMRP tunnel entries.

**show ip dvmrp tunnel** [*local\_address remote\_address*]

---

### Syntax Definitions

*local\_address*

The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.

*remote\_mask*

The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

### Examples

-> show ip dvmrp tunnel

Interface Name	Local Address	Remote Address	TTL	Status
vlan-2	143.209.92.203	12.0.0.1	255	Enabled

#### *output definitions*

---

<b>Interface Name</b>	The interface name.
<b>Local Address</b>	The 32-bit local IP address for the DVMRP tunnel.
<b>Remote Address</b>	The 32-bit remote IP address for the DVMRP tunnel.
<b>TTL</b>	The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Valid range from 0–255.
<b>Status</b>	The corresponding interface status. Options include <b>Enabled</b> or <b>Disabled</b> . If the interface specified by the local address has been configured and is operationally enabled, the status is <b>Enabled</b> . If the interface is down, the value displayed is <b>Disabled</b> .

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

# 33 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only through specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs).

PIM-SM builds unidirectional shared trees that are rooted at a Rendezvous Point (RP) multicast router. Bidirectional PIM (BIDIR-PIM) is a variant of PIM-SM that builds bidirectional shared trees also rooted at an RP. However, BIDIR-PIM forwards packets from the source to the RP without the overhead of encapsulation or source-specific states.

PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

The OmniSwitch implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

*Filename:* ALCATEL-IND1-VIRTUALROUTER-MIB.mib  
*Module:* alcatelIND1VirtualRouterMIB

*Filename:* ALCATEL-IND1-PIM-MIB.mib  
*Module:* alcatelIND1PIMMIB

*Filename:* PIM-BSR-MIB.mib  
*Module:* pimBsrMIB

*Filename:* PIM-STD-MIB.mib  
*Module:* pimStdMIB

A summary of the available commands is listed here:

---

<b>ip load pim</b>	<b>show ip pim static-rp</b>

---

## ip load pim

Dynamically loads PIM to memory.

**ip load pim**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip load pim
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip pim sparse admin-state</b>	Globally enables or disables the PIM-SM protocol on the switch.
<b>ip pim bidir admin-state</b>	Globally enables or disables the BIDIR-PIM protocol on the switch.
<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>ip pim dense admin-state</b>	Globally enables or disables PIM-DM protocol on the switch.
<b>show ip pim dense</b>	Displays the status of the various global parameters for the PIM Dense mode.
<b>ipv6 pim sparse admin-state</b>	Enables or disables IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>ipv6 pim bidir admin-state</b>	Enables or disables IPv6 BIDIR-PIM (bidirectional) globally for IPv6.
<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
<b>ipv6 pim dense admin-state</b>	Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.
<b>show ipv6 pim dense</b>	Displays the status of the various global parameters for the IPv6 PIM dense mode.

## MIB Objects

```
alaVrConfigTable  
  alaVrConfigPimStatus
```

---

## ip pim sparse admin-state

Globally enables or disables PIM-SM protocol on the switch.

**ip pim sparse admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Globally enables PIM-SM on the switch.
<b>disable</b>	Globally disables PIM-SM on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip pim sparse admin-state enable
-> ip pim sparse admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ip pim sparse</a>	Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmAdminStatus
```

---

## ip pim bidir admin-state

Globally enables or disables the BIDIR-PIM protocol on the switch.

```
ip pim bidir admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Globally enables BIDIR-PIM on the switch.
<b>disable</b>	Globally disables BIDIR-PIM on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- BIDIR-PIM is a variant of PIM-SM, which means that PIM-SM must also be globally enabled on the switch.

### Examples

```
-> ip pim bidir admin-state enable  
-> ip pim bidir admin-state disable
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ip pim sparse</a>	Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
alaPimsmBidirStatus
```

---

## ip pim dense admin-state

Globally enables or disables PIM-DM protocol on the switch.

```
ip pim dense admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Globally enables PIM-DM on the switch.
<b>disable</b>	Globally disables PIM-DM on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip pim dense admin-state enable  
-> ip pim dense admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ip pim dense</a>	Displays the status of the various global parameters for the PIM dense mode.

### MIB Objects

```
alaPimdmGlobalConfig  
alaPimdmAdminStatus
```

---

## ip pim rp-hash admin-state

Configures the version of the hashing algorithm that the Rendezvous Point (RP) hashing function will use to select an RP.

**ip pim rp-hash admin-state {enable | disable}**

---

### Syntax Definitions

**enable** Applies the newer version of the hashing algorithm.  
**disable** Applies the legacy version of the hashing algorithm.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The RP hashing function is applied when selecting an RP from two or more equal group-range-to-RP mappings.
- To maintain interoperability between PIM routers, make sure all routers have the same setting for the RP hash function. For example, this function is enabled for all PIM routers or this function is disabled for all PIM routers.

### Examples

```
-> ip pim rp-hash admin-state enable  
-> ip pim rp-hash admin-state disable
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmRPHashStatus
```

---

## ip pim ssm group

Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ip pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ip pim ssm group group_address/prefix_length
```

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>override</b>	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

### Examples

```
-> ip pim ssm group 225.0.0.0/24 priority 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ip pim ssm group</b>	Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.
<b>show ip pim group-map</b>	Displays the PIM group mapping table.

## MIB Objects

```
pimStaticRPTable  
  pimStaticRPGrpAddress  
  pimStaticRPGrpPrefixLength  
  pimStaticRPPimMode  
  pimStaticRPPrecedence  
  pimStaticRPOverrideDynamic  
  pimStaticRPRowStatus
```

---

## ip pim dense group

Statically maps the specified IP multicast group(s) to the PIM Dense mode (DM).

**ip pim dense group** *group\_address/prefix\_length* [[**no**] **override**] [**priority** *priority*]

**no ip pim dense group** *group\_address/prefix\_length*

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>override</b>	Specifies that this static Dense mode mapping configuration should override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

### Examples

```
-> ip pim dense group 225.0.0.0/24 priority 50
```

### Release History

Release 7.1.1; command was introduced.

```

---

## ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

**ip pim cbsr** *ip\_address* [**priority** *priority*] [**mask-length** *bits*]

**no ip pim cbsr** *ip\_address*

---

### Syntax Definitions

<i>ip_address</i>	Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<i>priority</i>	Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0–255.
<i>bits</i>	Specifies a 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1–32.

### Defaults

parameter	default
<i>priority</i>	64
<i>bits</i>	30

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

### Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### `show ip pim cbsr`

Displays the Candidate-BSR information that is used in the Bootstrap messages.

## MIB Objects

```
pimBsrCandidateBSRTable
  pimBsrCandidateBSRAddress
  pimBsrCandidateBSRPriority
  pimBsrCandidateBSRHashMaskLength
  pimBsrCandidateBSRRowStatus
```

---

## ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

**ip pim static-rp** *group\_address/prefix\_length rp\_address* [[no] **bidir**] [[no] **override**] [**priority** *priority*]

**no ip pim static-rp** *group\_address/prefix\_length rp\_address*

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<i>rp_address</i>	Specifies a 32-bit Rendezvous Point (RP) address.
<b>bidir</b>	Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
<b>override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range

- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority
- To view current static RP configuration settings, use the **show ip pim static-rp** command.

## Examples

```
-> ip pim static-rp 225.0.0.0/24 10.1.1.1 priority 10
-> ip pin static-rp 225.0.0.0/24 10.1.1.1 bidir override
-> no ip pin static-rp 225.0.0.0/24 10.1.1.1
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

## Related Commands

<a href="#">show ip pim sparse</a>	Displays the status of the various global parameters for the PIM sparse mode.
<a href="#">show ip pim static-rp</a>	Displays the PIM static RP table for ASM mode, which includes the group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).
<a href="#">show ip pim group-map</a>	Displays the PIM group mapping table.

## MIB Objects

```
pimStaticRPTable
  pimStaticRPGrpAddress
  pimStaticRPGrpPrefixLength
  pimStaticRPRPAddress
  pimStaticRPPimMode
  pimStaticRPOverrideDynamic
  pimStaticRPPrecedence
  pimStaticRPRowStatus
```

---

## ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

**ip pim candidate-rp** *rp\_address group-address/prefix\_length* [[**no**] **bidir**] [**priority** *priority*] [**interval** *seconds*]

**no ip pim candidate-rp** *rp\_address group-address/prefix\_length*

---

### Syntax Definitions

<i>rp_address</i>	Specifies a 32-bit address that will be advertised as a Candidate-RP.
<i>group_address</i>	Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>bidir</b>	Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

### Defaults

parameter	default
[ <b>no</b> ] <b>bidir</b>	<b>no bidir</b>
<i>priority</i>	192
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp\_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple C-RP entries are defined, they must specify the same *rp-address*.
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the C-RP entries.

- This command is supported only in the sparse mode.

## Examples

```
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 priority 100 interval 100
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 bidir priority 100 interval 100
-> no ip pim candidate-rp 50.1.1.1 225.0.0.0/24
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

## Related Commands

**show ip pim candidate-rp** Displays the IP multicast groups for which the local router will advertise itself as a Candidate-RP.

## MIB Objects

```
pimBsrCandidateRPTable
  pimBsrCandidateRPAddress
  pimBsrCandidateRPGroupAddress
  pimBsrCandidateRPGroupPrefixLength

  pimBsrCandidateRPPriority
  pimBsrCandidateRPAdvInterval
  pimBsrCandidateRPRowStatus
```

---

## ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

**ip pim rp-threshold** *bps*

---

### Syntax Definitions

*bps* The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

### Defaults

parameter	default
<i>bps</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the [show ip pim sparse](#) command.

### Examples

```
-> ip pim rp-threshold 131072
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the global parameters for PIM sparse mode.

### MIB Objects

alaPismGlobalConfig  
alaPismRPThreshold

---

## ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

**ip pim keepalive-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the timeout value, in seconds (0-65535).

### Defaults

parameter	default
<i>seconds</i>	210

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

### Examples

```
-> ip pim keepalive-period 500
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>show ip pim dense</b>	Displays the status of the various global parameters for the PIM dense mode.
<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
<b>show ipv6 pim dense</b>	Displays the status of the various global parameters for the IPv6 PIM dense mode.

## MIB Objects

pim  
pimKeepalivePeriod

---

## ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

**ip pim max-rps** *number*

---

### Syntax Definitions

*number* The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

### Defaults

parameter	default
<i>number</i>	32

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the [ip pim sparse admin-state command on page 33-5](#).

### Examples

```
-> ip pim max-rps 32
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

## MIB Objects

alaPimsmGlobalConfig  
alaPimsmMaxRPs

---

## ip pim probe-time

Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.

**ip pim probe-time** *seconds*

---

### Syntax Definitions

*seconds*                                      The probe time, in seconds (1–300).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is used with both IPv4 and IPv6 PIM-SM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim probe-time 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#)                              Displays the status of the various global parameters for the PIM sparse mode.

[show ipv6 pim sparse](#)                              Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

alaPimsmGlobalConfig  
  alaPimsmProbeTime

---

## ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

**ip pim register checksum {header | full}**

---

### Syntax Definitions

<b>header</b>	Specifies that the checksum for registers is done only on the PIM header.
<b>full</b>	Specifies that the checksum is done over the entire PIM register message.

### Defaults

---

parameter	default
header   full	header

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

## ip pim register-suppress-timeout

Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

**ip pim register-suppress-timeout** *seconds*

---

### Syntax Definitions

*seconds*                                      The timeout value, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim register-suppress-timeout 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## ip pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

**ip pim spt admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables last hop DR switching to the SPT.
<b>disable</b>	Disables last hop DR switching to the SPT.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the [show ip pim sparse](#) command.

### Examples

```
-> ip pim spt admin-state enable
-> ip pim spt admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

**ip pim state-refresh-interval** *seconds*

---

### Syntax Definitions

*seconds*                      The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

### Examples

```
-> ip pim state-refresh-interval 80
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

pim  
    pimRefreshInterval

---

## ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

**ip pim state-refresh- limit** *ticks*

---

### Syntax Definitions

*ticks* The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

### Defaults

parameter	default
<i>ticks</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

### Examples

```
-> ip pim state-refresh-limit 2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## ip pim state-refresh-ttl

Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

**ip pim state-refresh-ttl** *num*

---

### Syntax Definitions

*num*                                      The Time to Live to be used. Values may range from 0 to 255.

### Defaults

parameter	default
<i>num</i>	16

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6 PIM-DM.

### Examples

```
-> ip pim state-refresh-ttl 122
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

```
ip pim interface if_name
  [hello-interval seconds]
  [triggered-hello seconds]
  [joinprune-interval seconds]
  [hello-holdtime seconds]
  [joinprune-holdtime seconds]
  [prune-delay milliseconds]
  [override-interval milliseconds]
  [dr-priority priority]
  [prune-limit-interval seconds]
  [graft-retry-interval seconds]
  [df-election-robustness messages]
  [[no] stub]
```

```
no ip pim interface if_name
```

---

### Syntax Definitions

<i>if_name</i>	The interface name on which PIM is being enabled or disabled.
<b>hello-interval</b> <i>seconds</i>	The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values may range from 0 to 18000.
<b>triggered-hello</b> <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values may range from 0 to 60.
<b>joinprune-interval</b> <i>seconds</i>	The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
<b>hello-holdtime</b> <i>seconds</i>	Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>joinprune-holdtime</b> <i>seconds</i>	Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>prune-delay</b> <i>milliseconds</i>	Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
<b>override-interval</b> <i>milliseconds</i>	Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in <i>milliseconds</i> . Values may range from 0 to 65535.
<b>dr-priority</b> <i>priority</i>	Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority.

<b>prune-limit-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>graft-retry-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>df-election-robustness</b> <i>messages</i>	The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM ( <i>which is not supported on the OmniSwitch 9900</i> ).
<b>stub</b>	Specifies the interface not to send any PIM packets through this interface, and to ignore received PIM packets.

## Defaults

parameter	default
<b>hello-interval</b> <i>seconds</i>	30
<b>triggered-hello</b> <i>seconds</i>	5
<b>joinprune-interval</b> <i>seconds</i>	60
<b>hello-holdtime</b> <i>seconds</i>	105
<b>joinprune-holdtime</b> <i>seconds</i>	210
<b>prune-delay</b> <i>milliseconds</i>	500
<b>override-interval</b> <i>milliseconds</i>	2500
<b>dr-priority</b> <i>priority</i>	1
<b>prune-limit-interval</b> <i>seconds</i>	60
<b>graft-retry-interval</b> <i>seconds</i>	3
<b>df-election-robustness</b> <i>messages</i>	3
<b>stub</b>	Disabled

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

## Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the [ip pim sparse admin-state command on page 33-5](#). To enable or disable PIM-DM on the switch, refer to the [ip pim dense admin-state command on page 33-7](#).
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/Prune messages are not sent.

- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinite time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/ Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets through that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.

## Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-interval
100 hello-holdtime 350 joinprune-holdtime 400
-> no ip pim interface vlan-2
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **df-election-robustness** parameter added.

## Related Commands

### [show ip pim interface](#)

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

```

## ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

**ip pim neighbor-loss-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

### Examples

```
-> ip pim neighbor-loss-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

### MIB Objects

pimNeighborLossNotificationPeriod

---

## ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

**ip pim invalid-register-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim invalid-register-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

### MIB Objects

pim  
pimInvalidRegisterNotificationPeriod

---

## ip pim invalid-joinprune-notification-period

Specifies the minimum time that must elapse between the PIM invalid joinprune notifications originated by the router.

**ip pim invalid-joinprune-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between invalid joinprune notifications, in seconds (10–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid joinprune notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the control plane to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.

### Examples

```
-> ip pim invalid-joinprune-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

### MIB Objects

pimInvalidJoinPruneNotificationPeriod

---

## ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

**ip pim rp-mapping-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim rp-mapping-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

pimRPMappingNotificationPeriod

---

## ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

**ip pim interface-election-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim interface-election-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

pim  
pimInterfaceElectionNotificationPeriod

---

## ip pim nonbidir-hello-notification-period

Specifies the minimum time that must elapse between notifications that a Bidirectional PIM (BIDIR-PIM) router transmits whenever the router receives a PIM Hello message that *does not* contain the Bidirectional Capable option.

**ip pim nonbidir-hello-notification-period** *seconds*

---

### Syntax Definitions

*seconds*                      The minimum time value that must elapse between notifications, in seconds. The valid range is 10–65535.

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The default value of 65535 represents an infinite time. This type of notification is never sent when this value is set to infinite time.
- The default minimum time is set to a non-zero value to provide resilience against the propagation of denial-of-service (DoS) attacks from the control plane to the network management plane.
- The Bidirectional Capable option indicates that a router is capable of participating as a BIDIR-PIM neighbor.
- This value is used with both IPv4 and IPv6 PIM.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

### Examples

```
-> ip pim nonbidir-hello-notification-period 1000
-> ip pin nonbidir-hello-notification-period 65535
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

### [ip pim df-abort](#)

Configures whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

### [show ip pim notifications](#)

Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

## MIB Objects

alaPimsmGlobalConfig

alaPimsmNonBidirHelloPeriod

---

## ip pim df-abort

Configures whether or not the Designated Forwarder (DF) election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

**ip pim df-abort {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Administratively enables the DF abort operation (DF election is stopped).
<b>disable</b>	Administratively disables the DF abort operation (DF election is not stopped).

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The DF election process occurs between PIM routers that support BIDIR-PIM. When the DF abort option is disabled, this election process continues between the BIDIR-PIM routers.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

### Examples

```
-> ip pim df-abort enable  
-> ip pin df-abort disable
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**ip pim nonbidir-hello-notification-period**

Specifies the minimum time between notifications that a BIDIR-PIM router transmits when the router receives a Hello message from a neighbor that does not contain the Bidirectional Capable option.

**show ip pim sparse**

Displays the status of the various global parameters for the PIM sparse mode.

## MIB Objects

alaPimsmGlobalConfig

alaPimsmBidirDFAbort

---

## ip pim mbr all-sources

Configures whether or not PIM notifies DVMRP about the routes to all multicast sources learned. This command applies only when the local switch is operating as a Multicast Border Router (MBR).

**ip pim mbr all-sources**

**no ip pim mbr all-sources**

---

### Syntax Definitions

N/A

### Defaults

By default, PIM only notifies DVMRP about the routes for subnets directly connected to PIM interfaces.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable notification of all route sources learned.
- This command applies to both PIM-SM and PIM-DM. Note that PIM-SSM does not support MBR functionality.
- DVMRP advertises the routes received from PIM within the DVMRP domain using standard DVMRP mechanisms.

### Examples

```
-> ip pim mbr all-sources  
-> no ip pim mbr all-sources
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ip pim dense</b>	Displays the status of the various global parameters for the PIM dense mode.
<b>ip mroute mbr</b>	Configures the switch to operate as a Multicast Border Router to provide interoperability between PIM and DVMRP.
<b>ip dvmrp interface mbr-default-information</b>	Configures whether or not the DVMRP interface on a Multicast Border Router advertises a default route.

## MIB Objects

```
alaPimGlobalConfig  
  alaPimMbrAllSourcesStatus
```

---

## ip pim df-periodic-interval

Sets the interval at which the Designated Forwarder (DF) for each Rendezvous Point Address (RPA) periodically announces its status in a Winner message.

**ip pim df-periodic-interval** *seconds*

---

### Syntax Definitions

*seconds*                      The time interval between successive Winner messages, in seconds. The valid range is 0–2000.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When the value for this interval is set to zero, no messages are sent.
- This value is used with both IPv4 BIRDIR-PIM and IPv6 BIRDIR-PIM.
- Setting this interval value provides an additional degree of safety to ensure that two routers do not both consider themselves to be the DF for the same link.
- The periodic Winner messages will only occur for RPAs that have active groups, thus avoiding the periodic control traffic in areas of the network without senders or receivers for a particular RPA.

### Examples

```
-> ip pim df-periodic-interval 80
-> ip pin df-periodic-interval 0
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

### **show ip pim sparse**

Displays the status of the various global parameters for the PIM sparse mode.

### **show ipv6 pim sparse**

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

## MIB Objects

alaPimsmGlobalConfig

alaPimsmBidirPeriodicInterval

---

## ip pim bidir ssm-compat

Configures the status of the Source-specific Multicast (SSM) compatibility mode. When enabled, a BIDIR-PIM router will support receiving IGMPv3 SSM joins and process them as a (\*,G) join.

**ip pim bidir ssm-compat {enable | disable}**

---

### Syntax Definitions

**enable** Administratively enables BIDIR/SSM compatibility mode.  
**disable** Administratively disables BIDIR/SSM compatibility mode.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When the SSM compatibility mode is disabled, SSM joins are ignored by the BIDIR-PIM router.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

### Examples

```
-> ip pim bidir ssm-compat enable  
-> ip pim bidir ssm-compat disable
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmBidirSsmCompat
```

---

## ip pim bidir fast-join

Configures whether or not a BIDIR-PIM router will automatically create (\*,G) routes in the hardware as soon as BIDIR (\*,G) routes are learned.

```
ip pim bidir fast-join {enable | disable}
```

---

### Syntax Definitions

**enable** Administratively enables the BIDIR-PIM fast join functionality.  
**disable** Administratively disables the BIDIR-PIM fast join functionality.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This command is only applicable if BIDIR-PIM is globally enabled for the switch.
- When the BIDIR fast join functionality is enabled, convergence of multicast traffic may occur faster because the (\*,G) routes are already created before the actual multicast traffic is received.
- When the BIDIR fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

### Examples

```
-> ip pim bidir fast-join enable  
-> ip pim bidir fast-join disable
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmBidirFastJoin
```

---

## ip pim sparse asm-fast-join

Configures whether or not a PIM Sparse router will automatically create (\*,G) routes in the hardware as soon as the (\*,G) routes are learned.

**ip pim sparse asm-fast-join {enable | disable}**

---

### Syntax Definitions

**enable** Administratively enables the PIM Sparse ASM fast join functionality.  
**disable** Administratively disables the PIM Sparse ASM fast join functionality.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is only supported in the PIM Sparse mode.
- When the PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (\*,G) routes are already created before the actual multicast traffic is received.
- When the PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.
- This option should be used with caution due to the complicated nature of PIM ASM, which involves forwarding on the shared tree, the sending and receiving of PIM register packets, and switching to the SPT. As a result, only enable the ASM fast join function when there are no other locally attached sources, the router is not the RP, and the SPT is disabled.

### Examples

```
-> ip pim sparse asm-fast-join enable  
-> ip pim sparse asm-fast-join disable
```

### Release History

Release 8.3.1.R02; command was introduced.

## Related Commands

alaPimsmAsmFastJoin

---

## ip pim sparse ssm-fast-join

Configures whether or not a PIM Sparse router will automatically create both PIM Sparse and SSM (S,G) routes in the hardware as soon as the (S,G) routes are learned.

```
ip pim sparse ssm-fast-join {enable | disable}
```

---

### Syntax Definitions

**enable** Administratively enables the PIM Sparse SSM fast join functionality.  
**disable** Administratively disables the PIM Sparse SSM fast join functionality.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is only supported in the PIM Sparse mode.
- When the PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (S,G) routes are already created before the actual multicast traffic is received.
- When the PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

### Examples

```
-> ip pim sparse ssm-fast-join enable  
-> ip pim sparse ssm-fast-join disable
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

Displays the status of the various global parameters for the PIM sparse mode.

**show ip pim sparse**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip pim sparse
Status = disabled,
Keepalive Period = 210,
Max RPs = 32,
Probe Time = 5,
Register Checksum = header,
Register Suppress Timeout = 60,
RP Threshold = 1,
SPT Status = enabled,
BIDIR Status = disabled,
BIDIR Periodic Interval = 60,
BIDIR DF Abort Status = disabled,
BFD Status = disabled,
MoFRR Status = disabled,
MoFRR All Routes Status = disabled,
MBR All Sources Status = disabled,
MBR Operational Status = disabled,
RP Hash Algorithm = disabled,
ASM Fast Join = disabled,
SSM Fast Join = disabled,
BIDIR Fast Join = disabled,
BIDIR SSM Compatibility = enabled
```

### *output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of PIM-SM. Options include <b>enabled</b> and <b>disabled</b> .
<b>Keepalive Period</b>	The duration of the Keepalive timer. The default value is 210.

*output definitions (continued)*

<b>Max RPs</b>	The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32.
<b>Probe Time</b>	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
<b>Register Checksum</b>	The current application of the checksum function on register messages in the domain. Options include <b>header</b> and <b>full</b> . The default setting is <b>header</b> .
<b>Register Suppress Timeout</b>	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.
<b>RP Threshold</b>	Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled.
<b>SPT Status</b>	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include <b>enabled</b> (the default) and <b>disabled</b> .
<b>BIDIR Status</b>	The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include <b>enabled</b> and <b>disabled</b> (the default). <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>BIDIR Periodic Interval</b>	The amount of time, in seconds, between Winner messages the Designated Forwarder (DF) sends out to announce its status. The valid range is 0–2000. The default is 60 seconds. <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>BIDIR DF Abort Status</b>	Indicates whether or not the DF election process is stopped when a BIDIR-PIM router receives a Hello message that does not contain the Bidirectional Capable option. When <b>enabled</b> DF election is stopped; when <b>disabled</b> (the default) DF election continues. <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>BFD Status</b>	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is <b>enabled</b> or <b>disabled</b> (the default) for the PIM router.
<b>MoFRR Status</b>	Not supported in the current release.
<b>MoFRR All Routes Status</b>	
<b>MBR All Sources Status</b>	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include <b>enabled</b> (routes to all sources) or <b>disabled</b> (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
<b>MBR Operational Status</b>	Indicates whether or not PIM interaction with DVMRP is <b>enabled</b> or <b>disabled</b> on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

*output definitions (continued)*

---

<b>RP Hash Algorithm</b>	The status of the RP hashing algorithm. When <b>enabled</b> , a newer version of the algorithm is in use; when <b>disabled</b> (the default), a legacy version of the algorithm is in use.
<b>ASM Fast Join</b>	The status of the PIM Sparse fast join operation for ASM routes. When <b>enabled</b> , PIM ASM (*,G) routes are automatically created in hardware when the routes are initially learned; when <b>disabled</b> (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch.
<b>SSM Fast Join</b>	The status of the PIM Sparse fast join operation for PIM Sparse and SSM routes. When <b>enabled</b> , PIM Sparse and SSM (S,G) routes are automatically created in hardware when the routes are initially learned; when <b>disabled</b> (the default), the (S,G) routes are not created in hardware until multicast traffic reaches the switch.
<b>BIDIR Fast Join</b>	The status of the BIDIR-PIM fast join operation. When <b>enabled</b> , BIDIR-PIM (*,G) routes are automatically created in hardware when the routes are initially learned; when <b>disabled</b> (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch.
<b>BIDIR SSM Compatibility</b>	The status of the SSM compatibility mode. When <b>enabled</b> , a BIDIR-PIM router will accept and process SSM joins as (*,G) joins; when <b>disabled</b> (the default), SSM joins are ignored.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.

Release 7.3.4; BIDIR fields added, **RP Hash Algorithm** field added.

Release 8.2.1.R02: **ASM Fast Join**, **SSM Fast Join**, **BIDIR Fast Join**, and **BIDIR SSM Compatibility** fields added.

**Related Commands**

<a href="#">ip pim sparse admin-state</a>	Globally enables or disables PIM-SM protocol on the switch.
<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip pim keepalive-period</a>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<a href="#">ip pim max-rps</a>	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
<a href="#">ip pim probe-time</a>	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
<a href="#">ip pim register checksum</a>	Configures the application of the checksum function on sent and received register messages in the domain.

---

<b>ip pim register-suppress-timeout</b>	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
<b>ip pim rp-threshold</b>	Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.
<b>ip pim spt admin-state</b>	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.
<b>ip pim bidir admin-state</b>	Globally enables or disables BIDIR-PIM protocol on the switch.
<b>ip pim df-periodic-interval</b>	Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message
<b>ip pim df-abort</b>	Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
<b>ip pim mbr all-sources</b>	Configures PIM to notify DVMRP of all learned routes to sources. This command only applies when the switch is operating in the Multicast Border Router mode.
<b>ip pim rp-hash admin-state</b>	Globally enables or disables the RP hashing algorithm version for the switch.
<b>ip pim sparse asm-fast-join</b>	Configures the status of the PIM Sparse fast join operation for ASM routes.
<b>ip pim sparse ssm-fast-join</b>	Configures the status of the PIM Sparse fast join operation for both PIM Sparse and SSM routes.
<b>ip pim bidir fast-join</b>	Configures the status of the BIDIR-PIM fast join operation.
<b>ip pim bidir ssm-compat</b>	Configures the SSM compatibility mode for a BIDIR-PIM router.

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip pim dense
Status = enabled,
Source Lifetime = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL = 16,
BFD Status = disabled,
MoFRR Status = disabled,
MBR All Sources Status = disabled,
MBR Operational Status = enabled
```

### *output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of PIM-DM. Options include <b>enabled</b> and <b>disabled</b> .
<b>Source Lifetime</b>	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
<b>State Refresh Interval</b>	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
<b>State Refresh Limit Interval</b>	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval.
<b>State Refresh TTL</b>	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.
<b>BFD Status</b>	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is <b>enabled</b> or <b>disabled</b> (the default) for the PIM router.
<b>MoFRR Status</b>	Not supported in the current release.

*output definitions (continued)*

---

<b>MBR All Sources Status</b>	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include <b>enabled</b> (routes to all sources) or <b>disabled</b> (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
<b>MBR Operational Status</b>	Indicates whether or not PIM interaction with DVMRP is <b>enabled</b> or <b>disabled</b> on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

---

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

### Examples

```
-> show ip pim ssm group
Group Address/Prefix RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
225.0.0.0/24      0.0.0.0      ssm   false   none     enabled
```

### output definitions

---

<b>Group Address/Prefix</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>RP Address</b>	A 32-bit IP address that is the Rendezvous Point (RP) for groups within the group prefix.
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include <b>asm</b> , <b>ssm</b> , or <b>dm</b> .
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">ip pim ssm group</a>	Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).
<a href="#">show ip pim group-map</a>	Displays the PIM group mapping table.

## show ip pim dense group

Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).

**show ip pim dense group**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only on PIM dense mode.

### Examples

```
-> show ip pim dense group
Group Address/Prefix RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
225.0.0.0/24      0.0.0.0      dm   false   none   enabled
```

#### *output definitions*

<b>Group Address/Prefix</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>RP Address</b>	A 32-bit IP address that is the Rendezvous Point (RP) for groups within the group prefix.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

## show ip pim neighbor

Displays a list of active PIM neighbors.

```
show ip pim neighbor [ip_address]
```

---

### Syntax Definitions

*ip\_address*                      The 32-bit IP address for the PIM neighbor.

### Defaults

If a neighbor's IP address is not specified, the entire PIM neighbor table is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IP address in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

### Examples

```
-> show ip pim neighbor
Neighbor Address      Interface Name          Uptime               Expires               DR Priority
-----+-----+-----+-----+-----
212.61.20.250          vlan-2                  01h:07m:07s      00h:01m:38s      100
212.61.60.200          vlan-6                  01h:07m:07s      00h:01m:38s      100
214.28.4.254           vlan-26                01h:07m:07s      00h:01m:38s      100
```

If a specific neighbor IP address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ip pim neighbor 212.61.30.7
Neighbor IP Address      = 212.61.30.7,
Interface Name            = vlan-30,
Uptime                    = 00h:04m:14s,
Expires                   = 00h:01m:31s,
Lan Prune Delay Present   = true,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit field                = false,
Gen ID Present            = true,
Gen ID Value              = 0x79ca868e,
BiDir Capable            = false,
DR Priority Present        = true,
DR Priority                = 1,
State Refresh Capable     = true
```

*output definitions*

---

<b>Neighbor (IP) Address</b>	The 32-bit IP address of the active PIM neighbor.
<b>Interface Name</b>	The name of the interface used to reach this PIM neighbor.
<b>Uptime</b>	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
<b>Expiry time</b>	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
<b>Lan Prune Delay Present</b>	Evaluates to TRUE if this neighbor is using the Lan Prune Delay option.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on this network.
<b>DR Priority Present</b>	Evaluates to TRUE if the neighbor is using the DR Priority option.
<b>DR Priority</b>	The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE.
<b>TBit field</b>	The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
<b>Generation ID Present</b>	Evaluates to TRUE if this neighbor is using the Generation ID option.
<b>Generation ID Value</b>	The value of the Generation ID from the last PIM Hello message received from the neighbor.
<b>BiDir Capable</b>	Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option. <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>State Refresh Capable</b>	Displays whether the neighbor is capable of receiving State Refresh messages. Options include <b>true</b> or <b>false</b> .
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.

---

**Release History**

```

---

## show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

**show ip pim candidate-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip pim candidate-rp
RP Address      Group Address      Priority  Interval  Mode  Status
-----+-----+-----+-----+-----+-----
40.1.50.25     225.0.0.0/8       192      60        bidir enabled
```

#### output definitions

---

<b>RP Address</b>	A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP).
<b>Group Address</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash character (/). This is the group for which the local router advertises itself as a C-RP.
<b>Priority</b>	The C-RP router's priority. The lower the value, the higher the priority.
<b>Interval</b>	The time interval at which the C-RP advertisements are sent to the BSR.
<b>Mode</b>	Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group. ( <i>BIDIR is not supported on the OmniSwitch 9900.</i> )
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.

---

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **Mode** field added.

## Related Commands

### [ip pim candidate-rp](#)

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

## MIB Objects

```
pimBsrCandidateRPTable
  pimBsrCandidateRPAddressType
  pimBsrCandidateRPAddress
  pimBsrCandidateRPGroupAddress
  pimBsrCandidateRPGroupPrefixLength
  pimBsrCandidateRPBidir
  pimBsrCandidateRPAdvTimer
  pimBsrCandidateRPPriority
  pimBsrCandidateRPAdvInterval
  pimBsrCandidateRPHoldtime
  pimBsrCandidateRPStatus
  pimBsrCandidateRPStorageType
```

---

## show ip pim group-map

Displays the PIM group mapping table.

**show ip pim group-map** [bsr | static-rp | ssm | dense]

---

### Syntax Definitions

N/A

### Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

### Examples

```
-> show ip pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	225.0.0.0/24	172.21.63.11	asm	192
BSR	225.0.0.0/24	214.0.0.7	asm	192
BSR	225.0.0.0/8	40.1.50.25	bidir	192
Static RP	226.0.0.0/8	10.11.203.8	bidir	none
Static RP	232.0.0.0/8		ssm	

```
-> show ip pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	225.0.0.0/24	172.21.63.11	asm	192
BSR	225.0.0.0/24	214.0.0.7	asm	192
BSR	225.0.0.0/8	40.1.50.25	bidir	192

```

-> show ip pim group-map static-rp
Origin      Group Address/Pref Length  RP Address  Mode  Precedence
-----+-----+-----+-----+-----
Static RP 226.0.0.0/8          10.11.203.8  bidir none
Static RP 232.0.0.0/8                               ssm

```

### output definitions

<b>Origin</b>	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
<b>Group Address/Prefix Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>RP Address</b>	The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM.
<b>Mode</b>	The PIM mode to be used for groups in this prefix. ( <i>The BIDIR mode is not supported on the OmniSwitch 9900.</i> )
<b>Mapping Precedence</b>	The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

### Release History

Release 7.1.1; command was introduced.  
 Release 7.3.4; **bidir** mode support added.

### Related Commands

<b>ip pim ssm group</b>	Creates and manages the static configuration of a Source Specific Multicast mode group mappings.
<b>ip pim dense group</b>	Creates and manages the static configuration of dense mode (DM) group mappings.
<b>ip pim static-rp</b>	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

DF Election Robustness  = 3,
Operational Status      = disabled,
BFD Status              = disabled

```

### *output definitions*

---

<b>Interface Name</b>	The name of the interface on which PIM is enabled.
<b>IP address</b>	Specifies the IP address of the specified interface.
<b>Designated Router</b>	The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
<b>Hello Interval</b>	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
<b>Triggered Hello Interval</b>	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 1 to 60. The default value is 5.
<b>Hello Holdtime</b>	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
<b>Join/Prune Interval</b>	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 1 to 18000.
<b>Join/Prune Holdtime</b>	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
<b>Propagation (Prune) Delay Override Interval</b>	The expected propagation delay between PIM routers on this network. The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
<b>Generation ID</b>	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
<b>DR Priority</b>	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
<b>DR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the DR Priority option.

*output definitions (continued)*

---

<b>Lan Delay Enabled</b>	Options include <b>true</b> and <b>false</b> . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
<b>Effective Propagation Delay</b>	The Effective Propagation Delay on this interface.
<b>Effective Override Interval</b>	The Effective Override Interval on this interface.
<b>Suppression Enabled</b>	Specifies whether the Join suppression is enabled on this interface.
<b>Stub Interface</b>	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
<b>Prune Limit Interval</b>	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM.
<b>Graft Retry Interval</b>	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values may range from 1 to 65535. The default value is 3.
<b>State Refresh Enabled</b>	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
<b>BiDir Capable</b>	Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM ( <i>which is not supported on the OmniSwitch 9900</i> ).
<b>DF Election Robustness</b>	The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM ( <i>which is not supported on the OmniSwitch 9900</i> ).
<b>Operational Status</b>	The current operational status of the corresponding interface. Options include <b>enabled</b> and <b>disabled</b> . This value indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. The default setting is <b>disabled</b> . To globally enable or disable PIM on the switch, use the <b>ip pim sparse admin-state</b> and <b>ip pim dense admin-state</b> commands.
<b>BFD Status</b>	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is <b>enabled</b> or <b>disabled</b> (the default) for the PIM interface.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.

**Related Commands**

**ip pim interface** Enables or disables the PIM protocol on a specific interface.

## show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

**show ip pim static-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ip pim static-rp
```

Group Address/Pref Length	RP Address	Mode	Override	Precedence	Status
225.0.0.0/24	172.21.63.11	asm	false	none	enabled
226.0.0.0/8	10.11.203.8	bidir	false	none	enabled

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the <a href="#">ip pim static-rp command on page 33-15</a> .
<b>RP Address</b>	A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the <a href="#">ip pim static-rp command on page 33-15</a> .
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include <b>asm</b> , <b>ssm</b> , or <b>bidir</b> . ( <i>The BIDIR mode is not supported on the OmniSwitch 9900.</i> )
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).

---

*output definitions*

---

<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether static RP configuration is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> . To change the current status, refer to the <b>ip pim static-rp</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.4: **bidir** mode support added.

**Related Commands**

<b>ip pim static-rp</b>	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

```

---

## show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

```
show ip pim cbsr
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip pim cbsr
CBSR Address           = 214.0.0.7,
Status                 = enabled,
CBSR Priority           = 0,
Hash Mask Length       = 30,
Elected BSR           = False,
Timer                  = 00h:00m:00s
```

### *output definitions*

---

<b>CBSR Address</b>	The 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.
<b>CBSR Priority</b>	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
<b>Elected BSR</b>	Specifies whether the local router is the elected BSR.
<b>Timer</b>	The time value that is remaining before the local router originates the next bootstrap message. This value is zero if this router is not the elected BSR.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip pim cbsr](#)

Configures the Candidate-BSR information that is used in the Bootstrap messages.

## show ip pim bsr

Displays information about the elected BSR.

**show ip pim bsr**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip pim bsr
BSR Address           = 214.0.0.7
BSR Priority           = 192,
Hash Mask Length      = 30,
Expiry Time           = 00h:01m:35s
```

#### *output definitions*

---

<b>BSR Address</b>	The 32-bit address of the elected BSR.
<b>BSR Priority</b>	The priority value of the elected BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The 32-bit mask length that is advertised in the bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group).
<b>Expiry Time</b>	The minimum time remaining before the elected BSR will be declared down.

<b>Neighbor Loss Notification</b>	<p><b>Period:</b> Minimum time interval that must elapse between the PIM neighbor loss notification originated by the device.</p> <p><b>Count:</b> The number of neighbor loss events that have occurred. This counter is incremented whenever a neighbor loss notification is generated.</p>
<b>Invalid Register Notification</b>	<p><b>Period:</b> Minimum time interval that must elapse between the PIM invalid register notifications originated by the device.</p> <p><b>Msgs Rcvd:</b> The number of invalid PIM register notification messages that have been received by the device.</p> <p><b>Group:</b> The multicast group address to which the last unexpected Register message received by the device was addressed.</p> <p><b>RP:</b> The RP address to which the last unexpected Register message received by the device was delivered.</p> <p><b>Origin:</b> The source address of the last unexpected Register message received by the device.</p>
<b>Invalid Join/Prune Notification</b>	<p><b>Period:</b> Minimum time that must elapse between PIM invalid join/prune notifications originated by the device.</p> <p><b>Msgs Rcvd:</b> The number of invalid PIM join/prune messages that have been received by the device.</p> <p><b>Origin:</b> The source address of the last unexpected join/prune message received by the device.</p> <p><b>Group:</b> The multicast group address carried in the last unexpected join/prune message received by the device.</p> <p><b>RP:</b> The RP address carried in the last unexpected join/prune message received by the device.</p>
<b>RP Mapping Notifications</b>	<p><b>Period:</b> Minimum time that must elapse between PIM RP mapping change notifications originated by the device.</p> <p><b>Count:</b> The number of changes to active RP mappings on this device.</p>
<b>Interface Election Notifications</b>	<p><b>Period:</b> Minimum time that must elapse between PIM Interface Election traps originated by the router.</p> <p><b>Count:</b> The number of times this device has been elected DR on any interface.</p>
<b>Non Bidir Hello Notifications</b>	<p><b>Period:</b> Minimum time that must elapse between notifications that the Bidirectional PIM (BIDIR-PIM) router has received a PIM Hello message from a router that is <i>not</i> a BIDIR-PIM router.</p> <p><b>Msgs Rcvd:</b> The number of this type of PIM Hello messages that have been received by the router.</p> <p><b>Origin:</b> The source address of the last PIM Hello message received by the device from a router that is not a BIDIR-PIM router.</p>

*(BIDIR is not supported on the OmniSwitch 9900.)*

---

**Release History**

Release 7.1.1; command was introduced.  
 Release 7.3.4; **Non Bidir Hello Notifications** field added.

## Related Commands

<b>ip pim neighbor-loss-notification-period</b>	Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.
<b>ip pim invalid-register-notification-period</b>	Specifies the minimum time that must elapse between PIM invalid register notifications originated by the router.
<b>ip pim invalid-joinprune-notification-period</b>	Specifies the minimum time that must elapse between PIM invalid joinprune notifications originated by the router.
<b>ip pim rp-mapping-notification-period</b>	Specifies the minimum time that must elapse between PIM RP mapping notifications originated by this router.
<b>ip pim interface-election-notification-period</b>	Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.
<b>ip pim nonbidir-hello-notification-period</b>	Specifies the minimum time that must elapse between notifications that the BIDIR-PIM router has received a PIM Hello message from a router that is <i>not</i> a BIDIR-PIM router.

## show ip pim groute

Displays (\*,G) routing table entries for IPv4 PIM.

**show ip pim groute** [*group\_address*]

---

### Syntax Definitions

*group\_address* A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

### Defaults

By default, the entire (\*,G) routing table is displayed. To view more detailed (\*,G) state information about a particular group, specify the group address in the command line.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

When the *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

### Examples

```
-> show ip pim groute
```

```
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	Upstream Neighbor	UpTime	Mode
225.0.0.0	212.61.60.8	vlan-30	212.61.30.7	00h:01m:43s	asm
225.0.0.1	212.61.60.8	vlan-30	212.61.30.7	00h:01m:43s	bidir

```
-> show ip pim groute 225.0.0.0
```

```
(* ,225.0.0.0)
```

```

### *output definitions*

---

<b>Group-address</b>	The IPv4 Multicast Group Address.
<b>RP Address</b>	The address of the Rendezvous Point (RP) for the group.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Mode</b>	Whether this entry represents an <b>asm</b> (Any Source Multicast) or <b>bidir</b> (Bidirectional PIM) group. ( <i>The BIDIR mode is not supported on the OmniSwitch 9900.</i> )
<b>Pim Mode Origin</b>	The mechanism by which the PIM mode and RP for the group were learned.
<b>Upstream Join State</b>	Whether the local router should join the RP tree for the group.

*output definitions (continued)*

---

<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the RP.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
<b>RPF Route Address/Prefix Length</b>	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
<b>Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the RP.
<b>Route Metric</b>	The routing metric of the route used to find the RPF interface towards the RP.
<b>Interface Name</b>	The interface name that corresponds to the ifIndex.
<b>Local Membership</b>	Whether the local router has (*,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (*,G) Join/Prune messages received on this interface.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (*,G) Join state for this interface expires.
<b>Assert State</b>	The (*,G) Assert state for this interface. The possible values are No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
<b>Assert Winner Address</b>	If the Assert State is 'Loser', this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
<b>Assert Winner Metric</b>	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

## show ip pim sgroute

Displays (S,G) routing table entries for IPv4 PIM.

**show ip pim sgroute** [*source\_address* *group\_address*]

---

### Syntax Definitions

*source\_address*                    The 32-bit IP address for a specific multicast source.  
*group\_address*                    A 32-bit multicast address.

### Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source\_address* and *group\_address* associated with that entry.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- When the *source\_address* and *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

### Examples

```
-> show ip pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
          L = Local, R = RPT, T = SPT, F = Register,
          P = Pruned, O = Originator
```

```

### *output definitions*

---

<b>Source-address</b>	The IPv4 Source address.
<b>Group-address</b>	The IPv4 Multicast Group Address.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.

*output definitions (continued)*

<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Flags</b>	Flags indicating SPTBit, Prune State, Join State, etc.
<b>Pim Mode</b>	Whether the Group Address is SSM, ASM or DM.
<b>Upstream Join State</b>	Whether the local router should join the SPT for the source and group represented by this entry.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (S,G) Join message.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the source.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
<b>RPF Route Address/Prefix Length</b>	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
<b>RPF Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>RPF Route Metric</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>DR Register State</b>	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
<b>DR Register Stop Timer</b>	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
<b>Upstream Prune State</b>	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
<b>Upstream Prune Limit Timer</b>	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
<b>Originator State</b>	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
<b>Source Active Timer</b>	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
<b>State Refresh Timer</b>	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
<b>Interface Name</b>	The interface name corresponding to the ifIndex that corresponds to this entry.
<b>Uptime</b>	The time since this entry was created.
<b>Local Membership</b>	Whether the local router has (S,G) local membership on this interface.

*output definitions (continued)*

---

<b>Join Prune State</b>	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (S,G) Join state for this interface expires.
<b>Assert State</b>	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
<b>Assert Winner</b>	If the Assert State is Loser, this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
<b>Assert Winner Metric Metric</b>	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

## show ip pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

**show ip pim df-election** [*rp\_address* | *if\_name*]

---

### Syntax Definitions

*rp\_address*                      A 32-bit RP address.  
*if\_name*                            The interface name.

### Defaults

By default, the DF election state for all RP interfaces.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When the *rp\_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if\_name* is specified in the command line, only information associated with the specified interface is displayed.

### Examples

-> show ip pim df-election

RP Address	Interface Name	DF State	Winner Address	Uptime	Metric Pref	Metric	Expires
10.11.203.8	vlan-13	Win	10.11.126.3	00h:06m:31s	1	1	00h:00m:24s
	vlan-200	Win	10.11.200.1	00h:06m:31s	1	1	00h:00m:24s
	vlan-204	Win	10.11.204.8	00h:06m:31s	1	1	00h:00m:24s
	vlan-210	Win	10.5.5.8	00h:06m:31s	1	1	00h:00m:24s
40.1.50.25	vlan-203	Lose	10.11.203.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-13	Win	10.11.126.3	00h:06m:31s	110	2	00h:00m:32s
	vlan-200	Win	10.11.200.1	00h:06m:31s	110	2	00h:00m:32s
	vlan-204	Lose	10.11.204.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-210	Win	10.5.5.8	00h:06m:31s	110	2	00h:00m:32s

-> show ip pim df-election 40.1.50.25

RP Address	Interface Name	DF State	Winner Address	Uptime	Metric Pref	Metric	Expires
40.1.50.25	vlan-203	Lose	10.11.203.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-13	Win	10.11.126.3	00h:06m:31s	110	2	00h:00m:32s
	vlan-200	Win	10.11.200.1	00h:06m:31s	110	2	00h:00m:32s
	vlan-204	Lose	10.11.204.27	00h:00m:22s	1	1	00h:00m:00s
	vlan-210	Win	10.5.5.8	00h:06m:31s	110	2	00h:00m:32s

```
-> show ip pim df-election vlan-200
```

RP Address	Interface Name	DF State	Winner Address	Uptime	Metric Pref	Metric	Expires
10.11.203.8	vlan-200	Win	10.11.200.1	00h:06m:31s	1	1	00h:00m:24s
40.1.50.25	vlan-200	Win	10.11.200.1	00h:06m:31s	110	2	00h:00m:32s

### output definitions

<b>RP Address</b>	The IPv4 address of the Rendezvous Point (RP).
<b>Interface Name</b>	The name of the IPv4 interface.
<b>DF State</b>	The state of the DF election process ( <b>Offer</b> , <b>Lose</b> , <b>Win</b> , or <b>Backoff</b> ).
<b>Winner Address</b>	The primary IPv4 address of the winner of the DF election process.
<b>UpTime</b>	The amount of time since the current winner was last elected the DF for the RP.
<b>Metric Pref</b>	The metric preference advertised by the DF winner. This value is zero if there currently is no DF.
<b>Metric</b>	The metric value advertised by the DF winner. This value is zero if there currently is no DF.
<b>Expires</b>	The minimum time remaining before the local router expires the current DF state.

### Release History

Release 7.3.4; command was introduced.

## ipv6 pim sparse admin-state

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

**ipv6 pim sparse admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PIM-SM globally for IPv6.
<b>disable</b>	Disables PIM-SM globally for IPv6.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

### Examples

```
-> ipv6 pim sparse admin-state enable
-> ipv6 pim sparse admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ipv6 pim bidir admin-state

Enables or disables IPv6 BIDIR-PIM (bidirectional) globally for IPv6.

```
ipv6 pim bidir admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BIDIR-PIM globally for IPv6.
<b>disable</b>	Disables BIDIR-PIM globally for IPv6.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

### Examples

```
-> ipv6 pim bidir admin-state enable
-> ipv6 pim bidir admin-state disable
```

### Release History

Release 7.3.4; command was introduced.

---

## ipv6 pim dense admin-state

Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.

**ipv6 pim dense admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PIM-DM globally for IPv6.
<b>disable</b>	Disables PIM-DM globally for IPv6.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

### Examples

```
-> ipv6 pim dense admin-state enable
-> ipv6 pim dense admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

## ipv6 pim ssm group

Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ipv6 pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ipv6 pim ssm group group_address/prefix_length
```

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128.
<b>override</b>	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

### Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 pim group-map**

Displays the IPv6 PIM group mapping table.

**show ipv6 pim ssm group**

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

## MIB Objects

pimStaticRPTable

```
pimStaticRPGrpAddress  
pimStaticRPGrpPrefixLength  
pimStaticRPPimMode  
pimStaticRPPrecedence  
pimStaticRPOverrideDynamic  
pimStaticRPRowStatus
```

---

## ipv6 pim dense group

Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

```
ipv6 pim dense group group_address/prefix_length [[no] override] [priority priority]
```

```
no ipv6 pim dense group group_address/prefix_length
```

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<b>override</b>	Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

### Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50  
-> no ipv6 pim dense group ff0e::1234/128
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 pim group-map**

Displays the IPv6 PIM group mapping table.

## ipv6 pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

```
ipv6 pim cbsr ipv6_address [priority priority] [mask-length bits]
```

```
no ipv6 pim cbsr ipv6_address
```

---

### Syntax Definitions

<i>ipv6_address</i>	The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR. The specified address must be a domain-wide reachable address.
<i>priority</i>	The priority value of the local router as a Candidate-BSR. Values may range from 0 to 255.
<i>bits</i>	The hash mask length that is advertised in the bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128.

### Defaults

---

parameter	default
<i>priority</i>	64
<i>bits</i>	126

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

### Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4  
-> no ipv6 pim cbsr 2000::1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### `show ipv6 pim cbsr`

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

## MIB Objects

```
pimBsrCandidateBSRTable
  pimBsrCandidateBSRAddress
  pimBsrCandidateBSRPriority
  pimBsrCandidateBSRHashMaskLength
  pimBsrCandidateBSRRowStatus
```

---

## ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

**ipv6 pim static-rp** *group\_address/prefix\_length rp\_address* [[no] **bidir**] [[no] **override**] [**priority** *priority*]

**no ipv6 pim static-rp** *group\_address/prefix\_length rp\_address*

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<i>rp_address</i>	Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address.
<b>bidir</b>	Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
<b>override</b>	Specifies the static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range

- Note that once the priority option has been defined a value of 65535 can be used to unset the priority
- This command is supported only in the sparse mode.

## Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> ipv6 pin static-rp ff0e::1234/128 2000::1 bidir override
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

## Related Commands

[show ipv6 pim group-map](#)

Displays the IPv6 PIM group mapping table.

[show ipv6 pim static-rp](#)

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

## MIB Objects

pimStaticRPTable

```
pimStaticRPGrpAddress
pimStaticRPGrpPrefixLength
pimStaticRPRPAddress
pimStaticRPPimMode
pimStaticRPOverrideDynamic
pimStaticRPPrecedence
pimStaticRPRowStatus
```

---

## ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

**ipv6 pim candidate-rp** *rp\_address group\_address/prefix\_length* [[no] **bidir**] [**priority** *priority*] [**interval** *seconds*]

**no ipv6 pim candidate-rp** *rp\_address group\_address/prefix\_length*

---

### Syntax Definitions

<i>rp_address</i>	Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address.
<i>group_address</i>	Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the specified IPv6 multicast group address.
<b>bidir</b>	Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. <i>This parameter option is not supported on the OmniSwitch 9900.</i>
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

### Defaults

parameter	default
[no] <b>bidir</b>	no bidir
<i>priority</i>	192
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- This command is supported only in the sparse mode.

## Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 bidir priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

## Related Commands

**show ipv6 pim candidate-rp** Displays the IPv6 multicast groups for which the local router will advertise itself as a Candidate-RP.

## MIB Objects

```
pimBsrCandidateRPTable
  pimBsrCandidateRPAddress
  pimBsrCandidateRPGroupAddress
  pimBsrCandidateRPGroupPrefixLength
  pimBsrCandidateRPBidir
  pimBsrCandidateRPPriority
  pimBsrCandidateRPAdvInterval
  pimBsrCandidateRPRowStatus
```

---

## ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

```
ipv6 pim rp-switchover {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables the RP to switch to native forwarding.
<b>disable</b>	Disables the RP from switching to native forwarding.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim rp-switchover enable  
-> ipv6 pim rp-switchover disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show ipv6 pim sparse</a>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmV6RPSwitchover
```

---

## ipv6 pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

```
ipv6 pim spt admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables last hop DR switching to the SPT.
<b>disable</b>	Disables last hop DR switching to the SPT.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

### Examples

```
-> ipv6 pim spt admin-state enable  
-> ipv6 pim spt admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show ipv6 pim sparse</a>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

```

---

## ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

```

ipv6 pim interface if_name
  [hello-interval seconds]
  [triggered-hello seconds]
  [joinprune-interval seconds]
  [hello-holdtime seconds]
  [joinprune-holdtime seconds]
  [prune-delay milliseconds]
  [override-interval milliseconds]
  [dr-priority priority]
  [prune-limit-interval seconds]
  [graft-retry-interval seconds]
  [df-election-robustness messages]
  [[no] stub]

```

```
no ipv6 pim interface if_name
```

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the IPv6 PIM is being enabled or disabled.
<b>hello-interval</b> <i>seconds</i>	The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000.
<b>triggered-hello</b> <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60.
<b>joinprune-interval</b> <i>seconds</i>	The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
<b>hello-holdtime</b> <i>seconds</i>	Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>joinprune-holdtime</b> <i>seconds</i>	Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>prune-delay</b> <i>milliseconds</i>	Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
<b>override-interval</b> <i>milliseconds</i>	Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in <i>milliseconds</i> . Values may range from 0 to 65535.

<b>dr-priority</b> <i>priority</i>	Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority.
<b>prune-limit-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>graft-retry-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>df-election-robustness</b> <i>messages</i>	The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM ( <i>which is not supported on the OmniSwitch 9900</i> ).
<b>stub</b>	Specifies the interface not to send any IPv6 PIM packets through this interface, and to ignore received IPv6 PIM packets.

## Defaults

parameter	default
<b>hello-interval</b> <i>seconds</i>	30
<b>triggered-hello</b> <i>seconds</i>	5
<b>joinprune-interval</b> <i>seconds</i>	60
<b>hello-holdtime</b> <i>seconds</i>	105
<b>joinprune-holdtime</b> <i>seconds</i>	210
<b>prune-delay</b> <i>milliseconds</i>	500
<b>override-interval</b> <i>milliseconds</i>	2500
<b>dr-priority</b> <i>priority</i>	1
<b>prune-limit-interval</b> <i>seconds</i>	60
<b>graft-retry-interval</b> <i>seconds</i>	3
<b>df-election-robustness</b> <i>messages</i>	3
<b>stub</b>	Disabled

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

## Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.
- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the [ipv6 pim sparse admin-state command on page 33-95](#). To enable or disable IPv6 PIM-DM on the switch, refer to the [ipv6 pim dense admin-state command on page 33-97](#).

- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.
- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinite time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a joinprune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any IPv6 PIM packets through that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub.
- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.

## Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-  
interval 100 hello-holdtime 350 joinprune-holdtime 400  
-> no ipv6 pim interface vlan-2
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4: **df-election robustness** parameter added.

## Related Command

**show ipv6 pim interface**            Displays detailed IPv6 PIM settings for a specific interface.

## MIB Objects

```

  pimInterfaceIfIndex  
  pimInterfaceStatus  
  pimInterfaceHelloInterval  
  pimInterfaceTrigHelloInterval  
  pimInterfaceJoinPruneInterval  
  pimInterfaceHelloHoldtime  
  pimInterfaceJoinPruneHoldtime  
  pimInterfaceDFElectionRobustness  
  pimInterfacePropagationDelay  
  pimInterfaceOverrideInterval  
  pimInerfaceDRPriority  
  pimInterfaceStubInterface  
  pimInterfacePruneLimitInterval  
  pimInterfaceGraftRetryInterval
```

## ipv6 pim bidir ssm-compat

Configures the status of the Source-specific Multicast (SSM) compatibility mode. When enabled, an IPv6 BIDIR-PIM router will support receiving MLDv2 SSM joins and process them as a (\*,G) join.

**ipv6 pim bidir ssm-compat {enable | disable}**

---

### Syntax Definitions

**enable** Administratively enables the IPv6 BIDIR/SSM compatibility mode.  
**disable** Administratively disables IPv6 BIDIR/SSM compatibility mode.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When the SSM compatibility mode is disabled, MLDv2 SSM joins are ignored by the IPv6 BIDIR-PIM router.
- This command is only applicable if IPv6 BIDIR-PIM is globally enabled for the switch.

### Examples

```
-> ipv6 pim bidir ssm-compat enable  
-> ipv6 pim bidir ssm-compat disable
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

```

---

## ipv6 pim bidir fast-join

Configures whether or not an IPv6 BIDIR-PIM router will automatically create (\*,G) routes in the hardware as soon as IPv6 BIDIR (\*,G) routes are learned.

**ipv6 pim bidir fast-join {enable | disable}**

---

### Syntax Definitions

**enable** Administratively enables the IPv6 BIDIR-PIM fast join functionality.  
**disable** Administratively disables the IPv6 BIDIR-PIM fast join functionality.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This command is only applicable if IPv6 BIDIR-PIM is globally enabled for the switch.
- When the IPv6 BIDIR fast join functionality is enabled, convergence of multicast traffic may occur faster because the (\*,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 BIDIR fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

### Examples

```
-> ipv6 pim bidir fast-join enable  
-> ipv6 pim bidir fast-join disable
```

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

```

---

## ipv6 pim sparse asm-fast-join

Configures whether or not an IPv6 PIM Sparse router will automatically create (\*,G) routes in the hardware as soon as the IPv6 (\*,G) routes are learned.

**ipv6 pim sparse asm-fast-join {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Administratively enables the IPv6 PIM Sparse ASM fast join functionality.
<b>disable</b>	Administratively disables the IPv6 PIM Sparse ASM fast join functionality.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is only supported in the IPv6 PIM Sparse mode.
- When the IPv6 PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (\*,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.
- This option should be used with caution due to the complicated nature of IPv6 PIM ASM, which involves forwarding on the shared tree, the sending and receiving of PIM register packets, and switching to the SPT. As a result, only enable the IPv6 ASM fast join function when there are no other locally attached sources, the router is not the RP, and the SPT is disabled.

### Examples

```
-> ipv6 pim sparse asm-fast-join enable
-> ipv6 pim sparse asm-fast-join disable
```

### Release History

Release 8.3.1.R02; command was introduced.

## ipv6 pim sparse ssm-fast-join

Configures whether or not an IPv6 PIM Sparse router will automatically create both IPv6 PIM Sparse and SSM (S,G) routes in the hardware as soon as the IPv6 (S,G) routes are learned.

**ipv6 pim sparse ssm-fast-join {enable | disable}**

---

### Syntax Definitions

**enable** Administratively enables the IPv6 PIM SSM fast join functionality.  
**disable** Administratively disables the IPv6 PIM SSM fast join functionality.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- This command is only supported in the IPv6 PIM Sparse mode.
- When the IPv6 PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (S,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

### Examples

```
-> ipv6 pim sparse ssm-fast-join enable  
-> ipv6 pim sparse ssm-fast-join disable
```

## show ipv6 pim sparse

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

**show ipv6 pim sparse**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim sparse
Status = disabled,
Keepalive Period = 210,
Max RPs = 32,
Probe Time = 5,
Register Suppress Timeout = 60,
RP Switchover = enabled,
SPT Status = enabled,
BIDIR Status = disabled,
BIDIR Periodic Interval = 60,
BIDIR DF Abort Status = disabled,
BFD Status = disabled,
ASM Fast Join = disabled,
SSM Fast Join = disabled,
BIDIR Fast Join = disabled,
BIDIR SSM Compatibility = disabled
```

### *output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include <b>enabled</b> and <b>disabled</b> .
<b>Keepalive Period</b>	The duration of the Keepalive timer. The default value is 210.
<b>Max RPs</b>	The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32.

