  alaDaUNPCustDomainRuleProfile2
  alaDaUNPCustDomainRuleProfile3
```

---

## unp classification mac-address

Defines a MAC address classification rule for the specified UNP. If the source MAC address of the device traffic matches the MAC address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

```
unp classification mac-address mac_address [domain domain_id] [vlan-tag vlan_id |
outer_vlan_id:inner_vlan_id] {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp classification mac-address mac_address [profile1] [profile2] [profile3]
```

---

### Syntax Definitions

<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none
<i>domain_id</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the MAC address rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address classification rule, specify an optional VLAN tag and/or an optional customer domain ID before specifying the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is configured for this rule.

## Examples

```
-> unp classification mac-address 00:11:22:33:44:55 profile1 CustA
-> unp classification mac-address 00:2a:95:00:00:01 vlan-tag 200 profile1 VNP1

## unp classification mac-oui

Defines a MAC address Organizationally Unique Identifier (OUI) classification rule for the specified UNP profile. If the OUI of the source MAC address of the device traffic matches the OUI defined for the rule, the specified profile is applied to the device.

**unp classification mac-oui** *mac\_oui* [**vlan-tag** *vlan\_id* | *outer\_vlan\_id:inner\_vlan\_id*] {**profile1** *profile\_name* [**profile2** *profile\_name*] [**profile3** *profile\_name*]}

**no unp classification mac-oui** *mac\_oui* [**profile1**] [**profile2**] [**profile3**]

---

### Syntax Definitions

<i>mac_oui</i>	The first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the MAC OUI rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address OUI classification rule, specify an optional VLAN tag before specifying the UNP for which the rule will classify traffic.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address OUI *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address OUI; the VLAN ID tag is ignored if it is specified with this rule.

## Examples

```
-> unp classification mac-oui 00:11:22 profile1 unp1-vlan
-> unp classification mac-oui 00:11:33 vlan-tag 10 profile1 unp1-vlan profile2
unp2-spb profile3 unp3-vxlan
-> no classification mac-oui 00:11:33 profile3
-> no unp classification mac-oui 00:11:22
```

## Release History

  alaDaUNPMacOuiRuleProfile3
```

## unp classification mac-range

Defines a MAC address range classification rule for the specified UNP. If the source MAC address of the device traffic matches any address within the range of MAC addresses, the specified UNP is applied to the device. An optional VLAN ID tag parameter is also available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

```
unp classification mac-range low_mac_address high_mac_address [domain domain_id] [vlan-tag
vlan_id | outer_vlan_id:inner_vlan_id] {profile1 profile_name [profile2 profile_name] [profile3
profile_name]}
```

```
no unp classification mac-range low_mac_address high_mac_address [profile1] [profile2] [profile3]
```

---

### Syntax Definitions

<i>low_mac_address</i>	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none
<i>domain_id</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the MAC address range rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a MAC address range classification rule, specify and optional VLAN tag and/or an optional domain ID before specifying the UNP for which the rule will classify traffic.

- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing a source MAC address within the specified range *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address range; the VLAN ID tag is ignored if it is specified with this rule.

## unp classification ip-address

Defines an IP network address classification rule for the specified UNP. If the source IP address of the device traffic matches the IP address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source IP address.

**unp classification ip-address** *ip\_address* **mask** *subnet\_mask* [**domain** *domain\_id*] [**vlan-tag** *vlan\_id* | *outer\_vlan\_id:inner\_vlan\_id*] {**profile1** *profile\_name* [**profile2** *profile\_name*] [**profile3** *profile\_name*]}

**no unp classification ip-address** *ip\_address* **mask** *subnet\_mask* [**profile1**] [**profile2**] [**profile3**]

---

### Syntax Definitions

<i>ip_address</i>	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>subnet_mask</i>	An IP address mask to identify the IP subnet for the interface (supports class-less masking).
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>vlan_id</i>	none
<i>domain_id</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove an IP network address rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring an IP network address classification rule, specify and optional VLAN tag and/or an optional customer domain ID before specifying the UNP for which the rule will classify traffic.

- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source IP address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified IP address; the VLAN ID tag is ignored if it is specified with this rule.

## unp classification vlan-tag

Defines a VLAN tag classification rule for the specified UNP. If the VLAN ID tag of the device traffic matches the VLAN ID defined for the rule, the specified UNP is applied to the device.

**unp classification vlan-tag** {*vlan\_id* | *outer\_vlan\_id:inner\_vlan\_id*} [**domain** *domain\_id*] {**profile1** *profile\_name* [**profile2** *profile\_name*] [**profile3** *profile\_name*]}

**no unp classification vlan-tag** *vlan\_id* [**profile1**] [**profile2**] [**profile3**]

---

### Syntax Definitions

<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>domain_id</i>	An existing customer domain ID to which this rule will apply.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP.

parameter	default
<i>domain_id</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN tag rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.
- When configuring a VLAN tag classification rule, specify an optional customer domain ID before specifying the name of the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID. All UNP ports are automatically assigned to customer domain 0 at the time the port is configured as a UNP port.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Untagged packets are not classified with this rule.

## Examples

```
-> unp classification vlan-tag 400 profile1 CustA
-> unp classification vlan-tag 10:20 domain 3 profile1 unp1 profile2 spb1
-> no unp classification vlan-tag 10:20 profile1

  alaDaUNPCustDomainVlanTagRuleProfile3
```

---

## unp classification lldp med-endpoint

Defines a Link Layer Discovery Protocol (LLDP) classification rule for the specified UNP profile. This rule is used specifically for IP phones and OmniAccess Stellar Access Point (AP) devices.

```
unp classification lldp med-endpoint {ip-phone | access-point} {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp classification lldp med-endpoint {ip-phone | access-point} [profile1] [profile2] [profile3]
```

---

### Syntax Definitions

<b>ip-phone</b>	When LLDP TLVs from an IP phone are detected, apply the specified profile to the IP phone.
<b>access-point</b>	When LLDP TLVs from an OmniAccess Stellar AP are detected, apply the specified profile to the AP device.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP profile.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- There is a built-in LLDP classification rule for access points that is assigned to a built-in profile named “defaultWLANProfile”. This rule facilitates the automatic detection and classification of OmniAccess Stellar APs that are connected to UNP bridge ports. Consider the following regarding the built-in LLDP access point rule:
  - The rule cannot be removed from the switch configuration. However, the profile designation for the rule can be changed.
  - The rule does not appear in the configuration snapshot for the switch unless the profile assignment for the rule was changed.
  - When Stellar APs are detected, they are classified and assigned to the VLAN that is mapped to the built-in “defaultWLANProfile”. This VLAN serves as the management VLAN for untagged AP traffic.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.

- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).

## Examples

```
-> unp classification lldp med-endpoint ip-phone profile1 un1-vlan profile2 un2-  
vlan  
-> no unp classification lldp med-endpoint ip-phone profile2  
-> no unp classification lldp med-endpoint ip-phone  
  
-> unp classification lldp med-endpoint access-point profile1 defaultWLANProfile  
-> no unp classification lldp med-endpoint access-point  
ERROR: BUILT-IN Access-Point LLDP Rule cannot be deleted
```

## Release History

Release 8.3.1; command was introduced.

Release 8.4.1.R02; **access-point** parameter added.

alaDaUNPEndPoinRuleId  
alaDaUNPEndPoinProfile1  
alaDaUNPEndPoinProfile2  
alaDaUNPEndPoinProfile3
```

---

## unp classification authentication-type

Defines an Authentication Type classification rule for the specified UNP profile. If the type of authentication applied to the device traffic matches the authentication type defined for the rule, the specified profile is applied to the device.

```
unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [vlan-tag vlan_id |
outer_vlan_id:inner_vlan_id] {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [profile1] [profile2]
[profile3]
```

---

### Syntax Definitions

<b>none</b>	No authentication was applied to the device.
<b>mac</b>	The device was successfully authenticated through MAC authentication.
<b>802.1x</b>	The device was successfully authenticated through 802.1X authentication.
<b>fail</b>	Optional parameter to specify failed MAC or 802.1X authentication.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, no classification rules are defined for a UNP profile.

parameter	default
<i>vlan_id</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule or one or more of the associated profiles. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- Adding a UNP classification rule to the switch configuration does not cause a MAC address flush.

- When configuring this type of classification rule, specify an optional VLAN tag before specifying the UNP profile name for which the rule will classify traffic.
- Up to three different profile names are configurable for a classification rule. The profile applied to matching traffic is based on the order of precedence and mapping of each profile. For example:
  - Profiles mapped to a VLAN are applied only to matching traffic received on UNP bridge ports.
  - Profiles mapped to a service (SPB, VXLAN, or static) are only applied to matching traffic received on UNP access ports.
  - When a classification rule is configured with multiple profiles and traffic received on a UNP port matches the rule, each profile is checked in the order of precedence (**profile1** first, **profile2** second, and **profile3** third) to determine which profile is applied to the matching traffic.
- Configuring both a VLAN profile and a service profile for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified authentication type *and* the VLAN ID tag.
- Untagged packets are only classified using the specified authentication type; the VLAN ID tag is ignored if it is specified with this rule.

## Examples

```
-> unp classification authentication-type 802.1X profile1 un1-vlan profile2 un2-
vlan profile3 un3-vlan
-> no unp classification authentication-type 802.1X profile2
-> no unp classification authentication-type 802.1X

-> unp classification authentication-type 802.1X fail profile1 un1-vlan profile2
un2-vlan profile3 un3-vlan
-> no unp classification authentication-type 802.1X fail profile3
-> no unp classification authentication-type 802.1X fail

-> unp classification authentication-type MAC profile1 un1-vlan profile2 un2-vlan
profile3 un3-vlan
-> no unp classification authentication-type MAC profile2
-> no unp classification authentication-type MAC

-> unp classification authentication-type MAC fail profile1 un1-vlan profile2
un2-vlan profile3 un3-vlan
-> no unp classification authentication-type MAC fail profile3
-> no unp classification authentication-type MAC fail

-> unp classification authentication-type MAC vlan-tag 10 profile1 un1-vlan
profile2 un2-vlan profile3 un3-vlan
-> no unp classification authentication-type MAC profile2
-> no unp classification authentication-type MAC
```

## Release History

Release 8.3.1; command was introduced.

## Related Commands

<a href="#">unp classification</a>	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
<a href="#">unp profile</a>	Configures a UNP profile.
<a href="#">show unp classification</a>	Displays the UNP classification rule configuration.

## MIB Objects

```
alaDaUNPAuthRuleTable  
  alaDaUNPAuthRuleType  
  alaDaUNPAuthRuleVlanTag  
  alaDaUNPAuthRuleProfile1  
  alaDaUNPAuthRuleProfile2  
  alaDaUNPAuthRuleProfile3
```

---

## unp classification-rule

Configures an extended classification rule name and assigns a precedence value to the specified name. This type of rule defines a list of rule conditions, all of which a device must match to be classified into the UNP profile associated with the extended rule name.

**unp classification-rule** *rule\_name* [**precedence** *precedence\_value*] [**profile1** *profile\_name*] [**profile2** *profile\_name*] [**profile3** *profile\_name*]

**no unp classification-rule** *rule\_name* [**profile1**] [**profile2**] [**profile3**]

---

### Syntax Definitions

<i>rule_name</i>	The name to associate with the extended classification rule.
<i>precedence_value</i>	The precedence level to assign to the extended rule. The valid range is 1–255 (1 = lowest, 255 = highest).
<i>profile_name</i>	The name of an existing UNP profile to assign to the extended rule.

### Defaults

parameter	default
<i>precedence_value</i>	<b>1</b>
<i>profile_name</i>	none

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the extended rule from the switch configuration or to remove a UNP profile name assigned to the rule.
- The precedence value specified with this command is used to determine precedence among extended classification rules.
- Extended rules take precedence over all other UNP classification rules (individual rules and binding rule combinations).
- Although some individual classification rules can be combined to form a binding rule, a binding rule is not assigned a rule name and does not have a configurable precedence value. In addition, extended classification rules offer more rule combinations than binding rules.

### Examples

```
-> unp classification-rule ext-r1
-> unp classification-rule ext-r1 profile1 UNP1
-> no unp classification-rule ext-r1 profile1 UNP1
-> no unp classification-rule ext-r1
```

## Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **edge-profile** parameter deprecated; **profile1**, **profile2**, and **profile3** parameters added.

  alaDaUNPClassifRuleProfile2  
  alaDaUNPClassifRuleProfile3
```

---

## unp classification-rule port

Defines a Port rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name {port chassis/slot/port1[-port2] | linkagg agg_id}
```

```
no unp classification-rule rule_name {port | linkagg}
```

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>chassis/slot/port1[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i>	Link aggregate ID.

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the Port rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 port 1/1/10
-> no unp classification-rule ext-r1 port

-> unp classification-rule ext-r2 port 1/1/1-5
-> no unp classification-rule ext-r2 port

-> unp classification-rule ext-r3 linkagg 10
-> unp classification-rule ext-r3 linkagg
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.

  alaDaUNPClassifRulePort
```

---

## unp classification-rule domain

Defines a domain ID rule condition for the specified extended classification rule name.

**unp classification-rule** *rule\_name* **domain** *domain\_id*

**no unp classification-rule** *rule\_name* **domain**

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>domain_id</i>	Domain ID number.

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the Domain ID rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 domain-id GRP1  
-> no unp classification-rule ext-r1 domain-id
```

### Release History

Release 8.1.1; command was introduced.

Release 8.3.1; **group-id** parameter changed to **domain**.

### Related Commands

  alaDaUNPClassifRuleCustomerDomain
```

---

## unp classification-rule mac-address

Defines a MAC address, rule condition for the specified extended classification rule name.

**unp classification-rule** *rule\_name* **mac-address** *mac\_address*

**no unp classification-rule** *rule\_name* **mac-address**

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 mac-address 00:11:22:33:44:55  
-> no unp classification-rule ext-r1 mac-address
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

- unp classification-rule** Configures an extended classification rule name and associated UNP profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

## MIB Objects

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleMacAddr
```

---

## unp classification-rule mac-oui

Defines a MAC OUI rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name mac-oui mac_oui
```

```
no unp classification-rule rule_name mac-oui
```

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).
<i>mac_oui</i>	The Organizationally Unique Identifier (OUI) of the MAC address. The OUI is the first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 mac-oui 00:11:22  
-> no unp classification-rule ext-r1 mac-oui
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

## MIB Objects

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleMacOuiAddr
```

---

## unp classification-rule mac-range

Defines a MAC address range rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name mac-range low_mac_address high_mac_address
```

```
no unp classification-rule rule_name mac-range
```

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<i>low_mac_address</i>	MAC address that defines the low end of the range (for example, 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (for example, 00:00:39:59:f1:90).

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- Configuring all three types of MAC rules (MAC address, MAC OUI, and MAC address range) for the same extended classification rule is not allowed. Only one type of MAC rule is configurable for a given extended classification rule.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 mac-range 00:11:22:33:44:55 00:11:22:33:44:66  
-> no unp classification-rule ext-r1 mac-range
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

## MIB Objects

```

  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleMacRngLoaddr  
  alaDaUNPClassifRuleMacRngHiaddr
```

---

## unp classification-rule ip-address

Defines an IP network address rule condition for the specified extended classification rule name.

```
unp classification-rule rule_name ip-address ip_address mask subnet_mask
```

```
no unp classification-rule rule_name ip-address
```

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the IP address rule condition is assigned.
<i>ip_address</i>	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>subnet_mask</i>	An IP address mask to identify the IP subnet for the interface (supports class-less masking).

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 ip-address 10.0.0.20 mask 255.0.0.0  
-> no unp classification-rule ext-r1 ip-address
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleIpAddressType  
  alaDaUNPClassifRuleIpAddress  
  alaDaUNPClassifRuleIpMaskType  
  alaDaUNPClassifRuleIpMask
```

---

## unp classification-rule vlan-tag

Defines a VLAN tag rule condition for the specified extended classification rule name.

**unp classification-rule** *rule\_name* **vlan-tag** [*vlan\_id* | *outer\_vlan\_id:inner\_vlan\_id*]

**no unp classification-rule vlan-tag**

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the VLAN tag rule condition is assigned.
<i>vlan_id</i>	A VLAN ID to match single-tagged packets or the outer VLAN tag of double-tagged packets.
<i>outer_vlan_id:inner_vlan_id</i>	An outer VLAN ID and an inner VLAN ID to match double-tagged packets. For example, 10:20 specifies that only packets with an outer tag of 10 and an inner tag of 20 will match this rule.

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

### Examples

```
-> unp classification-rule ext-r1 vlan-tag 200
-> unp classification-rule ext-r2 vlan-tag 10:20
-> no unp classification-rule ext-r1 vlan-tag
```

### Release History

Release 8.2.1; command was introduced.

**Related Commands**

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

**MIB Objects**

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleVlanTag
```

---

## unp classification-rule lldp med-endpoint

Defines an LLDP rule condition for the specified extended classification rule name. This rule condition is specifically to detect IP phone TLVs or OmniAccess Stellar Access Point (AP) TLVs.

**unp classification-rule *rule\_name* lldp med-endpoint {ip-phone | access-point}**

**no unp classification-rule *rule\_name* lldp med-endpoint ip-phone**

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<b>ip-phone</b>	When LLDP TLVs from an IP phone are detected, apply the specified profile to the IP phone.
<b>access-point</b>	When LLDP TLVs from an OmniAccess Stellar AP are detected, apply the specified profile to the AP device.

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- When using the **access-point** option to define this rule condition, make sure “defaultWLANProfile” is assigned as the profile for the specified extended classification rule name.

### Examples

```
-> unp classification-rule ext-r1 lldp med-endpoint ip-phone
-> no unp classification-rule ext-r1 lldp med-endpoint ip-phone

-> unp classification-rule AP profile1 defaultWLANProfile
-> unp classification-rule AP lldp med-endpoint access-point
-> no unp classification-rule AP lldp med-endpoint access-point
```

### Release History

Release 8.1.1; command was introduced.

Release 8.4.1.R02; **access-point** parameter added.

## Related Commands

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

## MIB Objects

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleEndPoin
```

---

## unp classification-rule authentication-type

Defines an authentication type rule condition for the specified extended classification rule name.

**unp classification-rule** *rule\_name* **authentication-type** {**none** | **mac** [**fail**] | **802.1x** [**fail**]}

**no unp classification-rule** *rule\_name* **authentication-type**

---

### Syntax Definitions

<i>rule_name</i>	The name of an extended classification rule to which the port condition is assigned.
<b>none</b>	No authentication was applied to the device.
<b>mac</b>	The device was successfully authenticated through MAC authentication.
<b>802.1x</b>	The device was successfully authenticated through 802.1X authentication.
<b>fail</b>	Optional parameter to specify failed MAC or 802.1X authentication.

### Defaults

By default, no conditions are defined when an extended classification rule is created.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the profile is applied.

### Examples

```
-> unp classification-rule ext-r1 authentication-type 8021x
-> unp classification-rule ext-r1 authentication-type 8021X fail
-> unp classification-rule ext-r1 authentication-type mac
-> unp classification-rule ext-r1 authentication-type mac fail
-> no unp classification-rule ext-r1 authentication-type
```

### Release History

Release 8.1.1; command was introduced.

**Related Commands**

- unp classification-rule** Configures an extended classification rule name and associated profile.
- show unp classification-rule** Displays the UNP extended classification rule configuration.

**MIB Objects**

```
alaDaUNPClassifRuleTable  
  alaDaUNPClassifRuleName  
  alaDaUNPClassifRuleAuthType
```

---

## unp user-role

Configures a user-defined role name and assigns a precedence value to the specified name. This type of role is used to define a list of conditions and a QoS policy list name. If the current context of a device matches all of the role conditions, then the policy list is applied to that device.

**unp user-role** *role\_name* [**precedence** *precedence\_value*]

**no unp user-role** *role\_name*

---

### Syntax Definitions

<i>role_name</i>	The name to associate with the user-defined role.
<i>precedence_value</i>	The precedence level to assign to the user-defined role. The valid range is 1–255 (1 = lowest, 255 = highest).

### Defaults

parameter	default
<i>precedence_value</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the user-defined role from the switch configuration.
- The precedence value specified with this command is used to determine precedence among other user-defined roles.
- Every time the user context changes for a device, all the user-defined roles are checked to see if there is a role that matches the current user context.
- Only one user-defined role per user is allowed because only one QoS policy list per user is allowed.

### Examples

```
-> unp user-role role1
-> unp user-role role2 precedence 255
-> no unp user-role role2
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

<b>unp user-role policy-list</b>	Assigns a QoS policy list to a user-defined role.
<b>unp user-role profile</b>	Configures a UNP profile condition for a user-defined role name.
<b>unp user-role authentication-type</b>	Defines an authentication type condition for a user-defined role name.
<b>unp user-role cp-status-post-login</b>	Configures the Captive Portal post login status as a condition for a user-defined role.
<b>show unp user-role</b>	Displays the user-defined role configuration for the switch.

## MIB Objects

```
alaDaUNPUserRoleTable  
  alaDaUNPUserRoleName  
  alaDaUNPUserRolePrecedenceNum
```

---

## unp user-role policy-list

Assigns a QoS policy list to the specified user-defined role name. When the context of a user device matches all the user-defined role conditions, the policy list associated with the role is applied to the device.

**unp user-role** *role\_name* **policy-list** *list\_name*

**no unp user-role** *role\_name* **policy-list**

---

### Syntax Definitions

*role\_name*                      The name of a user-defined role to which the QoS policy list is assigned.  
*list\_name*                      The name of an existing QoS policy list.

### Defaults

By default, no QoS policy list is assigned to a user-defined role.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove a QoS policy list from the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the QoS policy list with that name.
- The QoS policy list name specified with this command must already exist in the switch configuration.

### Examples

```
-> unp user-role role1 policy-list role1-list  
-> unp user-role role2 policy-list role2-list  
-> no unp user-role role2 policy-list
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

<b>unp user-role</b>	Configures the name and precedence for a user-defined role.
<b>policy list</b>	Configures a QoS policy list.
<b>show unp user-role</b>	Displays the user-defined role configuration for the switch.

## MIB Objects

```

  alaDaUNPUserRoleName  
  alaDaUNPUserRolePolicyList
```

---

## unp user-role profile

Defines a UNP profile condition for the specified user-defined role name.

```
unp user-role role_name {profile1 profile_name [profile2 profile_name] [profile3 profile_name]}
```

```
no unp user-role role_name [profile1] [profile2] [profile3]
```

---

### Syntax Definitions

<i>role_name</i>	The name of a user-defined role.
<i>profile_name</i>	The name of an existing UNP profile.

### Defaults

By default, the profile condition is not configured for a user-defined role.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the profile name as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the profile with that name.
- The profile name specified with this command must already exist in the switch configuration.

### Examples

```
-> unp user-role role1 profile1 unp1
-> unp user-role role2 profile1 unp1 profile2 unp2
-> unp user-role role3 profile1 unp1 profile2 unp2 profile3 unp3
-> no unp user-role role1 profile1
-> no unp user-role role2 profile1 profile2
-> no unp user-role role3 profile3
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

**unp user-role**

Configures the name and precedence for a user-defined role.

**unp user-role policy-list**

Assigns a QoS policy list to a user-defined role.

**show unp user-role**

Displays the user-defined role configuration for the switch.

## MIB Objects

```
alaDaUNPUserRoleTable  
  alaDaUNPUserRoleName  
  alaDaUNPUserRoleProfile1  
  alaDaUNPUserRoleProfile2  
  alaDaUNPUserRoleProfile3
```

---

## unp user-role authentication-type

Defines an authentication type condition for the specified user-defined role name.

```
unp user-role role_name authentication-type {none | mac [fail] | 802.1x [fail]}
```

```
no unp user-role role_name authentication-type
```

---

### Syntax Definitions

<i>role_name</i>	The name of a user-defined role.
<b>none</b>	No authentication was applied to the device.
<b>mac</b>	The device was successfully authenticated through MAC authentication.
<b>802.1x</b>	The device was successfully authenticated through 802.1X authentication.
<b>fail</b>	Optional parameter to specify failed MAC or 802.1X authentication.

### Defaults

By default, the authentication type condition is not configured for a user-defined role.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the authentication type as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the profile with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1X authentication condition to determine whether or not the user role (policy list associated with the user role) is applied to the device.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1X authentication condition to determine whether or not the user role (policy list associated with the user role) is applied to the device.

### Examples

```
-> unp user-role role1 authentication-type 8021x
-> unp user-role role1 authentication-type 8021X fail
-> unp user-role role1 authentication-type mac
-> unp user-role role1 authentication-type mac fail
-> no unp user-role role1 authentication-type
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

Assigns a QoS policy list to a user-defined role.

**show unp user-role**

Displays the user-defined role configuration for the switch.

## MIB Objects

alaDaUNPUserRoleTable

alaDaUNPUserRoleName

alaDaUNPUserRoleAuthType

---

## unp user-role cp-status-post-login

Configures the Captive Portal (CP) post login status as a condition for the specified user-defined role name.

**unp user-role** *role\_name* **cp-status-post-login**

**no unp user-role** *role\_name* **cp-status-post-login**

---

### Syntax Definitions

*role\_name*                                      The name of an existing user-defined role.

### Defaults

By default, the CP post login status condition is not configured for a user-defined role.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the CP post login status as a condition for the specified user-defined role.
- When this condition is active for a user-defined role, the switch will check to see if a device is in a CP post login state before applying the QoS policy list associated with the user-defined role.

### Examples

```
-> unp user-role role1 cp-status-post-login
-> no unp user-role role1 cp-status-post-login
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

<a href="#">unp user-role</a>	Configures the name and precedence for a user-defined role.
<a href="#">unp user-role policy-list</a>	Assigns a QoS policy list to a user-defined role.
<a href="#">show unp user-role</a>	Displays the user-defined role configuration for the switch.

### MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePostLoginStatus
```

---

## unp restricted-role policy-list

Assigns an explicit QoS policy list to an implicit restricted role. When the switch assigns a user device to one of the restricted role states (unauthorized, Quarantine Manager, or Captive Portal pre-login), the explicit QoS policy list is applied instead of the built-in policy list associated with the restricted role.

**unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list *list\_name***

**no unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list**

---

### Syntax Definitions

<i>list_name</i>	The name of an existing QoS policy list.
<b>unauthorized</b>	Applies the explicit policy list to unauthorized devices.
<b>qmr</b>	Applies the explicit policy list to quarantined devices.
<b>cp-prelogin</b>	Applies the explicit policy list to devices in a Captive Portal pre-login state.

### Defaults

By default, the built-in policy list associated with the restricted role state.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the explicit QoS policy list assignment.
- An explicit QoS policy list overrides the built-in policy list associated with the restricted role state.
- When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

### Examples

```
-> unp restricted-role unauthorized policy-list unauth1
-> unp restricted-role qmr policy-list quarantined1
-> unp restricted-role cp-prelogin policy-list cplogin1
-> no unp restricted-role unauthorized
-> no unp restricted-role qmr
-> no unp restricted-role cp-prelogin
```

### Release History

Release 8.1.1; command was introduced.

**Related Commands****policy list**

---

## captive-portal name

Configures the name of the redirect URL to use for Captive Portal.

**captive-portal name** *cp\_url\_name*

**no captive-portal name** *cp\_url\_name*

---

### Syntax Definitions

*cp\_url\_name*                      The Captive Portal redirect URL.

### Defaults

By default, the Captive Portal redirect name is set to “captive-portal.com”.

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to revert the URL name back to the default “captive-portal.com”.
- Use this command to change the Captive Portal redirect URL name to match the common name (cn) used by the public certificate on the switch. Matching these two names prevents a certificate warning message caused when these names do not match.
- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login state. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login Web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

### Examples

```
-> captive-portal name cert-name  
-> no captive-portal name
```

### Release History

Release 8.1.1; command was introduced.

**Related Commands****captive-portal ip-address**

Configures the internal Captive Portal IP address for the switch.

**show captive-portal  
configuration**

Displays the global Captive Portal configuration for the switch.

**MIB Objects**

alaDaCPortalGlobalConfig

alaDaCPortalRedirectUrlName

---

## captive-portal ip-address

Configures the internal Captive Portal IP address for the switch.

**captive-portal ip-address** *ip\_address*

---

### Syntax Definitions

*ip\_address* IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).

### Defaults

By default, the internal Captive Portal IP address is set to 10.123.0.1.

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- If the default 10.123.0.0 subnet is already in use, then use this command to change the Captive Portal IP address to another 10.x.0.0 subnet (only the second octet of the Captive Portal IP address can be changed).
- When a device is classified into a UNP profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login role. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect URL name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

### Examples

```
-> captive-portal ip-address 10.255.0.20
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

### **captive-portal name**

Configures the name of the redirect URL that is used for accessing a public certificate.

### **show captive-portal configuration**

Displays the global Captive Portal configuration for the switch.

## MIB Objects

alaDaCPortalIpAddress

---

## **captive-portal success-redirect-url**

Configures the URL of a specific site to which a user is redirected after a successful Captive Portal authentication.

**captive-portal success-redirect-url** *redirect\_url*

**no captive-portal success-redirect-url**

---

### **Syntax Definitions**

*redirect\_url*                                      The redirect URL (up to 63 characters).

### **Defaults**

By default, no success redirect URL is configured.

### **Platforms Supported**

OmniSwitch 9900, 6860, 6865

### **Usage Guidelines**

Use the **no** form of this command to remove the success redirect URL from the Captive Portal global configuration.

### **Examples**

```
-> captive-portal success-redirect-url http://server-1.com/pass.html
-> no captive-portal success-redirect-url
```

### **Release History**

Release 8.1.1; command was introduced.

### **Related Commands**

### **MIB Objects**

```
alaDaCPortalGlobalConfig
    alaDaCPortalSuccRedirectUrl
```

---

## captive-portal proxy-server-port

Configures the proxy server port to use for Captive Portal.

**captive-portal proxy-server-port** *proxy\_port*

**no captive-portal proxy-server-port**

---

### Syntax Definitions

*proxy\_port*                                      The HTTP proxy port number. The valid range is 1024–49151.

### Defaults

By default, the proxy server port number is set to 8080.

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- This command overwrites the existing proxy port number for the switch.
- The proxy port number only requires changing if the proxy port used is not 80 or 8080.

### Examples

```
-> captive-portal proxy-server-port 1200
-> no captive-portal proxy-server-port
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

[show captive-portal configuration](#)                                      Displays the global Captive Portal configuration for the switch.

### MIB Objects

```
alaDaCPortalGlobalConfig
  alaDaCPortalProxyPort
```

---

## captive-portal authentication-pass

Configures a global authentication pass policy. This type of policy is applied to all devices successfully authenticated through the Captive Portal process. Each policy can specify a QoS policy list and UNP profile name to assign to the authenticated devices.

```
captive-portal authentication-pass {policy-list list_name | profile profile_name | profile-change {enable | disable}}
```

```
no captive-portal authentication-pass {policy-list | profile}
```

---

### Syntax Definitions

<i>list_name</i>	The name of a QoS policy list to apply to the authenticated user device.
<i>profile_name</i>	The name of an existing UNP profile.
<b>enable</b>	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
<b>disable</b>	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

### Defaults

By default, no policy list name or UNP profile name is specified for the global Captive Portal configuration.

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal authentication pass policy from the global Captive Portal configuration.
- When the **profile-change** parameter is enabled, the profile initially assigned to the Captive Portal users is changed to the profile derived through successful Captive Portal authentication. The QoS policy list associated with the new profile is applied to the authenticated users.
- When a profile change occurs, the new profile may assign a different VLAN to the authenticated device. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing Bring Your Own Device (BYOD) global commands are leveraged to configure the port bounce and pause timer values.
- If the new UNP profile assigned also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.
- When the **profile-change** parameter is disabled, the QoS policy list name returned from the RADIUS server or the list name specified with this command is applied instead.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
  - The policy list name returned from the RADIUS server.

- The policy list name specified with this command for the global Captive Portal configuration.
- The policy list name associated with the UNP profile returned from the RADIUS server.
- The policy list name associated with the UNP profile specified with this command for the global Captive Portal configuration.
- A policy list name or a UNP profile name returned from the RADIUS server takes precedence over the policy list name or UNP profile name configured through this command.

## Examples

```
-> captive-portal authentication-pass policy-list list1
-> captive-portal authentication-pass profile unpl-vlan profile-change enable
-> captive-portal authentication-pass profile-change disable
-> no captive-portal authentication-pass policy-list
-> no captive-portal authentication-pass profile
```

## Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

## Related Commands

**captive-portal authentication-pass domain** Configures a domain specific authentication pass policy to determine the QoS policy list or UNP profile name to apply to authenticated devices. This type of policy overrides the global Captive Portal configuration.

**show captive-portal configuration** Displays the global Captive Portal configuration for the switch.

## MIB Objects

```
alaDaCPortalGlobalConfig
  alaDaCPortalPolicyListName
  alaDaCPortalUNPProfile
  alaDaCPortalUNPProfileChange
```

---

## captive-portal authentication-pass domain

Configures a domain specific authentication pass policy. This type of policy is applied to all devices within the specified domain that were successfully authenticated through the Captive Portal process.

**captive-portal authentication-pass realm {prefix | suffix} domain *domain\_name* {policy-list *list\_name* | profile *profile\_name* | profile-change {enable | disable}}**

**no captive-portal authentication-pass [realm {prefix | suffix} domain *domain\_name*]**

---

### Syntax Definitions

<b>prefix</b>	Specifies a prefix domain name (for example, <i>domain_name/user</i> ).
<b>suffix</b>	Specifies a suffix domain name (for example, <i>user@domain_name</i> ).
<i>domain_name</i>	The domain name for the user device.
<i>list_name</i>	The name of a QoS policy list to apply to the authenticated user device.
<i>profile_name</i>	The name of an existing UNP profile.
<b>enable</b>	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
<b>disable</b>	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

### Defaults

By default, no domain specific authentication pass policy is configured for the Captive Portal process.

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the domain specific authentication pass policy from the Captive Portal configuration.
- Use the **realm prefix domain** or **realm suffix domain** parameter to apply the authentication policy list or UNP profile based on the domain name of the Captive Portal authenticated user device.
- If the **profile-change** parameter is enabled, the profile initially assigned to the Captive Portal user is changed to the profile derived through successful Captive Portal authentication. The QoS policy list associated with the new profile is then applied to the authenticated users.
- When a profile change occurs, the new profile may assign a different VLAN to the authenticated device. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing Bring Your Own Device (BYOD) global commands are leveraged to configure the port bounce and pause timer values.
- If the new profile assigned to the user also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.

- If the **profile-change** parameter is disabled, then the QoS policy list name returned from the RADIUS server or the list name specified through the global (non-domain specific) Captive Portal configuration is applied.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
  - The policy list name returned from the RADIUS server.
  - The policy list name specified with this command or through the global Captive Portal configuration.
  - The policy list name associated with the UNP profile returned from the RADIUS server.
  - The policy list name associated with the UNP profile specified with this command or through the global Captive Portal configuration.
- A policy list name or a UNP profile name returned from the RADIUS server takes precedence over the policy list name or UNP profile name configured through this command.

## Examples

```
-> captive-portal authentication-pass realm prefix domain asia-pacific policy-list
list2
-> captive-portal authentication-pass realm suffix domain north-america profile
unp2 profile-change enable
-> no captive-portal authentication-pass realm suffix domain north-america
```

## Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

## Related Commands

**captive-portal authentication-pass** Configures a global authentication pass policy. This type of policy is applied to all devices successfully authenticated through the Captive Portal process.

**show captive-portal configuration** Displays the global Captive Portal configuration for the switch.

## MIB Objects

```
alaDaCPortalAuthPassTable
  alaDaCPortalAuthDomainName
  alaDaCPortalAuthRealm
  alaDaCPortalAuthPolicyListName
  alaDaCPortalAuthRowStatus
  alaDaCPortalAuthUNPProfile
  alaDaCPortalAuthUNPProfileChange
```

---

## captive-portal-profile

Configures a Captive Portal profile that is assigned to a UNP profile. This type of profile defines Captive Portal configuration options that are applied to devices classified into the assigned UNP profile. This command page describes the base command (**captive-portal-profile** *profile\_name*) along with the other command keywords that are used to configure profile attributes.

```
captive-portal-profile profile_name
  [aaa-profile aaa_profile_name]
  [success-redirect-url redirect_url]
  [retry-count retries]
  [authentication-pass [realm {prefix | suffix} domain domain_name] {policy-list list_name | profile
profile_name | profile-change {enable | disable}}
```

```
no captive-portal-profile profile_name
```

---

### Syntax Definitions

<i>profile_name</i>	The name to assign to the Captive Portal profile (up to 32 characters).
<i>aaa_profile_name</i>	The name of an authentication, authorization, and accounting (AAA) profile to associate with the Captive Portal profile.
<i>redirect_url</i>	A URL (up to 63 characters) to which user devices are redirected after successful Captive Portal authentication.
<i>retries</i>	The number of login attempts allowed. The range is 1–99.
<b>realm prefix</b>	Specifies a prefix domain name (for example, <i>domain_name</i> /user).
<b>realm suffix</b>	Specifies a suffix domain name (for example, user@ <i>domain_name</i> ).
<i>domain_name</i>	The domain name for the user device.
<i>list_name</i>	The name of a QoS policy list to apply to the authenticated user device.
<i>profile_name</i>	The name of an existing UNP profile.
<b>enable</b>	Enables the profile change operation. Authenticated devices are assigned to the specified profile name.
<b>disable</b>	Disables the profile change operation. Authenticated devices are not assigned to a new profile.

## Defaults

parameter	default
<i>aaa_profile_name</i>	none
<i>redirect_url</i>	none
<i>retries</i>	3
<b>realm prefix   suffix</b>	none
<i>domain_name</i>	none
<i>list_name</i>	none
<i>profile_name</i>	none
<b>enable   disable</b>	disabled

## Platforms Supported

OmniSwitch 9900, 6860, 6865

## Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal profile from the switch configuration.
- Creating a Captive Portal profile name with the base command (**captive-portal-profile** *profile\_name*) is not required to configure a profile attribute value. If the profile name does not exist, the switch will automatically create the name specified when the attribute is configured. For example, the **unp captive-portal-profile cp-prof1 retry-count 5** command will create the “cp-prof1” profile if it does not already exist in the switch configuration.
- When a Captive Portal profile is applied to a UNP profile, the parameter values defined in the profile override the global Captive Portal parameter values configured for the switch.
- A Captive Portal profile is applied only when Captive Portal authentication is enabled for the UNP profile. If there is no Captive Portal profile associated with a UNP profile, then the global Captive Portal configuration is applied.
- Assigning an AAA profile to a Captive Portal profile defines specific AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are used for Captive Portal authentication. If there is no AAA profile assigned, then the global AAA configuration is used.
- AAA profiles are configured using the **aaa profile** command. See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

## Examples

```
-> captive-portal-profile cp-p1
-> captive-portal-profile cp-p1 aaa-profile aaa_p1
-> captive-portal-profile cp-p1 authentication-pass realm prefix domain asia-
pacific policy-list list1
-> no captive-portal-profile cp-p1 aaa-profile aaa_p1
-> no captive-portal-profile cp-p1

-> captive-portal-profile cp-p2 retry-count 5
-> captive-portal-profile cp-p2 authentication-pass profile ep-1
-> captive-portal-profile cp-p2 authentication-pass profile-change enable
```

```
-> captive-portal-profile cp-p2 success-redirect-url http://server-1.com/pass.html
-> captive-portal-profile cp-p2 authentication-pass profile-change disable
-> no captive-portal-profile cp-p2 authentication-pass profile
-> no captive-portal-profile cp-p2
```

## Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

Release 8.3.1; **edge-profile** and **edge-profile-change** parameters changed to **profile** and **profile-change**.

## Related Commands

---

## show captive-portal configuration

Displays the global Captive Portal parameter settings configured for the switch.

**show captive-portal configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Currently only the internal Captive Portal mode (Web server on the switch) is configurable for the switch. An external Captive Portal operation is provided through interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.
- The parameter values configured and applied through a Captive Portal profile override any values set through the global Captive Portal configuration. A Captive Portal profile is associated with a UNP profile and is applied to devices classified into that profile.

### Examples

```
-> show captive-portal configuration
```

```
Captive Portal Global Configuration:
```

```

Captive Portal Mode           = Internal
Captive Portal IP address     = 10.123.0.1
Captive Portal Redirect String = captive-portal.com
Captive Portal Success Redirect URL =
Captive Portal Proxy Server Port = 8080
Captive Portal Retry Count    = 3
Captive Portal Global Auth Policy List =
Captive Portal Page Customization = Disable
Captive Portal Profile Name   =
Captive Portal Profile Change = Disable
Domain Specific Policy Lists:

```

Domain	Realm	Policy List	Profile Name	Profile Change
na01	Suffix	qos-bw1	unp1-vlan	Enable
na02	Prefix	qos-bw2	unp2-vlan	Enable

*output definitions*

<b>Captive Portal Mode</b>	The Captive Portal mode of operation. Only the internal mode (Web server on the OmniSwitch) is supported at this time.
<b>Captive Portal IP address</b>	The internal Captive Portal IP address for the switch. Configured through the <b>captive-portal ip-address</b> command.
<b>Captive Portal Redirect String</b>	The name of the redirect URL that is used for accessing a public certificate. Configured through the <b>captive-portal name</b> command.
<b>Captive Portal Success Redirect URL</b>	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication. Configured through the <b>captive-portal success-redirect-url</b> command.
<b>Captive Portal Proxy Server Port</b>	The proxy server port to use for Captive Portal. Configured through the <b>captive-portal proxy-server-port</b> command.
<b>Captive Portal Retry Count</b>	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed. Configured through the <b>captive-portal retry-count</b> command.
<b>Captive Portal Global Auth Policy List</b>	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication. Configured through the <b>captive-portal authentication-pass</b> command.
<b>Captive Portal Profile Name</b>	The name of a UNP profile for the global Captive Portal configuration. The specified profile is only applied to Captive Portal authenticated devices when the Captive Portal profile change option is enabled. Configured through the <b>captive-portal authentication-pass</b> command.
<b>Captive Portal Profile Change</b>	The status of profile change ( <b>Enable</b> or <b>Disable</b> ). When enabled, the profile initially assigned to the Captive Portal user is changed to the profile specified through the Captive Portal profile name option. Configured through the <b>captive-portal authentication-pass</b> command.
<b>Domain Specific Policy Lists:</b>	A list of Captive Portal domain specific policies. The policy list is applied when the domain for a Captive Portal authenticated device matches the domain criteria associated with the list. Domain specific policies take precedence over the global Captive Portal settings.
<b>Domain</b>	The domain name associated with a domain specific policy. Configured through the <b>captive-portal authentication-pass domain</b> command.
<b>Realm</b>	The realm of the domain name ( <b>prefix</b> or <b>suffix</b> ) associated with a domain specific policy. The realm identifies the domain name as a prefix ( <i>domain-name/user</i> ) or as a suffix ( <i>user@domain-name</i> ). Configured through the <b>captive-portal authentication-pass domain</b> command.
<b>Policy List</b>	The name of the QoS policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name. Configured through the <b>captive-portal authentication-pass domain</b> command.

*output definitions*

---

<b>Profile Name</b>	The name of the UNP profile that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the profile name. Configured through the <b>captive-portal authentication-pass domain</b> command.
<b>Profile Change</b>	The status of profile change ( <b>Enable</b> or <b>Disable</b> ) for the associated domain name. When enabled, the initial profile assigned to the Captive Portal device is changed to the profile specified through the profile change option associated with the domain name. Configured through the <b>captive-portal authentication-pass domain</b> command.

---

**Release History**

Release 8.1.1; command was introduced.

## show captive-portal profile-names

Displays the Captive Portal profile configuration for the switch. The parameter values configured and applied through a Captive Portal profile override any values set through the global Captive Portal configuration.

**show captive-portal {profile-names | profile-name *profile\_name* configuration}**

---

### Syntax Definitions

**profile-names** Displays a list of configured Captive Portal profiles.

**profile-name *profile\_name* configuration** Displays the Captive Portal parameter configuration for the specified profile name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

Currently only the internal Captive Portal mode (Web server on the switch) is configurable for the switch. An external Captive Portal operation is provided through interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.

### Examples

```
-> show captive-portal profile-names
```

```

      Captive Portal Profile Names
-----
 1. cpl
 2. cp2
 3. cp3

```

```
-> show captive-portal profile-name cpl configuration
```

```

Captive Portal Profile cpl Configuration:
  Captive Portal Mode           = Internal
  Captive Portal AAA Profile Name =
  Captive Portal Success Redirect URL =
  Captive Portal Retry Count     = 3
  Captive Portal Global Auth Policy List =
  Captive Portal Profile Name     =
  Captive Portal Profile Change   = Disable
Domain Specific Policy Lists:
  Domain      | Realm | Policy List | Profile Name | Profile Change
-----|-----|-----|-----|-----
na01          | Suffix | qos-bw1    | unp1-vlan    | Enable
na02          | Prefix | qos-bw2    | unp2-vlan    | Enable

```

*output definitions*

---

<b>Captive Portal Mode</b>	The Captive Portal mode of operation. Only internal mode (Web server on the OmniSwitch) is supported at this time.
<b>Captive Portal AAA Profile Name</b>	The name of an authentication, authorization, and accounting (AAA) profile associated with the Captive Portal profile.
<b>Captive Portal Success Redirect URL</b>	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication.
<b>Captive Portal Retry Count</b>	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed.
<b>Captive Portal Global Auth Policy List</b>	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication.
<b>Captive Portal Profile Name</b>	The name of a UNP profile for the global Captive Portal configuration. The specified profile is only applied to Captive Portal authenticated devices when the Captive Portal profile change option is enabled.
<b>Captive Portal Profile Change</b>	The status of profile change ( <b>Enable</b> or <b>Disable</b> ). When enabled, the profile initially assigned to the Captive Portal user is changed to the profile specified through the Captive Portal profile name option.
<b>Domain Specific Policy Lists:</b>	A list of Captive Portal domain specific policies. The policy list is applied when the domain for a Captive Portal authenticated device matches the domain criteria associated with the list. Domain specific policies take precedence over the global Captive Portal settings.
<b>Domain</b>	The domain name associated with a domain specific policy.
<b>Realm</b>	The realm of the domain name ( <b>prefix</b> or <b>suffix</b> ) associated with a domain specific policy. The realm identifies the domain name as a prefix ( <i>domain-name/user</i> ) or as a suffix ( <i>user@domain-name</i> ).
<b>Policy List</b>	The name of the QoS policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name.
<b>Profile Name</b>	The name of the UNP profile that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the profile name.
<b>Profile Change</b>	The status of profile change ( <b>Enable</b> or <b>Disable</b> ) for the associated domain name. When enabled, the initial profile assigned to the Captive Portal device is changed to the profile specified through the profile change option associated with the domain name.

```

---

## qmr quarantine path

Specifies the URL for a remediation server. This information is used by the Quarantine Manager and Remediation (QMR) application. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

**qmr quarantine path** *url*

**no qmr quarantine path**

---

### Syntax Definitions

*url* The URL for the QMR remediation server.

### Defaults

By default, no URL is configured.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of the command to remove the remediation server URL from the configuration.
- Make sure to add the corresponding IP address for the remediation server to the QMR list of exception subnets, configured through the **qmr quarantine allowed-name** command.
- Configuring the URL *and* adding the server IP address to the allowed list is required to redirect quarantined MAC addresses to the remediation server.

### Examples

```
-> qos quarantine path www.remediate.com  
-> no quarantine path
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

<b>qmr quarantine page</b>	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
<b>qmr quarantine allowed-name</b>	Configures a list of IP addresses to which a restricted quarantined user can access.
<b>qmr quarantine custom-proxy-port</b>	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
<b>qos quarantine mac-group</b>	Configures the name of the Quarantine MAC address group.
<b>show qmr</b>	Displays the Access Guardian QMR configuration.
<b>show quarantine mac group</b>	Displays the contents of the QoS quarantined MAC address group.

## MIB Objects

alaDaQMRGlobalConfig

alaDaQMRPath

---

## qmr quarantine page

Configures the QMR application to send a “Quarantined” page to a client if a remediation server is not configured. This page is used to notify the client that QMR has quarantined the client.

**qmr qos quarantine page {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the sending of a “Quarantined” page to the client.
<b>disable</b>	Disables the sending of a “Quarantined” page to the client.

### Defaults

By default, no “Quarantined” page is sent to the client.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

A “Quarantined” page is only sent if a remediation server path was not configured for QMR. Note that even if the remediation server is not active, QMR will not send the page as long as there is a value set for the remediation server path.

### Examples

```
-> qmr quarantine page enable  
-> qmr quarantine page disable
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

<b>qmr quarantine path</b>	Specifies the URL for a remediation server.
<b>qmr quarantine allowed-name</b>	Configures a list of IP addresses to which a restricted quarantined user can access.
<b>qmr quarantine custom-proxy-port</b>	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
<b>qos quarantine mac-group</b>	Configures the name of the Quarantine MAC address group.

<b>show quarantine mac group</b>	Displays the contents of the QoS quarantined MAC address group.

## MIB Objects

alaDaQMRGlobalConfig  
alaDaQMRPage

---

## qmr quarantine allowed-name

Configures a list of IP addresses that a restricted quarantined user is allowed to access.

**qmr quarantine allowed-name** *name* **ip-address** *ip\_address* [**ip-mask** *ip\_mask*]

**no qmr quarantine allowed-name** *name*

---

### Syntax Definitions

<i>name</i>	Specify a name to assign to the allowed IP network address.
<i>ip_address</i>	An IPv4 network address (for example, 10.0.0.0, 171.15.0.0, or 196.190.254.0).
<i>ip_mask</i>	A valid IP address mask for the allowed IP network address (for example, 255.0.0.0 or 255.255.0.0)

### Defaults

By default, no IP addresses are configured as QMR allowed addresses.

parameter	default
<i>ip_mask</i>	IP address class

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- A maximum of three allowed IP addresses is supported.
- Make sure the IP address of the QMR remediation server is configured as an allowed IP address. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

### Examples

```
-> qmr quarantine allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no qmr quarantine allowed-name server2
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

<b>qmr quarantine path</b>	Specifies the URL for a remediation server.
<b>qmr quarantine page</b>	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
<b>qmr quarantine custom-proxy-port</b>	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
<b>qos quarantine mac-group</b>	Configures the name of the Quarantine MAC address group.
<b>show qmr</b>	Displays the Access Guardian QMR configuration.
<b>show quarantine mac group</b>	Displays the contents of the QoS quarantined MAC address group.

## MIB Objects

```
alaDaQMRAAllowedTable  
  alaDaQMRAAllowedName  
  alaDaQMRAAllowedIpAddr  
  alaDaQMRAAllowedIpMask
```

---

## qmr quarantine custom-proxy-port

Configures the HTTP proxy port number used in the Web browser configuration of a host device. Quarantine Manager uses this information when trapping HTTP packets from a quarantined device and redirecting traffic from the device for remediation.

**qmr quarantine custom-proxy-port** *proxy\_port*

**no qmr quarantine custom-proxy-port**

---

### Syntax Definitions

*proxy\_port* The HTTP proxy port number. The valid range is 1025–65535.

### Defaults

By default, the redirect proxy port number is set to 8080.

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

Use the **no** form of this command to set the proxy port number back to 8080 (the default).

### Examples

```
-> qmr quarantined custom-proxy-port 8887
-> no qmr quarantined custom-proxy-port
```

### Release History

Release 8.1.1; command was introduced.

## Related Commands

<b>qmr quarantine path</b>	Specifies the URL for a remediation server.
<b>qmr quarantine page</b>	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
<b>qmr quarantine allowed-name</b>	Configures a list of IP addresses to which a restricted quarantined user can access.
<b>qos quarantine mac-group</b>	Configures the name of the Quarantine MAC address group.
<b>show qmr</b>	Displays the Access Guardian QMR configuration.
<b>show quarantine mac group</b>	Displays the contents of the QoS quarantined MAC address group.

## MIB Objects

alaDaQMRGlobalConfig  
alaDaQMRCustomHttpProxyPort

---

## show qmr

Displays the Quarantine Manager and Remediation (QMR) configuration for the switch.

```
show qmr
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

QMR is an OmniSwitch application that interacts with the OmniVista Quarantine Manager (OVQM) application to restrict the network access of quarantined clients and provide a remediation path for such clients to regain their network access. This command displays the OmniSwitch QMR configuration.

### Examples

```
-> show qmr
```

```
Quarantine Mac Group Name      : Quarantine,
Allowed IP Subnets            : IT-HD 135.254.1.10 /255.255.255.248,
                               oss-lan 10.1.1.0 /255.255.255.0,
                               rem-ser 135.254.200.0 /255.255.255.0,
Custom Proxy port              : 8888,
Quarantine Path                : www.remediation-server.alu.com,
Quarantine Page                : enabled,
```

### *output definitions*

---

<b>Quarantine MAC Group Name</b>	The name of the QoS Quarantine MAC address group. Configured through the <a href="#">qos quarantine mac-group</a> command.
<b>Allowed IP Subnets</b>	A list of IP network addresses that devices can still access while in a quarantined state. Configured through the <a href="#">qmr quarantine allowed-name</a> command.
<b>Custom Proxy port</b>	The HTTP proxy port number used for redirection of HTTP traffic from quarantined devices. Configured through the <a href="#">qmr quarantine custom-proxy-port</a> command.

*output definitions*

---

<b>Quarantine Path</b>	The URL of a remediation server to which a device is redirected when the device is quarantined. Configured through the <b>qmr quarantine path</b> command.
<b>Quarantine Page</b>	Whether or not QMR sends a “Quarantined” page notification to a quarantined user when there is no remediation server configuration. Configured through the <b>qmr quarantine page</b> command.

---

**Release History**

Release 8.1.1; command was introduced.

**Related Commands**

**show quarantine mac group** Displays the contents of the QoS Quarantine MAC address group.

**MIB Objects**

```
alaQoSConfigTable
  alaQoSConfigQuarantineMacGroupName
alaDaQMRAllowedTable
  alaDaQMRAllowedName
  alaDaQMRAllowedIpAddr
  alaDaQMRAllowedIpMask

  alaDaQMRPath
  alaDaQMRPage
```

---

## show quarantine mac group

Displays the contents of the QoS Quarantine MAC address group.

**show quarantine mac group**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860, 6865

### Usage Guidelines

The QoS MAC address group contains the MAC addresses of clients that the OmniVista Quarantine Manager (OVQM) application has quarantined. This command displays the quarantined MAC addresses that belong to this group.

### Examples

```
-> show quarantine mac group
```

```
Group Name      : Quarantine,  
Number of MACs quarantined : 11,  
00:00:00:11:11:1b,  
00:00:00:11:11:1a,  
00:00:00:11:11:19,  
00:00:00:11:11:18,  
00:00:00:11:11:17,  
00:00:00:11:11:16,  
00:00:00:11:11:15,  
00:00:00:11:11:14,  
00:00:00:11:11:13,  
00:00:00:11:11:12,  
00:00:00:11:11:11,
```

### Release History

Release 8.1.1; command was introduced.

**Related Commands**

**qos quarantine mac-group** Configures the name of the QoS Quarantine MAC address group.

**MIB Objects**

N/A

---

## zeroconf mdns admin-state

Enables or disables the Multicast DNS (mDNS) relay on the switch.

**zeroconf mdns admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the mDNS relay on the switch.
<b>disable</b>	Disables the mDNS relay on the switch.

### Defaults

The mDNS relay feature is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Apple device use mDNS (multicast DNS) as the underlying protocol for Bonjour exchanges.
- The mDNS packets will be handled in the conventional way on disabling the mDNS relay on the switch.

### Example

```
-> zeroconf mdns admin-state enable
-> zeroconf mdns admin-state disable
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

<a href="#">zeroconf ssdp admin-state</a>	Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
<a href="#">show zeroconf</a>	Displays the zero configuration for the switch.

### MIB Objects

alaZeroConfMdnsAdminStatus

---

## zeroconf ssdp admin-state

Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch. SSDP relay enables the OmniSwitch to allow non-Apple devices to discover services with minimal configuration by the administrator.

**zeroconf ssdp admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the SSDP relay on the switch.
<b>disable</b>	Disables the SSDP relay on the switch.

### Defaults

The SSDP relay feature is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The Digital Living Network Alliance (DLNA) uses Universal Plug and Play (UPnP) for media management, discovery, and control. DLNA/UPnP uses SSDP to discover services, similar to how Bonjour uses mDNS for the same. All the SSDP packets coming in on an OmniSwitch are intercepted and tunneled through the GRE tunnel to the WLAN controller (acting as a gateway).
- When SSDP relay is disabled on the switch, SSDP packets are handled in the same manner as conventional packets.

### Example

```
-> zeroconf ssdp admin-state enable
-> zeroconf ssdp admin-state disable
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

<a href="#">zeroconf mdns admin-state</a>	Enables or disables the Multicast DNS (mDNS) relay on the switch.
<a href="#">show zeroconf</a>	Displays the zero configuration for the switch.

### MIB Objects

alaZeroConfSsdpAdminStatus

---

## zeroconf mode

Configures the mode of the SSDP or MDNS packet processing.

**zeroconf mode [tunnel [type standard] | gateway | responder]**

---

### Syntax Definitions

<b>tunnel</b>	This is Aruba mode. The packets are sent to the responder through the configured GRE tunnel with protocol value of 0x0. The tunnel mode is configured on the edge switch.
<b>tunnel type standard</b>	The packets are sent to the responder through the configured GRE tunnel with protocol value of 0x6558.
<b>gateway</b>	The received packets are forwarded to all the VLANs in the gateway VLAN list. The gateway mode is configured on the gateway switch.
<b>responder</b>	This is responder mode. The responder mode is configured on the core switch. Responder mode is not supported on OmniSwitch 9900.

### Defaults

The tunnel mode (Aruba mode) is enabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- In tunnel mode (both Aruba and Standard), the responder IP address must be configured to tunnel the mDNS or SSDP packets. The operational status will be DOWN until the responder IP address is configured.
- In tunnel mode (both Aruba and Standard) or responder mode, the mDNS and SSDP packets are processed only when the Loopback0 IP address is configured, which is considered as the source IP address for the tunneled packets. Use the **ip interface** command to configure the interface address.
- In responder mode, the tunnel for each edge switch must be configured manually.
- In responder mode if there is no service rules configured, the responder switch will learn all the service but will not process any query received from the mDNS client.
- The switch can operate in only one mode at a time.

### Example

```
-> zeroconf mode gateway
-> zeroconf mode tunnel
-> zeroconf mode responder
```

### Release History

Release 8.4.1 R02; command introduced.

**Related Commands**

<a href="#">zeroconf mdns admin-state</a>	Enables or disables the Multicast DNS (mDNS) relay on the switch.
<a href="#">zeroconf sdp admin-state</a>	Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch.
<a href="#">zeroconf responder-ip</a>	Configures the IP address of the tunnel endpoint (zero configuration responder).
<a href="#">zeroconf gateway-vlan-list</a>	Adds or deletes a VLAN from the gateway VLAN list
<a href="#">zeroconf access-vlan-list</a>	Adds or deletes a VLAN from the access VLAN list.
<a href="#">show zeroconf</a>	Displays the zero configuration for the switch.

**MIB Objects**

```
alaZeroConfMode  
alaZeroConfTunnelMode
```

---

## zeroconf responder-ip

Configures the IP address of the tunnel endpoint (zero configuration responder) on the edge switch.

```
zeroconf responder-ip ipv4address
```

```
no zeroconf responder-ip ipv4address
```

---

### Syntax Definitions

**responder-ip** This is the IP address of the zero configuration responder.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Only IPv4 address can be configured as a responder IP address.
- In gateway mode, the responder IP address must not be configured.
- In tunnel mode, the responder IP address must be configured to tunnel the mDNS or SSDP packets. The operational status will be DOWN until the responder IP address is configured.
- To remove the responder IP address configuration, use the **no** form of the command.

### Example

```
-> zeroconf responder-ip 10.0.0.1  
-> no zeroconf responder-ip 10.0.0.1
```

### Release History

Release 8.4.1 R02; command introduced.

## zeroconf gateway-vlan-list

Adds or deletes a VLAN from the gateway VLAN list.

**zeroconf gateway-vlan-list** *vlan-id1...vlan-idn*

**no zeroconf gateway-vlan-list** *vlan-id1...vlan-idn*

---

### Syntax Definitions

*vlan-id* The existing VLAN ID to be added or deleted from the gateway VLAN list. The valid range is 1-4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- The gateway VLAN list can be configured only in the gateway mode.
- A maximum of 10 gateway VLANs is supported.
- To remove a VLAN from the gateway VLAN list, use the **no** form of the command.

### Example

```
-> zeroconf gateway-vlan-list 1 2 4  
-> no zeroconf gateway-vlan-list 4
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

---

## zeroconf access-vlan-list

Adds or deletes a VLAN from the access VLAN list.

**zeroconf access-vlan-list** *vlan-id1...vlan-idn*

**no zeroconf access-vlan-list** *vlan-id1...vlan-idn*

---

### Syntax Definitions

*vlan-id* The existing VLAN ID to be added or deleted from the access VLAN list. The valid range is 1-4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The access VLAN list must be configured when the tunnel mode use GRE tunnel type standard.
- The query packets from the responder is sent to the VLANs configured in the access VLAN list.
- A maximum of 16 access VLANs is supported.
- To remove a VLAN from the access VLAN list, use the **no** form of the command.

### Example

```
-> zeroconf access-vlan-list 6 7 9  
-> no zeroconf access-vlan-list 7
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

**zeroconf mode** Configures the mode of the SSDP or mDNS packet processing.

alaZeroConfAccessVlanEntry

---

## zeroconf server-policy

Configures the server policy.

**zeroconf server-policy** *policy-name* [**role** | **vlan** | **location**]

**no zeroconf server-policy** *policy-name* [**role** | **vlan** | **location**]

---

### Syntax Definitions

<i>policy-name</i>	Provide the name of the zero configuration server policy. The policy name can be maximum 31 characters in length.
<b>role</b>	Provide the server role to be mapped with server policy. Multiple roles can be mapped to a server policy. The role name can be maximum 32 characters in length.
<b>vlan</b>	Provide the VLAN ID to be mapped with the server policy. Multiple VLAN IDs can be mapped to a server policy.
<b>location</b>	Provide the location name to be mapped with server policy. Multiple locations can be mapped to a server policy. The location name can be maximum 32 characters in length.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configured server policy is not applied unless it is mapped to a service rule.
- A maximum of 16 roles, 16 locations, and 16 VLANs can be configured for a server policy.
- The server policy can be modified even when it is mapped to a service rule.
- The server policy cannot be deleted if it is being used by a service rule.
- The server policy attribute can be deleted even when it is mapped to a service rule unless any one of the policy attributes remains configured for that policy.
- To remove the server policy, use the **no** form of the command. To remove specific attribute associated to the policy mention the attribute along with the **no** command.

### Example

```
-> zeroconf server-policy SP1 role employee
-> zeroconf server-policy SP1 vlan 10 20 30
-> zeroconf server-policy SP1 location meetingroom1 meetingroom2
-> no zeroconf server-policy SP1
-> no zeroconf server-policy SP1 role employee
-> no zeroconf server-policy SP1 vlan 10 20
```

```
-> no zeroconf server-policy SP1 location meetingroom1
```

## Release History

Release 8.4.1 R02; command introduced.

## Related Commands

<a href="#">zeroconf mode</a>	Configures the mode of the SSDP or mDNS packet processing.
<a href="#">zeroconf client-policy</a>	Configures the client policy.
<a href="#">zeroconf service-rule</a>	Allows to define service rules for selective sharing of services with the clients.
<a href="#">show zeroconf</a>	Displays the zero configuration for the switch.
<a href="#">show zeroconf mdns server policies</a>	Displays the information of the server policies configured and the service instance learned on the responder.

## MIB Objects

```
alaZeroConfServerPolicyTable  
  alaZeroConfServerPolicyEntry  
  alaZeroConfServerPolicyName  
  alaZeroConfServerRoleMappingName  
  alaZeroConfServerVlanMappingId  
  alaZeroConfServerLocationMappingString
```

---

## zeroconf client-policy

Configures the client policy.

**zeroconf client-policy** *policy-name* [**role** | **vlan** | **location**]

**no zeroconf client-policy** *policy-name* [**role** | **vlan** | **location**]

---

### Syntax Definitions

<i>policy-name</i>	Provide the name of the zero configuration client policy. The policy name can be maximum 31 characters in length.
<b>role</b>	Provide the client role to be mapped with client policy. Multiple roles can be mapped to a client policy. The role name can be maximum 32 characters in length.
<b>vlan</b>	Provide the VLAN ID to be mapped with the client policy. Multiple VLAN IDs can be mapped to a client policy.
<b>location</b>	Provide the location name to be mapped with client policy. Multiple locations can be mapped to a client policy. The location name can be maximum 32 characters in length.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configured client policy is not applied unless it is mapped to a service rule.
- A maximum of 16 roles, locations, and VLANs can be configured for a client policy.
- The client policy can be modified even when it is mapped to a service rule.
- The client policy cannot be deleted if it is being used by a service rule.
- The client policy attribute can be deleted even when it is mapped to a service rule unless any one of the policy attributes remains configured for that policy.
- To remove the client policy, use the **no** form of the command. To remove specific attribute associated to the policy mention the attribute along with the **no** command.

### Example

```
-> zeroconf client-policy SP1 role employee
-> zeroconf client-policy SP1 vlan 10 20 30
-> zeroconf client-policy SP1 location meetingroom1 meetingroom2
-> no zeroconf client-policy SP1
-> no zeroconf client-policy SP1 role employee
-> no zeroconf client-policy SP1 vlan 10 20
```

-> no zeroconf client-policy SP1 location meetingroom1

## Release History

Release 8.4.1 R02; command introduced.

## Related Commands

<a href="#">zeroconf mode</a>	Configures the mode of the SSDP or mDNS packet processing.
<a href="#">zeroconf server-policy</a>	Configures the server policy.

```
alaZeroConfClientPolicyTable
  alaZeroConfClientPolicyEntry
  alaZeroConfClientPolicyName
  alaZeroConfClientRoleMappingName
  alaZeroConfClientVlanMappingId
  alaZeroConfClientLocationMappingString
```

---

## zeroconf service-rule

Allows to define service rules for selective sharing of services with the clients.

**zeroconf service-rule** *rule name* **server-policy** *server-policy-name* **client-policy** *client-policy-name*

**no zeroconf service-rule** *rule name*

---

### Syntax Definitions

<i>rule name</i>	Name of the service rule. The rule name can be maximum 31 characters in length.
<i>server-policy-name</i>	Name of the server policy to be mapped with service rule. A server policy cannot be mapped to multiple service rule.
<i>client-policy-name</i>	Name of the client policy to be mapped with service rule. A client policy cannot be mapped to multiple service rule.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- There must be one-to-one mapping between the server and client policy.
- The responder will respond to a service query only when the server and client policy is matched.
- A service rule with an existing server and client policy mapping cannot be linked to a new server and client policy without deleting the existing mapping.
- A maximum of 64 service rule configuration is supported on a responder.
- To remove a service rule, use the **no** form of the command.

### Example

```
-> zeroconf service-rule SR1 server-policy SP1 client-policy CP1  
-> no zeroconf service-rule SR1
```

### Release History

Release 8.4.1 R02; command introduced.

## Related Commands

<a href="#">zeroconf server-policy</a>	Configures the server policy.
<a href="#">zeroconf client-policy</a>	Configures the client policy.
<a href="#">zeroconf service-rule mdns-service-id</a>	Allows to configure selective services for a service rule to be shared with the clients.
<a href="#">show zeroconf</a>	Displays the zero configuration for the switch.
<a href="#">show zeroconf mdns service rules</a>	Displays the information of the service rules configured on the responder.

## MIB Objects

```
alaZeroConfServiceRuleTable  
  alaZeroConfServiceRuleEntry  
  alaZeroConfServiceRuleName  
  alaZeroConfServiceRuleServerPolicyName  
  alaZeroConfServiceRuleClientPolicyName
```

---

## zeroconf service-rule mdns-service-id

Allows to configure selective services for a service rule.

**zeroconf service-rule** *rule name* **mdns-service-id** *service-id1.....[service-idn]*

**no zeroconf service-rule** *rule name* **mdns-service-id** *service-id1.....[service-idn]*

---

### Syntax Definitions

<i>rule name</i>	Name of the service rule.
<i>service-id</i>	Name of the service ID to be mapped with the service rule. Multiple service IDs can be mapped with a service rule.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- A service ID can be part of multiple service rule or multiple service IDs can be mapped to a service rule.
- A service ID can be mapped or removed form a service rule without deleting the service rule.
- The responder will respond to a service query only when the server and client policy is matched.
- A maximum of 64 service IDs can be configured for a service rule.
- To remove a service ID, use the **no** form of the command.

### Example

```
-> zeroconf service-rule SR1 mdns-service-id _scanner._tcp.local _ipp._tcp.local
-> no zeroconf service-rule SR1 mdns-service-id _scanner._tcp.local
```

### Release History

Release 8.4.1 R02; command introduced.

## Related Commands

<b>zeroconf service-rule</b>	Allows to define service rules for selective sharing of services with the clients.
<b>show zeroconf</b>	Displays the zero configuration for the switch.
<b>show zeroconf mdns service rules</b>	Displays the information of the service rules configured on the responder.

## MIB Objects

alaZeroConfServiceRuleMdnsServiceMappingTable  
alaZeroConfServiceRuleMdnsServiceMappingEntry

---

## zeroconf mdns service-list

Allows to configure a list of know services for mDNS service query.

**zeroconf mdns service-list** *service-id1...service-idn*

**no zeroconf mdns service-list** *service-id1...service-idn*

---

### Syntax Definitions

*service-id* Name of the service ID to be included in the service list. A maximum of 64 service IDs can be configured in the list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The services in the list are queried for re-learning by the responder, in an event of reload or takeover on the responder.
- A maximum of 64 service IDs can be configured in a service list.
- To remove a service ID from the service list, use the **no** form of the command.

### Example

```
-> zeroconf mdns service-list _scanner._tcp.local _ipp._tcp.local
-> no zeroconf mdns service-list _scanner._tcp.local
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

- |   |  |
|---|--|
| <a href="#">zeroconf service-id query-request</a> | Allows to query a specific service.  |

| <a href="#">show zeroconf</a>                     | Displays the zero configuration for the switch.                            |

### MIB Objects

```
alaZeroConfMdnsServiceTable
  alaZeroConfMdnsServiceEntry
```

---

## zeroconf service-id query-request

Allows to query a specific service. If the responder misses to learn a service, that specific service can be queried for re-learning by the responder.

**zeroconf mdns service-id *service-id* query-request**

---

### Syntax Definitions

*service-id* Name of the service ID to be queried for learning by the responder.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Use this command to manually query for a specific service.