*output definitions*

---

<b>Probe Time</b>	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the RP. This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
<b>Register Suppress Timeout</b>	The amount of time, in seconds, the DR will stop sending registers to the RP once a Register-Stop is received (1–300). The default value is 60.
<b>RP switchover</b>	The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .
<b>SPT Status</b>	The current status of last hop DR switching to the SPT. Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .
<b>BIDIR Status</b>	The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include <b>enabled</b> and <b>disabled</b> (the default). <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>BIDIR Periodic Interval</b>	The amount of time, in seconds, between Winner messages the DF sends out to announce its status. The valid range is 0–2000. The default is 60 seconds. <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>BIDIR DF Abort Status</b>	Indicates whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message is received from a non-Bidirectional PIM (BIDIR-PIM) capable router. Options include <b>enabled</b> and <b>disabled</b> (the default). <i>BIDIR is not supported on the OmniSwitch 9900.</i>
<b>BFD Status</b>	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is <b>enabled</b> or <b>disabled</b> (the default) for the PIM router.
<b>ASM Fast Join</b>	The status of the PIM Sparse fast join operation for ASM routes. When <b>enabled</b> , PIM ASM (*,G) routes are automatically created in hardware when the routes are initially learned; when <b>disabled</b> (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch.
<b>SSM Fast Join</b>	The status of the PIM Sparse fast join operation for PIM Sparse and SSM routes. When <b>enabled</b> , PIM Sparse and SSM (S,G) routes are automatically created in hardware when the routes are initially learned; when <b>disabled</b> (the default), the (S,G) routes are not created in hardware until multicast traffic reaches the switch.
<b>BIDIR Fast Join</b>	The status of the BIDIR-PIM fast join operation. When <b>enabled</b> , BIDIR-PIM (*,G) routes are automatically created in hardware when the routes are initially learned; when <b>disabled</b> (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch.
<b>BIDIR SSM Compatibility</b>	The status of the SSM compatibility mode. When <b>enabled</b> , a BIDIR-PIM router will accept and process SSM joins as (*,G) joins; when <b>disabled</b> (the default), SSM joins are ignored.

---

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; BIDIR fields added.

Release 8.3.1.R02; **ASM Fast Join**, **SSM Fast Join**, **BIDIR Fast Join**, and **BIDIR SSM Compatibility** fields added.

## Related Commands

<b>ipv6 pim sparse admin-state</b>	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<b>ip pim max-rps</b>	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
<b>ip pim probe-time</b>	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
<b>ip pim register-suppress-timeout</b>	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
<b>ipv6 pim rp-switchover</b>	Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.
<b>ipv6 pim spt admin-state</b>	Enables or disables last hop DR switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received.
<b>ip pim bidir admin-state</b>	Globally enables or disables BIDIR-PIM protocol on the switch.
<b>ip pim df-periodic-interval</b>	Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message
<b>ip pim df-abort</b>	Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.
<b>ipv6 pim interface</b>	Enables IPv6 PIM and configures statistics on the interface.
<b>ip pim sparse asm-fast-join</b>	Configures the status of the PIM Sparse fast join operation for ASM routes.
<b>ip pim sparse ssm-fast-join</b>	Configures the status of the PIM Sparse fast join operation for both PIM Sparse and SSM routes.
<b>ip pim bidir fast-join</b>	Configures the status of the BIDIR-PIM fast join operation.
<b>ip pim bidir ssm-compat</b>	Configures the SSM compatibility mode for a BIDIR-PIM router.

## show ipv6 pim dense

Displays the status of the various global parameters for the IPv6 PIM dense mode.

**show ipv6 pim dense**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show IPv6 pim dense
Status = enabled,
Source Lifetime = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL = 16
BFD Status = enabled
```

### *output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include <b>enabled</b> and <b>disabled</b> .
<b>Source Lifetime</b>	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
<b>State Refresh Interval</b>	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
<b>State Refresh Limit Interval</b>	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0.
<b>State Refresh TTL</b>	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.
<b>BFD Status</b>	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is <b>enabled</b> or <b>disabled</b> (the default) for the PIM interface.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ipv6 pim dense admin-state</b>	Enables or disables IPv6 PIM-DM (dense mode) globally on the switch.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<b>ip pim state-refresh-interval</b>	Sets the interval between successive State Refresh messages originated by a router.
<b>ip pim state-refresh-limit</b>	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
<b>ip pim state-refresh-ttl</b>	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

## show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

```
show ipv6 pim ssm group
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ipv6 pim ssm group
```

Group Address/Prefix	RP Address	Mode	Override	Precedence	Status
ff00::/8	::	ssm	false	none	enabled
ff34::/32	::	ssm	false	none	enabled

#### *output definitions*

---

<b>Group Address/Prefix</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the Rendezvous Point (RP) for groups within this group prefix
<b>Mode</b>	The IPv6 PIM mode that is used for the groups in this prefix.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that can be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

### Release History

## show ipv6 pim dense group

Displays the static configuration of IPv6 multicast group mappings for PIM Dense Mode (DM).

```
show ipv6 pim dense group
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ipv6 pim dense group
Group Address/Prefix RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
ff00::/8           ::          dm    false   none    enabled
ff34::/32          ::          dm    false   none    enabled
```

#### *output definitions*

---

<b>Group Address/Pref</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the Rendezvous Point (RP) for groups within this group prefix
<b>Mode</b>	The IPv6 PIM mode that is used for the groups in this prefix.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that can be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

```

---

## show ipv6 pim interface

Displays detailed IPv6 PIM settings for a specific interface. In general, it displays IPv6 PIM settings for all the interfaces if no argument is specified.

**show ipv6 pim interface** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                      The name of the interface.

### Defaults

By default, a summary list of all IPv6 PIM interfaces is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

### Examples

```
-> show ipv6 pim interface
```

```
Total 0 Interfaces
```

Interface Name	Designated Router	Hello Interval	J/P Interval	Oper Status	BFD Status
vlan-5	fe80::2d0:95ff:feac:a537	30	60	enabled	disabled
vlan-30	fe80::2d0:95ff:feac:a537	30	60	disabled	disabled
vlan-40	fe80::2d0:95ff:fee2:6eec	30	60	enabled	disabled

```
-> show ipv6 pim interface vlan-5
```

```
Interface Name           = vlan-5,
IP Address               = fe80::2d0:95ff:fee2:6eec,
Designated Router       = fe80::2d0:95ff:fee2:a537,
Hello Interval          = 30,
Triggered Hello Interval = 5,
Hello HoldTime          = 105,
Join/Prune Interval     = 60,
Join/Prune HoldTime     = 210,
Propagation (Prune) Delay = 500,
Override Interval       = 2500,
Generation ID           = 0x4717be4d,
DR Priority              = 1,
DR Priority Enabled      = true,
Lan Delay Enabled       = true,
Effective Propagation Delay = 500,
```

```

Effective Override Interval = 2500,
Suppression Enabled       = true,
Stub Interface            = false,
Prune Limit Interval      = 60,
Graft Retry Interval      = 3,
State Refresh Enabled     = true,
BiDir Capable             = false,
DF Election Robustness    = 3,
Operational Status        = enabled
BFD Status                 = disabled

```

### *output definitions*

---

<b>Interface Name</b>	The name of the IPv6 PIM interface.
<b>IPv6 address</b>	Specifies the IPv6 address of the specified interface.
<b>Designated Router</b>	The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
<b>Hello Interval</b>	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
<b>Join/Prune Interval</b>	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60.
<b>Triggered Hello Interval</b>	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5.
<b>Hello Holdtime</b>	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
<b>Join/Prune Holdtime</b>	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500.
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
<b>Generation ID Option</b>	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.

*output definitions (continued)*

---

<b>DR Priority</b>	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
<b>Lan Delay Enabled</b>	Options include <b>true</b> and <b>false</b> . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
<b>Effective Propagation Delay</b>	The Effective Propagation Delay on this interface.
<b>Effective Override Interval</b>	The Effective Override Interval on this interface.
<b>Suppression Enabled</b>	Specifies whether the Join suppression is enabled on this interface.
<b>DR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
<b>Stub Interface</b>	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
<b>Prune Limit Interval</b>	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60.
<b>Graft Retry Interval</b>	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3.
<b>SR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
<b>BiDir Capable</b>	Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM ( <i>which is not supported on the OmniSwitch 9900</i> ).
<b>DF Election Robustness</b>	The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM ( <i>which is not supported on the OmniSwitch 9900</i> ).
<b>Operational Status</b>	The current operational status of the corresponding interface. Options include <b>enabled</b> and <b>disabled</b> . This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is <b>disabled</b> . To enable or disable PIM on an interface, refer to the <a href="#">ipv6 pim interface command on page 33-110</a> . To globally enable or disable PIM on the switch, refer to the <a href="#">ipv6 pim sparse admin-state command on page 33-95</a> and <a href="#">ipv6 pim dense admin-state command on page 33-97</a> .
<b>BFD Status</b>	Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is <b>enabled</b> or <b>disabled</b> (the default) for the PIM interface.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.

## show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

```
show ipv6 pim neighbor [ipv6_address] [if_name]
```

---

### Syntax Definitions

*ipv6\_address*                      The IPv6 address for the PIM neighbor.  
*if\_name*                              The name of the interface.

### Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

### Examples

```
-> show ipv6 pim neighbor
Neighbor Address                      Interface Name                      Uptime                      Expires                      DR Pri
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
fe80::2d0:95ff:feac:a537              vlan-30                              02h:56m:51s                  00h:01m:28s                  1
```

If a specific neighbor address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ipv6 pim neighbor fe80::2d0:95ff:feac:a537
vlan-30
Neighbor IPv6 Address                  = fe80::2d0:95ff:feac:a537,
Uptime                                    = 02h:57m:09s,
Expires                                   = 00h:01m:40s,
Lan Prune Delay Present                = True,
Propagation Delay                        = 500,
Override Interval                        = 2500,
TBit Field                                = True,
Gen ID Present                           = True,
Gen ID Value                             = 0x7720c123,
BiDir Capable                           = False,
DR Priority Present                      = True,
DR Priority                               = 1,
State Refresh Capable                   = True,
Secondary Addresses:
  3000::11
```

```

vlan-40
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 03h:57m:03s,
Expires                   = 00h:01m:20s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval        = 2500,
TBit Field                = True,
Gen ID Present            = True,
Gen ID Value              = 0x7720c123,
BiDir Capable             = False,
DR Priority Present       = True,
DR Priority                = 1,
State Refresh Capable     = True,
Secondary Addresses:
  4000::11

```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```

-> show IPv6 pim neighbor vlan-30
vlan-30
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 02h:57m:09s,
Expires                   = 00h:01m:40s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval        = 2500,
TBit Field                = True,
Gen ID Present            = True,
Gen ID Value              = 0x7720c123,
BiDir Capable             = False,
DR Priority Present       = True,
DR Priority                = 1,
State Refresh Capable     = True,
Secondary Addresses:
  3000::11

```

### *output definitions*

---

<b>Neighbor IPv6 Address</b>	The IPv6 address of the active PIM neighbor.
<b>Interface Name</b>	The name of the IPv6 PIM interface that is used to reach the neighbor.
<b>Uptime</b>	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
<b>Expires</b>	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
<b>LAN Prune Delay present</b>	Specifies whether this neighbor is using the LAN Prune Delay option. Options include <b>true</b> or <b>false</b> .
<b>Propagation Delay</b>	The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.

*output definitions (continued)*

---

<b>Override Interval</b>	The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.
<b>TBit field</b>	The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
<b>Gen ID present</b>	Specifies whether this neighbor is using Generation ID option. Options include <b>true</b> or <b>false</b> .
<b>Gen ID Value</b>	The value of the Generation ID in the last PIM Hello message received from this neighbor.
<b>BiDir Capable</b>	Specifies whether this neighbor is using the Bidirectional-PIM Capable option. ( <i>BIDIR is not supported on the OmniSwitch 9900</i> ).
<b>DR Priority Present</b>	Displays whether the neighbor is using the Designated Router option. Options include <b>true</b> or <b>false</b> .
<b>DR priority</b>	The value of the Designated Router Priority in the last PIM Hello message received from this neighbor.
<b>State Refresh Capable</b>	Displays whether the neighbor is capable of receiving State Refresh messages. Options include <b>true</b> or <b>false</b> .
<b>Secondary Addresses</b>	The secondary IPv6 address of this PIM neighbor.

## show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

**show ipv6 pim static-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

-> show ipv6 pim static-rp

Group Address/Pref Length	RP Address	Mode	Override	Precedence	Status
ff00::/8	3000::11	asm	false	none	enabled
ff08::/32	2100::8	bidir	false	none	enabled

### output definitions

---

<b>Group Address/Pref Length</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM.
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include <b>asm</b> , <b>ssm</b> , <b>dm</b> , or <b>bidir</b> . ( <i>The BIDIR mode is not supported on the OmniSwitch 9900</i> ).
<b>Override</b>	Specifies that this static RP configuration can override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that is used for this static RP configuration.
<b>Status</b>	Displays whether the static RP configuration is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.4; **bidir** mode support added.

## Related Commands

### [ipv6 pim static-rp](#)

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

## MIB Objects

```
pimStaticRPTable  
  pimStaticRPAddressType  
  pimStaticRPGrpAddress  
  pimStaticRPGrpPrefixLength  
  pimStaticRPRPAddress  
  pimStaticRPPimMode  
  pimStaticRPOverrideDynamic  
  pimStaticRPPrecedence  
  pimStaticRPRowStatus  
  pimStaticRPStorageType
```

---

## show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

**show ipv6 pim group-map** [**bsr** | **static-rp** | **ssm** | **dense**]

---

### Syntax Definitions

N/A

### Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

### Examples

```
-> show ipv6 pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	ff00::/8	2000::8	bidir	192
BSR	ff00::/8	3000::11	asm	192
BSR	ff00::/8	4000::7	asm	192
SSM	ff33::/32		ssm	

```
-> show ipv6 pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	ff00::/8	2000::8	bidir	192
BSR	ff00::/8	3000::11	asm	192
BSR	ff00::/8	4000::7	asm	192

```
-> show ipv6 pim group-map ssm
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
SSM	ff33::/32		ssm	

*output definitions*

---

<b>Origin</b>	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
<b>Group Address/Prefix Length</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the Rendezvous Point to be used for groups within the group prefix.
<b>Mode</b>	The IPv6 PIM mode to be used for groups in this prefix. The possible values include <b>asm</b> , <b>ssm</b> , <b>dm</b> , or <b>bidir</b> . ( <i>The BIDIR mode is not supported on the OmniSwitch 9900</i> ).
<b>Mapping Precedence</b>	The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

---

**Release History**

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** mode support added.

**Related Commands**

<b>ipv6 pim static-rp</b>	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).
<b>ipv6 pim ssm group</b>	Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).
<b>ipv6 pim dense group</b>	Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

**MIB Objects**

```

---

## show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

**show ipv6 pim candidate-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim candidate-rp
RP Address      Group Address      Priority  Interval  Mode  Status
-----+-----+-----+-----+-----+-----
2000::8        ff00::/8           192      60        bidir enabled
```

#### output definitions

---

<b>RP Address</b>	An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP).
<b>Group Address</b>	The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP.
<b>Priority</b>	The C-RP router's priority. The lower the value, the higher the priority.
<b>Interval</b>	The time interval at which the C-RP advertisements are sent to the BSR.
<b>Mode</b>	Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group. ( <i>The BIDIR mode is not supported on the OmniSwitch 9900.</i> )
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.

---

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **Mode** field added.

## Related Commands

### [ipv6 pim candidate-rp](#)

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

```

---

## show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

**show ipv6 pim cbsr**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim cbsr
CBSR Address           = 3000::7,
Status                 = enabled,
CBSR Priority           = 0,
Hash Mask Length       = 126,
Elected BSR           = False,
Timer                  = 00h:00m:00s
```

### *output definitions*

---

<b>CBSR Address</b>	An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.
<b>CBSR Priority</b>	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The hash mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group)
<b>Elected BSR</b>	Specifies whether the local router is the elected BSR.
<b>Timer</b>	The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

  pimBsrCandidateBSRStatus
```

---

## show ipv6 pim bsr

Displays information about the elected IPv6 BSR.

```
show ipv6 pim bsr
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim bsr
BSR Address           = 3000::7,
BSR Priority           = 192,
Hash Mask Length      = 126,
Expiry Time           = 00h:01m:35s
```

#### *output definitions*

---

<b>BSR Address</b>	The IPv6 unicast address of the elected BSR.
<b>BSR Priority</b>	The priority value of the elected BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The hash mask length that is advertised in the Bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
<b>Expiry Time</b>	The minimum time remaining before the elected BSR will be declared down.

---

---

## show ipv6 pim groute

Displays (\*,G) routing table entries for IPv6 PIM.

```
show ipv6 pim groute [group_address]
```

---

### Syntax Definitions

*group\_address*                      The IPv6 address of the Multicast Group.

### Defaults

By default, entire (\*,G) routing table is displayed. To view more detailed (\*,G) state information about a particular group, specify the group address in the command line.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

When the *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

### Examples

```
-> show ipv6 pim groute
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	UpTime	Mode
ff08::2	2000::8	vlan-200	00h:05m:42s	bidir
ff0e::7	5ffe::3	vlan-4	00h:01m:23s	asm

```
-> show ipv6 pim groute ff0e::7
(*,ff0e::7)
  UpTime           = 00h:01m:28s

```

### *output definitions*

---

<b>Group-address</b>	The IPv6 Multicast Group Address.
<b>RP Address</b>	The address of the Rendezvous Point (RP) for the group.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>UpTime</b>	The time since this entry was created.
<b>Mode</b>	Whether this entry represents an <b>asm</b> , (Any Source Multicast) or <b>bidir</b> (Bidirectional PIM) group. ( <i>The BIDIR mode is not supported on the OmniSwitch 9900</i> ).
<b>Pim Mode Origin</b>	The mechanism by which the PIM mode and RP for the group were learned.
<b>Upstream Join State</b>	Whether the local router should join the RP tree for the group.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the RP.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
<b>RPF Route Address/Prefix Length</b>	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
<b>Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the RP.
<b>Route Metric</b>	The routing metric of the route used to find the RPF interface towards the RP.

*output definitions (continued)*

---

<b>Interface Name</b>	The interface name that corresponds to the ifIndex.
<b>Local Membership</b>	Whether the local router has (*,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (*,G) Join/Prune messages received on this interface.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (*,G) Join state for this interface expires.
<b>Assert State</b>	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
<b>Assert Timer</b>	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
<b>Assert Winner Address</b>	If the Assert State is 'Loser', this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
<b>Assert Winner Metric</b>	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

## show ipv6 pim sgroute

Displays (S,G) routing table entries for IPv6 PIM.

**show ipv6 pim sgroute** [*source\_address* *group\_address*]

---

### Syntax Definitions

*source\_address*                    The IPv6 address for a specific multicast source.  
*group\_address*                    A IPv6 multicast address.

### Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source\_address* and *group\_address* associated with that entry.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- When the *source\_address* and *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

### Examples

```
-> show ipv6 pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
           L = Local, R = RPT, T = SPT, F = Register,
           P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

Source Address	Group Address	RPF Interface	UpTime	Flags

### *output definitions*

---

<b>Source-address</b>	The IPv6 Source address.
<b>Group-address</b>	The IPv6 Multicast Group Address.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Flags</b>	Flags indicating SPTBit, Prune State, Join State, etc.
<b>Pim Mode</b>	Whether the Group Address is SSM, ASM or DM.
<b>Upstream Join State</b>	Whether the local router should join the SPT for the source and group represented by this entry.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (S,G) Join message.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the source.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
<b>RPF Route Address/Prefix Length</b>	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
<b>RPF Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the source.

*output definitions (continued)*

---

<b>RPF Route Metric</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>DR Register State</b>	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
<b>DR Register Stop Timer</b>	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
<b>Upstream Prune State</b>	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
<b>Upstream Prune Limit Timer</b>	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
<b>Originator State</b>	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
<b>Source Active Timer</b>	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
<b>State Refresh Timer</b>	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
<b>Interface Name</b>	The interface name corresponding to the ifIndex that corresponds to this entry.
<b>Uptime</b>	The time since this entry was created.
<b>Local Membership</b>	Whether the local router has (S,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (S,G) Join state for this interface expires.
<b>Assert State</b>	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
<b>Assert Winner</b>	If the Assert State is Loser, this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
<b>Assert Winner Metric Metric</b>	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

## show ipv6 pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

**show ipv6 pim df-election** [*rp\_address* / *if\_name*]

---

### Syntax Definitions

*rp\_address*                      An IPv6 RP address.  
*if\_name*                              The interface name.

### Defaults

By default, the DF election state for all RP interfaces.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- When the *rp\_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if\_name* is specified in the command line, only information associated with the specified interface is displayed.

### Examples

```
-> show ipv6 pim df-election
RP Address Interface Name DF State Winner Address      Uptime      Metric Metric Expires
                                     Pref
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2000::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:13s
          vlan-210     Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:13s
2100::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:03s
          vlan-210     Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:03s
```

```
-> show ipv6 pim df-election 2000::8
RP Address Interface Name DF State Winner Address      Uptime      Metric Metric Expires
                                     Pref
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2000::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:13s
          vlan-210     Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:13s
```

```
-> show ipv6 pim df-election vlan-13
RP Address Interface Name DF State Winner Address      Uptime      Metric Metric Expires
                                     Pref
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2000::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:13s
2100::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1           1           00h:00m:03s
```

*output definitions*

---

<b>RP Address</b>	The IPv6 address of the Rendezvous Point (RP).
<b>Interface Name</b>	The name of the IPv6 interface.
<b>DF State</b>	The state of the DF election process ( <b>Offer</b> , <b>Lose</b> , <b>Win</b> , or <b>Backoff</b> ).
<b>Winner Address</b>	The primary IPv6 address of the winner of the DF election process.
<b>UpTime</b>	The amount of time since the current winner was last elected the DF for the RP.
<b>Metric Pref</b>	The metric preference advertised by the DF winner. This value is zero if there currently is no DF.
<b>Metric</b>	The metric value advertised by the DF winner. This value is zero if there currently is no DF.
<b>Expires</b>	The minimum time remaining before the local router expires the current DF state.

# 34 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for multicast routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

*Filename:* ALCATEL-IND1-IPMRM-MIB.mib  
*Module:* alcatelIND1IPMRMMIB

*Filename:* IPMCAST-MIB.mib  
*Module:* ipMcastMIB

A summary of the available commands is listed here:

**ip mroute-boundary**  
**ip mroute-boundary extended**  
**ip mroute interface ttl**  
**ip mroute mbr**  
**show ip mroute-boundary**  
**show ip mroute**  
**show ip mroute interface**  
**show ip mroute-nexthop**  
**show ip mroute mbr**  
**ipv6 mroute interface ttl**  
**show ipv6 mroute**  
**show ipv6 mroute interface**  
**show ipv6 mroute-nexthop**

---

## ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

**ip mroute-boundary** *if\_name scoped\_address mask*

**no ip mroute-boundary** *if\_name scoped\_address mask*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the boundary is being assigned.
<i>scoped_address</i>	A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255.
<i>mask</i>	A corresponding Class A, B, or C mask address (e.g., 255.0.0.0).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.

### Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip mroute-boundary** Displays scoped multicast address boundaries for the switch’s router interfaces.

**MIB Objects**

```
ipMcastBoundaryTable  
  ipMcastBoundaryIfIndex  
  ipMcastBoundaryAddressType  
  ipMcastBoundaryAddress  
  ipMcastBoundaryAddressPrefixLength
```

---

## ip mroute-boundary extended

Enables or disables the multicast route boundary expansion feature. On enabling the multicast route boundary is extended to all the multicast groups (that is, the non-scoped address, 224.0.0.0 to 239.255.255.255). All multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

**ip mroute-boundary extended {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	The multicast route boundary is extended to all the multicast cast address groups (224.0.0.0 through 239.255.255.255).
<b>disable</b>	The multicast route boundary is limited to administratively scoped multicast address (239.0.0.0 through 239.255.255.255).

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip mroute-boundary extended enable  
-> ip mroute-boundary extended disable
```

### Release History

Release 8.2.1; command introduced.

**Related Commands****show ip mroute-boundary**

Displays multicast address boundaries for the switch's router interfaces.

**MIB Objects**

alaIpirmGlobalConfig

alaIpirmExtendedBoundaryStatus

---

## ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

**ip mroute interface** *if\_name* **ttl** *threshold*

---

### Syntax Definitions

<i>if_name</i>	The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM).
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

### Defaults

parameter	default
<i>threshold</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ip mroute interface vlan-1 ttl 255
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip mroute interface](#) Displays IP multicast interface information.

### MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

---

## ip mroute mbr

Configures the switch to serve as a Multicast Border Router (MBR) that will provide interoperability between DVMRP and PIM domains.

**ip mroute mbr admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables MBR functionality on the switch.
<b>disable</b>	Disables MBR functionality on the switch.

### Defaults

MBR functionality is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- To configure the switch to operate as an MBR, first configure the DVMRP and PIM protocols for the switch then enable MBR functionality.
- The MBR functionality is operationally enabled only when there is at least one PIM interface and one DVMRP interface enabled and both interfaces are operationally active on the switch.
- The MBR feature only supports interoperability between DVMRP and PIM (includes PIM-DM and PIM-SM) domains; no other routing protocols are supported.
- The following is *not* supported by the MBR feature in the current release:
  - PIM-SSM
  - Interoperability between multiple PIM domains
  - IPv6 (only IPv4)

### Examples

```
-> ip mroute mbr admin-state enable
-> ip mroute mbr admin-state disable
```

### Release History

Release 7.3.2; command was introduced.

**Related Commands**

**show ip mroute mbr** Displays MBR configuration information.

**MIB Objects**

alaIpmrmMbrStatus

---

## ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

**ipv6 mroute interface** *if\_name* **ttl** *threshold*

---

### Syntax Definitions

<i>if_name</i>	The name of the IPv6 interface.
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

### Defaults

---

parameter	default
<i>threshold</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 mroute interface](#) Displays IPv6 multicast interface information.

### MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

---

## show ip mroute-boundary

Displays scoped multicast address boundaries for the switch's router interfaces.

**show ip mroute-boundary**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip mroute-boundary
Extended Boundary Address Range: enabled
```

Interface Name	Interface Address	Boundary Address
vlan-4	214.0.0.7	239.1.1.1/32
vlan-2	170.2.0.1	224.2.2.2/24

#### *output definitions*

<b>Extended Boundary Address Range</b>	Displays the status of extended multicast route boundary on the interface.
<b>Interface Name</b>	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
<b>Interface Address</b>	The IP address of this interface where the boundary is assigned.
<b>Boundary Address</b>	The scoped multicast address that, when combined with the boundary mask, identifies the scoped boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24.

### Release History

Release 7.1.1; command was introduced.

Release 8.2.1; **Extended Boundary Address Range** output filed added.

## Related Commands

## show ip mroute

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

**show ip mroute**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

-> show ip mroute

Total 2 Mroutes

Group Address	Src Address	Upstream Nbr	Route Address	Proto
225.0.0.0	214.0.0.2/32	0.0.0.0	214.0.0.0/24	PIM-SM
225.0.0.1	214.0.0.2/32	0.0.0.0	214.0.0.0/24	PIM-DM

#### *output definitions*

---

<b>Group Address</b>	The IP multicast group address for this entry.
<b>Src Address</b>	The network address which identifies the source for this entry.
<b>Upstream Nbr</b>	The address of the upstream neighbor from which IP datagrams from these sources to this multicast address are received.
<b>Route Address</b>	The address portion of the route used to find the upstream or parent interface for this multicast forwarding entry.
<b>Proto</b>	The multicast routing protocol through which this multicast forwarding entry was learned (i.e., DVMRP, PIM-SM or PIM-DM).

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ip mroute interface**

Displays IP multicast interface information.

**show ip mroute-nexthop**

Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

## show ipv6 mroute

Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.

**show ipv6 mroute**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 mroute
```

```
Total 2 Mroutes
```

Group	Address	Source	Address	Interface	Upstream Neighbor	Route	Addr/PrefixLen	Proto
ff06:7777::1	2600::7		vlan-30	fe80::2d0:95ff:feac:a537	2600::/64			PIM-SM
ff06:7777::2	2600::7		vlan-30	fe80::2d0:95ff:feac:a537	2600::/64			PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IPv6 multicast group address for this entry.
<b>Source Address</b>	The IPv6 multicast address, which identifies the source for this entry.
<b>Interface</b>	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
<b>Upstream Neighbor</b>	The IPv6 address of the upstream neighbor from which the datagrams from these sources to this multicast address are received.
<b>Route Addr/Prefix len</b>	The IPv6 address portion of the route used to find the upstream or parent interface for this IPv6 multicast forwarding entry.
<b>Proto</b>	The IPv6 multicast routing protocol through which this IPv6 multicast forwarding entry was learned.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

---

## show ip mroute interface

Displays IP multicast interface information.

**show ip mroute interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

### Examples

-> show ip mroute interface

Interface Name	IP Address	TTL	Multicast Protocol
vlan-4	214.0.0.7	0	PIM
vlan-26	172.21.63.7	0	PIM
vlan-11	212.61.11.7	0	PIM

### output definitions

---

<b>Interface Name</b>	The name configured for the interface.
<b>IP Address</b>	The IP address of this interface entry.
<b>TTL</b>	The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface.
<b>Multicast Protocol</b>	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show ip mroute](#)

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

### [show ip mroute-next-hop](#)

Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

## show ipv6 mroute interface

Displays IPv6 multicast interface information.

**show ipv6 mroute interface** *{interface\_name}*

---

### Syntax Definitions

*interface\_name*                      The name of the interface

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Not specifying an interface name displays all known IPv6 multicast interfaces information.

### Examples

-> show ipv6 mroute interface

Interface Name	IP Address	TTL	Multicast Protocol
vlan-4	2000::1	0	PIM
vlan-26	2000::2	0	PIM
vlan-11	2000::3	0	PIM

#### *output definitions*

---

<b>Interface Name</b>	The name configured for the IPv6 interface.
<b>IP Address</b>	The IPv6 address of this interface entry.
<b>TTL</b>	The datagram TTL threshold for the interface. Any IPv6 multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface.
<b>Multicast Protocol</b>	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

## show ip mroute-nexthop

Displays next-hop information on outgoing interfaces for routing IP multicast datagrams.

**show ip mroute-nexthop**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ip mroute-nexthop
```

Total 10 Nexthops

Group Address	Src Address	Interface Name	Next Hop Address	Protocol
225.0.0.0	214.0.0.2/32	vlan-26	225.0.0.0	PIM-SM
225.0.0.1	214.0.0.2/32	vlan-26	225.0.0.1	PIM-SM
225.0.0.2	214.0.0.2/32	vlan-26	225.0.0.2	PIM-SM
225.0.0.3	214.0.0.2/32	vlan-26	225.0.0.3	PIM-SM
225.0.0.4	214.0.0.2/32	vlan-26	225.0.0.4	PIM-SM
225.0.0.5	214.0.0.2/32	vlan-26	225.0.0.5	PIM-SM
225.0.0.6	214.0.0.2/32	vlan-26	225.0.0.6	PIM-SM
225.0.0.7	214.0.0.2/32	vlan-26	225.0.0.7	PIM-SM
225.0.0.8	214.0.0.2/32	vlan-26	225.0.0.8	PIM-SM
225.0.0.9	214.0.0.2/32	vlan-26	225.0.0.9	PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IP multicast group address for this entry.
<b>Src Address</b>	The network address, which identifies the source for this entry.
<b>Interface Name</b>	Generally, this is the name configured for the interface.
<b>Next Hop Address</b>	The address of the next-hop that is specific to this entry.
<b>Protocol</b>	The routing protocol by which this next-hop was learned (i.e., DVMRP or PIM-SM).

---

## Release History

```

---

## show ipv6 mroute-nexthop

Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

**show ipv6 mroute-nexthop**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 mroute-nexthop
```

```
Total 2 Nexthops
```

Group Address	Source Address	Interface	Next Hop Address	Protocol
ff06:7777::1	2600::7	vlan-40	ff06:7777::1	PIM-SM
ff06:7777::2	2600::7	vlan-40	ff06:7777::2	PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IPv6 multicast group address for this entry.
<b>Src Address</b>	The IPv6 multicast address, which identifies the source for this entry.
<b>Interface Name</b>	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
<b>Next Hop Address</b>	The IPv6 address of the next-hop that is specific to this entry.
<b>Protocol</b>	The IPv6 multicast routing protocol by which this IPv6 multicast forwarding entry was learned.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [show ipv6 mroute](#) Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.
- [show ipv6 mroute interface](#) Displays IPv6 multicast interface information.

**MIB Objects**

```
alaIpMcastRouteNextHopTable  
  alaIpMcastRouteNextHopGroup

  alaIpMcastRouteNextHopProtocol
```

---

## show ip mroute mbr

Displays the MBR status for the switch.

```
show ip mroute mbr
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The MBR feature only supports interoperability between DVMRP and PIM. Both of these multicast protocols must be configured and operationally active on the switch.

### Examples

```
-> show ip mroute mbr
MBR Status                = enabled,
Protocols Registered      = DVMRP PIM
```

#### *output definitions*

---

<b>MBR Status</b>	The administrative status ( <b>enabled</b> or <b>disabled</b> ) of MBR functionality on the switch.
<b>Protocols Registered</b>	The operationally active multicast protocols ( <b>DVMRP</b> , <b>PIM</b> ) to which MBR functionality is applied.

---

### Release History

Release 7.3.2; command was introduced.

### Related Commands

[ip mroute mbr](#) Configures the administrative status of Multicast Border Router functionality.

### MIB Objects

```
alaIpMrMGlobalConfig
  alaIpMrMBrStatus
  alaIpMrMBrProtocolApps
```

---

# 35 QoS Commands

The OmniSwitch QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to [Chapter 44, “QoS Policy Commands,”](#) for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

*Filename:* ALCATEL-IND1-QOS-MIB.mib  
*Module* alaQoS MIB

*Filename:* ALCATEL-IND1-VIRTUAL-FLOW-CONTROL-MIB.mib  
*Module* alcatelIND1VfcMIB

---

**Important Note.** Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

---

The QoS commands are listed here:

---

<b>Global commands</b>	<b>qos</b> <b>qos trust-ports</b> <b>qos forward log</b> <b>qos log console</b> <b>qos log lines</b> <b>qos log level</b> <b>qos stats interval</b> <b>qos phones</b> <b>qos quarantine mac-group</b> <b>qos user-port</b> <b>qos dei</b> <b>qos dscp-table</b> <b>debug qos</b> <b>debug qos internal</b> <b>clear qos log</b> <b>qos apply</b> <b>qos revert</b> <b>qos flush</b> <b>qos reset</b> <b>qos stats reset</b> <b>qos switch-group</b> <b>show qos log</b> <b>show qos config</b> <b>show qos statistics</b> <b>show qos dscp-table</b>
------------------------	--

---

<b>Port and Slice commands</b>	<code>qos port</code> <code>qos port reset</code> <code>qos port trusted</code> <code>qos port maximum egress-bandwidth</code> <code>qos port maximum ingress-bandwidth</code> <code>qos port maximum depth</code> <code>qos port default 802.1p</code> <code>qos port default dscp</code> <code>qos port default classification</code> <code>qos port dei</code> <code>show qos port</code>
<b>Queue Management commands</b>	<code>qos qsp import</code> <code>qos qsp qp</code> <code>qos qsi qsp</code> <code>qos qsp system-default</code> <code>qos qsi wred</code> <code>qos qsi stats</code> <code>show qos qsi summary</code> <code>show qos qsp</code> <code>show qos wrp</code> <code>show qos qsi</code> <code>show qos qsi stats</code> <code>show qos qsi wred-stats</code> <code>show qos qsp system-default</code> <code>clear qos qsi stats</code>

---

## qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of this option, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos {enable | disable}
    [trust-ports]
    [forward log]
    [log console]
    [log lines lines]
    [log level level]
    [stats interval seconds]
    [phones [priority priority_value | trusted]]
    [user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcpserver
    | dns-reply}]
```

---

### Syntax Definitions

<b>enable</b>	Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The <b>enable</b> setting may be used alone or in conjunction with optional command keywords.
<b>disable</b>	Disables QoS. Flows coming into the switch are not matched to policies. The <b>disable</b> setting cannot be used with any other command keyword.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

## Examples

```
-> qos disable
-> qos enable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy rule</a>	Configures a policy rule on the switch.
<a href="#">show policy rule</a>	Displays information for policy rules configured on the switch.

## MIB Objects

```
alaQoSConfigTable
  alaQoSConfigEnable
  alaQoSConfigTrustedPorts
  alaQoSConfigForwardLog
  alaQoSConfigLogLines
  alaQoSConfigLogLevel
  alaQoSConfigLogConsolealaQoSConfigStatsInterval
  alaQoSConfigAutoPhones
  alaQoSConfigUserportFilter
  alaQoSConfigAppliedUserportFilter
  alaQoSConfigUserportShutdown
  alaQoSConfigAppliedUserportShutdown
```

---

## qos trust-ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See [page 35-35](#) for more information about this command.

**qos trust-ports**

**qos no trust-ports**

---

### Syntax Definitions

N/A

### Defaults

By default, all ports are untrusted.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **qos ports trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

### Examples

```
-> qos trust-ports
-> qos no trust-ports
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<b>qos port</b>	Configures a physical port for QoS.
<b>qos port trusted</b>	Configures whether or not a particular port is trusted or untrusted.
<b>show qos port</b>	Displays information about QoS ports.

**MIB Objects**

```
alaQoSConfigTable  
  alaQoSConfigTrustedPorts
```

---

## qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

**qos forward log**

**qos no forward log**

---

### Syntax Definitions

N/A

### Defaults

By default, logged events are not sent to the policy server software in the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

### Examples

```
-> qos forward log
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigForwardLog
```

---

## qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

**qos log console**

**qos no log console**

---

### Syntax Definitions

N/A

### Defaults

QoS log messages are not sent to the switch logging utility by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

### Examples

```
-> qos log console
-> qos no log console
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket (remote session).
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable
  alaQoSConfigLogConsole
```

---

## qos log lines

Configures the number of lines in the QoS log.

**qos log lines** *lines*

---

### Syntax Definitions

*lines* The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–10240.

### Defaults

parameter	default
<i>lines</i>	10240

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **boot.cfg** file. The log length will be changed at the next reboot.

### Examples

```
-> qos log lines 5
-> qos log lines 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos log](#) Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable
  alaQoSConfigLogLines
```

---

## qos log level

Configures the level of log detail.

**qos log level** *level*

**qos no log level**

---

### Syntax Definitions

*level* The level of log detail, ranging from 1 (least detail) to 8 (most detail).

### Defaults

parameter	default
<i>level</i>	5

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **debug qos** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **debug qos** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- Note that a high log level value will impact the performance of the switch.

### Examples

```
-> qos log level 4  
-> qos log level 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [qos log lines](#) Configures the number of lines in the QoS log.
- [debug qos](#) Configures the type of QoS events that will be displayed in the QoS log.
- [show qos log](#) Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigLogLevel
```

---

## qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

**qos stats interval** *seconds*

---

### Syntax Definitions

*seconds*

The number of seconds before the switch polls network interfaces for statistics. The range is 1–3600.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

### Examples

```
-> qos stats interval 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

### MIB Objects

alaQoSConfigTable  
  alaQoSConfigStatsInterval

---

## qos phones

Enables or disables the automatic prioritization of IP phone traffic.

**qos phones** [*priority* *priority\_value* | **trusted**]

**qos no phones**

---

### Syntax Definitions

*priority\_value*                      The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

**trusted**                                Trusts IP phone traffic; priority value of the IP phone packet is used.

### Defaults

parameter	default
<i>priority_value</i>   <b>trusted</b>	trusted

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC:  
 00:80:9f:00:00:00 – 00:80:9f:ff:ff:ff  
 00:13:fa:00:00:00 – 00:13:fa:ff:ff:ff
- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.
- On the OmniSwitch 6860, consider the following:
  - When automatic prioritization of QoS IP phone traffic is enabled, a rule is configured in the FFP (Fast Filtering Processor) with the source MAC address as 00:80:9F:00:00:00 and the mask FF:FF:FF:00:00:00 and 00-13-FA-xx-xx-xx and mask FF:FF:FF:00:00:00.
  - The QoS IP phone prioritization and SIP Snooping features are mutually exclusive. If one of these features is enabled when an attempt is made to enable the other feature, an error message is displayed. To enable QoS IP phone prioritization, first use the **sip-snooping admin-state disable** command to disable SIP Snooping. To enable the SIP Snooping feature, first use the **qos no phones** command to disable QoS IP phone prioritization.

---

**Note.** QoS IP phone prioritization is configured, by default, on initialization

---

## Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show qos config](#) Displays the QoS configuration for the switch.

## MIB Objects

```
alaQoSConfigTable
    alaQoSConfigAutoPhones
```

---

## qos quarantine mac-group

Configures the name of the Quarantine MAC address group. The OmniVista Quarantine Manager application identifies source MAC addresses to quarantine and adds these addresses to the Quarantine MAC group.

**qos quarantine mac-group** *mac\_group*

**qos no quarantine mac-group**

---

### Syntax Definitions

*mac\_group*                      The name of the Quarantine MAC group (up to 31 alphanumeric characters).

### Defaults

By default, the quarantine MAC group is not configured on the switch.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to reset the default MAC group name back to “Quarantined”.
- The *mac\_group* name specified with this command must match the group name specified with the OmniVista Quarantine Manager application.
- Each switch can have a different Quarantine MAC group name as long as each switch matches the OmniVista Quarantine Manager MAC group name for that switch. Note that there is only one such MAC group per switch.
- Do not use the Quarantine MAC group name in regular QoS policies.
- This group is also used by the switch Quarantine Manager and Remediation (QMR) application to restrict or restore network access to quarantined MACs.
- Note that QMR is not available if VLAN Stacking services or QoS VLAN Stacking inner VLAN and 802.1p policies are configured on the switch.
- QMR is considered active when there are MAC addresses in the Quarantine MAC address group. Use the **show quarantine mac group** command to display the contents of this group. In addition, the **show mac-learning** command output display identifies quarantined MAC addresses.

### Examples

```
-> qos quarantine mac-group mac_group1
-> no quarantine mac-group
```

### Release History

Release 8.1.1; command was introduced.

**Related Commands**

<b>qmr quarantine path</b>	Specifies the URL for a remediation server.
<b>qmr quarantine page</b>	Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured.
<b>show quarantine mac group</b>	Displays information about the Quarantine MAC group.
<b>show qmr</b>	Displays the QMR configuration for the switch.

**MIB Objects**

alaQoSConfigTable  
  alaQoSConfigQuarantineMacGroupName

---

## qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

**qos user-port** {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcp-server | dns-reply}

**qos no user-port** {filter | shutdown}

---

### Syntax Definitions

<b>filter</b>	Filters the specified type of traffic when it is received on UserPort ports.
<b>shutdown</b>	Administratively disables UserPort ports that receive the specified type of traffic.
<b>spoof</b>	Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets.
<b>bgp</b>	Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured.
<b>bpdu</b>	Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets.
<b>rip</b>	Filters RIP protocol packets.
<b>ospf</b>	Filters OSPF protocol packets.
<b>vrrp</b>	Filters VRRP protocol packets.
<b>dvmrp</b>	Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options.
<b>pim</b>	Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options.
<b>isis</b>	Filters IS-IS protocol packets.
<b>dhcp-server</b>	Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67.
<b>dns-reply</b>	Filters all packets (both TCP and UDP) that originate from the known DNS port 53.

### Defaults

parameter	default
<b>filter</b>	spoof
<b>shutdown</b>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spoof bgp ospf**).
- The **filter** option is applied only to ingress traffic on ports that are members of the UserPorts group. However, the switch will still process the filtered packets to determine if an egress update is sent on the same port. For example, if RIP traffic is filtered, the switch will still send RIP peer updates on that port.
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spoof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.

## Examples

```
-> qos user-port filter spoof bpdu
-> qos user-port shutdown spoof bgp ospf
-> qos no user-port shutdown
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">policy port group</a>	Configures a port group and its associated slot and port numbers.
<a href="#">show qos config</a>	Displays QoS configuration information.

## MIB Objects

```
alaQoSConfigTable

  alaQoSConfigAppliedUserportFilter
  alaQoSConfigUserportShutdown
  alaQoSConfigAppliedUserportShutdown
```

---

## qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

**qos dei {ingress | egress}**

**qos no dei {ingress | egress}**

---

### Syntax Definitions

<b>ingress</b>	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic.
<b>egress</b>	Marks the DEI/CFI bit for egress packets if TCM marked the packets yellow.

### Defaults

By default, no DEI/CFI bit marking or mapping is done.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

### Examples

```
-> qos dei ingress
-> qos dei egress
-> qos no dei ingress
-> qos no dei egress
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>qos port</b>	Configures a physical port for QoS.
<b>qos port dei</b>	Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port.
<b>policy action cir</b>	Configures a Tri-Color Marking policy action.
<b>show qos config</b>	Displays global information about the QoS configuration.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigDEIMapping  
  alaQoSConfigDEIMarking
```

---

## qos dscp-table

Configures the internal priority and drop precedence for the specified Differentiated Services Code Point (DSCP) value. This value defines the six most significant bits of the DS byte in the IP header.

**qos dscp-table** *value*[-*value2*] **priority** *priority* **drop-precedence** {**low** | **medium** | **high**}

---

### Syntax Definitions

<i>value</i> [- <i>value2</i> ]	The DSCP value. The range is 0–63.
<i>priority</i>	The internal priority value to map to the DSCP value. The valid range is 0–7,
<b>low</b>	Sets the drop precedence to low for the DSCP value.
<b>medium</b>	Sets the drop precedence to medium for the DSCP value.
<b>high</b>	Sets the drop precedence to high for the DSCP value.

### Defaults

By default, the drop precedence value is set to low precedence.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The priority and drop precedence settings configured with this command are global settings that are applied to all trusted ports.
- The values set in the DSCP table do not apply to untrusted ports.

### Examples

```
-> qos dscp-table 63 priority 1 drop-precedence medium
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

[show qos dscp-table](#) Configures the priority and drop-precedence to be associated with the configured DSCP table.

```
alaQoSdSCPEntryNumber  
alaQoSdSCPPriority  
alaQoSdSCPDropPrecedence
```

---

## debug qos

Configures the type of QoS events that will be displayed in the QoS log.

```
debug qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3]
[classifier] [nat] [sem] [pm] [ingress] [egress]
```

```
debug no qos
```

```
debug no qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3]
[classifier] [nat] [sem] [pm] [ingress] [egress]
```

---

### Syntax Definitions

<b>info</b>	Logs basic information about the switch.
<b>config</b>	Logs information about the global configuration.
<b>rule</b>	Logs events for rules configured on the switch.
<b>main</b>	Logs information about basic program interfaces.
<b>port</b>	Logs events related to QoS ports.
<b>msg</b>	Logs QoS messages.
<b>sl</b>	Logs information about source learning.
<b>mem</b>	Logs information about memory.
<b>mapper</b>	Logs information about mapping queues.
<b>slot</b>	Logs events related to slots.
<b>l2</b>	Logs Layer 2 QoS events on the switch.
<b>l3</b>	Logs Layer 3 QoS events on the switch.
<b>classifier</b>	Logs information whenever the switch classifies a flow; more details are provided if the log level is higher.
<b>nat</b>	Logs events for Network Address Translation policies.
<b>sem</b>	Logs information about semaphore, process locking.
<b>pm</b>	Logs events related to the Policy Manager.
<b>ingress</b>	Logs information about packets arriving on the switch.
<b>egress</b>	Logs information about packets leaving the switch.

### Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.

- Use this command to troubleshoot QoS events on the switch.

## Examples

```
-> debug qos flows queue
-> qos debug no flows no queue
-> debug no qos
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos forward log</a>	Enables the switch to send events to the PolicyView application in real time.
<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">qos log level</a>	Configures the level of log detail.
<a href="#">show qos log</a>	Displays the log of QoS events.

## MIB Objects

```
alaQoSConfigTable
  alaQoSConfigDebug
```

---

## debug qos internal

Displays debugging information for QoS internal to the switch.

**debug qos internal** [*slice slot/slice*] [**flow**] [**queue**] [**port**] [**l2tree**] [**l3tree**] [**vector**] [**pending**] [**verbose**] [**mapper**] [**pool**] [**log**] [**pingonly** | **nopingonly**]

---

### Syntax Definitions

<i>slot/slice</i>	The slot number and slice to view debugging information. A <i>slice</i> is a logical section of hardware that corresponds to particular ports on a network interface module.
<b>flow</b>	Displays information about QoS flows.
<b>queue</b>	Displays information about QoS queues.
<b>port</b>	Displays information about QoS ports.
<b>l2tree</b>	Displays information about Layer 2 flows.
<b>l3tree</b>	Displays information about Layer 3 flows.
<b>vector</b>	Displays information about vectors.
<b>pending</b>	Displays information about pending QoS objects.
<b>verbose</b>	Sets the output to verbose mode for more detailed information.
<b>mapper</b>	Displays information about QoS mapping flows to queues.
<b>pool</b>	Displays information about the buffer pool.
<b>log</b>	Displays information about QoS information that is logged.
<b>pingonly</b>	Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies.
<b>nopingonly</b>	Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets.

### Defaults

Debugging is disabled by default.

parameter	default
<b>pingonly</b>   <b>nopingonly</b>	<b>nopingonly</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **debug qos** command to configure the type of QoS events that will be displayed in the QoS log.
- Use the **qos log level** command to set the level of log detail in the QoS log.

## Examples

```
-> debug qos internal "verbose log"
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[debug qos](#)

Configures the type of QoS events that will be displayed in the QoS log.

[qos log level](#)

Configures the level of log detail.

## MIB Objects

N/A

---

## clear qos log

Clears messages in the current QoS log.

```
clear qos log
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

### Examples

```
-> clear qos log
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">debug qos</a>	Configures the type of QoS events that will be displayed in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigClearLog
```

---

## qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

**qos apply**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

### Examples

```
-> qos apply
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos revert</a>	Removes any policies configured through policy rule but not applied to the current configuration through the <b>qos apply</b> command.
<a href="#">qos reset</a>	Resets the QoS configuration to its default values.
<a href="#">qos flush</a>	Deletes all pending policy information.

### MIB Objects

alaQoSConfigTable  
alaQoSConfigApply

---

## qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

**qos revert**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

### Examples

```
-> qos revert
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">policy rule</a>	Configures a policy rule and saves it to the current configuration but does not make it active on the switch.
<a href="#">qos apply</a>	Applies all QoS settings configured on the switch to the current configuration.
<a href="#">qos reset</a>	Resets the QoS configuration to its defaults.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigRevert
```

---

## qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

**qos flush**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration*.

---

**Note.** Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

---

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

---

#### base commands

---

<b>policy rule</b>	<b>policy mac group</b>
<b>policy network group</b>	<b>policy port group</b>
<b>policy service</b>	<b>policy condition</b>
<b>policy service group</b>	<b>policy action</b>

---

### Examples

```
-> qos flush
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****qos revert**

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

**qos apply**

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

**policy server flush**

Removes all cached LDAP policy data from the switch.

**MIB Objects**

alaQoSConfigTable  
  alaQoSConfigFlush

---

## qos reset

Resets the QoS configuration to its defaults.

**qos reset**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

### Examples

```
-> qos reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### **qos apply**

Applies all QoS settings configured on the switch to the current configuration.

#### **qos revert**

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

### MIB Objects

alaQoSConfigTable

alaQoSConfigReset

---

## qos stats reset

Resets QoS statistic counters to zero.

```
qos stats reset
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.

### Examples

```
-> qos stats reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigStatsReset
```

---

## qos switch-group

Changes how the switch handles IP addresses configured on the switch to help reduce the number of hardware entries required for QoS policies that use an IP address configured on the switch.

**qos switch-group {expanded | compact}**

---

### Syntax Definitions

<b>expanded</b>	Uses the expanded method for populating the hardware routing table. This method requires a hardware entry for each individual IP interface belonging to either the built-in 'Switch' or 'Switch6' network groups.
<b>compact</b>	Uses the compact method for populating the hardware routing table by programming a single next hop entry for all IP interfaces belonging to either the built-in 'Switch' or 'Switch6' network groups.

### Defaults

---

parameter	default
expanded   compact	expanded

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The **expanded** method can be used to reduce the hardware entries required and allow for a single hardware entry to be programmed for all the IP interfaces belonging to either the built-in 'Switch' or 'Switch6' network groups instead of a hardware entry for each individual IP address.
- The built-in policy network group 'Switch' contains all the IPv4 interfaces configured on the switch.
- The built-in policy network group 'Switch6' contains all the IPv6 interfaces configured on the switch.
- It is required to reboot the switch for the switch group setting to take effect. The current setting will always be shown, with the modified setting in parentheses in the **show qos config** command.

### Examples

```
-> qos switch-group compact
-> qos switch-group expanded
```

### Release History

Release 8.4.1 R02; command introduced.

**Related Commands****show qos config**

Displays global information about the QoS configuration.

**MIB Objects**

alaQoSConfig

alaQoSConfigSwitchGroup

---

## qos port reset

Resets all QoS port configuration to the default values.

```
qos port chassis/slot/port[-port2] reset
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The QoS port configuration parameters that are reset include:

parameter	default
default queues	8
trusted	not trusted

### Examples

```
-> qos port 3/1 reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos port](#) Displays information about QoS ports.

### MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortReset
```

---

## qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos port chassis/slot/port[-port2]  
  [trusted]  
  [maximum egress-bandwidth bps]  
  [maximum ingress-bandwidth bps]  
  [maximum depth bps]  
  [default 802.1p value]  
  [default dscp value]  
  [default classification {802.1p | tos | dscp}]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

### Defaults

- All ports are untrusted.
- By default, QoS ports do not preempt queues of lower priority.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

### Examples

```
-> qos port 3/1 trusted  
-> qos port 4/2 no trusted
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port trusted</b>	Configures whether the default mode for QoS ports is trusted or untrusted.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSPortTable
  alaQoSPortSlot
  alaQoSPortPort
  alaQoSPortTrusted
  alaQoSPortMaximumBandwidth
  alaQoSPortMaximumBandwidthStatus
  alaQoSPortMaximumIngBandwidth
  alaQoSPortMaximumIngBandwidthStatus
  alaQoSPortMaximumDefaultDepth
  alaQoSPortMaximumDefaultDepthStatus
  alaQoSPortDefault8021p
  alaQoSPortDefaultDSCPalaQoSPortDefaultClassification
```

---

## qos port trusted

Configures whether an individual port is trusted or untrusted. Trusted ports can accept the 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

**qos port chassis/slot/port[-port2] trusted**

**qos port chassis/slot/port no trusted**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).

### Defaults

By default, all ports are untrusted.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the [qos trust-ports](#) command to set the default trust mode for all QoS ports. The **qos port trusted** command may be used to override the default.
- The setting applies only to ports with incoming traffic.
- Use the [qos port default 802.1p](#) or [qos port default dscp](#) commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different 802.1p or ToS/DSCP value for such packets.

### Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****qos apply**

Applies configured QoS and policy settings to the current configuration.

**qos port**

Configures a physical port for QoS.

**qos trust-ports**

Configures the global trust mode for QoS ports.

**show qos port**

Displays information about QoS ports.

**MIB Objects**

alaQoSPortTable

    alaQoSPortTrusted

---

## qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

**qos port** *chassis/slot/port[-port2]* **maximum egress-bandwidth** *bps[k | m | g | t]*

**qos port** *chassis/slot/port[-port2]* **no maximum egress-bandwidth**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>bps[k   m   g   t]</i>	The maximum amount of bandwidth, in bits-per-second, for all traffic that egresses on the port. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> , <b>1t</b> ).

### Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
<b>k   m   g   t</b>	<b>k</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- If the maximum egress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum egress-bandwidth 1000
-> qos port 4/1-8 maximum egress-bandwidth 10m
-> qos port 3/1 no maximum egress-bandwidth
-> qos port 4/1-8 no maximum egress-bandwidth
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos port maximum ingress-bandwidth</a>	Configures the rate at which traffic is received on a QoS port.

```

---

## qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

**qos port** *chassis/slot/port[-port2]* **maximum ingress-bandwidth** *bps[k | m | g | t]*

**qos port** *chassis/slot/port[-port2]* **no maximum ingress-bandwidth**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>bps[k   m   g   t]</i>	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> , <b>1t</b> ).

### Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
<b>k   m   g   t</b>	<b>k</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- If the maximum ingress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum ingress-bandwidth 1000
-> qos port 4/1-8 maximum ingress-bandwidth 10m
-> qos port 3/1 no maximum ingress-bandwidth
-> qos port 4/1-8 no maximum ingress-bandwidth
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">qos port maximum egress-bandwidth</a>	Configures the rate at which traffic is sent on a QoS port.

---

## qos port maximum depth

Configures the maximum bucket size used for traffic metering. The bucket size determines how much the traffic can burst over the maximum bandwidth rate.

**qos port** *chassis/slot/port[-port2]* **maximum depth** *bps[k | m | g | t]*

**qos port** *chassis/slot/port[-port2]* **no maximum depth**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>bps[k   m   g   t]</i>	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> ).

### Defaults

parameter	default
<i>k   m   g   t</i>	<b>k</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This QoS port parameter is configured in conjunction with the maximum bandwidth parameters. When the bucket size is reached, the switch starts to drop packets.
- Use the **no** form of the command to remove the maximum depth setting from a port.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- Modifying the maximum depth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum depth 100
-> qos port 4/1-8 maximum depth 10m
-> qos port 3/1 no maximum depth
-> qos port 4/1-8 no maximum depth
```

### Release History

Release 7.1.1; command was introduced.

```

---

## qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

**qos port** *chassis/slot/port[-port2]* **default 802.1p** *value*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>value</i>	The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.
- Note that the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

### Examples

```
-> qos port 3/1 default 802.1p 5
-> qos port 4/1-8 default 802.1p 7
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****qos apply**

Applies configured QoS and policy settings to the current configuration.

**qos port**

Configures a physical port for QoS.

**MIB Objects**

alaQoSPortTable

alaQoSPortDefault8021p

---

## qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

```
qos port chassis/slot/port[-port2] default dscp value
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>value</i>	The ToS/DSCP value. The range is 0–63.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the [qos port default 802.1p](#) command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the [qos port default dscp](#) command.

### Examples

```
-> qos port 3/1 default dscp 63  
-> qos port 4/1-8 default dscp 33
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**MIB Objects**

alaQoSPortTable  
alaQoSPortDefaultDSCP

---

## qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

**qos port *chassis/slot/port[-port2]* default classification {tos | 802.1p | dscp}**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<b>tos</b>	Specifies that the ToS value of the flow will be used to prioritize flows coming in on the port.
<b>802.1p</b>	Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port.
<b>dscp</b>	Specifies that the DSCP value of the flow will be used to prioritize flows coming in on the port.

### Defaults

parameter	default
<b>tos   802.1p   dscp</b>	dscp

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified using this command.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

### Examples

```
-> qos port 8/24 default classification dscp
-> qos port 4/1-8 default classification dscp
-> qos port 7/1 default classification 802.1p
-> qos port 5/1-8 default classification 802.1p
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.

---

## qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

```
qos port chassis/slot/port dei {ingress | egress}
```

```
qos port chassis/slot/port no dei {ingress | egress}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5).
<b>ingress</b>	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress packets.
<b>egress</b>	Sets the DEI/CFI bit for egress packets if TCM marked the packets yellow.

### Defaults

By default, no DEI/CFI bit mapping or marking is done.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

### Examples

```
-> qos port 1/10 dei ingress
-> qos port 1/20 dei egress
-> qos port 1/10 no dei ingress
-> qos port 1/20 no dei egress
```

## Release History

Release 7.2.1; command was introduced.

## MIB Objects

```
alaQoSPortTable  
  alaQoSPortDEIMapping  
  alaQoSPortDEIMarking
```

---

## qos qsp import

Imports a predefined QSet profile (QSP) to a new or previous custom profile.

```
qos qsp {qsp_id | qsp_name} import qsp {import_qsp_id | import_qsp_name}
```

```
no qos qsp {qsp_id | qsp_name}
```

---

### Syntax Definitions

<i>qsp_id</i>	A QSet custom profile ID. The valid custom profile ID range is 6–16.
<i>qsp_name</i>	The QSet profile name.
<i>import_qsp_id</i>	The ID of the QSet profile to import (1 or 5).
<i>import_dcp_name</i>	The name of the QSet profile to import (QSP-1 or QSP-5).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6560

### Usage Guidelines

- The new QSet profile must be unique and not contain the same name and ID of an existing QSet profile.
- Use the **no** form of the command to remove an existing custom QSet profile from the switch configuration.
- The predefined QSet profiles 1 and 5 cannot be removed from the switch configuration.
- A custom profile can be assigned to any port or link aggregate, but not to a VFL link.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.

### Examples

```
-> qos qsp 12 import qsp 1  
-> qos qsp qsp-16 import qsp 5  
-> no qsp 12
```

### Release History

Release 8.3.1.R02; command was introduced.

## Related Commands

---

## qos qsp qp

Modifies the Peak Information Rate (PIR), WFQ weight, and WFQ scheduler mode attributes for an individual queue profile (QP) associated with a custom QSet profile (QSP).