### Example

```
-> zeroconf mdns service-id _scanner._tcp.local query-request
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

[zeroconf mode](#) Configures the mode of the SSDP or mDNS packet processing.  
[show zeroconf](#) Displays the zero configuration for the switch.

### MIB Objects

alaZeroConfMdnsServiceTriggerQuery

---

## zeroconf edge-ip-list

Allows to configure the list of tunnel edge endpoint IP addresses. The edge-ip-list must be configured for the responder.

**zeroconf edge-ip-list** *ipaddress1...ipaddressn*

**no zeroconf edge-ip-list** *ipaddress1...ipaddressn*

---

### Syntax Definitions

*ipaddress*

The tunnel edge endpoint IP address. It is the Loopback0 IP address of the edge switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The configured tunnel edge endpoint IP address in the list must be reachable. If the IP addresses are not reachable then the operational status of the mDNS will be down.
- To remove a tunnel edge endpoint IP address from the list, use the **no** form of the command.

### Example

```
-> zeroconf edge-ip-list 10.1.1.1 10.2.2.2 10.3.3.3  
-> no zeroconf edge-ip-list 10.1.1.1
```

### Release History

Release 8.4.1 R02; command introduced.

### Related Commands

[zeroconf mode](#)

Configures the mode of the SSDP or mDNS packet processing.

[show zeroconf edge-details](#)

Displays the IP address and reachability status of the tunnel endpoints configured on the responder.

[show zeroconf](#)

Displays the zero configuration for the switch.

### MIB Objects

---

## show zeroconf

Displays the basic zero configuration details.

**show zeroconf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Example

```
-> show zeroconf
zero-conf mode           : responder,
MDNS admin status       : enabled,
SSDP admin status       : disabled
MDNS operational status : up,
SSDP operational status : down,
Tunnel Source IP       : 172.16.1.1
```

```
-> show zeroconf
zero-conf mode           : gateway,
MDNS admin status       : disabled,
SSDP admin status       : disabled
MDNS operational status : down,
SSDP operational status : down,
Gateway vlans list      : 1, 2, 3
```

```
-> show zeroconf
zero-conf mode           : tunnel,
zero-conf tunnel type   : standard,
MDNS admin status       : disabled,
SSDP admin status       : disabled
MDNS operational status : down,
SSDP operational status : down,
Responder IP            : -
Tunnel source IP        : -
Access vlans list       : 4, 5, 6
```

```
-> show zeroconf
zero-conf mode           : tunnel,
zero-conf tunnel type   : aruba,
MDNS admin status       : disabled,
```

```

SSDP admin status      : disabled
MDNS operational status : down,
SSDP operational status : down,
Responder IP           : -
Tunnel source IP       : -

```

### *output definitions*

---

<b>zero-conf mode</b>	Displays the zero configuration mode configured.
<b>zero-conf tunnel type</b>	Displays if the tunnel type is Aruba or Standard. This is displayed if the mode type is tunnel.
<b>MDNS admin status</b>	Displays the administrative status of the mDNS.
<b>SSDP admin status</b>	Displays the administrative status of the SSDP.
<b>MDNS operational status</b>	Displays the operational status of mDNS. The operation status will be down if the responder IP address is not configured or not reachable.
<b>SSDP operational status</b>	Displays the operational status of SSDP. The operation status will be down if the responder IP address is not configured or not reachable.
<b>Responder IP</b>	Displays the configured responder IP address. This is displayed if the mode type is tunnel.
<b>Tunnel Source IP</b>	Displays the source IP address of the tunnel. This is displayed if the mode type is tunnel or responder.
<b>Gateway vlans list</b>	Displays the configured gateway VLANs list. This is displayed if the mode type is gateway.
<b>Access vlans list</b>	Displays the configured access VLANs list. This is displayed if the mode type is tunnel and the tunnel type is standard.

---

## Release History

Release 8.4.1 R02; command introduced.

## Related Commands

## show zeroconf services-cache

Display the list of services learned by mDNS stack.

**show zeroconf mdns services-cache**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Example

```
-> show zeroconf mdns services-cache
Service Instance  Service-ID      IP address  Port  TTL  Role  Location
-----+-----+-----+-----+-----+-----+-----
Officejet[3EA581] _ipp._tcp      18.6.1.2   631   4500 Teacher  Library
Officejet[3EA581] _scanner._tcp  18.6.1.2   9500   4500 Teacher  Library
```

### *output definitions*

---

<b>Service Instance</b>	Displays the device name of the service instance.
<b>Service-ID</b>	Displays the type of service.
<b>IP address</b>	Displays the IP address of the device on which the service is discovered.
<b>Port</b>	Displays the UDP port number of the discovered service instance.
<b>TTL</b>	Displays the age of the service cache entry in seconds.
<b>Role</b>	Displays the role derived from UNP policy list name on the edge switch.
<b>Location</b>	Displays the location derived from the edge switch.

---

## show unip profile

Displays the UNP profile configuration for the switch.

**show unip profile** [*profile\_name*]

---

### Syntax Definitions

*profile\_name*                      The name of the UNP to display.

### Defaults

By default, the configuration for all profiles is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Enter a UNP profile name with this command to display information for a specific profile.
- Use the [show unip profile map](#) command to display the VLAN or service type (SPB, VXLAN, or static) that is mapped to the UNP profile.

### Examples

```
-> show unip profile
Profile Name: unip2-spb
  Qos Policy      = qrules1,
  Location Policy = -,
  Period Policy   = -,
  CP Profile      = -,
  Redirect State  = Dis,
  CP State        = Dis,
  Authen Flag     = Dis,
  Mobile Tag      = Dis,
  SAA Profile     = -,

### *output definitions*

<b>Profile Name</b>	The name of the UNP profile. Configured through the <b>unip profile</b> command.
<b>QoS Policy</b>	The name of the QoS policy list associated with the profile. Configured through the <b>unip profile qos-policy-list</b> command.
<b>Location Policy</b>	The name of the location policy assigned to the UNP profile. Configured through the <b>unip profile location-policy</b> command.
<b>Period Policy</b>	The name of the period policy assigned to the UNP profile. Configured through the <b>unip profile period-policy</b> command.
<b>CP Profile</b>	The name of the Captive Portal (CP) profile assigned to the UNP profile. A CP profile defines a CP configuration that is applied to devices when CP authentication is enabled for the UNP profile. Configured through the <b>unip profile captive-portal-profile</b> command.

---

*output definitions*

---

<b>Redirect State</b>	The redirection status ( <b>Ena</b> or <b>Dis</b> ) for the UNP profile. Indicates whether the profile is one that is returned through interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM). Configured through the <b>unip profile redirect</b> command.
<b>CP State</b>	The CP authentication status ( <b>Ena</b> or <b>Dis</b> ) for the UNP profile. Indicates whether CP authentication is triggered for devices classified into the profile. Configured through the <b>unip profile captive-portal-authentication</b> command.
<b>Authen Flag</b>	The authentication flag status ( <b>Ena</b> or <b>Dis</b> ) for the UNP profile. Indicates whether only authenticated devices are allowed into the profile. Configured through the <b>unip profile authentication-flag</b> command.
<b>Mobile Tag</b>	The mobile tag status ( <b>Ena</b> or <b>Dis</b> ) for the UNP profile. When enabled, the first user that is learned on a UNP port and is classified into a UNP profile will cause the UNP port to be added as a tagged member of the VLAN associated with the profile. If the profile is mapped to a service, a tagged virtual port association is created. Configured through the <b>unip profile mobile-tag</b> command.
<b>SAA Profile</b>	The name of a Service Assurance Agent (SAA) profile that is associated with the UNP profile. Configured through the <b>unip profile saa-profile</b> command.
<b>Ingress BW</b>	The maximum ingress bandwidth setting that is applied to ports associated with the profile. Configured through the <b>unip profile maximum-ingress-bandwidth</b> command.
<b>Egress BW</b>	The maximum egress bandwidth setting that is applied to ports associated with the profile. Configured through the <b>unip profile maximum-egress-bandwidth</b> command.
<b>Ingress Depth</b>	The maximum ingress depth setting that is applied to ports associated with the profile. Configured through the <b>unip profile maximum-ingress-depth</b> command.
<b>Egress Depth</b>	The maximum egress depth setting that is applied to ports associated with the profile. Configured through the <b>unip profile maximum-egress-depth</b> command.
<b>Inact Interval</b>	The amount of time, in seconds, that a device can remain inactive after the MAC address for the device has aged out. When the timer reaches this value, inactive devices are automatically logged out of the network. Configured through the <b>unip profile inactivity-interval</b> command.

---

## Release History

Release 8.3.1; command was introduced.

Release 8.4.1.R02; the built-in defaultWLANProfile included in the display.

## Related Commands

- show unip classification** Displays the UNP classification rule configuration for the switch.
- show unip global configuration** Displays the UNP global parameter values configured for the switch.
- show unip port** Displays the UNP configuration for the port.
- show unip user** Displays information about the devices learned on a UNP port.

## show unprofile map

Displays the VLAN, service, or tunnel mapping configuration assigned to a UNP profile.

```
show unprofile [profile_name] map {vlan | service-type {spb | vxlan | static | l2gre}}
```

---

### Syntax Definitions

<i>profile_name</i>	The name of the UNP to display.
<b>vlan</b>	Displays the VLAN mapping configuration for a UNP profile.
<b>spb</b>	Displays the Shortest Path Bridging (SPB) service mapping configuration for a UNP profile.
<b>vxlan</b>	Displays the Virtual eXtensible Local Area Network (VXLAN) service mapping configuration for a UNP profile.
<b>static</b>	Displays the existing SPB or VXLAN service IDs that are statically assigned to a UNP profile. This type of mapping is used to map the profile to a known service ID.
<b>l2gre</b>	Displays the L2 GRE tunnel mapping configuration for a UNP profile.

### Defaults

By default, the VLAN, service, or GRE tunnel mapping configuration for all profiles is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Enter a UNP profile name with this command to display the mapping information for a specific profile.
- Only one VLAN, service, or GRE tunnel is mapped to a profile at any given time.
- SPB services are not supported on the OmniSwitch 9900.
- VXLAN services are supported only on the OmniSwitch 6900-Q32 and OmniSwitch 6900-X72.
- UNP profile mapping to an L2 GRE tunnel is supported only on the OmniSwitch 6860 and OmniSwitch 6865 that serves as an edge (access) switch for a Guest Tunneling configuration.

### Examples

```
-> show unprofile map vlan
Profile Name                Vlan-Id
-----+-----
unp1-vlan                   300
unp2-vlan                   301
unp3-vlan                   500
unp4-vlan                   501

Total Profile Vlan-Map Count: 4
```

```
-> show unprofile map unprofile2-vlan map vlan
Profile Name          Vlan-Id
-----+-----
unprofile2-vlan      301
```

**output definitions**

<b>Profile Name</b>	The name of the UNP profile that is mapped to the VLAN ID.
<b>Vlan-Id</b>	The VLAN ID associated with the profile.

```
-> show unprofile map service-type spb
Profile Name          Isid      Tag Value   BVlan   Vlan Xlation   Mcast Mode
-----+-----+-----+-----+-----+-----
unprofile1-spb       1500      10         400     Ena      Tandem
unprofile2-spb       1600      20:30      401     Ena      Headend
```

Total Profile Spb-Map Count: 2

**output definitions**

<b>Profile Name</b>	The name of the UNP profile that is mapped to the SPB service.
<b>Isid</b>	The SPB service instance identifier (I-SID) that will be used to dynamically create the SPB service access point (SAP) for the profile.
<b>Tag Value</b>	The VLAN ID tags of the traffic that the dynamically created SPB SAP will carry for the profile.
<b>BVlan</b>	The SPB BVLAN ID that will be associated with the I-SID for the dynamically created SPB SAP.
<b>Vlan Xlation</b>	The status of egress VLAN translation ( <b>Ena</b> or <b>Dis</b> ) for the dynamically created SPB SAP.
<b>Mcast Mode</b>	The multicast mode ( <b>Headend</b> or <b>Tandem</b> ) for the dynamically created SPB SAP.

```
-> show unprofile map service-type vxlan
Profile Name          Vnid      Tag Value   Far-End-List Vlan Xlation   Mcast Mode   Mcast Group
-----+-----+-----+-----+-----+-----+-----
unprofile1-vxlan     2300      20         vtep-ip1     Ena      Tandem      225.1.1.2
unprofile2-vxlan     2301      40:50      vtep-ip2     Ena      Headend     -
```

Total Profile Vxlan-Map Count: 2

**output definitions**

<b>Profile Name</b>	The name of the UNP profile that is mapped to the VXLAN service.
<b>Vnid</b>	The VXLAN network identifier for the VXLAN segment that will be used to dynamically create the VXLAN service access point (SAP) for the profile.
<b>Tag Value</b>	The VLAN ID tags of the traffic that the dynamically created VXLAN SAP will carry for the profile.
<b>Far-End-List</b>	The name of the list that contains the IP addresses for the far-end VXLAN Tunnel End Points (VTEPs). The VTEPs are used to create service distribution points (SDPs) for the dynamically created VXLAN SAP.

*output definitions*

---

<b>Vlan Xlation</b>	The status of egress VLAN translation ( <b>Ena</b> or <b>Dis</b> ) for the dynamically created VXLAN SAP.
<b>Mcast Mode</b>	The multicast mode ( <b>Headend</b> or <b>Tandem</b> ) for the dynamically created VXLAN SAP.
<b>Mcast Group</b>	The multicast group IP address that the dynamically created VXLAN SAP will use to forward traffic to participating VTEPs.

---

```
-> show unip profile map service-type l2gre
```

Profile Name	Vnid	Tag Value	Far-End-List	Far-End-IP
-----+-----+-----+-----				
guest-profile	200	0		20.2.2.1

```
Total Profile L2-Gre-Map Count: 1
```

*output definitions*

---

<b>Profile Name</b>	The name of the UNP profile that is mapped to the L2 GRE tunnel.
<b>Vpnid</b>	The tunnel ID that identifies a GRE tunnel VPN.
<b>Tag Value</b>	The VLAN ID tags of the traffic that the dynamically created L2 GRE SAP will carry for the profile.
<b>Far-End-List</b>	The name of the list that contains the IP address for the far-end Guest Tunnel Termination Switch (GTTS).
<b>Far-End-IP</b>	The IP address for the far-end GTTS.

---

```
-> show unip profile map service-type static
```

Profile Name	SvcId	Tag Value
-----+-----+-----		
unp1-staticSPB	10	20
unp2-staticVXLAN	20	40:50

```
Total Profile Static-Service-Map Count: 2
```

*output definitions*

---

<b>Profile Name</b>	The name of the UNP profile that is mapped to the static service.
<b>SvcId</b>	The service ID for the existing SPB or VXLAN service.
<b>Tag Value</b>	The VLAN ID tags of the traffic that the SAP associated with the service ID will carry.

---

**Release History**

Release 8.3.1; command was introduced.

Release 8.4.1.R02; **l2gre** parameter added.

## Related Commands

<b>unprofile map vlan</b>	Configures the mapping of a standard VLAN to a UNP profile.
<b>unprofile map service-type spb</b>	Configures the mapping of SPB parameters that are used to dynamically create an SPB SAP to carry profile traffic.
<b>unprofile map service-type vxlan</b>	Configures the mapping of VXLAN parameters that are used to dynamically create a VXLAN SAP to carry profile traffic.
<b>unprofile map service-type l2gre</b>	Configures the mapping of L2 GRE tunnel parameters that are used to dynamically create an L2 GRE tunnel SAP to carry guest profile traffic.
<b>unprofile map service-type static</b>	Configures the mapping of an existing SPB or VXLAN service to the profile.
<b>show unprofile</b>	Displays the UNP profile configuration for the switch.
<b>show unprofile vxlan far-end-ip-list</b>	Displays the contents of a far-end IP address list that is used to map VXLAN service parameters to a profile.

## show unip vxlan far-end-ip-list

Displays the contents of an IP address list. Each address represents a VXLAN Tunnel End Point (VTEP). A far-end IP list is associated with a VXLAN service to identify all the VTEPs that will participate in that service.

```
show unip vxlan far-end-ip-list [ip_list_name]
```

---

### Syntax Definitions

*ip\_list\_name*                      The name of a list that contains the IP addresses for the far-end VTEPs.

### Defaults

By default, the contents of all the VXLAN far-end IP address lists is displayed.

### Platforms Supported

OmniSwitch 6900-Q32, OmniSwitch 6900-X72

### Usage Guidelines

Enter a list name with this command to display information for a specific list.

### Examples

```
-> show unip vxlan far-end-ip-list
Far-End-IP-List Name: toDataCenter1, IP-Count: 3,
  IP-Addresses:
    101.1.1.1
    102.1.1.1
    103.1.1.1
Far-End-IP-List Name: toDataCenter2, IP-Count: 3,
  IP-Addresses:
    201.1.1.1
    202.1.1.1
    203.1.1.1
```

```
-> show unip vxlan far-end-ip-list toDataCenter2
Far-End-IP-List Name: toDataCenter2, IP-Count: 3,
  IP-Addresses:
    201.1.1.1
    202.1.1.1
    203.1.1.1
```

### *output definitions*

---

<b>Far-End-IP-List Name</b>	The name of the far-end IP address list.
<b>IP-Count</b>	The number of IP addresses in the list.
<b>IP-Addresses</b>	The IP addresses that are members of the specified list name.

---

## Release History

Release 7.3.4; command was introduced.

## Related Commands

**unip vxlan far-end-ip-list**

Configures a UNP VXLAN far-end IP list.

**show unip profile map**

Displays the VXLAN service profile mapping configuration for the switch.

## MIB Objects

alaDaUNPVxlanFarEndIPListName

alaDaUNPVxlanFarEndIPListIPAddressCount

---

## show unp saa-profile

Displays the Service Assurance Agent (SAA) performance monitoring profile configuration for the switch. SAA profiles are assigned to UNP VLAN profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP VLAN profile.

**show unp saa-profile** [*profile\_name*]

---

### Syntax Definitions

*profile\_name*                      The name of an existing SAA profile to display.

### Defaults

By default, all SAA profiles are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Enter an SAA profile name with this command to display information for a specific profile.
- This command does not provide the UNP assignment for each SAA profile. Use the [show unp profile](#) command to display the assignment information.

### Examples

```
-> show unp saa-profile
```

Profile Name	Latency Threshold	Jitter Threshold	MC Conf Status
unp_saa1	500	100	Local
unp_saa2	0	150	Local
unp_saa3	250	0	Local

#### output definitions

---

<b>Profile Name</b>	The name of the SAA profile.
<b>Latency Threshold</b>	The latency threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
<b>Jitter Threshold</b>	The jitter threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
<b>MC Conf Status</b>	The MCLAG consistency check status of the UNP configuration ( <b>Sync</b> , <b>Out-Of-Sync</b> , or <b>Local</b> ). <i>Note that MCLAG is not supported in this release.</i>

---

### Release History

Release 7.3.2; command was introduced.

## Related Commands

**unip saa-profile**

Configures SAA performance monitoring profiles.

**show unip profile**

Displays the UNP profile configuration for the switch.

## show unip global configuration

Displays the switch configuration for the global Universal Network Profile (UNP) parameter settings.

**show unip global configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- UNP global parameter settings determine specific actions related to the following:
  - Dynamically creating VLANs and/or profiles.
  - Whether or not devices attempting to authenticate are assigned to a temporary profile if the authentication server is unreachable.
  - Interaction with the Unified Policy Access Manager (UPAM) or the ClearPass Policy Manager (CPPM) as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.
- A hyphen, “-”, indicates that a value has not been configured for the global UNP parameter.

### Examples

```
-> show unip global configuration
Dynamic Vlan Configuration      = Disabled,
Dynamic Profile Configuration  = Disabled,
Auth Server Down Profile1      = -,
Auth Server Down Profile2      = -,
Auth Server Down Profile3      = -,
Auth Server Down Timeout       = 60,
Redirect Port Bounce           = Enabled,
Redirect Pause Timer           = -
Redirect http proxy-port       = 8080
Redirect Server IP             = 10.1.1.1
Allowed IP                    = -
Force L3-Learning             = Disabled
Force L3-Learning Port Bounce = Disabled
802.1x Pass Through Mode      = Disabled
AP Mode                       = Enabled
```

*output definitions*

---

<b>Dynamic Vlan Configuration</b>	The status ( <b>Enabled</b> or <b>Disabled</b> ) of dynamic VLAN configuration. Configured through the <b>unip dynamic-vlan-configuration</b> command.
<b>Dynamic Profile Configuration</b>	The status ( <b>Enabled</b> or <b>Disabled</b> ) of dynamic profile configuration. Configured through the <b>unip dynamic-profile-configuration</b> command.
<b>Auth Server Down Profile1 Auth Server Down Profile2 Auth Server Down Profile3</b>	The name of a UNP that a device is assigned to in the event the RADIUS server is unreachable. Up to three different profile names are configurable as authentication server down UNP profiles. Configured through the <b>unip auth-server-down</b> command.
<b>Auth Server Down Timeout</b>	The amount of time, in seconds, that devices remain assigned to the authentication server down UNP. Configured through the <b>unip auth-server-down-timeout</b> command.
<b>Redirect Port Bounce</b>	The status ( <b>Enabled</b> or <b>Disabled</b> ) of the port bounce operation for non-supplicant devices. Configured through the <b>unip redirect port-bounce</b> command.
<b>Redirect Pause Timer</b>	The amount of time, in seconds, the switch pauses to clear all device authentication states and trigger re-authentication. Configured through the <b>unip redirect pause-timer</b> command.
<b>Redirect http proxy-port</b>	The HTTP proxy port number to use for redirection to a server. Configured through the <b>unip redirect proxy-server-port</b> command.
<b>Redirect Server IP</b>	The IP network address of a redirection server. Configured through the <b>unip redirect-server</b> command.
<b>Allowed IP</b>	A list of IP addresses to which a host can access additional servers. Configured through the <b>unip redirect allowed-name</b> command.
<b>Force L3-Learning</b>	The status ( <b>Enabled</b> or <b>Disabled</b> ) of UNP Layer 3 learning. Configured through the <b>unip force-l3-learning</b> command.
<b>Force L3-Learning Port Bounce</b>	The status ( <b>Enabled</b> or <b>Disabled</b> ) of the port bounce action, which is associated with the Layer 3 learning function. Configured through the <b>unip force-l3-learning</b> command.
<b>802.1x Pass Through Mode</b>	Whether a supplicant device is authenticated locally ( <b>Enabled</b> ) or passed through to another switch for authentication ( <b>Disabled</b> ). Configured through the <b>unip 802.1x-pass-through</b> command.
<b>AP Mode</b>	The status ( <b>Enabled</b> or <b>Disabled</b> ) of the Access Point (AP) mode. This mode is enabled to support the detection of connected OmniAccess Stellar AP devices. Configured through the <b>unip ap-mode</b> command.

---

**Release History**

Release 7.2.1; command was introduced.

Release 7.2.1.R02; **Dynamic Profile Configuration** and **MC Conf Status** fields added.

Release 7.3.4; VXLAN fields added (supported only on the OmniSwitch 6900-Q32 and the OmniSwitch 6900-X72); **MC Conf Status** fields deprecated.

Release 8.3.1; **Auth Server Down UNP** field replaced with **Auth Server Down UNP Profile1**, **Auth Server Down UNP Profile2**, and **Auth Server Down UNP Profile3** fields; **Force L3-Learning** field added.

Release 8.3.1.R02; **Force L3-Learning Port Bounce** field added.

Release 8.4.1.R02; **802.1x Pass Through Mode** and **AP Mode** fields added.

## Related Commands

<b>show unnp profile</b>	Displays the UNP configuration for the switch.

---

## show unnp domain

Displays the UNP domain configuration for the switch.

**show unnp domain**

---

### Syntax Definitions

N/A

### Defaults

N/A.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific domain, classification rules associated with the same domain ID are applied only to UNP ports associated with that same domain ID.

### Examples

```
-> show unnp domain
```

```
Domain  Description
-----+-----
0       Default-Domain
1       UNP Domain 1
2       UNP Domain 2
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

- |   |  |
|---|--|
| <a href="#">unnp domain description</a> | Configures a domain ID to which UNP ports and classification rules are assigned. |
| <a href="#">unnp domain</a>             | Assigns a UNP port to a customer domain ID.                                      |
| <a href="#">show unnp port</a>          | Displays the UNP configuration for the port.                                     |

### MIB Objects

  alaDaUnnpCustomerDomainId
  alaDaUnnpCustomerDomainDesc
```

---

## show unip classification

Displays the UNP classification rule configuration for the switch.

**show unip classification** *rule\_type*

---

### Syntax Definitions

*rule\_type* The rule type to display (refer to the table in the “Usage Guidelines” section of this command page for a list of rule type parameters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Specifying one of the following classification rule type parameters is required with this command:

Standard Rule Parameters	Binding Rule Parameters
<b>mac-rule</b>	<b>mac-port-rule</b>
<b>mac-domain-rule</b>	<b>mac-ip-port-rule</b>
<b>mac-oui-rule</b>	<b>mac-ip-domain-rule</b>
<b>mac-range-rule</b>	<b>ip-port-rule</b>
<b>mac-range-domain-rule</b>	
<b>ip-rule</b>	
<b>ip-domain-rule</b>	
<b>vlan-tag-rule</b>	
<b>vlan-domain-rule</b>	
<b>port-rule</b>	
<b>domain</b>	
<b>authentication-type-rule</b>	
<b>lldp-rule</b>	

- Standard classification rule parameters are combined at the time a rule is created to define a binding classification rule. The parameter combinations provided with this command reflect the allowed binding rule parameter combinations.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than the binding rule configuration (see the **show unip classification-rule** command).

**Examples**

```
-> show unip classification mac-rule
```

MAC Address	VLAN Tag	Profile1 Name	Profile2 Name	Profile3 Name
00:2a:da:11:22:01	-	unp1-vlan	unp2-vxlan	unp3-vlan
00:0f:b5:46:d7:56	20	unp4-spb	-	-
00:2a:95:57:e1:67	-	unp2-vxlan	-	-

```
Total Mac Rule Count: 3
```

```
-> show unip classification mac-range-rule
```

Low MAC Address	High MAC Address	VLAN Tag	Profile1 Name	Profile2 Name	Profile3 Name
00:11:22:33:44:66	00:11:22:33:44:77	-	VNI-2400	-	-
00:11:22:33:44:88	00:11:22:33:44:99	10	CustB	VNP-B	-

```
Total Mac Range Rule Count: 2
```

```
-> show unip classification ip-rule
```

*output definitions*

---

<b>Domain</b>	The customer domain ID assigned to the classification rule for the specified profiles. The rule is applied to traffic received on UNP ports that are assigned to the same domain ID. This rule is also supported in combination with each of the other classification rules. Configured through the <b>unip domain</b> command or as a parameter with the other classification rule commands.
<b>MAC Address</b>	The MAC address value to match for this profile rule. Configured through the <b>unip classification mac-address</b> command.
<b>Low MAC Address</b> <b>High MAC Address</b>	The lowest and highest MAC address values used to specify a range of addresses to match for this rule. Configured through the <b>unip classification mac-range</b> command.
<b>IP Address</b> <b>IP Mask</b>	The IP network address and mask values to match for this rule. Configured through the <b>unip classification ip-address</b> command.
<b>Profile1, Profile2, Profile3</b>	The name of the UNP profile to which the rule is applied. Configured through the <b>unip profile</b> command.
<b>VLAN Tag</b>	The VLAN ID value to match for this profile rule. <ul style="list-style-type: none"> <li>• If one VLAN ID is displayed, the rule will match single-tagged packets or the outer VLAN tag of double-tagged packets.</li> <li>• If two VLAN IDs are displayed, the rule will match double-tagged packets (for example, 10:20 will match outer VLAN tag 10 <i>and</i> inner VLAN tag 20).</li> </ul> This rule is also supported in combination with each of the other classification rules. Configured through the <b>unip classification vlan-tag</b> or as a parameter with the other classification rule commands.
<b>MED Endpoint</b>	The LLDP Media Endpoint Device to match for this profile rule ( <b>IP-Phone</b> or <b>Access-Point</b> ). Configured through the <b>unip classification lldp med-endpoint</b> command.

---

**Release History**

Release 8.3.1; command was introduced.

**Related Commands**

<b>show unip classification-rule</b>	Displays the extended classification rule configuration for the switch.
<b>show unip profile</b>	Displays the UNP configuration for the switch.
<b>show unip port</b>	Displays the UNP configuration for the port.
<b>show unip user</b>	Displays information about the devices learned on a UNP port.

## show unp classification-rule

Displays the UNP extended classification rule configuration for the switch. An extended classification rule defines a list of rule conditions, all of which a device must match to be classified into the UNP profile associated with the extended rule name. A name and precedence value is also assigned to the list of rule conditions.

**show unp classification-rule** [*rule-name*]

---

### Syntax Definitions

*rule\_name*                               The name of an existing extended classification rule.

### Defaults

By default, the configuration for all extended rules is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Enter the name of an extended classification rule to display information for a specific rule.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than a binding rule configuration.
- An extended classification rule is associated with a UNP profile and applied to traffic learned on UNP ports.

### Examples

```
-> show unp classification-rule
Rule Name: "ext_rule1"
  Precedence           = 10,
  Profile1             = unp1-vlan,
  Conditions:
    Domain             = 2,
    Mac-OUI            = 00:22:11,
    VLAN Tag           = 100
Rule Name: "ext_rule2"
  Precedence           = 1,
  Profile1             = unp1-vlan,
  Profile2             = unp2-vxlan,
  Profile3             = unp3-vlan,
  Conditions:
    Domain             = 20,
    Mac-Address        = 00:2a:94:11:22:01,
    Port               = 1/11 ,
    LLDP MED Endpoint = IP-Phone,
    Authentication-Type = None,
```

```

-> show unp classification-rule ext_rule2
Rule Name: "ext_rule2"
  Precedence           = 1,
  Profile1             = unp1-vlan,
  Profile2             = unp2-vxlan,
  Profile3             = unp3-vlan,
  Conditions:
    Domain              = 1,
    Mac-Address         = 00:2a:94:11:22:01,
    Port                = 1/11 ,
    LLDP MED Endpoint  = IP-Phone,
    Authentication-Type = None,

```

## Release History

Release 8.1.1; command was introduced.

Release 8.2.1; **VLAN Tag** field added.

Release 8.3.1; **Edge-Profile** field replaced with **Profile1**, **Profile2**, and **Profile3** fields.

## Related Commands

## show unprivileged user-role

Displays the user-defined role configuration for the switch.

**show unprivileged user-role** [*role\_name*]

---

### Syntax Definitions

*role\_name*                                      The name of an existing user-defined role.

### Defaults

By default, all user-defined role are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Enter a user-defined role name with this command to display information for a specific role.

### Examples

```
-> show unprivileged user-role
```

```
Role Name: ur1
  QoS Policy List      : qlist1
  Priority              : 1
  Conditions:
    Profile1           : unprivileged-vlan
    Profile2           : unprivileged-spb
    Profile3           : -
  Authentication-Type  : Mac
  CP Status            : Enabled
```

```
Role Name: ur2
  QoS Policy List      : qlist-allow
  Priority              : 1
  Conditions:
    Profile1           : -
    Profile2           : -
    Profile3           : -
  Authentication-Type  : 802.1x Fail
  CP Status            : Disabled
```

```
Total User Role Derivation Rule Count: 2
```

```
-> show unprivileged user-role ur2
```

Role Name	QoS Policy List Name	Priority
ur2	qlist-allow	1

*output definitions*

---

<b>Role Name</b>	The name of the user-defined role. Configured through the <b>unip user-role</b> command.
<b>Qos Policy List</b>	The name of the QoS policy list associated with the role name. The specified list defines the user role for the device. Configured through the <b>unip user-role policy-list</b> command.
<b>Priority</b>	The role precedence, which assigns a priority value to the user-defined role. This value determines which role to apply if a device matches the conditions of more than one user-defined role. Configured through the <b>unip user-role</b> command.
<b>Profile1, Profile2, Profile3</b>	The name of a UNP profile. The user-defined role is only applied to devices classified into the specified profile name. Configured through the <b>unip user-role profile</b> command.
<b>Authentication-Type</b>	The type of authentication applied to a device ( <b>none</b> , <b>mac</b> , or <b>802.1x</b> ). The user-defined role is only applied to devices authenticated with the specified type. Configured through the <b>unip user-role authentication-type</b> command.
<b>CP Status</b>	The Captive Portal post login status. If enabled, the role is only applied to devices in this state. Configured through the <b>unip user-role cp-status-post-login</b> command.

---

**Release History**

Release 8.1.1; command was introduced.

Release 8.3.1; **Edge-Profile** field replaced with **Profile1**, **Profile2**, and **Profile3** fields.

**Related Commands**

<b>unip user-role</b>	Configures a user-defined role.
<b>show unip user</b>	Displays information about devices learned on UNP ports.

  alaDaUNPUserRoleName
  alaDaUNPUserRolePrecedenceNum
  alaDaUNPUserRolePolicyList
  alaDaUNPUserRoleProfile1
  alaDaUNPUserRoleProfile2
  alaDaUNPUserRoleProfile3
  alaDaUNPUserRoleAuthType
  alaDaUNPUserRolePostLoginStatus

```

---

## show unp restricted-role

Displays the names of the explicit QoS policy lists assigned to the built-in restricted role states (Captive Portal pre-login, Unauthorized, and QMR) used by the switch.

**show unp restricted-role**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

An explicit QoS policy list overrides the built-in policy list associated with the restricted role state. When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

### Examples

```
-> show unp restricted-role
Role name      Qos Policy List Name
-----+-----
UNAUTHORIZED  qlist-bad
QMR           qlist-qmr
CP PRE-LOGIN  qlist-cp
```

Total Restricted Role Count: 3

#### *output definitions*

---

<b>Role Name</b>	The restricted role name.
<b>Qos Policy List</b>	The name of the QoS policy list associated with the restricted role name.

---

### Release History

Release 8.1.1; command was introduced.

**Related Commands**

- unpr restricted-role policy-list** Configures a user-defined role.  
**show unpr user** Displays information about devices learned on UNP ports.

**MIB Objects**

```
alaDaUNPRstrctedRoleTable  
  alaDaUNPRstrctedRoleType  
  alaDaUNPRstrctedRolePolicyList
```

---

## show unp port

Displays the UNP configuration for the port. Includes only ports and link aggregates on which UNP is enabled.

```
show unp {port [chassis/slot/port1[-port2]] | linkagg [agg_id[-agg_id2]]} [type {bridge | access}]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
<b>bridge</b>	Displays only UNP bridge ports.
<b>access</b>	Displays only UNP access ports.

### Defaults

By default, configuration information for all UNP ports or link aggregates is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Enter a port or link aggregate ID number to display information specific to the port or link aggregate.
- Specify a UNP port type (**bridge** or **access**) to display information only for that type of UNP port.

### Examples

```
-> show unp port
Port  Port  Type  802.1x  Mac      Class.  Default  802.1X  MAC      Trust-Tag
      Domain Auth   Auth

1/16   1 Bridge Disabled Disabled Enabled  unp-1001 -        -        Disabled
1/17   0 Bridge Disabled Disabled Disabled unp-1001 -        -        Disabled
1/18   0 Access Disabled Enabled  Enabled spb1001 -        -        Enabled
1/35   0 Access Disabled Enabled  Disabled -        -        Disabled
1/36   5 Bridge Enabled  Enabled Disabled DefUnp  1XProf1 MacPAS  Enabled
1/37   5 Access Enabled  Disabled Enabled  -        1XProf2 -        Enabled

-> show unp port 1/17
Port  Port  Type  802.1x  Mac      Class.  Default  802.1X  MAC      Trust-Tag
      Domain Auth   Auth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/17   0 Bridge Disabled Disabled Disabled unp-1001 -        -        Disabled
```

```

-> show unip linkagg type bridge
LagID Port      Type      802.1x  Mac      Class.  Default  802.1X  MAC      Trust-Tag
      Domain    Auth      Auth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
10          1 Bridge Disabled Disabled Enabled  unip-1001  -        -        Disabled
15          0 Bridge Disabled Disabled Disabled unip-1001  -        -        Disabled

```

### output definitions

<b>Port/LagID</b>	The port or link aggregate on which UNP is enabled. Configured through the <b>unip port-type</b> command.
<b>Port Domain</b>	The customer domain ID assigned to the UNP port. Traffic received on the port is classified with UNP profile rules that are assigned to the same domain ID. Configured through the <b>unip domain</b> command.
<b>Type</b>	The type of UNP port ( <b>Bridge</b> or <b>Access</b> ). UNP bridge ports classify traffic into VLAN profiles; UNP access ports classify traffic into service profiles. Configured through the <b>unip port-type</b> command.
<b>802.1x Auth</b>	The status of 802.1X authentication ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unip 802.1x-authentication</b> command.
<b>Mac Auth</b>	The status of MAC authentication ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unip mac-authentication</b> command.
<b>Class.</b>	The status of classification ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unip classification</b> command.
<b>Default</b>	The name of the default UNP assigned to the port or link aggregate. Configured through the <b>unip default-profile</b> command.
<b>802.1X Pass-Alt</b>	The name of the 802.1X authentication pass alternate UNP assigned to the port or link aggregate. Configured through the <b>unip 802.1x-authentication pass-alternate</b> command.
<b>MAC Pass-Alt</b>	The name of the MAC authentication pass alternate UNP assigned to the port or link aggregate. Configured through the <b>unip mac-authentication pass-alternate</b> command.
<b>Trust-Tag</b>	The status of the trust VLAN tag option for the UNP port or link aggregate. Configured through the <b>unip trust-tag</b> command.

### Release History

Release 8.3.1; command was introduced.

## Related Commands

## show unnp port config

Displays detailed configuration information for UNP ports and link aggregates.

**show unnp {port [*chassis/slot/port1*[-*port2*]] | linkagg [*agg\_id*[-*agg\_id2*]]} config**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID. Use a hyphen to specify a range of link aggregates IDs (10-15).

### Defaults

By default, configuration information for all ports or link aggregates is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.