```
qos qsp {qsp_id | qsp_name} qp qp_id {pir % | weight weight | scheduler {sp | wrr | wrr2}}
```

---

### Syntax Definitions

<i>qsp_id</i>	A QSet custom profile ID. The valid custom profile ID range is 6–16.
<i>qsp_name</i>	The QSet custom profile name.
<i>qp_id</i>	The queue profile number in the QSet custom profile.
<i>%</i>	The PIR rate limit to apply to queue traffic.
<i>weight</i>	The queue weight that is used to determine the amount of shared bandwidth allocated for queue traffic. The valid range is 0–127.
<b>sp</b>	Selects the Strict Priority scheduler.
<b>wrr</b>	Selects the Weighted Round Robin scheduler.
<b>wrr2</b>	Selects a second Weighted Round Robin scheduler that is available on the OmniSwitch 9900.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6560

### Usage Guidelines

- The queue weight value is only used when WRR is the scheduler for the queue.
- The **pir**, **weight**, and **scheduler** attributes are only configurable for individual queues that are associated with a custom QSet profile.
- When a custom profile is modified, the changes are applied to all ports that are associated with that custom profile. To apply specific changes to a single port (QSet instance), import a custom or default profile into a new custom profile, make the necessary changes, then apply the new custom profile to the port.

### Examples

```
-> qos qsp 6 qp 1 scheduler wrr weight 2 pir 100
-> qos qsp 6 qp 2 scheduler wrr weight 1 pir 100
-> qos qsp 6 qp 3 scheduler wrr weight 3 pir 100
-> qos qsp 6 qp 4 scheduler wrr weight 4 pir 100
-> qos qsp 6 qp 5 scheduler wrr weight 2 pir 100
-> qos qsp 6 qp 6 scheduler sp pir 50
-> qos qsp 6 qp 7 scheduler wrr2 weight 2 pir 100
-> qos qsp 6 qp 8 scheduler wrr2 weight 2 pir 100
```

## Release History

---

## qos qsi qsp

Configures the QSet profile (QSP) association for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port, link aggregate, and virtual fabric link (VFL).

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] | vf-link vfl_id} qsp {qsp_id | qsp_name}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
<i>vfl_id</i>	The VFL link ID (1/0). <i>This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.</i>
<i>qsp_id</i>	An existing QSet profile (QSP) ID number to assign to this instance. <ul style="list-style-type: none"> <li>On an OmniSwitch 9900, QSP IDs 1 and 5 are supported; profiles 2, 3, and 4 are not supported. QSP IDs 6 through 16 refer to custom profiles that are also supported.</li> <li>On all other OmniSwitch platforms, QSP IDs 1 through 4 are supported, but custom profiles are not supported.</li> </ul>
<i>qsp_name</i>	An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to assign to this instance.

### Defaults

By default, QSP 1 is assigned to each QSet instance.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- There is only one QSI for each port, link aggregate, and VFL and only one QSP associated with each QSI.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.
- On an OmniSwitch 6860 or OmniSwitch 6865, changing the QSP assignment for one VFL instance automatically changes the QSP assignment for all other VFL instances to the same QSP. For example, if QSP 2 is assigned to VFL 1/0, then the QSP assignment for VFL 2/0 is also changed to QSP 2. It is not necessary to configure the QSP assignment separately for each VFL on the switch.

## Examples

```
-> qos qsi port 1/2 qsp 2
-> qos qsi port 2/1-10 qsp 3
-> qos qsi slot 3 qsp 4
-> qos qsi linkagg 10 qsp 2
```

The following command examples show that when the QSP assignment for VFL 1 is changed to QSP 2, the QSP for VFL 2 is automatically changed as well:

```
-> qos qsi vf-link 1/0 qsp 2
WARNING: configuration change applied to all VFLs in the system
```

```
-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
vfl-1/0	2	qsp-2	NDCB	vfl-1/0

```
-> show qos qsi vf-link 2/0 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
vfl-2/0	2	qsp-2	NDCB	vfl-2/0

## Release History

Release 7.2.1.R02; command introduced.

Release 8.3.1; **vf-link** parameter added.

## Related Commands

<a href="#">qos qsp import</a>	Imports a predefined QSet profile (QSP) to a new or previous custom profile.
<a href="#">qos qsi wred</a>	Configures the WRED administrative status for a QSet instance.

<a href="#">show qos qsi</a>	Displays the QSet instance configuration.
<a href="#">show qos qsp</a>	Displays the QSet profile attributes.

## MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetInstanceTable
  alaVfcQsetId
  alaVfcQsetQSPid
  alaVfcQsetQSPName
```

## qos qsp system-default

Changes the default QSet profile (QSP) that is assigned to each port, link aggregate ID, and virtual fabric link (VFL).

```
qos qsp system-default {qsp_id | qsp_name}
```

---

### Syntax Definitions

<i>qsp_id</i>	An existing QSet profile (QSP) ID number to use as the default QSP. The valid range is 1–4.
<i>qsp_name</i>	An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to use as the default QSP.

### Defaults

By default, QSP 1 is assigned to each QSet instance.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- When this command is used, the specified QSP is assigned to all ports, link aggregates, and VFLs on the switch.
- Changing the system default profile is only allowed when the switch is running in the non-Data Center Bridging (NDCB) mode. This mode is active by default when there is no OmniSwitch Data Center software license installed on the switch.
- A QSP assigned through the **qos qsi qsp** command overrides the system default QSP assignment. For example, if the system default QSP is set to 1 and the **qos qsi qsp** command is used to change the QSP to 2 on port 1/1/20, the QSP 2 settings are applied to port 1/1/20.

### Examples

```
-> qos qsp system-default 2  
-> qos qsp system-default qsp-4
```

### Release History

Release 8.3.1; command introduced.

## Related Commands

- qos qsi qsp** Configures the QSet profile association for the QSet instance.
- show qos qsp system-default** Displays the name and ID of the default QSP for the switch.

## MIB Objects

```
alcatelIND1VfcMIB  
  alaVfcSystemDefaultQsetQSPName  
  alaVfcSystemDefaultQsetQSPID
```

---

## qos qsi wred

Configures the WRED profile (WRP) administrative status for the QSet profile associated with the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port chassis/slot/port[-port2] | slot slot | linkagg agg_id[-agg_id2]} wred admin-state {enable | disable}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-20).
<b>enable</b>	Enables the WRED profile for the instance.
<b>disable</b>	Disables the WRED profile for the instance.

### Defaults

By default, WRED is disabled for the QSet instance.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- There is only one QSI per port or LAG ID and only one profile (WRP 1) associated with the QSI.
- Changing the WRED profile status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.
- WRP 1 is the only profile supported. Configuring additional profiles is not supported at this time.
- When enabled, WRP 1 applies the following color threshold values only to TCP traffic. The threshold values indicated are a percentage of the maximum average queue length.

Color	Min Threshold	Max Threshold	Drop Probability	Gain
Red	10	50	36	9
Yellow	50	90	30	9
Green	90	100	24	9

### Examples

```
-> qos qsi port 1/2 wred admin-state enable
-> qos qsi port 2/1-10 wred admin-state disable
-> qos qsi slot 3 wred admin-state enable
```

```
-> qos qsi linkagg 10 wred admin-state enable
```

## Release History

  alaVfcQsetStatsInterval
```

---

## qos qsi stats

Configures the administrative status and interval for statistics collection for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats {admin-state {enable | disable} | interval interval_time}}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
<b>enable</b>	Enables statistics collection for the instance.
<b>disable</b>	Disables statistics collection for the instance.
<i>interval_time</i>	The time interval for statistics gathering. The valid range is 10–300 seconds.

### Defaults

By default, statistics collection is disabled and the time interval is set to 10 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSet profile (QSP) or DCB profile (DCP) associated with the QSI.
- Changing the statistics collection status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.

### Examples

```
-> qos qsi port 1/2 stats admin-state enable
-> qos qsi port 1/2 stats interval 30
-> qos qsi port 2/1-10 stats admin-state enable
-> qos qsi linkagg 10 stats admin-state enable interval 120
```

### Release History

Release 7.2.1.R02; command introduced.

  alaVfcQsetStatsInterval
```

---

## show qos port

Displays information about all QoS ports or a particular port.

**show qos port** [*chassis/slot/port*] [**statistics**]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1).
<b>statistics</b>	Displays statistics for high-density gigabit modules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

---

character	definition
+	Indicates that the port is manually configured as trusted through the <b>qos port trusted</b> command; the port setting takes precedence over the global trust setting configured through the <b>qos trust-ports</b> command.
*	Indicates that the port is automatically trusted regardless of the global setting set through the <b>qos trust-ports</b> command. (Applies to mobile ports and ports configured for 802.1Q.)

---

### Examples

```
-> show qos port
```

Slot/ Port	Active	Trust	Default P/DSCP	Default Classification	Bandwidth Physical	Ingress	Egress	DEI Map/Mark	Type

### output definitions

<b>Slot/Port</b>	The slot and physical port number.
<b>Active</b>	Whether or not the port is sending/receiving QoS traffic.
<b>Trust</b>	Whether the port is trusted or not trusted. Configured through the <b>qos port trusted</b> command.
<b>Default P</b>	The default 802.1p setting for the port. Configured through the <b>qos port default 802.1p</b> command.
<b>Default DSCP</b>	The default ToS/DSCP setting for the port. Configured through the <b>qos port default dscp</b> command.
<b>Default Classification</b>	The default classification setting for the port ( <b>802.1p</b> , <b>ToS</b> , or <b>DSCP</b> ). Configured through the <b>qos port default classification</b> command.
<b>Physical Bandwidth</b>	The amount of physical bandwidth available on the port.
<b>Ingress Bandwidth</b>	The amount of ingress bandwidth configured for the port. Configured through the <b>qos port maximum ingress-bandwidth</b> command.
<b>Egress Bandwidth</b>	The amount of egress bandwidth configured for the port. Configured through the <b>qos port maximum egress-bandwidth</b> command.
<b>DEI Map/Mark</b>	The Drop Eligible Indicator (DEI) bit mapping and marking setting for the port. Configured through the <b>qos port dei</b> command.
<b>Type</b>	The interface type, <b>ethernet</b> or <b>wan</b> .

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**qos port** Configures a physical port for QoS.

### MIB Objects

```

## show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

**show qos slice** [*slot/slice*]

---

### Syntax Definitions

*slot/slice* The slot number and slice for which you want to view information. The number of slices per module varies depending on the type of module.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Information for all slots/slices is displayed unless a particular slot/slice is requested.
- This command is useful for monitoring switch resources required for policy rules.
- On the OmniSwitch 9900 and OmniSwitch 6560, use the [show tcam utilization](#) command instead of the **show qos slice** command.

### Examples

-> show qos slice

Slot/ Unit	Ranges Type Total/Free	Rules CAM Total/Free	Counters Total/Free	Meters Total/Free
1/1/(0)	IFP 24/24	0 256/252	256/252	256/256

---

*output definitions*

---

<b>Slot/Unit</b>	The slot and slice number.
<b>Type</b>	The type of slice.
<b>Ranges Total</b>	The total number of TCP/UDP port ranges supported per slot/slice.
<b>Ranges Free</b>	The number of TCP/UDP port ranges that are still available for use.
<b>CAM</b>	The CAM number.
<b>Rules Total</b>	The total number of rules supported per CAM.
<b>Rules Free</b>	The number of rules that are still available for use. On startup, the switch uses 27 rules.
<b>Counters Total</b>	The total number of counters supported per CAM.
<b>Counter Free</b>	The number of counters that are still available for use.
<b>Meters Total</b>	The total number of meters supported per CAM.
<b>Meters Free</b>	The number of meters that are still available for use.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**[policy rule](#)

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

**MIB Objects**

N/A

---

## show qos log

Displays the log of QoS events.

**show qos log**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to display the current QoS log. To clear the log, use the **clear qos log** command.

### Examples

```
-> show qos log
**QoS Log**
Insert rule 0
Rule index at 0
Insert rule 1
Rule index at 1
Insert rule 2
Rule index at 2
Enable rule r1 (1) 1,1

Update condition c1 for rule 1 (1)
Verify rule r2(1)
Enable rule r2 (0) 1,1
Really enable r2
Update condition c2 for rule 0 (1)
Verify rule yuba1(1)
Enable rule yuba1 (2) 1,1
Really enable yuba1
Update condition yubamac for rule 2 (1)
QoS Manager started TUE MAR 10 13:46:50 2002

Match rule 2 to 1
Match rule 2 to 2
Match rule 2 to 3
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[clear qos log](#)

Clears messages in the current QoS log.

[qos log lines](#)

Configures the number of lines in the QoS log.

## MIB Objects

N/A

---

## show qos config

Displays global information about the QoS configuration.

**show qos config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to view the current global configuration for QoS. Use the **show qos statistics** command to view statistics about the QoS software in the switch.

### Examples

```
-> show qos config
QoS Configuration
Admin                = enable,
Switch Group         = expanded,
Trust ports          = no,
Phones               = trusted,
Log lines            = 10240,
Log level            = 5,
Log console          = no,
Forward log          = no,
Stats interval       = 60,
User-port filter     = spoof,
User-port shutdown  = none,
Debug               = info,
DEI Mapping          = Disabled,
DEI Marking          = Disabled,
Pending changes     = none
```

### *output definitions*

---

<b>Admin</b>	Whether or not QoS is enabled or disabled. Configured through the <b>qos</b> command.
<b>Switch Group</b>	Whether the expanded or compact method is used to populate the hardware routing table. Configured through the <b>qos switch-group</b> command.
<b>Trust Ports</b>	The default trusted mode for switch ports. Configured through the <b>qos trust-ports</b> command.

*output definitions (continued)*

---

<b>Phones</b>	Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the <b>qos phones</b> command.
<b>Log lines</b>	The number of lines included in the QoS log. Configured through the <b>qos log lines</b> command.
<b>Log level</b>	The level of log detail. Configured through the <b>qos log level</b> command.
<b>Log console</b>	Whether or not log messages are sent to the console. Configured through the <b>qos log console</b> command.
<b>Forward log</b>	Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the <b>qos forward log</b> command.
<b>Stats interval</b>	How often the switch polls network interfaces for statistics about QoS events. Configured through the <b>qos stats interval</b> command.
<b>User-port filter</b>	The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the <b>qos user-port</b> command.
<b>User-port shutdown</b>	The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the <b>qos user-port</b> command.
<b>Debug</b>	The type of information that will be displayed in the QoS log. A value of <b>info</b> indicates the default debugging type.
<b>DEI Mapping</b>	The status (enabled or disabled) of Drop Eligible Indicator (DEI) bit mapping for ingress traffic. Configured through the <b>qos dei</b> command.
<b>DEI Marking</b>	The status (enabled or disabled) of DEI bit marking for egress traffic. Configured through the <b>qos dei</b> command.
<b>Pending changes</b>	QoS changes not yet applied to the configuration.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>qos</b>	Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch.
<b>show qos statistics</b>	Displays statistics about the QoS configuration.

### *output definitions*

---

<b>Events</b>	The number of Layer 2 or Layer 3 flows transmitted on the switch.
<b>Matches</b>	The number of Layer 2 or Layer 3 flows that match policies.
<b>Drops</b>	The number of Layer 2 or Layer 3 flows that were dropped.
<b>L2</b>	The number of Layer 2 events, matches, and drops.
<b>L3 Ingress</b>	The number of Layer 3 ingress events, matches, and drops.
<b>L3 Egress</b>	The number of Layer 3 egress events, matches, and drops.
<b>IGMP join</b>	The number of multicast events, matches, and drops.
<b>Fragments</b>	The number of fragments dropped.
<b>Bad Fragments</b>	The number of fragments received with an offset of 1.
<b>Unknown Fragments</b>	The number of out-of-order fragments received.
<b>Sent NI messages</b>	The number of messages sent to network interfaces.
<b>Received NI messages</b>	The number of messages received by network interfaces.
<b>Failed NI messages</b>	The number of failed message attempts to network interfaces.
<b>Load balanced flows</b>	The number of Server Load Balance flow entries.
<b>Reflexive flows</b>	The number of reflexive flows.
<b>Reflexive correction</b>	The number of reflexive flow corrections.
<b>Flow lookups</b>	The number of flow table lookups.
<b>Flow hits</b>	The number of flow table lookup hits.
<b>Max PTree nodes</b>	The highest number of nodes in the classifier tree.
<b>Max Ptree depth</b>	The length of the longest path in the classifier tree.
<b>Spoofed Events</b>	The number of spoofed events.
<b>Nonspoofed Events</b>	The number of non-spoofed events.
<b>DropServices</b>	The number of TCP/UDP flows dropped.

---

### **Release History**

Release 7.1.1; command was introduced.

### **Related Commands**

[qos stats reset](#) Resets QoS statistic counters to zero.

## show qos dscp-table

Displays the QoS DSCP table. This table contains the internal priority mapping and drop precedence value for each of the DSCP values.

**show qos dscp-table**

---

### Syntax Definitions

N/A

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The DSCP table mapping is a global configuration that applies to all trusted ports; does not apply to untrusted ports.

### Examples

```
-> show qos dscp-table
DSCP-Table   Priority      Drop-Precedence
-----+-----+-----
0             0             low
1             0             low
2             0             low
3             0             low
4             0             low
5             0             low
6             0             low
7             0             low
8             1             low
9             1             low
10            1             low
```

#### *output definitions*

---

<b>DSCP-Table</b>	The DSCP number.
<b>Priority</b>	The priority number mapped to the DSCP value.
<b>Drop-Precedence</b>	The drop precedence value mapped to the DSCP value.

---

### Release History

Release 8.1.1; command was introduced.

**Related Commands****qos dscp-table**

Configures the priority and drop-precedence value associated with the DSCP number.

## show qos qsi summary

Displays a list of switch ports showing the QoS or DCB profile assigned to each port.

**show qos qsi {port chassis/slot/port[-port2] | linkagg agg\_id[-agg\_id2]} summary**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays the summary of the user ports in the switch.

### Examples

```
-> show qos qsi port 1/1-5 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
1/1	8	dcp-8	DCB	1/1
1/2	8	dcp-8	DCB	1/2
1/3	8	dcp-8	DCB	1/3
1/4	1	dcp-1	DCB	1/4
1/5	1	dcp-1	DCB	1/5

### output definitions

---

<b>Port</b>	Configured DCB ports.
<b>Profile #</b>	Identifies the DCB profile assigned to the port.
<b>Profile Name</b>	Name of the DCB profile assigned to the port.
<b>Mode</b>	Indicates if the port is DCB or NDCB.
<b>Parent</b>	Lists the parent of the port.

---

### Release History

Release 7.3.1; command was introduced.

## Related Commands

**show qos qsi dcb dcbx**

Displays the configured ports in the system and the related DCBX information.

**qos qsi qsp dcb**

Assigns a DCB profile to a port or link aggregate.

## MIB Objects

alaVfcQsetInstanceTable

  alaVfcQsetId

  alaVfcQsetQSPId

  alaVfcQsetQSPName

  alaDcbxPortInstanceTable

  alaVfcQsapParent

---

## show qos qsp

Displays the QSet profile (QSP) configuration for the switch.

```
show qos qsp [qsp_id | qsp_name] [detail [port chassis/slot/port[-port2]] | linkagg agg_id[-agg_id2]]]
```

---

### Syntax Definitions

<i>qsp_id</i>	A QSet profile (QSP) ID number. The valid range is 1–4.
<i>qsp_name</i>	A QSP profile name.
<b>detail</b>	Displays QSP configuration details for a specific profile, port, slot, or link aggregate.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

By default, displays the configuration for all four of the QSet profiles (QSP 1–4).

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the *qsp\_id* or the *qsp\_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information for all ports and link aggregates.
- Use the **port** *slot/port* and **linkagg** *agg\_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.
- The QSP assignment is not configurable on the OmniSwitch 9900. Only the QSP 1 profile is applied by default to switch ports and link aggregates on an OmniSwitch 9900.
- Configuring a QSP assignment for a virtual fabric link (VFL) is supported only on the OmniSwitch 6860 and OmniSwitch 6865.

### Examples

```
-> show qos qsp 2
QSP 2 (qsp-2)

```

### *output definitions*

---

<b>QSP</b>	The QSet profile (QSP) ID number and name.
<b>#Ports</b>	The number of ports to which this profile is attached.
<b>#Queues</b>	The number of queues associated with this QSet. Currently there are eight queues for each QSet.
<b>BW%</b>	The bandwidth percentage for the QSet. The bandwidth is shared between all the queues.
<b>WRP</b>	The WRED profile (WRP) ID number associated with the QSet.
<b>Name</b>	The WRP name.
<b>Scheduler</b>	The type of scheduler, such as queue specific priority (Qspec) or strict priority.

*output definitions (continued)*

<b>Type</b>	Whether the QSP is static or dynamic. Currently there are 4 pre-defined, static profiles (QSP 1–4). User-configured, dynamic profiles are not supported at this time.
<b>QP 1..8</b>	The queue profile configuration for each QSet queue. The configuration for each of the individual queue profiles is defined by the QSP in use. For example, QSP 1 applies a different queue configuration than QSP 2, 3, or 4.

```
-> show qos qsp detail
```

Legends: T (Type): S = Static, D = Dynamic

*output definitions*

---

<b>QSAP Port</b>	The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time.
<b>QSAP Type</b>	The type of QSAP port; Phy = physical (slot/port), Log = logical (linkagg ID or VFL ID).
<b>dQSI</b>	The default QSet instance (dQSI) ID number. This number is generated internally by the switch to identify the QSI that is automatically assigned to each port, link aggregate, and VFL.
<b>ID</b>	The QSet profile (QSP) ID number.
<b>Name</b>	The QSP name.
<b>QSAP Parent</b>	The QSAP parent ID number. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or a VFL.
<b>BW (%) Admin</b>	The administrative bandwidth percentage for the QSet. The administrative percentage is not configurable at this time.
<b>BW (%) Oper</b>	The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports.
<b>Type</b>	Whether the QSP is static or dynamic. Currently there are 4 pre-defined, static profiles (QSP 1–4). User-configured, dynamic profiles are not supported at this time.

---

**Release History**

Release 7.2.1; command was introduced.

**Related Commands**

## show qos wrp

Displays the Weighted Random Early Detection (WRED) profile (WRP) configuration for the switch.

```
show qos wrp [wrp_id | wrp_name] [detail [port chassis/slot/port[-port2]] | slot slot | linkagg agg_id[-agg_id2]]
```

---

### Syntax Definitions

<i>wrp_id</i>	A WRED profile (WRP) ID number. The valid range is 1.
<i>wrp_name</i>	A WRED profile name.
<b>detail</b>	Displays WRED profile configuration details for a port, slot, or link aggregate.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all non-DCB ports on the slot.
<i>agg_id[-agg_id2]</i>	The link aggregate ID for a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the *wrp\_id* or the *wrp\_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

### Examples

```
-> show qos wrp
WRP 1 (wrp-1)
  #Ports: 480, MTU: 1540
  Red
    Min-Th: 10, Max-Th: 50, Max-Pb: 36, Gain: 9
  Yellow
    Min-Th: 50, Max-Th: 90, Max-Pb: 30, Gain: 9
  Green
```

Min-Th: 90, Max-Th: 100, Max-Pb: 24, Gain: 9

### *output definitions*

---

<b>WRP</b>	The WRED profile (WRP) ID number and name.
<b>#Ports</b>	The number of ports to which this profile is attached.
<b>MTU</b>	The MTU size.
<b>Min-Th</b>	The minimum queue threshold percentage for red, green, and yellow packets.
<b>Max-Th</b>	The maximum queue threshold percentage for red, green, and yellow packets.
<b>Max-Pb</b>	The maximum drop probability percentage for red, green, and yellow packets.
<b>Gain</b>	The gain value to smooth out the queue (1–15).

<b>Port</b>	The physical slot and port number (or link aggregate ID for a logical port).
<b>QSAP</b>	The QSet attachment point (QSAP). This is a logical entity used internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
<b>Parent</b>	The QSAP ID for the parent QSAP, if any.
<b>WRP Name Admin</b>	The WRED profile (WRP) ID number, name, and administrative status.
<b>QSI</b>	The switch port associated with the QSet instance (QSI).
<b>QSP Name Admin</b>	The QSet profile (QSP) ID number, name, and administrative status.
<b>QI 1...8</b>	The WRP information for each of the QSet queues.

## show qos qsi

Displays the QSet instance (QSI) configuration for the switch. A QSI is a logical set of eight egress queues associated with each port, link aggregate (LAG) ID, and virtual fabric link (VFL).

**show qos qsi** [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*] | **vf-link** *vfl\_id*] [**detail** | **summary**]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>vfl_id</i>	The VFL ID (1/0). <i>This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.</i>
<b>detail</b>	Displays additional queue information for the instance.
<b>summary</b>	Displays summary information for the instance.

### Defaults

By default, displays the entire QSI configuration for the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **port** *slot/port*, **slot** *slot*, **linkagg** *agg\_id*, and **vf-link** *vfl\_id* parameters to display the QSI information associated with specific ports, link aggregates, or VFLs. These parameters can also be combined with the **detail** or **summary** parameters.

### *output definitions*

---

<b>QSAP</b>	The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time.
<b>Parent</b>	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL.
<b>QSI</b>	The QSet instance (QSI) ID number, internally generated by the switch.
<b>QSP, Name</b>	The QSet profile (QSP) ID number and name associated with the QSI.
<b>WRP, Name, Admin, Oper</b>	The WRED profile (WRP) ID number and name associated with the QSI. Also indicates the administrative and operational status of the WRP for the QSI. Only default WRP 1 is supported.
<b>Stats, Admin, Oper, Interval</b>	The QSI administrative status, operational status, and time interval for statistics collection.
<b>BW Admin (%)</b>	The administrative percentage of bandwidth (currently not user-configurable).
<b>BW Oper (%)</b>	The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports.
<b>QI 1-8</b>	The queue scheduling and bandwidth configuration for each QSI queue. These values are determined by which one of the QSet profiles (QSP 1-4) is associated with the QSI.

---

```
-> show qos qsi port 1/1/20 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name

```
-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.
```

Port	Profile		Mode	Parent
	#	Name		
vfl-1/0	2	qsp-2	NDCB	vfl-1/0

### output definitions

<b>Port</b>	The physical slot and port number (or link aggregate ID or VFL ID for a logical port).
<b>Profile #, Name</b>	The QSet profile (QSP) ID number and name associated with the QSI.
<b>Mode</b>	The QSI operating mode ( <b>NDCB</b> or <b>DCB</b> ). This mode determines whether Data Center Bridging (DCB) profiles or QSet profiles (non-DCB) are applied to the QSI instance. DCB and QSet profiles are mutually exclusive in that if the OmniSwitch Data Center software license is installed, only DCB profiles are applied.
<b>Parent</b>	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL.

### Release History

Release 7.1.1; command was introduced.  
 Release 7.2.1; output display modified for the OmniSwitch 6900.  
 Release 7.2.1.R02; output display modified for the OmniSwitch 6900.  
 Release 8.3.1; **vf-link** and **summary** parameters added.

### Related Commands

<b>qos qsi qsp</b>	Changes the QSet profile association for a QSet instance.
<b>qos qsi wred</b>	Configures the administrative status of the WRED profile.

## show qos qsi stats

Displays statistics for the QSet instance (QSI) queues that are associated with non-DCB (NDCB) ports.

```
show qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats [bytes | rate [bytes]]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
<b>bytes</b>	Displays the total number of bytes (instead of packets) that flow through the QSI queues.
<b>rate</b>	Displays the number of packets-per-second that flow through the QSI queues.

### Defaults

parameter	default
bytes   rate	bytes

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The specified port or link aggregate must have statistics collection enabled.
- Use the **port** *slot/port* or **linkagg** *agg\_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- It is possible to combine the **bytes** parameter with the **rate** parameter to display the number of bytes-per-second that flow through the QSI queues. For example, **show qos qsi port 1/20 stats rate bytes**.
- Statistics are displayed on a per-queue basis for each port. There are eight queues associated with a single QSet instance. Each queue is identified with a queue ID (1–8). Each port and link aggregate is associated with one QSet instance.

**Examples**

```
-> show qos qsi port 1/20 stats
```

Port	Q	Total	
		Tx	Drop
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	9984	0

```
-> show qos qsi port 1/20 stats bytes
```

Port	Q	Total	
		Tx	Drop
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	987424	0

```
-> show qos qsi port 1/20 stats rate
```

Port	Q	Average	
		Tx/s	Drop/s
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	7	0

```
-> show qos qsi port 1/20 stats rate bytes
```

Port	Q	Average	
		Tx/s	Drop/s
1/20	1	0	0
1/20	2	0	0
1/20	3	0	0
1/20	4	0	0
1/20	5	0	0
1/20	6	0	0
1/20	7	0	0
1/20	8	694	0

*output definitions*

---

<b>Port</b>	The slot and port number.
<b>Q</b>	The QSet queue ID number (1–8) associated with the QoS (non-DCB) port.
<b>Total Tx</b>	Total packets or bytes transmitted.
<b>Total Drop</b>	Total packets or bytes dropped.

---

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

<a href="#">qos qsi stats</a>	Enables or disables statistics collection for a DCB or non-DCB port.
<a href="#">clear qos qsi stats</a>	Clears statistics collected for one or more QSet instances.

**MIB Objects**

```

  alaVfcQInstancePacketsEnqueued  
  alaVfcQInstanceBytesEnqueued  
  alaVfcQInstancePacketsDropped  
  alaVfcQInstanceBytesDropped
```

---

## show qos qsi wred-stats

Displays the Weighted Random Early Detection (WRED) statistics for the QSet instance.

```
show qos qsi {port chassis/slot/port[-port2] | slot slot | linkagg agg_id[-agg_id2]} wred-stats [rate | bytes]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15).
<b>rate</b>	Displays the number of packets per second.
<b>bytes</b>	Displays the total number of bytes.

### Defaults

By default, displays the total number of packets for all the QSI queues.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- This command displays the total number of packets or bytes.

### Examples

```
-> show qos qsi port 1/2 wred-stats
* OS6900 WRED Per Q stats not supported, Tx stats not supported
Port          Green          Yellow          Red
             Q Drop             Drop             Drop
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
Port 1/2      - 0                   0                   0
-> show qos qsi port 1/1 wred-stats rate
* OS6900 WRED Per Q stats not supported, Tx stats not supported

### output definitions

<b>Port</b>	The switch port.
<b>Q</b>	The egress queue ID (1–8) associated with the port.
<b>Green TX, Green Drop</b>	The number of green packets or bytes transmitted and dropped.
<b>Yellow TX, Yellow Drop</b>	The number of yellow packets or bytes transmitted and dropped.
<b>Red TX, Red Drop</b>	The number of red packets or bytes transmitted and dropped.

### Release History

Release 7.2.1.R01; WRED per Q stats not supported; Tx stats not supported.

### Related Commands

<a href="#">qos qsi wred</a>	Configures the administrative status of the WRED profile.
<a href="#">show qos wrp</a>	Displays the WRED profile (WRP) configuration for the switch.
<a href="#">show qos qsi</a>	Displays the QSet instance configuration.
<a href="#">clear qos qsi stats</a>	Clears statistics collected for one or more QSet instances.

## show qos qsp system-default

Displays the name and ID of the QSet profile (QSP) that serves as the default system QSP. when the switch is running in the non-DCB (NDCB) mode.

**show qos qsp system-default**

---

### Syntax Definitions

N/A

### Defaults

By default, QSP 1 is assigned to each QSet instance.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- The switch is operating in the NDCB mode when the OmniSwitch Data Center software license is *not* installed on the switch.
- The switch is operating in the Data Center Bridging (DCB) mode when the OmniSwitch Data Center software license is installed on the switch. Configuring the system default profile is not supported in the DCB mode.

### Examples

```
-> show qos qsp system-default
NDCB Default QSP profile      : 1   (qsp-1)
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[qos qsp system-default](#) Configures the default QSet profile for the switch.

## clear qos qsi stats

Clears QSet instance (QSI) statistics.

**clear qos qsi {port *chassis/slot/port*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} stats**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (1\5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **port** *slot/port* and **linkagg** *agg\_id* parameters to clear QSI statistics associated with specific ports or link aggregates.
- QSI statistics can only be cleared on ports or link aggregates that have statistics collection enabled.

### Examples

```
-> clear qos qsi port 1/1/2 stats
-> clear qos qsi port 1/1/10-15 stats
-> clear qos qsi linkagg 5 stats
-> clear qos qsi linkagg 10-15 stats
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos qsi stats](#) Displays QSet instance statistics.

### MIB Objects

alaVfcQsapTable
  alaVfcQsapClearStats
  alaVfcQsapQpId
```

---

## qos qsp dcb import

Imports a Data Center Bridging profile (DCB) to a new or previous custom profile.

```
qos qsp dcb {dcp_id | dcp_name} import qsp dcb {import_dcp_id | import_dcp_name} [802.3x-pause]
```

```
no qos qsp dcb {dcp_id | dcp_name}
```

---

### Syntax Definitions

<i>dcp_id</i>	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
<i>dcp_name</i>	The DCB profile name.
<i>import_dcp_id</i>	The ID of the DCB profile to import. The valid profile ID range is 1–11 to specify a predefined profile and 12–128 to specify a custom profile.
<i>import_dcp_name</i>	The name of the DCB profile to import.
<b>802.3x-pause</b>	Makes the profile pause-ready. When enabled, the Priority based Flow Control (PFC) is lossy for all traffic classes in the profile and they cannot be changed to lossless.

### Defaults

By default the **802.3x-pause** flag is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The new DCB profile must be unique and not contain the same name and ID of an existing DCB profile.
- On an OmniSwitch 6900-Q32, only import DCB profile 8 to create a custom profile. Do not use any of the other pre-defined profiles to create a custom profile.
- Use the **no** form of the command to remove an existing custom DCB profile from the switch configuration.
- The pre-defined DCB profiles from 1 to 11 cannot be removed from the switch configuration.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.
- Use the **802.3x-pause** tag to enable pause-ready on the profile. When enabled, the PFC is lossy for all traffic classes in the profile and they cannot be changed to lossless. This type of custom profile is created to support legacy PAUSE frames on ports to which the profile is applied. However, before applying the custom profile to a port, disable PFC TLV and PFC willing on the port.

### Examples

```
-> qos qsp dcb 33 import qsp dcb 8
-> qos qsp dcb lossyETS import qsp 10
```

```
-> qos qsp dcb 34 import qsp dcb 7 802.3x-pause
-> no qsp dcb 33
```

## Release History

Release 7.3.1; command was introduced.

```

---

## qos qsp dcb tc

Modifies the Data Center Bridging (DCB) traffic class attributes of a DCB profile.

```
qos qsp dcb {dcp_id | dcp_name} tc tc_num {pfc flow-type { ll | nll} | pfc link-delay allowance | min-bw % | max-bw % | recommended bw %}
```

---

### Syntax Definitions

<i>dcp_id</i>	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
<i>dcp_name</i>	The DCB custom profile name.
<i>tc_num</i>	The traffic class number in the DCB profile.
<b>ll</b>	Designates traffic class as lossless.
<b>nll</b>	Designates traffic class as non-lossless (lossy).
<i>allowance</i>	Link delay allowance value for PFC.
<b>min-bw %</b>	Sets the minimum bandwidth guaranteed for the Enhanced Transmission Selection (ETS) traffic class.
<b>max-bw %</b>	Sets the maximum bandwidth guaranteed for the Strict Priority (SP) traffic class.
<b>recommended bw %</b>	Sets the recommended minimum bandwidth for the traffic class.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The **pfc flow-type** option is used to change a traffic class from lossless (ll) to lossy (nll) or from lossy (nll) to lossless (ll).
- The **pfc link-delay** option sets the actual headroom for the traffic class. An incorrect setting can result in traffic loss.
- The **min-bw** option sets the minimum bandwidth guaranteed for the ETS traffic class.
- The **max-bw** option sets the maximum bandwidth guaranteed for the SP traffic class.
- The **recommended bw** option sets the recommended minimum bandwidth for the traffic class.

### Examples

```
-> qos qsp dcb 11 tc 0 min-bw 3
-> qos qsp dcb lossyETS tc 1 min-bw 12
-> qos qsp dcb lossyETS tc 2 pfc flow-type ll
-> qos qsp dcb 11 tc 0 recommended bw 3
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

  alaDcbxDCPTCMinimumBandwidth
  alaDcbxDCPTCMaximumBandwidth
  alaDcbxDCPTCRecommendedBandwidth
```

---

## qos qsp dcb tc-numbering

Modifies the traffic class (TC) numbering for custom profiles.

```
qos qsp dcb {dcp_id | dcp_name} tc-numbering tc_num
```

---

### Syntax Definitions

<i>dcp_id</i>	A DCB custom profile ID. The valid custom profile ID range is 12 through 128.
<i>dcp_name</i>	The DCB custom profile name.
<i>tc_num</i>	Enter the traffic class numbering sequence for the DCB profile.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The command can be used to modify the traffic class numbering for the custom profiles.
- The numbering must be assigned in ascending order. For example, a profile with TCs numbered 0, 1, 2, can be changed to 1, 5, 7.
- The number of TCs specified must match the number of TCs in the profile.

### Examples

```
-> qos qsp dcb 11 tc-numbering 1 5 7 9
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show qos qsp dcb](#) Displays the configured DCB profiles and the traffic classes associated to the DCB profile.

### MIB Objects

```

---

## qos qsi qsp dcb

Assigns a DCB profile to a port or link aggregate.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} qsp dcb {dcp_id | dcb_name}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>dcp_id</i>	DCB profile ID. DCB profile ID 11 through 128 refers to the custom profiles. DCB profile ID 1 through 10 refers to the predefined profiles.
<i>dcp_name</i>	DCB profile name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When a DCB profile is assigned to a link aggregate, the profile is applied to all the ports associated with the linkagg.
- Avoid configuring different profiles for each port of the link aggregate.
- The command will not work if the link aggregate is associated with 1Gig port. Different combination of ports (10G and 40G) are allowed in a link aggregate.

### Examples

```
-> qos qsi port 1/11 qsp dcb lossyETS  
-> qos qsi port 1/11 qsp dcb 7
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### `show qos qsp dcb`

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

## MIB Objects

alaDcbxPortInstanceEntry

    alaDcbxPIAdminDCPId

    alaDcbxPIAdminDCPName

---

## qos qsi dcb dcbx version

Selects the version of the DCB Exchange protocol (DCBX) to apply to the specified DCB port.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx version {ieee | cee | auto}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<b>ieee</b>	Selects IEEE 802.1Qaz DCBX.
<b>cee</b>	Selects Converged Enhanced Ethernet DCBX 1.01.
<b>auto</b>	Automatically detects the DCBX version used by the peer switch.

### Defaults

By default, the DCB port is configured to automatically use the DCBX version detected from the peer.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Initially, the IEEE version of DCBX is run on the port until the switch detects the peer is running the CEE version. At that point, the switch will stop IEEE DCBX and start to run the CEE version.

### Examples

```
-> qos qsi port 1/10 dcb dcbx version ieee
-> qos qsi port 1/10 dcb dcbx version cee
-> qos qsi port 1/11 dcb dcbx version auto
```

### Release History

Release 7.3.3; command was introduced.

**Related Commands**

<b>qos qsi dcb dcbx admin-state</b>	Enables or disables DCBX functionality on the port.
<b>qos qsi dcb dcbx ets</b>	Enables or disables application Type, Length, Value (TLV) transmission on a per-port basis.
<b>qos qsi dcb dcbx pfc</b>	Enables or disables config-TLV, defense mode, and willing bit for PFC on a per-port basis.
<b>show qos qsi dcb dcbx</b>	Displays the DCBX configuration and status for the specified port.

**MIB Objects**

```

```

---

## qos qsi dcb dcbx admin-state

Enables or disables DCB exchange protocol (DCBX) functionality on a per port basis.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx admin-state {enable | disable}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<b>enable</b>	Enables the DCBX functionality on the port.
<b>disable</b>	Disables the DCBX functionality on the port.

### Defaults

parameter	default
dcbx admin-state	enable

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The DCBX admin-state, enables or disables DCBX TLVs and negotiation on a port.

### Examples

```
-> qos qsi port 1/10 dcb dcbx admin-state enable
-> qos qsi port 1/10 dcb dcbx admin-state disable
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

**qos qsi dcb dcbx version**

Selects the version of DCBX to apply to the specified DCB port.

**qos qsi dcb dcbx ets**

Enables or disables application Type, Length, Value (TLV) transmission on a per port basis.

**qos qsi dcb dcbx pfc**

Enables or disables config-TLV, defense mode, and willing bit for PFC on a per port basis.

**show qos qsi dcb dcbx**

Displays the configured ports in the system and the related DCBX information.

## MIB Objects

alaDcbxPortInstanceEntry

    alaDcbxPIIfIndex

    alaDcbxPIDCBXAdmin

---

## qos qsi dcb dcbx ets

Enables or disables config-TLV, recommended-TLV, and the willing bit for ETS on a per-port basis.

**qos qsi** {port *chassis/slot/port*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} **dcb dcbx ets** [config-tlv {enable | disable} | recommend-tlv {enable | disable} | willing {yes | no}]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<b>config-tlv enable</b>	Enables the transmission of ETS configuration TLVs.
<b>config-tlv disable</b>	Disables the transmission of ETS configuration TLVs.
<b>recommend-tlv enable</b>	Enables the transmission of ETS recommended TLVs.
<b>recommend-tlv disable</b>	Disables the transmission of ETS recommended TLVs.
<b>yes</b>	Sets the willing bit to on in the TLVs.
<b>no</b>	Sets the willing bit to off in the TLVs.

### Defaults

parameter	default
<b>config-tlv</b> {enable   disable}	enable
<b>ets recommend-tlv</b> {enable   disable}	enable
<b>willing</b> {yes   no}	yes

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the option **ets config-tlv** to enable or disable the transmission of ETS configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets recommended-tlv** to enable or disable the transmission of ETS recommended TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to set the willing bit on the TLVs. This option is used when the DCBX is enabled on the port and the ETS configuration TLV is sent on the port.

### Examples

```
-> qos qsi port 1/1-10 dcb dcbx ets config-tlv disable
-> qos qsi port 1/11 dcb dcbx ets recommended-tlv disable
-> qos qsi linkagg 5 dcb dcbx ets willing no
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

<b>qos qsi dcb dcbx version</b>	Selects the version of DCBX to apply to the specified DCB port.
<b>qos qsi dcb dcbx admin-state</b>	Enables or disables DCBX functionality for the port.
<b>qos qsi dcb dcbx pfc</b>	Enables or disables config-TLV, defense mode, and willing bit for PFC on a per port basis.
<b>show qos qsi dcb dcbx</b>	Displays the configured ports in the system and the related DCBX information.
<b>show qos qsi dcb ets</b>	Displays the configured ports in the system and the related DCBX ETS and ETS traffic class information.

```

---

## qos qsi dcb dcbx pfc

Enables or disables config-TLV, defense mode, and willing for PFC on a per port basis.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx pfc [config-tlv {enable |
disable} | defense {enable | disable} | willing {yes | no}]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<b>config-tlv enable</b>	Enables the transmission of PFC configuration TLVs.
<b>config-tlv disable</b>	Disables the transmission of PFC configuration TLVs.
<b>defense enable</b>	Enables the defense mode for the PFC.
<b>defense disable</b>	Disables the defense mode for the PFC.
<b>willing yes</b>	Allows the PFC to negotiate with the network.
<b>willing no</b>	Stops the PFC from negotiating with the network.

### Defaults

parameter	default
<b>pfc config-tlv</b>	enable
<b>pfc defense</b>	enable
<b>pfc willing</b>	yes

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the option **pfc config-tlv** to enable or disable the transmission of PFC configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to allow the PFC to negotiate with the network.

### Examples

```
-> qos qsi port 1/1-10 dcb dcbx pfc config-tlv disable
-> qos qsi port 1/11 dcb dcbx pfc defense disable
-> qos qsi linkagg 5 dcb dcbx pfc willing no
```

### Release History

Release 7.3.1; command was introduced.

## show qos qsp dcb

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

```
show qos qsp dcb [dcp_id | dcp_name] [tc tc_num]
```

---

### Syntax Definitions

<i>dcp_id</i>	DCB profile ID. DCB profile ID 11–128 refers to the custom profiles. DCB profile ID 1–0 refers to the predefined profiles.
<i>dcp_name</i>	DCB profile name.
<i>tc_num</i>	The traffic class associated to the DCB profile. The valid range is 0–7.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command displays the details of the configured DCB profile.
- Use the **tc** option to display the traffic classes associated to the DCB profile.

### Examples

```
-> show qos qsp dcb
```

Legends: Prio TC Map:

Represents the priority to traffic class mapping;  
begins with priority 0 on the left and displays the  
traffic class it belongs to.

#	Name	Priority TC Map	PFC Cap	Max TC	ETS		802.3x Pause-Ready
					Template-DCP #	Name	
1	dcp-1	00001122	8	8	1	dcp-1	No

<b>qos qsp dcb tc</b>	Modifies the Data Center Bridging (DCB) attributes of a DCB profile.
<b>qos qsp dcb tc-numbering</b>	Modifies the priority of traffic class mapping the custom profiles.
<b>clear qos qsi dcb pfc stats</b>	Clears the port statistics.

## show qos qsi dcb dcbx

Displays the DCBX port configuration and status.

```
show qos qsi [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] dcb dcbx [status]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<b>status</b>	Displays the DCBX operational status for the port.

### Defaults

By default, the DCBX configuration is displayed for all ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** *slot/port* or **linkagg** *agg\_id*, parameters to display information for a specific port or link aggregate.
- Use the **status** option to display the status information of the DCBX related to the port.

### Examples

```
-> show qos qsi port 1/1-5 dcb dcbx
```

Port	DCP Name	DCBX Ver	DCBX Admin	Stats Admin	PFC Defense	ETS				
						PFC TLV	PFC Will	Cfg TLV	Reco TLV	ETS Will
1/1	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/2	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/3	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/4	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes
1/5	8 dcp-8	AUTO	Ena	Dis	Ena	Ena	Yes	Ena	Ena	Yes

#### output definitions

---

<b>Port</b>	The DCB slot and port number or link aggregate ID.
<b>DCP Name</b>	The DCB profile ID assigned to the port.
<b>Name</b>	The name of the DCB profile assigned to the port.
<b>DCBX Ver</b>	The version of DCBX running on the port ( <b>CEE</b> , <b>IEEE</b> , or <b>AUTO</b> ).
<b>DCBX Admin</b>	Indicates the administrative status of DCBX on the port.
<b>Stats Admin</b>	Indicates if statistics collection is enabled or disabled on the port.

*output definitions (continued)*

---

<b>PFC Defense</b>	Indicates the status of PFC defense ( <b>Ena</b> or <b>Dis</b> ). Applies when PFC negotiation fails. If enabled then PFC becomes disabled but traffic still flows. If disabled then the PFC local configuration remains on the port.
<b>PFC TLV</b>	Indicates whether the IEEE 802.1 organizationally defined PFC TLV transmission is allowed on a given LLDP transmission capable port.
<b>PFC Will</b>	Indicates whether or not the port is willing to accept the PFC configuration from a remote peer.
<b>Cfg TLV</b>	Indicates whether or not ETS configuration TLV transmission is allowed on a port.
<b>Reco TLV</b>	Indicates whether or not ETS configuration TLV transmission is allowed on a port.
<b>ETS Will</b>	Indicates whether or not the port is willing to accept the recommended ETS configuration from a remote peer.

---

```
-> show qos qsi port 1/1-5 dcb dcbx status
```

```

          DCBX
          Local  Local Remote

1/1      Dis  No    AUTO  -    No             -
1/2      Dis  No    AUTO  -    No             -
1/3      Dis  No    AUTO  -    No             -
1/4      Dis  No    AUTO  -    No             -
1/5      Dis  No    AUTO  -    No             -

```

*output definitions*

---

<b>Port</b>	The DCB slot and port number or link aggregate ID.
<b>DCBX Oper</b>	Indicates the operational status of DCBX on the port.
<b>Local Oper Changed</b>	Identifies if the local configuration is different from the configuration imported from the DCB profile applied to the port.
<b>Error</b>	Indicates if there is an error condition.
<b>Local Oper Ver</b>	The version of DCBX running on the local port ( <b>CEE</b> , <b>IEEE</b> , or <b>AUTO</b> ).
<b>Remote Oper Ver</b>	The version of DCBX running on the remote port ( <b>CEE</b> , <b>IEEE</b> , or <b>AUTO</b> ).
<b>Action</b>	Indicates the action taken as a result of the status.

---

**Release History**

Release 7.3.1; command was introduced.

Release 7.3.3; fields added to display the version of DCBX (IEEE or CEE).

## Related Commands

<a href="#">qos qsi qsp dcb</a>	Assigns a DCB profile to a port or link aggregate.

## show qos qsi dcb ets

Displays the configured ports in the system and the related DCBX ETS and ETS traffic class information.

**show qos qsi** {port *chassis/slot/port*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} **dcb ets** [*tc* [*tc\_num*]]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i> ]	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>tc_num</i>	Enter the traffic class for which the information needs to be displayed. The valid range is 0-7.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the *tc\_num* option to display the DCBX ETS information for a specific traffic class.

### Examples

```
-> show qos qsi port 1/1 dcb ets
```

Legends: Prio TC Map:

Represents the priority to traffic class mapping;  
begins with priority 0 on the left and displays the  
traffic class it belongs to.

\* indicates port oper status is different than the configured status

Port	Loc-Adm		Loc-Oper		Loc-Oper		Rem-Oper		Rem-Oper			
	Prio	Max	Prio	Max	Prio	Max	Prio	Max	Prio	Max		
1/1	00111222	3	Dis	Yes	00111222	3	Dis	Yes	00111222	3	Ena	Ena

#### output definitions

---

<b>Port</b>	Configured DCB ports.
<b>Loc-Adm Prio TC Map</b>	Indicates the traffic class to which the priority is to be assigned.
<b>Loc-Adm Max TC</b>	Indicates the number of traffic classes supported.
<b>Loc-Adm CBS</b>	Indicates the status of the credit-based shaper traffic support.
<b>Loc-Adm Will</b>	Indicates if the local system is willing to accept the ETS configuration recommended by the remote system.
<b>Loc-Oper Prio TC Map</b>	Indicates the traffic class the priority belongs to.

*output definitions (continued)*

---

<b>Loc-Oper Max TC</b>	Indicates the number of traffic classes supported in the local system.
<b>Loc-Oper CBS</b>	Indicates if the credit-based shaper traffic is supported on the local system.
<b>Loc-Oper Will</b>	Indicates if the credit-based shaper traffic selection is supported on the local system.
<b>Rem-Oper Prio TC Map</b>	Indicates the priority that is assigned to a traffic class.
<b>Rem-Oper Max TC</b>	Indicates the number of traffic classes supported in the remote system.
<b>Rem-Oper CBS</b>	Indicates if the credit-based shaper traffic selection is supported on the remote system.
<b>Rem-Oper Will</b>	Indicates if the remote system is willing to accept the ETS configuration recommended by the remote system.

---

## show qos qsi dcbx pfc

Displays the configured ports in the system and the related DCBX PFC information.

**show qos qsi {port chassis/slot/port[-port2] | linkagg agg\_id[-agg\_id2]} dcb pfc**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

If there is no PFC TLV received from the remote end, then the remote information will be blank.

### Examples

```
-> show qos qsi port 4/1-2 dcb pfc
```

Legends: \* indicates port oper status is different than the configured status

Port	Priorities	Loc-Adm			Loc-Oper			Rem-Oper				
		MBC	Will	Cap	Priorities	MBC	Will	Cap	Priorities	MBC	Will	Cap
4/1*	0467	No	Yes	3	01	No	No	3	01	Yes	No	3
4/2*	23	No	No	3	-	No	No	3	-	Yes	No	3

### output definitions

---

<b>Port</b>	Configured DCB ports.
<b>Loc-Adm Priorities</b>	Indicates the priority for which PFC is enabled or disabled.
<b>Loc-Adm MBC</b>	Indicates if the local system is capable of bypassing MACsec processing when MACsec is disabled.
<b>Loc-Adm Will</b>	Indicates if the local system is willing to accept the PFC configuration of the remote system.
<b>Loc-Adm Cap</b>	Indicates the number of traffic classes on the local device that have simultaneously PFC enabled.
<b>Loc-Oper Priorities</b>	Indicates if PFC is enabled on the corresponding priority.
<b>Loc-Oper MBC</b>	Indicates if the local system is capable of bypassing MACsec processing when MACsec is disabled.

*output definitions (continued)*

---

<b>Loc-Oper Will</b>	Indicates if the local system is willing to accept the PFC configuration of the remote system.
<b>Loc-Oper Cap</b>	Indicates the number of traffic classes on the local device that have simultaneously PFC enabled.
<b>Rem-Oper Priorities</b>	Indicates if PFC is enabled on the corresponding priority on the remote system.
<b>Rem-Oper MBC</b>	Indicates if the remote system is capable of bypassing MACsec processing when MACsec is disabled.
<b>Rem-Oper Will</b>	Indicates if the remote system is willing to accept the PFC configuration of the local system.
<b>Rem-Oper Cap</b>	Indicates the number of traffic classes on the remote device that have simultaneously PFC enabled.

## show qos pfc-lossless-usage

Displays the usage of the PFC lossless traffic class on the switch.

```
show qos pfc-lossless-usage
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

This command displays the PFC lossless traffic class usage on the switch.

### Examples

```
-> show qos pfc-lossless-usage
Lossless Priorities in use      : 55,
Lossless Priorities reserved   : 60,
Lossless Priorities available  : 73
```

#### *output definitions*

---

<b>Lossless Priorities in use</b>	Indicates the number of PFC lossless priorities in use in the system.
<b>Lossless Priorities reserved</b>	Indicates the number of PFC lossless priorities in reserve in the system.
<b>Lossless Priorities available</b>	Indicates the number of priorities available to be configured as PFC lossless.

---

### Release History

Release 7.3.1; command was introduced.

### Related Commands

---

## show qos qsi dcb pfc stats

Displays the Priority Flow Control (PFC) statistics for the specified DCB port.

**show qos qsi [port chassis/slot/port[-port2] dcb pfc stats**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Statistics are displayed on a per-traffic class (TC) basis.

### Examples

```
-> show qos qsi port 1/11 dcb pfc stats
```

Legends: displays packet count

Port	Q	PFC		PFC
		TC	TX (req)	
1/11	0	0	0	0
1/11	1	0	0	0
1/11	2	0	0	0
1/11	3	0	0	0
1/11	4	1	0	0
1/11	5	1	0	0
1/11	6	2	0	0
1/11	7	2	0	0

### output definitions

---

<b>Port</b>	The DCB port number.
<b>Q</b>	The 802.1p priority number (0–7). This number is mapped to a traffic class (TC) based on the DCB profile assigned to the port.
<b>TC</b>	Indicates the traffic class to which the priority belongs.
<b>Priority</b>	Indicates the priority of the DCB port.
<b>PFC TX (req)</b>	Total count of PFC packets transmitted.
<b>PFC RX (ind)</b>	Total count of PFC packets received.

---

## Release History

Release 7.3.1; command was introduced.

## Related Commands

---

# 36 QoS Policy Commands

This chapter describes the CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

---

**Note.** Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

---

Refer to [Chapter 35, “QoS Commands,”](#) for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

*Filename:* ALCATEL-IND1-QOS-MIB.mib  
*Module* alaQoS MIB

---

**Important Note.** Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

---

The QoS Policy commands are listed here:

---

<b>Policy commands</b>	<b>policy rule</b> <b>policy validity-period</b> <b>policy list</b> <b>policy list rules</b> <b>policy condition</b> <b>policy action</b> <b>show policy action</b> <b>show policy condition</b> <b>show active policy rule</b> <b>show policy rule</b> <b>show policy validity period</b> <b>show active policy list</b> <b>show policy list</b> <b>show policy ipv4-summary</b> <b>show policy ipv6-summary</b>
------------------------	---

---

**Group commands**

**policy network group**  
**policy service**  
**policy service group**  
**policy mac group**

---

---

<b>Action commands</b>	<p> <a href="#">policy action</a>  <a href="#">policy action disposition</a>  <a href="#">policy action shared</a>  <a href="#">policy action priority</a>  <a href="#">policy action maximum bandwidth</a>  <a href="#">policy action maximum depth</a>  <a href="#">policy action cir</a>  <a href="#">policy action cpu priority</a>  <a href="#">policy action tos</a>  <a href="#">policy action 802.1p</a>  <a href="#">policy action dscp</a>  <a href="#">policy action map</a>  <a href="#">policy action permanent gateway-ip</a>  <a href="#">policy action permanent gateway-ipv6</a>  <a href="#">policy action port-disable</a>  <a href="#">policy action redirect port</a>  <a href="#">policy action redirect linkagg</a>  <a href="#">policy action no-cache</a>  <a href="#">policy action mirror</a> </p>
------------------------	---

---

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

---

<b>Access Control Lists</b>	<p> <a href="#">policy condition</a>  <a href="#">policy action disposition</a>  <a href="#">policy rule</a> </p>

---

## policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

```
policy rule rule_name [enable | disable] [precedence precedence] [condition condition] [action action]  
[validity-period name] [save] [log [log-interval seconds]] [count {packets | bytes}] [trap] [default-list]
```

```
policy rule rule_name no {validity-period | save | log | trap | default-list}
```

```
no policy rule rule_name
```

---

### Syntax Definitions

<i>rule_name</i>	The name of the policy rule, any alphanumeric string.
<b>enable</b>	Enables the policy rule.
<b>disable</b>	Disables the policy rule.
<i>precedence</i>	The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView.
<i>condition</i>	The condition name that is associated with this rule. Conditions are configured through the <b>policy condition</b> command.
<i>action</i>	The name of the action that is associated with this rule. Actions are configured through the <b>policy action</b> command.
<i>name</i>	The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the <b>policy validity period</b> command.
<b>save</b>	Marks the policy rule so that it may be captured as part of the switch configuration.
<b>log</b>	Configures the switch to log messages about specific flows coming into the switch that match this policy rule.
<i>seconds</i>	Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible.
<b>packets</b>	Counts the number of packets that match the rule.
<b>bytes</b>	Counts the number of bytes that match the rule.
<b>trap</b>	Enables or disables traps for the rule.
<b>default-list</b>	Adds the rule to the QoS default policy list.

## Defaults

parameter	default
<b>enable   disable</b>	enable
<i>precedence</i>	0
<b>log</b>	no
<i>seconds</i>	60
<b>packets   bytes</b>	packets
<b>trap</b>	enable
<b>default-list</b>	adds rule to the default list

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration or to remove parameters from a particular rule. The change will not take effect, however, until the **qos apply** command is issued.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **copy running-config working** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- If the rule is going to belong to a QoS policy list for a Universal Network Profile (UNP), use the **no default-list** option when creating the rule. Doing so will give the rule precedence over default list rules when the policy list is applied to UNP device traffic.

- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.
- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

**from {cli | ldap | blt}**

This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.

- The **log** option is useful for determining the source of attacks on the switch firewall.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.

## Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule3 condition c3 action a3 no default-list
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity-period vp01
-> policy rule rule2 no precedence
-> policy rule rule2 no validity-period
-> policy rule rule3 no default-list
-> no policy rule rule2
```

## Release History

---

## policy validity-period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

**policy validity-period** *name* [**days** *days*] [**months** *months*] [**hours** *hh:mm to hh:mm*] [**interval** *mm:dd:yy hh:mm to mm:dd:yy hh:mm*]

**policy validity-period** *name* **no** {**hours** / **interval**}

**no policy validity-period** *name*

---

### Syntax Definitions

<i>name</i>	The name of the validity period (up to 31 alphanumeric characters).
<i>days</i>	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., <b>monday</b> , <b>tuesday</b> , <b>wednesday</b> , etc.).
<i>months</i>	The month(s) in which the validity period is active. Enter the actual month (e.g., <b>january</b> , <b>february</b> , <b>march</b> , etc.).
<i>hh:mm</i>	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
<i>mm:dd:yy hh:mm</i>	An interval of time during which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:17 12:01 to 11:02:17 12:01).

### Defaults

By default, no validity period is in effect for a policy rule.

parameter	default
<i>days</i>	no restriction
<i>months</i>	no restriction
<i>hh:mm</i>	no specific time
<i>mm:dd:yyyy hh:mm</i>	no interval

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.