### Examples

```

```

*output definitions*

<b>Port or Linkagg ID</b>	The port or link aggregate on which UNP is enabled. Configured through the <b>unnp port-type</b> command. A “0” indicates the port is a link aggregate (for example, 0/12 is link aggregate ID 12).
<b>Port Type</b>	The type of UNP port ( <b>Bridge</b> or <b>Access</b> ).
<b>Redirect Port Bounce</b>	The status of the port bounce operation ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unnp redirect port-bounce</b> command. This field applies only to UNP bridge ports and link aggregates.
<b>802.1x Authentication</b>	The 802.1X authentication status ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unnp 802.1x-authentication</b> command.
<b>802.1x Pass Alternate Profile</b>	The name of the 802.1X authentication pass alternate profile assigned to the port or link aggregate. Configured through the <b>unnp 802.1x-authentication pass-alternate</b> command
<b>802.1x Bypass</b>	The status of 802.1X bypass ( <b>Enabled</b> or <b>Disabled</b> ).
<b>802.1x failure-policy</b>	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails ( <b>default</b> = no MAC authentication or <b>mac-authentication</b> ).
<b>Mac-auth allow-eap</b>	Indicates the conditions under which 802.1X authentication is performed or bypassed based on the initial MAC authentication process ( <b>pass</b> = MAC authentication passes, <b>fail</b> = if MAC authentication fails, <b>noauth</b> = no MAC authentication, or <b>none</b> = do not attempt 802.1X authentication). This parameter option only applies to a UNP port or link aggregate on which 802.1X authentication bypass is enabled. Configured through the <b>unnp mac-authentication allow-eap</b> command.
<b>Mac Authentication</b>	The MAC authentication status ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unnp mac-authentication</b> command.
<b>Mac Pass Alternate Profile</b>	The name of the MAC authentication pass alternate profile assigned to the port or link aggregate. Configured through the <b>unnp mac-authentication pass-alternate</b> command.
<b>Classification</b>	The classification status ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unnp classification</b> command.
<b>Trust-Tag</b>	The status of the trust VLAN tag option for the UNP port or link aggregate. Configured through the <b>unnp trust-tag</b> command.
<b>Default Profile</b>	The name of the default UNP profile assigned to the UNP port or link aggregate. Configured through the <b>unnp default-profile</b> command.
<b>Port Domain Name</b>	The Group ID number assigned to the UNP port or link aggregate. Configured through the <b>unnp domain</b> command.
<b>AAA Profile</b>	The name of an AAA profile assigned to the UNP port or link aggregate. Configured through the <b>unnp aaa-profile</b> command.
<b>Port Template</b>	The name of a port template assigned to the UNP port or link aggregate. A port template defines and saves UNP port configuration options (such as the type of authentication, classification status, a default profile). Configured through the <b>unnp port port-template</b> command.

<b>Port Control Direction</b>	Whether 802.1X access control is applied to ingress and egress traffic ( <b>both</b> ) or just ingress traffic ( <b>in</b> ). Configured through the <b>unip direction</b> command. This field applies only to UNP bridge ports and link aggregates.
<b>Egress Flooding</b>	Indicates whether egress broadcast, unknown unicast, and multicast traffic is blocked ( <b>Not Allowed</b> ) or unblocked ( <b>Allowed</b> ) on the UNP port. The value displayed in this field is based on the port control direction setting for the port ( <b>both</b> = Not Allowed; <b>in</b> = Allowed). This field is displayed only for UNP bridge ports and link aggregates.
<b>Admin State</b>	The administrative status ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unip admin-state</b> command.
<b>Dynamic Service</b>	The type of dynamic service ( <b>vlan</b> or <b>spb</b> ) to generate on the UNP port or link aggregate. Configured through the <b>unip dynamic-service</b> command. This field applies only to UNP access ports and link aggregates.
<b>PVLAN Port Type</b>	The Private VLAN (PVLAN) port type for the UNP port or link aggregate ( <b>promiscuous</b> , <b>isl</b> , <b>community</b> , or <b>isolated</b> ). This field is displayed only for UNP access ports, not link aggregates.
<b>Force L3-Learning</b>	The status of Layer 3 learning ( <b>Enabled</b> or <b>Disabled</b> ) for the UNP port or link aggregate. Configured through the <b>unip force-l3-learning</b> command.
<b>Force L3-Learning Port Bounce</b>	The status of the port bounce action, which is an optional parameter associated with the Layer 3 learning function. Configured through the <b>unip force-l3-learning</b> command.
<b>802.1x Tx-Period</b>	The amount of time, in seconds, before an EAP Request Identity is retransmitted. Configured through the <b>unip 802.1x-authentication tx-period</b> command.
<b>802.1x Supp-Timeout</b>	The amount of time, in seconds, the switch waits before timing out an 802.1X user (supplicant) that is attempting to authenticate. Configured through the <b>unip 802.1x-authentication supp-timeout</b> command.
<b>802.1x Max-Req</b>	The maximum number of times the switch will retransmit a request for authentication information. Configured through the <b>unip 802.1x-authentication max-req</b> command.
<b>L2 Profile</b>	The name of a Layer 2 profile that is assigned to the UNP port or link aggregate. Configured through the <b>unip l2-profile</b> command. This field applies only to UNP access ports and link aggregates.

---

**Release History**

Release 8.3.1; command was introduced.

Release 8.3.1.R02; **Force L3-Learning** and **Force L3-Learning Port Bounce** fields added.

Release 8.4.1; **L2 Profile** field added.

## Related Commands

## show unip port bandwidth

Displays the bandwidth parameter values applied to a UNP port or link aggregate. These values are optionally assigned through the UNP profile to which a UNP port is associated.

**show unip {port chassis/slot/port1[-port2] | linkagg agg\_id[-agg\_id2]} bandwidth**

---

### Syntax Definitions

<i>chassis/slot/port</i> [-port2]	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>agg_id</i> [-agg_id2]	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.
- Bandwidth parameter values are not applied to UNP link aggregates that are assigned to the profile. As a result, this command will always show the bandwidth parameter values as not set for link aggregates.
- The optional bandwidth parameter values are applied when a UNP port is classified into a UNP profile. The profile name is obtained through local classification or returned from the RADIUS server.
- The source from which the bandwidth parameter values was last updated is also included in the display information. The source updates are based on the following conditions:
  - The UNP profile applies the bandwidth values at the time the UNP port is classified into the profile. This overrides any existing QoS bandwidth policies configured on the physical port.
  - QoS bandwidth policies defined in a QoS policy list associated with the profile are applied after the port is classified into the profile. This overrides the profile bandwidth values initially applied.
  - User-configured QoS bandwidth policies are applied after the port is classified into the profile.

### Examples

The following example shows the default display of UNP rate limit parameters when no users are learned on the UNP port:

```
-> show unip port 1/1/11 bandwidth
Port  Port  Type  Max Ingress Ingress BW Ingr BW  Max Egress Egress BW Egress BW Max Ingress Max Egress
  Domain  Bandwidth  Source  profile  Bandwidth  Source  profile  Depth  Depth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/11 0      Bridge 0          -         0          -         0          0          0
```

The following example shows the UNP rate limit parameters that are applied when user devices are assigned to a UNP profile that specifies bandwidth parameter values:

```
-> show unip port 1/1/11 bandwidth
Port  Port  Type  Max Ingress Ingress BW Ingr BW  Max Egress Egress BW Egress BW Max Ingress Max Egress
   Domain Bandwidth Source      profile Bandwidth Source  profile Depth      Depth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/11 0      Bridge 50.0M      UNP      Ingress50 30.0M      UNP      Egress30 0      0
```

The following example shows the rate limit parameter values that are applied when QoS policies override the bandwidth parameter values that were applied through UNP profile settings:

```
-> qos port 1/1/11 maximum ingress-bandwidth 60M maximum egress-bandwidth 60M

-> show unip port 1/1/11 bandwidth
Port  Port  Type  Max Ingress Ingress BW Ingr BW  Max Egress Egress BW Egress BW Max Ingress Max Egress
   Domain Bandwidth Source      profile Bandwidth Source  profile Depth      Depth
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
1/1/11 0      Bridge 60.0M      QoS      -      60.0M      QoS      -      0      0
```

### output definitions

<b>Port</b>	The port or link aggregate on which UNP is enabled. A “0” indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11). Configured through the <b>unip port-type</b> command.
<b>Port Domain</b>	The domain ID assigned to the UNP port or link aggregate. Configured through the <b>unip domain</b> command.
<b>Type</b>	The type of UNP port ( <b>Bridge</b> or <b>Access</b> ). Configured through the <b>unip port-type</b> command.
<b>Max Ingress Bandwidth</b>	The maximum ingress bandwidth value applied to the UNP port. Configured through the <b>unip profile maximum-ingress-bandwidth</b> command.
<b>Ingress BW Source</b>	The source from which the maximum ingress bandwidth value was updated on the port ( <b>UNP</b> or <b>QoS</b> ).
<b>Ingr BW Profile</b>	The name of the UNP profile responsible for setting the maximum ingress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
<b>Max Egress Bandwidth</b>	The maximum egress bandwidth value applied to the UNP port. Configured through the <b>unip profile maximum-egress-bandwidth</b> command.
<b>Egress BW Source</b>	The source from which the maximum egress bandwidth value was updated on the port ( <b>UNP</b> or <b>QoS</b> ).
<b>Egress BW Profile</b>	The name of the UNP profile responsible for setting the maximum egress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
<b>Max Ingress Depth</b>	The maximum ingress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum ingress bandwidth rate. Configured through the <b>unip profile maximum-ingress-depth</b> command.
<b>Max Egress Depth</b>	The maximum egress depth value that is applied to the UNP port. This value determines how much the traffic can burst over the maximum egress bandwidth rate. Configured through the <b>unip profile maximum-egress-depth</b> command.

## Release History

Release 8.2.1; command was introduced.

## show unip port 802.1x statistics

Displays 802.1X statistics for a UNP port or link aggregate on which 802.1X authentication is enabled.

**show unip {port *chassis/slot/port1*[-*port2*] | linkagg *agg\_id*[-*agg\_id2*]} 802.1x statistics**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID. Use a hyphen to specify a range of link aggregates IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **port** or **linkagg** parameter to display information for a specific UNP port or link aggregate ID.

### Examples

```
-> show unip port 1/1/13 802.1x statistics
Port 1/1
  Mac-address=00:00:00:00:00:01,
  Vlan=0,

---

## show unp port configured-vlans

Displays the VLANs assigned to UNP bridge ports or link aggregates.

**show unp [port [*chassis/slot/port1*[-*port2*]] | linkagg [*agg\_id*[-*agg\_id2*]] configured-vlans**

---

### Syntax Definitions

*chassis/slot/port*[-*port2*]      The chassis ID, slot, and port number (3/1/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1/1-8).

*agg\_id*[-*agg\_id2*]              Link aggregate ID for a specific UNP bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific UNP bridge port or link aggregate ID.
- If the **port** or **linkagg** parameter is used without specifying an individual port, a range of ports, or link aggregate ID, then the configured VLAN information for all UNP ports and link aggregates is displayed.

### Examples

```
-> show unp port configured-vlans
Port      Configured Vlans
-----+-----
0/10      500
0/10      501
1/1/10    500
1/1/11    501
1/1/11    502
1/1/11    503

-> show unp port 1/1/11 configured-vlans
Port      Configured Vlans
-----+-----
1/1/11    501
1/1/11    502
1/1/11    503

-> show unp linkagg 10 configured-vlans
LagID     Configured Vlans
-----+-----
0/10      500
0/10      501
```

## Release History

Release 8.2.1; command was introduced.

## Related Commands

[unp vlan](#)

Configures VLAN assignments for UNP bridge ports.

## MIB Objects

alaDaUNPPortVlanTable

alaDaUNPPortVlanVID

---

## show unip port-template

Displays the port template configuration for the switch.

**show unip port-template** [*template\_name*] [**config** | **configured-vlans**]

---

### Syntax Definitions

<i>template_name</i>	The name of the UNP port template to display.
<b>config</b>	Displays additional details about the parameter configuration for the template.
<b>configured-vlans</b>	Displays the VLAN IDs that the specified template assigns to a UNP port.

### Defaults

By default, displays a summary of the configuration information for all port templates.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Enter a template name with this command to display information for a specific port template.
- Use the **config** option with this command to display the full configuration for each template.
- Use the **configured-vlans** option with this command to display the VLAN IDs that a port template will statically assign to a UNP bridge port when the template is applied on the port. Configuring a static VLAN-port association (VPA) applies only to UNP bridge ports.

### Examples

```
-> show unip port-template
      802.1x
Template Name      802.1x  Pass-Alt Profile Mac-Auth Pass-Alt Profile Redirect

### *output definitions*

---

<b>Port Template</b>	The name of the port template. By default, the “accessDefaultPortTemplate” is assigned to UNP access ports and the “bridgeDefaultPortTemplate” is assigned to UNP bridge ports.
<b>802.1x Authentication</b>	The 802.1X authentication status ( <b>Enabled</b> or <b>Disabled</b> ).

*output definitions*

---

<b>802.1x Pass Alternate Profile</b>	The name of an alternate profile for devices that pass 802.1X authentication.
<b>Mac Authentication</b>	The MAC authentication status ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Mac-Auth Pass Alternate Profile</b>	The name of an alternate profile for devices that pass MAC authentication.
<b>Classification</b>	The classification status ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Trust-Tag</b>	The trust VLAN ID tag status ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Default Profile</b>	The name of a default profile for devices that are not classified by any other classification methods.
<b>Port Domain Num</b>	The domain ID number assignment for the UNP port.
<b>Redirect Port Bounce</b>	The status of port bounce ( <b>Enabled</b> or <b>Disabled</b> ) for BYOD registration and authorization. This parameter is only configurable on UNP bridge ports.
<b>AAA Profile</b>	The name of an AAA profile to apply to the port.
<b>Port Control Direction</b>	Whether 802.1X access control is applied to ingress and egress traffic ( <b>both</b> ) or just ingress traffic ( <b>in</b> ). This parameter is only configurable on UNP bridge ports.
<b>802.1x Tx-Period</b>	The amount of time, in seconds, before an EAP Request Identity is retransmitted.
<b>802.1x Supp-Timeout</b>	The amount of time, in seconds, the switch will wait before timing out an 802.1X user that is attempting to authenticate.
<b>802.1x Max-Req</b>	The maximum number of times the switch will retransmit a request for authentication information.
<b>802.1x Bypass</b>	The status of 802.1X bypass ( <b>Enabled</b> or <b>Disabled</b> ).
<b>802.1x failure-policy</b>	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails ( <b>default</b> = no MAC authentication is attempted or <b>mac-authentication</b> ).
<b>Mac-auth allow-eap</b>	The conditions under which 802.1X authentication is performed or bypassed based on the initial MAC authentication process ( <b>pass</b> = if MAC authentication passes, <b>fail</b> = if MAC authentication fails, or <b>noauth</b> = if MAC authentication is not configured). This parameter option only applies to UNP ports on which 802.1X authentication bypass is enabled.
<b>Force L3-Learning</b>	The status of Layer 3 learning ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Force L3-Learning Port Bounce</b>	The status of the port bounce action, which is an optional parameter associated with the Layer 3 learning function.
<b>Admin State</b>	The administrative status of the UNP port configuration ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Dynamic Service</b>	Whether the UNP port generates dynamic SPB or VXLAN services. This parameter is only configurable on UNP access ports.
<b>L2 Profile</b>	The name of a Layer 2 service profile to apply to a UNP access port. This parameter is not configurable when the template is assigned to a UNP bridge port.

---

```
-> show unip port-template unip-port1 configured-vlans
Template Name          Configured Vlans
-----+-----
unip-port1            503
```

### output definitions

<b>Template Name</b>	The name of a UNP port template.
<b>Configured VLANs</b>	The VLAN IDs that are assigned to a UNP bridge port when the template is applied to the port.

## Release History

Release 8.3.1; command was introduced.

Release 8.3.1.R02; **Force L3-Learning** and **Force L3-Learning Port Bounce** fields added.

Release 8.4.1; **L2 Profile** field added.

## show unp user

Displays information about the MAC addresses learned on a UNP port or link aggregate.

**show unp user** [**port** *chassis/slot/port*[-*port2*]] | **linkagg** *agg\_id*[-*agg\_id2*]] [**sap-id** *sap\_id*] [**service-id** *service\_id*] [**profile** *profile\_name*] [**authentication-type** {**none** | **mac** | **802.1x**}] [**mac-address** *mac\_address*] [**count**]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.
<i>sap_id</i>	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
<i>service_id</i>	A service ID number. This parameter displays all UNP users associated with the specified service ID.
<i>profile_name</i>	The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.
<b>none</b>	Displays all UNP users that did not undergo the authentication process.
<b>mac</b>	Displays all UNP users that were authenticated through the MAC authentication process.
<b>802.1x</b>	Displays all UNP users that were authenticated through the 802.1X authentication process.
<i>mac_address</i>	A source MAC address. This parameter displays the UNP user device with the specified source MAC address.
<b>count</b>	Displays the number of UNP users learned on the switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
  - Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
  - Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “Username” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

## Examples

```
-> show unp user count
Total users: 6
```

```
-> show unp user
```

Port	Username	Mac address	User IP	Vlan	Profile	Type	Status
1/1/1	00:00:00:00:00:01	00:00:00:00:00:01	1.1.1.1	10	unp-1	Access	Active
1/1/2	00:00:00:00:00:02	00:00:00:00:00:02	1.1.1.2	11	unp-2	Bridge	Active
1/1/3	guest_user	00:00:00:00:00:04	1.1.1.4	20	unp-guest	Access	Active
1/1/7	00:00:00:00:00:07	00:00:00:00:00:07	1.1.1.7	11	unp-emp	Bridge	Active
0/10	Employee-001	00:00:00:00:00:03	1.1.1.3	12	unp-emp	Bridge	Active
0/12	00:00:00:00:00:14	00:00:00:00:00:14	1.1.2.4	20	unp-7	Bridge	Active

```
Total users : 6
```

### output definitions

<b>Port</b>	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
<b>Username</b>	Displays either a source MAC address or a Captive Portal user name for the learned user device.
<b>MAC address</b>	The MAC address of the user device. This field and the <b>Username</b> field may contain the same MAC address, depending on how the user device was authenticated.
<b>User IP</b>	The IP network address of the user device.
<b>Vlan</b>	The UNP VLAN ID to which the user device was assigned. This only applies for users authenticated into VLAN profiles.
<b>Profile</b>	The name of the UNP profile to which the user device was assigned.
<b>Type</b>	The type of UNP port on which the device was learned ( <b>Bridge</b> or <b>Access</b> ).
<b>Status</b>	The status of the device ( <b>Active</b> or <b>Blocked</b> )

```
-> show unp user port 1/1/3
```

Port	Username	Mac address	User IP	Vlan	Profile	Auth	Role
1/1/3	guest_user	00:00:00:00:00:04	1.1.1.4	20	unp-guest	8021X	Guest

```
Total users : 1
```

```
-> show unip user linkagg 10
```

Port	Username	Mac address	User		Profile	Auth	Role
			IP	Vlan			
0/10	Employee-001	00:00:00:00:00:03	1.1.1.3	12	unp-emp	8021X	Employee

```
Total users : 1
```

```
-> show unip user profile unp-emp
```

Port	Username	Mac address	User		Profile	Auth	Role
			IP	Vlan			
1/1/7	00:00:00:00:00:07	00:00:00:00:00:07	1.1.1.7	11	unp-emp	MAC	Employee
0/10	Employee-001	00:00:00:00:00:03	1.1.1.3	12	unp-emp	8021X	Employee

```
Total users : 2
```

```
-> show unip user authentication-type mac
```

Port	Username	Mac address	User		Profile	Auth	Role
			IP	Vlan			
1/1/7	00:00:00:00:00:07	00:00:00:00:00:07	1.1.1.7	11	unp-emp	MAC	Employee
0/12	00:00:00:00:00:14	00:00:00:00:00:14	1.1.2.4	20	unp-7	MAC	Employee

```
Total users : 2
```

### output definitions

<b>Port</b>	The port or link aggregate on which the MAC address was learned. A "0" indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
<b>Username</b>	Displays either a source MAC address or a Captive Portal user name for the learned user device.
<b>MAC address</b>	The MAC address of the user device. This field and the <b>Username</b> field may contain the same MAC address, depending on how the user device was authenticated.
<b>User IP</b>	The IP network address of the user device.
<b>Vlan</b>	The UNP VLAN ID to which the user device was assigned. This only applies for users authenticated into VLAN profiles.
<b>Profile</b>	The name of the UNP profile to which the user device was assigned.
<b>Auth</b>	The type of authentication applied to the user ( <b>none</b> , <b>mac</b> , or <b>802.1X</b> ).
<b>Role</b>	The user role (QoS policy list) applied to the user device.

### Release History

Release 8.1.1; command was introduced.

**Related Commands**

<b>show unp user status</b>	Displays information about the authentication and validation status of users learned on UNP ports.
<b>show unp user details</b>	Displays detailed information about user devices learned on UNP ports.
<b>unp user flush</b>	Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).
<b>show unp profile</b>	Displays the UNP configuration for the switch.
<b>show unp port</b>	Displays the UNP configuration for the port.

**MIB Objects**N/A

---

## show unip user status

Displays the status of the authentication and validation process for MAC addresses learned on a UNP port or link aggregate.

```
show unip user status [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] [sap-id sap_id]
[service-id service_id] [profile profile_name] [authentication-type {none | mac | 802.1x}] [mac-address
mac_address]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
<i>sap_id</i>	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
<i>service_id</i>	A service ID number. This parameter displays all UNP users associated with the specified service ID.
<i>profile_name</i>	The name of an existing UNP profile.
<b>none</b>	Displays users that did not undergo the authentication process.
<b>mac</b>	Displays users that were authenticated through MAC authentication.
<b>802.1x</b>	Displays users that were authenticated through 802.1X authentication.
<i>mac_address</i>	The user device MAC address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:

- Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
- Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

## Examples

```
-> show unip user status port 1/1/1
      Profile Profile Authentication Role Role Restricted
Port Mac address Name Source Type Status Name Source CP Redirect Access
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1/1/1 00:00:00:00:00:05 Prf1 Radius 8021x Passed emp1 Profile Y - -
```

Total users : 1

```
-> show unip user status linkagg 100
      Profile Profile Authentication Role Role Restricted
Port Mac address Name Source Type Status Name Source CP Redirect Access
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
0/100 00:00:00:00:00:06 Prf3 Radius 8021x Passed emp1 Profile Y - -
```

Total users : 1

```
-> show unip user status authentication type MAC
      Profile Profile Authentication Role Role Restricted
Port Mac address Name Source Type Status Name Source CP Redirect Access
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
1/1/2 00:00:00:00:00:15 Prf2 Alt MAC Passed emp2 Profile Y - -
```

Total users : 1

### output definitions

<b>Port</b>	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
<b>MAC address</b>	The MAC address of the user device.
<b>Profile Name</b>	The name of the UNP to which the user device was assigned.
<b>Profile Source</b>	The source of the profile assignment (e.g., Radius, Alt).
<b>Authentication Type</b>	The type of authentication applied to the user ( <b>none</b> , <b>mac</b> , or <b>802.1X</b> ).
<b>Authentication Status</b>	The authentication status for the device.
<b>Role Name</b>	The name of the user role applied to the user device.
<b>Role Source</b>	The source of the user role applied to the user device.
<b>CP</b>	Indicates if the device was authenticated through Captive Portal.
<b>Redirect</b>	The redirection status.
<b>Restricted Access</b>	Whether or not access is restricted for the user.

## Release History

Release 8.1.1; command was introduced.

**Related Commands****show unip user**

Displays information about users learned on a UNP ports.

## show unp user details

Displays additional details about the MAC addresses learned on a UNP port or link aggregate.

**show unp user details** [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*]] [**sap-id** *sap\_id*] [**service-id** *service\_id*] [**profile** *profile\_name*] [**authentication-type** {**none** | **mac** | **802.1x**}] [**mac-address** *mac\_address*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). This parameter displays all UNP users learned on the specified port number.
<i>agg_id</i> [- <i>agg_id2</i> ]	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15). This parameter displays all UNP users learned on the specified link aggregate ID.
<i>sap_id</i>	A Service Access Point (SAP) ID. This parameter displays all UNP users associated with the specified SAP ID.
<i>service_id</i>	A service ID number. This parameter displays all UNP users associated with the specified service ID.
<i>profile_name</i>	The name of an existing UNP profile. This parameter displays all UNP users associated with the specified profile name.
<b>none</b>	Displays all UNP users that did not undergo the authentication process.
<b>mac</b>	Displays all UNP users that were authenticated through the MAC authentication process.
<b>802.1x</b>	Displays all UNP users that were authenticated through the 802.1X authentication process.
<i>mac_address</i>	A source MAC address. This parameter displays the UNP user device with the specified source MAC address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the optional parameters provided with this command to filter the output display results. In addition, some parameters can be combined to further narrow the display results. For example:
  - Combine the **port** or **linkagg** parameter with the **profile** parameter option to display users learned on the port or link aggregate that are classified into the specified profile.
  - Combine the **port** or **linkagg** parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

- The “User Name” field displays the user name that was entered to authenticate an 802.1X user device or the user name that was entered to successfully authenticate a user device through the Captive Portal process. However, if a user device first undergoes 802.1X authentication and then undergoes successful Captive Portal authentication, the user name entered during the Captive Portal process is displayed in this field.

*output definitions*

---

<b>Port</b>	The UNP port or link aggregate on which the device was learned.
<b>Mac-address</b>	The MAC address of the device.
<b>SAP</b>	The port or link aggregate and encapsulation value for an SPB or VXLAN Service Access Point (SAP).
<b>Service ID</b>	The SPB or VXLAN service ID number.
<b>VNID</b>	The VXLAN Network Identifier. This value is associated with a VXLAN service ID.
<b>ISID</b>	The SPB service instance identifier. This value is associated with an SPB service ID.
<b>VPNID</b>	The L2 GRE tunnel VPN ID.
<b>Access Timestamp</b>	The date and time the device was learned.
<b>User Name</b>	The MAC address of the user.
<b>IP-Address</b>	The IP network address of the device.
<b>Vlan</b>	The VLAN ID number for the VLAN in which the device was learned.
<b>Authentication Type</b>	The type of authentication used ( <b>Mac-Authentication</b> or <b>802.1x-Authentication</b> ).
<b>Authentication Status</b>	The status of the authentication process ( <b>blank “-”</b> , <b>Authenticated</b> , <b>Failed</b> , or <b>In Progress</b> ).
<b>Authentication Failure Reason</b>	The reason authentication failed.
<b>Authentication Retry Count</b>	The number of times authentication has been attempted.
<b>Authentication Server IP Used</b>	The IP address of the authentication server.
<b>Authentication Server Used</b>	The name of the authentication server used.
<b>Server Reply-Message</b>	Reply message from the authentication server.
<b>Profile</b>	The name of the VLAN profile to which the user was assigned.
<b>Profile Source</b>	The source of the profile (returned from the server or assigned through the UNP process on the switch).
<b>Profile From Auth Server</b>	The name of the UNP profile returned from the authentication server.
<b>Classification profile rule</b>	The rule that resulted in the device classification into the profile VLAN.
<b>QMR Status</b>	The Quarantine Manager Remediation status for the device.
<b>Redirect Url</b>	The URL to which the device is redirected upon classification.
<b>SIP Call Type</b>	The Session Initiation Protocol (SIP) call type status for a non-suppliant (non-802.1X) device.
<b>SIP Media Type</b>	The SIP media type status for a non-suppliant device.
<b>Applications</b>	The applications a non-suppliant device is running.

---

**Release History**

Release 8.1.1; command was introduced.

Release 8.4.1.R02; **VPNID** field added.

**Related Commands**

<b>show unip user status</b>	Displays information about the authentication and validation status of users learned on UNP ports.
<b>unip user flush</b>	Performs a MAC address flush of Access Guardian users (devices learned on UNP ports).
<b>show unip profile</b>	Displays the UNP configuration for the switch.
<b>show unip port</b>	Displays the UNP configuration for the port.

## show unnp policy validity-period

Displays the UNP period policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

**show unnp policy validity-period** [*policy\_name*]

---

### Syntax Definitions

*policy\_name*                      The name of an existing UNP period policy.

### Defaults

By default, all UNP period policies are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Enter a UNP period policy name to display information about a specific policy.

### Examples

```
-> show unnp policy validity-period
Policy Days    Months          Hours           Interval                            TZ Active
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
tp1   SMTWTFS JFMAMJJASOND 08:00 - 17:00          - - -                               - NO
tp2   ----- -----          - - -           01/01/13 00:00 - 01/02/13 00:00  CST NO

Total Period Policy Count: 2
```

```
-> show unnp policy validity-period tp1
Policy Days    Months          Hours           Interval                            TZ Active
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
tp1   SMTWTFS JFMAMJJASOND 08:00 - 17:00          - - -                               - NO
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

**unnp policy validity-period**      Configures a UNP period policy.  
**unnp profile period-policy**      Assigns a UNP period policy to a UNP profile.

## show unip policy validity-location

Displays the UNP location policy configuration for the switch. This type of policy is assigned to a UNP profile and applied to devices classified into the profile.

**show unip policy validity-location** [*policy\_name*]

---

### Syntax Definitions

*policy\_name*                      The name of an existing UNP location policy.

### Defaults

By default, all UNP location policies are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Enter a location policy name to display information about a specific policy.

### Examples

```
-> show unip policy validity location
Policy: 11
  Port           = 1/1
  System Name    = shasta
  System Location = Bangalore
```

```
Total Location Policy Count: 1
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

[unip policy validity-location](#)      Configures a UNP location policy.  
[unip profile location-policy](#)      Assigns a UNP location policy to a UNP profile.

### MIB Objects

```
alaDaUNPLocationPolicyTable
  alaDaUNPLocationPolicyName
  alaDaUNPLocationPolicyPort
  alaDaUNPLocationPolicyPortHigh
  alaDaUNPLocationPolicyPortStatus
  alaDaUNPLocationPolicySystemName
  alaDaUNPLocationPolicySystemLocation
```

---

# 40 Application Monitoring and Enforcement Commands

Application usage patterns in the enterprise network is changing with the increase in use of the social networking, browser based file sharing, and peer to peer applications. The use of these applications result in the new traffic patterns in the network that are not straightforward to distinguish. There is also an increase in consumerization of IT with multiplication of thin clients, HTTP based, and virtual desktop clients.

OmniSwitch Application Monitoring and Enforcement (AppMon) feature addresses the key challenges of real time classification of flows at application level by providing differential QoS treatment in the form of higher priority marking and security policies at application level. AppMon feature improves the quality of user experience through application aware network optimization and control.

---

**Note.** AppMon is supported in a virtual chassis of OmniSwitch 6860 and OmniSwitch 6860E platforms where at least one OmniSwitch 6860E is mandatory for the feature to work.

---

MIB information for the AppMon commands is as follows:

*Filename:* ALCATEL-IND1-APP-MON-MIB.mib  
*Module:* alaAppMonMIB

A summary of the available commands is listed here:

---

**app-mon admin-state**  
**app-mon port admin-state**  
**app-mon auto-group create**  
**app-mon app-group**  
**app-mon app-list**  
**app-mon apply**  
**app-mon l3-mode**  
**app-mon l4-mode**  
**app-mon l4port-exclude**  
**app-mon flow-table flush**  
**app-mon flow-table enforcement stats**  
**app-mon aging enforcement**  
**app-mon logging-threshold**  
**app-mon flow-sync enforcement interval**  
**app-mon force-flow-sync**  
**show app-mon config**  
**show app-mon port**  
**show app-mon app-pool**  
**show app-mon app-list**  
**show app-mon app-group**  
**show app-mon app-record**  
**show app-mon ipv4-flow-table**  
**show app-mon ipv6-flow-table**  
**show app-mon l4port-exclude**  
**show app-mon stats**  
**show app-mon aging enforcement**  
**show app-mon vc-topology**  
**clear app-mon app-list**

---

## app-mon admin-state

Enable or disable the Application Monitoring and Enforcement (AppMon) feature.

**app-mon admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables AppMon support on the switch.
<b>disable</b>	Disables AppMon support on the switch.

### Defaults

By default, AppMon is disabled on the switch.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- AppMon cannot be enabled globally when,
  - all the mirroring sessions are used by port mirroring or monitoring features.
  - mirroring session is used by policy manager.
- When AppMon is enabled globally, it reserves a mirroring session in the system.
- If AppMon functionality is enabled at a port level, disabling AppMon globally overrides the functionality of all AppMon ports; however, configuration on the ports remain the same.

### Examples

```
-> app-mon admin-state enable  
-> app-mon admin-state disable
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

<a href="#">app-mon port admin-state</a>	Enable or disable AppMon on one or more switch ports.
<a href="#">show app-mon config</a>	Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

### MIB Objects

alaAppMonAdminStatus

---

## app-mon port admin-state

Enable or disable AppMon Monitoring and Enforcement on one or more switch ports.

**app-mon {port *chassis/slot/port*[-*port2*] | slot *chassis/slot* [-*slot*]} admin-state {enable | disable}**

---

### Syntax Definitions

<i>chassis/slot/port</i> [- <i>port2</i> ]	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>chassis/slot</i>	The chassis ID and slot number (3/1) for a specific slot.
<b>enable</b>	Enables AppMon on the port.
<b>disable</b>	Disables AppMon on the port.

### Defaults

By default, AppMon is disabled on all ports.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- It is mandatory to enable AppMon globally for the port level AppMon to function.
- When slot option is used, then AppMon configuration is applied on all the physical ports of that particular slot.
- AppMon configuration is not allowed on Virtual Fabric Link, ERP, VLAN stacking, or SPB ports.
- AppMon cannot be configured on a port that is part of a link aggregate or a port mirroring port.
- AppMon must not be configured on user ports and uplink ports at the same time.

### Examples

```
-> app-mon slot 1/1 admin-state enable
-> app-mon port 1/1/2-5 admin-state enable
-> app-mon slot 1/1 admin-state disable
```

### Release History

Release 8.2.1; command introduced.

## Related Commands

**app-mon admin-state**

Enable or disable the Application Monitoring feature.

**show app-mon port**

Displays AppMon status per physical port or per slot for the switch.

## MIB Objects

alaAppMonPortConfigTable

alaAppMonPortConfigSlotPortIndex

alaAppMonPortConfigPortStatus

---

## app-mon auto-group create

Creates application groups automatically on the switch. The application groups are automatically created based on the 'category' field of each application present in the application pool.

**app-mon auto-group create**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- Modifications are allowed in auto application groups with addition or deletion of applications using the **app-mon app-group** command.
- Enter **app-mon apply** and **write memory** to save the auto group configuration or modification on the switch.
- The **show app-mon app-pool** command displays the application categories in the signature file. The application group names are derived from the category name.

### Examples

```
-> app-mon auto-group create
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

<a href="#">app-mon apply</a>	Updates the set of application signatures configured for application monitoring.
<a href="#">show app-mon app-group</a>	Displays the details of all the applications in an application group.
<a href="#">show app-mon app-pool</a>	Displays all the applications that are part of an application pool.

### MIB Objects

alaAppMonAutoGroupCreation

---

## app-mon app-group

Creates an application group. Applications can be added or removed from the application group.

**app-mon app-group** *app\_group\_name* {**add** | **remove**} {**app-name** *app\_name* | **from** *app\_name* **to** *app\_name*}

**no app-mon app-group** *app\_group\_name*

---

### Syntax Definitions

<i>app_group_name</i>	Name of the application group. The group name can be a maximum of 32 alphanumeric characters.
<i>app_name</i>	The name of the application to be added to the application group. The application name can be a maximum of 32 alphanumeric characters.
<b>from</b> <i>app_name</i>	The first application name when adding a range of applications to an application group.
<b>to</b> <i>app_name</i>	The last application name when adding a range of applications to an application group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- Use the **no** form of this command to remove an application group.
- This command can be used to add or delete applications for the auto application groups as well.
- One application can belong to more than one application group.
- Only those applications that are part of an application pool are allowed to be added to an application group.
- To add a range of applications or multiple applications to an application group, use the **from** and **to** options. Range is expanded based on the list of applications in the app-pool list (application pool). Use the **show app-mon app-pool** command to view the application names.
- If an application is removed from an application group which has only one application, then the complete application group is removed.
- If any application is added to a user group (group name same name as category name), and signature toolkit update operation or 'app-mon auto-group create' is done, then added group is not deleted. Only update happens.
- If an application group contains a single application and the group is part of an application list, then this single application cannot be removed from the application group.
- An application group cannot be deleted when it is part of an application list.

- When the last application from the application group is removed, the application group is automatically deleted.
- The list of applications (added or deleted) to an application group is displayed in **show configuration snapshot** command after **app-mon apply** command is entered. A list of applications (added or deleted) are displayed with the **show app-mon app-group** command even without using the **app-mon apply** command.

## Examples

```
-> app-mon app-group apg2 add app-name whatsapp
-> app-mon app-group apg2 remove app-name whatsapp
-> no app-mon app-group apg2
```

To add a range of applications or multiple applications to an application group, use the **show app-mon app-pool** command to view the application names. For example:

```
-> show app-mon app-pool
Legend: Application-name: *= Not present in recently updated kit,
AppId      Application-name      Revision      Category
-----+-----+-----+-----
968         amazon                1.0.0        Web
244         facebook              1.0.0        Web
182         sip                   1.0.0        Audio/Video
183         skype                 1.1.0        Instant Messaging
211         tftp                  1.0.0        File Server
503         twitter               1.0.0        Web
597         viber                 1.0.0        Audio/Video
890         webex                 1.0.0        Audio/Video
1093        whatsapp              1.0.0        Instant Messaging
240         youtube               1.0.0        Web
-----
Number of Applications: 10
```

Select any two applications for the range option using the **app-mon app-group** command.