- Use the **policy rule** command to associate a validity period with a rule.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **snapshot** command is entered after the **policy validity-period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity-period** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy validity-period vp01 days tuesday thursday months january february
-> policy validity-period vp01 hours 13:00 to 19:00
-> policy validity-period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity-period vp01 no days thursday
-> no policy-validity period vp02
```

## Release History

---

## policy list

Configures a QoS policy list. There are four types of lists available: a Universal Network Profile (UNP) policy list, an egress policy list, an Application Fingerprinting policy list, and a default policy list.

**policy list** *list\_name* **type** {**unp** | **egress** | **appfp** | **empacl**} [**enable** | **disable**]

**no policy list** *list\_name*

---

### Syntax Definitions

<i>list_name</i>	The name to assign to the policy list. Note that the list name is case sensitive.
<b>unp</b>	Applies the list of policy rules to traffic classified into the User Network Profile to which the list is assigned
<b>egress</b>	Applies the list of policy rules to traffic egressing on switch ports.
<b>appfp</b>	Applies the list of policy rules to an Application Fingerprinting interface. <i>This parameter is supported only on the OmniSwitch 6900.</i>
<b>empacl</b>	<i>This parameter is not supported in this release.</i>
<b>enable</b>	Enables the policy list.
<b>disable</b>	Disables the policy list.

### Defaults

A default policy list is available when the switch boots up; all policy rules belong to this list unless otherwise specified (see the [policy list rules](#) and [policy rule](#) commands for more information).

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a policy list from the configuration.
- Once a policy list is created, use the [policy list rules](#) command to add rules to the list.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.
- If the **snapshot** command is entered after the **policy list** command is configured, the resulting ASCII file will include the following additional syntax for the **policy list** command:

**from** {**cli** | **ldap** | **blt**}

This syntax indicates how the list was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy list unpl type unp
-> policy list unpl disable
-> policy list unpl enable
-> no policy list unpl
```

## Release History

Release 7.2.1; command was introduced.

Release 8.4.1; **egress** parameter added.

## Related Commands

---

## policy list rules

Assigns existing QoS policy rules to the specified QoS policy list.

**policy list** *list\_name* **rules** *rule\_name* [*rule\_name2*...]

**policy list** *list\_name* **no rules** *rule\_name* [*rule\_name2*...]

---

### Syntax Definitions

<i>list_name</i>	The name of an existing QoS policy list. Note that the list name is case sensitive.
<i>rule_name</i>	The name of an existing QoS policy rule to include in the policy list.
<i>rule_name2</i>	Optional. The name of another QoS policy rule to include in the policy list. Separate each rule name specified with a space.

### Defaults

A default policy list is available when the switch boots up. This list has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a policy rule from an existing list.
- The QoS policy list and rule names specified with this command must already exist in the switch configuration.
- A rule may belong to a Universal Network Profile (UNP) list, the default list, and an egress policy list at the same time. By default, a rule is assigned to a default policy list when the rule is created. If the rule is subsequently assigned to another policy list, it still remains associated with the default list.
- If a rule is a member of multiple policy lists but one or more of these lists are disabled, the rule is still active in those lists that are enabled.
- If the QoS status of a policy rule is disabled, then the rule is disabled for all lists even if a list to which the policy rule belongs is enabled.
- If a policy rule is going to be assigned to a UNP policy list, make sure the rule was created using the **no default-list** option of the **policy rule** command. This will ensure that the rule will take precedence over other default list rules when the UNP policy list is applied to device traffic.
- A QoS policy list that is assigned to an Application Fingerprinting interface must contain policy rules with the **appfp-group** condition.

- Only those rules that are assigned to an egress policy list are applied to egress traffic. The following policy conditions and actions are supported when creating rules for an egress policy list:

policy conditions	policy actions
Source IPv4 address and mask	Disposition accept
Source IPv6 address and mask	Disposition drop
Outgoing port	Disposition deny
Outgoing VLAN	

- QoS policy lists that contain rules with a link aggregate source port condition are not supported on the OmniSwitch 9900 or the OmniSwitch 6560. In addition, using policy lists that contain rules with a source port condition are not supported when applied to 10G ports on an OmniSwitch 6560.
- On the OmniSwitch 9900, only policy rules with the following conditions can be assigned to a UNP policy list:
  - Destination MAC
  - EtherType / IPv6 Hop limit
  - Source VLAN
  - SIP
  - DIP / DIPv6
  - Layer 4 Protocol /NextHeader
  - Layer 4 source port
  - Layer 4 destination port
  - Source port bitmap
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.

## Examples

```
-> policy list unpl rules r1 r2 r3
-> policy list unpl no rules r2
```

## Release History

Release 7.2.1; command was introduced.

## policy network group

Configures a network group name and its associated IP addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the network group.

**policy network group** *net\_group ip\_address [mask net\_mask] [ip\_address2 [mask net\_mask2]...]*

**no policy network group** *net\_group*

**policy network group** *net\_group no ip\_address [mask netmask] [ip\_address2 [mask net\_mask2]...]*

---

### Syntax Definitions

<i>net_group</i>	The name of the network group (up to 31 alphanumeric characters).
<i>ip_address</i>	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
<i>net_mask</i>	The mask for the IPv4 address. If no mask is entered, the IPv4 address is assumed to be a host address.
<i>ip_address2</i>	Optional. Another IPv4 address to be included in the network group. Multiple IP addresses may be configured for a network group. Separate each address/mask combination with a space.
<i>net_mask2</i>	Optional mask for the IPv4 address. If no mask is entered, the natural mask for the address will be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to configure a group of IPv4 addresses to which you want to apply QoS rules. Rather than create a condition for each IPv4 address, group the addresses together. Use the **policy condition** command to associate a condition with the network group.
- Use the **no** form of the command to remove a network group from the configuration, or to remove an IP address from a network group.
- If the **snapshot** command is entered after the **policy network group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy network group** command:

**from {cli | ldap | blt}**

This syntax indicates how the network group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in network group, this setting is not configurable.

## Examples

```
-> policy network group webgroup1 10.10.12.5 10.50.3.1
-> policy network group webgroup1 no 10.10.12.5
-> no policy network group webgroup1
```

## Release History

Release 7.1.1; command was introduced.

## policy service group

Configures a service group and its associated services. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the service group.

**policy service group** *service\_group service\_name1 [service\_name2...]*

**no policy service group** *service\_group*

**policy service group** *service\_group no service\_name1 [service\_name2...]*

---

### Syntax Definitions

<i>net_group</i>	The name of the network group (up to 31 alphanumeric characters).
<i>ip_address</i>	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
<i>service_group</i>	The name of the service group (up to 31 alphanumeric characters).
<i>service_name1</i>	The service name is configured through the <b>policy service</b> command and includes information about protocol, source port, and destination port.
<i>service_name2...</i>	Optional. Additional service names may be configured for a service group. Separate each service name with a space.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to configure a group of services to which you want to apply QoS rules. Rather than create a condition for each service, group services together. Use the **policy condition** command to associate a condition with the service group.
- Use the **no** form of the command to remove a service group from the configuration, or to remove a service from a service group.
- To drop packets destined to specific TCP and UDP ports, create port services for the traffic that you want dropped and add these services to a service group. Then create a condition for this service group and a source port group, which can then be used in a deny rule. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- If the **snapshot** command is entered after the **policy service group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service group** command:

**from {cli | ldap | blt}**

This syntax indicates how the service group was created. The **cli** and **ldap** options may be changed by

a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in service group, this setting is not configurable.

## Examples

```
-> policy service group servgroup2 telnet ftp
-> policy service group servgroup2 no telnet
-> no policy service group servgroup2
```

## Release History

Release 7.1.1; command was introduced.

## policy mac group

Configures a MAC group and its associated MAC addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the MAC group.

**policy mac group** *mac\_group mac\_address [mask mac\_mask] [mac\_address2 [mask mac\_mask2]...]*

**no policy mac group** *mac\_group*

**policy mac group** *mac\_group no mac\_address [mask mac\_mask] [mac\_address2 [mask mac\_mask2]...]*

---

### Syntax Definitions

<i>mac_group</i>	The name of the MAC group (up to 31 alphanumeric characters).
<i>mac_address</i>	The MAC address associated with the group (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	The mask of the MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.
<i>mac_address2</i>	Optional. Additional MAC addresses may be configured for a MAC group. Separate each address with a space.
<i>mac_mask2</i>	The mask of an additional MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to configure a group of source or destination MAC addresses to which you want to apply QoS rules. Rather than create a condition for each MAC address, group MAC addresses together. Use the **policy condition** command to associate a condition with the MAC group.
- Use the **no** form of the command to remove a MAC group from the configuration, or to remove a MAC address from a MAC group.
- The MAC group name “alaPhones” is a reserved group name used to identify the MAC addresses of IP phones. See the [qos phones](#) command for more information.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

**from** {cli | ldap | blt}

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy mac group mac_group1 00:20:da:05:f6:23 00:20:da:05:f6:24
-> no policy mac group mac_group1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

---

## policy port group

Configures a port group and its associated slot and port numbers. A port group may be attached to a policy condition. The action associated with that policy will be applied to all members of the port group.

**policy port group** *group\_name* {*chassis//slot/port[-port2]* | *agg\_id[-agg\_id2]*} [*chassis//slot/port[-port2]* / *agg\_id[-agg\_id2]*]

**no policy port group** *group\_name*

**policy port group** *group\_name* **no** {*chassis//slot/port[-port2]* | *agg\_id[-agg\_id2]*} [*chassis//slot/port[-port2]* / *agg\_id[-agg\_id2]*]

---

### Syntax Definitions

<i>group_name</i>	The name of the port group (up to 31 alphanumeric characters).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port (or port range) to be included in the group. At least one slot/port combination must be specified. Additional combinations may be included in the group; each combination should be separated by a space.
<i>agg_id[-agg_id2]</i>	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15). Additional combinations may be included in the group; each combination should be separated by a space.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to configure a group of ports or link aggregates to which you want to apply QoS rules. Rather than create a condition for each port, group ports together. Use the **policy condition** command to associate a condition with the port group.
- Configuring ports and link aggregates in the same port group is allowed.
- Use the **no** form of the command to remove a port group from the configuration, or to remove a slot/port from a port group.
- If a range of ports is specified using the syntax *slot/port-port2* (i.e., 2/1-8), a single port within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- If a range of link aggregates is specified using the syntax *agg\_id[-agg\_id2]* (i.e., 10-15), a single aggregate within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- When a port group is used as part of a policy rule and a policy action specifies a maximum bandwidth, each interface in the port group will be allowed the maximum bandwidth.

- To prevent IP source address spoofing, add ports to the port group called **UserPorts**. This port group does not need to be used in a condition or rule to be effected on flows and applies to both bridged and routed traffic. Ports added to the UserPorts group will block spoofed traffic while still allowing normal traffic on the port. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- Use the **qos user-port** command to configure the option to filter or administratively disable a port when a specific type of traffic (Spoof, RIP, BPDU, OSPF, and/or BGP) is received on a port that is a member of the pre-defined UserPorts group.
- If the **snapshot** command is entered after the **policy port group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

**from {cli | ldap | blt}**

This syntax indicates how the port group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy port group port_group4 3/1-2 4/3 5/4
-> policy port group port_group4 no 3/1-2
-> policy port group UserPorts 4/1-8 5/1-8
```

## Release History

Release 7.1.1; command was introduced.

Release 8.3.1; *agg\_id* parameter added.

## Related Commands

  alaQoSAppliedPortGroupsName
  alaQoSAppliedPortGroupSlot
  alaQoSAppliedPortGroupPort
  alaQoSAppliedPortGroupPortEnd
```

## policy map group

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values. A map group may be referenced in a policy action with the **map** keyword.

```
policy map group map_group {value1:value2...}
```

```
no policy map group map_group
```

```
policy map group no {value1:value2...}
```

---

### Syntax Definitions

<i>map_group</i>	The name of the map group (up to 31 alphanumeric characters).
<i>value1</i>	The 802.1p, ToS, or DSCP value to be mapped to another value. May be a value or a range of values (for example, <b>1-2</b> ).
<i>value2...</i>	The 802.1p, ToS, or DSCP value to be used in place of <i>value1</i> . Additional mapping pairs may be included.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a mapping pair or to remove the map group entirely.
- The map group may contain more than one mapping pair.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy map group tosGroup 1-4:3 5-6:5 7:6  
-> policy map group tosGroup no 7:6  
-> no policy map group tosGroup
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [policy action map](#)

## policy service

Configures a service that may be used as part of a policy service group or included as part of a policy condition. A service is a source and/or destination TCP or UDP port or port range.

This overview section describes the base command. *At least one option must be configured with the base command.* Some options may be used in combination; some options are shortcuts for keyword combinations (see the Usage Guidelines). Options are described as separate commands. See the command descriptions and usage guidelines for valid combinations.

Use the **no** form for keywords to remove a parameter from a service.

```
policy service service_name
  [protocol protocol]
  [source ip-port port[-port]]
  [destination ip-port port[-port]]
  [source tcp-port port[-port]]
  [destination tcp-port port[-port]]
  [source udp-port port[-port]]
  [destination udp-port port[-port]]
```

```
no policy service service_name
```

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported. This value must be specified for <b>source ip-port</b> or <b>destination ip-port</b> ; it cannot be specified for <b>source tcp-port</b> , <b>destination tcp-port</b> , <b>source udp-port</b> , or <b>destination udp-port</b> .
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. Specify a range of ports using a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.

- The command options offer alternate ways of configuring TCP or UDP ports for a service. Note that port types (TCP or UDP) cannot be mixed in the same service. The following table shows how the keywords are used:

To configure:	Use keywords:	Notes
TCP or UDP ports for a service	<b>protocol</b> <b>source ip-port</b> <b>destination ip-port</b>	<i>The protocol must be specified with at least one source or destination port.</i>
TCP ports for a service	<b>source tcp-port</b> <b>destination tcp-port</b>	<i>Keywords may be used in combination.</i>
UDP ports for a service	<b>source udp-port</b> <b>destination udp-port</b>	<i>Keywords may be used in combination.</i>

- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

The following two commands show two different ways of configuring the same service:

```
-> policy service telnet2 protocol 6 destination ip-port 23
-> policy service telnet3 destination tcp-port 23
```

## Release History

Release 7.1.1; command was introduced.

## policy service protocol

Configures a service with a protocol and IP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **protocol** *protocol* {[**source ip-port** *port*[-*port*]] [**destination ip-port** *port*[-*port*]]}

**no policy service** *service\_name*

**policy service** *service\_name* **no** {**source ip-port** | **destination ip-port**}

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported.
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration or to remove parameters from a particular service. (A protocol value cannot be removed from a service.)
- Shortcut commands for the **policy service protocol** command include the following: **policy service source tcp-port**, **policy service destination tcp-port**, **policy service source udp-port**, and **policy service destination udp-port**.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from** {**cli** | **ldap** | **blt**}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service telnet2 protocol 6 destination ip-port 23 source ip-port 22
-> policy service telnet2 no source ip-port
```

---

## policy service source tcp-port

Configures a service with a source TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **source tcp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no source tcp-port**

---

### Syntax Definitions

*service\_name*

The name of the service (up to 31 alphanumeric characters).

*port*

The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp-port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service serv_5 source tcp-port 21-22
-> policy service serv_5 no source tcp-port
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

```

---

## policy service destination tcp-port

Configures a service with a destination TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **destination tcp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no destination tcp-port**

---

### Syntax Definitions

*service\_name*

The name of the service (up to 31 alphanumeric characters).

*port*

The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a service from the configuration, or to remove parameters from a particular service.
- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service service4 destination tcp-port 23
-> policy service service4 no destination tcp-port
```

### Release History

Release 7.1.1; command was introduced.

  alaQoSAppliedServiceDestinationTcpPort
  alaQoSAppliedServiceDestinationTcpPortEnd
```

---

## policy service source udp-port

Configures a service with a source UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **source udp-port** *port*[-*port*]

**no policy service** *service\_name*

**policy service** *service\_name* **no source udp-port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. Specify a port range with a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp-port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service serv_a source udp-port 1000
-> no policy service serv_a source udp-port
```

### Release History

Release 7.1.1; command was introduced.

## policy service destination udp-port

Configures a service with a destination UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **destination udp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no destination udp-port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. For example, a port number for NETBIOS is 137. A port range should be separated by a hyphen (for example, <b>137-138</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service service4 destination udp-port 137
-> policy service service4 no destination udp-port
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition

Creates a QoS policy condition. The condition determines what parameters the switch uses to classify incoming flows. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

Some condition parameters may not be supported depending on the platform you are using. Also some condition parameters may not be supported with some action parameters. See the condition/action tables in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

**policy condition** *condition\_name*

```
[source ip ip_address [mask netmask]]
[source ipv6 {any | ipv6_address [mask netmask]}]
[destination ip ip_address [mask netmask]]
[destination ipv6 {any | ipv6_address [mask netmask]}]
[multicast ip ip_address [mask netmask]]
[source network group network_group]
[destination network group network_group]
[multicast network group multicast_group]
[source ip-port port[-port]]
[destination ip-port port[-port]]
[source tcp-port port[-port]]
[destination tcp-port port[-port]]
[source udp-port port[-port]]
[destination udp-port port[-port]]
[ethertype etype]
[established]
[tcpflags {any | all} flag [mask flag]]
[service service]
[service group service_group]
[icmptype type]
[icmpcode code]
[ip-rotocol protocol]
[ipv6]
[nh next_header_value]
[flow-label flow_label_value]
[tos tos_value tos_mask]
[dscp {dscp_value[-value] [dscp_mask]}]
[source mac mac_address [mask mac_mask]]
[destination mac mac_address [mask mac_mask]]
[source mac group group_name]
[destination mac group mac_group]
[source vlan vlan_id]
[destination vlan vlan_id]
[802.1p 802.1p_value]
```

```
[source port chassis/slot/port[-port2]]
[source port group group_name]
[destination port chassis/slot/port[-port2]]
[destination port group group_name]
[vrf {vrf_name | default}]
[fragments]
[appfp-group group_name]
```

```
no policy condition condition_name
```

---

## Syntax Definitions

*condition\_name*                      The name of the condition. Any alphanumeric string.

## Defaults

N/A

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the [policy rule](#) command.
- Use the [qos apply](#) command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from a policy rule.
- At least one parameter must be associated with a condition.
- If the **snapshot** command is entered after the **policy condition** command is configured, the resulting ASCII file will include the following additional syntax for the **policy condition** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the condition was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in condition, this option is not configurable.

## Examples

```
-> policy condition cond4 source port 3/1
```

## Release History

Release 7.1.1; command was introduced.

---

## policy condition source ip

Configures a source IP address for a policy condition.

**policy condition** *condition\_name* **source ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no source ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The source IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the source IP address.

### Defaults

---

parameter	default
<i>netmask</i>	IP address class

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A source IP address and a source IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a source IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond3 source ip 173.201.18.3
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

## policy condition source ipv6

Configures a source IPv6 address for a policy condition.

```
policy condition condition_name source ipv6 {any | ipv6_address [mask netmask]}
```

```
policy condition condition_name no source ipv6
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Any source IPv6 address.
<i>ipv6_address</i>	A specific source IPv6 address.
<i>netmask</i>	The mask for the source IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

### Examples

```
-> policy condition cond3 source ipv6 ::1234:531F:BCD2:F34A
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination ip

Configures a destination IP address for a policy condition.

**policy condition** *condition\_name* **destination ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no destination ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The source IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the source IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a destination IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 destination ip 208.192.21.0 mask 255.255.255.0
```

## policy condition destination ipv6

Configures a destination IPv6 address for a policy condition.

```
policy condition condition_name destination ipv6 {any | ipv6_address [mask netmask]}
```

```
policy condition condition_name no destination ipv6
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Any destination IPv6 address.
<i>ipv6_address</i>	A specific destination IPv6 address.
<i>netmask</i>	The mask for the destination IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a destination IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

## policy condition multicast ip

Configures a multicast IP address for a policy condition.

**policy condition** *condition\_name* **multicast ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no multicast ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The multicast IP address.
<i>netmask</i>	Optional. The mask for the multicast IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A multicast IP address and a multicast network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a multicast IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 multicast ip 224.1.1.1
```

### Release History

## policy condition source network group

Associates a source network group with a policy condition.

**policy condition** *condition\_name* **source network group** *network\_group*

**policy condition** *condition\_name* **no source network group**

---

### Syntax Definitions

*condition\_name*

The name of the condition.

*network\_group*

The name of the source network group. Network groups are configured through the **policy network group** command. See [page 44-16](#) for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source network group from a condition; however, at least one classification parameter must be associated with a condition.
- A source IP address and a source IP network group cannot be specified in the same condition.

### Examples

```
-> policy condition cond5 source network group webgroup1
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination network group

Associates a destination network group with a policy condition.

**policy condition** *condition\_name* **destination network group** *network\_group*

**policy condition** *condition\_name* **no destination network group**

---

### Syntax Definitions

*condition\_name*

The name of the condition.

*network\_group*

The name of the destination network group. Network groups are configured through the [policy network group](#) command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a destination network group from a condition; however, at least one classification parameter must be associated with a condition.
- A destination IP address and a destination IP network group cannot be specified in the same condition.

## policy condition multicast network group

Associates a multicast group with a policy condition.

**policy condition** *condition\_name* **multicast network group** *multicast\_group*

**policy condition** *condition\_name* **no multicast network group**

---

### Syntax Definitions

*condition\_name*

The name of the condition.

*multicast\_group*

The multicast group name. Multicast groups are configured through the **policy network group** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a multicast group from a condition; however, at least one classification parameter must be associated with a condition.
- A multicast address and a multicast network group cannot be specified in the same condition.

### Examples

```
-> policy condition cond3 multicast group video2
```

## policy condition source ip-port

Configures a source IP port number for a policy condition.

**policy condition** *condition\_name* **source ip-port** *port[-port]*

**policy condition** *condition\_name* **no source ip-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the condition, either on the same command line or in a previous command. Use the **ip-protocol** keyword. See the [policy condition ip-protocol](#) command.
- The same condition cannot specify a source IP port with a source TCP port, source UDP port, service, or service group.

### Examples

```
-> policy condition cond1 ip-protocol 6 source ip-port 137
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## policy condition destination ip-port

Configures a destination IP port number for a policy condition.

**policy condition** *condition\_name* **destination ip-port** *port[-port]*

**policy condition** *condition\_name* **no destination ip-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a destination IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the same condition, either on the same command line or in a previous command. Use the **ip-protocol** keyword. See the [policy condition ip-protocol](#) command.
- The same condition cannot specify a destination IP port with a service or service group.

### Examples

```
-> policy condition cond2 ip-protocol 6 destination ip-port 137-138
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>policy condition ip-protocol</b>	Configures an IP protocol for a policy condition.
<b>show policy condition</b>	Shows information about policy conditions configured on the switch.

## MIB Objects

```
alaQoSConditionTable
  alaQoSConditionName
  alaQoSConditionDestinationIpPort
  alaQoSConditionDestinationIpPortEnd

  alaQoSAppliedConditionName
  alaQoSAppliedConditionDestinationIpPort
  alaQoSAppliedConditionDestinationIpPortEnd
```

---

## policy condition source tcp-port

Configures a source TCP port number for a policy condition.

```
policy condition condition_name source tcp-port port[-port]
```

```
policy condition condition_name no source tcp-port
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip-protocol**, use **source tcp-port**.
- The same condition cannot specify a source TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond3 source tcp-port 137
-> policy condition cond4 ipv6 source tcp-port 21
-> policy condition cond3 no source tcp-port
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination tcp-port

Configures a destination TCP port number for a policy condition.

**policy condition** *condition\_name* **destination tcp-port** *port*[-*port*]

**policy condition** *condition\_name* **no destination tcp-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a destination TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip-protocol**, use **destination tcp-port**.
- The same condition cannot specify a destination TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond4 destination tcp-port 137-138
-> policy condition cond5 ipv6 destination tcp-port 140
-> policy condition cond4 no destination tcp-port
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition source udp-port

Configures a source UDP port number for a policy condition.

**policy condition** *condition\_name* **source udp-port** *port[-port]*

**policy condition** *condition\_name* **no source udp-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip-protocol**, use **source udp-port**.
- The same condition cannot specify a source UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond5 source udp-port 1200-1400
-> policy condition cond6 ipv6 source udp-port 1000
-> policy condition cond5 no source udp-port
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination udp-port

Configures a destination UDP port number for a policy condition.

```
policy condition condition_name destination udp-port port[-port]
```

```
policy condition condition_name no destination udp-port
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a destination UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip-protocol**, use **destination udp-port**.
- The same condition cannot specify a destination UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond4 destination udp-port 137-138  
-> policy condition cond5 ipv6 destination udp-port 140  
-> policy condition cond4 no destination udp-port
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy condition ethertype

Configures an ethertype value to use for traffic classification.

**policy condition** *condition\_name* **ethertype** *etype*

**policy condition** *condition\_name* **no ethertype**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>etype</i>	The ethertype value, in the range 1536–65535 or 0x600–0xffff hex.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an ethertype value from a condition; however, at least one classification parameter must be associated with a condition.
- Enter a numeric or equivalent hex value for the *etype*.

### Examples

```
-> policy condition cond12 ethertype 8137
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy condition</a>	Creates a policy condition.

---

## policy condition established

Configures an established TCP connection as a policy condition. A connection is considered established if the **ack** or **rst** flags in the TCP header of the packet are set.

**policy condition** *condition\_name* **established**

**policy condition** *condition\_name* **no established**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove **established** from a condition; however, at least one classification parameter must be associated with a condition.
- When an initial TCP connection packet is received only the **syn** flag is set. As a result, TCP packets are only examined if they are not the starting packet.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source tcp-port**, or **destination tcp-port** conditions.
- Note that even though **established** can be used with most action parameters, it is mainly intended for ACL use.

### Examples

```
-> policy condition cond2 source ip 192.168.5.10 established
-> policy condition cond3 destination ip 10.255.11.40
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy condition</a>	Creates a policy condition.
<a href="#">show policy condition</a>	Shows information about policy conditions configured on the switch.

**MIB Objects**

```
alaQoSConditionTable
  alaQoSConditionTcpEstablished
alaQoSAppliedConditionTable
  alaQoSAppliedConditionTcpEstablished
```

---

## policy condition tcpflags

Configures a specific TCP flag value or combination of flag values as a policy condition.

**policy condition** *condition\_name* **tcpflags** [**any** | **all**] {**f** | **s** | **r** | **p** | **a** | **u** | **e** | **w**} **mask** {**f** | **s** | **r** | **p** | **a** | **u** | **e** | **w**}

**policy condition** *condition\_name* **no tcpflags**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Match on any of the specified TCP flags.
<b>all</b>	Match all specified TCP flags.
<b>f</b>   <b>s</b>   <b>r</b>   <b>p</b>   <b>a</b>   <b>u</b>   <b>e</b>   <b>w</b>	TCP flag value to match ( <b>f</b> =fin, <b>s</b> =syn, <b>r</b> =rst, <b>p</b> =psh, <b>a</b> =ack, <b>u</b> =urg, <b>e</b> =ecn, and <b>w</b> =cwr). <i>The e and w flags are currently not supported.</i>

### Defaults

parameter	default
<b>any</b>   <b>all</b>	all

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove **tcpflags** from a condition; however, at least one classification parameter must be associated with a condition.
- Use the **any** option to indicate that a match on any one of the specified TCP flags qualifies as a match for the condition. Use the **all** option to indicate that a match on all specified TCP flags is required to qualify as a match for the condition.
- Enter one or more TCP flags after the **any** or **all** keyword to indicate that the value of the flag bit must be set to one to qualify as a match.
- Enter one or more TCP flags after the **mask** keyword to indicate which TCP flags to match.
- If a TCP flag is specified as part of the **mask** but does not have a corresponding match value specified with the **any** or **all** options, then zero is assumed as the match value. For example, **tcpflags all f s mask f s a** looks for the following bit values to determine a match: **f**=1, **s**=1, **a**=0.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source tcp-port**, or **destination tcp-port** conditions.
- Note that even though **tcpflags** can be used with most action parameters, it is mainly intended for ACL use.

## Examples

```
-> policy condition c1 tcpflags all f s mask f s a
-> policy condition c2 tcpflags any a r mask a r
```

## Release History

Release 7.1.1; command was introduced.

---

## policy condition service

Configures a service for a policy condition.

**policy condition** *condition\_name* **service** *service\_name*

**policy condition** *condition\_name* **no service**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*service\_name* The service name, configured through the **policy service** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service cannot also specify a service group, IP protocol, source IP port, or destination IP port.

### Examples

```
-> policy condition cond12 service serv2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[policy service](#) Configures a service that may be used as part of a policy service group.

[qos apply](#) Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

[show policy service](#) Displays information about all particular policy services or a particular policy service configured on the switch.

## policy condition service group

Associates a policy service group with a policy condition.

**policy condition** *condition\_name* **service group** *service\_group*

**policy condition** *condition\_name* **no service group**

---

### Syntax Definitions

*condition\_name*

The name of the condition.

*service\_group*

The service group name. Service groups are configured through the [policy service group](#) command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service group cannot also specify a service, IP protocol, source IP port, or destination IP port.

### Examples

```
-> policy condition cond12 service group servgroup2
```

### Release History

Release 7.1.1; command was introduced.

## policy condition icmptype

Configures an ICMP type value to use for traffic classification.

**policy condition** *condition\_name* **icmptype** *type*

**policy condition** *condition\_name* **no icmptype**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>type</i>	The ICMP type value, in the range 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove an ICMP type value from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond12 icmptype 100
```

### Release History

Release 7.1.1; command was introduced.

Configures an ICMP code value to use for traffic classification.

**policy condition** *condition\_name* **icmpcode** *code*

**policy condition** *condition\_name* **no icmpcode**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>code</i>	The ICMP code value, in the range 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove an ICMP code value from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond12 icmpcode 150
```

### Release History

## policy condition ip-protocol

Configures an IP protocol for a policy condition.

**policy condition** *condition\_name* **ip-protocol** *protocol*

**policy condition** *condition\_name* **no ip-protocol**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*protocol* The protocol associated with the flow. The range is 0–255.

### Defaults

parameter	default
<i>protocol</i>	6

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a protocol from a condition; however, at least one classification parameter must be associated with a condition.
- If a source or destination port is specified (through the **policy condition source ip-port** or **policy condition destination ip-port** commands), the protocol must be specified.
- The same condition cannot specify an IP protocol with a service or service group.

### Examples

```
-> policy condition cond4 ip-protocol 6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**policy condition source ip-port** Configures a source IP port number for a policy condition.

**policy condition destination ip-port** Configures a destination IP port number for a policy condition.

**qos apply** Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

---

## policy condition ipv6

Configures a policy condition to classify IPv6 traffic.

**policy condition** *condition\_name* **ipv6**

**policy condition** *condition\_name* **no ipv6**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove IPv6 traffic as a condition; however, at least one classification parameter must be associated with a condition.
- When the **ipv6** keyword is used in a condition, a policy that uses the condition is considered an IPv6 policy. IPv6 policies are effected only on IPv6 traffic. All other IP policies are considered IPv4 policies and are effected only on IPv4 traffic.
- IPv6 Layer 4 policies are supported and are configured using the **ipv6** keyword in a condition that specifies Layer 4 information, services, or service groups. Note that IPv6 Layer 4 policies only work with packets that contain a single header.
- The **icmptype** and **icmpcode** keywords in an IPv6 policy imply the ICMPv6 protocol, not the ICMPv4 protocol.

### Examples

```
-> policy condition cond4 ipv6
-> policy condition cond5 ipv6 tos 7
-> policy condition cond6 ipv6 source port 1/1
-> policy condition cond7 ipv6 source tcp-port 21
-> policy condition cond8 ipv6 source tcp-port 0-1024
-> policy condition cond6 no ipv6
```

### Release History

Release 7.1.1; command was introduced.

## policy condition nh

Configures an IPv6 next header value as a policy condition. This value is compared to the next header value in the IPv6 header.

**policy condition** *condition\_name* **nh** *next\_header\_value*

**policy condition** *condition\_name* **no nh**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>next_header_value</i>	The next header value (0–255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove the next header value as a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 nh 100
-> policy condition cond4 no nh
```

### Release History

Release 7.1.1; command was introduced.

## policy condition flow-label

Configures an IPv6 flow label value as a policy condition. This value is compared to the flow label value in the IPv6 header.

**policy condition** *condition\_name* **flow-label** *flow\_label\_value*

**policy condition** *condition\_name* **no flow-label**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>flow_label_value</i>	The flow-label value (0–1048575).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove the flow label value as a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 flow-label 1500
-> policy condition cond4 no flow-label
```

### Release History

Release 7.1.1; command was introduced.

## policy condition tos

Configures the precedence bits in the Type of Service (ToS) byte value for a policy condition.

**policy condition** *condition\_name* **tos** *tos\_value* [**mask** *tos\_mask*]

**policy condition** *condition\_name* **no tos**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>tos_value</i>	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).
<i>tos_mask</i>	The mask for the ToS bits, in the range 0–7.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a condition; however, at least one classification parameter must be associated with a condition.
- If a ToS value is specified, a DSCP value may not be specified.

### Examples

```
-> policy condition cond2 tos 7
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">policy condition</a>	Creates a policy condition.

---

## policy condition dscp

Configures the Differentiated Services Code Point (DSCP) for a policy condition. The DSCP value defines the six most significant bits of the DS byte in the IP header.

**policy condition** *condition\_name* **dscp** {*dscp\_value*[-*value*]} [**mask** *dscp\_mask*]

**policy condition** *condition\_name* **no dscp**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>dscp_value</i> [- <i>value</i> ]	The DiffServ Code Point value, in the range 0–63. Use a hyphen to specify a range of DSCP values for the condition (for example, 10-20).
<i>dscp_mask</i>	The mask for the DiffServ Code Point, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a condition; however, at least one classification parameter must be associated with a condition.
- If a DSCP value is specified, a ToS value may not be specified.
- When a DSCP policy condition is configured on one of these switches, QoS automatically calculates the appropriate mask value.

### Examples

```
-> policy condition cond4 dscp 10
-> policy condition cond5 dscp 20-30
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition source mac

Configures a source MAC address for a policy condition.

**policy condition** *condition\_name* **source mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **no source mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The source MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23)
<i>mac_mask</i>	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond2 source mac 00:20:da:05:f6:23
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination mac

Configures a destination MAC address for a policy condition.

---

**Note.** Specifying a destination MAC address and mask of all zeros (00:00:00:00:00:00) as a policy condition can result in the switch dropping all traffic. Only use this type of condition in combination with other policies that will allow desired traffic and/or if a source or destination slot/port is also part of the destination MAC condition.

---

**policy condition** *condition\_name* **destination mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **no destination mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The destination MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	Optional. The mask for the destination MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a destination MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond3 destination mac 00:20:da:05:f6:23
```

### Release History

Release 7.1.1; command was introduced.

## policy condition source mac group

Associates a source MAC group with a policy condition.

**policy condition** *condition\_name* **source mac group** *group\_name*

**policy condition** *condition\_name* **no source mac group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source MAC group, configured through the <b>policy mac group</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a source MAC group from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

### Examples

## policy condition source vlan

Configures a source VLAN for a policy condition.

**policy condition** *condition\_name* **source vlan** *vlan\_id*

**policy condition** *condition\_name* **no source vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The source VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove a source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond5 source vlan 3
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

alaQoSAppliedConditionTable  
  alaQoSAppliedConditionName  
  alaQoSAppliedConditionSourceVlan
```

---

## policy condition inner source-vlan

Configures an inner source VLAN ID as a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner VLAN ID tag, also known as the customer VLAN ID.

**policy condition** *condition\_name* **inner source-vlan** *vlan\_id*

**policy condition** *condition\_name* **no inner source-vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The inner source VLAN ID (customer VLAN ID) to match on double-tagged packets.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove an inner source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner source VLAN condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

### Examples

```
-> policy condition cond5 inner source-vlan 3
-> policy condition cond5 no inner source-vlan
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination vlan

Configures a destination VLAN (multicast only) for a policy condition. Use the **no** form of the command to remove a destination VLAN from a condition.

**policy condition** *condition\_name* **destination vlan** *vlan\_id*

**policy condition** *condition\_name* **no destination vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The destination VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a destination VLAN from a condition; however, at least one classification parameter must be associated with a condition.
- Note that this condition is supported for multicast only policies.

### Examples

```
-> policy condition cond4 destination vlan 3 multicast ip any
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy condition</a>	Creates a policy condition.

## policy condition 802.1p

Configures the 802.1p value for a policy condition.

**policy condition** *condition\_name* **802.1p** *802.1p\_value*

**policy condition** *condition\_name* **no 802.1p**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>802.1p_value</i>	The 802.1p value in the 802.1Q VLAN tag for the flow. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond3 802.1p 7
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy condition</a>	Creates a policy condition.
<a href="#">show policy condition</a>	Shows information about policy conditions configured on the switch.

alaQoSAppliedConditionTable  
  alaQoSAppliedConditionName  
  alaQoSAppliedCondition8021p
```

---

## policy condition inner 802.1p

Configures an inner (customer) source 802.1p value for a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner 802.1p bit value.

**policy condition** *condition\_name* **inner 802.1p** *802.1p\_value*

**policy condition** *condition\_name* **no inner 802.1p**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>802.1p_value</i>	The inner 802.1p value of the inner 802.1Q VLAN tag (customer VLAN) to match on double-tagged packets. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner 802.1p condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

### Examples

```
-> policy condition cond3 inner 802.1p 7
-> policy condition cond3 no inner 802.1p
```

### Release History

Release 7.1.1; command was introduced.

## policy condition source port

Configures a source port number for a policy condition. Use the **no** form of the command to remove a source port number from a condition.

```
policy condition condition_name source {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
policy condition condition_name no source {port | linkagg}
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number on which the frame is received. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID on which the frame is received. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove a source port from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond2 source port 3/1
-> policy condition cond3 source port 3/2-4
-> policy condition cond3 no source port
-> policy condition cond3 source linkagg 10
-> policy condition cond3 source linkagg 15-20
-> policy condition cond3 no source linkagg
```

### Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **linkagg** parameter added.

## Related Commands

---

## policy condition destination port

Configures a destination port number for a policy condition.

```
policy condition condition_name destination {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

```
policy condition condition_name no destination {port | linkagg}
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number for which the frame is destined. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id[-agg_id2]</i>	The link aggregate ID for which the frame is destined. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a destination port from a condition; however, at least one classification parameter must be associated with a condition.
- The destination port condition does not apply to routed traffic. Only bridged unicast traffic is supported (bridged multicast and broadcast traffic is not supported).

### Examples

```
-> policy condition cond3 destination port 4/2
-> policy condition cond4 destination port 4/3-4
-> policy condition cond4 no destination port
-> policy condition cond4 destination linkagg 10
-> policy condition cond4 destination linkagg 15-20
-> policy condition cond4 no destination linkagg
```

### Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **linkagg** parameter added.

## policy condition source port group

Associates a source port group with a policy condition. Use the **no** form of the command to remove a source port group from a condition.

**policy condition** *condition\_name* **source port group** *group\_name*

**policy condition** *condition\_name* **no source port group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source port group. Port groups are configured through the <a href="#">policy port group</a> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove a source port group from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond6 source port group portgr4
```

### Release History

Release 7.1.1; command was introduced.

## policy condition vrf

Associates a Virtual Routing and Forwarding (VRF) instance with a policy condition.

**policy condition** *condition\_name* **vrf** {*vrf\_name* / **default**}

**policy condition** *condition\_name* **no vrf**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vrf_name</i>	The name of the VRF instance to which the QoS policy condition applies.
<b>default</b>	Specifies the default VRF instance.

### Defaults

By default, QoS policy conditions are not associated with any VRF instance. The policy applies across all instances.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove a VRF instance from a condition; however, at least one classification parameter must be associated with a condition.
- VRF policies are configured in the default VRF, similar to how all other QoS policies are configured. If the VRF name specified does not exist, the policy is not allocated any system resources.
- Policies that do not specify a VRF name are considered global policies and are applied across all VRF instances and VLANs.
- Policies that specify the default VRF apply only to traffic in the default VRF instance.
- Policies that specify a VRF name apply only to traffic in the VRF instance associated with that name.
- The **switch** network group is supported only in VRF policies that specify the default VRF instance. If this group is specified in a global policy (no VRF specified) then the policy is applied across all VRF instances.

### Examples

```
-> policy condition cond6 vrf engr-vrf
-> policy condition cond7 vrf default
-> policy condition cond6 no vrf
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition fragments

Associates TCP packet fragments with a policy condition.

**policy condition** *condition\_name* **fragments**

**policy condition** *condition\_name* **no fragments**

---

### Syntax Definitions

*condition\_name*                      The name of the condition. May be an existing condition name or a new condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of the command to remove TCP packet fragments from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond6 fragments
-> policy condition cond7 no fragments
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## policy condition appfp-group

Associates an Application Fingerprinting (AFP) application signature group with a policy condition.

**policy condition** *condition\_name* **appfp-group** *group\_name*

**policy condition** *condition\_name* **no appfp-group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the AFP application group to which the QoS policy condition applies.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove an AFP group name from a condition; however, at least one classification parameter must be associated with a condition.
- The **appfp-group** policy condition is used in rules associated with QoS policy lists that are applied to AFP ports running in either the QoS or UNP mode.

### Examples

```
-> policy condition cond6 appfp-group my-p2p
-> policy condition cond6 no appfp-group
```

### Release History

Release 7.3.2; command was introduced.

  alaQoSConditionAppFpGroupStatus
```

---

## policy condition vxlan

Creates a VXLAN Snooping policy condition to determine the parameters the switch uses to classify incoming encapsulated Virtual eXtensible Local Area Network (VXLAN) packets. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

```
policy condition condition_name vxlan vni vxlan_id  
    [inner source mac mac_address [mask mac_mask]]  
    [inner source mac-group mac_group]  
    [inner source ip ip_address [mask netmask]]  
    [inner source ipv6 ip6_address [mask netmask]]  
    [inner ip-protocol protocol]  
    [inner l4-port {src src_port / dest dest_port}]  
    [vxlan-port udp_port]
```

```
no policy condition condition_name
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the VXLAN condition. Any alphanumeric string.
<i>vxlan_id</i>	A 24-bit numerical value that identifies traffic for a VXLAN segment. The valid range is 1– 2147483647.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the [policy rule](#) command.
- Use the [qos apply](#) command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from the switch configuration.
- The **vni** (VXLAN Network Identifier) parameter is required to configure a VM Snooping policy condition. The VXLAN header contains the VNI that is associated with the source MAC address of the Ethernet frame that is encapsulated in a VXLAN packet. The VNI represents the VXLAN segment ID to which the packet belongs.

- The **vxlan-port** condition parameter applies only to the outer header of an encapsulated VXLAN packet. All other **inner** condition parameters apply only to the inner header of the Ethernet frame that was encapsulated in a VXLAN packet.
- When a VXLAN Snooping policy condition is used in a policy rule, the rule is then applied only to traffic on ports that have the VM Snooping feature enabled.
- All existing policy actions are supported in combination with VXLAN Snooping policy conditions; there are no specific policy actions required for policy rules containing VXLAN Snooping policy conditions. Policy actions are applied to the outer header of an encapsulated VXLAN packet.
- See the “Configuring VXLAN Snooping” chapter in the *OmniSwitch AOS Release 8 Data Center Switching Guide* for more information about using VXLAN Snooping policy rules.

## Examples

```
-> policy condition cond4 vxlan vni 23000
```

The following is an example of using VM Snooping policy conditions in a policy rule that is added to a UNP policy list:

```
-> policy condition c1 vxlan vni 1234 udp-port 4789
-> policy condition c1 vxlan inner source mac 00:11:22:33:44:00
-> policy condition c1 vxlan inner source ip 10.10.10.10
-> policy action a1 disposition dscp 45
-> policy rule r1 condition c1 action a1 no default-list
-> policy list list1 type UNP
-> policy list list1 rule r1
-> qos apply
```

## Release History

Release 7.3.4; command was introduced.

## policy condition vxlan inner source mac

Configures a source MAC address as a policy condition for a VM Snooping policy rule. This type of condition applies to the source MAC address of the inner Ethernet frame of an encapsulated VXLAN packet.

**policy condition** *condition\_name* **vxlan inner source mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **vxlan no source mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>mac_address</i>	The source MAC address of a VM (inner MAC address of an encapsulated VXLAN frame).
<i>mac_mask</i>	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the VM source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VM Snooping ports.

### Examples

```
-> policy condition c1 vxlan inner source mac 00:11:22:33:44:00
-> policy condition c2 vxlan inner source mac 00:20:da:05:f6:23 mask
ff:ff:ff:ff:ff:ff
-> policy condition c2 vxlan no source mac
```

### Release History

Release 7.3.4; command was introduced.

## policy condition vxlan inner source mac-group

Configures a source MAC address group as a policy condition for a VXLAN Snooping policy rule. This type of condition checks to see if the source MAC address of the inner Ethernet frame of an encapsulated VXLAN packet matches any of the MAC addresses specified in the MAC address group.

**policy condition** *condition\_name* **vxlan inner source mac-group** *group\_name*

**policy condition** *condition\_name* **vxlan no source mac-group**

---

### Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>group_name</i>	The name of the source MAC group, configured through the <b>policy mac group</b> command.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the source MAC address group name from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

### Examples

```
-> policy condition c1 vxlan inner source mac-group vm-macs  
-> policy condition c1 vxlan no source mac-group
```

### Release History

Release 7.3.4; command was introduced.

## policy condition vxlan inner source ip

Configures a source IPv4 address as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the source IP address of the inner Ethernet frame of an encapsulated VXLAN packet.

**policy condition** *condition\_name* **vxlan inner source ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **vxlan no source ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>ip_address</i>	A specific source IP address.
<i>netmask</i>	The network mask for the source IP address (for example, 255.0.0.0, 255.255.0.0).

### Defaults

parameter	default
<i>netmask</i>	IP address class

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the source IP address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

### Examples

```
-> policy condition c1 vxlan inner source ip 10.1.1.2
-> policy condition c2 vxlan inner source ip 10.1.1.3 mask 255.0.0.0
-> policy condition c1 vxlan no source ip
```

### Release History

Release 7.3.4; command was introduced.

## policy condition vxlan inner source ipv6

Configures a source IPv6 address as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the source IP address of the inner Ethernet frame of an encapsulated VXLAN packet.

**policy condition** *condition\_name* **vxlan inner source ipv6** *ipv6\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **vxlan no source ipv6**

---

### Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>ipv6_address</i>	A specific source IPv6 address.
<i>netmask</i>	The network mask for the source IPv6 address.

### Defaults

parameter	default
<i>netmask</i>	IPv6 address class

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

### Examples

```
-> policy condition c1 vxlan inner source ipv6 ::1234:531F:BCD2:F34A
-> policy condition c1 vxlan no source ipv6
```

### Release History

Release 7.3.4; command was introduced.

## policy condition vxlan inner ip-protocol

Configures a an IP protocol number as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the IP protocol of the inner Ethernet frame of an encapsulated VXLAN packet.

**policy condition** *condition\_name* vxlan inner ip-protocol *protocol*

**policy condition** *condition\_name* vxlan no ip-protocol

---

### Syntax Definitions

*condition\_name*                      The name of an existing policy condition.  
*protocol*                                The IP protocol number. The range is 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the IP protocol number from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter VXLAN packets received on VXLAN Snooping ports.

### Examples

```
-> policy condition c1 vxlan inner ip-protocol 6  
-> policy condition c1 vxlan no ip-protocol
```

### Release History

Release 7.3.4; command was introduced.

## policy condition vxlan inner l4-port

Configures a Layer 4 (UDP or TCP) source port and/or destination port as a policy condition for a VXLAN Snooping policy rule. This type of condition applies to the Layer 4 port of the inner Ethernet frame of an encapsulated VXLAN packet.

**policy condition** *condition\_name* **vxlan inner l4-port** {**src** *src\_port* | **dest** *dest\_port*}

**policy condition** *condition\_name* **vxlan no l4-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>src_port</i>	The source port number. The valid range is 0–65535
<i>dest_port</i>	The destination port number. The valid range is 0–65535

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the Layer 4 port number from a condition; however, at least one classification parameter must be associated with a condition.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

### Examples

```
-> policy condition c1 vxlan inner l4-port dest 9445
-> policy condition c1 vxlan inner l4-port src 4000
-> policy condition c2 vxlan inner l4-port dest 8100 inner l4-port src 3000
-> policy condition c1 vxlan no l4-port
```

### Release History

Release 7.3.4; command was introduced.

```

---

## policy condition vxlan vxlan-port

Configures a UDP destination port number as a policy condition for a VXLAN Snooping policy rule. This number is found in the outer IP header of an encapsulated VXLAN packet.

**policy condition** *condition\_name* vxlan vxlan-port *udp\_port*

**policy condition** *condition\_name* vxlan no vxlan-port

---

### Syntax Definitions

<i>condition_name</i>	The name of an existing policy condition.
<i>udp_port</i>	The UDP destination port number of the VXLAN packet. The valid range is 0–65535

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the VXLAN port number from a condition; however, at least one classification parameter must be associated with a condition.
- VXLAN packets use the well-known UDP destination port 4789 by default.
- The **vxlan** policy conditions are used to filter packets received on VXLAN Snooping ports.

### Examples

```
-> policy condition c1 vxlan vxlan-port 6000
-> policy condition c1 vxlan 7000
-> policy condition c1 vxlan no vxlan-port
```

### Release History

Release 7.3.4; command was introduced.

---

## policy action

Configures or deletes a QoS action. A QoS action describes how traffic that matches a particular QoS condition should be treated. It may specify a particular set of bandwidth and queue parameters, or it may simply specify whether the flow is allowed or denied on the switch.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove the parameter from the action.

Note that some action parameters may not be supported depending on the platform you are using. Also some action parameters may not be supported with some conditions. See the condition in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

**policy action** *action\_name*

[**disposition** {**accept** | **drop** | **deny**}]  
 [**shared**]  
 [**priority** *priority\_value*]  
 [**maximum bandwidth** *bps*]  
 [**maximum depth** *bytes*]  
 [**cir** *bps* [**cbs** *bps*] [**pir** *bps*] [**pbs** *bps*] [**color-only**]  
 [**cpu priority** *priority*]  
 [**tos** *tos\_value*]  
 [**802.1p** *802.1p\_value*]  
 [**dcsp** *dcsp\_value*]  
 [**map** {**802.1p** | **tos** | **dscp**} **to** {**802.1p** | **tos** | **dscp**} **using** *map\_group*]  
 [**permanent gateway ip** *ip\_address*]  
 [**permanent gateway ipv6** *ipv6\_address*]  
 [**port-disable**]  
 [**redirect port** *chassis/slot/port*]  
 [**redirect linkagg** *link\_agg*]  
 [**no-cache**]  
 [{**ingress** | **egress** | **ingress egress** | **no**} **mirror** *chassis/slot/port*]

**policy no action** *action\_name*

---

### Syntax Definitions

*action\_name* A name for the action, any alphanumeric string.

### Defaults

By default, no drop algorithm is configured for the action, and any queues created by the action are not shared.

parameter	default
<b>accept</b>   <b>drop</b>   <b>deny</b>	accept

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Any condition parameters that the hardware supports will be used to classify the traffic; any condition parameters that are not supported by the hardware will not be used to classify traffic, and the event will be logged in the QoS log.
- Bandwidth parameters may be specified when the action is created or may be specified as separate commands.
- Use the **qos apply** command to activate configuration changes.
- Use the **no** form of the command to remove a QoS action from the configuration.
- If the **snapshot** command is entered after the **policy action** command is configured, the resulting ASCII file will include the following additional syntax for the **policy action** command:

**from {cli | ldap | blt}**

This syntax indicates how the action was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in action, this setting is not configurable.

## Examples

```
-> policy action action1 accept
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">policy condition</a>	Configures a condition associated with the action.

  alaQoSAppliedActionName  
  alaQoSAppliedActionSource
```

---

## policy action disposition

Configures a disposition for a policy action.

**policy action** *action\_name* **disposition** {**accept** | **drop** | **deny**}

**policy action** *action\_name* **no disposition**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>accept</b>	Specifies that the switch should accept the flow.
<b>drop</b>	Specifies that the switch should silently drop the flow.
<b>deny</b>	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as <b>drop</b> ; that is, the flow is silently dropped.

### Defaults

parameter	default
<b>accept</b>   <b>drop</b>   <b>deny</b>	accept

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to remove a disposition from an action.

### Examples

```
-> policy action a3 disposition deny
-> policy action a3 no disposition
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## policy action shared

Enables bandwidth sharing among multiple QoS rules that use the same maximum bandwidth action.

**policy action** *action\_name* **shared**

**policy action** *action\_name* **no shared**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

By default, queues created by an action are *not* shared.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the **shared** policy action is not specified, then each bandwidth rule will implement a separate instance of the specified bandwidth allocation.
- Use the **no** form of the command to disable sharing.

### Example

```
-> policy action action5 maximum bandwidth 10m shared
-> policy action action6 maximum bandwidth 10m shared
-> policy action action5 no shared
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## policy action priority

Configures the priority for queuing a flow to which the QoS action applies.

**policy action** *action\_name* **priority** *priority\_value*

**policy action** *action\_name* **no priority**

---

### Syntax Definitions

*action\_name*

The name of the action.

*priority\_value*

The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a priority value from an action.
- This priority value is independent of 802.1Q, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

### Examples

```
-> policy action action1 priority 1
-> policy action action1 no priority
```

### Release History

Release 7.1.1; command was introduced.

## policy action maximum bandwidth

Configures a maximum bandwidth value for a policy action.

**policy action** *action\_name* **maximum bandwidth** *bps[k | m | g | t]*

**policy action** *action\_name* **no maximum bandwidth**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps[k   m   g   t]</i>	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> , <b>1t</b> ).

### Defaults

parameter	default
<i>k   m   g   t</i>	<b>k</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove a maximum bandwidth value from an action.
- If the maximum bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- Use the **shared** policy action to enabling sharing of bandwidth across policy rules that specify the same maximum bandwidth action.

### Examples

```
-> policy action action3 maximum bandwidth 10000
-> policy action action4 maximum bandwidth 10k shared
-> policy action action5 maximum bandwidth 10k shared
-> policy action action4 no maximum bandwidth
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

  alaQoSAppliedActionName
  alaQoSAppliedActionMaximumBandwidth
```

---

## policy action maximum depth

Configures the maximum bucket size assigned to this action. The bucket size determines how much the traffic can burst over the maximum bandwidth rate. When the bucket size is reached, the switch starts to drop packets.

**policy action** *action\_name* **maximum depth** *bps*[**k** | **m** | **g** | **t**]

**policy action** *action\_name* **no maximum depth**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [ <b>k</b>   <b>m</b>   <b>g</b>   <b>t</b> ]	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> ).

### Defaults

parameter	default
<b>k</b>   <b>m</b>   <b>g</b>   <b>t</b>	<b>k</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a maximum depth value from a policy action.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- A maximum depth action is used in combination with a maximum bandwidth action.

### Examples

```
-> policy action action2 maximum depth 100
-> policy action action2 no maximum depth
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>policy action</b>	Creates a policy action.
<b>show policy action</b>	Displays information about policy actions.

  alaQoSAppliedActionName
  alaQoSAppliedActionMaximumDepth
```

---

## policy action cir

Configures a Tri-Color Marking (TCM) policy action. This type of action includes parameters for Committed Information Rate (CIR), Committed Burst Size (CBS), Peak Information Rate (PIR), and Peak Burst Size (PBS). The TCM policier meters and marks packets red, green, or yellow based on the parameter values of this policy action.

**policy action** *action\_name* **cir** *bps* [**cbs** *bps*] [**pir** *bps*] [**pbs** *bps*] [**color-only**]

**policy action** *action\_name* **no cir**

**policy action** *action\_name* **no pir**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [ <b>k</b>   <b>m</b>   <b>g</b>   <b>t</b> ]	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> , <b>1t</b> ).
<b>color-only</b>	Disables TCM rate limiting based on the metering results. Packets are only marked the specific color that applies to the level of packet conformance.

### Defaults

parameter	default
<b>cbs pir pbs</b> <i>bps</i>	0
<b>k</b>   <b>m</b>   <b>g</b>   <b>t</b>	<b>k</b>

By default, this action enables rate limiting based on TCM marking and metering.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the TCM parameter values.
- If the **color-only** parameter is specified with this command, the TCM action will only mark packet color; packets are not rate limited based on the metering results. In this case, packets are then subject to any rate limiting specifications as defined in the queue management configuration for the switch. See the [qos qsi wred](#) command for more information.
- This implementation of TCM supports two rate limiting modes: Single-Rate (srTCM) and Two-Rate (trTCM). The srTCM mode marks packets based only on the CIR and the two burst sizes: CBS and PBS. The trTCM mode marks packets based on both the CIR and PIR and their associated CBS and PBS values.
- There is no explicit CLI command to configure the mode (srTCM or trTCM) in which the TCM meter operates. Instead, the mode is determined by the CIR and PIR values configured for the policy action.

If the PIR value is greater than the CIR value, trTCM is used. If the PIR value is less than the CIR value, srTCM is used.

- Configuring CIR and CBS is similar to configuring a maximum bandwidth. Configuring CIR and PIR is similar to configuring maximum depth.
- The number of packets counted as a result of the counter color mode setting is displayed using the **show active policy rule** command. These statistics are only shown for those rules that are configured with a TCM policy action.

## Examples

The following command examples configure srTCM (the default):

```
-> policy action A3 cir 10M
-> policy action A4 cir 10M cbs 4k
-> policy action A5 cir 10M cbs 4k pir 10M
-> policy action A6 cir 10M cbs 4k pir 10M pbs 4k
-> policy action a7 cir 5M cbs 2k color-only
-> policy action A3 no cir
-> policy action A5 no pir
```

The following command examples configure trTCM (note that PIR is greater than CIR):

```
-> policy action A7 cir 10M cbs 4k pir 20M
-> policy action A8 cir 10M cbs 4k pir 20M pbs 40M
-> policy action a9 cir 5M cbs 1M pbs 10M pbs 2M color-only
-> policy action A7 no cir
```

## policy action cpu priority

Configures a CPU priority policy action.

**policy action** *action\_name* **cpu priority** *priority*

**policy action** *action\_name* **no cpu priority**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>priority</i>	The CPU queue on which packets destined for the CPU are received. The valid range is 0–31.

### Defaults

By default, the CPU priority is set to zero.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to remove the CPU priority parameter value.

### Examples

```
-> policy action A7 cpu priority 15
-> policy action A8 cpu priority 31
-> policy action A7 no cpu priority
```

### Release History

## policy action tos

Configures a Type of Service (ToS) bits value to be applied to packets in outgoing flows to which the specified policy applies.

**policy action** *action\_name* **tos** *tos\_value*

**policy action** *action\_name* **no tos**

---

### Syntax Definitions

*action\_name*

The name of the action.

*tos\_value*

The three-bit priority value in the IP header that should be set on outgoing frames in flows that match the specified policy. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

### Examples

```
-> policy action action3 tos 4  
-> policy action action3 no tos
```

### Release History

Release 7.1.1; command was introduced.

---

## policy action 802.1p

Configures a value to be set in the 802.1p bits of the 802.1Q byte of an outgoing frame for traffic that matches a policy with this action.

**policy action** *action\_name* **802.1p** *802.1p\_value*

**policy action** *action\_name* **no 802.1p**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>802.1p_value</i>	The priority value to be set in 802.1Q frames. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value from a policy action.
- Note that specifying both ToS and DSCP in the same action is not allowed.

### Examples

```
-> policy action action4 802.1p 7
-> policy action action4 no 802.1p
```

## policy action dscp

Configures a Differentiated Services Code Point (DSCP) value to be set in an outgoing flow for traffic that matches rules with this action.

**policy action** *action\_name* **dscp** *dscp\_value*

**policy action** *action\_name* **no dscp**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>dscp_value</i>	The DSCP value to be set, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

### Examples

```
-> policy action action2 dscp 61
-> policy action action2 no dscp
```

Configures a mapping group for a policy action.

**policy action map** {802.1p | tos | dscp} to {802.1p | tos | dscp} using *map\_group*

**policy action no map**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>802.1p</b>	Indicates that an 802.1p value should be mapped.
<b>tos</b>	Indicates that a ToS value should be mapped.
<b>dscp</b>	Indicates that a DSCP value should be mapped.
<i>map_group</i>	The name of the map group, configured through the <a href="#">policy map group</a> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When remapping is configured with this command and a flow matches a policy with this remapping action, and the 802.1p, ToS, or DSCP setting in the incoming flow is specified by the map group, the value will be remapped in the outgoing flow according to the map group.
- If the 802.1p, ToS, or DSCP setting in the incoming flow is not a value specified in the map group, the switch will do one of two things:

If the *remap from* and *remap to* types are the same (802.1p to 802.1p, ToS to ToS, or DSCP to DSCP), the values in the outgoing flow will be unchanged. If the *remap from* and *remap to* types are not the same (for example: 802.1p to ToS), the switch will determine the outgoing 802.1p and ToS based on whether or not the port is trusted or untrusted).

- Use the **no** form of the command to delete the map group from the configuration.

### Examples

```
-> policy action a1 map 802.1p to 802.1p using mapGroup2
-> policy action a2 map 802.1p to tos using mapGroup3
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

```

---

## policy action permanent gateway-ip

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IP address specified in the action regardless of whether or not a route already exists in the switch routing table.

**policy action** *action\_name* **permanent gateway-ip** *ip\_address*

**policy action** *action\_name* **no permanent gateway-ip**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>ip_address</i>	The destination IP address to which packets will be routed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove a gateway IP address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

### Examples

```
-> policy action pbr2 permanent gateway-ip 10.10.2.1  
-> policy action pbr2 no permanent gateway-ip
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## policy action permanent gateway-ipv6

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IPv6 address specified in the action regardless of whether or not a route already exists in the switch routing table.

**policy action** *action\_name* **permanent gateway-ipv6** *ipv6\_address*

**policy action** *action\_name* **no permanent gateway-ipv6**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>ipv6_address</i>	The destination IPv6 address to which packets will be routed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove a gateway IPv6 address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

### Examples

```
-> policy action pbr2 permanent gateway-ipv6 2607:f0d0:2001:000a:0000:0000:0010
-> policy action pbr2 no permanent gateway-ipv6
```

### Release History

---

## policy action port-disable

Administratively disables the source port of the traffic to which this action is applied.