```
-> app-mon app-group apg1 add from sip to viber
```

This command adds the applications from sip to viber to the application group (sip, skype, tftp, twitter, and viber).

If an application is removed from an application group which has only one application, then the complete application group is removed. For example:

```
-> show app-mon app-group group1
AppGrp-Id  App-group              App-name
-----+-----+-----
1093       whatsapp              Instant Messaging
```

Now, remove the application name 'whatsapp' from the application group. The complete application group gets removed as shown below.

```
-> app-mon app-group group1 remove app-name whatsapp
-> show app-mon app-group group1
AppGrp-Id  App-group              App-name
-----+-----+-----
```

## Release History

Release 8.2.1; command introduced.

## Related Commands

<a href="#">app-mon apply</a>	Updates the set of application signatures configured for application monitoring.
<a href="#">show app-mon app-group</a>	Displays the details of all the applications in an application group.
<a href="#">show app-mon app-list</a>	Displays a list of applications and application groups added to an application list.
<a href="#">show app-mon app-pool</a>	Displays all the applications that are part of an application pool.

## MIB Objects

```
alaAppMonAppGroupTable  
  alaAppMonAppGroupName  
  alaAppMonAppGroupMember  
  alaAppMonAppGroupStatus  
  alaAppMonAppGrpFromAppName  
  alaAppMonAppGrpToAppName  
  alaAppMonAddAppGrpName  
  alaAppMonAppGroupBuiltIn  
  alaAppMonAppGroupCategoryName  
  alaAppMonAppGrpId  
  alaAppMonAppGroupAppStatus
```

---

## app-mon app-list

Add or remove applications or application groups to an application list for enforcement or monitoring.

```
app-mon app-list {enforcement | monitor} {add | remove} {app-name app_name | app-group
app_group_name}
```

---

### Syntax Definitions

<b>add</b>	Adds the specified application or application group to an application list.
<b>remove</b>	Removes the specified application or application group from an application list.
<i>app_name</i>	Name of the application to be added to the application list. This adds the specified application to the application list.
<i>app_group_name</i>	Name of the application group to be added to the application list. This enables the addition of multiple applications in the application group to the application list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- The application group can be user created or generated automatically (see [app-mon app-group](#) and [app-mon auto-group create](#) command).
- Separate application list is maintained for enforcement and monitoring.
- The [show configuration snapshot](#) command displays the applications added or removed from the application list only after the [app-mon apply](#) command is used. The [app-mon apply](#) command saves the list of applications added or removed to the application list. The saved list of applications are displayed with the [show app-mon app-list active](#) command.
- QoS policy rules can be configured for a given application as well as an application group where the same application also exists. QoS matches policies based on the application-name or application-group name configured in an application list. For more information on configuring enforcement for QoS policy rules, see the “[QoS Policy Commands](#)” chapter.

### Examples

```
-> app-mon app-list enforcement add app-name whatsapp
-> app-mon app-list enforcement add app-group apg1
-> app-mon app-list monitor add app-group apg2
-> app-mon app-list enforcement remove app-name whatsapp
```

## Release History

Release 8.2.1; command introduced.

## Related Commands

<b>app-mon auto-group create</b>	Enables or disables Auto-Group functionality on the switch.
<b>app-mon app-group</b>	Creates an application group. Applications can be added or removed from the application group.
<b>show app-mon app-list</b>	Displays list of applications and application groups added to an application list.
<b>clear app-mon app-list</b>	Removes all applications signatures from the application list.

## MIB Objects

```
alaAppMonAppListTable  
  alaAppMonAppListMemberName  
  alaAppMonAppListMemberType  
  alaAppMonAppListMemberStatus  
  alaAppMonAppListAppId  
  alaAppMonAppListAppStatus
```

---

## app-mon apply

This activates both enforcement and monitoring application lists for flow classification.

**app-mon apply**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

The following operations are performed with the **app-mon apply** command:

- Saves the current application-list, application-group, and auto-groups to flash when 'write memory' command is used.
- The application list is checked for any application configured more than once in an application list (individually or as a part of application group).
  - The **app-mon apply** command will not be successful until the conflict is resolved.
  - The **show app-mon app-list** command with the **monitor conflict** or the **enforcement conflict** parameter displays the available conflicts in an application list.
  - The duplicate application names must be removed for a successful **app-mon apply** operation.
- QoS is applied to the flows learned for the activated applications based on the configured QoS policies for Enforcement application list.

### Examples

```
-> app-mon apply
```

### Release History

Release 8.2.1; command introduced.

## Related Commands

### **show app-mon config**

Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

### **show app-mon port**

Displays AppMon status per physical port or per slot for the switch.

### **show app-mon app-list**

Displays a list of applications and application groups added to an application list.

## MIB Objects

alaAppMonUpdateAppList

---

## app-mon l3-mode

Enables or disables monitoring and enforcement for IPv4 flows, IPv6 flows, or both.

```
app-mon l3-mode {ipv4 | ipv6} admin-state {enable | disable}
```

---

### Syntax Definitions

<b>IPv4</b>	Applies monitoring and enforcement to IPv4 flows.
<b>IPv6</b>	Applies monitoring and enforcement to IPv6 flows.
<b>enable</b>	Enables the specified L3 mode on the switch.
<b>disable</b>	Disables the specified L3 mode on the switch.

### Defaults

By default, monitoring and enforcement is enabled for both IPv4 and IPv6 flows.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

N/A

### Examples

```
-> app-mon l3-mode ipv4 admin-state disable
-> app-mon l3-mode ipv4 admin-state enable
-> app-mon l3-mode ipv6 admin-state disable
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

- show app-mon ipv4-flow-table** Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- show app-mon ipv6-flow-table** Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
- show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

### MIB Objects

```
alaAppMonEnforcementIpv4
alaAppMonEnforcementIpv6
```

---

## app-mon l4-mode

Enables or disables monitoring and enforcement for TCP or UDP flows.

**app-mon** {port *chassis/slot/port[-port2]* | slot *chassis/slot*} **l4-mode** {tcp | udp} **admin-state** {enable | disable}

---

### Syntax Definitions

<i>chassis/slot/port[-port2]</i>	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
<i>chassis/slot</i>	The chassis ID and slot number (3/1) for a specific slot.
<b>tcp</b>	Applies monitoring and enforcement to TCP flows.
<b>udp</b>	Applies monitoring and enforcement to UDP flows.
<b>enable</b>	Enables the specified L4 mode on the switch.
<b>disable</b>	Disables the specified L4 mode on the switch.

### Defaults

By default, both TCP and UDP flows are processed.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

N/A

### Examples

```
-> app-mon port 1/1/2 l4-mode udp admin-state disable
-> app-mon slot 1/1 l4-mode tcp admin-state enable
-> app-mon port 1/1/2 l4-mode udp admin-state enable
```

### Release History

Release 8.2.1; command introduced.

## Related Commands

- app-mon l4port-exclude** Configures the L4 port range to exclude from the AppMon operation.
- show app-mon ipv4-flow-table** Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- show app-mon ipv6-flow-table** Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
- show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

## MIB Objects

```
alaAppMonPortConfigTable  
  alaAppMonPortConfigSlotPortIndex  
  alaAppMonEnforcementPortConfigTcpStatus  
  alaAppMonEnforcementPortConfigUdpStatus
```

---

## app-mon l4port-exclude

Configures the L4 port range to exclude from the AppMon operation.

```
app-mon l4port-exclude range-id number {tcp-service-port | udp-port} start number end number
```

```
no app-mon l4port-exclude range-id
```

---

### Syntax Definitions

<b>range-id</b> <i>number</i>	The range ID number. The valid range is 1–8.
<b>tcp-service-port</b>	Specifies TCP service ports.
<b>udp-port</b>	Specifies UDP ports.
<b>start</b> <i>number</i>	The first port associated with the range ID number. The valid port range is 1–65535.
<b>end</b> <i>number</i>	The last port associated with the range ID number. The valid port range is 1–65535.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- Use the **no** form of this command to remove an L4 exclude range ID from the switch configuration.
- For the **udp-port** option, the AppMon operation is not performed on the flows with a source or destination port that is in the excluded port range.
- For the **tcp-service-port** option, the AppMon operation is not performed on the flows with a destination TCP port of TCP-SYN packet or a source TCP port of TCP-SYN-ACK packet that is in the excluded port range.
- This configuration applies to both enforcement and monitor features.

### Examples

```
-> app-mon l4port-exclude range-id 5 tcp-service-port start 20 end 30
-> app-mon l4port-exclude range-id 6 udp-port start 90 end 100
-> no app-mon l4port-exclude range-id 6
```

### Release History

Release 8.2.1; command introduced.

## Related Commands

**show app-mon l4port-exclude** Displays the port range excluded from AppMon operation.

## MIB Objects

```
alaAppMonEnforcementL4PortRangeTable  
  alaAppMonEnforcementL4PortRangeStart  
  alaAppMonEnforcementL4PortRangeEnd  
  alaAppMonEnforcementL4PortType  
  alaAppMonEnforcementL4PortStatus
```

---

## app-mon flow-table flush

Clears all the learned flow-table entries for both IPv4 and IPv6 flow tables.

**app-mon flow-table {enforcement | monitor} flush**

---

### Syntax Definitions

<b>enforcement</b>	Flushes all the learned flow-table entries from the enforcement application.
<b>monitor</b>	Flushes all the learned flow-table entries from the monitor application.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- When the **enforcement** option is used, all the active flows information are cleared; no QoS treatment is provided (if configured). The data (active, gross counters, statistics, and flow information) in the following commands are cleared: **show app-mon app-list enforcement active**, **show app-mon app-list enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon ipv6-flow-table enforcement**, **show app-mon stats**.
- When the **monitor** option is used, all the learned flows information will be cleared. The data (gross counters and flow information) in the following commands are cleared: **show app-mon app-list monitor active**, **show app-mon ipv4-flow-table monitor**, **show app-mon ipv6-flow-table monitor**.
- When this command is used, application-record information is not cleared.

### Examples

```
-> app-mon flow-table enforcement flush  
-> app-mon flow-table monitor flush
```

### Release History

Release 8.2.1; command introduced.

## Related Commands

- show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
- show app-mon app-list** Displays a list of applications and application groups added to an application list. 'stats' option in this command displays active or gross packets/byte counters on per application basis.
- show app-mon ipv4-flow-table** Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
- show app-mon ipv6-flow-table** Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

## MIB Objects

alaAppMonFlowTableFlush

---

## app-mon flow-table enforcement stats

Enable or disable flow table statistics update for enforcement applications.

**app-mon flow-table enforcement stats admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enable flow-table statistics update.
<b>disable</b>	Disable flow-table statistics update.

### Defaults

By default, statistics admin status is disabled.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- This command is applicable only for enforcement applications.
- The statistics collection capability is shared with Service Manager, which means that either the Service Manager feature or AppMon can use this capability at any given time. Hence, disabling the counter usage in Service Manager using the **service stats disable** command is required to view the flow table statistics update for enforcement applications. For more information about this command, see the “Service Manager Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- When update statistics is enabled, the updated statistics is displayed in the **show app-mon ipv4-flow-table enforcement verbose**, **show app-mon ipv6-flow-table enforcement verbose**, and **show app-mon app-list enforcement active stats** commands. Statistics are refreshed every 160 seconds from data path, and based on the flow sync interval between the data path and the control path.

### Examples

```
-> app-mon flow-table enforcement stats admin-state enable
-> app-mon flow-table enforcement stats admin-state disable
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

**show app-mon config** Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

### MIB Objects

alaAppMonEnforcementFlowTableStatsAdminStatus

---

## app-mon aging enforcement

Configures aging time for dynamically learned TCP/UDP flows for each application for Enforcement applications.

**app-mon aging enforcement app-name** *app\_name* [tcp | udp] interval {120m | 60m | 30m | 10m | 5m | 3m | default}

---

### Syntax Definitions

<i>app_name</i>	Name of the application to configure its aging interval. The application must be part of the application pool.
<b>interval</b>	The aging time interval for dynamically learned flows in the flow table, in minutes.
<b>default</b>	Configures the default aging interval.

### Defaults

By default, aging interval is set per application and TCP or UDP flow type basis.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- User can set separate TCP or UDP flows aging interval for an given application.
- When TCP option is used to configure aging interval for an application, TCP flows generated by a given application age out with configured value.
- When UDP option is used to configure aging interval for an application, UDP flows generated by a given application age out with configured value.
- Flow aging is supported for the applications that are part of the enforcement application list. Flows related with enforcement application list are made active for QoS treatment as well statistics collection.
- Flow aging is not supported for applications that are part of Monitor application list. Monitor flow tables log these flows when they are detected until logging threshold is reached.

### Examples

```
-> app-mon aging enforcement app-name sip tcp interval 60m
-> app-mon aging enforcement app-name tftp udp interval 120m
```

### Release History

Release 8.2.1; command introduced.

## Related Commands

### **show app-mon config**

Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

### **show app-mon aging enforcement**

Displays the aging interval for each application for enforcement feature.

## MIB Objects

alaAppMonEnforcementAgingTimerTable

alaAppMonEnforcementAgingTimerValue

---

## app-mon logging-threshold

Configures the threshold for the number of matched flows for enforcement and monitor applications.

**app-mon logging-threshold {enforcement | monitor} num-of-flows {number | default}**

---

### Syntax Definitions

<i>number</i>	Threshold value for the number of matched flows. The valid range is 1000–60000.
<b>default</b>	Sets the threshold back to the default value of 20K.

### Defaults

By default, 20000 flows are logged.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- When the logging threshold value is set to '0', flows are not logged to the log file.
- When used with enforcement option, it configures the threshold for the number of matched flows to be saved on to the log file for enforcement applications.
- When used with monitor option, it configures the threshold for the number of matched flows to be displayed in the monitor flow table commands.

### Examples

```
-> app-mon logging-threshold monitor num-of-flows 10000
-> app-mon logging-threshold monitor num-of-flows default
-> app-mon logging-threshold enforcement num-of-flows 10000
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

[show app-mon config](#) Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

### MIB Objects

alaAppMonThresholdNumberOfFlows

---

## app-mon flow-sync enforcement interval

Configures the interval at which the enforcement flows information is refreshed.

**app-mon flow-sync enforcement interval** {*number* | **default**}

---

### Syntax Definitions

<i>number</i>	Flow sync interval at which the enforcement flows information is refreshed. The valid range is 10–3600 seconds. The interval can be configured only for the enforcement feature.
<b>default</b>	Configures the default flow-sync interval.

### Defaults

Default flow-sync interval is 60 seconds for enforcement.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

The refreshed information is shown in the following show commands: **show app-mon applist enforcement active**, **show app-mon applist enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon stats**.

### Examples

```
-> app-mon flow-sync enforcement interval 10
-> app-mon flow-sync enforcement interval default
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

[show app-mon ipv4-flow-table](#) Displays the flow table for IPv4 flows entries.

[show app-mon ipv6-flow-table](#) Displays the flow table for IPv6 flows entries.

### MIB Objects

alaAppMonFlowSyncEnforcementInterval

---

## app-mon force-flow-sync

Synchronizes flows learned in the data path.

**app-mon force-flow-sync {enforcement | monitor}**

---

### Syntax Definitions

<b>enforcement</b>	Synchronizes flows learned in the data path for the enforcement feature from the hardware.
<b>monitor</b>	Synchronizes flows learned in the data path for the monitor feature from the hardware.

### Defaults

By default, flow synchronization occurs every 5 minutes for monitor flows and 60 seconds for enforcement flows.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

Use this command to force a flow synchronization with the control path database in real time.

### Examples

```
-> app-mon force-flow-sync enforcement
-> app-mon force-flow-sync monitor
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

[show app-mon ipv4-flow-table](#) Displays the flow table for IPv4 flows entries.

[show app-mon ipv6-flow-table](#) Displays the flow table for IPv6 flows entries.

### MIB Objects

alaAppMonForceFlowSyncStatus

---

## show app-mon config

Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

**show app-mon config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

The operational state is enabled if there is at least one OmniSwitch 6860E chassis in the virtual chassis (VC). If there is no OmniSwitch 6860E in the VC, the operational-state is disabled.

### Examples

```
-> show app-mon config
Admin State                : Enable,
Operational State          : Enable,
L3-IPv4                    : Enable,
L3-IPv6                    : Enable,
Enforcement Flow-Table Stats : Enable,
Enforcement Flow-Sync Interval : 10 seconds,
Monitor Logging Threshold   : 20000,
Enforcement Logging Threshold : 20000,
App-Pool Applications       : 10,
Monitor Applied Applications : 10,
Enforcement Applied Applications : 10,
Upgraded Signature File Type : Factory,
AOS Compatible Signature Kit Version : 1,
Signature Kit version       : 1.1.1
```

#### *output definitions*

---

<b>Admin-state</b>	The AppMon administrative status ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>app-mon admin-state</b> command.
<b>Operational State</b>	The operational status ( <b>Enabled</b> or <b>Disabled</b> ).
<b>L3-IPv4</b>	Status of IPv4 I3 mode on the switch ( <b>Enable</b> or <b>Disable</b> )
<b>L3-IPv6</b>	Status of IPv6 I3 mode on the switch ( <b>Enable</b> or <b>Disable</b> )
<b>Enforcement Flow-Table Stats</b>	Status of the enforcement flow table statistics update.
<b>Enforcement Flow Sync interval</b>	Enforcement flow sync interval at which the switch polls for flow information.

*output definitions (continued)*

---

<b>Monitor Logging-Threshold</b>	Monitor threshold value for the flows to be saved in the IPv4 or IPv6 flow table.
<b>Enforcement Logging-Threshold</b>	Enforcement threshold value for the flows to be saved on to the log file.
<b>App-Pool Applications</b>	The number of application signatures in the application pool.
<b>Monitor Applied Applications</b>	The number of active applications in the Monitor application list.
<b>Enforcement Applied Applications</b>	The number of active applications in the enforcement application list.
<b>Upgraded Signature File Type</b>	The signature file type: Factory or Production
<b>AOS Compatible Signature Kit Version</b>	Determines the compatibility between AOS software and the signature file.
<b>Signature Kit version</b>	The signature file version that contains the application signatures.

---

## show app-mon port

Displays AppMon status per physical port or per slot for the switch.

**show app-mon** [**port** *chassis/slot/port* | **slot** *chassis/slot*]

---

### Syntax Definitions

*chassis/slot/port*[-*port2*]      The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

*chassis/slot*                      The chassis ID and slot number (3/1) for a specific slot.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

N/A

### Examples

```
-> show app-mon port
  Port      Admin-Status  Oper-Status  L4-mode
-----+-----+-----+-----
1/1/1      Enable        Up           TCP-UDP
1/1/2      Enable        Up           TCP-UDP
1/1/3      Enable        Up           TCP-UDP
1/1/4      Enable        Up           TCP-UDP
1/1/5      Enable        Up           TCP-UDP
1/1/6      Enable        Up           TCP-UDP
1/1/7      Enable        Up           TCP-UDP
.
```

```

## show app-mon app-list

Displays a list of applications and application groups added to an application list.

**show app-mon app-list** {**monitor** | **enforcement**} [**active** [**stats**]] [**conflict**]

---

### Syntax Definitions

<b>monitor</b>	Displays information for applications added for monitoring.
<b>enforcement</b>	Displays information for applications added for enforcement.
<b>active</b> [ <b>stats</b> ]	Displays the list of activated applications in an application list. Use the <b>stats</b> option together with the <b>enforcement</b> option.
<b>conflict</b>	Displays the list of applications that are present more than once in an application list.

### Defaults

By default, all applications and application groups that belong to an application list are displayed.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- Use the **conflict** option to identify applications that are present more than once in an application list. This needs to be checked and resolved for **app-mon apply** to be successful.
- The **active** option displays active and gross number of flows detected on per application basis.
- For monitor feature, **active** option displays only the gross counters.
- The **stats** option is used only for the **enforcement** option. This displays active or gross packets/byte counters per application basis.

### Examples

```
-> show app-mon app-list monitor
App-Id/      Application-List
AppGrp-Id   Member Name      Application-List
Member Type
-----+-----+-----
244         facebook        APP
182         sip             APP-GRP
```

#### *output definitions*

---

<b>App-Id/AppGrp-Id</b>	Identity of the application or application group.
<b>Application-List Member Name</b>	Name of the application group or application.
<b>Application-List Member Type</b>	Specifies the application type: individual application or whether the application belongs to any application group.

---

```
-> show app-mon app-list monitor active

## show app-mon app-group

Displays the details of all the applications in an application group.

**show app-mon app-group** [**group-name** *group\_name*]

---

### Syntax Definitions

*group\_name*                                      The name of an application group. This is a case sensitive string.

### Defaults

By default, information is displayed for all application groups.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

- This command displays both user created and automatically created application groups and the applications added to the respective group.
- Application names which are added to group and not yet activated are also displayed.
- This also display the auto application groups.

### Examples

```
-> show app-mon app-group
Legend: Application-name: *= Not present in recently updated kit,
```

AppGrp-Id	App-group	App-name
AG-1	Web	amazon facebook twitter youtube
AG-2	Instant Messaging	whatsapp skype
AG-3	Audio/Video	sip viber webex
AG-4	File Server	tftp

#### output definitions

---

<b>AppGrp-Id</b>	Identity of the application group.
<b>App-group</b>	Name of the application group whose details are viewed.
<b>App-name</b>	Name of the applications attached to the application group.

## show app-mon app-record

Displays current-hour application-record information as well the historic application-records on the hourly or 24-hours basis for monitored applications.

**show app-mon app-record [hourly | twenty-four-hours | current-hour] [verbose]**

---

### Syntax Definitions

<b>hourly</b>	Displays flows detected for an applications in an hour. An Hour is defined with fixed boundary (for example, 1:30 p.m to 2:30 p.m).
<b>twenty-four-hours</b>	Displays aggregate of available 'hourly' records for each application, flows detected in last 24-hours since last hour boundary. 'current-hour' data will not be part of this. This information is updated every one hour when 'hourly' record is updated.
<b>current-hour</b>	Displays new flow detected for an application in the current hour which is not part of 'hourly' historic data. When current-hour reaches an hour boundary, this data is moved to 'hourly' records. For example, if current time is 2.40 p.m, then information between 2.30 p.m to 2.40 p.m is displayed. On 3.30 p.m, current-hour information is moved to the latest hourly record.
<b>verbose</b>	Select this option to view detail information for each option. Detail information include minimum, maximum and average flows detected for each application.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

This is supported for monitoring.

### Examples

## show app-mon ipv4-flow-table

Displays the flow table for IPv4 flows entries for enforcement and monitor flows.

```
show app-mon ipv4-flow-table {monitor | enforcement [verbose]} [{src-ipv4 | dest-ipv4} ip_address]
[app-name app_name | app-group grp_name]
```

---

### Syntax Definitions

<b>verbose</b>	Displays detailed information of the flows.
<b>src-ipv4</b> <i>ip_address</i>	Filter flow table based on the specified source IPv4 address.
<b>dest-ipv4</b> <i>ip_address</i>	Filter flow table based on the specified destination IPv4 address.
<i>app_name</i>	Filter flow table based on application name.
<i>grp_name</i>	Filter flow table based on application group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

The **verbose** option displays additional information about the flow start time, statistics counters, associated application group, policy rule, and so on. This option is supported only for enforcement feature.

### Examples

```
-> show app-mon ipv4-flow-table monitor

## show app-mon ipv6-flow-table

Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

```
show app-mon ipv6-flow-table {monitor | enforcement [verbose]} [{src-ipv6 | dest-ipv6} ip_address]
[app-name app_name | app-group grp_name]
```

---

### Syntax Definitions

<b>verbose</b>	Displays detailed information of the flows.
<b>src-ipv6</b> <i>ip_address</i>	Filter flow table based on the specified source IPv6 address.
<b>dest-ipv6</b> <i>ip_address</i>	Filter flow table based on the specified destination IPv6 address.
<i>app_name</i>	Filter flow table based on application name.
<i>grp_name</i>	Filter flow table based on application group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

The **verbose** option displays additional information about the flow start time, statistics counters, associated application group, policy rule, and so on. This option is supported only for enforcement feature.

## show app-mon l4port-exclude

Displays the port range excluded from AppMon operation.

```
show app-mon l4port-exclude range-id [number]
```

---

### Syntax Definitions

*number*                                      A range ID number. The valid range is 1–8.

### Defaults

By default, information is displayed for all range ID numbers.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

Enter a range ID number with this command to display information for a specific range.

### Examples

```
-> show app-mon l4port-exclude range-id
Range-Id   Start-port   End-port     Port-type
-----+-----+-----+-----
1           100          200         UDP-Port
2           20           25          TCP-Service-Port
```

```
-> show app-mon l4port-exclude range-id 1
Range-Id   Start-port   End-port     Port-type
-----+-----+-----+-----
1           100          200         UDP-Port
```

#### *output definitions*

---

<b>Range-Id</b>	The service port range ID.
<b>Start-port</b>	The start port associated with the range ID.
<b>End-port</b>	The end port associated with the range ID.
<b>Port-type</b>	Indicates the port type ( <b>TCP</b> or <b>UDP</b> )

---

### Release History

Release 8.2.1; command introduced.

## Related Commands

[app-mon l4port-exclude](#) Configures the L4 port range to exclude from the AppMon operation.

## MIB Objects

```

  alaAppMonEnforcementL4PortStatus
```

---

## show app-mon stats

Displays the number of flow statistics.

**show app-mon stats**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

Use the **app-mon flow-table enforcement flush** command to clear the counters.

### Examples

```
-> show app-mon stats
Chassis/  Total Enforcement  Total          Total TCP      Total UDP
Slot      Matched Flows      Used Flows      Overflow Flows  Overflow Packets
-----+-----+-----+-----+-----
1/1        8192                8192            1422           0
2/1         0                   3                0               0
3/1         0                   0                0               0
4/1         0                   0                0               0
Total      8192                8195            1422           0
```

#### *output definitions*

---

<b>Chassis/Slot</b>	The chassis ID and slot number.
<b>Total Enforcement Matched Flows</b>	Total number of active flows that matched to any active application signature for enforcement feature.
<b>Total Used Flows</b>	Total number of active flows (including unmatched and enforcement matched) on a given chassis/slot. Each IPv4 flow takes one entry count, while each IPv6 flow takes two entries for Total Used Flows count.
<b>Total TCP Overflow Flows</b>	Total number of TCP flows missed to create flow entry in flow table due to hash collision.
<b>Total UDP Overflow Packets</b>	Cumulative number of UDP packets missed to create flow entry in flow table due to hash collision.

---

### Release History

Release 8.2.1; command introduced.

## Related Commands

### [app-mon flow-table enforcement stats](#)

Enable or disable flow table statistics update for enforcement applications.

## MIB Objects

```
alaAppMonStatisticsTable
  alaAppMonStatsSlotIndex
  alaAppMonTotalEnforcementActiveFlows
  alaAppMonTotalFlowTableInUseFlows
  alaAppMonTCPOverflowFlows
  alaAppMonUDPOverflowPackets
```

---

## show app-mon aging enforcement

Displays the aging interval for each application for enforcement feature.

**show app-mon aging enforcement** [**app-name** *app\_name*]

---

### Syntax Definitions

*app\_name*                                 The name of the application. This is a case sensitive string.

### Defaults

By default, the aging time for all applications is displayed.

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

N/A

### Examples

-> show app-mon aging enforcement

```

AppId      Application-name      TCP Aging-time/
                               UDP Aging-time(minutes)
-----+-----+-----
968        amazon          6/1
244        facebook       6/1
182        sip            60/60
183        skype          6/1
211        tftp           15/15
503        twitter        6/1
597        viber          6/1
890        webex          6/1
1093       whatsapp         6/1
240        youtube         6/1

```

-> show app-mon aging enforcement app-name sip

```

AppId      Application-name      TCP Aging-time/
                               UDP Aging-time(minutes)
-----+-----+-----
182        sip            60/60

```

### output definitions

---

<b>AppId</b>	Identity of the application.
<b>Application-name</b>	Name of the application.
<b>TCP Aging-time/UDP Aging-time (minutes)</b>	Aging time configured for the application.

---

## Release History

Release 8.2.1; command introduced.

## Related Commands

**app-mon aging enforcement** Configures the aging time for dynamically learned flows for each application for enforcement feature.

## MIB Objects

```
alaAppMonEnforcementAgingTimerTable  
  alaAppMonEnforcementAgingTimerAppName  
  alaAppMonEnforcementAgingTimerValue
```

---

## show app-mon vc-topology

Displays the AppMon virtual chassis topology.

**show app-mon vc-topology**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

Displays the topology of the available OmniSwitch 6860 and OmniSwitch 6860E chassis. This also displays the connectivity between the chassis for flow classification.

### Examples

```
-> show app-mon vc-topology
```

Chassis/ Slot	Node Type	Designated Chassis/Slot
1/1	OS6860	2/1
2/1	OS6860E	2/1
3/1	OS6860E	3/1

#### *output definitions*

---

<b>Chassis/Slot</b>	The chassis ID and slot number.
<b>Node Type</b>	Indicates the switch type.
<b>Designated Chassis/Slot</b>	The chassis and slot of the switch.

---

### Release History

Release 8.2.1; command introduced

### Related Commands

N/A

**MIB Objects**

```
alaAppMonVCTopologyTable  
  alaAppMonVCTopologyChassisIndex  
  alaAppMonVCTopologyChassisType  
  alaAppMonVCTopologyDesignatedChassisIndex
```

---

## clear app-mon app-list

Removes all applications from the enforcement or monitor application list.

```
clear app-mon app-list {monitor| enforcement}
```

---

### Syntax Definitions

**monitor**

Removes all applications from the monitor application list.

**enforcement**

Removes all applications from the enforcement application list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

This command does not clear the active application list until the **app-mon apply** command is used.

### Examples

```
-> clear app-mon app-list enforcement  
-> clear app-mon app-list monitor
```

### Release History

Release 8.2.1; command introduced.

### Related Commands

[app-mon app-list](#)

Add or remove applications or application groups to an application list for enforcement or monitoring.

### MIB Objects

alaAppMonClearAppList

---

# 41 Application Fingerprinting Commands

The OmniSwitch Application Fingerprinting feature attempts to detect and identify remote applications by scanning IP packets and comparing them to pre-defined bit patterns (application signatures). Once an application is identified, Application Fingerprinting collects and stores information about the application flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and generating SNMP traps when a signature match occurs.

Using this implementation of Application Fingerprinting, an administrator can obtain more detailed information about protocols running on a specific device or make sure that certain QoS actions are automatically applied wherever an application might be running.

MIB information for the Application Fingerprinting commands is as follows:

*Filename:* ALCATEL-IND1-APP-FINGERPRINT-MIB.mib  
*Module:* alcatelIND1AppFPMIB

A summary of the available commands is listed here:

---

**app-fingerprint admin-state**  
**app-fingerprint port**  
**app-fingerprint signature-file**  
**app-fingerprint reload-signature-file**  
**app-fingerprint trap**  
**show app-fingerprint configuration**  
**show app-fingerprint port**  
**show app-fingerprint app-name**  
**show app-fingerprint app-group**  
**show app-fingerprint database**  
**show app-fingerprint statistics**

---

## app-fingerprint admin-state

Enables or disables the Application Fingerprinting process on all Application Fingerprinting ports.

**app-fingerprint admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables Application Fingerprinting.
<b>disable</b>	Disables Application Fingerprinting.

### Defaults

By default, Application Fingerprinting is enabled for the switch.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- When Application Fingerprinting is enabled for the switch, traffic flows on Application Fingerprinting ports are sampled and compared to REGEX application signatures defined in the “app-regex.txt” file located in the **/flash/app-signature** directory on the local switch. This is done to identify the presence of remote applications on a flow-by-flow basis.
- Disabling the administrative status of the Application Fingerprinting feature does not remove the Application Fingerprinting configuration from the switch.

### Examples

```
-> app-fingerprint admin-state disable
-> app-fingerprint admin-state enable
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

**show app-fingerprint configuration** Displays the Application Fingerprinting configuration for the switch.

### MIB Objects

```
alaAppFPGlobalMIBConfigObjects
alaAppFPGlobalAdminState
```

---

## app-fingerprint port

Configures a port or link aggregate as an Application Fingerprinting interface. Once the interface is configured and Application Fingerprinting is enabled for the switch, IP packets received on the interface are sampled to determine if they match pre-defined patterns in application signature files that reside on the local switch. When a match occurs, the flow is monitored and/or subject to QoS policy rules.

```
app-fingerprint {port chassis/slot/port[-port] | linkagg agg_id[-agg_id2]} {monitor-app-group
group_name | policy-list-name policy_list | unp-profile}
```

```
no app-fingerprint {port chassis/slot/port[-port] | linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports.
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
<i>group_name</i>	The name of an existing signature application group.
<i>policy_list</i>	The name of an existing QoS policy list.
<b>unp-profile</b>	Apply QoS policy list from UNP to which matching traffic is classified.

### Defaults

By default, Application Fingerprinting is disabled on all switch ports.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the Application Fingerprinting service on the specified port or link aggregate.
- Use the **monitor-app-group** parameter to specify a group (profile) that represents a set of application signature files. All of the signature files in the group are checked against the IP packets received on the port. When a packet match is detected, the flow is identified and monitored. No other action is taken.
- Use the **policy-list-name** parameter to associate a QoS policy list with the Application Fingerprinting port. When a packet match is detected, the policy rules in the specified policy list are applied to the matching traffic flow.
- Use the **unp-profile** parameter to specify that if traffic received on an Application Fingerprinting interface is classified into a Universal Network Profile (UNP), then the QoS policy list rules associated with that profile are applied to the traffic.
- The QoS policy list specified with the **policy-list-name** parameter or assigned to a UNP for Application Fingerprinting traffic, must contain policy rules with the **appfp-group** condition.
- The QoS policy list specified with the **policy-list-name** parameter must be configured as an **appfp** list. However, the UNP policy list must be configured as a UNP list.

- Application Fingerprinting uses the sFlow mechanism to sample packets. Do not run Application Fingerprinting and other sFlow services on the same port or link aggregate.

## Examples

```
-> app-fingerprint port 2/1-5 monitor-app-group my-p2p
-> app-fingerprint linkagg 10 policy-list-name list1
-> app-fingerprint port 1/11 unp
-> no app-fingerprint port 2/1-5
-> no app-fingerprint linkagg 10
```

## Release History

Release 7.3.2; command was introduced.

## Related Commands

**show app-fingerprint port**      Displays the Application Fingerprinting port configuration.

## MIB Objects

```
alaAppFPPortTable
  alaAppFPPort
  alaAppFPGroupNameOrPolicyList
  alaAppFPPortOperationMode
  alaAppFPPortStatus
  alaAppFPPortRowStatus
```

---

## app-fingerprint signature-file

Specifies the name of the Application Fingerprinting signature file. This file contains the REGEX signatures that are used to identify applications accessing the network on Application Fingerprinting ports.

**app-fingerprint signature-file** *filename*

---

### Syntax Definitions

*filename*                                  The name of an existing REGEX application signature file.

### Defaults

By default, the “app-regex.txt” file is used.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- This command is only required to use a REGEX signature file that has a filename that is different from the default “app-regex.txt” name..
- The signature file must reside in the **/flash/app-signature** directory on the local switch.
- After specifying the signature filename to use, upload the signature file into the switch memory using the **app-fingerprint reload-signature-file** command.

### Examples

```
-> app-fingerprint signature-file app2_regex.txt
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

**app-fingerprint reload-signature-file**                  Reloads the contents of the active application signature file into the switch memory.

### MIB Objects

```
alaAppFPGlobalMIBConfigObjects  
  alaAppFPGlobalSignatureFile
```

---

## app-fingerprint reload-signature-file

Reloads the contents of the active application signature file into the switch memory. Use this command after making any changes to the current signature file.

**app-fingerprint reload-signature-file**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- This command reloads the application signature file that was previously applied to the switch. This may be the default “app-regex.txt” file or another signature file that was applied through the **app-fingerprint signature-file** command.
- A switch reboot is *not* required after the signature file is reloaded.

### Examples

```
-> app-fingerprint reload-signature-file
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

**app-fingerprint signature-file** Specifies a different signature file to use for Application Fingerprinting.

### MIB Objects

```
alaAppFPGlobalMIBConfigObjects  
alaAppFPGlobalReloadSignatureFile
```

---

## app-fingerprint trap

Enables or disables trap generation for the Application Fingerprinting feature.

**app-fingerprint trap {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables Application Fingerprinting traps.
<b>disable</b>	Disables Application Fingerprinting traps.

### Defaults

By default, traps are disabled for this feature.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

A trap is generated when a traffic flow matches an application signature.

### Examples

```
-> app-fingerprint trap enable  
-> app-fingerprint trap disable
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

<a href="#">show app-fingerprint configuration</a>	Displays the Application Fingerprinting status and configuration for the switch.
--	--

### MIB Objects

```
alaAppFPGlobalMIBConfigObjects  
alaAppFPGlobalTrapConfig
```

---

## show app-fingerprint configuration

Displays the Application Fingerprinting status and configuration information for the switch.

**show app-fingerprint configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

N/A

### Examples

```
-> show app-fingerprint configuration
```

```
Admin-state:          Enabled,  
SNMP Trap:           Disabled,  
Signature File:      app-regex.txt
```

### *output definitions*

---

<b>Admin-state</b>	The administrative status of Application Fingerprinting for the switch ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>app-fingerprint admin-state</b> command.
<b>SNMP Trap</b>	The status of SNMP trap generation for the switch ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>app-fingerprint trap</b> command.
<b>Signature File</b>	The name of the text file that contains the REGEX application signatures used to identify traffic flows. This file resides in the <b>/flash/app-signature</b> directory on the switch. Configured through the <b>app-fingerprint signature-file</b> and <b>app-fingerprint reload-signature-file</b> commands.

---

### Release History

Release 7.3.2; command was introduced.

## Related Commands

**show app-fingerprint port**      Displays the Application Fingerprinting port configuration.

## MIB Objects

```
alaAppFPGlobalMIBConfigObjects
  alaAppFPGlobalAdminState
  alaAppFPGlobalSignatureFile
  alaAppFPGlobalReloadSignatureFile
  alaAppFPGlobalTrapConfig
```

---

## show app-fingerprint port

Displays the Application Fingerprinting port configuration for the switch.

**show app-fingerprint** [**port** *chassis/slot/port* | **linkagg** *agg\_id*]

---

### Syntax Definitions

*chassis*                                    The chassis identifier.  
*slot/port[-port]*                        The slot and port number (3/1).  
*agg\_id*                                     The link aggregate ID number.

### Defaults

By default, the configuration for all Application Fingerprinting ports is displayed.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

### Examples

```
-> show app-fingerprint port
Legend: * = Port or App-Group is invalid
```

Port	Operation Mode	App-group/Policy-list
1/2/1	Monitoring	Testing13
1/2/1	QoS	list1
1/2/1	QoS	list2

```
-> show app-fingerprint linkagg
Legend: * = Port or App-Group is invalid
```

Port	Operation Mode	App-group/Policy-list
0/100	Monitoring	Testing16
0/100	QoS	list3
0/100	QoS	list4

*output definitions*

---

<b>Port</b>	The slot/port or link aggregate ID of the Application Fingerprinting interface. A “0” slot number indicates that the interface is a link aggregate.
<b>Operation Mode</b>	The Application Fingerprinting mode ( <b>Monitoring, QoS, or UNP</b> ) in which the port is operating.
<b>App-group/Policy-list</b>	The name of the group of application signatures or the QoS policy list that is applied to the traffic flows on the port.

---

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

<a href="#">show app-fingerprint port</a>	Displays the Application Fingerprinting interface configuration.
<a href="#">show app-fingerprint configuration</a>	Displays the Application Fingerprinting status and configuration for the switch.

**MIB Objects**

```
alaAppFPPortTable
  alaAppFPPort
  alaAppFPGroupNameOrPolicyList
  alaAppFPPortOperationMode
  alaAppFPPortStatus
  alaAppFPPortRowStatus
```

---

## show app-fingerprint app-name

Displays the REGEX application signature configuration for the switch. When the switch samples Application Fingerprinting ports, the traffic flow patterns on these ports are compared against the REGEX signatures specified in the “app-regex.txt” file. When a match occurs, the traffic flow is classified and monitored. In addition, QoS policies can be applied to these flows based on a specific match to an application signature group.

```
show app-fingerprint app-name [app_name]
```

---

### Syntax Definitions

*app\_name*                      The name of an existing application signature.

### Defaults

By default, all application signatures are displayed.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- Application signatures are defined in the “app-regex.txt” file that resides in the **/flash/app-signature** directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.
- Application signatures can also be combined into an application group. This type of group is then assigned to one or more Application Fingerprinting ports. All the application signatures that are members of the assigned group are then applied to traffic flows on that same port.
- Use the *app\_name* parameter to display information for a specific application signature.

### Examples

```
-> show app-fingerprint app-name
App Name: ciscovpn
  Description: VPN client software to a Cisco VPN server
  REGEX Signature: \x01\xf4\x01\xf4

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58

App Name: dhcp
  Description: Dynamic Host Configuration Protocol
  REGEX Signature: [\x01\x02][\x01- ]\x06.*c\x82sc

-> show app-fingerprint app-name citrix

App Name: citrix
  Description: Citrix ICA - proprietary remote desktop application
  REGEX Signature: \x32\x26\x85\x92\x58
```

*output definitions*

---

<b>App-name</b>	The name of the application for which this signature applies.
<b>Description</b>	A description of the application.
<b>REGEX signature</b>	The regular expression (REGEX) that identifies this application.

---

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

<a href="#">show app-fingerprint app-group</a>	Displays the application group configuration.
<a href="#">show app-fingerprint configuration</a>	Displays the Application Fingerprinting status and configuration.

**MIB Objects**

alaAppFPAppGrpNameTable  
alaAppFPGrpAppName

---

## show app-fingerprint app-group

Displays the Application Fingerprinting application group configuration for the switch. An application group contains a user-configured list of REGEX application signatures that are represented by the group name. The group name is then assigned to Application Fingerprinting ports or link aggregates.

```
show app-fingerprint app-group [group_name]
```

---

### Syntax Definitions

*group\_name*                      The name of an existing application group.

### Defaults

By default, all application groups are displayed.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- Application groups are defined in the “app-regex.txt” file that is located in the **/flash/app-signature** directory on the switch. A default version of this file is available, but the file is user-configurable and new files can also be created.
- Use the *group\_name* parameter to display information for a specific application group.

### Examples

```
-> show app-fingerprint app-group

App Group: chatting
  App names: jabber

App Group: mail
  App names: smtp

App Group: network
  App names: bgp dhcp rtsp smb

App Group: p2p
  App names: hotline

App Group: remote_access
  App names: ciscovpn citrix rdp ssh vnc

App Group: voip
  App names: h323 sip

-> show app-fingerprint app-group network

App Group: network
  App names: bgp dhcp rtsp smb
```

*output definitions*

---

<b>App-Group</b>	The name of the application group file.
<b>App names</b>	The names of the application signature files that belong to this group.

---

**Release History**

Release 7.3.2; command was introduced.

**Related Commands**

**show app-fingerprint app-name** Displays the contents of the REGEX application signatures that are stored in the “app-regex.txt” file on the switch.

**show app-fingerprint configuration** Displays the Application Fingerprinting status and configuration.

**MIB Objects**

alaAppFPAppGrpNameTable  
    alaAppFPAppGroupName  
    alaAppFPGrpAppName

---

## show app-fingerprint database

Displays Application Fingerprinting database entries. When a match occurs between an IP traffic flow and a REGEX application signature, a multi-tuple classifier and the name of the matching application group and signature are stored in a local switch database to identify and track the application associated with the flow.

**show app-fingerprint database** [*port chassis/slot/port* | *linkagg agg\_id*] [*detail*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and the port number (3/1).
<i>agg_id</i>	The link aggregate ID number.
<i>detail</i>	Displays additional information about the classified traffic flow.

### Defaults

By default, all application flow database entries are displayed.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- The following multi-tuple classifier is used to identify an application traffic flow:
  - Ingress Port
  - Dest MAC
  - Src MAC
  - VLAN
  - Dest IP
  - Src IP
  - Dest Port
  - Src Port
- Each database entry is subject to a 15 minute aging period. If the database fills up, older entries are aged out before the 15 minute limit (fast aging). However, fast aging is not applied to database entries associated with QoS. In this case, the QoS is removed after the regular 15 minute aging time period expires.
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

## Examples

```
-> show app-fingerprint database
```

Port	App-Group/Name	SRC MAC	VLAN	SRC IP/Port
0/1/2	P2P/aim	00:00:22:33:44:55	20	2.3.4.4/200
0/1/2	P2P/ares	00:00:22:33:44:55	20	2.3.4.4/200
0/1/2	Mail/sntp	00:00:22:33:44:55	20	2.3.4.4/100

### output definitions

<b>Port</b>	The slot/port or link aggregate ID of the AFP interface on which the flow was classified. A "0" slot number indicates a link aggregate.
<b>App-Group/Name</b>	The name of the application group and signature that matched the flow.
<b>SRC MAC</b>	The source MAC address of the flow.
<b>VLAN</b>	The VLAN on which the flow is learned and forwarded.
<b>SRC IP/Port</b>	The source IP network address and port.

```
-> show app-fingerprint database detail
```

```
Port 1/2/1:
```

```
App-Group/Name: Testing2/App_4
SRC-DST MAC:    00:00:00:00:04:01 - 00:e0:b1:e6:f9:b5,
VLAN:           20,
SRC IP/PORT:    20.20.20.21/65,
DST IP/PORT:    10.10.10.11/55
```

```
App-Group/Name: Testing2/App_5
SRC-DST MAC:    00:00:00:00:04:02 - 00:e0:b1:e6:f9:b5,
VLAN:           20,
SRC IP/PORT:    20.20.20.21/64,
DST IP/PORT:    10.10.10.11/54
```

```
App-Group/Name: Testing2/App_6
SRC-DST MAC:    00:00:00:00:04:03 - 00:e0:b1:e6:f9:b5,
VLAN:           20,
SRC IP/PORT:    20.20.20.21/66,
DST IP/PORT:    10.10.10.11/56
```

```
Port 2/3/23:
```

```
App-Group/Name: Testing1/App_1
SRC-DST MAC:    00:00:00:00:03:01 - 00:e0:b1:e6:f9:b5,
VLAN:           10,
SRC IP/PORT:    10.10.10.11/115,
DST IP/PORT:    20.20.20.21/137
```

```
App-Group/Name: Testing1/App_2
SRC-DST MAC:    00:00:00:00:03:02 - 00:e0:b1:e6:f9:b5,
VLAN:           10,
SRC IP/PORT:    10.10.10.11/114,
DST IP/PORT:    20.20.20.21/138
```

```
App-Group/Name: Testing1/App_3
SRC-DST MAC:    00:00:00:00:03:03 - 00:e0:b1:e6:f9:b5,
VLAN:           10,
SRC IP/PORT:    10.10.10.11/113,
DST IP/PORT:    20.20.20.21/135
```

*output definitions*

---

<b>Port</b>	The slot and port number on which the flow was classified.
<b>App-Group/Name</b>	The name of the application group and signature that matched the flow.
<b>SRC-DST MAC</b>	The source and destination MAC addresses of the flow.
<b>VLAN</b>	The VLAN on which the flow is learned and forwarded.
<b>SRC IP/Port</b>	The source IP network address and port.
<b>DST IP/Port</b>	The destination IP network address and port.

---

**Release History**

```

---

## show app-fingerprint statistics

Displays statistics for each application flow on an Application Fingerprinting ingress port.

**show app-fingerprint statistics** [**port** *chassis/slot/port* | **linkagg** *agg\_id*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and the port number (3/1).
<i>agg_id</i>	The link aggregate ID number.

### Defaults

By default, statistics are displayed for all application flows.

### Platforms Supported

OmniSwitch 9900, 6900

### Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- Statistics displayed with this command include total number of packets matched, the number of unmatched packets, and the packets matched for each application signature.

### Examples

```
-> show app-fingerprint statistics
```

Port	Group/App name	Last 1 hour	Last 1 day
1/2/1	Testing2/App_4	19976	19976
1/2/1	Testing2/App_5	20000	20000
1/2/1	Testing2/App_6	20000	20000
2/3/23	Testing1/App_1	19975	19975
2/3/23	Testing1/App_2	20000	20000
2/3/23	Testing1/App_3	20000	20000

### Release History

Release 7.3.2; command introduced.

### Related Commands

**show app-fingerprint port** Displays the Application Fingerprinting interface configuration.

**MIB Objects**

```
alaAppFPStatsTable  
  alaAppFPStatsPort  
  alaAppFPStatsGroupName  
  alaAppFPStatsAppName  
  alaAppFPTotalMatchedLast1Hour  
  alaAppFPTotalMatchedLast1Day
```

---

# 42 Edge Virtual Bridging Commands

The OmniSwitch implementation of Edge Virtual Bridging (EVB) is based on the the 802.1Qbg IEEE Standard. EVB is activated only on the backbone edge switches in a Data Center network. EVB is used to automate the discovery of Virtual Machines and connect them to the correct network domains, either the backbone bridge service network, or the VLAN bridged network.

The Edge Virtual Bridging commands allow you to configure and view Virtual Bridge settings required to be setup on an Edge OmniSwitch.

MIB information for the Edge Virtual Bridging commands is as follows:

*Filename:* IEEE8021-EVBB-MIB.mib  
*Module:* IEEE8021-EVBB-MIB

*Filename:* ALCATEL-IND1-EVB-MIB.mib  
*Module:* ALCATEL-IND1-EVB-MIB

A summary of available commands is listed here:

---

<b>Management Commands</b>	<b>evb port auto enable type</b> <b>evb port auto disable</b> <b>evb port type</b> <b>evb evb-ldp manual</b> <b>evb ecp default-ack-timer</b> <b>evb vdp default-keep-alive-timeout</b>
<b>Monitoring Commands</b>	<b>show evb</b> <b>show evb config</b> <b>show evb vsi-db-table</b> <b>show evb vsi-manager</b> <b>show evb sbp-config</b> <b>show evb cdcp-status</b> <b>show evb s-channel</b> <b>show evb ecp-status</b>

---

## evb port auto enable type

Enables the EVB automatic mode for the switch. This mode allows ports to automatically become EVB ports when the port receives S-Channel Discovery and Configuration Protocol (CDCP) or EVB TLV (type, length, value) control packets. When EVB is automatically enabled, this command also specifies whether the port operates as a VLAN bridging port or a service access port.

**evb port auto enable type {vlan-bridging | service-access}**

---

### Syntax Definitions

<b>vlan-bridging</b>	Enables the port to operate as a VLAN bridging port.
<b>service-access</b>	Enables the port to operate as a service access port.

### Defaults

By default, the EVB automatic mode is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

VLAN bridging cannot be enabled on ports that are associated with a GroupID or S-Channel.

### Examples

```
-> evb port auto enable type service-access
-> evb port auto enable type vlan-bridging
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">evb port auto disable</a>	Disables EVB port auto mode.
<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.

### MIB Objects

```
evbMIBScalarObjects
  evbPortAutoMode
  evbDefaultType
```

---

## evb port auto disable

Disables the EVB automatic mode for the switch. The port becomes an EVB port only when the port is configured through the CLI command.

**evb port auto disable**

---

### Syntax Definitions

N/A

### Defaults

By default, the EVB automatic mode is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

All EVB control packets are ignored when the EVB automatic mode is disabled.

### Examples

```
-> evb port auto disable
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">evb port auto enable type</a>	Enables the EVB port to VLAN bridging mode or service access mode.
<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.

### MIB Objects

```
evbMIBScalarObjects  
  evbPortAutoMode
```

---

## evb port type

Enables or disables the EVB VLAN bridging functionality on a switch port or link aggregate.

**evb port** {*chassis/slot/port* | **linkagg** *agg\_id*} **type** {**vlan-bridging** | **service-access**}

**no evb port** {*chassis/slot/port* | **linkagg** *agg\_id*}

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>agg_id</i>	The link aggregate ID number.
<b>vlan-bridging</b>	Specifies the EVB VLAN bridging port type.
<b>service-access</b>	Specifies the EVB service-access port type.

### Defaults

By default, EVB is not enabled on switch ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- If the EVB port auto mode is enabled, this command can be used to overwrite the default EVB port type.
- Use the **no** form of this command to disable the EVB configuration on the specified port.
- This command designates the specified port or link aggregate as a EVB Station-facing Bridge Port (SBP) that will connect to an EVB server.

### Examples

```
-> evb port 1/1 type vlan-bridging
-> evb port 1/2 type service-access
-> evb port linkagg 2 type vlan-bridging
-> evb port linkagg 3 type service-access
```

### Release History

Release 7.3.1; command introduced.

**Related Commands****show evb config**

Displays the current EVB configuration on the switch.

**MIB Objects**

evbPortModeTable

evbPortId

evbPortMode

---

## evb evb-lldp manual

Enables or disables manual operating configuration for OmniSwitch after obtaining the EVB TLV setting.

**evb evb-lldp manual {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables local EVB TLV manual setting.
<b>disable</b>	Disables local EVB TLV manual setting.

### Defaults

By default, the EVB LLDP manual setting is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When EVB LLDP manual is enabled, the operating configuration of the OmniSwitch is determined only by the local EVB TLV settings.
- When EVB LLDP manual is disabled, the operating configuration is automatically determined by comparing the local and remote EVB TLV settings.

### Examples

```
-> evb evb-lldp manual enable
-> evb evb-lldp manual disable
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.
<a href="#">show evb sbp-config</a>	Displays the Virtual Station Interface (VSI) to Station-facing Bridge Port (SPB) mapping information.

### MIB Objects

```
ieee8021BridgeEvbConfig
  ieee8021BridgeEvbSysEvbLldpManual
```

---

## evb ecp default-ack-timer

Configures the default amount of time to wait to receive an acknowledgment (ACK) Edge Control Protocol (ECP) data packet.

**evb ecp default-ack-timer** *ack\_timer*

---

### Syntax Definitions

*ack\_timer*                      The default wait timer value to receive an acknowledgment (ACK) Edge Control Protocol (ECP) data packet.

### Defaults

By default, the default ACK timer value is set to 14 (approximately 163.84 milliseconds).

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The ECP operates between the EVB server and EVB OmniSwitch and provides reliable delivery of VSI Discovery and Configuration Protocol (VDP) PDUs.
- Use the following formula to get the real timer value from the ACK timer:

Timer (in milliseconds) =  $10 \times 2^{\text{ack\_timer}}$

### Examples

```
-> evb ecp default-ack-timer 20
-> evb ecp default-ack-timer 14
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.
<a href="#">show evb vsi-db-table</a>	Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

### MIB Objects

```
ieee8021BridgeEvbConfig
  ieee8021BridgeEvbECPAckTimer
```

---

## evb ecp default-max-retry

Configures the maximum number of times the Edge Control Protocol (ECP) must be retransmitted if no acknowledgment (ACK) packet is received.

**evb ecp default-max-retry** *max-try*

---

### Syntax Definitions

*max-try* The maximum number of times that the ECP retries a transmission if no ACK (acknowledgment packet) is received. The valid range is 0 to 7.

### Defaults

By default, the maximum number of retries value is set to 3.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The retransmission of packets occurs only after the default ACK timer value has expired.
- Once the maximum number of retries value is reached without success (no ACK packet received), then the transmit buffer is cleared.

### Examples

```
-> evb ecp default-max-retry 5
-> evb ecp default-max-retry 3
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.
<a href="#">show evb vsi-db-table</a>	Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

### MIB Objects

```
ieee8021BridgeEvbConfig
  ieee8021BridgeEvbECPMaxRetries
```

---

## evb vdp default-resource-wait-delay

Configures the amount of time to wait to initialize the timer on the edge OmniSwitch when a VSI Discovery and Configuration Protocol (VDP) resource is waiting for a response.

**evb vdp default-resource-wait-delay *delay***

---

### Syntax Definitions

*delay* The amount of time to wait for a response.

### Defaults

By default, the *delay* parameter value is 20 (approximately 10.48576 seconds).

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the following formula to get the default-resource-wait-delay value:

Timer (in micro second) =  $10 \times 2^{\text{delay}}$

### Examples

```
-> evb vdp default-resource-wait-delay 25  
-> evb vdp default-resource-wait-delay 20
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.
<a href="#">show evb vsi-db-table</a>	Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

### MIB Objects

```
ieee8021BridgeEvbConfig  
  ieee8021BridgeEvbSysVdpDfltRsrcWaitDelay
```

---

## evb vdp default-keep-alive-timeout

Configures the value to initialize the timer by the station VDP to determine when to transmit keep-alive messages.

```
evb vdp default-keep-alive-timeout ka_timeout
```

---

### Syntax Definitions

*ka\_timeout*                              The keep-alive value for the timer.

### Defaults

By default, the default keep-alive timeout value is set to 20 (approximately 0.48576 seconds).

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the following formula to get the real timer value from the default-keep-alive timeout:

Timer (in micro second) =  $10 \times 2^{\text{ka\_timeout}}$

### Examples

```
-> evb vdp default-keep-alive-timeout 25
```

### Release History

Release 7.3.1; command introduced.

### Related Commands

<a href="#">show evb config</a>	Displays the current EVB configuration on the chassis.
<a href="#">show evb vsi-db-table</a>	Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

### MIB Objects

```
ieee8021BridgeEvbConfig  
  ieee8021BridgeEvbSysVdpDfltReinitKeepAlive
```

---

## show evb

Displays the EVB port and the port bridging type.

**show evb** [**port** *chassis/slot/port* | **linkagg** *agg\_id*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Slot and port number of the EVB port.
<i>agg_id</i>	Link aggregate ID of the EVB port.

### Defaults

By default, the EVB port type is displayed for all ports and link aggregates.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the **port** or **linkagg** parameters with this command to display information for a specific port or link aggregate.

### Examples

```
-> show evb port linkagg
Port      Bridging Type
-----+-----
0/1       VLAN
0/2       VLAN

-> show evb port
Port      Bridging Type
-----+-----
1/1       VLAN
1/2       VLAN

-> show evb port 1/2
Port      Bridging Type
-----+-----
1/2       VLAN
```

### output definitions

---

<b>Port</b>	The slot/port number or link aggregate ID of the EVB port.
<b>Bridging Type</b>	Specifies the EVB port bridging type.

---

**Related Commands****evb port type**

Configures the EVB port type.

**MIB Objects**

evbPortModeTable

evbPortId

    evbPortMode

---

## show evb config

Displays the current EVB configuration on the switch.

**show evb config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

NA

### Examples

-> show evb config

```

Auto Port Mode:                Enabled
Auto Default Port Type:        Vlan-Bridging
No. of external ports:         102
EVB-LLDP TX:                   -
EVB-LLDP manual:               Disabled
EVB-LLDP GroupID-capable:      -
ECP default-ack-timer (msec):   14 (163.84)
ECP default-max-retry:          3
VDP resource-wait-delay (sec):  20 (10.48)
VDP keep-alive-timeout (sec):   20 (10.48)

```

### *output definitions*

---

<b>Auto Port Mode</b>	The EVB auto mode status ( <b>Enabled</b> or <b>Disabled</b> ). <i>Not supported in the current release; the EVB port type is manually configured.</i>
<b>Auto Default Port Type</b>	The default port type setting in auto mode - <b>Vlan-Bridging</b> or <b>Service-Access</b> . <i>Not supported in the current release..</i>
<b>No. of external ports</b>	The number of external ports on the EVB.
<b>EVB-LLDP TX</b>	The EVB-LLDP transmission status ( <b>Enabled</b> or <b>Disabled</b> ). <i>Not supported in the current release.</i>
<b>EVB-LLDP manual</b>	The EVB-LLDP manual setting ( <b>Enabled</b> or <b>Disabled</b> ).
<b>EVB-LLDP GroupID</b>	The EVB-LLDP groupID capability status ( <b>Enabled</b> or <b>Disabled</b> ). <i>Not supported in the current release.</i>
<b>ECP ack-timer (msec)</b>	The EVB acknowledgement timer value in milli seconds.

*output definitions (continued)*

---

<b>ECP max-retry</b>	The value for the maximum number of times that the ECP is retransmitted if no acknowledgment (ACK) packet is received.
<b>VDP resource-wait-delay (sec)</b>	The VDP resource wait delay value in seconds.
<b>VDP keep-alive-timeout (sec)</b>	The VDP keep-alive timeout value in seconds.

---

**Release History**

Release 7.3.1; command introduced.

**Related Commands**

<b>evb ecp default-ack-timer</b>	Configures the default wait timer value to receive an acknowledgment (ACK) data packet.
<b>evb ecp default-max-retry</b>	Configures the maximum number of times that the ECP must be retransmitted if no acknowledgment (ACK) packet is received.
<b>evb vdp default-resource-wait-delay</b>	Configures the delay value to initialize the timer for VDP on the edge OmniSwitch when a resource is waiting for a response.
<b>evb vdp default-keep-alive-timeout</b>	Configures the value to initialize the timer by the station VDP to determine when to transmit keep-alive messages.

**MIB Objects**

```

  evbDefaultType
ieee8021BridgeEvbConfig
  ieee8021BridgeEvbSysNumExternalPorts
  ieee8021BridgeEvbSysEvbLldpTxEnable
  ieee8021BridgeEvbSysEvbLldpManual
  ieee8021BridgeEvbSysEvbLldpGidEnable
  ieee8021BridgeEvbECPACKTimer
  ieee8021BridgeEvbECPMaxRetires
  ieee8021BridgeEvbSysVdpDfltRsrcWaitDelay
  ieee8021BridgeEvbSysVdpDfltReinitKeepAlive

```

---

## show evb vsi-db-table

Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

```
show evb vsi-db-table chassis/slot/port | linkagg agg_id] [sbp sbp | vsi-id vsi_id | mac mac_address]
[vlan vlan_id | group-id group_id] [detail]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Slot and port number of the Station-facing Bridge Port (SBP).
<i>agg_id</i>	Link aggregate ID of the of the group of Station-facing Bridge Ports (SBP).
<i>sbp</i>	Specifies a Station-facing Bridge Port ID.
<i>vsi_id</i>	The VSI ID that uniquely identifies the VSI in the Data Centre Network (DCN) in 32 digit format.
<i>mac_address</i>	The MAC address of the VLANs for the VSI.
<i>vlan_id</i>	The VLAN ID of the VLANs for the VSI.
<i>group_id</i>	The group ID of the VLANs for the VSI. <i>This parameter is not supported in the current release.</i>
<b>detail</b>	Displays additional detail about the VSI information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This show command has three layers of options that can be entered to narrow the scope of display. The first layer consists of the following options:
  - *slot/port*: to get information related to a specific port.
  - *sbp* or *vsi\_id* or *mac\_address*: to get information related to a specific SBP ID, VSI ID, or MAC address
  - no option: to get information related to all ports.
- For the second layer of information detail, some specific filter option can be entered after the first layer option such as *vlan*.
- For the third layer of information detail, the **detail** keyword can be specified for a more detailed display. When detail option is specified, extensive information of VSI is displayed in paragraph format. A proper filter option must be used to get exact data.

## Examples

```
-> show evb vsi-db-table
```

Port	SBP	Vsi Id	GID	MAC	VID	TLV Type
0/1/1	0	11111111-1111-1111-1111-111111111111	-	-	111	ASSOC(3)
0/1/2	42	11111111-1111-1111-1111-111111111150	-	-	150	ASSOC(3)
0/1/2	42	11111111-1111-1111-1111-111111111150	-	-	200	ASSOC(3)
0/1/2	42	11111111-1111-1111-1111-111111111150	-	-	300	ASSOC(3)
0/1/3	84	11111111-1111-1111-1111-111111111157	-	-	157	ASSOC(3)

```
-> show evb vsi-db-table 1/1 detail
```

```
port: 0/1/1
sbp port: 10
VSI Mgr ID: 6bd3:2344:cb34:9889:4823:2343:3435:2352
VSI Type: 83db20
VSI Type Version: 1a
VSI ID Type: UUID
VSI ID: 44444444-2222-2222-2222-666666666666
VDP Operation Command: pre-associate
VDP Machine State: pre-associate
Most recent KEEP indicator: FALSE
Most recent HARD indicator: FALSE
Operation Reason: Success
Time Since Create (sec): 2394234.23
MAC/VLAN Format: Basic
No. of VDP Command Succeeded: 12
No. of VDP Command Failed: 0
No. of VDP Command Reverted: 0
Counter Discontinuity (sec): 324.33
No. of Filter Info Entries: 2
```

### output definitions

<b>port</b>	Specifies chassis and port number in <b>chassis/slot/port [-port1]</b> format.
<b>sbp port</b>	The assigned SBP port number
<b>VSI Mgr ID</b>	Specifies the VSI Manager ID with the specific VSI type and instance.
<b>VSI Type</b>	Specifies the VSI Type ID, an integer value that identifies the pre-configured set of controls and attributes that are associated with a group of VSIs.
<b>VSI Type Version</b>	VSI Type Version is a specific version number of the VSI Type. Specifies the VSI Type Version in the VSI Manager Database to denote and store multiple versions of a given VSI Type.
<b>VSI ID Type</b>	Specifies the VSI ID Type for the VSI ID in the Data Centre Network (DCN).
<b>VSI ID</b>	The VSI ID that uniquely identifies the VSI in the DCN is of 16 octet string length.
<b>Time Since Create (sec)</b>	Specifies the time since creation of EVB VSI association in seconds.
<b>VDP Operation Command</b>	Specifies the type of VDP TLV. Valid options are - <b>Pre-Associate</b> , <b>Pre-Associate-With-Resource-Reservation</b> , <b>Associate</b> , or <b>De-Associate</b> .

*output definitions (continued)*

---

<b>Most recent KEEP indicator</b>	The most recent value of the KEEP indicator obtained from VDP protocol exchange.
<b>Most recent HARD indicator</b>	The most recent value of the HARD indicator obtained from VDP protocol exchange.
<b>Operation Reason</b>	Indicates the outcome of a request - <b>Success, Invalid Format, Insufficient Resources, Failure.</b>
<b>Time Since Create (sec)</b>	Specifies the time since creation of the
<b>MAC/VLAN Format</b>	The most recent KEEP indicator from the VDP exchange.
<b>ECP max-retry</b>	The most recent HARD indicator from the VDP exchange.
<b>VDP resource-wait-delay (sec)</b>	Specifies the value set for the VDP resource-wait-delay timer at the EVB Bridge.
<b>VDP keep-alive-timeout (sec)</b>	Specifies how long an EVB station waits for a response from the EVB Bridge. Indicates a time that EVB station waits for the Keep Alive VDP packet from the EVB Station. If the timer expires, the corresponding VSI entry is treated as <b>De-Association.</b>
<b>No. of VDP Command Succeeded</b>	Number of successful VDP commands since creation.
<b>No. of VDP Command Failed</b>	Number of failed VDP commands since creation.
<b>No. of VDP Command Reverted</b>	Number of reverted VDP commands since creation.
<b>Counter Discontinuity (sec)</b>	Time since the last counter discontinuity.
<b>No. of Filter Info Entries</b>	Number of filter information entries in the VDP TLV.

## show evb vsi-manager

Displays the slot, port, Station-facing Bridge Port and VSI ID based on the VSI database filtering option.

**show evb vsi-manager** [*manager\_id* | **vsi-type** *vsi\_type*]

---

### Syntax Definitions

*manager\_id* Specifies the VSI manager ID to get the configuration information.  
*vsi\_type* Specifies the VSI type assigned to the VSI manager.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

### Examples

-> show evb vsi-manager

VSI Manager	Type	Ver	VSI ID	port	SBP
xxxxx	xx	xx	xxxxx	1/1	10
xxxxx	xx	xx	xxxxx	1/5	20

#### *output definitions*

---

<b>VSI Manager</b>	VSI Manager ID.
<b>Type</b>	VSI Type ID.
<b>Ver</b>	VSI Type Version.
<b>VSI ID</b>	The VSI ID stored in the table VSI DB table that contains database of the active Virtual Station Interfaces.
<b>port</b>	Specifies the slot and port number.
<b>SBP</b>	Specifies the SBP or Virtual Port Number information.

---

### Release History

Release 7.3.1; command introduced.

## Related Commands

[show evb](#)

Displays the EVB port and its port bridging type.

[show evb vsi-db-table](#)

Displays the different configuration settings stored in the Virtual Station Interface (VSI) database.

## MIB Objects

```
ieee8021BridgeEvbVSIDBTable  
  ieee8021BridgeEvbVSIgrID  
  ieee8021BridgeEvbVSIType  
  ieee8021BridgeEvbVSITypeVersion  
  ieee8021BridgeEvbVSIID  
  ieee8021BridgeEvbVSIPortNumber
```

---

## show evb sbp-config

Displays the Virtual Station Interface (VSI) to Station-facing Bridge Port (SBP) mapping information.

**show evb sbp-config** *chassis/slot/port* | **linkagg** *agg\_id*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Slot and port number of the EVB port.
<i>agg_id</i>	Link aggregate ID of the of the group of the EVB port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The *slot/port* and *agg\_id* parameter values specify the port number or link aggregate ID number to display the EVB CDCP status. If no port number is specified, then the mapping for all ports is displayed.

### Examples

```
-> show evb sbp-config
```

port	sbp	manual mode	resource wait delay	reinit keep alive	tout keep alive
1/1	10	enabled	10.48	10.48	11.6
1/1	20	enabled	10.48	10.48	11.6
1/2	33	enabled	10.48	10.48	11.6
1/3	40	enabled	10.48	10.48	11.6

```
-> show evb sbp-config port linkagg 1
```

port	SBP	manual mode	resource wait delay (usec)	reinit keep alive (usec)	tout keep alive (usec)
0/1	61472	disabled	10485760	10485760	17448960
0/1	61473	disabled	10485760	10485760	17448960

### output definitions

---

<b>port</b>	Specifies the slot and port number of the EVB port.
<b>sbp</b>	Specifies the SBP ID.
<b>manual mode</b>	Specifies whether manual mode is <b>enabled</b> or <b>disabled</b> .
<b>resource wait delay</b>	Specifies the configured resource wait delay value in seconds.

*output definitions*

---

<b>reinit keep alive</b>	Specifies the configured reinit keep alive value in seconds.
<b>tout keep alive</b>	Specifies the configured keep alive timeout value in seconds.

---

**Release History**

Release 7.3.1; command introduced.

**Related Commands**

```

---

## show evb cdcp-status

Displays the S-channel discovery and configuration protocol (CDCP) status of Uplink Access Ports (UAP).

**show evb cdcp-status** *chassis/slot/port*]

---

### Syntax Definitions

*chassis*                                      The chassis identifier.  
*slot/port*                                      Slot and port number of the Uplink Access Ports.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The *slot/port* parameter specifies the port number to display the EVB CDCP status. If no port number is specified, then the EVB CDCP status is displayed for all the related ports.

### Examples

-> show evb cdcp-status

Admin	CDCP State		No. of S-channel		S-VLAN allocated		
Port	state	local	remote	Max No.	operational	lowest	highest
1/1	enable	running	enabled	55	20	1001	1020
1/2	enable	down	disabled	55	10	1001	1010

### output definitions

---

<b>Admin Port</b>	Slot and port number of UAP.
<b>Admin port state</b>	Administrative status of CDCP of UAP - <b>enable</b> or <b>disable</b> .
<b>CDCP State - local</b>	Local running state of CDCP - <b>running</b> or <b>down</b> .
<b>CDCP State - remote</b>	Remote state for S-channel - <b>enabled</b> or <b>disabled</b> .
<b>No. of S-channel - Max No.</b>	Number of S-channels supported by the bridge.
<b>No. of S-channel - operational</b>	Number of S-channels that can be used.
<b>S-VLAN allocated - lowest</b>	The lowest S-VLAN available for assignment by CDCP.
<b>S-VLAN allocated - highest</b>	The highest S-VLAN available for assignment by CDCP.

---

```

---

## show evb s-channel

Displays the S-Channel information.

**show evb s-channel** *chassis/slot/port*]

---

### Syntax Definitions

*chassis*                      The chassis identifier.  
*slot/port*                      Slot and port number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The *slot/port* parameter specifies the port number to display the S-channel configuration. If no port number is specified, then the S-channel configuration is displayed for all the related ports.

### Examples

```
> show evb s-channel
```

Port	S-Ch Id	S-VLAN	SBP
1/1	1	1	20
1/1	2	1002	21
1/2	1	1	200

#### *output definitions*

---

<b>Port</b>	Specifies the slot and port number.
<b>S-Ch ID</b>	Specifies the S-Channel ID.
<b>S-VLAN</b>	Specifies the S-VLAN ID.
<b>SBP</b>	Specifies the Station-facing Bridge Port (SBP) number.

---

### Release History

Release 7.3.1; command introduced.

## Related Commands

### [show evb cdcg-status](#)

Displays the S-channel Discovery and Configuration Protocol (CDCP) status of Uplink Access Ports (UAP).