**policy action** *action\_name* **port-disable**

**policy action** *action\_name* **no port-disable**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove **port-disable** from the policy action.
- An SNMP trap is sent when a port is administratively disabled through a port disable action or a UserPorts shutdown function.
- To enable a port disabled by this action, use the **interfaces** or **clear violation** command to administratively enable the port, or physically disconnect and reconnect the port cable.

### Examples

```
-> policy action pd01 port-disable  
-> policy action pb02 no port-disable
```

### Release History

Release 7.1.1; command was introduced.

---

## policy action redirect port

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified port instead of the port to which the traffic was destined.

**policy action** *action\_name* **redirect port** *chassis/slot/port*

**policy action** *action\_name* **no redirect port**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number that will receive the redirected traffic.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove **redirect port** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect port must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect port is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified port or link aggregate and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port must belong to VLAN A (tagged or default VLAN).

### Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

  alaQoSAppliedActionRedirectSlot
  alaQoSAppliedActionRedirectPort
```

---

## policy action redirect linkagg

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified link aggregate ID instead of the link aggregate to which the traffic was destined.

**policy action** *action\_name* **redirect linkagg** *agg\_id*

**policy action** *action\_name* **no redirect linkagg**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>agg_id</i>	The link aggregate ID number (0–32) to assign to the specified VLAN. See the “Link Aggregation Commands” chapter in this guide.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove **redirect linkagg** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect link aggregate ID must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect link aggregate ID is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified link aggregate ID and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port or link aggregate ID to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port or link aggregate ID must belong to VLAN A (tagged or default VLAN).

### Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

## Release History

```

---

## policy action no-cache

Disables logging of rule entries to the hardware cache.

**policy action** *action\_name* **no-cache**

**policy action** *action\_name* **no no-cache**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove **no cache** from the policy action.
- Recommended for use when applied to traffic going to the switch.

### Examples

```
-> policy action nc01 no-cache
-> policy action nc01 no no-cache
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy action</a>	Creates a policy action.
<a href="#">show policy action</a>	Displays information about policy actions.

  alaQoSActionName
  alaQoSActionNocache
alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionNocache
```

---

## policy action mirror

Mirrors ingress, egress, or both ingress and egress packets that match a mirroring policy to the specified port.

**policy action** *action\_name* [**ingress** | **egress** | **ingress egress**] **mirror** *chassis/slot/port*

**policy action** *action\_name* **no mirror** *slot/port*

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>ingress</b>	Mirrors ingress packets.
<b>egress</b>	Mirrors egress packets.
<b>ingress egress</b>	Mirrors ingress and egress packets.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number that will receive the mirrored traffic.

### Defaults

parameter	default
<b>ingress</b>   <b>egress</b>   <b>ingress egress</b>	<b>ingress</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove **mirror** from the policy action.
- Use this command to configure a mirror-to-port (MTP) action that is used for policy based mirroring.
- Only one MTP session is supported at any given time. As a result, all mirroring policies should specify the same MTP port.
- Policy based mirroring and the port based mirroring feature can run simultaneously on the same switch.

### Examples

```
-> policy action a1 mirror 1/7 (default ingress)
-> policy action a1 ingress mirror 1/7
-> policy action a1 egress mirror 1/7
-> policy action a1 ingress egress mirror 1/7
-> policy action a1 no mirror
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy action</a>	Creates a policy action.
<a href="#">show policy action</a>	Displays information about policy actions.

  alaQoSActionName  
  alaQoSActionMirrorSlot  
  alaQoSActionMirrorPort  
  alaQoSActionMirrorMode  
  alaQoSActionMirrorModeStatus
```

---

## show policy network group

Displays information about pending and applied policy network groups.

**show [applied] policy network group** [*network\_group*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only network groups that have been applied should be displayed.
<i>network_group</i>	The name of the policy network group for which you want to display information; or a wildcard sequence of characters for displaying information about network groups with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Information for all policy network groups displays unless *network\_group* is specified.

### Examples

```
-> show policy network group
Group Name           : netg1
State                = new,
Entries              = 198.206.10.1
```

```
-> show policy network group
Group Name           : group1
Entries              = 203.185.129.0 mask 255.255.255.0,
                    203.185.131.192 mask 255.255.255.192,
                    203.185.132.0 mask 255.255.252.0,
                    204.226.0.0 mask 255.255.0.0
```

### output definitions

---

<b>Group Name</b>	The name of the port group, configured through the <b>policy network group</b> command.
<b>State</b>	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Entries</b>	The IP addresses associated with the network group.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[policy network group](#) Configures policy network groups.

```

---

## show policy service

Displays information about pending and applied policy services.

**show** [**applied**] **policy service** [*service\_name*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only network groups that have been applied should be displayed.
<i>service_name</i>	The name of the service for which you want to display information; or a wildcard sequence of characters for displaying information about services with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Information about all policy services is displayed unless *service\_name* is specified.

### Examples

```
-> show policy service
Service name           : s1
State                  = new,
Destination UDP port   = 1001-2004
```

### *output definitions*

---

<b>Service Name</b>	The name of the port group, configured through the <b>policy service</b> command.
<b>State</b>	This field appears if the service was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>IPProto</b>	The IP protocol associated with the service.
<b>SrcPort</b>	A source port associated with the service.
<b>DstPort</b>	A destination port associated with the service.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [policy service](#)

Configures a service that may be used as part of a policy service group.

## MIB Objects

## show policy action

Displays information about pending and applied policy actions configured on the switch.

**show [applied] policy action** [*action\_name*]

---

### Syntax Definitions

<b>applied</b>	Displays only actions that have been applied to the QoS configuration for the switch.
<i>action_name</i>	The name of the action for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all policy actions displays unless *action\_name* is specified.
- When the optional **applied** parameter is used, pending QoS actions are not displayed.

### Examples

```
-> show policy action
Action name           : a1
  Committed Information Rate = 10.0M,
  Committed Burst size    = 5.00M,
  Peak Information Rate    = 20.0M,
  Peak Burst size         = 5.00M

Action name           : a2
  State                 = new,
  Disposition           = deny

Action name           : a3
  State                 = new,
  Priority               = 7,

-> show applied policy action
Action name           : a1
  Committed Information Rate = 10.0M,
  Committed Burst size    = 5.00M,
  Peak Information Rate    = 20.0M,
  Peak Burst size         = 5.00M
```

*output definitions*

---

<b>Action Name</b>	The name of the action, configured through the <b>policy action</b> command.
<b>State</b>	This field appears if the action was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Policy Action Parameters</b>	Displays the configured policy action parameters.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**policy action** Creates a policy action. A QoS action is a particular set of bandwidth and queue parameters that may be applied to a flow matching particular QoS conditions.

**MIB Objects**

```

alaQoSActionTable
  alaQoSActionName
  alaQoSActionSource
  alaQoSActionDisposition
  alaQoSActionShared
  alaQoSActionMinimumBandwidth
  alaQoSActionMaximumBandwidth
  alaQoSActionMaximumDepth
alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionSource
  alaQoSAppliedActionDisposition
  alaQoSAppliedActionShared
  alaQoSAppliedActionMinimumBandwidth
  alaQoSAppliedActionMaximumBandwidth
  alaQoSAppliedActionMaximumDepth

```

---

## show policy condition

Displays information about pending and applied policy conditions.

**show** [**applied**] **policy condition** [*condition\_name*]

---

### Syntax Definitions

<b>applied</b>	Displays only conditions that have been applied to the QoS configuration for the switch.
<i>condition_name</i>	The name of the condition for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all policy conditions displays unless *condition\_name* is specified.
- When the optional **applied** parameter is used, pending QoS conditions are not displayed.

### Examples

```
-> show policy condition
Condition name           : c1
  Source VLAN           = 1001

Condition name           : c2
  State                 = new,
  Source IP              = 10.2.2.1,
  Destination UDP port  = 17

-> show applied policy condition
Condition name           : c1
  Source VLAN           = 1001
```

### output definitions

---

<b>Condition Name</b>	The name of the condition, configured through the <b>policy condition</b> command.
<b>State</b>	This field appears if the condition was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Policy Condition Parameters</b>	Displays the configured policy condition parameters.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [policy condition](#)

Creates a policy condition. The condition determines what parameters the switch uses to classify incoming flows.

## MIB Objects

```

```

---

## show active policy rule

Displays information about pending and applied policy rules that are active (enabled) on the switch.

**show active policy rule** [*rule\_name*]

---

### Syntax Definitions

*rule\_name*                      The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **show policy rule** command to display inactive as well as active policy rules.
- Information for all rules is displayed unless *rule\_name* is specified.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option in the **policy rule** command.

### Examples

```
-> show active policy rule
Rule name           : r1
Condition name      = c1,
Action name         = a1,
Packets             = 4166772,
Bytes               = 266665728
```

#### *output definitions*

---

<b>Rule name</b>	The name of the policy rule, configured through the <b>policy rule</b> command.
<b>Condition name</b>	The name of the condition configured for this rule.
<b>Action name</b>	The name of the action configured for this rule.
<b>Packets</b>	The number of packets that match this rule.
<b>Bytes</b>	The number of bytes that match this rule.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [policy rule](#)

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

## MIB Objects

```
alaQoSRuleTable
  alaQoSRuleName
  alaQoSRuleEnabled
  alaQoSRuleSource
  alaQoSRulePrecedence
  alaQoSRuleActive
  alaQoSRuleReflexive

  alaQoSRuleTrapEvents
  alaQoSRuleSave
  alaQoSRuleCondition
  alaQoSRuleAction
```

---

## show policy rule

Displays information about pending and applied policy rules.

```
show [applied] policy rule [rule_name]
```

---

### Syntax Definitions

<b>applied</b>	Indicates that only policy rules that have been applied should be displayed.
<i>rule_name</i>	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all rules is displayed unless *rule\_name* is specified.
- Use the [show active policy rule](#) command to display only active rules that are currently being enforced on the switch.

### Examples

```
-> show policy rule
Rule name           : r1
  Condition name    = c1,
  Action name       = a1

Rule name           : r2
  State             = new,
  Condition name    = c2,
  Action name       = a1

Rule name           : r3
  State             = new,
  Condition name    = c2,
  Action name       = a2

-> show applied policy rule
Rule name           : r1
  Condition name    = c1,
  Action name       = a1
```

*output definitions*

---

<b>Rule name</b>	The name of the policy rule, configured through the <b>policy rule</b> command.
<b>State</b>	This field appears if the rule was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Condition name</b>	The name of the condition configured for this rule.
<b>Action name</b>	The name of the action configured for this rule.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands****policy rule**

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

```

---

## show policy validity period

Displays information about policy validity periods.

**show policy validity period** [*name*]

---

### Syntax Definitions

*name*                                      The name of the validity period.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all validity periods is displayed unless *name* is specified.
- Use the [show policy rule](#) command to display the validity period that is associated with a policy rule.

### Examples

```
-> show policy validity-period
Validity period name      = tuesday
State                    = new,
Days                     = tuesday

Validity period name      = february
Months                   = february

-> show applied policy validity-period
Validity period name      = february
Months                   = february
```

### *output definitions*

---

<b>Validity period name</b>	The name of the policy validity period, configured through the <a href="#">policy validity-period</a> command.
<b>State</b>	This field appears if the validity period was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Days</b>	The days of the week the validity period is active, configured through the <a href="#">policy validity-period</a> command. If this field does not appear, then the validity period is not restricted to specific days.
<b>Months</b>	The months during which the validity period is active, configured through the <a href="#">policy validity-period</a> command. If this field does not appear, then the validity period is not restricted to specific months.

*output definitions*

---

<b>Hours</b>	The time of day the validity period begins and ends, configured through the <b>policy validity-period</b> command. If this field does not appear, then the validity period is not restricted to a specific time.
<b>Interval</b>	The date and time a validity period interval begins and ends, configured through the <b>policy validity-period</b> command. If this field does not appear, then the validity period is not restricted to a specific date and time interval.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**policy validity-period** Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.

**MIB Objects**

```

alaQoSValidityPeriodTable
  alaQoSValidityPeriodName
  alaQoSValidityPeriodSource
  alaQoSValidityPeriodDays
  alaQoSValidityPeriodDaysStatus
  alaQoSValidityPeriodMonths

  alaQoSAppliedValidityPeriodEndHour
  alaQoSAppliedValidityPeriodInterval
  alaQoSAppliedValidityPeriodIntervalStatus
  alaQoSAppliedValidityPeriodEndInterval

```

---

## show active policy list

Displays information about applied policy lists that are active (enabled) on the switch.

**show active policy list** [*list\_name*]

---

### Syntax Definitions

*list\_name* The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all active rules is displayed unless a *list\_name* is specified.
- Use the **show policy list** command to display inactive as well as active policy lists.
- Applied lists may or may not be active on the switch. Applied lists are inactive if they have been administratively disabled with the **disable** option in the **policy list** command.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

### Examples

```
-> show active policy list
```

```
Group Name           From  Type    Enabled  Entries
-----+-----+-----+-----+-----
list1                 cli   unp     Yes      r1
                   r2
+list2                cli   unp     Yes      r3
egress_list1         cli   egress  Yes      r1
                   r2
                   r3
```

*output definitions*

---

<b>Group Name</b>	The name of the policy list. Configured through the <a href="#">policy list</a> command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last <b>qos apply</b> .
<b>From</b>	Where the list originated.
<b>Type</b>	The type of rule ( <b>unp, egress, appfp</b> ). Configured through the <a href="#">policy list</a> command. Note that the default policy list is not shown. Use the <a href="#">show policy rule</a> command to display rules that are members of the default policy list.
<b>Enabled</b>	Whether or not the rule is enabled. Configured through the <a href="#">policy list</a> command.
<b>Entries</b>	The QoS policy rules that are grouped together in this policy list. Configured through the <a href="#">policy list</a> command.

---

**Release History**

Release 7.2.1; command was introduced.

**Related Commands**

<a href="#">show policy list</a>	Displays information about pending and applied policy lists.

---

## show policy list

Displays information about pending and applied policy lists.

**show [applied] policy list** *[list\_name]*

---

### Syntax Definitions

<b>applied</b>	Displays only those policy lists that have been applied to the switch configuration.
<i>list_name</i>	The name of the list to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Information for all rules is displayed unless a *list\_name* is specified.
- Use the [show active policy list](#) command to display only active policy lists that are currently enforced on the switch.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

### Examples

```
-> show policy list
Group Name          From  Type   Enabled  Entries
-----+-----+-----+-----+-----
list1               cli   unp    Yes      r1
                   cli   unp    Yes      r2
+list2              cli   unp    Yes      r3
```

```
-> show applied policy list
```

Group Name	From	Type	Enabled	Entries
list1	cli	unp	Yes	r1 r2

### output definitions

<b>Group Name</b>	The name of the policy list. Configured through the <a href="#">policy list</a> command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last <b>qos apply</b> .
<b>From</b>	Where the list originated.
<b>Type</b>	The type of rule ( <b>unp</b> , <b>egress</b> , <b>appfp</b> ). Configured through the <a href="#">policy list</a> command. Note that the default policy list is not shown. Use the <a href="#">show policy rule</a> command to display rules that are members of the default policy list.
<b>Enabled</b>	Whether or not the rule is enabled. Configured through the <a href="#">policy list</a> command.
<b>Entries</b>	The QoS policy rules that are grouped together in this policy list. Configured through the <a href="#">policy list</a> command.

### Release History

## show policy ipv4-summary

Displays all the IPv4 networks that are currently matched by ACLs on the system.

**show policy ipv4-summary** [*rule rule\_name*]

---

### Syntax Definitions

*rule\_name*                      The name of the policy rule.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Specifying the rule name displays the detailed summary for the corresponding rule. If no rule name is specified, then the summary for each rule is displayed in a tabular form.
- If there is an explicit default rule that is set to deny, the same is displayed in the output.

### Examples

```
-> show policy ipv4-summary
```

Legends:

P= Protocol

Act= Action (d = deny, a = accept)

Rule	P	Source IP/ Source Group	Destination IP/ Destination Group	VRF Name	Act	Hit Count
rle-rule3	IP	224.0.0.0/4	224.0.0.0/4	default	a	30129
rle-rule4	UDP	0.0.0.0/0	0.0.0.0/0	default	d	10202020
rle-rule1	IP	192.168.10.0/*	192.168.20.0/24	guest	a	458723011
rle-rule2	IP	192.168.30.0/24	192.168.10.0/24	enterpr*	a	458723011

```
-> show policy ipv4-summary rule rle-rule2
```

```
Rule name           : rle-rule2,
Protocol            : IP,
Source IP           : 192.168.30.0/24,
Destination IP      : 192.168.10.0/24,
VRF Name            : enterprise,
Action              : Accept,
Hit Count           : 458723011
```

#### *output definitions*

---

<b>Rule</b>	Name of the rule.
<b>P</b>	The associated IP protocol.
<b>Source IP/ Source Group</b>	The IPv4 address of the source or source group.

*output definitions*

---

<b>Destination IP/Destination Group</b>	The IPv4 address of the destination or destination group.
<b>VRF Name</b>	The name of the VRF.
<b>Act</b>	The name of the action.
<b>Hit Count</b>	The sum of packet counts from all NIs matching the corresponding rule.

# 37 Policy Server Commands

This chapter describes CLI commands used for managing policies downloaded to the switch from an attached LDAP server. Policy rules can be created on an attached server through the PolicyView GUI application. Policy rules can also be created on the switch directly through CLI or SNMP commands. This chapter describes commands related to managing LDAP policies only. See [Chapter 35, “QoS Commands,”](#) for information about commands for creating and managing policies directly on the switch.

The policy commands are based on RFC 2251 and RFC 3060.

MIB information for policy server commands is as follows:

*Filename:* ALCATEL-IND1-POLICY-MIB.mib  
*Module:* alcatelIND1PolicyMIB

The policy server commands are summarized here:

---

**policy server load**  
**policy server flush**  
**policy server**  
**show policy server**  
**show policy server long**  
**show policy server statistics**  
**show policy server rules**  
**show policy server events**

---

## policy server load

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

**policy server load**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Policies are downloaded to the switch from the directory server with the highest preference setting; this server must be enabled and operational (able to bind).

### Examples

```
-> policy server load
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[policy server flush](#) Removes all cached LDAP policy data from the switch.

### MIB Objects

```
serverPolicyDecision
```

---

## policy server flush

Removes all cached LDAP policy data from the switch.

**policy server flush**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to remove LDAP policies. Policies configured through the CLI or SNMP are not removed.

### Examples

```
-> policy server flush
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

### MIB Objects

```
serverPolicyDecision
```

---

## policy server

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

**policy server** *ip\_address* [**port** *port\_number*] [**admin-state** {**enable** | **disable**}] [**preference** *preference*] [**user** *user\_name* **password** *password*] [**searchbase** *search\_string*] [**ssl** | **no ssl**]

**no policy server** *ip\_address* [**port** *port\_number*]

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the LDAP-enabled directory server.
<i>port_number</i>	The TCP/IP port number used by the switch to connect to the directory server.
<b>enable</b>	Enables the specified policy server to download rules to the switch. The policy servers are <b>up</b> by default.
<b>disable</b>	Prevents the specified policy server from downloading rules to the switch.
<i>preference</i>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<i>user_name</i>	The user name for accessing the database entries on the directory server. When spaces are used in the user name, quotation marks must be included: (e.g. “Directory Manager”).
<i>password</i>	The password associated with the user name. The password must match the password defined on the directory server.
<i>search_string</i>	The root of the directory required for searching the policy information. Typically, the <i>search_string</i> includes <b>o=organization</b> and <b>c=country</b> . For example, <b>o=company</b> and <b>c=country</b> .
<b>ssl</b>	Enables a Secure Socket Layer between the switch and the policy server.
<b>no ssl</b>	Disables a Secure Socket Layer between the switch and the policy server.

### Defaults

parameter	default
<b>admin</b>	<b>up</b>
<i>port_number</i>	389 (SSL disabled) 636 (SSL enabled)
<i>preference</i>	0
<b>ssl</b>   <b>no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

If you change the port number, another entry is added to the policy server table; the existing port number is not changed. To remove a port number, use the **no** form of this command with the relevant policy server IP address and the port number you want to remove.

## Examples

```
-> policy server 222.22.22.2 port 345 user dirmgr password secret88 searchbase  
ou=qos,o=company,c=country
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show policy server](#) Displays information about policies downloaded from an LDAP server.

## MIB Objects

  directoryServerSearchbase  
  directoryServerEnableSSL
```

---

## show policy server

Displays information about servers from which policies can be downloaded to the switch.

**show policy server**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays basic information about policy servers. Use the **show policy server long** command to display more details about the servers.

### Examples

```
-> show policy server
```

Server	IP Address	port	enabled	status	primary
1	208.19.33.112	389	Yes	Up	X
2	208.19.33.66	400	No	Down	-

### output definitions

---

<b>Server</b>	The index number corresponding to the LDAP server.
<b>IP Address</b>	The IP address of the LDAP server.
<b>port</b>	The TCP/IP port number used by the switch to connect to the policy server.
<b>enabled</b>	Whether or not the policy server is enabled.
<b>status</b>	The state of the policy server, <b>Unkn</b> , <b>Up</b> or <b>Down</b> .
<b>primary</b>	Indicates whether the server is the primary server; this server can be used for the next download of policies; only one server is a primary server.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [policy server](#)

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

## show policy server long

Displays more detailed information about an LDAP policy server.

**show policy server long**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays detailed information about policy servers. Use the **show policy server** command to display basic information about policy servers.

### Examples

```
-> show policy server long
LDAP server 0
  IP address       : 155.132.44.98,
  TCP port        : 16652,
  Enabled         : Yes,
  Operational status : Unkn,
  Preference      : 99,
  Authentication  : password,
  SSL            : Disabled,
  login DN       : cn=Directory Manager,
  searchbase     : ou:4.1, cn=policyRoot, o=company.fr
  Last load time  : 09/13/01 16:38:18
LDAP server 1
  IP address       : 155.132.48.27,,
  TCP port        : 21890,
  Enabled         : Yes,
  Operational status : Unkn,
  Preference      : 50,
  Authentication  : password,
  SSL            : Disabled,
  login DN       : cn=Directory Manager,
  searchbase     : o=company.fr
  Last load time  : 00/00/00 00:00:00
```

### *output definitions*

---

<b>IP address</b>	The IP address of the policy server.
<b>TCP port</b>	The TCP/IP port number used by the switch to connect to the policy server.

*output definitions (continued)*

---

<b>Enabled</b>	Displays whether the policy server is enabled through the PolicyView application.
<b>Operational status</b>	The state of the policy server, <b>Up</b> or <b>Down</b> .
<b>Preference</b>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<b>Authentication</b>	Displays <b>password</b> if a user name and password was specified for the server through the <b>policy server</b> command. Displays <b>anonymous</b> if a user name and password are not configured.
<b>login DN</b>	The directory user name.
<b>searchbase</b>	The searchbase name, which is the root of the directory that can be searched for policy download information.
<b>Last load time</b>	The date and time that policies were last downloaded. Values of zero indicate that no policies have been downloaded.

---

**Release History**

Release 7.1.1; command introduced.

---

## show policy server statistics

Displays statistics about policy directory servers.

**show policy server statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays statistics about server downloads. For information about server parameters, use the **show policy server** command.

### Examples

```
-> show policy server statistics
Server  IP Address      port  accesses  delta  successes  delta  errors  delta
-----+-----+-----+-----+-----+-----+-----+-----+-----
   1    155.132.44.98 16652     793     793       295     295       0       0
   2    155.132.48.27 21890       0       0         0       0       0       0
```

### *output definitions*

---

<b>Server</b>	The index number corresponding to the server.
<b>IP Address</b>	The IP address of the LDAP server.
<b>port</b>	The TCP/IP port number used by the switch to connect to the policy server.
<b>accesses</b>	The number of times the server was polled by the switch to download policies.
<b>delta</b>	The change in the number of accesses since the last time the policy server was accessed.
<b>successes</b>	The number of times the server was polled by the switch to download policies and the policies were successfully downloaded.
<b>delta</b>	The change in the number of successful policy downloads since the last time the policy server was accessed.
<b>errors</b>	The number of errors returned by the server.
<b>delta</b>	The change in the number of errors returned by the server since the last time the policy server was accessed.

---

## show policy server rules

Displays the names of policies originating from a directory server, that have been downloaded to the switch.

**show policy server rules**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays information about policies created on directory servers only. [Chapter 35, “QoS Commands,”](#) for information about configuring and displaying policies directly on the switch.

### Examples

```
-> show policy server rules
Num      name          prio      scope      status
-----+-----+-----+-----
1         QoSRule1       0         Provisioned Active
2         QoSrule2       0         Provisioned Active
```

Fields are defined here:

#### *output definitions*

---

<b>Num</b>	An index number corresponding to the policy rule.
<b>name</b>	The name of the policy rule; only rules configured through PolicyView are displayed in this table.
<b>prio</b>	The priority or preference of the rule. Indicates the order in which rules can be checked to match to the incoming traffic. If two or more rules apply to the traffic, the rule with the highest preference is applied. Preference is determined when the rule is created.
<b>scope</b>	The type of rule. <b>Provisioned</b> is the only type valid for the current release.
<b>status</b>	The status of the rule: <b>Active</b> indicates that the rule is available in the QoS software on the switch and is available to be applied to the traffic; <b>notInService</b> means the rule can be pushed to the QoS software in the future but is not available yet (typically because of a variable validity period); <b>notReady</b> indicates that the rule can never be pushed to the QoS software because its validity period has expired or because it has been disabled through SNMP.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

## show policy server events

Displays any events related to a directory server on which policies are stored.

**show policy server events**

---

### Syntax Definitions

N/A

### Defaults

The display is limited to 50 events.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The Policy Manager initialization event is always the first event logged.

### Examples

```
-> show policy server events
  Event Time                event description
-----+-----
09/13/01 16:38:15 Policy manager log init
09/13/01 16:38:17 LDAP server 155.132.44.98/16652 defined

# 38 AAA Commands

This chapter includes descriptions for authentication, authorization, and accounting (AAA) commands. The commands are used for configuring the type of authentication as well as the AAA servers and the local user database on the switch.

- **Authenticated Switch Access.** Authenticates users into the switch to manage the switch. User information is stored on a RADIUS, TACACS+, LDAP or information may be stored locally in the switch user database.
- **Local user database.** User information may be configured for Authenticated Switch Access. For functional management access, users may be allowed to access specific command families or domains.

MIB information for the AAA commands is as follows:

*Filename:* ALCATEL-IND1-AAA-MIB.mib  
*Module:* alcatelIND1AAAMIB

A summary of the available commands is listed here:

---

<b>Authentication servers</b>	<b>aaa radius-server</b> <b>aaa tacacs+-server</b> <b>aaa tacacs command-authorization</b> <b>aaa ldap-server</b> <b>aaa test-radius-server</b> <b>show aaa server</b>
<b>Federal Information Processing Standards (FIPS)</b>	<b>system fips admin-state</b> <b>show system fips</b>

## aaa radius-server

Configures or modifies a RADIUS server for Authenticated Switch Access and device authentication.

**aaa radius-server** *server\_name* **host** {*hostname* | *ip\_address* / *ipv6\_address*} [*hostname2* | *ip\_address2* / *ipv6\_address2*] {**key** *secret* | **prompt-key**} [**hash-key** *hash\_secret*] [**retransmit** *retries*] [**timeout** *seconds*] [**auth-port** *auth\_port*] [**acct-port** *acct\_port*] [**vrf-name** *name*] [**ssl** | **no ssl**]

---

### Syntax Definitions

<i>server_name</i>	The name of the RADIUS server.
<i>hostname</i>	The host name (DNS name) of the primary RADIUS server. The host name or IP address is required when creating a server.
<i>ip_address</i> / <i>ipv6_address</i>	The IPv4 or IPv6 address of the primary RADIUS server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup RADIUS server.
<i>ip_address2</i> / <i>ipv6_address2</i>	The IPv4 or IPv6 address of an optional backup RADIUS server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
<b>prompt-key</b>	This option allows to enter the secret key in a obscured format rather than as clear text. When this option is selected, press the Enter key. A prompt appears prompting to enter the secret key. Secret key needs to be re-entered, and only if both the entries match, command is accepted. Key provided in this mode is not displayed on the CLI as text.
<i>hash_secret</i>	A shared secret that the switch saves with a hashing algorithm.
<i>retries</i>	The number of retries the switch makes to authenticate a user before trying the backup server ( <i>hostname2</i> or <i>ip_address2</i> ).
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>auth_port</i>	The UDP destination port for authentication requests.
<i>acct_port</i>	The UDP destination port for accounting requests.
<i>name</i>	The name of the VRF to be used to access the server.
<b>ssl</b>	Enables a Secure Socket Layer between the switch and the RADIUS server.
<b>no ssl</b>	Disables a Secure Socket Layer between the switch and the RADIUS server.

## Defaults

parameter	default
<i>retries</i>	3
<i>seconds</i>	2
<i>auth_port</i>	1812
<i>acct_port</i>	1813
<b>ssl   no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be RADIUS servers.
- Use the **no** form of the command to remove a RADIUS server from the configuration. Only one server can be deleted at a time.
- RADIUS server can be configured on any VRF instance or the default VRF instance. However, all the RADIUS servers must reside on the same VRF instance.

## Examples

```
-> aaa radius-server pubs2 host 10.10.2.1 key wwwtoe timeout 5
-> no aaa radius-server pubs2

-> aaa radius-server radsrv1 host rad1_ipaddr key rad1_secret vrf-name rad_vrf

-> aaa radius-server rad1 prompt-key host 10.10.2.1
Enter Key: *****
Confirm Key: *****
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.3.1; **prompt-key** parameter added.  
Release 8.4.1; **IPv6** and **SSL support** for radius server added.

## Related Commands

<a href="#">show aaa server</a>	Displays information about AAA servers.
<a href="#">aaa authentication</a>	Specifies the AAA servers to be used for Authenticated Switch Access.
<a href="#">aaa device-authentication</a>	Specifies the AAA servers to use for Access Guardian device authentication.
<a href="#">aaa accounting session</a>	Specifies the accounting servers to be used for Authenticated Switch Access.

```

---

## aaa tacacs+-server

Configures or modifies a TACACS+ server for Authenticated Switch Access.

```
aaa tacacs+-server server_name host {hostname | ip_address} [hostname2 | ip_address2] {key secret | prompt-key} [timeout seconds] [port port] [vrf-name name]
```

```
no aaa tacacs+-server server
```

---

### Syntax Definitions

<i>server_name</i>	The name of the TACACS+ server.
<i>hostname</i>	The host name (DNS name) of the primary TACACS+ server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary TACACS+ server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup TACACS+ server.
<i>ip_address2</i>	The IP address of an optional backup TACACS+ server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
<b>prompt-key</b>	This option allows to enter the secret key in a obscured format rather than as clear text. When this option is selected, press the Enter key. A prompt appears prompting to enter the secret key. Secret key needs to be re-entered, and only if both the entries match, command is accepted. Password provided in this mode is not displayed on the CLI as text.
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>port</i>	The port number for the primary TACACS+ server.
<i>name</i>	The name of the VRF to be used to access the server.

### Defaults

parameter	default
<i>seconds</i>	2
<i>port</i>	49

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove a TACACS+ server from the configuration. Only one server may be deleted at a time.
- A host name (or IP address) and a secret are required when configuring a server.

- The server and the backup server must both be TACACS+ servers.
- TACACS+ server can be configured on any VRF instance or the default VRF instance. However, all the TACACS+ servers must reside on the same VRF instance.

## Examples

```
-> aaa tacacs+-server tpub host 10.10.2.2 key otna timeout 10
-> no aaa tacacs+-server tpub
-> aaa tacacs+-server tacsrv1 host tac1_ipaddr key tac1_secret vrf-name tac_vrf

-> aaa tacacs+-server tac1 prompt-key host 10.10.2.2
Enter Key:  *****
Confirm Key:  *****
```

## Release History

Release 7.1.1; command was introduced.  
Release 7.3.1; **vrf-name** parameter added.  
Release 8.3.1; **prompt-key** parameter added.

## Related Commands

<a href="#">show aaa server</a>	Displays information about AAA servers.
<a href="#">aaa authentication</a>	Specifies the AAA servers to be used for Authenticated Switch Access.
<a href="#">aaa accounting session</a>	Specifies the accounting servers to be used for Authenticated Switch Access.

## MIB Objects

```
aaaServerTable
  aaasName
  aaasProtocol
  aaasHostName
  aaasIpAddress
  aaasHostName2
  aaasIpAddress2
  aaasTacacsKey
  aaasTimeout
  aaasTacacsPort
  aaasVrfName
```

---

## aaa tacacs command-authorization

Configures a command based authorization in TACACS+ server for authenticated switch.

**aaa tacacs command-authorization {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enable command based authorization in TACACS+ server.
<b>disable</b>	Disable command based authorization. This enables partition-management family based authorization in TACACS+ server.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This command is applicable only for CLI commands.
- If this command is enabled, then in the TACACS+ server the authorization of every command executed on the switch is command based. CLI commands executed on the switch are sent for authorization to the TACACS+ server along with mode of operation (read or read-write). After authorization, the server will send the response message to the TACACS+ client.
- If the command is disabled, then in the TACACS+ server the authorization is partition-management family based.
- Use **show configuration snapshot aaa** command to view the configuration details of this command.

### Examples

```
-> aaa tacacs command-authorization enable
-> aaa tacacs command-authorization disable
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

[show aaa server](#)

Displays information about AAA servers.

## MIB Objects

alaAaaAuthConfig

alaAaaTacacsServerCmdAuthorization

---

## aaa ldap-server

Configures or modifies an LDAP server for Authenticated Switch Access.

```
aaa ldap-server server_name host {hostname | ip_address} [hostname2 | ip_address2] dn dn_name
{password super_password | prompt-password} [base search_base] [retransmit retries] [timeout
seconds] [ssl | no ssl] [port port] [vrf-name name]
```

```
no aaa ldap-server server-name
```

---

### Syntax Definitions

<i>server_name</i>	The name of the LDAP server.
<i>hostname</i>	The host name (DNS name) of the primary LDAP server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary LDAP server.
<i>hostname2</i>	The host name (DNS name) of the backup LDAP server.
<i>ip_address2</i>	The IP address of a backup host for the LDAP server.
<i>dn_name</i>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers. For example: <b>cn=manager</b> . Must be different from the <i>search-base</i> name and must be in a format supported by the server. Required when creating a new server.
<i>super_password</i>	The super-user password recognized by the LDAP-enabled directory servers. The password may be clear text or hexadecimal format. Required when creating a new server.
<b>prompt-password</b>	This option allows to enter the super-user password in a obscured format rather than as clear text. When this option is selected, press the Enter key. A password prompt appears prompting to enter the super-user password. Password needs to be re-entered, and only if both the passwords match, command is accepted. Password provided in this mode is not displayed on the CLI as text.
<i>search_base</i>	The search base recognized by the LDAP-enabled directory servers. For example, <b>o=company</b> or <b>c=country</b> . Must be different from the <i>dn_name</i> . Required when creating a new server.
<i>retries</i>	The number of retries the switch makes to the LDAP server to authenticate a user before trying the backup server.
<i>seconds</i>	The timeout in seconds for server replies to authentication requests from the switch.
<b>ssl</b>	Enables a secure switch layer (SSL) between the switch and the LDAP server.
<b>no ssl</b>	Disables a secure switch layer (SSL) between the switch and the LDAP server.
<i>port</i>	The port number for the primary LDAP server and any backup server. Must match the port number configured on the server.
<i>name</i>	The name of the VRF to be used to access the server.

## Defaults

Defaults for optional parameters are as follows:

parameter	default
<i>port</i>	389 (SSL disabled) 636 (SSL enabled)
<i>retries</i>	3
<i>seconds</i>	2
<b>ssl   no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- The *dn\_name* must be different from the *search\_base* name.
- Use the **no** form of the command to remove an LDAP server from the configuration. Only one server may be removed at a time.
- The port number configured on the switch must match the port number configured for the server.
- LDAP server can be configured on any VRF instance or the default VRF instance. However, all the LDAP servers must reside on the same VRF instance.

## Examples

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager password tpub base c=us
retransmit 4
-> aaa ldap-server omnivista host 1.2.3.4 dn "cn=DirMgr, o=alcatel.com" password
somepass base "ou=People, o=alcatel.com" vrf-name ldap_vrf
-> no aaa ldap-server topanga5
```

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager prompt-password base c=us
retransmit 4
Enter Password: ******
Confirm Password: ******
```

## Release History

Release 7.1.1; command was introduced.  
 Release 7.3.1; **vrf-name** parameter added.  
 Release 8.3.1; **prompt-password** parameter added.

  aaasRetries
  aaasTimeout
  aaasLdapEnableSsl
  aaasVrfName
```

---

## aaa test-radius-server

RADIUS test tool allows the user to test the RADIUS server reachability from the OmniSwitch. Use this command to start the authentication or accounting test for the specified user name and password.

```
aaa test-radius-server server-name type {authentication user user-name password password [method {md5 | pap}] | accounting user user-name}
```

---

### Syntax Definitions

<i>server_name</i>	RADIUS server name for which test has been configured.
<b>authentication</b>   <b>accounting</b>	Type of test to run.
<i>user-name</i>	User name configured on the server.
<i>password</i>	Password for the given user name.
<b>md5</b>   <b>pap</b>	Authentication method for the test.

### Defaults

By default, MD5 is used as the authentication method.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- RADIUS server must be configured on the switch to test the tool.
- The switch must have the following RADIUS server configuration before starting the test tool: RADIUS server name, acct-port, auth-port, secret key, retransmit count, and timeout. See the [aaa radius-server](#) command for more information on RADIUS server configuration.
- Supports multiple sessions (console, telnet, SSH) to test multiple RADIUS servers.
- The CLI of the user session (console, telnet, SSH) goes in the blocking state when the test is started. In the blocking state, no other command (CLI) is accepted. The blocking state of the CLI prompt of the switch can be terminated by pressing any key.
- Two IP addresses are configurable for a RADIUS server. When the test starts, the requests are sent to the first address. When all the requests to the first address time out, then the requests are sent to the second address.

### Examples

```
-> aaa test-radius-server rad1 type authentication user admin password switch  
method MD5  
-> aaa test-radius-server rad2 type authentication user admin password switch  
method pap  
-> aaa test-radius-server rad1 type accounting user admin
```

## Release History

Release 8.1.1; command introduced.

## Related Commands

---

## system fips admin-state

Enable or disable the Federal Information Processing Standards (FIPS) mode on the switch.

```
system fips admin-state {enable | disable}
```

---

### Syntax Definitions

**enable | disable**                      Enables or disables the FIPS mode.

### Defaults

By default, the FIPS mode is disabled on the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Enabling or disabling FIPS mode takes effect only after a switch reboot. The FIPS mode configuration is persistent across reboots.
- When FIPS mode is disabled, all other existing cryptographic algorithms will be supported.
- A FIPS supported client is required to access the switch in FIPS enabled mode. For example, Absolute Telnet.
- Other unsecured management interfaces, such as Telnet or FTP, have to be manually disabled after FIPS mode is enabled to achieve a completely secure device.

### Examples

```
-> system fips admin-state enable
WARNING: FIPS Admin State only becomes Operational after write memory and reload

-> system fips admin-state disable
WARNING: FIPS Admin State only becomes Operational after write memory and reload
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

### MIB Objects

```
systemFipsAdminState
```

---

## aaa authentication

Configures the interface for Authenticated Switch Access and specifies the server(s) to be used. This type of authentication gives users access to manage the switch.

**aaa authentication** {console | telnet | ftp | http | snmp | ssh | default} *server1* [*server2...*] [local]

**no aaa authentication** [console | telnet | ftp | http | snmp | ssh | default]

---

### Syntax Definitions

<b>console</b>	Configures Authenticated Switch Access through the console port.
<b>telnet</b>	Configures Authenticated Switch Access for any port used for Telnet.
<b>ftp</b>	Configures Authenticated Switch Access for any port used for FTP.
<b>http</b>	Configures Authenticated Switch Access for any port used for Web-based management.
<b>snmp</b>	Configures Authenticated Switch Access for any port used for SNMP.
<b>ssh</b>	Configures Authenticated Switch Access for any port used for Secure Shell.
<b>default</b>	Configures Authenticated Switch Access for any port using any service ( <b>telnet</b> , <b>ftp</b> , etc.). Note that SNMP access is enabled only if an LDAP or local server is specified with the command.
<i>server1</i>	The name of the authentication server used for Authenticated Switch Access. At least one server is required. The server may be a RADIUS, TACACS+, LDAP, or the local user database. RADIUS, TACACS+, and LDAP server names are set up through the <b>aaa radius-server</b> , <b>aaa tacacs+-server</b> , and <b>aaa ldap-server</b> commands.
<i>server2...</i>	The names of backup servers for Authenticated Switch Access. Up to 3 backups may be specified (including <b>local</b> ). These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.
<b>local</b>	Specifies that the local user database will be a backup for the authentication servers. If you want to use the local user database as the only authentication server, specify <b>local</b> for <i>server1</i> .

### Defaults

- At switch startup, Authenticated Switch Access is available through console port via the local database. Authentication for other management interfaces (Telnet, FTP, etc.) is disabled.
- The default user on the switch is **admin**, and **switch** is the password.
- Remote authentication is not supported on secondary CMMs or Slave chassis. Use local authentication on secondary CMMs and Slave chassis.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- The server type may be RADIUS, TACACS+, LDAP, or the local user database. Up to 4 servers may be configured for an interface type; at least one is required. Each server name should be separated by a space.
- The switch uses *only the first available server* in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.
- If the local switch database will be used as the only authentication server, specify **local** for *server1*. If **local** is specified as a backup server, it should be entered last in the list of servers. The local user database is always available if the switch is up.
- Only LDAP or the local database may be used for authenticated SNMP management.
- If Secure Shell (**ssh**) is enabled, Telnet and FTP should be disabled.

## Examples

```
-> aaa authentication telnet pubs1
-> no aaa authentication telnet
-> aaa authentication default pubs2 pubs3
```

## Release History

## aaa console admin-only

Enables or disables the user restriction for all users except the user “admin” from accessing the switch through the secure console session.

**aaa console admin-only {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Restricts all users from accessing the switch through the secure console session except the user “admin”. Only user “admin” can access the switch through the secure console session.
<b>disable</b>	Disables the user restrictions.

### Defaults

By default, console admin-only is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Enable this feature to restrict all users except user “admin” from accessing the switch through the secure console session.

### Examples

```
-> aaa console admin-only enable
-> aaa console admin-only disable
```

### Release History

Release 8.3.1 R02; command was introduced.

### Related Commands

---

## aaa authentication default

Sets the authenticated switch access type to the default server setting.

**aaa authentication {console | telnet | ftp | http | snmp | ssh} default**

---

### Syntax Definitions

<b>console</b>	Configures the default Authenticated Switch Access server setting for the console port.
<b>telnet</b>	Configures the default Authenticated Switch Access server setting for Telnet.
<b>ftp</b>	Configures the default Authenticated Switch Access server setting for FTP.
<b>http</b>	Configures the default Authenticated Switch Access server setting for Web-based management.
<b>snmp</b>	Configures the default Authenticated Switch Access server setting for any port used for SNMP.
<b>ssh</b>	Configures the default Authenticated Switch Access server setting for any port used for Secure Shell.

### Defaults

By default, the default Authenticated Switch Access server setting does not include any servers.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **aaa authentication** command to set the default servers.

### Examples

```
-> aaa authentication telnet default
-> aaa authentication default default
```

### Release History

Release 7.1.1; command was introduced.

## aaa accounting session

Configures an accounting server or servers for authenticated switch sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting session** *server1* [*server2...*] [**local**]

**no accounting session**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP server used for accounting of authenticated switch sessions. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands.
<i>server2...</i>	The names of backup servers. Up to 3 backups may be specified (including <b>local</b> ); each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switching Logging feature on the switch.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable accounting for Authenticated Switch Access.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

## Examples

```
-> aaa accounting session ldap1 radius2 local  
-> no aaa accounting session
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

```

---

## aaa accounting command

Enables or disables the server for command accounting. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting command** *server1* [*server2...*] [**local**]

**no accounting command**

---

### Syntax Definitions

<i>server1</i>	The name of the TACACS+ server used for command accounting. At least one server is required. TACACS+ server names are set up through the <b>aaa tacacs+-server</b> commands.
<i>server2...</i>	The names of TACACS+ backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switching Logging feature on the switch.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable command accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers can be only TACACS+ servers.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- TACACS+ server may each have an additional backup specified through the **aaa tacacs+-server** command.

### Examples

```
-> aaa accounting command tacacs1 tacacs2 tacacs3
-> no aaa accounting command
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show aaa accounting](#)

```

---

## aaa device-authentication

Configures the switch to use RADIUS servers for 802.1X, MAC, and Captive Portal device authentication.

```
aaa device-authentication {802.1x | mac | captive-portal} server1 [server2] [server3] [server4]
```

```
no device-authentication {802.1x | mac | captive-portal}
```

---

### Syntax Definitions

<b>802.1x</b>	Use the specified RADIUS server to authenticate 802.1X users.
<b>mac</b>	Use the specified RADIUS server for MAC authentication.
<b>captive-portal</b>	Use the specified RADIUS server for Captive Portal authentication.
<i>server1</i>	The name of the RADIUS authentication server to use for the specified type of authentication. ( <i>Note that only RADIUS servers are supported for these types of authentication.</i> ) At least one server is required. RADIUS server names are configured through the <a href="#">aaa radius-server</a> command.
<i>server2...server4</i>	The names of backup servers used for authentication. Up to 3 backups may be specified; include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a RADIUS server assignment for a specific authentication type.
- Up to 4 RADIUS servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses **only the first available server** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the **aaa radius-server** command.
- Configuring the RADIUS servers to use for 802.1X, MAC, and Captive Portal authentication is required to support authentication and classification of devices connected to Universal Network Profile (UNP) ports.

## Examples

```
-> aaa device-authentication 802.1x rad1
-> aaa device-authentication 802.1x rad1 rad2
-> no aaa device-authentication 802.1x

-> aaa device-authentication mac rad1
-> aaa device-authentication mac rad1 rad2
-> no aaa device authentication mac

-> aaa device-authentication captive-portal rad1
-> aaa device-authentication captive-portal rad1 rad2
-> no aaa device-authentication captive-portal
```

## Release History

Release 7.2.1; command was introduced.  
Release 7.3.4; **802.1x** parameter added.  
Release 8.1.1; **captive-portal** parameter added.

## MIB Objects

```
AaaAuthDATable
  aaaDaName1
  aaaDaName2
  aaaDaName3
  aaaDaName4
```

---

## aaa accounting

Configures RADIUS server accounting or local Switch Logging (syslog) accounting for 802.1X, MAC, and Captive Portal authenticated device sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting** {802.1x | mac | captive-portal} {server1 [server2...]} | **syslog** ip\_address [port udp\_port]}

**no accounting** {802.1x | mac | captive-portal}

---

### Syntax Definitions

<b>802.1x</b>	Enables the specified RADIUS or syslog server to log accounting of 802.1X authenticated sessions.
<b>mac</b>	Enables the specified RADIUS or syslog server to log accounting for MAC authenticated sessions.
<b>captive-portal</b>	Enables the specified RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.
<i>server1</i>	The name of the RADIUS server used for accounting of authenticated switch sessions. At least one server is required. RADIUS server names are configured through the <b>aaa radius-server</b> command.
<i>server2...</i>	The names of backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<i>ip_address</i>	The IP network address for syslog accounting.
<i>udp_port</i>	The UDP port number for syslog accounting.

### Defaults

By default, no RADIUS server or syslog accounting is configured for the switch.

parameter	default
<i>udp_port</i>	514

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to disable accounting for device authentication sessions.
- Up to 4 RADIUS accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.

- Accounting with the local syslog facility is not allowed if RADIUS accounting is already configured. In other words, configure either RADIUS *or* syslog accounting.
- RADIUS servers may each have an additional backup specified through the [aaa radius-server](#) command.

## Examples

```
-> aaa accounting 802.1x rad1
-> aaa accounting 802.1x rad1 rad2 rad3 rad4
-> aaa accounting 802.1x syslog 10.135.67.99 port 8000
-> no aaa accounting 802.1x

-> aaa accounting mac rad1
-> aaa accounting mac rad1 rad2
-> aaa accounting mac syslog 10.135.67.99 port 8000
-> no aaa accounting mac

-> aaa accounting captive-portal rad1
-> aaa accounting captive-portal rad1 rad2 rad3
-> aaa accounting captive-portal syslog 10.135.67.99 port 8000
-> no aaa accounting captive-portal
```

## Release History

```

---

## aaa accounting radius calling-station-id

Configures the RADIUS Calling-Station-Id attribute for the specified accounting session type.

```
aaa accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}
```

---

### Syntax Definitions

<b>802.1x</b>	Configures the attribute for 802.1X accounting sessions.
<b>mac</b>	Configures the attribute for MAC accounting sessions.
<b>captive-portal</b>	Configures the attribute for Captive Portal accounting sessions.
<b>mac-address</b>	Sets the Calling Station ID to the MAC address of the user.
<b>ip-address</b>	Sets the Calling Station ID to the IP address of the user.

### Defaults

By default, the RADIUS Calling -Station-Id attribute value is set to the MAC address of the user.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Configuring the Calling-Station-Id attribute is not allowed if the accounting server configuration is set to use local Switch Logging (syslog) for the specified accounting session type (802.1x, MAC, or Captive Portal).
- The Calling Station ID attribute is defined in a RADIUS Accounting-Request message that is sent to the RADIUS accounting server.

### Examples

```
-> aaa accounting 802.1x radius calling-station-id ip-address
-> no aaa accounting 802.1x radius calling-station-id ip-address
-> aaa accounting 802.1x radius calling-station-id mac-address

-> aaa accounting mac radius calling-station-id ip-address
-> no aaa accounting mac radius calling-station-id ip-address
-> aaa accounting mac radius calling-station-id mac-address

-> aaa accounting captive-portal radius calling-station-id ip-address
-> no aaa accounting onex radius calling-station-id ip-address
-> aaa accounting captive-portal radius calling-station-id mac-address
```

### Release History

## aaa 802.1x re-authentication

Enables or disables the automatic re-authentication of authenticated 802.1X users.

**aaa 802.1x re-authentication {enable | disable} [interval *seconds*] [trust-radius {enable | disable}]**

---

### Syntax Definitions

<b>enable</b>	Enables re-authentication of 802.1X users.
<b>disable</b>	Disables re-authentication of 802.1X users.
<i>seconds</i>	The amount of time the switch waits before triggering re-authentication of 802.1X users. The valid range is 600–7200 seconds.
<b>trust-radius enable</b>	Directs the switch to use the Session-Timeout attribute value for the re-authentication time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
<b>trust-radius disable</b>	Directs the switch to use the locally configured re-authentication time interval value.

### Defaults

By default, 802.1X re-authentication is disabled for the switch.

parameter	default
<i>seconds</i>	3600
<b>trust-radius enable   disable</b>	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The re-authentication time interval is triggered when 802.1X re-authentication is enabled.
- When the trust RADIUS option is enabled, the Session-Timeout attribute value received from the RADIUS server overrides the locally configured value for the switch.
- When the re-authentication time interval is changed, the new value does not apply to existing authenticated 802.1X users until the user is flushed out or when the user is authenticated again. Any new 802.1X users are re-authenticated based on the current time interval setting.

### Examples

```
-> aaa 802.1x re-authentication enable
-> aaa 802.1x re-authentication enable interval 7200
-> aaa 802.1x re-authentication enable trust-radius enable
-> aaa 802.1x re-authentication enable interval 7200 trust-radius enable
-> aaa 802.1x re-authentication enable interval 7200 trust-radius disable
-> aaa 802.1x re-authentication disable
```

## aaa interim-interval

Configures the amount of time between each interim accounting update for any given session.

**aaa {802.1x | mac | captive-portal} interim-interval *seconds* [trust-radius {enable | disable}]**

---

### Syntax Definitions

<b>802.1x</b>	Configures the interim interval value for 802.1X accounting sessions.
<b>mac</b>	Configures the interim interval value for MAC accounting sessions.
<b>captive-portal</b>	Configures the interim interval value for Captive Portal accounting sessions.
<i>seconds</i>	The amount of time between each interim accounting update. The valid range is 60–1200 seconds.
<b>trust-radius enable</b>	Directs the switch to use the Acct-Interim-Interval attribute value for the interim time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
<b>trust-radius disable</b>	Directs the switch to use the locally configured interim time interval value.

### Defaults

By default, the accounting interim interval value is set to 600 seconds.

parameter	default
<b>trust-radius enable   disable</b>	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the trust RADIUS option is enabled, the accounting interim interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the accounting interim interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.

### Examples

```
-> aaa 802.1x interim-interval 1200
-> aaa 802.1x interim-interval 1200 trust-radius enable
-> aaa 802.1x interim-interval 1200 trust-radius disable

-> aaa mac interim-interval 1200
-> aaa mac interim-interval 1200 trust-radius enable
-> aaa mac interim-interval 1200 trust-radius disable

-> aaa captive-portal interim-interval 1200
```

```
-> aaa captive-portal interim-interval 1200 trust-radius enable
-> aaa captive-portal interim-interval 1200 trust-radius disable
```

## Release History

Release 8.1.1; command was introduced.

## Related Commands

```

---

## aaa session-timeout

Configures whether or not an authenticated user is automatically logged out of the network based on a session timeout value.

**aaa {mac | captive-portal} session-timeout {enable | disable} [interval *seconds*] [trust-radius {enable | disable}]**

---

### Syntax Definitions

<b>mac</b>	Configures the session timeout parameter for authenticated MAC users.
<b>captive-portal</b>	Configures the session timeout parameter for authenticated Captive Portal users.
<b>session-timeout enable</b>	Enables the session timeout timer for authenticated user sessions.
<b>session-timeout disable</b>	Disables the session timeout timer for authenticated user sessions.
<i>seconds</i>	The session timeout value. The valid range is 12000–86400 seconds.
<b>trust-radius enable</b>	Directs the switch to use the Session-Timeout attribute returned from the RADIUS server in an Accept-Accept message.
<b>trust-radius disable</b>	Directs the switch to use the locally configured timeout interval value.

### Defaults

By default, the session timer is disabled for the switch.

parameter	default
<i>seconds</i>	43200 seconds (12 hours)
<b>trust-radius enable   disable</b>	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The session timeout parameter is configurable only for MAC and Captive Portal authentication sessions. When 802.1x re-authentication is enabled, the session timeout is set to 43200 seconds by default.
- The timeout interval is triggered when the session timeout parameter is enabled for the switch.
- When the trust RADIUS option is enabled, the timeout interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the session timeout interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- When the session timeout value is reached, the authenticated users are logged out and the MAC address for each logged out user device is flushed.

## Examples

```
-> aaa mac session-timeout enable interval 13000
-> aaa mac session-timeout enable interval 14000 trust-radius enable
-> aaa mac session-timeout disable

-> aaa captive-portal session-timeout enable interval 13000
-> aaa captive-portal session-timeout enable interval 14000 trust-radius enable
-> aaa captive-portal session-timeout disable
```

---

## aaa inactivity-logout

Configures whether or not an authenticated user is automatically logged out of the network after a specific period of inactivity.

**aaa {mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds*]**

---

### Syntax Definitions

<b>mac</b>	Configures the inactivity logout timer for authenticated MAC users.
<b>captive-portal</b>	Configures the inactivity logout timer for authenticated Captive Portal users.
<b>enable</b>	Enables the inactivity logout timer for the specified authentication type.
<b>disable</b>	Disables the inactivity logout timer for the specified authentication type.
<i>seconds</i>	The inactivity logout time. The valid range is 60–1200 seconds, or enter 0 to indicate that an authenticated user should never be logged out.

### Defaults

By default, the inactivity logout timer is disabled for the switch.

parameter	default
seconds	600 seconds

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The inactivity logout timer is configurable only for MAC and Captive Portal authentication sessions.
- The timer is triggered when the inactivity logout parameter is enabled for the switch.
- Make sure the configured inactivity logout time is set to a value greater than the MAC address aging time for the switch.
- If a specific time is configured for the inactivity logout timer, the user is *not* logged out of the network even if the MAC address for the user device ages out before the inactivity logout timer value expires.
- Setting the inactivity logout time to zero helps prevent silent devices from getting automatically logged out; the silent device will always remain logged in.
- When the inactivity logout time is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- If a user undergoes MAC authentication and then secondary Captive Portal authentication, the higher of the two inactivity logout timer values is applied to the device.

## Examples

```
-> aaa mac inactivity-logout enable
-> aaa mac inactivity-logout enable interval 600
-> aaa mac inactivity-logout enable interval 0
-> aaa mac inactivity-logout disable

-> aaa captive-portal inactivity-logout enable
-> aaa captive-portal inactivity-logout enable interval 600
-> aaa captive-portal inactivity-logout enable interval 0
-> aaa captive-portal inactivity-logout disable
```

## Release History

Release 8.1.1; command was introduced.

Release 8.4.1.R02; setting the inactivity logout time to zero is supported (user is never logged out).

```

---

## aaa radius nas-port-id

Configures the RADIUS client NAS-Port attribute for authentication and accounting sessions.

```
aaa radius nas-port-id {user-string string | default}
```

---

### Syntax Definitions

<i>string</i>	A text string (up to 31 characters) used to define a NAS-Port identifier for the NAS-Port attribute.
<b>default</b>	Sets the NAS-Port attribute value to the chassis/slot/port of the user.

### Defaults

By default, the NAS-Port attribute is set to the user port (chassis/slot/port).

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The NAS-Port attribute value specified with this command is used in Account-Request messages and in Accounting-Request messages.

### Examples

```
-> aaa radius nas-port-id default
-> aaa radius nas-port-id user-string nasport
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

[show aaa radius config](#) Displays the global RADIUS client attribute configuration.

### MIB Objects

```
alaAaaClientAttrGroup
  alaAaaRadNasPortId
```

---

## aaa radius nas-identifier

Configures the RADIUS client NAS-Identifier attribute for authentication and accounting sessions.

```
aaa radius nas-identifier {user-string string | default}
```

---

### Syntax Definitions

<i>string</i>	A text string (up to 31 characters) used to identify the switch (RADIUS client) in the NAS-Identifier attribute.
<b>default</b>	Sets the NAS-Identifier attribute to the system name of the switch.

### Defaults

By default, the NAS-Identifier attribute is set to the system name of the switch.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The NAS-Identifier attribute value specified with this command is used in both Account-Request and Accounting-Request messages.

### Examples

```
-> aaa radius nas-identifier default
-> aaa radius nas-identifier user-string os6860
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

### MIB Objects

```
alaAaaClientAttrGroup
  alaAaaRadNasIdentifier
```

---

## aaa radius mac-format

Configures the MAC address format to use in the specified RADIUS client attributes.