## MIB Objects

```

---

## show evb ecp-status

Displays the Edge Control Protocol (ECP) status.

**show evb ecp-status** *chassis/slot/port*]

---

### Syntax Definitions

*chassis*                                    The chassis identifier.  
*slot/port*                                   Slot and port number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The *slot/port* parameter specifies the port number to display the ECP status. If no port number is specified, then the ECP status is displayed for all the related ports.

### Examples

-> show evb ecp-status

Port	SBP	ACK Timer (msec)	MAX Retry	TX Pkt Counter	TX Retry Counter	TX Fail Counter	Rx Pkt Counter
1/1	10	163.84	3	4	0	0	4
1/1	20	163.84	3	4	0	0	4
1/2	300	163.84	3	5	0	0	5

-> show evb ecp-status 1/2

Port	SBP	ACK Timer (msec)	MAX Retry	TX Pkt Counter	TX Retry Counter	TX Fail Counter	RX Pkt Counter
0/1/2	300	163.84	3	5	0	0	5

### output definitions

---

<b>Port</b>	Slot and port number of the EVB port.
<b>SBP</b>	ECP port number which is same as SBP number.
<b>ACK Timer</b>	Operational ECP ACK timer in milliseconds.
<b>MAX Retry</b>	Maximum number of retries to receive ACK messages.
<b>TX Pkt Counter</b>	Number of ECP frames transmitted since ECP was instantiated.
<b>TX Retry Counter</b>	Number of times ECP re-tried transmission since ECP was instantiated.

*output definitions*

---

<b>TX Fail Counter</b>	Number of times ECP failed to successfully deliver a frame since ECP was instantiated.
<b>RX Pkt Counter</b>	Number of ECP frames received since ECP was instantiated.

---

**Release History**

Release 7.3.1; command introduced.

**Related Commands**

# 43 FIP Snooping Commands

The OmniSwitch implementation of Fibre Channel over Ethernet (FCoE) Initiation Protocol (FIP) snooping supports the FCoE technology used to tunnel Fibre Channel (FC) frames within Ethernet MAC frames. When the FCoE and FIP snooping functionality is enabled, the OmniSwitch serves as an FCoE transit switch. In this role, the OmniSwitch implementation of Data Center Bridging (DCB) is also used to provide the lossless Ethernet network required to support FCoE.

This implementation of FIP snooping ensures the security of the FCoE network and maintains a virtual point-to-point network connection between FCoE Nodes (ENodes) and FCoE Forwarder (FCF) devices. In addition, FIP snooping is also required to support OmniSwitch FCoE/FC gateway functionality that allows the switch to provide FCoE forwarding services between an FCoE network and a native FC storage area network (SAN).

- An OmniSwitch FCoE transit switch is placed between ENodes (servers or other bridges) and an FCF or an OmniSwitch FCoE/FC gateway to extend the reach of the FCoE network without extending the physical FC connections.
- An OmniSwitch FCoE/FC gateway runs FIP snooping on the 10G Ethernet FCoE ports that connect to an FCoE network. On the same switch, FC ports connect to native FC switches or nodes. Traffic is transmitted between the FCoE network and the FC SAN through the gateway switch.

This chapter provides information about configuring FCoE and FIP global and port parameters through the Command Line Interface (CLI). See [Chapter 44, “FCoE/FC Gateway Commands,”](#) for more information about configuring OmniSwitch FCoE/FC gateway functionality.

MIB information for the FCoE and FIP snooping commands is as follows:

*Filename:* ALCATEL-IND1-FIPS-MIB.mib  
*Module:* alcatelIND1FipsMIB

The FCoE and FIP Snooping commands are listed here:

<b>Global commands</b>	<b><a href="#">fcoe fip-snooping</a></b> <b><a href="#">fcoe address-mode</a></b> <b><a href="#">fcoe priority</a></b> <b><a href="#">fcoe priority-protection</a></b> <b><a href="#">fcoe priority-protection action</a></b> <b><a href="#">fcoe filtering-resource trap-threshold</a></b> <b><a href="#">fcoe house-keeping-time-period</a></b>
<b>VLAN and Port commands</b>	<b><a href="#">fcoe vlan</a></b> <b><a href="#">fcoe fcf mac</a></b> <b><a href="#">fcoe fc-map</a></b> <b><a href="#">fcoe discovery-advertisement</a></b> <b><a href="#">fcoe role</a></b>

----------------------------	---

---

## fcoe fip-snooping

Enables or disables Fibre Channel Initiation Protocol (FIP) snooping on the switch. FIP Snooping is enabled to allow the OmniSwitch to serve as an FCoE transit switch.

**fcoe fip-snooping admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables FIP Snooping.
<b>disable</b>	Disables FIP Snooping.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

When FIP Snooping is enabled, traffic with an Ethertype of FCoE is dropped on all switch VLANs and ports that are not configured as FCoE VLANs and ports.

### Examples

```
-> fcoe fip-snooping admin-state enable
-> fcoe fip-snooping admin-state disable
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

<b>show fcoe</b>	Displays the FCoE and FIP snooping status and configuration for the switch.
------------------	---

### MIB Objects

```
alaFipsConfig
  alaFipsConfigFIPSAdmin
```

---

## fcoe address-mode

Configures the FCoE addressing mode. This mode determines whether a server-provided MAC address (SPMA) or a fabric-provided MAC address (FPMA) is assigned to virtual FCoE entities.

```
fcoe address-mode {spma | fpma}
```

---

### Syntax Definitions

**spma** Selects the SPMA address mode.  
**fpma** Selects the FPMA address mode.

### Defaults

parameter	default
spma   fpma	FPMA

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The FCoE Node (ENode) and the FCoE Forwarder (FCF) must use the same addressing mode to establish virtual links between the ENode and FCF. Configure the global OmniSwitch addressing mode to match the mode used by the ENode and FCF.
- When the FPMA mode is active, a MAC address is assigned by an FCF to a single ENode MAC. This MAC address is not assigned to any other ENode MAC in the same VLAN.
- When the SPMA mode is active, MAC addresses are assigned by the ENode server.
- To change the addressing mode selection, disable FIP Snooping for the switch then make the change and enable FIP Snooping again.

### Examples

```
-> fcoe address-mode spma  
-> fcoe address-mode fpma
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

**fcoe fip-snooping**

Enables or disables FIP Snooping on the switch

**show fcoe**

Displays the FCoE and FIP snooping status and configuration for the switch.

## MIB Objects

alaFipsConfig

alaFipsConfigAddressMode

---

## fcoe priority

Configures up to two global priority values that are designated as lossless for FCoE traffic.

**fcoe priority** {*priority*} [*priority*]

---

### Syntax Definitions

*priority*                                  A priority value between 0–7.

### Defaults

parameter	default
<i>priority</i>	3

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command overwrites the existing FCoE priority values used by the switch.
- If two priority values are configured but there is a need to change only one of the values, both priority values must be specified with this command. For example, if the current priority is set to 2 and 5, to change priority 2 to 3, specify both 3 and 5 as the priority values.
- Specify a priority value of 3 to set the priority back to the default value.
- The FCoE priority values are used when FCoE priority protection is enabled for the switch.
- In addition to enabling priority protection, a lossless DCB FCoE profile with the same FCoE priority values must be assigned to the FCoE interfaces.

### Examples

```
-> fcoe priority 2 5
-> fcoe priority 3 5
-> fcoe priority 3
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

<b>fcoe priority-protection</b>	Configures the status of priority protection for the switch.
<b>fcoe priority-protection action</b>	Configures the action taken when traffic is not FCoE or FIP.
<b>fcoe fip-snooping</b>	Enables or disables FIP Snooping on the switch
<b>show fcoe</b>	Displays the FCoE and FIP snooping status and configuration for the switch.

## MIB Objects

```
alaFipsConfig  
  alaFipsConfigPriorityOne  
  alaFipsConfigPriorityTwo
```

---

## fcoe priority-protection

Enables or disables priority protection.

```
fcoe priority-protection {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables priority protection for the switch.
<b>disable</b>	Disables priority protection for the switch.

### Defaults

By default, priority protection is disabled for the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When priority protection is enabled, only FCoE and FIP traffic that matches the FCoE lossless priority values is allowed. All other traffic is either marked or dropped, based on the priority protection action configured for the switch.
- This command applies only to the priority value that is specified using the [fcoe priority](#) command.
- The FCoE priority value is advertised to FCoE-enabled hosts using the Data Center Bridging Exchange (DCBx) protocol.

### Examples

```
-> fcoe priority-protection enable  
-> fcoe priority-protection disable
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

<b>fcoe priority</b>	Configures the lossless priority values for the switch.
<b>fcoe priority-protection action</b>	Determines whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value.
<b>fcoe fip-snooping</b>	Enables or disables FIP Snooping on the switch
<b>show fcoe</b>	Displays the FCoE and FIP snooping status and configuration for the switch.

## MIB Objects

```
alaFipsConfig  
  alaFipsConfigPrioProtection
```

---

## fcoe priority-protection action

Specifies whether non-FCoE and non-FIP traffic is dropped or marked with a lower priority value. This action is only valid when FCoE priority protection is enabled for the switch.

**fcoe priority-protection action** {**drop** | **remark** *priority*}

---

### Syntax Definitions

<b>drop</b>	All non-FCoE and non-FIP traffic is dropped.
<i>priority</i>	Specifies the priority value to use for remarking non-FCoE and non-FIP traffic.

### Defaults

By default, non-FCoE and non-FIP traffic is dropped when priority protection is enabled for the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When priority protection is enabled, only FCoE traffic that matches the protected priority values is allowed in the priority queues. All other traffic is either re-marked or dropped, based on the priority protection action configured for the switch.
- If the re-mark action is configured, traffic is marked with the specified priority value and forwarded on the switch.

### Examples

```
-> fcoe priority-protection action drop
-> fcoe priority-protection action remark 0
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

<b>fcoe priority</b>	Configures the lossless priority values for the switch.
<b>fcoe priority-protection</b>	Configures the status of priority protection for the switch
<b>fcoe fip-snooping</b>	Enables or disables FIP Snooping on the switch
<b>show fcoe</b>	Displays the FCoE and FIP snooping status and configuration for the switch.

## MIB Objects

```
alaFipsConfig  
  alaFipsConfigPriorityProtectionAction
```

---

## fcoe filtering-resource trap-threshold

Configures the percentage of filtering resources used as a trap threshold value. When this percentage is reached, a trap is generated by the switch.

**fcoe filtering-resource trap-threshold** *percentage*

---

### Syntax Definitions

*percentage*                      The percentage of filtering resources used.

### Defaults

By default, the filtering resource trap threshold percentage is set to 80%.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

To disable the generation of filtering resource traps, set the trap threshold value to “0”.

### Examples

```
-> fcoe filtering-resource trap-threshold 50
-> fcoe filtering-resource trap-threshold 0
```

### Release History

Release 7.3.2; command was introduced.

### Related Commands

[show fcoe](#)                      Displays the FCoE and FIP snooping status and configuration for the switch.

### MIB Objects

Notifications (Traps)  
    alaFipsResourceThresholdReached  
    alaFipsFilterResourceUsage

---

## **fcoe house-keeping-time-period**

Configures the amount of time the FCoE switch waits to receive keep alive messages from the ENode and FCF for a given FCoE session. When this time expires and no keep alive messages were received for any entity of the session, the session information is removed.

**fcoe house-keeping-time-period** *seconds*

---

### **Syntax Definitions**

*seconds*                      The keep alive wait time, in seconds.

### **Defaults**

By default, the housekeeping timer is set to 300 seconds.

### **Platforms Supported**

OmniSwitch 6900

### **Usage Guidelines**

To disable the housekeeping timer, set the timer value to “0”

### **Examples**

```
-> fcoe house-keeping-time-period 120
-> fcoe house-keeping-time-period 0
```

### **Release History**

Release 7.3.2; command was introduced.

### **Related Commands**

**show fcoe**                      Displays the FCoE and FIP snooping status and configuration for the switch.

### **MIB Objects**

```
alaFipsConfig
  alaFipsConfigHouseKeepingTimePeriod
```

---

## fcoe vlan

Configures an FCoE VLAN. This type of VLAN is used to deploy the OmniSwitch implementation of FIP snooping.

**fcoe vlan** *vlan\_id* [**admin-state** {**enable** | **disable**}] [**name** *description*]

**no fcoe vlan** *vlan\_id*

---

### Syntax Definitions

<i>vlan_id</i>	A numeric value that uniquely identifies an individual FCoE VLAN. The valid ID range is 2–4094.
<b>enable</b>	Enables the FCoE VLAN administrative status.
<b>disable</b>	Disables the FCoE VLAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the VLAN ID. Enclose the description in double quotes if it contains more than one word with a space in between.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>description</i>	<b>VLAN ID</b>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a FCoE VLAN from the switch configuration. All VLAN ports are detached before the VLAN is removed.
- Specify a VLAN ID that does not exist in the switch configuration, or the ID of a dynamically created MVRP VLAN.
- Only 802.1q-tagged FCoE ports and link aggregates can be members of FCoE VLANs.
- Configuring a FCoE VLAN as a default VLAN for a port or link aggregate is not allowed. All port associations are created by tagging FCoE ports with the FCoE VLAN ID.
- Configuring default VLAN 1 as an FCoE VLAN is not allowed.

- The following features are not supported on FCoE VLANs:
  - IGMP Snooping
  - IP interface
  - HA VLANs
  - SVLAN and CVLAN
  - Shortest Path Bridging (SPB)
  - MCLAG
  - UDP Relay, DHCP Snooping
  - Universal Network Profile (UNP)
- An OmniSwitch FCoE transit switch operates between an FCoE Node (ENode) and a FCoE Forwarder (FCF). Manual configuration of the FCoE VLAN is required along the transit switch path. However, the ENode and FCF may invoke FIP VLAN discovery to discover the FCoE VLANs within the transit path. If not, manual configuration of the FCoE VLANs may also be required on the appropriate ENodes and FCFs.

## Examples

```
-> fcoe vlan 100
-> no fcoe vlan 100
-> fcoe vlan 100 admin-state enable name fcoe-vlan1
-> fcoe vlan 100 admin-state enable
```

## Release History

Release 7.3.2; command introduced.

## Related Commands

<a href="#">fcoe fcf mac</a>	Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN.
<a href="#">fcoe fip-snooping</a>	Enables or disables FIP Snooping on the switch
<a href="#">show vlan</a>	Displays the VLAN configuration for the switch.

## MIB Objects

```
alaFipsVlanTable
  alaFipsVlanId
  alaFipsVlanFCMap
  alaFipsVlanRowStatus
```

---

## fcoe fcf mac

Configures a static Fibre Channel Forwarder (FCF) MAC address for the specified FCoE VLAN. Virtual Fibre Channel (FC) links that traverse the lossless Ethernet network send FCoE frames to and from the FCF MAC address.

```
fcoe fcf mac mac_address vlan vlan_id
```

```
no fcoe fcf mac mac_address vlan vlan_id
```

---

### Syntax Definitions

<i>mac_address</i>	Enter the FCF MAC Address (for example, 00:00:39:59:f1:0c).
<i>vlan_id</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the FCF MAC address from the specified FCoE VLAN.
- The FCoE VLAN ID must already exist in the switch configuration.

### Examples

```
-> fcoe fcf mac 30:10:94:01:00:00 vlan 100  
-> no fcoe fcf 30:10:94:01:00:00
```

### Release History

Release 7.3.2; command introduced.

### Related Commands

<a href="#">fcoe vlan</a>	Configures an FCoE VLAN for the switch.
<a href="#">fcoe fip-snooping</a>	Enables or disables FIP Snooping on the switch
<a href="#">show vlan</a>	Displays the VLAN configuration for the switch.

### MIB Objects

```
alaFipsVlanTable  
  alaFipsVlanId  
  alaFipsVlanFCMap
```

---

## fcoe fc-map

Configures a static Fibre Channel Mapped Address Prefix (FC-MAP) for the specified FCoE VLAN. The FC-MAP is a 24-bit value used by the Fibre Channel Forwarder (FCF) to identify an individual fabric.

**fcoe fc-map** *prefix* **vlan** *vlan\_id*

**no fcoe fc-map** *prefix* **vlan** *vlan\_id*

---

### Syntax Definitions

<i>prefix</i>	Enter the FC-MAP prefix value. The valid range is 0EFC00–0EFCFF.
<i>vlan_id</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094.

### Defaults

By default, the FC-MAP is set to 0E:FC:00.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- On an OmniSwitch 6900, use the **no** form of this command to set the FC-MAP back to the default value (0E:FC:00) for the specified FCoE VLAN.
- The FCoE VLAN ID must already exist in the switch configuration.
- The configured FC-MAP value assigned to an FCoE VLAN must match the FC-MAP value used by the FCF device. FCF advertisement packets that contain a different FC-MAP are not processed by the switch.
- When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FCF uses the FC-MAP value (upper 24 bits) combined with an FCID value (lower 24 bits) to generate a unique MAC address to identify an ENode VN\_Port for FCoE transactions.

### Examples

```
-> fcoe fc-map 0E:FC:04 vlan 30
-> no fcoe fc-map 0E:FC:04 vlan 30
```

### Release History

Release 7.3.2; command introduced.

**Related Commands**

<b>fcoe vlan</b>	Configures an FCoE VLAN for the switch.
<b>fcoe fip-snooping</b>	Enables or disables FIP Snooping on the switch
<b>show vlan</b>	Displays the VLAN configuration for the switch.

**MIB Objects**

```
alaFipsVlanTable  
  alaFipsVlanId  
  alaFipsVlanFCMap
```

---

## fcoe discovery-advertisement

Configures FIP discovery advertisement message parameters for the specified FCoE VLAN. These parameter values are advertised in both unicast and multicast advertisements.

**fcoe discovery-advertisement** *vlan* *vlan\_id*[-*vlan\_id2*] [**a-bit** {**enable** | **disable**}] [**fka-adv-period** *adv\_seconds*] [**priority** *priority*] [**uds-retries** *retries*]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
<b>enable</b>	Enables the available-for-login bit (A-bit) in the discovery advertisement message to indicate that the switch can accept fabric logins from ENodes.
<b>disable</b>	Disables the A-bit in the discovery advertisement message to indicate that the switch cannot accept fabric logins from ENodes.
<i>adv_seconds</i>	The discovery advertisement transmission interval and the number of FIP ENode keep alive packets expected. The valid range is 1–90 seconds.
<i>priority</i>	The priority value assigned to the switch, indicated in the priority descriptor of the discovery advertisement message. The valid range is 0–255 (0 = highest priority, 255 = lowest priority).
<i>retries</i>	The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down. The valid range is 0–10.

### Defaults

parameter	default
<b>a-bit</b> <i>enable</i>   <i>disable</i>	<b>enable</b>
<b>fka-adv-period</b> <i>adv_seconds</i>	<b>8</b>
<b>priority</b> <i>priority</i>	<b>128</b>
<b>uds-retries</b> <i>retries</i>	<b>0</b>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When the A-bit parameter is disabled, the switch will not process any new logins for the FCoE VLAN. However, there is no impact on existing VN\_Port sessions, which are allowed to continue.
- Transmitting unicast discovery solicitations helps to find out if the same FCF is reachable on some other port of the same FCoE VLAN.

## Examples

```
-> fcoe discovery-advertisement vlan 100 priority 10
-> fcoe discovery-advertisement uds-retries 3
-> no fcoe discovery-advertisement vlan 100
```

## Release History

Release 7.3.3; command introduced.

## Related Commands

[show fcoe discovery-advertisement](#)

Displays the discovery advertisement parameter values for the specified VLANs.

  alaFipsDiscAdvtAbit,
  alaFipsDiscAdvtFkaAdvPeriod,
  alaFipsDiscAdvtPriority,
  alaFipsDiscAdvtUdsRetries,
  alaFipsDiscAdvtRowStatus
```

---

## fcoe role

Configures the specified port or link aggregate as an FCoE interface and defines the role of the interface in the FCoE network.

**fcoe** {port *chassis/slot/port*[-*port2*] / linkagg *agg\_id*[-*agg\_id2*]} **role** {**edge** | **enode-only** | **fcf-only** | **mixed** | **trusted** | **ve**}

**no fcoe** {port *chassis/slot/port*[-*port2*] / linkagg *agg\_id*[-*agg\_id2*]}

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). FCoE is only supported on 10G or faster ports.
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>edge</b>	Port connects directly to an ENode for transmission of FCoE and FIP frames from the ENode to the FCF.
<b>enode-only</b>	Link between FCoE switches that carries traffic from ENode to FCF.
<b>fcf-only</b>	Link between FCoE switches that carries traffic from FCF to ENode.
<b>mixed</b>	Link between FCoE switches that carries traffic in both directions (from FCF to ENode or from ENode to FCF).
<b>trusted</b>	Trust the FCoE Edge port; traffic on this port is not filtered by FIP ACLs. This port role type is typically assigned to the switch FCoE port that connects to an Ethernet port on the FCF.
<b>ve</b>	Configures port as a virtual expansion port (VE_Port) that is associated with an E2E-tunnel session. A VE_Port emulates an E_Port in an FCoE network, providing connectivity between FC switches. VE_Ports discover FCFs.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to revert the FCoE port back to a regular switch port. Before doing so, however, delete any associations the port may have with an FCoE VLAN.
- To change the role of an FCoE port, first remove the FCoE configuration from the port, then configure FCoE and the new role again for that same port.
- FCoE is only supported on 10G or faster ports that are associated with an FCoE lossless DCB profile. In addition, DCBX must be enabled on the port with both PFC and ETS in an active state (either forced

or negotiated via DCBX). The DCB configuration is done separately using QoS port and profile commands.

- The maximum frame size for an FCoE port must be at least 2500 bytes to accommodate FCoE encapsulated frames, which are larger than the standard Ethernet frame size. In addition, make sure the FCoE port frame size is configured the same end-to-end.
- When configuring a link aggregate as an FCoE port, make sure the link aggregate ID number already exists in the switch configuration. Ports already configured as FCoE ports cannot be added to a link aggregate.
- FCoE ports must be manually assigned to a default VLAN and then tagged with the FCoE VLAN that will carry the FCoE and FIP frames on that port.
- The following features are not supported on FCoE ports:
  - Edge Virtual Bridging (EVB)
  - Learned Port Security (LPS)
  - Port Mirroring and Remote Port Mirroring
  - Shortest Path Bridging (SPB)
- Enabling FCoE on a Universal Network Profile (UNP) port is only supported to allow UNP dynamic assignment of a default VLAN for an FCoE port. Manual tagging of the FCoE UNP port with FCoE VLAN IDs is still required.
- FCoE VLANs may be dynamically learned through the transmission of MVRP join PDU, but any port associations with that VLAN must be manually configured.
- Assigning FCoE interfaces to different FCoE VLANs provides a method for configuring multiple FC fabrics through the same FCoE switch.

## Examples

```
-> fcoe port 1/1 role edge
-> fcoe port 1/1/1 role edge
-> fcoe port 2/1 role fcf-only
-> no fcoe port 2/1
```

House Keeping Time Period : 300
```

### *output definitions*

---

<b>FIP Snooping</b>	The administrative status of FIP snooping for the switch ( <b>Enable</b> or <b>Disable</b> ). Configured through the <b>fcoe fip-snooping</b> command.
<b>Address-mode</b>	Indicates whether a server-provided MAC address ( <b>SPMA</b> ) or a fabric-provided MAC address ( <b>FPMA</b> ) is assigned to virtual FCoE entities. Configured through the <b>fcoe address-mode</b> command.
<b>Priority 1</b>	One of two global lossless priority values for FCoE traffic. Configured through <b>fcoe priority</b> command.
<b>Priority 2</b>	Two of two global lossless priority values for FCoE traffic. Configured through <b>fcoe priority</b> command.

*output definitions (continued)*

---

<b>Priority Protection</b>	The status of priority protection for the switch ( <b>Enable</b> or <b>Disable</b> ). Configured through the <b>fcoe priority-protection</b> command.
<b>Priority Protection Action</b>	The action applied to traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value ( <b>Drop</b> or <b>Remark</b> ). Configured through the <b>fcoe priority-protection action</b> command.
<b>Re-mark Priority</b>	The priority value to use for marking traffic that does not match the FCoE/FIP Ethertype and configured FCoE priority value. This value is only applied when the priority protection action is set to <b>Remark</b> . Configured through the <b>fcoe priority-protection action</b> command.
<b>Total Filtering Resources</b>	The number of ACL entries available for filtering of FCoE traffic.
<b>Used Filtering Resources</b>	The number of ACL entries currently in use for filtering FCoE traffic.
<b>Trap threshold (%)</b>	The percentage of filtering resources used for FIP. When this percentage is reached, a trap is sent indicating the available and maximum percentage of filtering resources. Configured through the <b>fcoe filtering-resource trap-threshold</b> command.
<b>House Keeping Time Period</b>	The amount of time the FCoE switch will wait to receive keep alive messages from the ENode and FCF. When this amount of time expires, information for the specific FCoE session is removed. Configured through the <b>fcoe house-keeping-time-period</b> command

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

This command also shows the FCoE role assigned to the interface.

### Examples

```
-> show fcoe ports
  Ports      FCoE Role      Status
-----+-----+-----
  1/3        Edge Port      DISABLE
  1/4        Edge Port      DISABLE
  1/5        Edge Port      DISABLE
  1/6        Edge Port      DISABLE
  1/7        Edge Port      DISABLE
  1/11       Edge Port      DISABLE
  1/13       Edge Port      ENABLED
  1/14       Edge Port      ENABLED
  1/15       Edge Port      DISABLE
  1/19       FCF Port       DISABLE
  2/1        Edge Port      DISABLE
  2/8        Edge Port      DISABLE
  0/1        Mixed Port     DISABLE
  0/12       Mixed Port     ENABLED
  0/40       Mixed Port     DISABLE
  0/50       Mixed Port     ENABLED
```

#### *output definitions*

---

<b>Ports</b>	The slot/port or link aggregate ID of the FCoE interface. A “0” slot number indicates that the FCoE interface is a link aggregate.
<b>FCoE Role</b>	The designated role of the FCoE interface ( <b>Edge Port</b> , <b>ENode Port</b> , <b>FCF Port</b> , <b>Mixed Port</b> , or <b>Trusted Port</b> ).
<b>Status</b>	The operational status of the FCoE interface ( <b>ENABLE</b> or <b>DISABLE</b> ).

---

## Release History

Release 7.3.2; command was introduced.

## Related Commands

[fcoe role](#)

Configures a port or link aggregate as an FCoE interface.

[show fcoe](#)

Displays the FCoE and FIP status and configuration for the switch.

## MIB Objects

AlaFipsIntfTable

```
alaFipsIntfIfIndex  
alaFipsIntfOperStatus  
alaFipsIntfPortRole  
alaFipsIntfRowStatus
```

---

## show fcoe sessions

Displays the FIP snooping session status and configuration for the switch.

```
show fcoe sessions [[fips | npiv-proxy | r-npiv] [port chassis/slot/port] / vlan vlan_id | linkagg agg_id] |
[e-tunnel [tunnel_id]]
```

---

### Syntax Definitions

<b>fips</b>	Displays FIP snooping sessions on FCoE ports.
<b>npiv-proxy</b>	Displays N_Port proxy (NPIV) sessions between ENode and FC switch.
<b>r-npiv</b>	Displays F_Port proxy (R- NPIV) sessions between the HBA and the gateway switch.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>vlan_id</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094.
<i>agg_id</i>	The link aggregate ID number.
<i>tunnel_id</i>	Displays E2E tunnel sessions between two E_Ports on different FC switches. Optionally enter a tunnel ID to display information for a specific tunnel.

### Defaults

By default, all FCoE sessions are displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** or **linkagg** parameter to display sessions for a specific FCoE port or link aggregate ID.
- Use the **vlan** parameter to display the sessions for a specific FCoE VLAN ID.
- The output displays for this command include FIP snooping, N\_Port proxy (NPIV), F\_Port proxy (reverse-NPIV), and E2E tunnel sessions. However, the N\_Port proxy, F\_Port proxy, and E2E tunnel sessions are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see [Chapter 44, “FCoE/FC Gateway Commands”](#) for more information).

**output definitions**

<b>PORT</b>	The FCoE port or link aggregate ID for a FIP snooping session. A "0" slot number indicates that the FCoE interface is a link aggregate. Configured through the <b>fcoe role</b> command.
<b>ENODE MAC</b>	The MAC address of the ENode for this session.
<b>VN_PORT MAC</b>	The MAC address of the virtual node (VN) port for this session.
<b>FCF MAC</b>	The MAC address of the FCoE Forwarder (FCF) for this session.

*output definitions*

---

<b>VLAN</b>	The FCoE VLAN used for this session. Configured through the <b>fcoe vlan</b> command.
<b>STATUS</b>	The operational status of this session.
<b>IN-PORT</b>	The FCoE port or link aggregate ID for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the <b>fcoe role</b> command.
<b>OUT-PORT</b>	The FC port for an N_Port proxy (NPIV) or F_Port proxy (R-NPIV) session. Configured through the <b>fibre-channel port mode</b> command.
<b>VSAN</b>	The VSAN ID mapped to the FCoE VLAN ID for an F_Port proxy (R-NPIV) session. Configured through the <b>fibre-channel vsan</b> command.
<b>FCID</b>	The FC port ID (also referred to as N_Port ID) received after successful login for an F_Port proxy (R-NPIV) session.
<b>TUNNEL-ID</b>	The E2E tunnel ID associated with the session. Configured through the <b>fcoe e-tunnel</b> command.
<b>PORT1, PORT2</b>	The FCoE port (in VE_Port role) and/or FC port (in TE_Port mode) for this session. The FCoE port rule is configured through the <b>fcoe role</b> command. The FC port mode is configured through the <b>fibre-channel port mode</b> command.
<b>PAIR MODE</b>	The type of E2E tunnel ( <b>TE to VE</b> or <b>TE to TE</b> ).

---

**Release History**

Release 7.3.2; command introduced.

Release 7.3.3; fields added to display NPIV, reverse-NPIV, and E2E tunnel sessions.

## show fcoe enode

Displays FCoE Node (ENode) information for FIP Snooping sessions associated with the switch.

**show fcoe enode** [*mac\_address*]

---

### Syntax Definitions

*mac\_address* Enter an ENode MAC Address (for example, 00:00:39:59:f1:0c).

### Defaults

By default, information is displayed for all ENodes associated with the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Specify an ENode MAC address to display more detailed information about a specific ENode.

### Examples

```
-> show fcoe enode
Port   Enode MAC           VLAN   Sessions
-----+-----+-----+-----
1/1    00:10:00:00:00:02   100    2
2/1    00:00:a0:bb:00:01   200    1
```

```
->show fcoe enode 00:10:00:00:00:02
Enode MAC: 00:10:00:00:00:02   Port : 1/1
```

```

0E:FC:00:00:00:09   0E:AE:00:00:00:01   200   Thu Feb 14 07:12:22 2013
```

### output definitions

---

<b>Port</b>	The slot/port or link aggregate ID of the FCoE interface that is connected to the FCoE Node (ENode). A “0” slot number indicates that the FCoE interface is a link aggregate.
<b>Enode MAC</b>	The MAC address of the ENode connected to the FCoE interface.
<b>VLAN</b>	The FCoE VLAN ID.
<b>Sessions</b>	The number of sessions associated with the ENode MAC.
<b>VN-Port-MAC</b>	The MAC address of the virtual node port (VN_port) for this session.
<b>FCF-MAC</b>	The MAC address of the FCoE Forwarder (FCF).
<b>Login time</b>	The date and time the ENode logged into the FCoE fabric.

---

## Release History

## Related Commands

### [show fcoe sessions](#)

Displays FCoE FIP snooping session status and configuration for the switch.

### [show fcoe fcf](#)

Displays FCoE Forwarder (FCF) information for the switch.

## MIB Objects

```
alaFipsSessionTable
  alaFipsSessionEnodeMAC
  alaFipsSessionVNMAC
  alaFipsSessionVlanId
  alaFipsSessionIfIndex
  alaFipsSessionFCFMAC
  alaFipsSessionLoginTime
```

---

## show fcoe fcf

Displays FCoE Forwarder (FCF) information for FIP Snooping sessions associated with the switch.

**show fcoe fcf** [*mac\_address*]

---

### Syntax Definitions

*mac\_address*                      Enter an FCF Address (for example, 00:00:39:59:f1:0c).

### Defaults

By default, information is displayed for all FCFs associated with the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Specify an FCF MAC address with this command to display more detailed information for a specific FCF.

### Examples

```
-> show fcoe fcf
      FCF-MAC          VLAN    Config    Sessions  A-bit    MaxFrmVer  Priority
-----+-----+-----+-----+-----+-----+-----
E8:E7:32:3F:FD:F0    46      Npiv      4          1         0           0
E8:E7:32:63:8B:B0    56      Dynamic   1          1         1          128
E8:E7:32:94:68:17    4000    Dynamic   0          1         0          128
E8:E7:32:94:68:E8    3000    Static    0          1         1           0
E8:E7:32:94:68:EE    4000    Static    0          1         1           0
```

```
-> show fcoe fcf E8:E7:32:3F:FD:F0
FCF : E8:E7:32:3F:FD:F0
```

```
      VLAN      VN-Port-MAC
-----+-----
46      0E:FC:00:01:00:03

46      0E:FC:00:01:00:82
46      0E:FC:00:01:00:81
```

### output definitions

---

<b>FCF-MAC</b>	The MAC address of the FCoE Forwarder (FCF).
<b>VLAN</b>	The FCoE VLAN ID.
<b>Config</b>	Whether the FCF MAC address was user-configured or learned through the FIP Snooping session for the given FCoE VLAN.
<b>Sessions</b>	The number of sessions associated with the FCF MAC for the given FCoE VLAN.
<b>A-bit</b>	Whether or not the available-for-login bit is set for this FCF.

*output definitions*

---

<b>MaxFrmVer</b>	Whether or not the maximum frame size was verified for this FCF.
<b>VN-Port-MAC</b>	The MAC address of the virtual node port (VN_Port) for this session. This address is comprised of the FCID that the FCF assigned to the port combined with the FC-MAP.

---

**Release History**

Release 7.3.2; command introduced.  
 Release 7.3.3; **A-bit** and **MaxFrmVer** fields added.

**Related Commands**

<a href="#">show fcoe sessions</a>	Displays FCoE FIP snooping session status and configuration for the switch.
<a href="#">show fcoe enode</a>	Displays FCoE Node (ENode) information for the switch.

**MIB Objects**

```

alaFipsFcfTable
  alaFipsFcfSessions
  alaFipsSessionFCFMAC
  alaFipsSessionVlanId
  alaFipsFcfConfigType
  alaFipsFcfAvailForLogin
  alaFipsFcfMaxFcoeFrmSizeVerified
  
```

---

## show fcoe fc-map

Displays the Fibre Channel Mapped Address Prefix (FC-MAP) for each FCoE VLAN.

**show fcoe fc-map**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

When the FCoE address mode is set to Fabric-Provided MAC Address (FPMA), the FC-MAP value is the required upper 24 bits of a MAC address that is assigned to a Virtual N\_Port (VN\_Port).

### Examples

```
-> show fcoe fc-map
  VLAN      FC-MAP
-----+-----
    10     0E:FC:00
   100     0E:FC:22
   200     0E:FC:23
   300     0E:FC:23
```

### Release History

Release 7.3.2; command introduced.

### Related Commands

<a href="#">fcoe vlan</a>	Configures an FCoE VLAN for the switch.
<a href="#">fcoe fc-map</a>	Configures the FC-MAP for and FCoE VLAN.
<a href="#">show vlan</a>	Displays the VLAN configuration for the switch.

```

---

## show fcoe discovery-advertisement

Displays the FIP discovery advertisement message parameter values for the specified FCoE VLAN.

**show fcoe discovery-advertisement** [**vlan** *vlan\_id*[-*vlan\_id2*]]

---

### Syntax Definitions

*vlan\_id*[-*vlan\_id2*]                      An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).

### Defaults

By default, the discovery advertisement parameters are displayed for all FCoE VLANs.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the *vlan\_id*[-*vlan\_id2*] parameter to display information for a specific FCoE VLAN or for a range of FCoE VLANs.

### Examples

```
-> show fcoe discovery-advertisement
VLAN  A-Bit   FKA Pd Priority  UDS-Retries
-----+-----+-----+-----+-----
46     ENABLE  8       128      3
56     ENABLE  8       128      3
76     ENABLE  8       128      3
3000  ENABLE  8       128      3
4000  ENABLE  8       128      3
```

```
VC_of_3-> show fcoe discovery-advertisement vlan 3000
  VLAN      A-Bit      FKA Period  Priority      UDS-Retries
-----+-----+-----+-----+-----
   3000    ENABLE          8           128           3
```

### output definitions

---

<b>VLAN</b>	The FCoE VLAN ID. Configured through the <b>fcoe vlan</b> command.
<b>A-Bit</b>	The status of the available-for-login bit (Enabled or Disabled). When enabled, indicates the switch can accept fabric logins from ENodes.
<b>FKA-PD</b>	The discovery advertisement transmission interval, in seconds.
<b>Priority</b>	The priority value assigned to the switch (0 = highest priority, 255 = lowest priority).
<b>UDS-Retries</b>	The number of times a unicast discovery solicitation is transmitted after a port on which an FCF MAC was learned goes down.