```
aaa radius mac-format {username | password | calling-station-id | called-station-id} delimiter {char | none} case {uppercase | lowercase}
```

---

### Syntax Definitions

<b>username</b>	Configures the MAC address format for the User-Name attribute.
<b>password</b>	Configures the MAC address format for the User-Password attribute.
<b>calling-station-id</b>	Configures the MAC address format for the Calling-Station-Id attribute.
<b>called-station-id</b>	Configures the MAC address format for the Called-Station-Id attribute.
<i>char</i>	The delimiter character to use to separate the octets within a MAC address. The valid characters are a space (“ ”), a hyphen (“-”), or a colon (“:”). For example, “e8 e7 32 a4 63 23”, “e8-e7-32-a4-63-23”, or “e8:e7:32:a4:63:23”.
<b>none</b>	No delimiter is used in the MAC address format.
<b>uppercase</b>	Uses uppercase characters in the MAC address format.
<b>lowercase</b>	Uses lowercase characters in the MAC address format.

### Defaults

By default, no delimiter is used and the MAC address characters are in uppercase.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The MAC address format configured for the User-Name and User-Password attributes is only applied for MAC authentication and accounting, where these attributes are set to the MAC address of the user. The configured format is not applied for 802.1X or Captive Portal authentication and accounting.
- The MAC address format configured for the Called-Station-Id and Calling-Station-Id attributes is applied for MAC, 802.1X, and Captive Portal authentication and accounting sessions when these attributes are set to a MAC address value.
- The Called-Station-Id attribute is set to the base MAC address of the switch.
- The Calling-Station-ID attribute is configurable and can be set to the MAC address or IP address of the user.

### Examples

```
-> aaa radius mac-format username delimiter none case lowercase
-> aaa radius mac-format username delimiter ":" case lowercase

-> aaa radius mac-format password delimiter none case lowercase
-> aaa radius mac-format password delimiter ":" case lowercase
```

```
-> aaa radius mac-format calling-station-id delimiter none case lowercase
-> aaa radius mac-format calling-station-id delimiter ":" case lowercase

-> aaa radius mac-format called-station-id delimiter none case lowercase
-> aaa radius mac-format called-station-id delimiter ":" case lowercase
```

## Release History

Release 8.1.1; command was introduced.

## aaa profile

Configures an AAA profile that is used to define and apply specific AAA parameter values to Universal Network Profile (UNP) Edge ports, link aggregates, or an Access Guardian Captive Portal profile. This section describes the base command (**aaa profile** *profile\_name*) along with the other command keywords that are used to configure AAA parameter values that are applied when the profile is assigned to a UNP port or link aggregate.

**aaa profile** *profile\_name*

```
[device-authentication {802.1x | mac | captive-portal} server1 [server2] [server3] [server4]]
[accounting {802.1x | mac | captive-portal} {server1 [server2...]} | syslog ip_address
 [port udp_port]]]
[accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}]
[802.1x re-authentication {enable | disable} [interval seconds] [trust-radius {enable | disable}]]
[{802.1x | mac | captive-portal} interim-interval seconds [trust-radius {enable | disable}]]
[{mac | captive-portal} session-timeout {enable | disable} [interval seconds] [trust-radius
 {enable | disable}]]
[{mac | captive-portal} inactivity-logout {enable | disable} [interval seconds]]
[radius nas-port-id {user-string string | default}]
[radius nas-identifier {user-string string | default}]
[radius mac-format {username | password | calling-station-id | called-station-id} delimiter
 {char | none} case {uppercase | lowercase}]
```

**no aaa profile** *profile\_name*

---

### Syntax Definitions

*profile\_name*                                      The name to associate with the AAA configuration profile.

### Defaults

The AAA profile parameters are set to the same default values that are set when the explicit AAA command is used to configure the parameter value. See the **show aaa profile** command output example in the “Examples” section of this command page to determine default values for AAA profile parameters.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the AAA profile from the switch configuration.
- Creating the template name with the base command (**aaa profile** *profile\_name*) is required before attempting to configure profile parameter values.
- When an AAA profile is assigned to a UNP port, the parameter values defined in the profile will override any existing global AAA configuration for users authenticating on that port.

- When an AAA profile is assigned to a Captive Portal profile, the parameters values defined in the AAA profile will override any existing global AAA configuration for users authenticated through the Captive Portal profile configuration.
- For more information about specific AAA parameter values, refer to the following explicit AAA configuration commands for each profile parameter option:

AAA Profile Parameter	Explicit Port Configuration Command
<b>[device-authentication {802.1x   mac   captive-portal} server1 [server2] [server3] [server4]]</b>	<b>aaa device-authentication</b>
<b>[accounting {802.1x   mac   captive-portal} {server1 [server2...]}   syslog ip_address [port udp_port]]</b>	<b>aaa accounting</b>
<b>[accounting {802.1x   mac   captive-portal} radius calling-station-id {mac-address   ip-address}]</b>	<b>aaa accounting radius calling-station-id</b>
<b>[802.1x re-authentication {enable   disable} [interval seconds] [trust-radius {enable   disable}]]</b>	<b>aaa 802.1x re-authentication</b>
<b>[{802.1x   mac   captive-portal} interim-interval seconds [trust-radius {enable   disable}]]</b>	<b>aaa interim-interval</b>
<b>[{mac   captive-portal} session-timeout {enable   disable} [interval seconds] [trust-radius {enable   disable}]]</b>	<b>aaa session-timeout</b>
<b>[{mac   captive-portal} inactivity-logout {enable   disable} [interval seconds]]</b>	<b>aaa inactivity-logout</b>
<b>[radius nas-port-id {user-string string   default}]</b>	<b>aaa radius nas-port-id</b>
<b>[radius nas-identifier {user-string string   default}]</b>	<b>aaa radius nas-identifier</b>
<b>[radius mac-format {username   password   calling-station-id   called-station-id} delimiter {char   none} case {uppercase   lowercase}]</b>	<b>aaa radius mac-format</b>

## Examples

```

-> aaa profile prof1
-> no aaa profile prof1

-> aaa profile ap-1 device-authentication mac rad1 rad2
-> aaa profile ap-1 device-authentication 802.1x serv1 serv2 serv3 serv4
-> aaa profile ap-2 device-authentication captive-portal rad3 rad4
-> no aaa profile ap-2 device-authentication captive-portal

-> aaa profile ap-1 accounting 802.1x rad1 rad2 rad3
-> aaa profile ap-1 accounting mac rad1 rad2
-> aaa profile ap-1 accounting captive-portal syslog 10.135.67.99 port 8000
-> no aaa profile ap-1 accounting captive-portal

-> aaa profile ap-1 mac inactivity-logout enable
-> aaa profile ap-1 mac inactivity-logout enable interval 600
-> aaa profile ap-1 mac inactivity-logout disable

-> aaa profile ap-1 captive-portal inactivity-logout enable
-> aaa profile ap-1 captive-portal inactivity-logout enable interval 600
-> aaa profile ap-1 captive-portal inactivity-logout disable

```

The following **show aaa profile** command output example shows the default values applied when the AAA profile is created:

```
-> show aaa profile ap-2

AAA profile name = ap-2
Authentication type = mac
  Session Timeout:
    Status          = disable,
    Interval (sec)  = 43200,

## user

Configures or modifies user entries in the local user database. Use the **no** form of the command to remove the user from the local database.

**user** *username*

{**password** *password* | **password-prompt**}

[**expiration** {*day* | *date*}]

[**read-only** | **read-write** [*families...* / *domains...* / **all** | **none** | **all-except** [*families* / *domains...*]]]

[**no snmp** | **no auth** | **sha** | **md5** | **sha+des** | **md5+des** | **sha+aes** | **sha224** | **sha256**]

[**console-only** {**enable** | **disable**}]

[**priv-password** *password* | **prompt-priv-password**]

**no user** *username*

---

### Syntax Definitions

<i>username</i>	The name of the user. Used for logging into the switch. Required to create a new user entry or for modifying a user. Maximum 63 characters.
<i>password</i>	The user's password in clear text or hexadecimal (corresponding to encrypted form). Required to create a new user entry. Maximum 47 characters.
<b>password-prompt</b>	This option allows to enter the password in a obscured format rather than as clear text. Select this option with the 'user' command to configure the password for the user. When this option is selected, a password prompt appears and the password can be provided. Password needs to be re-entered, and only if both the passwords match, command is accepted. Password provided in this mode is not displayed on the CLI as text.
<i>day</i>	The number of days before this user's current password expires. The range is 1 to 150 days.
<i>date</i>	The date (in the format <i>mm/dd/yyyy hh:mm</i> ) that the user's current password will expire.
<b>read-only</b>	Specifies that the user will have read-only access to the switch.
<b>read-write</b>	Specifies that the user will have read-write access to the switch.
<i>families</i>	Determines the command families available to the user on the switch. Each command family should be separated by a space. Command families are subsets of domains.
<i>domains</i>	Determines the command domains available to the user on the switch. Each domain should be separated by a space.
<b>all</b>	Specifies that all command families and domains are available to the user.
<b>none</b>	Specifies that no command families or domains are available to the user.
<b>all-except</b>	Specifies that functional privileges for families or domains followed by 'all-except' are disabled to the user.
<b>no snmp</b>	Denies the specified user SNMP access to the switch.

<b>no auth</b>	Specifies that the user has SNMP access without any required SNMP authentication and encryption protocol.
<b>sha</b>	Specifies that the SHA authentication algorithm should be used for authenticating SNMP PDU for the user.
<b>md5</b>	Specifies that the MD5 authentication algorithm should be used for authenticating SNMP PDU for the user.
<b>sha+des</b>	Specifies that the SHA authentication algorithm and DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
<b>md5+des</b>	Specifies that the MD5 authentication algorithm and the DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
<b>sha+aes</b>	Specifies that the SHA authentication algorithm and AES encryption standard is used for authenticating and encrypting SNMP PDU for the user.
<b>sha224</b>	Specifies that the SHA224 authentication algorithm used for storing the user passwords.
<b>sha256</b>	Specifies that the SHA256 authentication algorithm used for storing the user passwords.
<b>console-only enable</b>	Enables console only access for the user <i>admin</i> .
<b>console-only disable</b>	Disables console only access for the user <i>admin</i> .
<b>priv-password</b>	Separate password that is used for SNMPv3 encryption. (8-30 characters)
<b>prompt-priv-password</b>	<p>This option allows to enter the privacy password in a obscured format rather than as clear text.</p> <p>When this option is selected, press the Enter key.</p> <p>Select this option with the ‘user’ command to configure the privacy password for the user. When this option is selected, a password prompt appears and the privacy password can be provided. Password needs to be re-entered, and only if both the passwords match, command is accepted.</p> <p>Password provided in this mode is not displayed on the CLI as text.</p>

## Defaults

- By default, if a user is created without indicating the read and write privileges and SNMP access, the user will be given privileges based on the *default user account*. The **default** user account may be modified.
- By default, the password will be encrypted using SHA for all non SNMP users.
- For SNMP users without authentication, password will be encrypted with SHA.
- For SNMP users with authentication, it will be encrypted with the authentication method set for the user. If user is created with MD5, then it will be still encrypted with MD5.
- Users created with SHA2 authentication algorithm cannot be used for SNMP authentication.

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- At least one user with SHA/MD5 authentication and/or DES encryption must be configured on the switch for SNMPv3 communication with OmniVista.
- Note that the exclamation point ‘!’ is not a valid password character. In addition, specifying an asterisk (\*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password \*\*123456\*\*** is allowed; **password \*\*\*\*\*** is not allowed.
- Some special characters are interpreted as a Linux shell variable by the switch when being used in a password. They can still be used in a password but they must be escaped (‘\’). For example, to use the ‘\$’ as part of a password the following should be entered:

```
-> user test password test\$1234
```

this password will be interpreted as *test\$1234*.

- An alternative method is to use the **password-prompt** parameter when using special characters in a password. The **password-prompt** parameter exits the Linux shell and special characters are no longer interpreted as shell variables. The following characters are the majority of characters considered special characters by the switch [ " " (white space), \$, "", \, #, [], >, <, |, ;, { }, (), ~, `].
- A password expiration for the user’s current password may be configured with the **expiration** option. However, if the password is changed, or the global password expiration setting is configured with the **user password-expiration** command, the user’s password expiration will be configured with the global expiration setting.
- When modifying a user’s SNMP access, the user password must be re-entered (or a new one configured). This is required because the hash algorithm used to save the password in the switch depends on the SNMP authentication level.
- At initial startup, the default user on the switch is **admin** with a password of **switch**. The switch will not recreate this user at any successive startup as long as there exists at least one user defined with write access to all commands. (Note that if password expiration is configured for the **admin** user, or configured globally through the **user password-expiration** command, when the **admin** user’s password expires, the **admin** user will have access only through the console port.)
- New users or updated user settings are saved *automatically*.
- The **priv-password** token is accepted only when SNMP level with encryption is configured for the user. If SNMP level with encryption is not selected and **priv-password** is configured, then CLI command is rejected with error.
- If **priv-password** is not configured for the user with encryption SNMP level, then the user password parameter is used for **priv-password** (both for authentication/encryption).
- Password policy is not applicable for the new optional parameter **priv-password**.
- For authenticating switch access through other access types such as telnet, FTP, SSH the existing user password will be used irrespective of whether **priv-password** is configured or not.
- When the SNMP level for an existing user with **priv-password** configured is changed from one encryption level to another encryption level, then the previously configured **priv-password** will not be

used with the new SNMP level. Priv-password needs to be configured again when SNMP level is changed for an existing user.

## Examples

```
-> user techpubs password writer_pass read-only config
-> user techpubs password-prompt
Enter Password: *****
Confirm Password: *****

-> user techpubs password writer_pass read-write all sha256
```

The following example creates a user with read-write privileges for all families except aaa.

```
-> user techpubs password writer_pass read-write all-except aaa

-> no user techpubs

-> user snmpv3user password passlpass1 priv-password privlprivl read-write all
sha+aes

-> user snmpv3user password passlpass1 prompt-priv-password
Enter Priv-Password: *****
Confirm Priv-Password: *****
```

## Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **password-prompt**, **all-except**, **priv-password**, **prompt-priv-password** parameter added, **sha224** and **sha256** algorithm support added.

## Related Commands

<a href="#">password</a>	Configures the current user's password.
<a href="#">show user</a>	Displays information about users configured in the local database on the switch.

## MIB Objects

```
aaaUserTable
  aaauPassword
  aaauReadRight
  aaauWriteRight
  aaauSnmpLevel
  aaauSnmpAuthKey
  aaauPasswordExpirationDate
```

---

## password

Configures the current user's password.

**password**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the **snapshot** command is used to capture the switch configuration, the text of the password is not displayed in the file. Instead an authentication key is included in the file.
- A new password cannot be identical to the current password; it cannot be identical to any of the three passwords that preceded the current password.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (\*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password \*\*123456\*\*** is allowed; **password \*\*\*\*\*** is not allowed.
- Password settings are saved *automatically*.

### Examples

```
-> password
enter old password: *****
enter new password: *****
reenter new password: *****
->
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **user**

Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

## MIB Objects

aaaUserTable

    aaauPassword

    aaauOldPassword

---

## user password-size min

Configures the minimum number of characters required when configuring a user password.

**user password-size min** *size*

---

### Syntax Definitions

*size* The number of characters required when configuring a user password through the **password** command or when setting up a user password through the **user** command. The range is 1 to 14 characters.

### Defaults

parameter	default
<i>size</i>	6

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A.

### Examples

```
-> user password-size min 9
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[user](#) Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig  
aaaAsaPasswordSizeMin

---

## user password-expiration

Configures an expiration date for all user passwords stored locally on the switch or disables password expiration.

**user password-expiration** {*day* / **disable**}

---

### Syntax Definitions

<i>day</i>	The number of days before locally configured user passwords will expire. The range is 1 to 150 days.
<b>disable</b>	Disables password expiration for users configured locally on the switch.

### Defaults

---

parameter	default
<i>day</i> / <b>disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The **user password-expiration** command sets a default password expiration for users configured locally on the switch.
- Password expiration may be configured on a per-user basis through the **user** command; the user setting overrides the **user password-expiration** setting until the user password is changed or the **user password-expiration** command is entered again.

### Examples

```
-> user password-expiration 2
-> user password-expiration disable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [user](#)

Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

### [show user password-policy](#)

Displays the global password policy configuration for the switch.

## MIB Objects

aaaAsaConfig

aaaAsaDefaultPasswordExpirationInDays

---

## user password-policy cannot-contain-username

Specifies whether or not a user can configure a password that contains the username for the account.

`user password-policy cannot-contain-username {enable | disable}`

---

### Syntax Definitions

**enable** Does not allow the password to contain the username.  
**disable** Allows the password to contain the username.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The status of this function is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- When this function is enabled, a check is done at the time the password is created or modified to ensure that the username is not specified as part of the password text.

### Examples

```
-> user password-policy cannot-contain-username enable  
-> user password-policy cannot-contain-username disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig  
  aaaAsaPasswordContainUserName
```

---

## user password-policy min-upper-case

Configures the minimum number of uppercase English characters required for a valid password.

**user password-policy min-upper-case** *number*

---

### Syntax Definitions

*number* The minimum number of uppercase characters. The valid range is 0–7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify **0** with this command to disable the minimum uppercase character requirement.
- The minimum number of uppercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-upper-case 2
-> user password-policy min-upper-case 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinUpperCase
```

---

## user password-policy min-lowercase

Configures the minimum number of lowercase English characters required for a valid password.

**user password-policy min-uppercease** *number*

---

### Syntax Definitions

*number* The minimum number of uppercase characters. The valid range is 0–7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify **0** with this command to disable the minimum lowercase character requirement.
- The minimum number of lowercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-lowercase 2
-> user password-policy min-lowercase 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinLowerCase
```

---

## user password-policy min-digit

Configures the minimum number of base-10 digits required for a valid password.

**user password-policy min-digit** *number*

---

### Syntax Definitions

*number* The minimum number of uppercase characters. The valid range is 0–7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify **0** with this command to disable the minimum number of digits requirement.
- The minimum number of digits requirement is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-digit 2
-> user password-policy min-digit 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinDigit
```

---

## user password-policy min-nonalpha

Configures the minimum number of non-alphanumeric characters (symbols) required for a valid password.

**user password-policy min-nonalpha** *number*

---

### Syntax Definitions

*number* The minimum number of non-alphanumeric characters. The valid range is 0–7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify **0** with this command to disable the minimum non-alphanumeric character requirement.
- The minimum number of non-alphanumeric characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-nonalpha 2  
-> user password-policy min-nonalpha 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show user password-policy** Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig  
  aaaAsaPasswordMinNonAlpha
```

---

## user password-history

Configures the maximum number of old passwords to retain in the password history.

**user password-history** *number*

---

### Syntax Definitions

*number* The maximum number of old passwords to retain. The range is 0–24.

### Defaults

parameter	default
<i>number</i>	4

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify **0** with this command to disable the password history function.
- The user is prevented from specifying any passwords that are recorded in the password history and fall within the range configured through this command.
- The password history value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-history 2  
-> user password-history 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig  
aaaAsaPasswordHistory
```

---

## user password-min-age

Configures the minimum number of days during which a user is prevented from changing a password.

**user password-min-age** *days*

---

### Syntax Definitions

*days* The number of days to use as the minimum age of the password. The range is 0–150.

### Defaults

parameter	default
<i>days</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specify **0** with this command to disable the minimum number of days requirement.
- Configure the minimum age of a password with a value that is less than the value configured for the password expiration.
- The password minimum age value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-min-age 7
-> user password-min-age 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinAge
```

---

## user lockout-window

Configures a moving period of time (observation window) during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts. The number of failed login attempts is decremented by the number of failed attempts that age beyond the observation window time period.

**user lockout-window** *minutes*

---

### Syntax Definitions

*minutes* The number of minutes the observation window remains active. The range is 0–99999.

### Defaults

parameter	default
<i>minutes</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Specify **0** with this command to disable the observation window function. This means that failed login attempts will never age out; the number of failed attempts is never decremented.
- Do not configure an observation window time period that is greater than the lockout duration time period.
- If the number of failed login attempts exceeds the number of failed attempts allowed before the observation window time expires, then the user account is locked out of the switch.
- The observation window time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*.

### Examples

```
-> user lockout-window 500  
-> user lockout-window 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">user lockout-duration</a>	Configures the amount of time a user account remains locked out of the switch.
<a href="#">user lockout-threshold</a>	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
<a href="#">user lockout unlock</a>	Manually locks or unlocks a user account on the switch.
<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutWindow
```

---

## user lockout-threshold

Configures the number of failed password login attempts allowed during a certain period of time (observation window). If the number of failed attempts exceeds the lockout threshold number before the observation window period expires, the user account is locked out.

**user lockout-threshold** *number*

---

### Syntax Definitions

*number* The number of failed login attempts allowed. The range is 0–999.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- If the lockout threshold is set to zero (the default), there is no limit to the number of failed login attempts allowed.
- A user account remains locked out for the length of the lockout duration time period; at the end of this time, the account is automatically unlocked.
- If the lockout duration time period is set to zero, only the **admin** user or a user with read/write AAA privileges can unlock a locked user account. An account is unlocked by changing the user account password or with the **user lockout unlock** command.
- The lockout threshold time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user lockout-threshold 3  
-> user lockout-threshold 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">user lockout-window</a>	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts.
<a href="#">user lockout-duration</a>	Configures the length of time a user account remains locked out of the switch.
<a href="#">user lockout unlock</a>	Manually locks or unlocks a user account on the switch.
<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutThreshold
```

---

## user lockout-duration

Configures the length of time a user account remains locked out of the switch. At the end of this time period, the user account is automatically unlocked.

**user lockout-duration** *minutes*

---

### Syntax Definitions

*minutes* The number of minutes the user account remains locked out. The range is 0–99999.

### Defaults

parameter	default
<i>minutes</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Note that if the lockout duration time period is set to zero (the default), then locked user accounts are never automatically unlocked.
- Only the **admin** user or a user with read/write AAA privileges can unlock a locked user account when the lockout duration time is set to zero. An account is unlocked by changing the user password or with the **user lockout unlock** command.
- Do not configure a lockout duration time period that is less than the amount of time configured for the observation window.
- The lockout duration time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **write memory**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user lockout-duration 60
-> user lockout-duration 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">user lockout-window</a>	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts,
<a href="#">user lockout-threshold</a>	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
<a href="#">user lockout unlock</a>	Manually locks or unlocks a user account on the switch.
<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutDuration
```

---

## user lockout unlock

Manually locks or unlocks a user account on the switch.

```
user username {lockout | unlock}
```

---

### Syntax Definitions

<i>username</i>	The username of the account to lock or unlock.
<b>lockout</b>	Locks the user account out of the switch.
<b>unlock</b>	Unlocks a locked user account.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is only available to the **admin** user or a user with read/write AAA privileges.
- The **admin** user account is protected from any type of lockout attempt.
- User lockouts and unlocks are saved *automatically*.

### Examples

```
-> user j_smith lockout  
-> user j_smith unlock
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show user</a>	Displays information about all users or a particular user configured in the local user database on the switch.
<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

### MIB Objects

```
aaaUserTable  
  aaauPasswordLockoutEnable
```

---

## show aaa server

Displays information about a particular AAA server or AAA servers.

**show aaa server** [*server\_name*]

---

### Syntax Definitions

*server\_name*                      The server name, which is defined through the **aaa radius-server**, **aaa tacacs+-server**, or **aaa ldap-server** commands.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If you do not include a server name in the syntax, information for all servers is displayed.

### Examples

```
-> show aaa server
Server name = ldap2
  Server type           = LDAP,
  Host name 1           = ors40535,
  Retry number          = 3,
  Timeout (in sec)     = 2,
  Port                  = 389,
  Domain name           = manager,
  Search base           = c=us,
  VRF                    = default
Server name = rad1
  Server type           = RADIUS,
  IP Address 1          = 10.10.2.1,
  IP Address 2          = 10.10.3.5,
  Retry number          = 3,
  Timeout (in sec)     = 2,
  Authentication port   = 1645,
  Accounting port       = 1646
  SSL enable            = TRUE,
  VRF                    = default
Server name = Tpub1
  Server type           = TACACS+,
  IP Address 1          = 10.10.5.1,
  Port                  = 3,
  Timeout (in sec)     = 2,
  Encryption enabled    = no
  VRF                    = default
```

```

-> show aaa server ldap2
Server name = ldap2
  Server type           = LDAP,
  Host name 1          = ors40535,
  Retry number         = 3,
  Timeout (in sec)    = 2,
  Port                 = 389,
  Domain name         = manager,
  Search base         = c=us,
  VRF                  = default

```

### *output definitions*

---

<b>Server name</b>	The name of the server. A RADIUS, TACACS+ or LDAP server name is defined through the <b>aaa radius-server</b> , <b>aaa tacacs+-server</b> , and <b>aaa ldap-server</b> commands respectively.
<b>Server type</b>	The type of server (LDAP, TACACS+, or RADIUS).
<b>Host name</b>	The name of the primary LDAP, TACACS+, or RADIUS host.
<b>IP address</b>	The IP address of the server.
<b>Retry number</b>	The number of retries the switch makes to authenticate a user before trying the backup server.
<b>Timeout</b>	The timeout for server replies to authentication requests.
<b>Port</b>	The port number for the primary LDAP or TACACS+ server.
<b>Encryption enabled</b>	The status of the encryption.
<b>Domain name</b>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers.
<b>Search base</b>	The search base recognized by the LDAP-enabled directory servers.
<b>Authentication port</b>	The UDP destination port for authentication requests.
<b>Accounting port</b>	The UDP destination port for accounting requests.
<b>SSL enable</b>	The SSL enable field is displayed for the RADIUS server only when the SSL is enabled for RADIUS server.
<b>VRF</b>	Name of the VRF associated with the server.

---

### **Release History**

Release 7.1.1; command was introduced.

Release 8.4.1; **SSL enable** output field added for RADIUS server.

### **Related Commands**

<b>aaa radius-server</b>	Configures or modifies a RADIUS server for Authenticated Switch Access.
<b>aaa ldap-server</b>	Configures or modifies an LDAP server for Authenticated Switch Access.
<b>aaa tacacs+-server</b>	Configures or modifies an TACACS+ server for Authenticated Switch Access.

## show aaa authentication

Displays information about the current authenticated switch session.

**show aaa authentication**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **show aaa authentication** command to display authentication information about switch management services (Telnet, FTP, console port, Secure Shell, etc.).

### Examples

```
-> show aaa authentication
Service type = Default
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Console
  1st authentication server = local
Service type = Telnet
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = FTP
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Http
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Snmp
  Authentication = Use Default,
  1st authentication server = RadiusServer
  2nd authentication server = local
Service type = Ssh
  Authentication = Use Default,
  1st authentication server = TacacsServer
  2nd authentication server = local
```

*output definitions*

---

<b>Authentication</b>	Displays <b>denied</b> if the management interface is disabled. Displays <b>Use Default</b> if the management interface is configured to use the default configuration.
<b>1st authentication server</b>	The first server to be polled for authentication information.
<b>2nd authentication server</b>	The next server to be polled for authentication information.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[aaa authentication](#) Configures the interface for Authenticated Switch Access and specifies the server(s) to be used.

## show aaa device-authentication

Displays a list of RADIUS servers assigned to provide 802.1X, MAC, or Captive Portal authentication.

**show aaa device-authentication** [**802.1x** | **mac** | **captive-portal**]

---

### Syntax Definitions

<b>802.1x</b>	Displays the servers used for 802.1X authentication.
<b>mac</b>	Displays the servers used for MAC authentication.
<b>captive-portal</b>	Uses the servers used for Captive Portal authentication.

### Defaults

By default, all assigned servers are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the optional **802.1x**, **mac**, or **captive-portal** parameters to display the servers assigned to provide the specified type of authentication.

### Examples

```
-> show aaa device-authentication
Authentication type = mac
  Authentication Server:
    1st authentication server = cppm,
    2nd authentication server = rad1
    3rd authentication server = rad2,
    4th authentication server = rad3

Authentication type = 802.1x
  Authentication Server:
    1st authentication server = cppm,
    2nd authentication server = rad1

Authentication type = captive-portal
  Authentication Server:
    1st authentication server = cppm,
    2nd authentication server = rad1
```

### *output definitions*

---

<b>Authentication type</b>	The type of authentication the server is assigned to provide ( <b>802.1x</b> , <b>mac</b> , or <b>captive-portal</b> )
<b>1st authentication server</b>	The first server to be polled for authentication information. Any backup servers are also displayed on subsequent lines.

---

## Release History

Release 7.2.1; command was introduced.

Release 7.3.4; **802.1x** and **mac** parameters added.

Release 8.1.1; **captive-portal** parameter added.

## show aaa accounting

Displays information about accounting servers configured for authenticated switch access and device authentication sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**show aaa accounting [802.1x | mac | captive-portal]**

---

### Syntax Definitions

<b>802.1x</b>	Displays the RADIUS or syslog server used to log accounting for 802.1X authenticated sessions.
<b>mac</b>	Displays the RADIUS or syslog server used to log accounting for MAC authenticated sessions.
<b>captive-portal</b>	Displays the RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.

### Defaults

By default, the accounting server configuration is displayed for TACACS+ commands and management sessions (Telnet, FTP, console port, HTTP, or SNMP).

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **802.1x**, **mac**, or **captive-portal** parameters to display the accounting server configuration for a specific type of device authentication.
- If no parameters are entered with this command, the accounting server configuration for authentication sessions and TACACS+ commands is displayed.

### Examples

```
-> show aaa accounting mac
Accounting type = mac
  Accounting Server:
    1st Acct Server = rad1,
    2nd Acct Server = rad2

-> show aaa accounting 802.1x
Accounting type = 802.1x
  Syslog Acct Server:
    IP Address = 135.254.163.110,
    UDP port   = 514

-> show aaa accounting captive-portal
Accounting type = captive-portal
  Syslog Acct Server:
    IP Address = 135.254.163.110,
    UDP port   = 514
```

```
-> show aaa accounting
Session (telnet, ftp, ...)
  1st accounting server = rad1
Command accounting server
  1st accounting server = server1
```

## Release History

Release 7.1.1; command was introduced.

Release 8.1.1; **802.1x**, **mac**, and **captive-portal** parameters added.

## Related Commands

<a href="#">aaa accounting session</a>	Configures an accounting server for authenticated switch access sessions.
<a href="#">aaa accounting command</a>	Enables or disables the TACACS+ server for command accounting
<a href="#">aaa accounting</a>	Configures RADIUS server accounting or local Switch Logging (syslog) accounting for device authentication sessions.

  aaacdSyslogIPAddr
  aaacdSyslogUdpPort
  aaacdRowStatus
```

---

## show aaa config

Displays the AAA parameter configuration for 802.1X, MAC, and Captive Portal sessions.

```
show aaa {802.1x | mac | captive-portal} config
```

---

### Syntax Definitions

<b>802.1x</b>	Displays the parameter configuration for 802.1X authenticated sessions.
<b>mac</b>	Displays the parameter configuration for MAC authenticated sessions.
<b>captive-portal</b>	Displays the parameter configuration for Captive Portal authenticated sessions.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **802.1x**, **mac**, or **captive-portal** parameters to display the parameter configuration for a specific type of device authentication.

### Examples

```
-> show aaa 802.1x config
Authentication type = 802.1x
  Re-Authentication Timeout:
    Status                = enable,
    Interval (sec)        = 3600,
    Trust Radius           = disable

  Accounting Interim:
    Interval (sec)        = 600,
    Trust Radius           = disable

-> show aaa mac config
Authentication type = mac
  Session Timeout:
    Status                = disable,
    Interval (sec)        = 43200,
    Trust Radius           = disable

  Inactivity Timeout:
    Status                = disable,
    Interval (sec)        = 600

  Accounting Interim:
    Interval (sec)        = 600,
    Trust Radius           = disable
```

```

-> show aaa captive-portal config
Authentication type = captive-portal
  Session Timeout:
    Status                = disable,
    Interval (sec)        = 43200,
    Trust Radius          = disable

  Inactivity Timeout:
    Status                = disable,
    Interval (sec)        = 600

  Accounting Interim:
    Interval (sec)        = 600,
    Trust Radius          = disable

```

### *output definitions*

---

<b>Authentication type</b>	The type of authentication ( <b>802.1x</b> , <b>mac</b> , or <b>captive-portal</b> ).
<b>Session Timeout</b>	The parameter values for the AAA session timeout parameter. Does not apply to 802.1X authentication. Configured through the <b>aaa session-timeout</b> command.
<b>Inactivity Logout</b>	The parameter values for the AAA inactivity logout parameter. Does not apply to 802.1X authentication. Configured through the <b>aaa inactivity-logout</b> command.
<b>Accounting Interim</b>	The parameter values for the AAA accounting interim parameter. Configured through the <b>aaa interim-interval</b> command.
<b>Re-authentication Timeout</b>	The parameter values for the AAA 802.1X re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication. Configured through the <b>aaa 802.1x re-authentication</b> command.

---

### **Release History**

Release 8.1.1; command was introduced.

### **Related Commands**

<b>show aaa device-authentication</b>	Displays the device authentication server configuration.
<b>show aaa accounting</b>	Displays the accounting server configuration.
<b>show aaa profile</b>	Displays the AAA parameter profile configuration.

## show aaa radius config

Displays the global AAA attribute values and MAC address format.

**show aaa radius config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The MAC address format determines the delimiter character used between MAC address octets and whether or not characters are in uppercase or lowercase. This format is applied only when the RADIUS attribute value is set to a MAC address.

### Examples

```
-> show aaa radius config
RADIUS client attributes:
  NAS port id          = default,
  NAS identifier       = default
  MAC format delimiter:
    Username           = none, UserNameCase = uppercase,
    Password           = none, PasswordCase = uppercase,
    calling station id = none, ClgStaIdCase = uppercase,
    called station id  = none, CldStaIdCase = uppercase
```

### Release History

Release 8.1.1; command was introduced.

## show aaa profile

Displays the AAA profile configuration.

**show aaa profile** [*profile\_name*]

---

### Syntax Definitions

*profile\_name*                      The name of an existing AAA profile.

### Defaults

By default, all profiles are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Enter an AAA profile name with this command to display information about a specific profile.

### Examples

```
-> show aaa profile ap2
```

```
AAA profile name = ap2
Authentication type = mac
  Authentication Server:
    1st Auth Server   = rad1,
    2nd Auth Server   = rad2

  Accounting Server:
    1st Acct Server   = rad1,
    2nd Acct Server   = rad2

  Session Timeout:
    Status             = disable,
    Interval (sec)     = 43200,
    Trust Radius       = disable

  Inactivity Timeout:
    Status             = disable,
    Interval (sec)     = 600

  Accounting Interim:
    Interval (sec)     = 600,
    Trust Radius       = disable

Authentication type = 802.1x
  Re-Authentication Timeout:
    Status             = disable,
    Interval (sec)     = 3600,
    Trust Radius       = disable
```

```

Accounting Interim:
  Interval (sec)      = 600,
  Trust Radius       = disable

Authentication type = captive-portal
Session Timeout:
  Status              = disable,
  Interval (sec)     = 43200,
  Trust Radius       = disable

Inactivity Timeout:
  Status              = disable,
  Interval (sec)     = 600

Accounting Interim:
  Interval (sec)     = 600,
  Trust Radius       = disable

RADIUS client attributes:
  NAS port id        = default,
  NAS identifier     = default,
  MAC format delimiter:
  Username           = none, UserNameCase = uppercase,
  Password           = none, PasswordCase = uppercase,
  calling station id = none, ClgStaIdCase = uppercase,
  called station id  = none, CldStaIdCase = uppercase

```

### *output definitions*

<b>Authentication type</b>	The type of authentication ( <b>802.1x</b> , <b>mac</b> , or <b>captive-portal</b> ) configured through the profile.
<b>Session Timeout</b>	The profile values defined for the AAA session timeout parameter. Does not apply to 802.1X authentication.
<b>Inactivity Logout</b>	The profile values defined for the AAA inactivity logout parameter. Does not apply to 802.1X authentication.
<b>Accounting Interim</b>	The profile values defined for the AAA accounting interim parameter.
<b>Re-authentication Timeout</b>	The profile values defined for the AAA re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication.
<b>RADIUS client attributes</b>	The profile values defined for the NAS-Port and NAS-Port-Identifier attributes and the format to use when the specified attribute value is set to a MAC address.

## show user

Displays information about all users or a particular user configured in the local user database on the switch.

**show user** [*username*]

---

### Syntax Definitions

*username* The name of the user. Used for logging into the switch.

### Defaults

By default, all users are displayed if the *username* parameter is not specified with this command.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to display information about read/write access and partitioned management access (domains and families).

### Examples

```
-> show user
User name = Customer1,
  Password expiration      = 10/27/2010 11:01 (30 days from now),
  Password allow to be modified date    = 9/30/2010 10:59 (3 days from now),
  Account lockout         = Yes (Automatically unlocked after 19 minute(s)from now),
  Password bad attempts   = 3,
  Read Only for domains   = None,
  Read/Write for domains  = Admin System Physical Layer2 Services policy Security ,
  Read/Write for families = ip rip ospf bgp vrrp ip-routing ipx ipmr ipms ,
  Snmp allowed            = YES,
  Snmp authentication     = SHA,
  Snmp encryption        = DES
User name = admin,
  Password expiration      = 10/27/2010 11:01 (30 days from now),
  Password allow to be modified date    = 9/30/2010 10:59 (3 days from now),
  Account lockout         = None,
  Password bad attempts   = 0,
  Read Only for domains   = None,
  Read/Write for domains  = All ,
  Snmp allowed            = NO
```

*output definitions*

<b>User name</b>	The user name for this account.
<b>Password expiration</b>	The date and time on which the password will expire. This field only displays if the password expiration is configured specifically for a user, or a default password expiration is configured globally on the switch through the <b>user password-expiration</b> command. (Note that the date/time are based on the switch's default system date/time or the system date/time configured through the <b>system date</b> and <b>system time</b> commands.)
<b>Password allow to be modified date</b>	The earliest date and time on which the user may change the password. Configured through the <b>user password-min-age</b> command.
<b>Account lockout</b>	Indicates if the user account is locked out ( <b>Yes</b> or <b>No</b> ) and how many minutes remain until the user account is automatically unlocked. If no remaining time is displayed, the <b>admin</b> user or a user with admin privileges must manually unlock the account. Configured through the <b>user lockout-duration</b> and <b>user lockout unlock</b> commands.
<b>Password bad attempts</b>	The number of failed password login attempts for this user account.
<b>Read Only for domains</b>	The command domains available with the user's read-only access. See the table on the next page for a listing of valid domains.
<b>Read/Write for domains</b>	The command domains available with the user's read-write access. See the table on the next page for a listing of valid domains.
<b>Read Only for families</b>	The command families available with the user's read-only access. See the table on the next page for a listing of valid families.
<b>Read/Write for families</b>	The command families available with the user's read-write access. See the table on the next page for a listing of valid families.
<b>Snmp allowed</b>	Indicates whether or not the user is authorized to use SNMP ( <b>YES</b> or <b>NO</b> ). SNMP is allowed for the user account when SNMP authentication is specified for the account.
<b>Snmp authentication</b>	The level of SNMP authentication, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
<b>Snmp encryption</b>	The level of SNMP encryption, if any, configured for the user. This field only displays if the user is authorized to use SNMP.

Possible values for command domains and families are listed here:

<b>Domain</b>	<b>Corresponding Families</b>
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

## Release History

## show user password-policy

Displays the global password settings configured for the switch.

**show user password-policy**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The password policy contains parameter values that define configuration requirements for all passwords that are created on the switch. Use this command to display the current parameter values for the password policy.

### Examples

```
-> show user password-policy
Password Policy:
Contain username flag: Enable
Minimum number of English uppercase characters: 6
Minimum number of English lowercase characters: 4
Minimum number of base-10 digit: 2
Minimum number of non-alphanumeric: 3
Minimum size: 8
Password history: 4
Password minimum age: 20 (days)
Password expiration: 40 (days)
```

#### *output definitions*

<b>Contain username flag</b>	Indicates if the username is included with the password check ( <b>Enable</b> or <b>Disable</b> ). Configured through the <b>user password-policy cannot-contain-username</b> command.
<b>Minimum number of English uppercase characters</b>	The minimum number of uppercase characters required in a password. Configured through the <b>user password-policy min-uppercase</b> command.
<b>Minimum number of English lowercase characters</b>	The minimum number of lowercase characters required in a password. Configured through the <b>user password-policy min-lowercase</b> .
<b>Minimum number of base-10 digit</b>	The minimum number of digits required in a password. Configured through the <b>user password-policy min-digit</b> command.

*output definitions*

---

<b>Minimum number of non-alphanumeric</b>	The minimum number of non-alphanumeric characters required in a password. Configured through the <b>user password-policy min-nonalpha</b> command.
<b>Minimum size</b>	The minimum number of characters required for the password size. Configured through the <b>user password-size min</b> command.
<b>Password history</b>	The maximum number of old passwords retained in the password history. Configured through the <b>user password-history</b> command.
<b>Password minimum age</b>	The number of days a password is protected from any modification. Configured through the <b>user password-min-age</b> command.
<b>Password expiration</b>	The default expiration date applied to all passwords. Configured through the <b>user password-expiration</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show user password-policy** Displays the expiration date for passwords configured for user accounts stored on the switch.

**MIB Objects**

aaaAsaConfig

```

aaaAsaPasswordContainUserName
aaaAsaPasswordMinUpperCase
aaaAsaPasswordMinLowerCase
aaaAsaPasswordMinDigit
aaaAsaPasswordMinNonAlpha
aaaAsaPasswordHistory
aaaAsaPasswordMinAge
aaaAsaPasswordSizeMin

```

---

## show user lockout-setting

Displays the global user lockout settings for the switch.

**show user lockout-setting**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The global lockout settings include parameter values that determine the length of a user observation window, the amount of time a locked user remains locked, and the number of failed password login attempts allowed.

### Examples

```
-> show user lockout-setting
Lockout Setting:
Observation window: 30 (minutes)
Duration: 200 (minutes)
Threshold: 20
```

#### *output definitions*

---

<b>Observation window</b>	The amount of time, in minutes, during which the number of failed password login attempts are counted. Configured through the <b>user lockout-window</b> command.
<b>Duration</b>	The amount of time, in minutes, that a locked user account remains locked out of the switch. Configured through the <b>user lockout-duration</b> command.
<b>Threshold</b>	The maximum number of failed password login attempts allowed before the user is locked out of the switch. Configured through the <b>user lockout-threshold</b> command.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[user lockout unlock](#)

Manually locks or unlocks a user account on the switch.

[show user](#)

Displays information about all users or a particular user configured in the local user database on the switch.

## MIB Objects

aaaAsaLockoutWindow

aaaAsaLockoutDuration

aaaAsaLockoutThreshold

---

## show aaa priv hexa

Displays hexadecimal values for command domains/families. Useful for determining how to express command families in hexadecimal; hexadecimal values are used in configuring user privileges in attributes on an external LDAP or RADIUS authentication server.

**show aaa priv hexa** [*domain or family*]

---

### Syntax Definitions

*domain or family*                      The CLI command domain or particular command family for which you want to display hexadecimal values. See table in Usage Guidelines.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Valid values for the family parameter are listed in the Corresponding Families column of the following table:

Domain	Corresponding Families
<b>domain-admin</b>	<b>file telnet dshell debug</b>
<b>domain-system</b>	<b>system aip snmp rmon webmgt config</b>
<b>domain-physical</b>	<b>chassis module interface pmm health</b>
<b>domain-network</b>	<b>ip rip ospf bgp vrrp ip-routing ipx ipmr ipms</b>
<b>domain-layer2</b>	<b>vlan bridge stp 802.1q linkagg ip-helper</b>
<b>domain-service</b>	<b>dns</b>
<b>domain-policy</b>	<b>qos policy slb</b>
<b>domain-security</b>	<b>session avlan aaa</b>

- Note that some command families may not be supported depending on the hardware platform you are running.
- If you do not specify a command family, hexadecimal values for all commands sets will display.

## Examples

```

-> show aaa priv hexa
file           = 0x00000001 0x00000000,
telnet         = 0x00000008 0x00000000,

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[user](#)

Configures or modifies user entries in the local user database.

## MIB Objects

N/A

---

## show system fips

Displays the administrative and operational status of the FIPS mode on the switch.

**show system fips**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The **show system fips** command is the only command that can be used to view the FIPS mode status. The FIPS status is not shown in the **show configuration snaphot** command output.

### Examples

```
-> show system fips
Admin State: Enabled
Oper State: Enabled
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

[aaa authentication](#) Enable or disable the FIPS mode on the switch.

### MIB Objects

```
systemFipsAdminState
  systemFipsOperState
```

---

## aaa switch-access mode

Globally sets the access mode as enhanced or default.

```
aaa switch-access mode {default | enhanced}
```

---

### Syntax Definitions

<b>default</b>	Sets the access mode as default.
<b>enhanced</b>	Sets the access mode as enhanced.

### Defaults

---

parameter	default
default   enhanced	default

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

It is recommended to save configuration and reboot the switch when the ASA access mode is configured.

### Example

```
-> aaa switch-access mode default
```

```
-> aaa switch-access mode enhanced
```

```
WARNING: Recommended to save configuration and reload the switch upon switch access mode change.
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[show aaa switch-access mode](#) Displays the access mode configuration.

### MIB Objects

```
aaaAsaConfig  
  aaaAsaAccessMode
```

---

## aaa switch-access ip-lockout-threshold

Configures the threshold value for failed login attempts from an IP address after which the IP address will be banned from switch access.

**aaa switch-access ip-lockout-threshold** *number*

---

### Syntax Definitions

*number* Set the threshold value for login attempts in the range 0 to 999.

### Defaults

parameter	default
<i>number</i>	6

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The command is applicable only if ASA enhanced mode is enabled.
- Set the IP threshold value to '0' to disable the IP lockout thresholds.
- IP address is permanently blocked/banned if the number of authentication failures from a particular IP reaches IP lockout threshold limit within two times of the user lockout window.
- Only the switch access will be restricted from the banned IP address. Any IP packet (with monitored port number) destined to a switch IP interfaces will be discarded. IP packets normally bridged/routed by the switch will not be discarded.
- A maximum of 128 IP addresses can be added to the banned list. When the maximum limit has reached, oldest entry from the list is removed to accommodate the new entries.
- User lockout window ([user lockout-window](#)) is applicable for IP lockout threshold as well.
- IP lockout threshold shall share the same window as user lockout window, and by default, IP lockout threshold shall be two times that of user lockout window. Since user lockout is giving more priority, the IP lockout threshold must be greater than the user lockout threshold value.
- The IP address will remain blocked until it is released using the command [aaa switch-access banned-ip release](#).

### Example

```
-> aaa switch-access ip-lockout-threshold 2
```

### Release History

Release 8.3.1; command introduced.

## Related Commands

**aaa switch-access mode**

Globally sets the access mode as enhanced or default.

**show aaa switch-access ip-lockout-threshold**

Displays the lockout threshold configured for the remote IP addresses.

## MIB Objects

aaaAsaConfig

aaaAsaAccessIpLockoutThreshold

---

## aaa switch-access banned-ip release

Releases the banned IP addresses that are blocked due to failed login attempts.

**aaa switch-access banned-ip {all | *ip\_address*} release**

---

### Syntax Definitions

**all** Release all banned IP addresses from the banned list.

*ip\_address* Release a specific IP address from the banned list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The IP addresses are banned if the failed login count reaches IP lockout threshold limit.

### Example

```
-> aaa switch-access banned-ip all release
-> aaa switch-access banned-ip 100.2.45.56 release
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[show aaa switch-access banned-ip](#) Displays the list of banned ip addresses.

### MIB Objects

```
aaaSwitchAccessBannedIpTable
  aaaSwitchAccessBannedIpAddress
  aaaSwitchAccessBannedIpRowStatus
```

---

## aaa switch-access priv-mask

Configure the functional privileges mask for the switch access based on the access type on top of the user privilege.

```
aaa switch-access priv-mask {console | telnet | ssh | http | https} {read-only | read-write} [families... / domains...] all | none | all-except families...
```

---

### Syntax Definitions

<b>read-only</b>	Specifies that the user will have read-only access to the switch through a specific access type.
<b>read-write</b>	Specifies that the user will have read-write access to the switch through a specific access type.
<i>families</i>	Determines the command families available to the user on the switch for a specific access type. Each command family should be separated by a space. Command families are subsets of domains. See <i>Usage Guidelines</i> for more details.
<i>domains</i>	Determines the command domains available to the user on the switch for a specific access type. Each domain should be separated by a space. See the <i>Usage Guidelines</i> for more details.
<b>all</b>	Specifies that all command families and domains are available to the user for a specific access type.
<b>none</b>	Specifies that no command families or domains are available to the user for a specific access type.
<b>all-except</b>	Specifies that functional privileges for families followed by 'all-except' are disabled for a specific access type.

### Defaults

By default, the access types are enabled with read-write privileges for all the families.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The command is applicable only when ASA enhanced mode is enabled.
- The access privileges for the SSH, TELNET, Console, HTTP, HTTPS can be defined.
- Possible values for domains and families are listed in the table here:

Domain	Corresponding Families
domain-admin	file telnet debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health

domain-network	ip rip ospf bgp vrrp ip-routing ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa
domain-mpls	mpls
domain-datacenter	fips, auto-fabric
domain-afn	sip-snooping, dpi, app-mon

### Example

```
-> aaa switch-access priv-mask ssh read-only webmgt vrrp vrf vlan udd
-> aaa switch-access priv-mask telnet read-write tftp-client telnet system stp ssh
-> aaa switch-access priv-mask ssh read-only all-except vlan
-> aaa switch-access priv-mask telnet read-write all-except ip
```

If privileges for specific families need to be applied, then remove the existing privilege using the **no** command, and re-apply the required family privilege.

```
-> no aaa switch-access priv-mask telnet read-write all
-> aaa switch-access priv-mask telnet read-write vlan aaa
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

**aaa switch-access mode** Globally sets the access mode as enhanced or default.

  aaaSwitchAccessWriteRight3
  aaaSwitchAccessWriteRight4
```

## aaa switch-access management-stations admin-state

Enables or disables the IP management station feature in a switch.

**aaa switch-access management-stations admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the IP management station feature in the switch.
<b>disable</b>	Disables the IP management station feature in the switch.

### Defaults

The IP management station feature is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The command is applicable only when ASA enhanced mode is enabled.
- When the IP management station is disabled, switch access from any IP address shall be allowed. If there is a login failure (based on the **ip-lockout threshold** value), the IP address will be banned/ blocked and added to the banned IP address list.
- When the IP management station is enabled, the switch access will be allowed only from those IPs configured in the management station list and only if those are not in banned list.
- It is recommended to enable this command from console since this may terminate the existing session, if enabled through telnet or SSH.

### Example

```
-> aaa switch-access management stations admin-state enable  
-> aaa switch-access management stations admin-state disable
```

### Release History

Release 8.3.1; command introduced.

## Related Commands

**aaa switch-access mode**

Globally sets the access mode as enhanced or default.

**aaa switch-access  
management-stations**

Configure the management station in the switch, with or without mask value for the corresponding IP of the management station.

**show aaa switch-access  
management-stations**

Displays the list of configured management stations.

## MIB Objects

aaaSwitchAccessMgmtStationTable

aaaSwitchAccessMgmtStationRowStatus

---

## aaa switch-access management-stations

Configure the management station in the switch, with or without mask value for the corresponding IP of the management station. The remote access is allowed only from these IP addresses if management station feature is enabled.

**aaa switch-access management-stations** [*ip\_address* / *ip\_address /mask*]

**no aaa switch-access management-stations** *ip\_address*

---

### Syntax Definitions

*ip\_address* IP address and the mask of the management station.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The command is configurable when **aaa switch-access management-stations admin-state** is enabled.
- A maximum of 64 management stations can be configured.
- Removing an IP address from the management station list will not remove the IP from the banned list.
- Whenever an IP address is removed from the management station, switch will stop responding to that IP. However, the existing sessions are not terminated automatically.

### Example

```
-> aaa switch-access management stations 100.15.9.8  
-> aaa switch-access management stations 100.15.9.9 255.255.255.0
```

### Release History

---

## aaa certificate update-ca-certificate

Updates the CA-bundle with the custom CA server certificate provided by CA.

**aaa certificate update-ca-certificate** *ca\_file*

---

### Syntax Definitions

*ca\_file*                      The custom CA server certificate (in PEM format) provided by the CA.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The custom CA server certificate should be copied in PEM format to the **/flash/switch/cert.d** directory via SFTP.
- This command appends the existing CA bundle (**certs.pem**) and the custom CA server certificate provided as input.
- The update of custom CA server certificates needs to be done before corresponding server configurations are done on the switch. If the update is done post server configuration, then a switch reboot needs to be done for the changes to take effect.

### Examples

```
-> aaa certificate update-ca-certificate ca.pem
```

### Release History

Release 8.3.1; command introduced.

---

## aaa certificate generate-rsa-key key-file

Generates the RSA 2048 bit key with the file name provided as input.

**aaa certificate generate-rsa-key key-file** *key\_file*

---

### Syntax Definitions

*key\_file*                      The name of the key file under which the RSA 2048 bit key is stored.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Generates RSA 2048 bit key in **/flash/switch/cert.d** directory with the file name as the input key file.

### Examples

```
-> aaa certificate generate-rsa-key key-file myCliPrivate.key
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

<a href="#">aaa certificate generate-self-signed</a>	Generates the X.509 self-signed certificate for TLS client authentication.
<a href="#">aaa certificate view</a>	Displays the contents of the X.509 certificate.

---

## aaa certificate generate-self-signed

Generates the X.509 self-signed certificate for TLS client authentication.

```
aaa certificate generate-self-signed {cert_file} key {key_file} [days valid_period] {CN common_name}  
{ON org_name} {OU org_unit} {L locality} {ST state} {C country}
```

---

### Syntax Definitions

<i>cert_file</i>	The name of the X.509 certificate file to be created.
<i>key_file</i>	The name of the key file under which the RSA 2048 bit key is stored.
<i>valid_period</i>	Validity period (in days) of the X.509 certificate.
<i>common_name</i>	Common Name used in X.509 certificate.
<i>org_name</i>	The Organization Name used in X.509 certificate.
<i>org_unit</i>	The Organization Unit used in X.509 certificate.
<i>locality</i>	The Locality used in X.509 certificate.
<i>state</i>	The State used in X.509 certificate.
<i>country</i>	The Country used in X.509 certificate.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command generates the file in **/flash/switch/cert.d** directory.
- Default values will be taken for all other optional parameters while generating the X.509 certificate.
- The X.509 certificate needs to be done before corresponding server configurations are done on the switch. If the certificate is created post server configuration, then a switch reboot needs to be done for the changes to take effect.

### Examples

```
-> aaa certificate generate-self-signed myCliCert.pem key clientkey.key days 3650  
cn client.ale.com on ALE ou ESD l BAN st KAR c IN
```

## Release History

Release 8.3.1; command introduced.

**Related Commands****aaa certificate generate-self-signed**

Generates the X.509 self-signed certificate for TLS client authentication.

**aaa certificate delete**

Deletes the X.509 certificate.

**MIB Objects**N/A

---

## aaa certificate verify ca-certificate

Verifies the contents of the X.509 certificate.

**aaa certificate verify ca-certificate** *cert\_file* **certificate** *cert\_file*

---

### Syntax Definitions

*ca\_cert\_file*                    The X.509 certificate file (in PEM format) to be displayed.  
*cert\_file*                        The X.509 certificate file (in PEM format) to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> aaa certificate verify ca-certificate ca_cert certificate cert_file
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[aaa certificate generate-self-signed](#)      Generates the X.509 self-signed certificate for TLS client authentication.  
[aaa certificate delete](#)                      Deletes the X.509 certificate.

### MIB Objects

N/A

---

## aaa certificate delete

Deletes the X.509 certificate.

**aaa certificate delete** *cert\_file*

---

### Syntax Definitions

*cert\_file*                      The X.509 certificate file (in PEM format) to be deleted.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> aaa certificate delete clientcert.pem
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[aaa certificate generate-self-signed](#)      Generates the X.509 self-signed certificate for TLS client authentication.

[aaa certificate view](#)                      Displays the contents of the X.509 certificate.

### MIB Objects

N/A

---

## aaa certificate generate-csr

Generates the CSR (Certificate Signing Request) to be sent to get a CA signed certificate for TLS client authentication.

```
aaa certificate generate-csr {csr_file} key {key_file} [dn domain_name] {CN common_name} {ON org_name} {OU org_unit} {L locality} {ST state} {C country}
```

---

### Syntax Definitions

<i>csr_file</i>	The name of the CSR certificate file to be created.
<i>key_file</i>	The name of the key file under which the RSA 2048 bit key is stored.
<i>domain_name</i>	Domain name to be used in the CSR.
<i>common_name</i>	Common Name used in X.509 certificate.
<i>org_name</i>	The Organization Name used in X.509 certificate.
<i>org_unit</i>	The Organization Unit used in X.509 certificate.
<i>locality</i>	The Locality used in X.509 certificate.
<i>state</i>	The State used in X.509 certificate.
<i>country</i>	The Country used in X.509 certificate.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Generates <csr\_file>.pem file in **/flash/switch** directory. The <csr\_file>.pem file created should be sent to CA signing authority to get the CA certificate.
- Default values will be taken for all other optional parameters while generating the CSR.
- The CSR needs to be created, sent to CA authority and the corresponding CA certificate (obtained from CA authority) should be uploaded to the **/flash/switch** directory before corresponding server configurations are done on the switch. If the CA certificate is uploaded post server configuration, then a switch reboot needs to be done for the changes to take effect.

### Examples

```
-> aaa certificate generate-csr myCliCert.pem key clientkey.key days 3650 cn client.ale.com on ALE ou ESD l BAN st KAR c IN
```

### Release History

Release 8.3.1; command introduced.

**Related Commands**

**show aaa common-criteria  
config**

Displays the common criteria status on the switch.

**MIB Objects**

N/A

---

## kerberos mac-move

Enable or disable MAC move globally on the switch.

**kerberos mac-move {enable | disable}**

---

### Syntax Definitions

**enable** Enable MAC move globally on the switch.

**disable** Disable MAC move globally on the switch.

### Defaults

By default, MAC move is enabled.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

There is no support for multiple users on the same MAC address. For the same MAC address, a new Kerberos authentication will overwrite the existing entry in the Kerberos Database.

### Examples

```
-> kerberos mac-move enable
-> kerberos mac-move disable
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[kerberos inactivity-timer](#) Configures global inactivity timer on the switch for Kerberos users.

[show kerberos configuration](#) Displays Kerberos global configuration.

### MIB Objects

```
alaDaKerberosGlobalConfig
  alaDaKerberosGlobalMacMoveStatus
```

---

## kerberos inactivity-timer

Configures global inactivity timer on the switch for Kerberos users.

**kerberos inactivity-timer** *num*

---

### Syntax Definitions

*mins* Time interval in minutes. The valid range is 10–600 minutes.

### Defaults

By default, inactivity timer is set to 300 minutes.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

N/A

### Examples

```
-> kerberos inactivity-timer 30
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

<a href="#">kerberos mac-move</a>	Enable or disable MAC move globally on the switch.
<a href="#">show kerberos configuration</a>	Displays Kerberos global configuration.

### MIB Objects

```
alaDaKerberosGlobalConfig  
  alaDaKerberosGlobalInactivityTimer
```

---

## kerberos ip-address

Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.

**kerberos ip-address** *ip\_address* [**udp-port** *num*]

**no kerberos ip-address** *ip\_address*

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the Kerberos server.
<i>num</i>	UDP or TCP port number of the Kerberos application running on the Kerberos server. UDP port range is 1–65535.

### Defaults

Default value of UDP port is 88.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- At least one Kerberos server and one Kerberos enabled port must be configured on the switch for Kerberos snooping to function.
- A maximum of four Kerberos server IP addresses can be configured on a switch
- Server IP address cannot be configured as 0.0.0.0, and the octet value in the IP address cannot be greater than 255 (for example, 1.256.2.3).
- Use the 'udp-port' keyword to configure both UDP and TCP protocol port number.
- Use the **no** form of this command to delete the Kerberos server IP address. Only one server can be deleted at a time.
- If all the authentication servers are removed from the switch, then all the Kerberos users learned so far on all the ports are not removed from the database.

### Examples

```
-> kerberos ip-address 172.21.160.102 udp-port 2001
-> kerberos ip-address 172.21.160.103 udp-port 2003
-> no kerberos ip-address 172.21.160.102
```

### Release History

Release 8.3.1; command introduced.

## Related Commands

<a href="#">kerberos mac-move</a>	Enable or disable MAC move globally on the switch.
<a href="#">kerberos inactivity-timer</a>	Configures global inactivity timer on the switch for Kerberos users.
<a href="#">kerberos server-timeout</a>	Configures global server reply time-out timer value on the switch for Kerberos users.
<a href="#">show kerberos configuration</a>	Displays Kerberos global configuration.

## MIB Objects

```
alaDaKerberosServerTable  
  alaDaKerberosIpAddressType  
  alaDaKerberosIpAddress  
  alaDaKerberosUdpPort  
  alaDaKerberosRowStatus
```

---

## kerberos server-timeout

Configures global server reply time-out timer value on the switch for Kerberos users.

**kerberos kerberos server-timeout** *num*

---

### Syntax Definitions

*secs* Server reply time-out time interval in seconds in the range 1 second to 30 seconds.

### Defaults

By default, reply-timeout is 2 seconds.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

All the users trying to get authenticated from a specific server will have the same value for reply-timeout timer. Whenever a Kerberos request packet is sent to the server, the server reply time-out starts. If the timer expires before receiving the reply from the server, the user authentication is marked as server-time-out and a trap is generated.

### Examples

```
-> kerberos server-timeout 20
```

### Release History

Release 8.3.1; command introduced.

### Related Commands

[show kerberos configuration](#) Displays Kerberos global configuration.

### MIB Objects

alaDaKerberosGlobalConfig  
alaDaKerberosGlobalServerTimeoutTimer

---

## kerberos authentication-pass policy-list-name

Configures global classification QoS policy list on the switch for Kerberos users.

**kerberos authentication-pass policy-list-name** *string*

**no kerberos authentication-pass policy-list-name**

---

### Syntax Definitions

*string*                                      Name of the QoS policy list.

### Defaults

By default, global policy list name is ‘none’; there is no Kerberos global QoS policy list configured.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- QoS policy list must be created prior to this configuration.
- Per user Kerberos policy list configuration is not supported.
- Use the **no** form of this command to remove the global classification QoS policy list from the switch.
- If a domain level policy list is configured in the switch and any user belonging to that domain gets authenticated from the Kerberos server, then the domain level policy list is applied to the user over the global policy list.
- If a user gets authenticated from the Kerberos server and the domain level policy list is not configured on the switch for the authenticated user, then the global policy list is applied to the user if the global policy list is configured on the switch.
- If a user gets authenticated from the Kerberos server and neither the domain level policy list (for that user domain) nor the global policy list is configured, then the user traffic is classified on the basis of already applied non-suppliant authentication classification.

## Examples

```
-> kerberos authentication-pass policy-list-name p2
```

The following example shows that the **p2** is configured as the global classification QoS policy list on the switch for Kerberos users.

```
-> show kerberos configuration
Mac-Move                :disabled,
Inactivity Timer        :30 (mins),
Server Timeout          :20 (secs),
Global QoS Policy List  :p2,
Global QoS Policy Status :Active,

Servers                  :
IP-Address              UDP Port
-----+-----
1.1.1.1                 88

Per Domain QoS policy List :
Domain-Name              Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM              p11                  Active
```

When the QoS policy list **p2** is removed from the system, the corresponding configuration in Kerberos is shown as below.

```
-> no policy list p2
-> qos apply

-> show kerberos configuration
Mac-Move                :disabled,
Inactivity Timer        :30 (mins),
Server Timeout          :20 (secs),
Global QoS Policy List  :p2,
Global QoS Policy Status :Inactive,

Servers                  :
IP-Address              UDP Port
-----+-----
1.1.1.1                 88

Per Domain QoS policy List :
Domain-Name              Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM              p11                  active
```

The following command removes the global classification QoS policy list from the switch.

```
-> no kerberos authentication-pass policy-list-name
```

## Release History

Release 8.3.1; command introduced.

## Related Commands

[kerberos ip-address](#)

Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.

[kerberos authentication-pass domain](#)

Configures "per domain" classification policy for the Kerberos users.

[show kerberos configuration](#)

Displays Kerberos global configuration.

## MIB Objects

alaDaKerberosGlobalConfig  
alaDaKerberosGlobalPolicy

---

## kerberos authentication-pass domain

Configures "per domain" classification policy for the Kerberos users.

**kerberos authentication-pass domain** *domain\_name* **policy-list-name** *policy\_list*

**no kerberos authentication-pass domain** *domain\_name*

---

### Syntax Definitions

*domain\_name* Domain name on which the QoS policy is applied. Domain name length can be a maximum of 32 characters. Domain name is case sensitive.

*policy\_list* Name of the QoS policy list already configured.

### Defaults

By default, global policy list name is 'none', that is, there is no Kerberos global QoS policy list configured.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Use the **no** form of this command to remove the "per domain" classification policy for Kerberos users.

### Examples

```
-> kerberos authentication-pass domain EXAMPLE.COM policy-list-name p11
```

The following example shows that the **p11** is configured as the policy list associated with the domain EXAMPLE.COM

```
-> show kerberos configuration
```

```
Mac-Move           :disabled,
Inactivity Timer    :30 (mins),
Server Timeout      :20 (secs),
Global QoS Policy List :p2,
Global QoS Policy Status :Active,
```

```
Servers           :
IP-Address         UDP Port
-----+-----
1.1.1.1           88
```

```
Per Domain QoS policy List :
Domain-Name           Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM           p11                Active
```

When the QoS policy list **p11** is removed from the system, the corresponding configuration in Kerberos is shown as below.

```
-> no policy list p11
-> qos apply

-> show kerberos configuration
Mac-Move                :disabled,
Inactivity Timer        :30 (mins),
Server Timeout          :20 (secs),
Global QoS Policy List  :p2,
Global QoS Policy Status :Active,

Servers                  :
IP-Address              UDP Port
-----+-----
1.1.1.1                 88

Per Domain QoS policy List :
Domain-Name              Policy-List-Name      Status
-----+-----+-----
EXAMPLE.COM              p11                  Inactive
```

The following command removes the “per domain” classification policy for Kerberos users.

```
-> no kerberos authentication-pass domain EXAMPLE.COM
```

## Release History

#### *output definitions*

---

<b>Mac-Move</b>	MAC-move status on the switch: Enabled or Disabled
<b>Inactivity Timer</b>	Global inactivity timer configured on the switch for Kerberos users.
<b>Server Timeout</b>	Global server reply time-out timer value configured on the switch for Kerberos users.
<b>Global QoS Policy List</b>	Global classification QoS policy list associated with the Kerberos users.

*output definitions (continued)*

---

<b>Global QoS Policy Status</b>	The global QoS policy status: Active or Inactive 'Inactive' status indicates that the policy list does not exist in the switch or the policy list exists, but not applied.
<b>Servers</b>	<b>IP Address:</b> IP address configured of the Kerberos server. <b>UDP Port:</b> UDP or TCP port of the Kerberos application running on the Kerberos server
<b>Per Domain QoS policy List</b>	<b>Domain-Name:</b> Per domain classification policy configured for Kerberos users. <b>Policy-List-Name:</b> Name of the QoS policy list associated with the domain. <b>Status:</b> Per domain QoS policy list status: Active or Inactive 'Inactive' status indicates that the policy list does not exist in the switch or the policy list exists, but not applied.

---

**Release History**

Release 8.3.1; command introduced.

**Related Commands**

<b>kerberos mac-move</b>	Enable or disable MAC move globally on the switch.
<b>kerberos inactivity-timer</b>	Configures global inactivity timer on the switch for Kerberos users.
<b>kerberos ip-address</b>	Configures IP address of the Kerberos server (Key Distribution Centre - KDC) and UDP or TCP port number.
<b>kerberos server-timeout</b>	Configures global server reply time-out timer value on the switch for Kerberos users.
<b>kerberos authentication-pass policy-list-name</b>	Configures global classification QoS policy list on the switch for Kerberos users.
<b>kerberos authentication-pass domain</b>	Configures "per domain" classification policy for the Kerberos users.
<b>show kerberos users</b>	Displays the learnt Kerberos users information.
<b>show kerberos statistics</b>	Displays the global Kerberos statistics.
<b>clear kerberos statistics</b>	Clears global Kerberos statistics.

**MIB Objects**

```

---

## show kerberos users

Displays the learnt Kerberos users information.

**show kerberos users** [*port slot/port* | *mac-address*]

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*mac-address* MAC address of the Kerberos user.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- If a slot/port is specified, the Kerberos users learnt on that port are displayed.
- If MAC address is specified, then the information related to that Kerberos user is displayed.
- If none of the parameters are specified (slot/port, MAC address), then the information related to all the Kerberos users learnt on the switch is displayed.

### Examples

```
-> show kerberos users
Slot/      MAC           Authentication      QOS
Port      Address        Status             Policy
-----+-----+-----+-----
 2/18 00:11:22:33:44:55 tgs-authenticated  p11
 2/19 00:01:02:03:04:05 tgs-timeOut
```

```
-> show kerberos users port 2/18
Slot/      MAC           Authentication      QOS
Port      Address        Status             Policy
-----+-----+-----+-----
 2/18 00:11:22:33:44:55 tgs-authenticated  p11
```

```
-> show kerberos users 00:11:22:33:44:55
Detail User Information:
  MAC Address       : 00:11:22:33:44:55
  Port              : 2/18
  Authentication Status : tgs-authenticated
  QoS Policy        : p11
  Domain Name       : EXAMPLE.COM
  User Name         : root\admin
```

```
User Entry State      : active
Inactivity Timer Left : -1
```

### *output definitions*

---

<b>Slot/Port</b>	The Kerberos slot and the port number.
<b>MAC Address</b>	MAC address of the Kerberos user.
<b>Authentication Status</b>	Kerberos authentication process involve exchange of two requests (AS_REQ and AS_REP) and two response (AS_REP and TGS_REP). This field indicates up to which level the authentication has reached. On successful authentication, "tgs-authenticated" is displayed.
<b>QoS Policy</b>	QoS policy list configured on the switch for the Kerberos user.
<b>Domain Name</b>	Per domain classification policy configured for the Kerberos user.
<b>User Name</b>	User name of the client

---

### **Release History**

```

---

## show kerberos statistics

Displays global and port-level Kerberos statistics.

**show kerberos statistics** [**port**] *slot/port*[-*port2*]

---

### Syntax Definitions

*slot/port*

The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-10).

### Defaults

By default, global Kerberos statistics are displayed.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the **port** parameter to display Kerberos statistics for all ports.
- Use the *slot/port* option along with the **port** parameter to display the statistics for a specific port.
- Use the *slot/port1-port2* (range of ports) option to display the statistics for a range of ports.

### Examples

```
-> show kerberos statistics
Total Client Packet Rx           : 52
Total Server Packet Rx           : 13
Total KRB-AS-REQ Packet Rx       : 47
Total KRB-AS-REP Packet Rx       : 8
Total KRB-TGS-REQ Packet Rx      : 5
Total KRB-TGS-REP Packet Rx      : 5
Total KRB-ERROR Packet Rx        : 0
Total Client Packet Sw Discard   : 0
Total Server Packet Sw Discard   : 2
Total Client Packet Hw Discard   : 0
Total Server Packet Hw Discard   : 0
```

#### *output definitions*

---

<b>Total Client Packet Rx</b>	Total client request packets received.
<b>Total Server Packet Rx</b>	Total server response packets received.
<b>Total KRB-AS-REQ Packet Rx</b>	Total AS-REQ request packets received.
<b>Total KRB-AS-REP Packet Rx</b>	Total AS-REP response packets received.
<b>Total KRB-TGS-REQ Packet Rx</b>	Total TGS-REQ request packets received.
<b>Total KRB-TGS-REP Packet Rx</b>	Total TGS-REP response packets received.
<b>Total KRB-ERROR Packet Rx</b>	Total error packets received from the server.

*output definitions (continued)*

---

<b>Total Client Packet Sw Discard</b>	Total client's request packets discarded at software by Kerberos module.
<b>Total Server Packet Sw Discard</b>	Total server's response packets discarded at software by Kerberos module.
<b>Total Client Packet Hw Discard</b>	Total client's request packets discarded at hardware.
<b>Total Server Packet Hw Discard</b>	Total server's response packets discarded at hardware.

## clear kerberos statistics

Clears global and port-level Kerberos statistics.

**clear kerberos statistics** [**port** [*slot/port*[-*port2*]]]

---

### Syntax Definitions

*slot/port*[-*port2*]

The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (3/1-10).

### Defaults

By default, global statistics are cleared.

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Use the **port** parameter to clear Kerberos statistics for all ports.
- Use the slot/port option along with the **port** parameter to clear the statistics for a specific port.
- Use the slot/port1-port2 (range of ports) option to clear the statistics for a range of ports.

### Examples

```
-> clear kerberos statistics
-> clear kerberos port 2/1 statistics
-> clear kerberos port 2/1-10 statistics
```

### Release History

```

---

## aaa jitc admin-state

Enables or disables Joint Interoperability Test Command (JITC) mode on the switch.

**aaa jitc admin-state** {enable | disable}

---

### Syntax Definitions

**enable | disable** Enables or disables the JITC (Joint Interoperability Test Command) mode.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The configuration is applied only after a reload of the switch.
- The JITC mode is mutually exclusive of Common Criteria mode and Enhanced-mode. If the switch is already running in Common Criteria or enhanced-mode (NIS) it must be disabled before enabling JITC mode and vice versa.

### Examples

```
-> aaa jitc admin-state enable  
WARNING: JITC mode configuration is applied only after reload
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

[show aaa jitc config](#) Displays the JITC status on the switch.

### MIB Objects

N/A

---

## show aaa jitc config

Displays the JITC status on the switch.

```
show aaa jitc config

# 39 Access Guardian Commands

Access Guardian refers to a set of OmniSwitch security functions that work together to provide a dynamic, proactive network security solution. This chapter provides information about the commands that are used to configure the following Access Guardian features through the Command Line Interface (CLI):

- **Universal Network Profile (UNP)**—Access Guardian is configured and applied through the framework of the UNP feature. UNP is enabled on switch ports to activate Access Guardian functionality that is used to authenticate and classify users into UNP profiles. Each profile is mapped to a VLAN ID or Service Access Point (SAP) to which the user is dynamically assigned. Specific UNP port configurations help to simplify and easily replicate the same configuration across multiple ports.
- **Bring Your Own Device (BYOD) - OmniSwitch / UPAM or ClearPass Integration:** The OmniSwitch leverages Access Guardian functionality along with the OmniVista Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) to provide an overall BYOD solution.
  - Configurable UNP port and profile attributes are used to redirect traffic from the OmniSwitch to the UPAM or CPPM server.
  - Configurable GRE tunnels allow the OmniSwitch to intercept and tunnel Multicast Domain Name System (mDNS) and Simple Service Discovery Protocol (SSDP) packets to or from a WLAN controller in a BYOD network.
- **Captive Portal**—Internal and external Captive Portal Web-based authentication. Internal Captive Portal authentication is provided through an internal Web server on the OmniSwitch that presents default or customized Web pages to the user. A post-authentication and/or post-classification process to validate user credentials and dynamically assign a new role (policy list) to enforce user access to the network. External, guest Captive Portal authentication is provided through the OmniSwitch Access Guardian interaction with the OmniVista Unified Policy Access Manager or the ClearPass Policy Manager.
- **Quarantine Manager and Remediation (QMR)**—QMR is a switch-based application that restricts the network access of known quarantined users and provides a remediation path to allow quarantined users to regain their network access.

For commands used to configure device authentication, authorization, and accounting parameters that are used to support Access Guardian functionality, see “[Chapter 38, “AAA Commands.”](#)”

For commands used to configure Learned Port Security (LPS), which is used by Access Guardian to help ensure that only certain devices are allowed to connect to the switch, see “[Chapter 47, “Learned Port Security Commands.”](#)”

MIB information for the UNP commands is as follows:

*Filename:* ALCATEL-IND1-DA-MIB.mib  
*Module:* alcatelIND1DaMIB

*Filename:* ALCATEL-IND1-UDP-RELAY-MIB.mib  
*Module:* alcatelIND1UDPRelayMIB

A summary of the available commands is listed here:

---

## unp dynamic-vlan-configuration

Configures the UNP status for dynamic VLAN configuration. When this functionality is enabled and a VLAN mapping is configured with a VLAN ID that does not exist, the switch will dynamically create the necessary VLAN ID.

**unp dynamic-vlan-configuration**

**no unp dynamic-vlan-configuration**

---

### Syntax Definitions

N/A

### Defaults

By default, dynamic VLAN configuration is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

---

**Note.** Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootstrap.

---

- Use the **no** form of this command to disable dynamic VLAN configuration.
- When dynamic VLAN configuration is disabled, configuring a VLAN mapping with a VLAN ID that does not exist in the switch configuration is not allowed.
- The VLAN status and other port (non-UNP port) assignments for a dynamic UNP VLAN are configurable using standard VLAN commands. In addition, the STP status is configurable and enabled by default when the dynamic VLAN is created.
- A dynamic VLAN cannot be deleted using standard VLAN commands (**no vlan *vlan\_id***).
- UNP dynamic VLANs are identified as a separate type of VLAN. The **show vlan** command will display this type with the default name of “UNP-DYN-VLAN” and the designated type as “UNP Dynamic Vlan”.

### Examples

```
-> unp dynamic-vlan-configuration
-> no unp dynamic-vlan-configuration
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

- unp profile** Configures a UNP in the switch configuration.
- show unp global configuration** Displays the dynamic VLAN configuration status for the switch.

## MIB Objects

alaDaUNPGlobalConfiguration  
alaDaUNPDynamicVlanConfigFlag

---

## unp dynamic-profile-configuration

Configures the UNP status for dynamic profile configuration. When this functionality is enabled, a UNP profile is dynamically created based on specific traffic conditions.

**unp dynamic-profile-configuration**

**no unp dynamic-profile-configuration**

---

### Syntax Definitions

N/A

### Defaults

By default, dynamic profile configuration is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable dynamic profile configuration.
- When dynamic profile configuration is enabled, a UNP profile is dynamically created when the trust VLAN tag option is enabled on the UNP port or link aggregate and one of the following conditions occurs:
  - A tagged packet received on the UNP port contains a VLAN tag that matches an existing MVRP VLAN in the switch configuration that is not assigned to a profile.
  - There is no matching VLAN in the switch configuration.
- Dynamically created profiles are saved in the **boot.cfg** file for the switch.
- By default, dynamically created profiles are automatically named **dynamic\_profile\_vlan\_id**, where the VLAN ID is the ID of the VLAN contained in the packet tag.
- After the dynamic profile is created, changing the profile name, the associated VLAN ID, or the QoS policy list is allowed. To avoid any confusion, change the profile name if the VLAN ID associated with the profile has changed.
- If the dynamic profile configuration option is enabled along with the dynamic VLAN configuration option and a dynamically created profile refers to a VLAN that is an MVRP VLAN, then the MVRP VLAN is automatically converted to a dynamic UNP VLAN (UNP-DYN-VLAN).

### Examples

```
-> unp dynamic-profile-configuration
-> no unp dynamic-profile-configuration
```

### Release History

Release 7.2.1.R02; command was introduced.

## Related Commands

**unp profile**

Configures a UNP in the switch configuration.

**unp dynamic-vlan-configuration**

Configures the status of dynamic VLAN configuration. When enabled, UNP will create a VLAN at the time a VLAN mapping for a profile is created that specifies a VLAN ID that does not exist in the switch configuration.

**show unp global configuration** Displays the dynamic profile configuration status for the switch.

## MIB Objects

alaDaUNPGlobalConfiguration

alaDaUNPDynamicProfileConfigFlag

---

## unp auth-server-down

Configures a UNP profile to which a device is classified if authentication fails because the RADIUS server is unreachable.

```
unp auth-server-down {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp auth-server-down [profile1] [profile2] [profile3]
```

---

### Syntax Definitions

*profile\_name*                      The name of an existing profile to which the device is assigned when the authentication server is unreachable.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an authentication server down UNP profile.
- When a device is classified into the specified profile, a configurable authentication down timer is started for that device. When the timer runs out, the authentication process is performed again. If authentication fails again, the device is classified back into the authentication server down profile. The switch will repeat this process until the device authentication is completed.
- Configuring an authentication server down UNP is highly recommended when MAC or 802.1X authentication is enabled on any UNP port or link aggregate. This is because after a switch reload, the traffic from devices connected to UNP ports and link aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.
- If the authentication server down UNP is removed, the authentication server down timer is also removed.
- Up to three different profile names are configurable as authentication server down UNP profiles. The profile applied to the traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to device traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to device traffic received on UNP access ports.
  - When multiple profiles are configured, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the device traffic.

- Configuring both a VLAN profile and a service profile ensures that an authentication server down UNP is available for device traffic received on both types of UNP ports (bridge and access).

## Examples

```
-> unp auth-server-down profile1 unp1-vlan
-> no unp auth-server-down profile1
-> unp auth-server-down profile1 unp1-vlan profile2 unp2-vxlan
-> no unp auth-server-down profile1 profile2
```

## Release History

Release 7.2.1; command was introduced.

Release 7.3.4; command syntax changed; **vxlan-profile** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Release 8.3.1; **vlan-profile** and **vxlan-profile** parameters replaced with **profile1**, **profile2**, and **profile3** parameters.

## Related Commands

**unp auth-server-down-timeout** Configures the value for the authentication server down timer.

**show unp global configuration** Displays the profiles designated as the authentication server down UNP for the switch.

## MIB Objects

```
alaDaUNPGlobalConfiguration
  alaDaUNPAuthServerDownUnp
```

---

## unp auth-server-down-timeout

Configures the authentication server down timer value. This timer value is applied to devices that are learned in the authentication server down UNP.

**unp auth-server-down-timeout** *seconds*

**no unp auth-server-down-timeout**

---

### Syntax Definitions

*seconds*                               The number of seconds the authentication server down timer is active. The valid range is 10 to 1000 seconds.

### Defaults

By default, the timeout value is set to 60 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to set the timer value back to the default value (60 seconds).
- When this timer expires, devices learned in the authentication server down UNP are cleared from that UNP. The authentication and classification process is attempted again.
- When the authentication server down UNP is removed, the authentication server down timer is also cleared.

### Examples

```
-> unp auth-server-down-timeout 500
-> unp auth-server-down-timeout 120
-> no unp auth-server-down-timeout
```

### Release History

Release 7.2.1; command was introduced.

Release 7.3.4; command syntax changed; **vxlan-profile** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72)

Release 8.3.1; **vlan-profile** and **vxlan-profile** parameters deprecated.

## Related Commands

- unp auth-server-down** Configures a UNP to which a device is classified if MAC or 802.1X authentication fails because the RADIUS server is not reachable.
- show unp global configuration** Displays the authentication server down timeout value for the switch.

## MIB Objects

alaDaUNPGlobalConfiguration

alaDaUNPAuthServerDownTimeout

---

## unp policy validity-period

Configures a UNP validity period policy that specifies the days and times during which a device can access the network. This type of policy is assigned to a UNP profile and applied to devices classified into the profile. A device must match all of the policy criteria.

**unp policy validity-period** *policy\_name* [**days** *days*] [**months** *months*] [**hours** *hh:mm to hh:mm*]  
**[interval** *mm:dd:yy hh:mm to mm:dd:yy hh:mm* **]** [**timezone** *zones*]

**no unp policy validity-period** *policy\_name* [**days** *days* | **months** *months* | **hours** / **interval** | **timezone**]

---

### Syntax Definitions

<i>policy_name</i>	The name of the validity period policy (up to 31 alphanumeric characters).
<i>days</i>	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., <b>monday</b> , <b>tuesday</b> , <b>wednesday</b> , etc.).
<i>months</i>	The month(s) in which the validity period is active. Enter the actual month (e.g., <b>january</b> , <b>february</b> , <b>march</b> , etc.).
<i>hh:mm</i>	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
<i>mm:dd:yy hh:mm</i>	An interval of time during which the validity period is active. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:17 12:01 to 11:02:17 12:01).
<i>zones</i>	The timezone in which the validity period is active (for example, <b>pst</b> , <b>est</b> , <b>gmt</b> , etc.)

### Defaults

parameter	default
<i>days</i>	no restriction
<i>months</i>	no restriction
<i>hh:mm</i>	no specific time
<i>mm:dd:yyyy hh:mm</i>	no interval
<i>zones</i>	local timezone

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove a UNP period policy from the configuration, or to remove parameters from a particular validity period policy.

- Any combination of the **days**, **months**, **hours**, **interval**, and **timezone** parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **unp profile period-policy** command to associate a period policy with a UNP profile.

## Examples

```
-> unp policy validity-period Office-Time
-> no unp policy validity-period Office-Time

-> unp policy validity-period Office-Time days monday
-> unp policy validity-period Office-Time days monday time-zone IST
-> no unp policy validity-period Office-Time time-zone
-> no unp policy validity-period Office-Time days monday

-> unp policy validity-period Office-Time days all
-> unp policy validity-period Office-Time days all time-zone PST
-> no unp policy validity-period Office-Time days saturday sunday

-> unp policy validity-period Office-Time hours 9:00 to 17:00
-> unp policy validity-period Office-Time hours 9:00 to 17:00 time-zone IST
-> no unp policy validity-period Office-Time hours

-> unp policy validity-period Holiday months december january
-> no unp policy validity-period Holiday months january

-> unp policy validity-period Holiday months december time-zone IST
-> no unp policy validity-period Holiday time-zone
-> no unp policy validity-period Holiday months december

-> unp policy validity-period Seminar interval 02/01/13 10:30 to 02/05/13 16:00
-> no unp policy validity-period Seminar interval

-> unp policy validity-period Seminar interval 02/01/13 10:30 to 02/05/13 16:00
time-zone PST
-> no unp policy validity-period Seminar time-zone
-> no unp policy validity-period Seminar interval
```

## Release History

Release 8.1.1; command introduced.

## Related Commands

```

---

## unp policy validity-location

Configures a UNP validity location policy that defines a specific location from which a device can access the network. This type of policy is assigned to a UNP profile and applied to devices classified into the profile. A device must match all of the policy criteria defined.

**unp policy validity-location** *policy\_name* [**port** *chassis/slot/port[-port2]* | **linkagg** *agg\_id[-agg\_id2]* [**system-name** *system\_name*] [**system-location** *system\_location*]

**no unp policy validity-location** *policy\_name* [**port** | **linkagg** | **system-name** | **system-location**]

---

### Syntax Definitions

<i>policy_name</i>	The name of the validity location policy (up to 31 alphanumeric characters).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a UNP port. Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number of a UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>system_name</i>	The configured system name for the switch from which the device can access the network.
<i>system_location</i>	The configured system location for the switch from which the device can access the network.

### Defaults

parameter	default
<i>chassis/slot/port[-port2]</i>	no restriction
<i>agg_id[-agg_id2]</i>	no restriction
<i>system_name</i>	no restriction
<i>system_location</i>	no restriction

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove a UNP location policy from the configuration, or to remove parameters from a particular location policy.
- Any combination of the **port**, **linkagg**, **system-name**, and **system-location** parameters is allowed. The location policy is only in effect when all specified parameters are true.
- Use the **unp profile location-policy** command to associate a location policy with a UNP profile.

## Examples

```
-> unp policy validity-location ALU-NA
-> no unp policy validity-location ALU-NA

-> unp policy validity-location ALU-NA port 1/1/10
-> unp policy validity-location ALU-NA port 1/1/1-5
-> no unp policy validity-location ALU-NA port

-> unp policy validity-location ALU-NA linkagg 10
-> unp policy validity-location ALU-NA linkagg 1-5
-> no unp policy validity-location ALU-NA linkagg

-> unp policy validity-location ALU-NA system-name OS6860
-> no unp policy validity-location ALU-NA system-name OS6860

-> unp policy validity-location ALU-NA system-location US-West
-> no unp policy validity-location ALU-NA system-location
```

## Release History

---

## unp domain description

Configures a customer domain ID to which UNP ports and classification rules are assigned.

**unp domain** *domain\_id* [**description** *domain\_description*]

**no unp domain** *domain\_id* **description** *domain\_description*

---

### Syntax Definitions

*domain\_id*                                    A numerical customer domain ID.  
*domain\_description*                        An alphanumeric string (1–128 characters).

### Defaults

By default, customer domain ID zero (0) is assigned to all UNP ports.

parameter	default
<i>domain_description</i>	Domain ID

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the customer domain ID from the switch configuration. When a domain ID is removed, the following actions are triggered:
  - All UNP ports assigned to that domain are moved to the default domain ID 0.
  - Any classification rules assigned to that domain are removed.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain (see the [unp domain](#) command page), classification rules associated with the same customer domain ID are applied only to UNP ports associated with the same domain ID.

### Examples

```
-> unp domain 1  
-> unp domain 2 description CustomerA
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

- unp domain** Assigns a UNP port or link aggregate to the specified customer domain (UNP group) ID.
- show unp domain** Displays the customer domain ID configuration for the switch.

## MIB Objects

alaDaUnpCustomerDomainTable  
  alaDaUnpCustomerDomainId  
  alaDaUnpCustomerDomainDesc

---

## unp redirect pause-timer

Configures the global pause timer value for the switch. Use this command to configure the amount of time the switch filters traffic from a non-suppliant (non-802.1X device) on a UNP port. This is done to allow enough time for the switch to clear the authentication state of the non-suppliant, at which time the device is re-authenticated.

**unp redirect pause-timer** *seconds*

**no redirect pause-timer**

---

### Syntax Definitions

*seconds*                                The pause timer value. The valid range is 60–65535

### Defaults

By default, the pause timer is set to zero.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to reset the pause time back to the default (timer no set).
- The pause timer is triggered when a Change of Authorization (COA) request is received that requires a VLAN change for a non-suppliant (non-802.1X device) *and* the port bounce action is not triggered for the device.
- During the pause time period, it is expected that the DHCP lease of the client IP in the old VLAN will expire and the client device will re-initiate DHCP resulting in new authentication and a UNP VLAN assignment.
- This command is used when configuring the switch to interact with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

### Examples

```
-> unp redirect pause-timer 180
-> no unp redirect pause-timer
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

- unp redirect port-bounce** Configures the port bounce action for a port or globally for the switch.
- unp redirect proxy-server-port** Configures the HTTP proxy port number to use for redirection.
- unp redirect allowed-name** Configures a list of additional IP addresses to which a host can access.
- unp redirect-server** Configures an IP network address to allow HTTP traffic redirection.
- show unp global configuration** Displays the global UNP parameter settings for the switch.

## MIB Objects

alaDaUNPGlobalConfiguration

alaDaUNPRedirectPauseTimer

---

## unp redirect proxy-server-port

Configures the HTTP proxy port number to use for redirection to the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) server.

**unp redirect proxy-server-port** *proxy\_port*

**no unp rediret proxy-server-port**

---

### Syntax Definitions

*proxy\_port*                                      The HTTP proxy port number. The valid range is 1024–49151.

### Defaults

By default, the redirect proxy port number is set to 8080 (traps HTTP 80, 8080, and 443).

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- Configuring the switch to interact with the UPAM or CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

### Examples

```
-> unp redirect proxy-server-port 8887
-> no unp redirect proxy-server-port
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

<a href="#">unp redirect port-bounce</a>	Configures the port bounce action for a port or globally for the switch.

alaDaUNPRedirectServerIP
```

---

## unp redirect-server

Configures an IP network address to allow redirection of HTTP traffic to the Unified Policy Access Manager (UPAM) server or the ClearPass Policy Manager (CPPM) server. Specify the address that is associated with the dynamic URL returned from the UPAM or CPPM server.

**unp redirect-server ip-address** *ip\_address*

**no unp redirect-server ip-address**

---

### Syntax Definitions

*ip\_address* IPv4 network address (e.g., 171.15.0.0).

### Defaults

By default, no redirect server IP address is specified.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the redirect server IP from the switch configuration.
- If the redirect server IP address does not match the UPAM or CPPM server configuration, then redirection to the URL will not work. This provides additional security.
- Configuring the switch to interact with UPAM or CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

### Examples

```
-> unp redirect-server ip-address 10.0.0.20  
-> no unp redirect-server ip-address
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

- unp redirect allowed-name** Configures a list of additional IP addresses to which a host can access.
- show unp global configuration** Displays the global UNP configuration for the switch.

## MIB Objects

alaDaUNPGlobalConfiguration  
alaDaUNPRedirectServerIP

---

## unp redirect allowed-name

Configures a list of additional IP addresses to which a host can access. This allows traffic to reach additional subnets other than that of the Unified Policy Access Manager (UPAM) server or the ClearPass Policy Manager (CPPM) server.

**unp redirect allowed-name** *name* **ip-address** *ip\_address* **ip-mask** *ip\_mask*

**no unp redirect allowed-name** *name*

---

### Syntax Definitions

<i>name</i>	Specify a name to assign to the allowed IP network address.
<i>ip_address</i>	An IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>ip_mask</i>	The IP subnet mask for the allowed IP network address.

### Defaults

By default, no allowed IP addresses are configured.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- Explicitly configure and append the allowed IP list to the built-in "restrictedPolicylist" policy list.

### Examples

```
-> unp redirect allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no unp redirect allowed-name server2
```

### Release History

Release 8.1.1; command was introduced.

```

---

## unp force-l3-learning

Configures the status of UNP Layer 3 learning on the specified UNP port or globally on all UNP ports. When this functionality is enabled and IP-based classification rules are configured on the switch, only Layer 3 packets are used to learn devices connected to UNP ports. Layer 2 packets are not used for learning devices.

**unp** [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*]] **force-l3-learning** [**port-bounce**]

**no unp** [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*]] **force-l3-learning** [**port-bounce**]

---

### Syntax Definitions

<i>chassis/slot/port</i> [- <i>port2</i> ]	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number for a specific UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>port-bounce</b>	Resets the context in which the user device is learned after the device is re-classified with a new IP address. This option is not supported on UNP link aggregates.

### Defaults

By default, UNP Layer 3 learning is disabled and the port bounce action is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To disable Layer 3 learning for a specific port or link aggregate, use the **no** form of this command with the **port** or **linkagg** parameter. To globally disable Layer 3 learning, use the **no** form of this command without the **port** or **linkagg** parameter.
- When UNP Layer 3 learning is enabled and there is at least one IP-based classification rule configured, the first packet of the following types of packets is used to learn the device:
  - An IP packet with a non-zero source IP address.
  - A valid ARP/GARP request/reply.
  - DHCP packets, even if the source IP address is 0.0.0.0.

However, the first packet of the following types of packets is *dropped* and not used to learn the device:

- Layer 2 frames.
  - Invalid ARP/GARP request/reply (one with sender IP address 0.0.0.0 or 169.254.0.0/16).
  - IP packet with a source IP address of 0.0.0.0, except for DHCP packets where the source IP address is 0.0.0.0.
- When Layer 3 learning is enabled and a device is learned and assigned to a UNP profile, any subsequent change to the IP address for that device (for example, the device is assigned a leased IP address) will trigger UNP to re-classify the device based on the new IP address.

- When Layer 3 learning is enforced, the following users learned on a UNP port or link aggregate would not undergo IP reclassification:
  - 802.1x (supplicant) and MAC authenticated (non-supplicant).
  - Users learned through a non-IP-based classification rule that has a higher precedence over IP-based classification rules (such as any UNP extended classification rule, binding rule, MAC address rule, or MAC address range rule).
- When Layer 3 learning is enforced, the following users learned on a UNP port or link aggregate might undergo IP reclassification:
  - Users learned through a non-IP-based classification rule that has a lower precedence than IP-based classification rules (such as a VLAN rule).
  - IP-based classification rule.
- If the port bounce action is enabled for Layer 3 learning, IP reclassification for a user might result in obtaining a new UNP profile based on an IP-based classification rule, and the new UNP profile may assign a VLAN that is different from the initial UNP profile VLAN. If this occurs, the port would be toggled causing the user context to get flushed, and the subsequent packet from the user would then be used to relearn the user. It is assumed that user in this case would subsequently send either a valid ARP packet or an IP packet with a valid source IP address as the first packet, which would be used for re-learning the user directly into the final UNP profile.
- Note that the IP address update/change for an already learned UNP user can happen only when a valid ARP packet is sent from the user after the user is initially learned. As a result, Layer 3 enforcement relies on an ARP packet from the user.
- Whenever an additional port is configured as a UNP port, the Layer 3 learning status is derived from the global setting for the switch.
- When Layer 3 learning is changed at the global level, all port-level configurations are also changed unless a custom port template that configures this function is assigned to the port. For example, when Layer 3 learning is globally disabled, it is automatically disabled on any port that has Layer 3 learning enabled. However, if a port is assigned to a custom port template that enables this function, then the Layer 3 learning status for that port is not changed.
- The port-level setting of the Layer 3 learning function overrides the global setting for the switch. For example, if Layer 3 learning is globally disabled but enabled on port 1/1/20, then Layer 3 learning is active only on port 1/1/20.

## Examples

```
-> unp force-l3-learning
-> unp force-l3-learning port-bounce
-> no unp force-l3-learning port-bounce
-> no unp force-l3-learning

-> unp port 1/1/20 force-l3-learning
-> unp port 1/1/20 force-l3-learning port-bounce
-> no unp port 1/1/20 force-l3-learning port-bounce
-> no unp port 1/1/20 force-l3-learning
```

## Release History

Release 8.3.1; command was introduced.

Release 8.3.1.R02; **port**, **linkagg**, and **port-bounce** parameters added.

## unp 802.1x-pass-through

Configures the global status of 802.1x pass through for the switch. When this functionality is enabled, 802.1x packets from supplicants attempting to authenticate are not processed on the local switch. Instead, the packets are passed along to another switch for authentication.

**unp 802.1x-pass-through**

**no unp 802.1x-pass-through**

---

### Syntax Definitions

N/A

### Defaults

By default, 802.1x pass through is disabled for the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable 802.1x pass through for the switch.
- Enabling 802.1x pass through on a switch that has an existing UNP or LPS configuration is not recommended. This functionality is intended for a local or intermediate switch when the supplicant device requires authentication through an upstream switch.
- If 802.1x pass through is enabled on a switch that has an existing UNP or LPS configuration, consider the following:
  - 802.1x authentication, 802.1x authentication bypass, and MAC authentication allow EAP functionality is not supported on UNP ports.
  - The initial frame for unknown 802.1x traffic is learned on the switch. If the frame is learned in the forwarding mode, subsequent frames with the same source MAC address are passed through to the next switch. If the frame is learned in the filtering mode, subsequent frames with the same source MAC address are dropped and not passed through.

### Examples

```
-> unp 802.1x-pass-through  
-> no 802.1x-pass-through
```

### Release History

Release 8.4.1.R02; command was introduced.

**Related Commands**

**show unp global configuration** Displays the status of 802.1x pass through for the switch.

**MIB Objects**

alaDaUNPGlobalConfiguration

---

## unp ap-mode

Configures the global status of the Access Point (AP) mode for the switch.

```
unp ap-mode {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables the AP mode.
<b>disable</b>	Disables the AP mode.

### Defaults

By default, the AP mode is enabled for the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the UNP AP mode is globally enabled (the default) and an AP device is detected on a UNP bridge port, the following actions are triggered to automatically change the operational status of the specified options (the operational status overrides the configured status):
  - The transmission of LLDP Port VLAN ID and AP Location TLVs is operationally enabled on the UNP bridge port.
  - The trust tag status for the UNP bridge port is operationally enabled.
  - The global status for dynamic VLAN configuration is operationally enabled for the switch.
- If the UNP AP mode is not enabled, the detection, learning, and management of connected OmniAccess Stellar AP devices may not occur as expected.

### Examples

```
-> unp ap-mode disable  
-> unp ap-mode enable
```

### Release History

Release 8.4.1.R02; command was introduced.

### Related Commands

[show unp global configuration](#) Displays the status of UNP Layer 3 learning for the switch.

### MIB Objects

```
alaDaUNPGlobalConfiguration  
alaDaUNPAPMode
```

---

## unp user flush

Performs a MAC address flush of Access Guardian users (devices learned on UNP ports) based on the specified port, link aggregate, authentication type, or MAC address.

**unp user flush** [**port** *chassis/slot/port1[-port2]* | **linkagg** *agg\_id[-agg\_id2]*] [**sap-id** [**linkagg**] *sap\_id*] [**service-id** *service\_id*] [**authentication-type** {**mac** | **802.1x** | **none**}] [**profile** *profile\_name*] [**mac-address** *mac\_address*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
[ <b>linkagg</b> ] <i>sap_id</i>	A Service Access Point (SAP) ID. Use the optional <b>linkagg</b> parameter if the SAP ID is for a link aggregate.
<i>service_id</i>	A service ID.
<b>mac</b>	Clears only the MAC authenticated users.
<b>802.1x</b>	Clears only the 802.1X authenticated users.
<b>none</b>	Clears only the users that have not been authenticated.
<i>mac_address</i>	A MAC address (e.g., 00:00:39:59:f1:0c).
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, all MAC addresses learned on all UNP ports are flushed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **port** or **linkagg** parameter to flush users on a specific port or link aggregate.
- Use the **sap-id** parameter to flush users learned on a specific SAP. A SAP ID is comprised of a device-facing port or link aggregate (referred to as a service access port) and an encapsulation value that is used to identify the type of device traffic to map to the associated service.
- Use the **service-id** parameter to flush users learned on a specific service.
- Use the **authentication-type** parameter with the **mac**, **802.1x**, or **none** options to flush users that were authenticated (MAC or 802.1X) or users that were not authenticated.
- Use the **mac-address** parameter to flush a specific device.

- Use the **profile** parameter to flush all users associated with the specified profile name. Combine this parameter with the **mac-address** parameter to flush a specific user associated with the specified profile name.
- Combine the **sap-id** or **service-id** parameter with the **profile** parameter option to flush only users on the SAP or service that are classified into the specified profile.
- Combine the **sap-id** or **service-id** parameter with the **authentication-type** parameter option to flush only users on the SAP or service that were authenticated with the specified authentication type.

## Examples

```
-> unp user flush
-> unp user flush port 1/1/6
-> unp user flush linkagg 10
-> unp user flush sap-id 1/1/2:50
-> unp user flush service-id 10
-> unp user flush authentication-type mac
-> unp user flush mac-address 00:11:22:33:44:55
-> unp user flush profile un1-vlan
-> unp user flush profile un1-vlan mac-address 00:da:95:11:22:01
```

## Release History

Release 8.3.1; command was introduced.

  alaDaUNPUserFlushServiceID
```

---

## unp profile

Configures a classification profile that is used to provide role-based access to the switch. This type of profile determines the VLAN or service a device can join and applies any additional profile-defined attributes to the device.

When a profile is created with this command, the base command (**unp profile** *profile\_name*) may be used with other command keywords to define attributes for the specified profile. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
unp profile profile_name
  [qos-policy-list list_name]
  [location-policy policy_name]
  [period-policy policy_name]
  [captive-portal-authentication]
  [captive-portal-profile profile_name]
  [authentication-flag]
  [mobile-tag]
  [redirect]
  [maximum ingress-bandwidth bps[k | m]]
  [maximum egress-bandwidth bps[k | m]]
  [maximum ingress-depth bps]
  [maximum egress-depth bps]
  [inactivity-interval seconds]
  [saa-profile profile_name]
```

```
no unp profile profile_name
```

---

### Syntax Definitions

*profile\_name*                          The name to assign to the UNP classification profile.

### Defaults

When a profile is created without specifying any parameter values, the profile parameters are set to the following default values:

parameter	default
<b>qos-policy-list</b> <i>list_name</i>	No list assigned
<b>location-policy</b>	No policy assigned
<b>period-policy</b>	No policy assigned
<b>captive-portal-authentication</b>	disabled
<b>captive-portal-profile</b>	No profile assigned
<b>authentication-flag</b>	disabled
<b>mobile-tag</b>	disabled

parameter	default
<b>redirect</b>	disabled
<b>maximum ingress-bandwidth</b> <i>bps[k   m]</i>	None
<b>maximum egress-bandwidth</b> <i>bps[k   m]</i>	None
<b>maximum ingress-depth</b> <i>bps</i>	None
<b>maximum egress-depth</b> <i>bps</i>	None
<b>inactivity-interval</b> <i>seconds</i>	10
<b>saa-profile</b> <i>profile_name</i>	No profile assigned

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Use the **no** form of this command to remove a profile from the switch configuration.
- Profiles are applied only to traffic received on UNP bridge and access ports or link aggregates.
- After a profile is created, use the **unp profile map** command to map the profile to a VLAN or service.
  - If the profile is mapped to a VLAN, the profile is used to classify traffic received on UNP bridge ports.
  - If the profile is mapped to a service (SPB, VXLAN, or static), the profile is used to classify traffic received on UNP access ports.
- Any configuration change to a profile will flush all MAC addresses learned on that profile.

## Examples

```
-> unp profile unp-profl  
-> no unp profile unp-profl
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<b>unp profile qos-policy-list</b>	Assigns a QoS policy list to an existing profile.
<b>unp profile location-policy</b>	Assigns a UNP location policy to the specified profile.
<b>unp profile period-policy</b>	Assigns a UNP time-based policy to the specified profile.
<b>unp profile captive-portal-authentication</b>	Configures the status of Captive Portal authentication for the specified profile.
<b>unp profile captive-portal-profile</b>	Assigns a Captive Portal configuration to the specified profile.
<b>unp profile authentication-flag</b>	Configures whether the specified profile only allows authenticated devices into the profile.
<b>unp profile mobile-tag</b>	Configures whether a tagged VLAN-port association is created for a device port that is classified into the specified profile.
<b>unp profile redirect</b>	Configures whether or not profile traffic is redirected to the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) for authentication.
<b>unp profile maximum-ingress-bandwidth</b>	Configures a maximum ingress bandwidth value that is applied to UNP ports associated with the specified profile.
<b>unp profile maximum-egress-bandwidth</b>	Configures a maximum egress bandwidth value that is applied to UNP ports associated with the specified profile.
<b>unp profile maximum-ingress-depth</b>	Configures a maximum ingress depth value that is applied to UNP ports associated with the specified profile.
<b>unp profile maximum-egress-depth</b>	Configures a maximum egress depth value that is applied to UNP ports associated with the specified profile.
<b>unp profile inactivity-interval</b>	Configures the inactivity interval timer for the specified profile.
<b>unp profile saa-profile</b>	Assigns an existing Service Assurance Agent (SAA) profile to the specified profile.
<b>show unp profile</b>	Displays the profile configuration for the switch.

## MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName
```

---

## unp profile qos-policy-list

Configures the QoS policy list attribute for the specified profile. Use this command to assign the name of an existing QoS policy list to the profile. A policy list contains QoS policy rules/ACLs that are applied to devices classified with the associated profile.

**unp profile** *profile\_name* **qos-policy-list** *list\_name*

**no unp profile** *profile\_name* **qos-policy-list**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>list_name</i>	The name of a QoS policy list to associate with the specified UNP.

### Defaults

By default, no profile attributes are enabled or defined when the profile is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the QoS list name from the profile configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS **policy list** command.
- The QoS policy list is used to define the initial role for any UNP user learned in the profile.
- QoS policy lists that contain rules with a link aggregate source port condition are not supported on the OmniSwitch 9900 or the OmniSwitch 6560. In addition, using policy lists that contain rules with a source port condition are not supported when applied to 10G ports on an OmniSwitch 6560.

### Examples

```
-> unp profile unp-profl qos-policy-list unp-list1
-> no unp profile unp-profl qos-policy-list unp-list2
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

  alaDaUNPProfileQoSPolicy
```

---

## unp profile location-policy

Configures the location policy attribute for the specified profile. Use this command to assign the name of an existing UNP location policy to a profile. This type of policy defines criteria (such as the slot/port, system name and location) to determine if a device is accessing the network from a valid location.

**unp profile** *profile\_name* **location-policy** *policy\_name*

**no unp profile** *profile\_name* **location-policy**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>policy_name</i>	The name of an existing UNP location policy.

### Defaults

By default, no profile attributes are enabled or defined when the profile is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the location policy name from the profile configuration.
- The location policy name specified with this command must already exist in the switch configuration.
- Profile location and time period policies are configurable on the switch or on the RADIUS server. If the policies are configured on both the switch and the RADIUS server, then the switch policies take precedence.
- If a UNP device does not meet the criteria applied through the location policy, the device role is changed to unauthorized.

### Examples

```
-> unp profile unp-profl location-policy alu-na  
-> no unp profile unp-profl location-policy
```

### Release History

Release 8.3.1; command was introduced.

**Related Commands**

<b>unp profile</b>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<b>unp policy validity-location</b>	Configures a UNP location policy.

**MIB Objects**

```
alaDaUNPProfileTable
  alaDaUNPProfileName
  alaDaUNPProfileLocationPolicy
```

---

## unp profile period-policy

Configures the period policy attribute for the specified profile. Use this command to assign the name of an existing UNP period policy to a profile. This type of policy specifies the days and times during which a device can access the network.

**unp profile** *profile\_name* **period-policy** *policy\_name*

**no unp profile** *profile\_name* **period-policy**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>policy_name</i>	The name of an existing UNP period policy.

### Defaults

By default, no profile attributes are enabled or defined when the profile is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the period policy name from the profile configuration.
- The period policy name specified with this command must already exist in the switch configuration.
- Profile location and time period policies are configurable on the switch or on the RADIUS server. If the policies are configured on both the switch and the RADIUS server, then the switch policies take precedence.
- If a UNP device does not meet the criteria applied through the period policy, the device role is changed to unauthorized.

### Examples

```
-> unp profile unp-profl period-policy office-time  
-> no unp profile unp-profl period-policy
```

### Release History

Release 8.3.1; command was introduced.

**Related Commands**

<b>unp profile</b>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<b>unp policy validity-period</b>	Configures a UNP period policy.
<b>show unp profile</b>	Displays the profile configuration for the switch.

**MIB Objects**

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfilePeriodPolicy
```

---

## unp profile captive-portal-authentication

Configures the status of Captive Portal (CP) authentication for the specified UNP profile. When enabled, the Captive Portal authentication process is triggered for devices classified into the profile.

**unp profile *profile\_name* captive-portal-authentication**

**no unp profile *profile\_name* captive-portal-authentication**

---

### Syntax Definitions

*profile\_name*                      The name of a UNP profile.

### Defaults

By default, Captive Portal authentication is disabled for the profile.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable Captive Portal authentication for the profile configuration.
- When CP authentication is enabled, the UNP user is assigned an implicit CP pre-login role to facilitate the CP authentication process with the configured CP RADIUS server.
- The CP profile associated with the UNP profile defines the CP RADIUS server to use for the CP authentication process. If a CP profile is not associated with the UNP profile, then the server defined in the global CP configuration for the switch is used instead.
- If CP authentication for the device is successful, the user role is automatically changed according to the CP pass policy list returned from the RADIUS server, if it is the highest precedence role known for the user.
- If CP authentication for the device fails, the user role will be changed to the last known highest precedence role for the user.

### Examples

```
-> unp profile unp-profl captive-portal-authentication
-> no unp profile unp-profl captive-portal-authentication
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

### **unp profile**

Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

### **show unp profile**

Displays the profile configuration for the switch.

## MIB Objects

alaDaUNPProfileTable

alaDaUNPProfileName

alaDaUNPProfileCPortalAuthentication

---

## unp profile captive-portal-profile

Configures the Captive Portal (CP) profile attribute for the specified profile. Use this command to assign the name of an existing CP profile to a profile. This type of profile defines a CP configuration that is applied to devices when CP authentication is enabled for the profile.

**unp profile** *profile\_name* **captive-portal-profile** *cp\_profile\_name*

**no unp profile** *profile\_name* **captive-portal-profile**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>cp_profile_name</i>	The name of an existing UNP Captive Portal profile.

### Defaults

By default, no CP profile is assigned to a profile.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the CP profile name from the profile configuration.
- The CP profile name specified with this command must already exist in the switch configuration.
- The configuration defined in the CP profile overrides the global CP configuration for the switch.

### Examples

```
-> unp profile unp-prof1 captive-portal-profile cp-prof  
-> no unp profile unp-prof1 captive-portal-profile
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp profile</a>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<a href="#">captive-portal-profile</a>	Configures a Captive Portal profile.

  alaDaUNPProfileName  
  alaDaUNPProfileCPortalProfile
```

---

## unp profile authentication-flag

Configures the authentication flag status for the specified UNP profile. When enabled, only devices successfully authenticated are classified into the profile.

**unp profile *profile\_name* authentication-flag**

**no unp profile *profile\_name* authentication-flag**

---

### Syntax Definitions

*profile\_name*                      The name of a UNP profile.

### Defaults

By default, the authentication flag is disabled for the profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable the authentication flag for the profile configuration.
- When the authentication flag is enabled for a profile, devices that did not pass L2 authentication (802.1X or MAC) are not allowed into the profile. However, other configured classification options are applied to such devices to determine the appropriate network access control for that device.

### Examples

```
-> unp profile unp-profl authentication-flag  
-> no unp profile unp-profl authentication-flag
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

**unp profile**                      Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

**show unp profile**                Displays the profile configuration for the switch.

### MIB Objects

```
alaDaUNPProfileTable  
    alaDaUNPProfileName  
    alaDaUNPProfileAuthenticationFlag
```

---

## unp profile mobile-tag

Configures the mobile tag status for the specified UNP profile. When enabled, the first user that is learned on a UNP port and classified into the specified UNP profile will cause the UNP port to be added as a tagged member of the VLAN associated with the profile. If the profile is mapped to a service, a tagged virtual port association is created.

**unp profile** *profile\_name* **mobile-tag**

**no unp profile** *profile\_name* **mobile-tag**

---

### Syntax Definitions

*profile\_name*                      The name of a UNP profile.

### Defaults

By default, the mobile tag status is disabled for the profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable the mobile tag status for the profile configuration.
- When the mobile tag status is disabled for a profile, any user device classified into the profile will remain learned in that profile. In this case, the tagged/untagged VLAN-port association would be determined based on the user traffic which was learned as tagged or untagged, respectively.
- If the device port is already an untagged member of the VLAN associated with the profile, then a tagged association is not created.

### Examples

```
-> unp profile unp-profl mobile-tag  
-> no unp profile unp-profl mobile-tag
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

### **unp profile**

Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.

### **show unp profile**

Displays the UNP profile configuration for the switch.

## MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMobileTag
```

---

## unp profile redirect

Configures the redirect status for the specified UNP profile. When enabled, the profile will interact with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

**unp profile** *profile\_name* **redirect**

**no unp profile** *profile\_name* **redirect**

---

### Syntax Definitions

*profile\_name*                      The name of a UNP profile.

### Defaults

By default, the redirect status is disabled for the profile.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to disable the redirect status for the profile configuration.
- The name of the OmniSwitch profile that has the redirect option enabled must also exist in the UPAM or CPPM configuration.
- Enabling the redirect option applies only to UNP profiles that are mapped to VLANs.
- To ensure proper redirection for devices classified into the profile, configure the redirection server as the preferred server through authentication, authorization, and accounting (AAA) commands for MAC and 802.1X authentication.

### Examples

```
-> unp profile unp-prof1 redirect
-> no unp profile unp-prof1 redirect
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp profile</a>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<a href="#">show unp profile</a>	Displays the profile configuration for the switch.
<a href="#">show unp profile map</a>	Displays the mapping configuration for UNP profiles.

## MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileRedirect
```

---

## unp profile maximum-ingress-bandwidth

Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified profile.

**unp profile** *profile\_name* **maximum-ingress-bandwidth** *bps*[**k** | **m**]

**no unp profile** *profile\_name* **maximum-ingress-bandwidth**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i> [ <b>k</b>   <b>m</b> ]	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> ).

### Defaults

By default, the maximum ingress bandwidth value is not defined for the profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress bandwidth value for the specified profile. If a maximum ingress depth value is set for the same profile, then both the maximum ingress bandwidth and depth values must be removed together (on the same command line).
- If the maximum ingress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum ingress bandwidth value is set to zero, then all ingress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

### Examples

```
-> unp profile unp-profl maximum-ingress-bandwidth 100
-> unp profile unp-profl maximum-ingress-bandwidth 10m
-> no unp profile unp-profl maximum-ingress-bandwidth

-> unp profile unp-profl maximum-ingress-bandwidth 100
-> unp profile unp-profl maximum-ingress-depth 50
-> no unp profile unp-profl maximum-ingress-bandwidth maximum-ingress-depth
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<b>unp profile</b>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<b>unp profile maximum-ingress-depth</b>	Configures how much the traffic can burst over the maximum ingress bandwidth rate.
<b>show unp profile</b>	Displays the profile configuration for the switch.
<b>show unp port bandwidth</b>	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

## MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxIngressBandwidth
```

---

## unp profile maximum-egress-bandwidth

Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified profile.

**unp profile** *profile\_name* **maximum-egress-bandwidth** *bps*[**k** | **m**]

**no unp profile** *profile\_name* **maximum-egress-bandwidth**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i> [ <b>k</b>   <b>m</b> ]	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> ).

### Defaults

By default, the maximum egress bandwidth value is not defined for the profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the maximum egress bandwidth value for the specified profile. If a maximum egress depth value is set for the same profile, then both the maximum egress bandwidth and depth values must be removed together (on the same command line).
- If the maximum egress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum egress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

### Examples

```
-> unp profile unp-profl maximum-egress-bandwidth 100
-> unp profile unp-profl maximum-egress-bandwidth 10m
-> no unp profile unp-profl maximum-egress-bandwidth

-> unp profile unp-profl maximum-egress-bandwidth 100
-> unp profile unp-profl maximum-egress-depth 50
-> no unp profile unp-profl maximum-egress-bandwidth maximum-egress-depth
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<b>unp profile</b>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<b>unp profile maximum-egress-depth</b>	Configures how much the traffic can burst over the maximum egress bandwidth rate.
<b>show unp profile</b>	Displays the profile configuration for the switch.
<b>show unp port bandwidth</b>	Displays the bandwidth parameter values applied to a UNP port or link aggregate.

## MIB Objects

```
alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxEgressBandwidth
```

---

## unp profile maximum-ingress-depth

Configures the maximum ingress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP profile. This value determines how much the traffic can burst over the maximum ingress bandwidth rate.

```
unp profile profile_name maximum-ingress-depth bps
```

```
no unp profile profile_name maximum-ingress-depth
```

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i>	The maximum ingress depth value in Kbps. The valid range is 0–16384.

### Defaults

By default, the maximum ingress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress depth value from the profile.
- The maximum ingress depth value is configured in conjunction with the maximum ingress bandwidth parameter. When the ingress depth value is reached, the switch starts to drop packets.
- Configure the maximum ingress bandwidth rate (**unp profile maximum-ingress-bandwidth**) before attempting to set the maximum ingress depth value.
- The maximum ingress bandwidth and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

### Examples

```
-> unp profile unp-profl maximum-ingress-bandwidth 10
-> unp profile unp-profl maximum-ingress-depth 5
-> no unp profile unp-profl maximum-ingress-depth
```

### Release History

Release 8.3.1; command was introduced.

  alaDaUNPProfileName  
  alaDaUNPProfileMaxIngressDepth
```

---

## unp profile maximum-egress-depth

Configures the maximum egress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP profile. This value determines how much the traffic can burst over the maximum egress bandwidth rate.

**unp profile** *profile\_name* **maximum-egress-depth** *bps*

**no unp profile** *profile\_name* **maximum-egress-depth**

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>bps</i>	The maximum egress depth value in Kbps. The valid range is 0–16384.

### Defaults

By default, the maximum egress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the maximum egress depth value from the profile.
- The maximum egress depth value is configured in conjunction with the maximum egress bandwidth parameter. When the egress depth value is reached, the switch starts to drop packets.
- Configure the maximum egress bandwidth rate (**unp profile maximum-egress-bandwidth**) before attempting to set the maximum egress depth value.
- The maximum egress bandwidth and depth values are applied to the port of a user device that is classified into the specified profile.
  - If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.
  - Bandwidth parameter values are *not* applied to UNP link aggregates that are assigned to the profile.

### Examples

```
-> unp profile unp-profl maximum-egress-bandwidth 10
-> unp profile unp-profl maximum-egress-depth 5
-> no unp profile unp-profl maximum-egress-depth
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

alaDaUNPProfileTable  
  alaDaUNPProfileName  
  alaDaUNPProfileMaxEgressDepth
```

---

## unp profile inactivity-interval

Configures whether or not an authenticated device is automatically logged out of the network after a specific period of inactivity (MAC address for the device has aged out). This timer value applies only to devices learned in the specified profile.

**unp profile *profile\_name* inactivity-interval *seconds***

---

### Syntax Definitions

<i>profile_name</i>	The name of a UNP profile.
<i>seconds</i>	The inactivity timer value. The valid range is 10 to 600 seconds.

### Defaults

By default, the inactivity interval value is set to 10 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Make sure the configured inactivity interval time is set to a value greater than the MAC address aging time for the switch.
- When a specific time is configured for the inactivity interval timer, the device is not logged out of the network if the MAC address aging time expires before the configured timer value.
- When the inactivity interval time is changed for the profile, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- If a user undergoes MAC authentication and then secondary Captive Portal authentication, the higher of the two inactivity logout timer values returned is applied to the device.
- An inactivity logout timer value is also configurable through authentication, authorization, and accounting (AAA) commands. The value set through the AAA commands takes precedence over the inactivity interval value set for the UNP.

### Examples

```
-> unp profile unp-profl inactivity-interval 500
-> unp profile unp-profl inactivity-interval 10
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

---

## unp profile saa-profile

Assigns a Service Assurance Agent (SAA) profile to the specified UNP profile. Although an SAA profile can be assigned to a UNP profile with this command, an SAA profile is mainly used by the OmniVista network management application to monitor connections between virtual machines (VMs) in a data center network.

**unp profile** *profile\_name* **saa-profile** *profile\_name*

**no unp profile** *profile\_name* **saa-profile**

---

### Syntax Definitions

**profile** *profile\_name*            The name of a UNP profile.

**saa-profile** *profile\_name*        The name of the SAA profile to assign to the UNP profile.

### Defaults

By default, no SAA profile is assigned to a UNP profile.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove an SAA profile assignment from a UNP profile configuration.
- The SAA profile specified with this command must already exist in the switch configuration.

### Examples

```
-> unp profile unp-profl saa-profile saal  
-> no unp profile unp-profl saa-profile
```

### Release History

Release 8.3.1; command was introduced.

**Related Commands**

<b>unp profile</b>	Configures a UNP profile. This type of profile is applied to traffic learned on UNP ports and link aggregates.
<b>unp saa-profile</b>	Configures an SAA profile.

  alaDaUNPProfileName  
  alaDaUNPProfileSaaProfile
```

---

## unp profile map vlan

Configures the mapping of a standard VLAN to a UNP profile. When a device is assigned to a profile through authentication or classification, the device and the port on which the device was learned are dynamically assigned to the VLAN that is mapped to the profile.

```
unp profile profile_name map vlan vlan_id
```

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
<i>vlan_id</i>	The VLAN ID number to associate with the specified profile name. Devices assigned to the profile are assigned to the associated VLAN.

### Defaults

By default, no mapping configuration is applied to a profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Removing a VLAN mapping configuration requires deleting the entire profile from the switch configuration (**no unp profile *profile\_name***).
- The VLAN associated with a profile must already exist in the switch configuration, unless one of the following conditions occur:
  - The dynamic VLAN configuration functionality is enabled for the switch.
  - The VLAN mapping to a profile is done when the switch boots up.
- Configuring a new VLAN mapping for a profile will overwrite the existing VLAN mapping for that profile. Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.

### Examples

```
-> unp profile unp1-vlan map vlan 10  
-> no unp profile unp1-vlan
```

### Release History

Release 8.3.1; command was introduced.

    alaDaUNPProfileName  
alaDaUNPProfileMapVlanTable  
    alaDaUNPProfileMapVlanVlanID
```

---

## unp profile map service-type spb

Configures the mapping of Shortest Path Bridging (SPB) parameters to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, an SPB service access point (SAP) is automatically created using the specified profile parameters. Traffic from the device is then forwarded on the SAP.

**unp profile** *profile\_name* **map service-type spb tag-value** {0 | *qtag* | *outer\_qtag:inner\_qtag*} **isid** *instance\_id* **bvlan** *bvlan\_id* [**multicast-mode** {**headend** | **tandem**}] [**vlan-xlation**]

**no unp profile** *profile\_name* **map service-type spb** [**vlan-xlation**]

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
<b>0</b>	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>qtag</i>	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
<i>outer_qtag:inner_qtag</i>	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
<i>instance_id</i>	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
<i>bvlan_id</i>	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
<b>headend</b>	Specifies the head-end replication mode for the service associated with this UNP.
<b>tandem</b>	Specifies the tandem replication mode for the service associated with this UNP.
<b>vlan-translation</b>	Configures egress VLAN translation for the service associated with this UNP.

### Defaults

By default, no mapping configuration is applied to a profile. When the SPB mapping is configured, the following default values are applied for the optional parameters:

parameter	default
<b>multicast-mode</b> { <b>headend</b>   <b>tandem</b> }	headend
<b>vlan-xlation</b>	disabled

### Platforms Supported

OmniSwitch 6900, 6860, 6865

## Usage Guidelines

- Use the **no** form of this command to disable VLAN translation for the profile. To remove any other SPB mapping parameter requires deleting the entire profile from the switch configuration (**no unp profile profile\_name**).
- Configuring a new SPB mapping for a profile will overwrite the existing SPB mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the SPB service that is dynamically created based on the specified I-SID and BVLAN values.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and I-SID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one for the profile traffic.
- If the I-SID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- The BVLAN ID specified with this command must already exist in the switch configuration.
- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.
- When an SPB service is configured to use the head-end multicast mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When an SPB service is configured to use the tandem multicast mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.

## Examples

```
-> unp profile unp1-spb map service-type spb tag-value 10 isid 1510 bvlan 4001
-> unp profile unp2-spb map service-type spb tag-value 20 isid 1520 bvlan 4002
multicast-mode tandem vlan-xlation
-> no unp profile unp2-spb map service-type spb vlan-xlation
-> no unp profile unp1-spb
```

## Release History

## unp profile map service-type vxlan

Configures the mapping of Virtual eXtensible LAN (VXLAN) parameters to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, a VXLAN service access point (SAP) is automatically created using the specified profile parameters. Traffic from the device is then forwarded on the SAP.

```
unp profile profile_name map service-type vxlan tag-value {0 | qtag | outer_qtag:inner_qtag} vnid
vxlan_id {far-end-ip-list ip_list_name [multicast-group mc_group_address] | multicast-group
mc_group_address [far-end-ip-list ip_list_name]} [multicast-mode [tandem | headend | hybrid] [vlan-
xlation]
```

```
no unp profile profile_name map service-type vxlan [far-end-ip-list | multicast-group | vlan-xlation]
```

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
<b>0</b>	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>qtag</i>	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
<i>outer_qtag:inner_qtag</i>	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
<i>vxlan_id</i>	The VXLAN network identifier that identifies the VLAN segment form where the frames originate. This value is used to create the VXLAN service that is required to dynamically create the SAP.
<i>ip_list_name</i>	The name of an existing list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEPs). The valid range is 1–32 characters. The IP addresses in this list are used to dynamically create service distribution points (SDPs) for the VXLAN service.
<i>mc_group_address</i>	The multicast IP address of the group to which this service will join.
<b>tandem</b>	Specifies the tandem replication mode for the service associated with this UNP. This mode uses PIM routing and sends traffic through multicast SDPs.
<b>headend</b>	Specifies the head-end replication mode for the service associated with this UNP. This mode sends traffic through unicast SDPs.
<b>hybrid</b>	Specifies the hybrid replication mode for the service associated with this UNP. This mode uses both the head-end and tandem methods.
<b>vlan-translation</b>	Configures egress VLAN translation for the VXLAN service associated with this UNP.

## Defaults

By default, no mapping configuration is applied to a profile. When the VXLAN mapping is configured, the following default values are applied for the optional parameters:

parameter	default
<b>multicast-mode</b> { <b>headend</b>   <b>tandem</b> }	tandem
<b>vlan-xlation</b> { <b>enable</b>   <b>disable</b> }	disabled

## Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

## Usage Guidelines

- Use the **no** form of this command to disable VLAN translation, remove a far-end IP list, or remove a multicast group IP address for the profile. To remove any other VXLAN mapping parameter requires deleting the entire profile from the switch configuration (**no unp profile** *profile\_name*).
- Configuring a new VXLAN mapping for a profile will overwrite the existing VXLAN mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the VXLAN service that is dynamically created based on the specified VXLAN ID value.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP on which the traffic is forwarded.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is forwarded on the SAP. If the traffic tags do not match, traffic is not forwarded on the SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags). If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one based on the profile attributes for the profile traffic.
- If the VXLAN ID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.

- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.
- The same far-end IP list can be used for multiple services that have to reach the same set of far-end VTEPs.
- Configuring both a far-end IP list and a multicast group IP address is allowed for the same profile.
- The following multicast modes are supported for a VXLAN service:
  - **Tandem:** In this mode, PIM multicast routing is required to discover the neighbor nodes and assign membership to VTEP nodes that desire to be in the same multicast group. This also requires the manual configuration of a multicast SDP object to tunnel traffic to the other VTEP nodes that belong to the same multicast group.
  - **Headend:** In this mode, unicast SDP objects are manually configured to tunnel traffic to the far-end nodes. In this case, PIM multicast routing is not required. Any BUM traffic is replicated and one copy is sent to each VTEP node as specified by the unicast SDP object.
  - **Hybrid:** In this mode, traffic is tunneled from this service instance to both a group of VTEPs that belong to the same multicast group address and to the VTEP nodes that are not associated with the same multicast group address.
- Enabling VLAN translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.

## Examples

```
-> unp profile unp1-vxlan map service-type vxlan tag-value 10:12 vnid 100
multicast-group 225.1.1.1
-> unp profile unp2-vxlan map service-type vxlan tag-value 15 vnid 200 far-end-ip-
list vtep-list1 vlan-xlation
-> unp profile unp3-vxlan map service-type vxlan tag-value 0 vnid 200 far-end-ip-
list vtep-list2 multicast-group 225.1.1.2
-> no unp profile unp3-vxlan map service-type vxlan vlan-xlation far-end-ip-list
-> no unp profile unp2-vxlan
```

## unp vxlan far-end-ip-list

Configures a list of IP addresses, each of which is assigned to the Loopback0 interface of a far-end VXLAN node. The list name is assigned to a profile through the mapping of VXLAN service parameters to the profile. This allows multiple far-end nodes to be associated with the service created for the VXLAN Network ID (VNID) specified in the VXLAN profile.

```
unp vxlan far-end-ip-list ip_list_name ip_address [ip_address]
```

```
no unp vxlan far-end-ip-list ip_list_name [ip_address [ip_address]]
```

---

### Syntax Definitions

<i>ip_list_name</i>	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEP). The valid range is 1–32 characters.
<i>ip_address</i>	The IP address of the Loopback0 interface for the far-end VTEP node. The Loopback0 address is required on every VXLAN node that serves as a VTEP. Use a space to specify a list of IP addresses to assign to the list name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

### Usage Guidelines

- Use the **no** form of this command to remove the far-end list from the switch configuration or to remove an individual IP address from the list.
- The reachability of a far-end IP address is not tested. Make sure the addresses are valid before adding them to the list.
- There is no limit to the number of IP addresses that can be assigned to a single list.
- The same far-end IP list can be used for multiple services that have to reach the same set of far-end VTEPs.
- The far-end IP list is used to build service distribution points (SDPs) for VXLAN services.
- When there is any change to the VXLAN profile, all users associated with that profile are flushed.

### Examples

```
-> unp vxlan far-end-ip-list vtep-list1 10.1.1.1 11.1.1.1 12.1.1.1 13.1.1.1
-> no unp vxlan far-end-ip-list vtep-list1 10.1.1.1
-> no unp vxlan far-end-ip-list vtep-list1
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

---

## unp profile map service-type l2gre

Configures the mapping of a Layer 2 Generic Routing Encapsulation (L2 GRE) tunnel to the specified UNP profile. When a device is dynamically assigned to the profile through authentication or classification, an L2 GRE Service Access Point (SAP) is automatically created using the specified parameters. Traffic from the device is then encapsulated and forwarded through the GRE tunnel to a Guest Tunnel Termination Switch (GTTS).

```
unp profile profile_name map service-type l2gre tag-value 0 vpnid vpn_id {far-end-ip-list  
ip_list_name | far-end-ip ip_address}
```

```
no unp profile profile_name map service-type l2gre [far-end-ip-list | far-end-ip]
```

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
<b>0</b>	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>vpn_id</i>	A GRE tunnel Virtual Private Network (VPN) ID. This is a unique value that is used in the header of a GRE encapsulated packet and should be the same at both ends of a Guest Tunnel.
<i>ip_list_name</i>	The name of an existing list that contains the IP address of the Loopback0 interface configured on the far-end GTTS. The valid range is 1–32 characters. The IP address in this list is used to dynamically create the L2 GRE tunnel from the edge switch to the GTTS.
<i>ip_address</i>	The IP address of the Loopback0 interface configured on the far-end GTTS.

### Defaults

By default, no mapping configuration is applied to a profile.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a far-end IP list or a far-end IP address for the profile. To remove any other L2 GRE mapping parameters requires deleting the entire profile from the switch configuration (**no unp profile** *profile\_name*).
- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the L2 GRE tunnel that is dynamically created based on the specified VPN ID value.

---

**Note.** This command is used to configure the mapping of an L2 GRE tunnel to a profile to create a Guest Tunnel endpoint on an edge switch. The Guest Tunnel feature requires the guest traffic to be untagged, so only the zero tag value is supported with this command.

---

- Configuring a new L2 GRE tunnel mapping for a profile will overwrite the existing tunnel mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, L2 GRE tunnel, or static) is associated with a profile at any given time. In addition, only one profile on each switch can be mapped to an L2 GRE tunnel.
- If a profile is mapped to a VLAN or an L2 GRE tunnel, then the profile is applied to traffic received on UNP bridge ports.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- UNP first checks the switch configuration to see if an L2 GRE tunnel SAP already exists for the expected VPN ID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one based on the profile attributes for the profile traffic.
- If the GRE tunnel VPN ID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the UNP GRE tunnel profile are learned as filtering.
- The same far-end IP address can be used for multiple L2 GRE tunnels that have to reach the same far-end GTTS.

## Examples

```
-> unp profile guest-profile map service-type l2gre tag-value 0 vpnid 100 far-end-  
ip 192.168.10.1  
-> unp profile guest-profile map service-type l2gre tag-value 0 vpnid 100 far-end-  
ip-list gtts-list  
-> no unp profile guest-profile map service-type l2gre far-end-ip  
-> no unp profile guest-profile
```

## Release History

Release 8.4.1.R02; command was introduced.

## Related Commands

  alaDaUNPProfileMapL2GreRowStatus
```

---

## unp l2gre far-end-ip-list

Configures an IP address list that contains the IP address of the Loopback0 interface configured on the far-end Guest Tunnel Termination Switch (GTTS). The list name is assigned to a profile through the mapping of L2 GRE tunnel parameters to the profile.

```
unp l2gre far-end-ip-list ip_list_name ip_address
```

```
no unp l2gre far-end-ip-list ip_list_name [ip_address]
```

---

### Syntax Definitions

<i>ip_list_name</i>	The name of the list that contains the IP address for the far-end GTTS. The valid range is 1–32 characters.
<i>ip_address</i>	The IP address of the Loopback0 interface for the far-end GTTS.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the far-end list from the switch configuration or to remove the IP address from the list.
- Only one IP address can be assigned to a single list.
- The reachability of a far-end IP address is not tested. Make sure the address is valid before adding them to the list.
- The same far-end IP list can be used on multiple L2 GRE tunnel edge switches that have to reach the same GTTS (also referred to as an aggregation switch).
- The far-end IP list is used to build L2 GRE tunnels to the GTTS.
- When there is any change to the L2 GRE profile associated with the far-end IP list, all users associated with that profile are flushed.

### Examples

```
-> unp l2gre far-end-ip-list l2gre-ip-list 192.168.10.1  
-> no unp l2gre far-end-ip-list l2gre-ip-list 192.168.10.1  
-> no unp l2gre far-end-ip-list l2gre-ip-list
```

### Release History

```

---

## unp profile map service-type static

Configures the mapping of an existing Shortest Path Bridging (SPB) or Virtual eXtensible LAN (VXLAN) service ID to the specified UNP profile. This type of profile mapping is only valid if the specified SPB or VXLAN service is already configured; the switch does not dynamically create the service. The specified service ID is then used to dynamically create a service access point (SAP) based on the specified tag value.

**unp profile** *profile\_name* **map service-type static tag-value** {0 | *qtag* | *outer\_qtag:inner\_qtag*} **service-id** *service\_id*

---

### Syntax Definitions

<i>profile_name</i>	The name of an existing UNP profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
<i>qtag</i>	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
<i>outer_qtag:inner_qtag</i>	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
<i>service_id</i>	An existing (statically configured) numerical value that identifies a specific SPB or VXLAN service. The valid service ID range is 1–32767.

### Defaults

By default, no mapping configuration is applied to a profile.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Removing a static service mapping configuration requires deleting the entire profile from the switch configuration (**no unp profile** *profile\_name*).
- Configuring a new static service mapping for a profile will overwrite the existing static service mapping for that profile.
- Any change to the mapping configuration of the profile will flush all MAC addresses learned on that profile.
- Only one type of profile mapping (VLAN, SPB, VXLAN, or static) is associated with a profile at any given time.
- If a profile is mapped to SPB, VXLAN, or static service parameters, then the profile is applied to traffic received on UNP access ports.
- If a profile is mapped to a VLAN, then the profile is applied to traffic received on UNP bridge ports.

- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the service ID value specified with this command.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and service ID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates one for the profile traffic.
- When there is a MAC flush for all UNP users learned and forwarded on the static service ID:
  - UNP triggers the removal of all dynamic SAPs associated with the service ID.
  - The service ID is not removed because the service was statically created; not dynamically generated through UNP.
- A static service ID cannot be removed until all the UNP users learned and forwarded on that service and associated SAPs are deleted.

## Examples

```
-> unp profile unp1-static map service-type static tag-value 10 service-id 1
-> unp profile unp2-static map service-type static tag-value 20 service-id 2
-> no unp profile unp1-static
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<b>unp profile</b>	Configures a UNP profile.
<b>unp profile map vlan</b>	Maps VLAN IDs to a UNP profile. Traffic assigned to the profile is forwarded on the associated VLAN IDs.
<b>unp profile map service-type spb</b>	Maps SPB parameters to a profile. The parameters are used for creating an SPB service access point (SAP) to forward profile traffic.
<b>unp profile map service-type vxlan</b>	Maps VXLAN parameters to a profile. The parameters are used for creating a VXLAN service access point (SAP) to forward profile traffic.
<b>show unp profile map</b>	Displays the VLAN or service mapping configuration for the profile.

```
alaDaUNPProfileTable
  alaDaUNPProfileName
alaDaUNPProfileMapStaticTable
  alaDaUNPProfileMapStaticEncapVal
  alaDaUNPProfileMapStaticServiceID
```

---

## unp saa-profile

Configures a Service Assurance Agent (SAA) performance monitoring profile. This type of profile is assigned to UNP profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP profile.

**unp saa-profile** *profile\_name* [**jitter-threshold** *jitter\_thresh*] [**latency-threshold** *latency\_thresh*]

**no unp saa-profile** *profile\_name*

---

### Syntax Definitions

<i>profile_name</i>	The name to assign to the SAA profile.
<i>jitter_thresh</i>	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
<i>latency_thresh</i>	The latency threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

### Defaults

parameter	default
<i>jitter_thresh</i>	0 (disabled)
<i>latency_thresh</i>	0 (disabled)

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the SAA profile from the switch configuration.
- Although SAA profiles can be configured and assigned to a UNP through the CLI, these profiles are mainly used by the OmniVista network management application to trigger SAA sessions that monitor connections between virtual machines (VMs) in a data center network.
- Assigning SAA profiles is supported only with UNP profiles that are assigned to UNP bridge ports. UNP access ports do not support this functionality.

### Examples

```
-> unp saa-profile unp_saa1 jitter-threshold 100 latency-threshold 500
-> unp saa-profile unp_saa2 jitter-threshold 150
-> unp saa-profile unp_saa3 latency-threshold 250
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

<code>unp profile</code>	Configures a UNP profile.
<code>show unp saa-profile</code>	Displays the SAA profile configuration for the switch.
<code>show unp profile</code>	Displays the profile configuration for the switch.

```
alaDaSaaProfileTable  
  alaDaSaaProfileName  
  alaDaSaaProfileLatencyThreshold  
  alaDaSaaProfileJitterThreshold
```

---

## unp port-type

Configures UNP functionality for the specified port or link aggregate. This includes configuring the UNP port type (bridge or access). Traffic received on a UNP bridge port is classified using VLAN profiles and port attributes. Traffic received on a UNP access port is classified using service profiles and port attributes.

**unp** {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id1*[-*agg\_id2*]} port-type {access | bridge}

**no unp** {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id1*[-*agg\_id2*]}

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id1</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
<b>access</b>	Configures the specified port or link aggregate as a service access port. This port type is used for classifying traffic into service-based profiles.
<b>bridge</b>	Configures the specified port or link aggregate as a standard bridge port. This port type is used for classifying traffic into VLAN-based profiles.

### Defaults

By default, UNP is disabled on all ports and link aggregates.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the UNP configuration from a port or link aggregate.
- Any configuration change to a UNP-enabled port will flush all MAC addresses learned on that port. This applies only to CLI commands used to configure UNP port parameters.
- Only one UNP port type is configurable for a specific port or link aggregate. To change the port type of an existing UNP port, remove the current UNP configuration first using the **no unp port** or **no unp linkagg** command then use the **unp port-type** command to set the new port type.
- There is no limit to the number of switch ports that can have UNP enabled.
- Enabling UNP is *not* supported on the following switch ports:
  - 802.1q-tagged ports.
  - MVRP ports.
  - Port Mirroring destination ports (MTP).
  - Port Mapping network ports.
  - STP and ERP ports.

- Ports on which a static MAC address is configured.
  - Ports on which dynamic Source Learning is disabled.
  - VLAN Stacking (Ethernet Services NNI or UNI) ports.
  - Service Manager access and network ports.
  - Ethernet OAM ports.
  - Edge Virtual Bridging (EVB) ports.
- UNP and Learned Port Security (LPS) are supported on the same port with the following conditions:
    - LPS is not supported on link aggregates.
    - The LPS learning window is set globally but not on a per-port basis. So the window applies to all UNP ports.
    - When LPS is enabled or disabled on a UNP bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
    - Configuring a static MAC address is not allowed on a UNP port unless LPS is also enabled on the same port.
    - When both LPS and UNP are enabled on the same port, UNP first authenticates and classifies any MAC addresses received, then LPS rules are applied. If a MAC address violates any of the LPS rules for the port, the address may get filtered or the port violated even if UNP initially determined the address was valid. In other words, LPS rules take precedence over UNP to determine if a MAC address is bridged or filtered on the port.
    - If UNP classifies a MAC address as learning but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
    - When a MAC address is filtered by LPS, the `show unp user` command will display “LPS-Blocked” as the classification source for that MAC address.
  - UNP ports support both tagged and untagged packets. If the VLAN ID of a tagged packet matches the VLAN associated with a UNP into which the packet was classified, the packet is learned as forwarding and a tagged VLAN-port association is created. However, if the VLAN ID tag does not match the VLAN ID associated with the profile, the packet is filtered.
  - UNP bridge and access ports support single-tagged and double-tagged packets with the following conditions:
    - Double-tagged packets are treated the same as single-tagged packets in that UNP will only use the outer VLAN tag to determine how the packet is processed on the UNP bridge port.
    - UNP access ports use the inner VLAN tag of double-tagged packets received on the port to determine the service access port (SAP) to use or create for forwarding the traffic on the network backbone.

## Examples

```
-> unp port 1/1 port-type access
-> unp port 1/1-3 port-type bridge
-> unp port 1/10 port-type access
-> no unp port 1/10

-> unp linkagg 5 port-type access
-> unp linkagg 8 port-type bridge
-> unp linkagg 2 port-type access
-> no unp linkagg 2
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp admin-state</a>	Configures the administrative status of the UNP configuration for the specified port or link aggregate.
<a href="#">unp profile</a>	Configures a UNP profile that is used to classify traffic received on UNP ports.
<a href="#">show unp port</a>	Displays the UNP configuration for the port.

  alaDaUNPPortIfIndex  
  alaDaUNPPortType
```

---

## unp l2-profile

Assigns an existing Layer 2 profile to the specified UNP access port. This profile determines how Layer 2 protocol frames received on the access port are processed.

**unp** {port chassis/slot/port[-port2] / linkagg agg\_id[-agg\_id2]} **l2-profile** l2profile\_name

**no unp** {port chassis/slot/port[-port2] / linkagg agg\_id[-agg\_id2]} **l2-profile**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The chassis number and the slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>l2profile_name</i>	The name of an existing Layer 2 profile.

### Defaults

By default, the Layer 2 profile “unp-def-access-profile” is assigned when a port is configured as a UNP access port.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the Layer 2 profile configuration from the UNP port.
- Specify only ports or link aggregates that are configured as UNP access ports. This command does not apply to UNP bridge ports.
- Specify a Layer 2 profile name that already exists in the switch configuration. Layer 2 profiles are created using the [service l2profile](#) command.

### Examples

```
-> unp port 1/1/3 l2-profile sap_1_profile
-> unp linkagg 10 l2-profile sap_1_profile
-> unp port 1/1/3 l2-profile unp-def-access-profile
-> unp linkagg 10 l2-profile unp-def-access-profile
-> no unp port 1/1/3 l2-profile
-> no unp linkagg 10 l2-profile
```

### Release History

Release 8.4.1; command was introduced.

## Related Commands

**unp port-type**

Configures UNP functionality on a port or link aggregate.

**service l2profile**

Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames ingressing on the access port.

**show service l2profile**

Displays the Layer 2 profile configuration information for the bridge.

**show unp port config**

Displays the UNP configuration for the port.

## MIB Objects

alaDaUNPPortTable

alaDaUNPPortIfIndex

alaDaUNPPortL2Profile

---

## unp redirect port-bounce

Enables or disables the port bounce action on the specified UNP bridge port or globally on all UNP bridge ports. When enabled, a port bounce is triggered upon receipt of a RADIUS Change of Authorization (COA) or a Disconnect request (DM) message from a redirection server to enforce a user role or terminate a user session.

**unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} redirect port-bounce**

**no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} redirect port-bounce**

**unp redirect port-bounce {enable | disable}**

---

### Syntax Definitions

<i>chassis/slot/port</i> [- <i>port2</i> ]	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>enable</b>	Globally enables the port bounce function for all UNP bridge ports.
<b>disable</b>	Globally disables the port bounce function for all UNP bridge ports.

### Defaults

By default, port bounce is disabled on all UNP bridge ports.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **port** or **linkagg** parameter to enable port bounce for a specific UNP bridge port or link aggregate. Use the **no** form of this command to disable port bounce for a specific UNP bridge port or link aggregate. Note that port bounce is not supported on UNP access ports.
- Use the **enable** or **disable** parameters to globally enable or disable the port bounce status for all UNP bridge ports or link aggregates on the entire switch.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.
- The port bounce action only applies to a MAC authenticated non-suppliant (non-802.1X device). If the device is a suppliant (802.1X device), then an EAP-Fail frame is sent instead. In both cases, re-authentication is triggered for both types of devices.
- The port-level setting of the port bounce action overrides the global setting for the switch. The following table indicates when a port is toggled based on the status of port bounce at the global and port level:

Global Port Bounce	Per-Port Bounce	Action
Enabled	Disabled	Port is not toggled
Enabled	Enabled	Port is toggled
Disabled	Enabled	Port is toggled
Disabled	Disabled	Port is not toggled

- This command is used when configuring the switch to interact with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

## Examples

Port-level configuration example:

```
-> unp port 1/1/6 redirect port-bounce
-> no unp port 1/1/6 redirect port-bounce
```

Global configuration example:

```
-> unp redirect port-bounce enable
-> unp redirect port-bounce disable
```

## Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **no** form of this command added for specific port or link aggregate configuration.

## unp 802.1x-authentication

Configures the status of 802.1X authentication for the specified UNP port. Enable this functionality to invoke 802.1X-based authentication for devices connected to the UNP port.

**unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} 802.1x-authentication**

**no unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} 802.1x-authentication**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

### Defaults

By default, 802.1X authentication is enabled on UNP ports.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable 802.1X authentication on a UNP port or link aggregate.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- An option exists to classify a device into an alternate UNP in the event successful 802.1X authentication does not return a UNP name. See the [unp 802.1x-authentication pass-alternate](#) command.
- If UNP MAC authentication, 802.1X authentication, and classification (see [unp classification](#) and [unp mac-authentication](#)) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured.
- Configuring an authentication server down UNP (see [unp auth-server-down](#)) is highly recommended when MAC or 802.1X authentication is enabled on VLAN bridge or SPB access ports or aggregates. This is because after a switch reload, traffic from devices connected to these types of ports and aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.

- The authentication server down functionality is *not* supported on VXLAN access ports or aggregates.

## Examples

```
-> unp port 1/1/5 802.1x-authentication
-> no unp port 1/1/5 802.1x-authentication

-> unp port 1/1/10-15 802.1x-authentication
-> no unp port 1/1/10-15 802.1x-authentication

-> unp linkagg 10 802.1x-authentication
-> no unp linkagg 20 802.1x-authentication

-> unp linkagg 10-50 802.1x-authentication
-> no unp linkagg 10-50 802.1x-authentication
```

## Release History

Release 7.3.4; command was introduced.

  alaDaUNPPortIfIndex
  alaDaUNPPort8021XAuthStatus
```

---

## unp 802.1x-authentication pass-alternate

Configures the name of an existing UNP to use as an alternate profile. A device is assigned to the alternate profile when successful 802.1X authentication does not return the name of a profile.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **802.1x-authentication pass-alternate** *profile\_name*

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id*} **802.1X-authentication pass-alternate**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>profile_name</i>	The name of an existing VLAN, SPB, or VXLAN profile.

### Defaults

By default, no alternate UNP is configured.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- The profile name specified with this command must already exist in the switch configuration.

### Examples

```
-> unp port 1/1/1 802.1x-authentication pass-alternate Finance
-> unp port 1/1/1-3 802.1x-authentication pass-alternate CustomerA
-> no unp port 1/1/1-3 802.1x-authentication pass-alternate

-> unp linkagg 5 802.1x-authentication pass-alternate AltUNP
-> unp linkagg 10-15 802.1x-authentication pass-alternate CustomerB
-> no linkagg 5 mac-authentication pass-alternate
```

### Release History

Release 7.3.4; command was introduced.

Release 8.3.1; **vlan-profile**, **spb-profile**, and **vxlan-profile** parameters deprecated.

## Related Commands

<b>unp profile</b>	Configures a UNP profile that is used to classify traffic received on UNP ports.
<b>unp port-type</b>	Configures UNP functionality on a port or link aggregate.
<b>unp 802.1x-authentication</b>	Configures the 802.1X authentication status for the UNP port.

  alaDaUNPPortIfIndex  
  alaDaUNPPort8021XPassAltProfileName
```

---

## unp 802.1x-authentication tx-period

Configures the 802.1X authentication re-transmission time interval for the specified UNP port.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **802.1x-authentication tx-period**  
*seconds*

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **802.1x-authentication tx-period**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>seconds</i>	The amount of time before an EAP Request Identity is retransmitted. The valid range is 1–60 seconds.

### Defaults

By default, the retransmission period is set to 30 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to set the re-transmission time interval back to the default value of 30 seconds.
- The re-transmission time period only applies to UNP ports on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

### Examples

```
-> unp port 1/1/5 802.1x-authentication tx-period 60
-> unp port 1/1/6-10 802.1x-authentication tx-period 20
-> no unp port 1/1/5 802.1x-authentication tx-period

-> unp linkagg 10 802.1x-authentication tx-period 60
-> unp linkagg 20-25 802.1x-authentication tx-period 20
-> no unp linkagg 10 802.1x-authentication tx-period
```

### Release History

Release 7.3.4; command was introduced.

## unp 802.1x-authentication supp-timeout

Configures the 802.1X authentication supplicant timeout for the specified UNP port. This value is the amount of time the switch will wait before timing out an 802.1X user that is attempting to authenticate.

**unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} 802.1x-authentication supp-timeout *seconds***

**no unp {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} 802.1x-authentication supp-timeout**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15)
<i>seconds</i>	The timeout value. The valid range is 1–120 seconds.

### Defaults

By default, the supplicant timeout value is set to 30 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to set the supplicant timeout back to the default value of 30 seconds.
- Increase the supplicant timeout value if the authentication process requires additional steps by the user (for example, entering a challenge).
- The supplicant timeout is applied only to 802.1X users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

### Examples

```
-> unp port 1/1/5 802.1x-authentication supp-timeout 10
-> unp port 1/1/10-15 802.1x-authentication supp-timeout 60
-> no unp port 1/1/5 802.1x-authentication supp-timeout

-> unp linkagg 10 802.1x-authentication supp-timeout 40
-> unp linkagg 2-5 802.1x-authentication supp-timeout 40
-> no unp linkagg 10 802.1x-authentication supp-timeout
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

alaDaUNPPortTable  
  alaDaUNPPort8021XSuppTimeOut
```

---

## unp 802.1x-authentication max-req

Configures the maximum number of times the switch will retransmit a request for authentication information (request identity, password, challenge) to an 802.1X user on the specified UNP port.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication max-req
max_req
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} 802.1x-authentication max-req
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>max_req</i>	The maximum number of times information requests are retransmitted. The valid range is 1–3.

### Defaults

By default, the maximum number of requests is set to two.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to set the maximum number of times information requests are retransmitted back to the default value of two.
- The 802.1X requests are transmitted, up to the maximum number allowed, until the authentication session is shut down based on the supplicant timeout value configured for the 802.1X port.
- The maximum number of requests is applied only to 802.1X users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports within the range are skipped.

### Examples

```
-> unp port 1/1/5 802.1x-authentication max-req 10
-> unp port 1/1/10-15 802.1x-authentication max-req 5
-> no unp port 1/1/5 802.1x-authentication max-req

-> unp linkagg 10 802.1x-authentication max-req 10
-> unp linkagg 2-5 802.1x-authentication max-req 5
-> no unp linkagg 10 802.1x-authentication max-req
```

## Release History

Release 7.3.4; command was introduced.

alaDaUNPPort8021XMaxReq

---

## unp 802.1x-authentication bypass-8021x

Configures whether the 802.1X authentication process is bypassed on the specified UNP port. When enabled, the 802.1X device authentication process is skipped; only MAC authentication or rule-based classification is applied to device traffic on the UNP port.

**unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} 802.1x-authentication bypass-8021x**

**no unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} 802.1x-authentication bypass-8021x**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

### Defaults

By default, 801.1X authentication bypass is disabled on the UNP port; 802.1X authentication is attempted first.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- Enabling 802.1X authentication bypass is not allowed on UNP ports that are configured with an 802.1X authentication failure policy.

### Examples

```
-> unp port 1/1/5 802.1x-authentication bypass-8021x
-> no unp port 1/1/5 802.1x-authentication bypass-8021x
-> unp port 1/1/10-15 802.1x-authentication bypass-8021x
-> no unp port 1/1/10-15 802.1x-authentication bypass-8021x

-> unp linkagg 10 802.1x-authentication bypass-8021x
-> no unp linkagg 10 802.1x-authentication bypass-8021x
-> unp linkagg 2-5 802.1x-authentication bypass-8021x
-> no unp linkagg 2-5 802.1x-authentication bypass-8021x
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

<b>unp port-type</b>	Configures UNP functionality on a port or link aggregate.
<b>unp 802.1x-authentication</b>	Configures the 802.1X authentication status for the UNP port.
<b>unp mac-authentication allow-eap</b>	Configures whether or not subsequent 802.1X authentication is attempted based on the MAC authentication results.

alaDaUNPPort8021XByPassStatus

---

## unp 802.1x-authentication failure-policy

Configures whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **802.1x-authentication failure-policy** {mac}

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **802.1x-authentication failure-policy**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>mac</b>	Perform MAC authentication if 802.1X authentication fails.

### Defaults

By default, device classification is performed after the initial 802.1X authentication process fails.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Configuring the 802.1X authentication failure policy is not allowed on UNP ports on which 802.1X authentication bypass is enabled.
- Device classification (the default) is performed based on the classification options configured for the UNP port.

### Examples

```
-> unp port 1/1/5 802.1x-authentication failure-policy mac
-> no unp port 1/1/10-15 802.1x-authentication failure-policy

-> unp linkagg 10 802.1x-authentication failure-policy mac
-> no unp linkagg 2-5 802.1x-authentication failure-policy
```

### Release History

alaDaUNPPort8021XFailurePolicy

---

## unp mac-authentication

Configures the status of MAC authentication for the specified UNP port. Enable this functionality to invoke MAC-based authentication for devices connected to the UNP port.

**unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} mac-authentication**

**no unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} mac-authentication**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, MAC authentication is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable MAC authentication on a UNP port or link aggregate.
- This command is only allowed on UNP-enabled ports (both bridge and access port types).
- MAC-based authentication is supported only through a RADIUS server.
- An option exists to classify a device into an alternate UNP in the event successful MAC authentication does not return a UNP name.
- If MAC authentication fails, any classification rules configured for the UNP port are applied.
- If UNP MAC authentication, 802.1X authentication, and classification (see [unp classification](#) and [unp 802.1x-authentication](#)) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured and/or trust VLAN tag is enabled for the port.
- Configuring an authentication server down UNP (see [unp auth-server-down](#)) is highly recommended when MAC or 802.1X authentication is enabled on VLAN bridge or SPB access ports or aggregates. This is because after a switch reload, traffic from devices connected to these types of ports and aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.

- If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.
- The authentication server down functionality is *not* supported on VXLAN access ports or aggregates.

## Examples

```
-> unp port 1/1 mac-authentication
-> no unp port 1/1 mac-authentication
-> unp linkagg 2 mac-authentication
-> no unp linkagg 2 mac-authentication
```

## Release History

Release 7.2.1; command was introduced.

Release 7.2.1.R02; **linkagg** parameter added.

## Related Commands

<a href="#">unp port-type</a>	Configures UNP functionality on a port or link aggregate.
<a href="#">unp mac-authentication pass-alternate</a>	Assigns the device to another VLAN-based or service-based UNP when successful MAC authentication does not return a UNP name.
<a href="#">unp classification</a>	Configures the classification status for the UNP port.
<a href="#">show unp port</a>	Displays the UNP configuration for the port.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortMacAuthFlag
```

---

## unp mac-authentication pass-alternate

Configures the name of an existing VLAN-based or service-based UNP to use as an alternate profile. A device is assigned to the alternate profile when successful MAC authentication does not return a UNP name.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication pass-alternate profile_name
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication pass-alternate
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>profile_name</i>	The name of an existing VLAN, SPB, or VXLAN profile.

### Defaults

By default, no alternate UNP is configured.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- Service-based profiles classify traffic received on UNP access ports; VLAN-based profiles classify traffic received on UNP bridge ports. Make sure the specified port is of the correct type for the specified profile.
- The UNP name specified with this command must already exist in the switch configuration.

### Examples

```
-> unp port 1/1 mac-authentication pass-alternate Finance
-> unp port 1/1-3 mac-authentication pass-alternate CustomerA
-> unp port 1/4-10 mac-authentication pass-alternate CustomerC
-> no unp port 1/1-3 mac-authentication pass-alternate

-> unp linkagg 5 mac-authentication pass-alternate AltUNP
-> unp linkagg 1-5 mac-authentication pass-alternate CustomerB
-> unp linkagg 10-12 mac-authentication pass-alternate CustomerD
-> no linkagg 5 mac-authentication pass-alternate
```

## Release History

Release 7.2.1; command was introduced.

Release 7.2.1.R02; **linkagg** parameter added.

Release 7.3.1; **spb-profile** parameter added, **unp-name** parameter changed to **vlan-profile**.

Release 7.3.4; **vxlan-profile** parameter added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72).

Release 8.3.1; **vlan-profile**, **spb-profile**, and **vxlan-profile** parameters deprecated.

## Related Commands

<a href="#">unp profile</a>	Configures a UNP profile that is used to classify traffic received on UNP ports.
<a href="#">unp port-type</a>	Configures UNP functionality on a port or link aggregate.

<a href="#">show unp port</a>	Displays the UNP port parameter configuration.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortPassAltProfileName
```

---

## unp mac-authentication allow-eap

Configures whether the switch attempts subsequent 802.1X authentication for a device connected to a UNP port on which 802.1X authentication bypass is enabled. When 802.1X bypass is enabled on the port, MAC authentication is performed first on any device connected to that port. This command specifies the conditions under which 802.1X authentication is performed or bypassed after the initial MAC authentication process.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication allow-eap {pass | fail | noauth}
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} mac-authentication allow-eap
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>pass</b>	Perform 802.1X (EAP frame) authentication if the device passes MAC authentication.
<b>fail</b>	Perform 802.1X (EAP frame) authentication if the device fails MAC authentication.
<b>noauth</b>	Perform 802.1X (EAP frame) authentication if MAC authentication is not configured on the UNP port.

### Defaults

By default, the allow 802.1X authentication option is not set.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to set the allow 802.1X authentication option back to the default value of none (option is not set).
- The port specified with this command must also have 802.1X bypass enabled (see the [unp 802.1x-authentication bypass-8021x](#) command). If bypass is not enabled, the option configured with this command does not apply.
- This command is only allowed on UNP-enabled ports and link aggregates.

### Examples

```
-> unp port 1/1/5 mac-authentication allow-eap pass
-> unp port 1/1/10-15 mac-authentication allow-eap fail
-> no unp port 1/1/5 mac-authentication allow-eap
```

```
-> unp linkagg 10 mac-authentication allow-eap noauth
-> unp linkagg 2-5 mac-authentication allow-eap none
-> no unp linkagg 10 mac-authentication allow-eap
```

---

## unp classification

Configures the classification status for the specified UNP port. When classification is enabled but authentication is disabled or fails, UNP classification rules (such as MAC address, MAC address range, IP network address, or VLAN tag) are applied to the traffic received on the UNP port.

**unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} classification**

**no unp {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} classification**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (10-20).

### Defaults

By default, classification is enabled on the UNP port.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable the classification status for a UNP port or link aggregate.
- This command is allowed only on UNP-enabled ports (both bridge and access ports).
- UNP classification rules are applied if authentication is disabled on the port, is enabled on the port but the RADIUS server is not configured, or the authentication method fails.
- If untagged device traffic does not match any of the classification rules, the device is assigned to the default UNP configured for the port.
- If tagged device traffic does not match any of the classification rules and the trust VLAN tag option (see [unp trust-tag](#)) is enabled for the port, the device is classified based on the VLAN tag of the traffic if a VLAN matching the tag exists in the switch configuration.
- If all of the UNP authentication methods *and* UNP classification are disabled for the UNP port, then all MAC addresses received on that port are blocked unless a default VLAN is specified and/or trust VLAN tag is enabled for the port.

- When classification is enabled for the port, UNP classification rules are applied in the following order of precedence:
  - MAC address + VLAN tag
  - MAC address
  - MAC address range + VLAN tag
  - MAC address range
  - IP address + VLAN tag
  - IP address
  - VLAN tag

### Examples

```
-> unp port 1/1 classification
-> no unp port 1/1 classification
-> unp port 1/1-4 classification
ERROR: Port 1/3 is not a unp-port
-> unp linkagg 5 classification
-> no unp linkagg 5 classification
```

### Release History

Release 7.2.1; command was introduced.  
Release 7.2.1.R02; **linkagg** parameter added.

### Related Commands

<a href="#">show unp classification</a>	Displays the UNP classification rule configuration for the switch.
<a href="#">show unp port</a>	Displays the UNP configuration for the port.

### MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortClassificationFlag
```

---

## unp trust-tag

Configures the option of whether or not to trust the VLAN ID of a tagged packet to determine how the packet is classified.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **trust-tag**

**no** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **trust-tag**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (10-20).

### Defaults

By default, the VLAN tag is not trusted.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable the trust tag status for a UNP port or link aggregate.
- When this option is enabled, the device is classified into a VLAN or service access point (SAP) when one of the following conditions occur:
  - MAC or 802.1X authentication passes, but the RADIUS server returns a UNP that does not exist in the switch configuration.
  - MAC or 802.1X authentication passes, but the RADIUS server does not return a UNP and the alternate UNP option is disabled for the port.
  - Device traffic does not match any of the classification rules configured for the UNP port.
  - The UNP VLAN obtained from a matching classification rule does not exist in the switch configuration.
  - Auth-Server-Down UNP option is used, but the VLAN associated with that UNP does not exist in the switch configuration.
- When the trust tag option is triggered on a UNP bridge port and a VLAN exists in the switch configuration that matches the VLAN tag, a VLAN-port-association (VPA) is created between the UNP port and the matching VLAN even if the matching VLAN is *not* associated with a UNP.
- When the trust tag option is triggered on a UNP access port, the VLAN tag information is used to create a dynamic SAP (virtual port) to which the access port is associated.
- Enabling the trust VLAN ID tag option provides an implicit method of VLAN tag classification that will accept tagged traffic matching any of the existing UNPs without the need to create specific classification rules for those profiles.

## Examples

```
-> unp port 1/1 trust-tag
-> unp port 1/1-4 trust-tag
-> no unp port 1/1 trust-tag

-> unp linkagg 5 trust-tag
-> unp linkagg 6-10 trust-tag
-> no unp linkagg 5 trust-tag
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">show unp port</a>	Displays the UNP configuration for the port.
<a href="#">show unp user</a>	Displays information about the devices learned on a UNP port.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortTrustTagStatus
```

---

## unp default-profile

Configures the name of an existing UNP classification profile to serve as the default UNP for the specified UNP port or link aggregate.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **default-profile** *profile\_name*

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id*} **default-profile**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port[-port2]</i>	The slot and port number (3/1) of a UNP-enabled port. Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>profile_name</i>	The name of an existing UNP classification profile.

### Defaults

By default, there is no default profile configured for UNP ports or link aggregates.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the default UNP from the port configuration.
- This command is allowed only on UNP-enabled ports.
- The UNP classification profile specified with this command must already exist in the switch configuration.
- The default UNP is used to classify devices on the port when one of the following conditions occur:
  - UNP authentication and classification are not enabled on the port.
  - MAC authentication fails.
  - Device traffic does not match any UNP classification rules.
  - The UNP trust VLAN tag option (see [unp trust-tag](#)) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist in the switch configuration.
  - Untagged device traffic is not classified.

### Examples

```
-> unp port 1/1 default-profile Sales
-> no unp port 1/1 default-profile
-> unp port 1/1-4 default-profile Sales
ERROR: Port 1/2 is not a unp port
ERROR: Port 1/3 is not a unp port
```

```
-> unp port 1/1 default-profile BAD-UNP
ERROR: UNP doesn't exist
-> no unp port 1/1-4 default-profile
-> unp linkagg 5 default-profile VM1-Server1
-> no unp linkagg 5 default-profile
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp profile</a>	Configures a UNP profile that is used to classify traffic received on UNP ports.
<a href="#">unp port-type</a>	Configures the status of UNP functionality on the port.
<a href="#">unp trust-tag</a>	Configures whether or not a device is classified into an existing VLAN that matches the VLAN ID tag of the packets received from the device.
<a href="#">show unp port</a>	Displays the UNP configuration for the port.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortDefaultProfileName
```

---

## unp domain

Assigns a UNP port or link aggregate to a customer domain (UNP group).

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **domain** *domain\_id*

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **domain** *domain\_id*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>domain_id</i>	The numerical domain ID to which the specified port or link aggregate is assigned.

### Defaults

By default, all UNP ports are assigned to customer domain zero (0).

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The domain ID specified with this command must already exist in the switch configuration.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain, only classification rules associated with the same customer domain ID are applied to that port.

### Examples

```
-> unp port 1/1 domain 1
-> unp port 1/1-3 domain 2
-> no unp port 1/1 domain 1
-> unp linkagg 5 domain 5
-> unp linkagg 8-10 domain 6
-> no unp linkagg 5 domain 5
```

### Release History

Release 8.3.1; command was introduced.

## MIB Objects

alaDaUNPPortTable

    alaDaUNPPortIfIndex

    alaDaUNPPortDomainId

---

## unp aaa-profile

Assigns the name of an existing authentication, authorization, and accounting (AAA) profile to the specified UNP port or link aggregate. This type of profile defines AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are applied to device traffic received on the UNP port to which the profile is assigned.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} aaa-profile profile_name
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} aaa-profile
```

---

### Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>profile_name</i>	The name of an existing AAA profile.

### Defaults

By default, there is no AAA profile assigned to UNP ports or link aggregates. The global AAA configuration for the switch is applied.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the AAA profile from the port configuration.
- The AAA profile specified with this command must already exist in the switch configuration.
- AAA profiles are configured using the **aaa profile** command. See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

### Examples

```
-> unp port 1/1/5 aaa-profile A1
-> no unp port 1/1/5 aaa-profile

-> unp port 1/1/1-5 aaa-profile A2
-> no unp port 1/1/1-5 aaa-profile

-> unp linkagg 10 aaa-profile A3
-> no unp linkagg 10 aaa-profile
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

**unp port-type**

Configures UNP functionality for the specified port or link aggregate.

**aaa profile**

Configures an AAA configuration profile.

**show unp port**

Displays the UNP configuration for the port.

## MIB Objects

alaDaUNPPortTable

    alaDaUNPPortIfIndex

    alaDaUNPPortAaaProfile

---

## unp port port-template

Assigns the name of an existing port template to the specified UNP port or link aggregate. A port template defines UNP port configuration options (such as the type of authentication, classification status, a default profile) that are applied to the UNP port to which the template is assigned.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **port-template** *template\_name*

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **port-template**

---

### Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>template_name</i>	The name of an existing port template.

### Defaults

By default, the “bridgeDefaultPortTemplate” port template is assigned to UNP bridge ports, and the “accessDefaultPortTemplate” port template is assigned to UNP access ports.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove the port template from the port configuration.
- When a custom template is removed from a UNP port, the port reverts back to using the default template to define UNP port parameter options.
- The port template specified with this command must already exist in the switch configuration.
- When a port template is applied to a UNP port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.

### Examples

```
-> unp port 1/1/5 port-template up1
-> unp port 1/1/1-5 port-template up2
-> no unp port 1/1/5 port-template
-> no unp port 1/1/1-5 port-template

-> unp linkagg 10 port-template up3
-> unp linkagg 10-50 port-template up4
-> no unp linkagg 10 port-template
-> no unp linkagg 10-50 port-template
```

```
-> unp port 1/10 802.1x-authentication
ERROR: Port Template already enforced on port, please remove it for manual config
on Port
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp port-type</a>	Configures the UNP status and port type for the specified port or link aggregate.
<a href="#">unp port-template</a>	Configures a port template.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortPortTemplate
```

---

## unp direction

Configures whether network access control is applied to both incoming and outgoing traffic or only applied to incoming traffic on the specified UNP bridge port or link aggregate.

**unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **direction** {both | in}

**no unp** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id[-agg\_id2]*} **direction**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>both</b>	Enables bidirectional network access control on the specified port or link aggregate.
<b>in</b>	Enables network access control for incoming traffic only on the specified port or link aggregate.

### Defaults

By default, bidirectional network access control is enabled on the port.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to set the network access control direction to the default (**both**).
- When the port control direction is set to **both**, egress broadcast, unknown unicast, and multicast traffic is blocked on the UNP port.
- When the port control direction is set to **in**, egress broadcast, unknown unicast, and multicast traffic is allowed on the UNP port.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.

### Examples

```
-> unp port 1/1/5 direction in
-> unp port 1/1/10-15 direction both
-> no unp port 1/1/10-15 direction

-> unp linkagg 10 direction in
-> unp linkagg 2-5 direction both
-> no unp linkagg 2-5 direction
```

## Release History

Release 7.3.4; command was introduced.

## Related Commands

<a href="#">unp port-type</a>	Configures UNP functionality on a port or link aggregate.
<a href="#">unp 802.1x-authentication</a>	Configures the 802.1X authentication status for the UNP port.
<a href="#">show unp port</a>	Displays the UNP configuration for the port.

## MIB Objects

alaDaUNPPortTable  
alaDaUNPPortAdminControlledDirections

---

## unp admin-state

Enables or disables the UNP configuration for a port or link aggregate.

```
unp {port {chassis/slot/port1[-port2] | linkagg agg_id1[-agg_id2]} admin-state {enable | disable}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id1[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of link aggregate ID numbers (5-10).
<b>enable</b>	Activates the UNP configuration for the UNP port or link aggregate. UNP functionality is applied to traffic received on the UNP port or link aggregate.
<b>disable</b>	Disables the UNP configuration for the UNP port or link aggregate. UNP functionality is not applied to traffic received on the UNP port or link aggregate.

### Defaults

By default, UNP is administratively enabled at the time UNP functionality is configured for the port or link aggregate.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

When UNP functionality is disabled, the UNP configuration for the port or link aggregate is retained but is not applied to traffic received on the port or link aggregate.

### Examples

```
-> unp port 1/1 admin-state disable
-> unp port 1/2-5 admin-state disable
-> unp port 1/1 admin-state enable
-> unp linkagg 5 admin-state disable
-> unp linkagg 8-10 admin-state disable
-> unp linkagg t admin-state enable
```

### Release History

Release 8.3.1; command was introduced.

## Related Commands

**unp port-type**

Configures UNP functionality for the specified port or link aggregate.

**show unp port**

Displays the UNP configuration for the port.

## MIB Objects

alaDaUNPPortTable

alaDaUNPPortIfIndex

alaDaUNPPortAdminState

---

## unp dynamic-service

Configures whether the System Default service profile dynamically creates an SPB Service Access Point (SAP) or a VXLAN SAP based on the traffic received on the UNP access port.

**unp** {port [*chassis\_id*]/slot/port1[-port2] | linkagg *agg\_id*[-*agg\_id2*]} **dynamic-service** {spb | vxlan}

**no unp** {port [*chassis\_id*]/slot/port1[-port2] | linkagg *agg\_id*[-*agg\_id2*]} **dynamic-service**

---

### Syntax Definitions

<i>chassis_id</i>	The chassis identifier when running in virtual chassis mode.
slot/port[-port2]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>spb</b>	Dynamically creates an SPB SAP.
<b>vxlan</b>	Dynamically creates a VXLAN SAP (supported only on OmniSwitch 6900-Q32 and OmniSwitch 6900-X72).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the System Default profile capability.
- This command applies only to ports and link aggregates configured as UNP access ports; this command does not apply to UNP bridge ports.
- Traffic received on UNP access ports that are not assigned to a user-defined service profile is assigned to the System Default service profile. The System Default profile attributes used to dynamically create a SAP for such traffic are derived based on the setting for this UNP port parameter.
  - If the dynamic service port parameter is set to SPB, then the SPB control BVLAN, a calculated default I-SID number, and an incremental reserved service ID number are used to dynamically create a SAP for SPB service traffic received on the UNP access port.
  - If the dynamic service port parameter is set to VXLAN, then a calculated VNI number, a default multicast group IP address, and an incremental reserved service ID number are used to dynamically create a SAP for VXLAN service traffic received on the UNP access port.

### Examples

```
-> unp port 1/1/5 dynamic-service vxlan
-> unp port 1/1/10-15 dynamic-service spb
-> no unp port 1/1/10-15 dynamic-service
```

```
-> unp linkagg 10 dynamic-service vxlan
-> unp linkagg 2-5 dynamic-service spb
-> no unp linkagg 2-5 dynamic-service
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp port-type</a>	Configures UNP functionality on a port or link aggregate.
<a href="#">show unp port</a>	Displays the UNP configuration for the port.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortDynamicService
```

---

## unp vlan

Configures an untagged VLAN-port association between the specified UNP bridge port and VLAN ID.

```
unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} vlan vlan_id [-vlan_id2]
```

```
no unp {port chassis/slot/port1[-port2] | linkagg agg_id[-agg_id2]} vlan vlan_id [-vlan_id2]
```

---

### Syntax Definitions

<i>chassis/slot/port</i> [-port2]	The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i> [-agg_id2]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>vlan_id</i> [-vlan_id2]	The VLAN ID to assign to the UNP port. Use a hyphen to specify a range of VLAN IDs.

### Defaults

By default, no VLAN associations are configured for UNP and bridge ports.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN association from the UNP port configuration.
- This command applies only to ports and link aggregates configured as UNP bridge ports; this command does not apply to UNP access ports.
- When this command is used to assign a VLAN to a UNP bridge port, the port goes into a forwarding state for egress traffic associated with the VLANs assigned to the port. This automatically occurs even when there is no MAC address learned on the UNP port in the assigned VLANs and regardless of the direction value (in or both) set for the port.

### Examples

```
-> unp port 1/1/5 vlan 500
-> unp port 1/1/10 vlan 100-105
-> no unp port 1/1/5 vlan 500
-> no unp port 1/1/10 vlan 100-105

-> unp linkagg 10 vlan 500
-> unp linkagg 20 vlan 100-105
-> no unp linkagg 10 vlan 500
-> no unp linkagg 20 vlan 100-105
```

### Release History

Release 8.2.1; command was introduced.

alaDaUNPPortVlanVID

---

## unp port-template

Configures a UNP port template that is used to apply a pre-defined port configuration to a UNP port or link aggregate. Using a port template to configure UNP functionality on a port or link aggregate avoids having to configure each parameter with a separate CLI command. Applying a template configures all port-based parameters with a single CLI command.

This section describes the base command (**unp port-template**) along with optional command keywords that are used to configure port parameter values that are applied when the template is assigned to a UNP port or link aggregate. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the template.

There are two default port templates: “bridgeDefaultPortTemplate” (applied to UNP bridge ports) and “accessDefaultPortTemplate” (applied to UNP access ports). These templates define a default set of port parameter values that are applied at the time a port or link aggregate is configured as a UNP bridge or access port. The default templates cannot be deleted, but the template parameter values are configurable through this command.

**unp port-template** {*template\_name* | **bridgeDefaultPortTemplate** | **accessDefaultPortTemplate**}

[**802.1x-authentication**]

[**802.1x-authentication pass-alternate** *profile\_name*]

[**mac-authentication allow-eap** {**pass** | **fail** | **noauth**}]

[**force-l3-learning** [**port-bounce**]]

[**admin-state** {**enable** | **disable**}]

[**dynamic-service** {**spb** | **vlan**}]

[**vlan** *vlan\_id* [-*vlan\_id2*]]

[**l2-profile** *l2profile\_name*]

**no unp port-template** *template\_name* [**802.1x-authentication** | **802.1x authentication pass-alternate** | **mac-authentication** | **mac-authentication pass-alternate** | ...]

## Syntax Definitions

<i>template_name</i>	The name to associate with the UNP port template.
<b>bridgeDefaultPortTemplate</b>	The name of the default port template applied to UNP bridge ports.
<b>accessDefaultPortTemplate</b>	The name of the default port template applied to UNP access ports.

## Defaults

The following table contains the default values for the system-defined port templates (“accessDefaultPortTemplate” and “bridgeDefaultPortTemplate”):

parameter	system-defined port template values
<b>802.1x-authentication</b>	enabled
<b>802.1x-authentication pass-alternate</b> <i>profile_name</i>	none
<b>mac-authentication</b>	enabled
<b>mac-authentication pass-alternate</b> <i>profile_name</i>	none
<b>classification</b>	enabled
<b>trust-tag</b>	enabled

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Use the **no** form of this command to remove a port template from the switch configuration.
- To change the value of a specific port template parameter, specify the parameter keyword with this command. For example, **no unp port-template port1 mac-authentication**, **unp port-template port1 domain 2**, or **unp port-template port1 default-profile defprof1**. The new parameter values are applied to all UNP ports to which the template is assigned.
- The **l2-profile** port template parameter is not supported on the OmniSwitch 9900.
- If the name of the template does not exist when this command is used to modify a port parameter, the switch will automatically create a new template using the name specified. For example, the **unp port-template port1 mac-authentication** command will create the “port1” template if it does not already exist in the switch configuration.
- When a port template is applied to a UNP port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.
- For more information about specific port parameter values, refer to the following explicit UNP port configuration commands for each template parameter:

Port Template Parameter	Explicit Port Configuration Command
[802.1x-authentication]	<b>unp 802.1x-authentication</b>
[802.1x-authentication pass-alternate <i>profile_name</i> ]	<b>unp 802.1x-authentication pass-alternate</b>
[mac-authentication]	<b>unp mac-authentication</b>
[mac-authentication pass-alternate <i>profile_name</i> ]	<b>unp mac-authentication pass-alternate</b>
[classification]	<b>unp classification</b>
[default-profile <i>profile_name</i> ]	<b>unp default-profile</b>
[domain <i>domain_id</i> ]	<b>unp domain</b>
[aaa-profile <i>profile_name</i> ]	<b>unp aaa-profile</b>
[redirect port-bounce]	<b>unp redirect port-bounce</b>
[direction {in   both}]	<b>unp direction</b>
[802.1x-authentication tx-period <i>seconds</i> ]	<b>unp 802.1x-authentication tx-period</b>
[802.1x-authentication supp-timeout <i>seconds</i> ]	<b>unp 802.1x-authentication supp-timeout</b>
[802.1x-authentication max-req <i>max_req</i> ]	<b>unp 802.1x-authentication max-req</b>
[802.1x-authentication bypass]	<b>unp 802.1x-authentication bypass-8021x</b>
[802.1x-authentication failure-policy {mac}]	<b>unp 802.1x-authentication failure-policy</b>
[mac-authentication allow-eap {pass   fail   noauth}]	<b>unp mac-authentication allow-eap</b>
[force-l3-learning [port-bounce]]	<b>unp force-l3-learning</b>
[trust-tag]	<b>unp trust-tag</b>

Port Template Parameter	Explicit Port Configuration Command
[ <b>admin-state</b> {enable   disable}]	<b>unp admin-state</b>
[ <b>dynamic-service</b> {spb   vxlan}]	<b>unp dynamic-service</b>
[ <b>vlan</b> <i>vlan_id</i> [- <i>vlan_id2</i> ]]	<b>unp vlan</b>
[ <b>l2-profile</b> <i>l2profile_name</i> ]	<b>unp l2-profile</b>

## Examples

```
-> unp port-template port1
-> unp port-template port1 mac-authentication
-> unp port-template port1 mac-authentication pass-alternate un1
-> unp port-template port1 classification
-> no unp port-template port1 mac-authentication
-> no unp port-template port1
-> unp port-template port2 802.1x-authentication
-> unp port-template port2 classification
-> unp port-template port2 domain 10
-> no unp port-template port2 classification
-> no unp port-template port2
```

## Release History

Release 8.3.1; command was introduced.  
 Release 8.3.1.R02; **force-l3-learning** parameter added.  
 Release 8.4.1; **l2-profile** parameter added.

## Related Commands

## unp classification port

Defines a Port classification rule for the specified UNP profile. If the UNP port or link aggregate on which the device traffic is received matches the port or link aggregate defined for the rule, the specified profile is applied to the device.

**unp classification** {port *chassis/slot/port1[-port2]* | linkagg [*agg\_id[-agg\_id2]*]} [vlan-tag *vlan\_id* | *outer\_vlan\_id:inner\_vlan\_id*] {profile1 *profile\_name* [profile2 *profile\_name*] [profile3 *profile\_name*]}

**no unp classification** {port *chassis/slot/port1[-port2]* | linkagg *agg\_id*} [profile1] [profile2] [profile3]

---

### Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific UNP port. Use a hyphen to specify a range of ports (3/1/1-8).
[ <i>agg_id[-agg_id2]</i> ]	The link aggregate ID for a specific UNP link aggregate. Use a hyphen to specify a range of IDs (5-10).
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the Port rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- The Port rule configured for the specified profile is applied only to traffic learned on the specified UNP port or link aggregate.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.
- When configuring a Port classification rule, specify an optional VLAN tag before specifying the UNP for which the rule will classify traffic.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is applied only to tagged packets that are received on the specified UNP port *and* that contain the VLAN ID tag.
- Untagged packets are only classified using the specified UNP port; the VLAN ID tag is ignored if it is specified with this rule.
- A Port classification rule can be combined with a MAC address rule and IP address rule to configure a port-based binding rule.

## Examples

```
-> unp classification port 1/1/5 vlan-tag 100 profile1 un1-vxlan profile2 un2-spb
-> unp classification port 1/1/10-15 profile1 un1-vlan profile2 un2-spb
-> no unp classification port 1/1/5 profile2
-> no unp classification port 1/1/5
```

```
-> unp classification linkagg 5 profile1 un1-vlan profile2 un2-vxlan profile3
unp3-spb
-> unp classification linkagg 6-10 vlan-tag 10:20 profile1 un1-vlan
-> no unp classification linkagg 5 profile3
-> no unp classification linkagg 5
```

Port + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15 profile1 Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15
```

Port + MAC address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 port 1/1/5 profile1 Pr1
-> no unp classification mac-address 00:11:22:33:44:55 port 1/1/5
```

Port + IP address binding rule example:

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 profile1
Pr2
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10
```

## unp classification domain

Defines a Domain ID classification rule for the specified UNP profile. If the port or link aggregate on which the device traffic is received belongs to a Domain ID that matches the Domain ID defined for the rule, the specified profile is applied to the device.

**unp classification domain** *domain\_id* [**vlan-tag** *vlan\_id* | *outer\_vlan\_id:inner\_vlan\_id*] {**profile1** *profile\_name* [**profile2** *profile\_name*] [**profile3** *profile\_name*]}

**no unp classification domain** *domain\_id* [**profile1**] [**profile2**] [**profile3**]

---

### Syntax Definitions

<i>domain_id</i>	A domain ID number.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the domain ID rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a Port classification rule, specify and optional VLAN tag before specifying the UNP for which the rule will classify traffic.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).

- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets received on a UNP port associated with the Domain ID *and* tagged with the specified VLAN ID.
- Untagged packets are only classified using the specified domain ID; the VLAN ID tag is ignored if it is specified with this rule.
- A domain ID classification rule can be combined with a MAC address rule and an IP address rule to configure a domain-based binding rule.

## Examples

```
-> unp classification domain 10 profile1 unp1-vlan
-> unp classification domain 20 vlan-tag 100 profile1 unp1-vxlan profile2 unp2-spb
profile3 unp3-vlan
-> no unp classification domain 20 profile3
-> no unp classification domain 20
```

Domain ID + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 domain 10 profile1 Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 domain 10
```