---

## Release History

Release 7.3.3; command introduced.

## Related Commands

[fcoe discovery-advertisement](#) Configures FIP discovery advertisement parameter values.

```

---

## show fcoe statistics

Displays both ENode and FCF generated statistics for FCoE interfaces or specific VLANs.

```
show fcoe statistics [enode | fcf] {interface | vlan [vlan_id[vlan_id2] | port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<b>enode</b>	Display statistics only for ENode traffic.
<b>fcf</b>	Display statistics only for FCF traffic.
<b>interface</b>	Display statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id[-vlan_id2]</i>	An existing FCoE VLAN ID. Use a hyphen to specify a range of FCoE VLAN IDs (10-25).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, FCF and ENode statistics are displayed for all FCoE interfaces and VLANs.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.
- The output displays for this command include FIP snooping, N\_Port proxy (NPV), and F\_Port proxy (reverse-NPV) statistics. However, the N\_Port proxy and F\_Port proxy statistics are only displayed on an OmniSwitch 6900 that is configured as an FCoE/FC gateway (see [Chapter 44, “FCoE/FC Gateway Commands”](#) for more information).

---

**Release History**

Release 7.3.2; command introduced.

Release 7.3.3; N\_Port proxy and F\_Port proxy statistics displayed only on an OmniSwitch 6900.

**Related Commands**

[clear fcoe statistics](#) Clears ENode and FCF statistics.

**MIB Objects**

alaFipsIntfEnodeStatsTable  
 alaFipsIntfFcfStatsTable  
 alaFipsVlanEnodeStatsTable  
 alaFipsVlanFcfStatsTable

---

## clear fcoe statistics

Clears ENode and FCF generated statistics on FCoE interfaces or specific VLANs.

**clear fcoe statistics** [**enode** | **fcf**] [**interface** | **vlan** [*vlan\_id*[*vlan\_id2*] | **port** *chassis/slot/port*[-*port2*] / **linkagg** *agg\_id*[-*agg\_id2*]]

---

### Syntax Definitions

<b>enode</b>	Clears statistics only for ENode traffic.
<b>fcf</b>	Clears statistics only for FCF traffic.
<b>interface</b>	Clears statistics on all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [ <i>vlan_id2</i> ]	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, statistics are cleared for all FCoE interfaces and VLANs.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** or **linkagg** parameters to clear the statistics for a specific FCoE port or link aggregate ID.
- Use the **vlan** parameter to clear the statistics for a specific FCoE VLAN ID.

### Examples

```
->clear fcoe statistics
->clear fcoe statistics interface
->clear fcoe statistics vlan
->clear fcoe statistics vlan 2
->clear fcoe statistics vlan 2-3
->clear fcoe statistics port 1/2
->clear fcoe statistics port 1/2-3
->clear fcoe statistics port 1/1/2
->clear fcoe statistics port 1/1/2-3
->clear fcoe statistics linkagg 2
->clear fcoe statistics linkagg 2-6

->clear fcoe statistics enode interface
->clear fcoe statistics enode vlan
```

```
->clear fcoe statistics enode vlan 2
->clear fcoe statistics enode vlan 2-3
->clear fcoe statistics enode port 1/2
->clear fcoe statistics enode port 1/2-3
->clear fcoe statistics enode port 1/1/2
->clear fcoe statistics enode port 1/1/2-3
->clear fcoe statistics enode linkagg 2
->clear fcoe statistics enode linkagg 2-6

->clear fcoe statistics fcf interface
->clear fcoe statistics fcf vlan
->clear fcoe statistics fcf vlan 2
->clear fcoe statistics fcf vlan 2-3
->clear fcoe statistics fcf port 1/2
->clear fcoe statistics fcf port 1/2-3
->clear fcoe statistics fcf port 1/1/2
->clear fcoe statistics fcf port 1/1/2-3
->clear fcoe statistics fcf linkagg 2
->clear fcoe statistics fcf linkagg 2-6
```

## Release History

# 44 FCoE/FC Gateway Commands

The OmniSwitch implementation of FCoE/FC gateway functionality allows the switch to transparently connect FCoE and FC nodes with an FC SAN across an FCoE (lossless Ethernet) network. To provide this type of connectivity, an OmniSwitch FCoE/FC gateway supports the following three modes of operation that are used to converge FC over Ethernet and FC-to-FC over Ethernet:

- **N\_Port Proxy mode**—allows ENodes in an FCoE network and FC switches in an FC SAN to communicate with each other. To an ENode the OmniSwitch gateway emulates an FCoE forwarder; to an FC switch the OmniSwitch gateway emulates an N\_Port ID Virtualization (NPIV) host.
- **F\_Port Proxy mode**—allows FC nodes to connect with FC switches and FCFs across an FCoE network. The OmniSwitch gateway forwards login requests from an FC node (N\_Port on a server or storage with an HBA) across Ethernet via an FCoE VLAN to an NPIV node or FCF. This mode is sometimes referred to as reverse-NPIV proxy (R-NPIV).
- **E\_Port Proxy mode**—allows FC switches to set up inter-switch link trunking between FC fabrics over an FCoE network. The OmniSwitch gateway provides an E\_Port to E\_Port (E2E) tunneling function that emulates a point-to-point FC link between E\_Ports on native FC switches.

The OmniSwitch FCoE/FC gateway sits at the entry point of an FC fabric, which is required to handle the login process for ENodes and FC nodes accessing the fabric through the gateway switch.

OmniSwitch FCoE/FC gateway operations are not automatically activated for the switch; there is no single command to enable or disable gateway functionality. Instead, the configuration of the following software components enables one or more of the supported gateway operations:

- **FIP snooping**—FCoE/FC gateway functionality requires an active FIP snooping configuration. FIP Snooping ensures the security of an FCoE network.
- **Virtual Storage Area Network (VSAN)**—an FC port is assigned to a VSAN to create an NP\_Port or F\_Port connection to an FC switch or node in that VSAN. Not required for E2E Tunnel configuration.
- **VSAN-to-FCoE VLAN mapping**—identifies the FCoE/FC gateway fabric for the ENode or FC node login process via the FCoE VLAN. Not required for E\_Port proxy (E2E Tunnel) configuration.
- **FC port mode**—the operational mode of the FC port determines the type of gateway functionality provided on that port. There are three modes supported: N\_Port proxy, F\_Port proxy, and E\_Port proxy.
- **FCoE port role**—an FCoE port serves as an E2E tunnel endpoint in an FCoE network only when the port is configured as a virtual E\_Port (VE\_Port). The role of other FCoE ports is configured based on the FIP snooping configuration for the gateway switch.

This chapter and the [Chapter 43, “FIP Snooping Commands,”](#) describe the command line interface (CLI) commands used to configure these components.

MIB information for the FCoE/FC gateway commands is as follows:

*Filename:* ALCATEL-IND1-FIPS-MIB.mib  
*Module:* alcatelIND1FipsMIB

The acronyms used in this chapter are defined here:

<b>CNA</b>	Converged Network Adapter
<b>CVL</b>	Clear Virtual Link
<b>E2E</b>	E_Port-to-E_Port Tunnel
<b>ELP</b>	Exchange Link Parameters
<b>ENode</b>	FCoE Node
<b>E_Port</b>	Expansion Port
<b>F_Port</b>	Fabric Port
<b>FC</b>	Fibre Channel
<b>FCF</b>	FCoE Forwarder
<b>FDISC</b>	Fabric Discovery
<b>FCID</b>	Fabric Port ID (same as N_Port ID).
<b>FCoE</b>	Fibre Channel over Ethernet
<b>FIP</b>	FCoE Initialization Protocol
<b>FLOGI</b>	Fabric Login
<b>FLOGO</b>	Fabric Logout
<b>HBA</b>	Host Bus Adapter
<b>ISL</b>	Inter-switch Link
<b>NPIV</b>	N_Port ID Virtualization
<b>N_Port</b>	Node Port
<b>NP_Port</b>	Proxy Node Port
<b>TE_Port</b>	Tunnel Expansion Port
<b>VE_Port</b>	Virtual E_Port
<b>VF_Port</b>	Virtual F_Port
<b>VN_Port</b>	Virtual N_Port
<b>VSAN</b>	Virtual Storage Area Network
<b>WWNN</b>	World Wide Node Name
<b>WWPN</b>	World Wide Port Name

The FCoE/FC gateway commands are listed here:

---

<b>Configuration commands</b>	<b>fibre-channel vsan</b> <b>fibre-channel port mode</b> <b>fibre-channel vsan members</b> <b>fcoe vsan-map</b> <b>fibre-channel npiv-proxy load-balance</b> <b>fibre-channel npiv-proxy load-balance static</b> <b>fcoe e-tunnel</b>

---

## fibre-channel vsan

Configures an OmniSwitch VSAN with the specified VSAN ID and an optional description. This type of VSAN is used to segment OmniSwitch Fibre Channel ports into a virtual FCoE/FC gateway fabric.

**Note.** The VSAN created with this command only applies to the local switch configuration. There is no correlation between an OmniSwitch VSAN and a VSAN created within a native FC SAN.

**fibre-channel vsan** {*vsan\_id*[-*vsan\_id2*]} [**admin-state** {**enable** | **disable**}] [**name** *description*]

**no fibre-channel vsan** {*vsan\_id*[-*vsan\_id2*]}

### Syntax Definitions

<i>vsan_id</i> [- <i>vsan_id2</i> ]	A numeric value that will uniquely identify the VSAN. Use a hyphen to specify a range of VSAN IDs (for example, 100-105). The valid range is 2–4094).
<b>enable</b>	Enable the VSAN administrative status.
<b>disable</b>	Disable the VSAN administrative status.
<i>description</i>	An alphanumeric string. Optional name description for the VSAN ID.

### Defaults

By default, VSAN 1 is created on the switch and all unassigned FC ports are assigned to VSAN 1.

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<b>name</b> <i>description</i>	<b>VSAN ID</b>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to delete a VSAN from the configuration.
- When a VSAN is administratively disabled, all sessions established over that VSAN are cleared and the switch stops sending periodic FIP multicast discovery advertisement messages for the corresponding FCoE VLAN.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.
- Only FC switch ports can be assigned to a VSAN.
- Assigning multiple FC ports to the same VSAN is allowed, but an FC port can only belong to one VSAN.

- Configuring N\_Port and F\_Port proxy functionality requires mapping a VSAN to an FCoE VLAN. Note that only one VSAN is mapped to one FCoE VLAN (one-to-one) at any given time. This mapping defines a single traffic path through the gateway switch.
- If an FCoE VLAN is not mapped to a VSAN, then the FCoE VLAN participates only in the FIP snooping process.

## Examples

```
-> fibre-channel vsan 200 name "Fabric A"  
-> fibre-channel vsan 100-105 admin-state disable  
-> no fibre-channel vsan 200
```

## Release History

Release 7.3.3; command introduced.

## Related Commands

<a href="#">fibre-channel vsan members</a>	Assigns FC switch ports to a VSAN.

```

---

## fibre-channel port mode

Configures the port type and operational mode for an eligible FC port. The port type is only set to Fibre Channel and the specified operational mode determines the type of gateway functionality provided on that port. There are three modes supported: N\_Port proxy, F\_Port proxy, and E\_Port proxy.

**fibre-channel port** *chassis/slot/port[-port2]* **mode** {np | f | te} [**bb-sc-n** *buffer\_num*]

**no fibre-channel port** *chassis/slot/port[-port2]*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). Only ports on an OmniSwitch 6900 OS-XNI-U12E module with an SFP-FC-SR transceiver are eligible for this command.
<b>np</b>	Activates N_Port proxy functionality on the port. In this mode the port serves as a proxy node port (NP_Port) that aggregates N_Port transactions between FCoE devices and FC switches.
<b>f</b>	Activates F_Port proxy functionality on the port. In this mode the port operates as a fabric port (F_Port), which connects to an N_Port in a point-to-point link between FC devices.
<b>te</b>	Activates E_Port functionality on the port. In this mode, the port operates as a tunnel expansion port (TE_Port) that connects to an E_Port on an FC switch. TE_Ports allow E_Ports to connect across an FCoE network as part of an inter-switch link (ISL) tunnel that is used to expand the native FC fabric over Ethernet.
<i>buffer_num</i>	The buffer-to-buffer state change (BB_SC) number. FC ports exchange BB_SC primitives after 2 <sup>BB_SC</sup> frames. These primitives are used to recalculate buffer credits as part of a buffer-to-buffer flow control function between FC switch connections. The valid range is 0–15.

### Defaults

By default, no operational mode is configured for the FC ports and the port type is set to Ethernet.

parameter	default
<b>bb-sc-n</b> <i>buffer_num</i>	<b>0</b>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the operational mode configuration from the FC port. The port type reverts back to Ethernet.
- To change the FC mode for the port, use the **no** form of this command to remove the current mode configuration then configure the FC mode again for the same port.

- Changing the **bb-sc-n** parameter value can be changed at any time (removing the FC mode configuration is not required to change this parameter value).
- Make sure the **bb-sc-n** parameter value is the same on both ends of the connection between the OmniSwitch FCoE/FC gateway and an FC switch. If the value is different on each end of the connection then the greater value is used. However, if this value is set to zero for one of the ports on the connection, then the buffer-to-buffer state change function is disabled.
- FC ports do not participate in Ethernet features, such as a link aggregates, a virtual fabric links (VFLs) in virtual chassis (VC) configurations, standard VLANs, or FCoE VLANs.
- To ensure end-to-end lossless connectivity through the gateway switch, assign a PAUSE-enabled DCB profile to each FC port. For more information, see Chapter 5, “Configuring an FCoE Gateway”, in the *OmniSwitch AOS Release 8 Data Center Switching Guide*.

## Examples

```
-> fibre-channel port 2/1 mode np
-> fibre-channel port 2/3 mode f
-> fibre-channel port 2/5 mode te
-> no fibre-channel port 2/5
```

To change the FC port mode:

```
-> no fibre-channel port 2/1
-> fibre-channel port 2/1 f
```

To change the **bb-sc-n** parameter value:

```
-> fibre-channel port 2/1 bb-sc-n 3
```

## Release History

Release 7.3.3; command introduced.

---

## fibre-channel vsan members

Configures the VSAN assignment for the specified FC port.

**fibre-channel vsan** *vsan\_id* **members port** *chassis/slot/port[-port2]*

**no fibre-channel vsan** *vsan\_id* **members port** *chassis/slot/port[-port2]*

---

### Syntax Definitions

<i>vsan_id</i>	An existing VSAN ID number.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all FC ports are assigned to VSAN 1.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the association between the specified FC port and VSAN.
- When an NP\_Port is removed from a VSAN, a FIP CVL is generated for all the VN\_Ports that are logged in through that NP\_Port and an FC LOGO is sent on the FC port. An FC LOGO is also sent for any R-NPIV sessions that exist when the CVL is generated.
- When an F\_Port (used for R-NPIV) is removed from a VSAN, then FC LOGO is sent to the host and also to the FCF.
- When an FC port is moved from VSAN 1 to another VSAN, traffic loss will occur for all existing sessions. Moving FC ports between other VSANs (for example, between VSAN 2 and 3) is not allowed.
- Multiple FC ports can belong to the same VSAN, but an FC port can belong to only one VSAN. In other words, it is not possible to tag FC ports with multiple VSANs.
- When a VSAN is mapped to an FCoE VLAN and an active FC port is assigned to that VSAN, the FC mode configured for that port determines the FCoE/FC gateway functionality provided. For example, if the FC port mode is set to operate as:
  - an NP\_Port, then NPIV proxy functionality is automatically enabled.
  - an F\_Port, then the R-NPIV functionality is automatically enabled.
  - a TE\_Port and an FCoE port is set to operate as a virtual E\_Port (VE\_Port), then E2E tunneling functionality is automatically enabled.

- When more than one NP\_Port is associated with the same VSAN, the OmniSwitch will load balance ENode FLOGI requests across the NP\_Ports for that VSAN. By default, the NP\_Port with the lowest number of logins provided is selected. If all the NP\_Ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

## Examples

```
-> fibre-channel vsan 10 members port 2/1
-> fibre-channel vsan 10 members port 2/1-3
-> no fibre-channel vsan 10 members port 2/1-3
```

## Release History

Release 7.3.3; command introduced.

```

---

## fcoe vsan-map

Maps an FC VSAN to an FCoE VLAN. This mapping is required to activate the processing of specific FCoE ENode traffic traveling to and from the designated virtual FC fabric through the FCoE/FC gateway OmniSwitch.

```
fcoe vsan-map vsan vsan_id vlan vlan_id
```

```
no fcoe vsan-map vsan vsan_id vlan vlan_id
```

---

### Syntax Definitions

<i>vsan_id</i>	An existing VSAN ID number.
<i>vlan_id</i>	An existing FCoE VLAN ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the VSAN-to-FCoE VLAN mapping.
- When a mapping is removed, all sessions associated with the FCoE VLAN are cleared.
- Only one VSAN is mapped to one FCoE VLAN.
- The FCoE/FC gateway does not participate in FCoE discovery mechanisms for FCoE VLANs not mapped to a VSAN.
- If an FCoE VLAN is not mapped to a VSAN, then only FIP snooping functionality is applied to that VLAN.

### Examples

```
-> fcoe vsan-map vsan 10 vlan 100  
-> no fcoe vsan-map vsan 10 vlan 100
```

### Release History

Release 7.3.3; command introduced.

  alaFipsVsanVlanMapVlanNumber  
  alaFipsVsanVlanMapRowStatus
```

---

## fibre-channel npiv-proxy load-balance

Configures the dynamic load balancing method that is applied to ENode FLOGI requests when more than one FC port is associated with the same VSAN. Load balancing is not applied to FDISC requests.

**fibre-channel npiv-proxy load-balance static {default | dynamic-reorder | enode-based}**

---

### Syntax Definitions

<b>default</b>	Selects the default load balancing method.
<b>dynamic-reorder</b>	Ensures that all sessions are load balanced evenly at any given time.
<b>enode-based</b>	Selects the FC for the new session based on the ENode MAC address.

### Defaults

By default, the FC port with the lowest number of logins provided is selected for new FLOGI requests. If all the ports have the same number of logins provided, then the switch will select a port using a round robin algorithm.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The load balancing method is globally applied to the switch, and only one method is applied at a time.
- Using the dynamic reorder load balancing method may trigger the tearing down of some sessions, so that upon re-login the ENode FLOGI is processed on a different NP\_Port in the same VSAN. For example, when a new FC NP\_Port is added to the VSAN, some of the sessions are torn down and logged in again on the newly added port to distribute sessions across all ports in the VSAN.
- When the ENode-based load balancing method is used, each NP\_Port in the VSAN will send a multicast discovery advertisement to all ENodes in the mapped FCoE VLAN. The FCF MAC address in the discovery advertisement is the MAC address of the FC port. The ENode then decides which FCF (NP\_Port) to use for the login.
- The default and ENode-based load balancing methods do not disturb existing sessions.
- The load balancing method is *not* applied to statically mapped FCoE and FC ports.

### Examples

```
-> fibre-channel npiv-proxy load-balance dynamic-reorder
-> fibre-channel npiv-proxy load-balance enode-based
-> fibre-channel npiv-proxy load-balance default
```

### Release History

Release 7.3.3; command introduced.

## Related Commands

- fibre-channel npiv-proxy load-balance static** Configures a static mapping between an FCoE port and an FC NP\_Port. Load balancing does not apply to statically mapped ports.
- show fibre-channel** Displays the global load balancing method applied to NP\_Ports.

## MIB Objects

alaFcInfo  
  alaFcConfigNpivLoadBalance

---

## fibre-channel npiv-proxy load-balance static

Configures a static port association between an FCoE port and an FC NP\_Port to ensure that FC sessions on the specified FCoE port are mapped to the specified NP\_Port.

**fibre-channel npiv-proxy load-balance static** {port *chassis/slot/port* / linkagg *agg\_id*} **fc-port** *chassis/slot/port*

**no fibre-channel npiv-proxy load-balance static** {port *chassis/slot/port* / linkagg *agg\_id*} **fc-port** *chassis/slot/port*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<b>port</b> <i>slot/port</i>	The slot and port number (3/1) of an FCoE port.
<i>agg_id</i>	The link aggregate ID number.
<b>fc-port</b> <i>slot/port</i>	The slot and port number (3/1) of an FC port.

### Defaults

By default, there are no static FCoE-to-FC port associations. The dynamic load balancing method is applied to the FC NP\_ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the static association between the FCoE port and the FC port. When this association is removed, the dynamic load balancing method is applied.
- Use caution when configuring static FCoE-to-FC port assignments. Static assignments exempt both the FCoE port and the FC NP\_Port from dynamic load balancing of sessions when multiple FC ports belong to the same VSAN.

### Examples

```
-> fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1
-> no fibre-channel npiv-proxy load-balance static port 1/1 fc-port 2/1

-> fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1
-> no fibre-channel npiv-proxy load-balance static linkagg 10 fc-port 2/1
```

### Release History

Release 7.3.3; command introduced.

## Related Commands

**show fibre-channel npiv-proxy load-balance** Displays the static FCoE port/FC NP\_Port mapping and FC port session counts.

## MIB Objects

```

  alaFcNpivStaticLoadBalanceEtherIfIndex  
  alaFcNpivStaticLoadBalanceFibreIfIndex
```

---

## fcoe e-tunnel

Configures an E2E tunnel identifier and associates the identifier with tunnel endpoints and an FCoE VLAN. An E2E tunnel allows FC switches to set up ISLs between fabrics over an FCoE network.

**fcoe e-tunnel** *tunnel\_id* {**fc-port1** *chassis/slot/port*} {**fc-port2** *chassis/slot/port* | **vlan** *vlan\_id*}

**no fcoe e-tunnel** *tunnel\_id*

---

### Syntax Definitions

<i>tunnel_id</i>	A unique ID number to assign to this tunnel session.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1) of an FC tunnel edge (TE) port.
<i>vlan_id</i>	An existing FCoE VLAN ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the tunnel configuration.
- An OmniSwitch FC port is configured as a tunnel E\_Port (TE\_Port) and connects to an E\_Port on an FC switch. TE\_Ports can carry traffic from multiple VSANs. This command is used to associate the TE port with an FCoE VLAN or with another TE port on the same switch.
- An OmniSwitch FCoE port is configured as a virtual expansion port (VE\_Port) on the FCoE network side. The VE port is associated with an FCoE VLAN by tagging the VE port with the FCoE VLAN ID.
- This command does not establish a connection. Once the required tunnel components are configured, successful exchange of exchange link parameters (ELP) between a TE\_Port and a VE\_Port or between two TE\_Ports will establish the tunnel session.
- To create a tunnel connection between two FC switches across the FCoE network requires the following steps:
  - Configure the FCoE port that will connect to the FCoE network as a virtual expansion port (VE\_Port).
  - Tag the VE\_Port to the FCoE VLAN that will carry traffic through the tunnel.
  - Configure the FC port that will connect to an E\_Port on an FC as a TE\_Port.
  - Use this command (**fcoe e-tunnel**) with the **fc-port1** and **vlan** parameters to associate the TE\_Port with the FCoE VLAN to which the VE\_Port is tagged.
- To create a tunnel between two FC TE\_Ports on the same switch or in a virtual chassis configuration, use the **fc-port1** and **fc-port2** parameters to specify the slot and port number of the two TE ports.

## Examples

```
-> fcoe e-tunnel 1 fc-port1 2/1 fc-port2 2/2
-> fcoe e-tunnel 10 fc-port1 2/3 vlan 200
-> fcoe e-tunnel 11 fc-port1 2/4 vlan 200
-> no fcoe e-tunnel 10
```

## Release History

## show fibre-channel vsan

Displays the VSAN configuration for the switch.

**show fibre-channel vsan** [*vsan\_id*]-*vsan\_id2*]

---

### Syntax Definitions

*vsan\_id*[-*vsan\_id2*]                      An existing VSAN ID. Use a hyphen to specify a range of VSAN IDs (10-25).

### Defaults

By default, a list of all VSANs is displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Specify a VSAN ID with this command to display information about a specific VSAN.

### Examples

```
-> show fibre-channel vsan
```

```
vsan  oper admin  name
-----+-----+-----
      1  Ena   Dis   test1
     1000 Dis   Dis   test2
     2000 Ena   Dis   test3
```

```
-> show fibre-channel vsan 101
```

```
vsan  oper admin  name
-----+-----+-----
     1000 Dis   Dis   test2
```

### *output definitions*

---

<b>vsan</b>	The numerical VSAN ID.
<b>oper</b>	The operational status of the VSAN: <b>Ena</b> (enabled) or <b>Dis</b> (disabled). The operational status remains disabled until an active FC port is assigned to the VSAN. A VSAN must have an enabled administrative status before it can become operationally enabled.
<b>admin</b>	The administrative status of the VSAN: <b>Ena</b> specifies that VSAN functions are enabled; <b>Dis</b> specifies that VLAN functions are disabled.
<b>name</b>	The user-defined text description for the VSAN. By default, the VSAN ID is displayed if the VLAN description is not specified.

---

## Release History

Release 7.3.3; command introduced.

## Related Commands

<a href="#">fibre-channel vsan</a>	Configures a VSAN for the switch.

---

## show fibre-channel vsan members

Displays the VSAN port assignments.

**show fibre-channel vsan** [*vsan\_id* [-*vsan\_id2*]] **members** [**port** *chassis/slot/port*[-*port2*]]

---

### Syntax Definitions

<i>vsan_id</i> [- <i>vsan_id2</i> ]	An existing VSAN ID number. Use a hyphen to specify a range of VSAN IDs (10-25).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all VSAN port assignments are displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- If the *vsan\_id* is specified without a *slot/port*, then all port assignments for that VSAN are displayed.
- If both the *vsan\_id* and *slot/port* are specified, then information only for that VSAN and slot/port is displayed.
- Only OmniSwitch FC ports can be assigned to a VSAN.

### Examples

```
-> show fibre-channel vsan members
vsan  port  status
-----+-----
      1  2/2/1   Enabled
    1003 2/2/12  Enabled
    1005 3/2/5   Disbled

-> show fibre-channel vsan 1003 members
  port  status
-----+-----
  2/2/12  Enabled

-> show fibre-channel vsan 1005 members port 3/2/5
vsan   : 1005,
port   : 3/2/5,
status : disabled
```

*output definitions*

---

<b>vsan</b>	The numerical VSAN ID. Configured through the <b>fibre-channel vsan</b> command.
<b>port</b>	The FC port number associated with the VSAN ID. Configured through the <b>fibre-channel vsan members</b> command.
<b>status</b>	The operational status of the port ( <b>enabled</b> or <b>disabled</b> ).

---

**Release History**

Release 7.3.3; command introduced.

**Related Commands**

**show fibre-channel vsan**      Displays the VSAN configuration for the switch.

**MIB Objects**

  alaFcVfpaState  
  alaFcVfpaRowStatus

---

## show fibre-channel port

Displays the FC port configuration for the switch.

**show fibre-channel port** [info]

---

### Syntax Definitions

**info** Displays session details for each FC port.

### Defaults

By default, the parameters for each FC port are displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When the **info** parameter is used with this command, the **fcid** field shows an FC port ID for NP\_Ports. For all other port modes, this field is blank. Only NP\_Ports perform fabric login (FLOGI) and obtain a port ID from an FC switch.
- If an FC port is configured to operate in the fabric or tunnel E\_Port mode, there is no fabric login process performed. Ports running in these modes will come up immediately.
- FLOGI is triggered only after an NP\_Port is assigned to a VSAN.

### Examples

```
-> show fibre-channel port
```

Legend: NP=Proxy N\_Port, F=Fabric Port connected to N\_port, TE=Tunnel E-Port

```
ports   oper-status mode  BB-SC-N  service class
-----+-----+-----+-----+-----
  2/1      Up      NP      3          3
  2/2      Up      F        0          3
  2/3      Up      TE      3          3/F
  2/4     Down     NP      0          3
```

### output definitions

---

<b>ports</b>	The slot and port number of the FC port.
<b>oper-status</b>	The operational status of the FC port.
<b>mode</b>	The operational mode for the FC port.
<b>BB-SC-N</b>	The buffer-to-buffer state change number configured for the FC port.
<b>service class</b>	The service class for the FC port session ( <b>2</b> , <b>3</b> , <b>F</b> , or <b>3/F</b> ). This value indicates the level of delivery integrity required for an application.

---

```
-> show fibre-channel port info
Legend: NP=Proxy N_Port, F=Fabric Port connected to N_port, TE=Tunnel E-Port
```

```
ports mode fcid wwpn state
-----+-----+-----+-----+-----+
 2/1 NP 010010c 10:00:01:00:00:0a:22:11 Up
 2/2 F - 10:00:01:00:00:0b:22:1a Up
 2/3 TE - 10:00:01:00:00:0b:23:22 Up
 2/4 NP - 10:00:01:00:00:0b:23:23 FLOGI_Sent
 2/5 NP - 10:00:01:00:00:0b:23:24 Not_Init
```

### output definitions

<b>ports</b>	The slot and port number of the FC port.
<b>mode</b>	The operational mode for the FC port ( <b>NP</b> = proxy N_Port, <b>F</b> = fabric port, <b>TE</b> = tunnel E_Port). Configured through the <b>fibre-channel port mode</b> command.
<b>fcid</b>	The FC port_ID obtained after successful fabric login. This field applies only to NP_Ports.
<b>wwpn</b>	The world-wide port name assigned to the OmniSwitch FC port.
<b>state</b>	The operational state of the fabric login process ( <b>Up</b> , <b>Down</b> , <b>FLOGI_Sent</b> , <b>Not_Init</b> , <b>ELP_Sent</b> , <b>Sess_Clear</b> ).

### Release History

Release 7.3.3; command introduced.

## show fcoe vsan-map

Displays the VSAN-to-FCoE VLAN mapping configuration.

**show fcoe vsan-map**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Mapping a VSAN to an FCoE VLAN is required to activate the processing of specific ENode traffic traveling to and from the designated virtual FC fabric through the NPIV OmniSwitch.

### Examples

```
-> show fcoe vsan-map
vsan  vlan
-----+-----
    10   10
   2000 2000
   3000 3000
```

#### *output definitions*

---

<b>vsan</b>	The VSAN ID. Configured through the <b>fibre-channel vsan</b> command.
<b>vlan</b>	The FCoE VLAN ID. Configured through the <b>fcoe vlan</b> command.

---

### Release History

Release 7.3.3; command introduced.

### Related Commands

<b>fcoe vsan-map</b>	Configures a one-to-one mapping between a VSAN and FCoE VLAN.
<b>show vlan</b>	Displays the FCoE VLAN configuration.

**MIB Objects**

```

  alaFipsVsanVlanMapVlanNumber  
  alaFipsVsanVlanMapRowStatus
```

---

## show fibre-channel sessions

Displays the sessions established on the OmniSwitch FC ports.

**show fibre-channel sessions** [**vsan** *vsan\_id* | **e-tunnel** *tunnel\_id*] [**port** *chassis/slot/port*] [**summary**]

---

### Syntax Definitions

<i>vsan_id</i>	An existing VSAN ID number.
<i>tunnel_id</i>	An existing E-Tunnel (E2E Tunnel) ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).

### Defaults

By default, all FC sessions are displayed for all FC ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The **port** parameter can be combined with the **vsan** or **e-tunnel** parameters to display sessions for a specific FC port within a VSAN or E2E tunnel.

### Examples

```
-> show fibre-channel sessions summary
Total FIBRE-CHANNEL Sessions      : 7
Total NPIV Sessions                : 4
Total R-NPIV Sessions              : 1
Total E-TUNNEL Sessions            : 2
```

```
-> show fibre-channel sessions
Total FIBRE-CHANNEL Sessions      : 4
Total NPIV Sessions                : 2
Total R-NPIV Sessions              : 1
Total E-TUNNEL Sessions            : 1
```

Port	Mode	VSAN	T-ID	WWPN	FCID	Status	Login Type

### output definitions

<b>Port</b>	The slot and port number for the FC port.
<b>Mode</b>	The operational mode for the FC port ( <b>F</b> = F_Port, <b>NP</b> = proxy N_Port, <b>TE</b> = tunnel E_Port). Configured through the <b>fibre-channel port mode</b> .
<b>vsan</b>	The VSAN ID to which the NP_Port or F_Port is assigned. Configured through the <b>fibre-channel vsan</b> command.
<b>T-ID</b>	The E2E tunnel ID. Configured through the <b>fcoe e-tunnel</b> command.
<b>WWPN</b>	The world-wide port name associated with the OmniSwitch FC port.
<b>FCID</b>	The FC port ID assigned to the node during login.
<b>Status</b>	The status of the login session.
<b>Login Type</b>	The type of login (FLOGI = fabric login, FDISC = fabric discovery, or ELP = exchange link parameters).

### Release History

## show fibre-channel node

Displays a list of FC nodes connected to OmniSwitch FC ports.

**show fibre-channel node** [**vsan** *vsan\_id* | **port** *chassis/slot/port*]

---

### Syntax Definitions

*vsan\_id* An existing VSAN ID number.  
*chassis* The chassis identifier.  
*slot/port* The slot and port number (3/1).

### Defaults

By default, a list of all FC nodes is displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Specify a VSAN ID to display nodes associated with a specific VSAN.
- Specify an FC port number to display nodes connected on a specific FC port.

### Examples

```
-> show fibre-channel node
```

VSAN	VLAN	WWNN	WWPN	Port	FC-ID
1	200	20:00:00:24:FF:37:DD:BB	21:00:00:24:FF:37:DD:BB	2/7	02:09:02
10	100	11:00:00:17:A4:B1:71:23	11:00:00:17:A4:B1:71:23	2/1	00:0A:01
10	-	11:00:00:17:A4:B1:71:24	11:00:00:17:A4:B1:71:24	2/2	00:0B:02

```
-> show fibre-channel node vsan 10
```

VSAN	VLAN	WWNN	WWPN	Port	FC-ID
10	100	11:00:00:17:A4:B1:71:23	11:00:00:17:A4:B1:71:23	2/1	00:0A:01
10	-	11:00:00:17:A4:B1:71:24	11:00:00:17:A4:B1:71:24	2/2	00:0B:02

```
-> show fibre-channel node port 2/1
```

Port	VSAN	VLAN	WWNN	WWPN	FC-ID
2/1	10	100	11:00:00:17:A4:B1:71:23	11:00:00:17:A4:B1:71:23	00:0A:01

*output definitions*

---

<b>Port</b>	The slot/port of the FC interface that is connected to the FC node.
<b>VSAN</b>	The VSAN ID associated with the FC node. Configured through the <b>fibre-channel vsan</b> command.
<b>VLAN</b>	The FCoE VLAN ID on which FC nodes are provided. Configured through the <b>fcoe vlan</b> command.
<b>WWNN</b>	The world-wide node name assigned to an FC node.
<b>WWPN</b>	The world-wide port name assigned to the FC port.
<b>FC-ID</b>	The FC port ID assigned to an N_Port (or VN_Port, or NP_Port) after successful fabric login.

---

**Release History**

Release 7.3.3; command introduced.

**Related Commands**

**show fibre-channel sessions**      Displays the sessions established on the OmniSwitch FC ports.

**MIB Objects**

---

## show fcoe e-tunnel

Displays the E2E tunnel configuration for the switch.

```
show fcoe e-tunnel [tunnel_id]
```

---

### Syntax Definitions

*tunnel\_id*                                      An existing tunnel ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the *tunnel\_id* to display parameters for a specific tunnel.

### Examples

```
-> show fcoe e-tunnel
```

```
tunnel  vlan  Port1   Port2
-----+-----+-----+-----
     1   1000  1/1/1    -
     2     -   1/1/2    3/3/1
     3   3000  1/1/3    -
```

```
-> show fcoe e-tunnel 2
```

```
tunnel  vlan  Port1   Port2
-----+-----+-----+-----
     2     -   1/1/2    3/3/1
```

### output definitions

---

<b>Tunnel</b>	The E2E tunnel ID associated with the session. Configured through
<b>Vlan</b>	The FCoE VLAN on which the tunnel is defined. Configured through the <b>fcoe vlan</b> command.
<b>Port1, Port2</b>	The FCoE port (in VE_Port role) and/or FC port (in TE_Port mode) for this session. The FCoE port rule is configured through the <b>fcoe role</b> command. The FC port mode is configured through the <b>fibre-channel port mode</b> command.

---

### Release History

Release 7.3.3; command introduced.

## Related Commands

  alaFipsEtunnelIfIndexTwo
```

---

## show fibre-channel

Displays global Fibre Channel parameter values.

```
show fibre-channel
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

This command currently displays the following:

- The load-balancing method that is applied to FLOGI requests when there is more than one NPIV proxy port assigned to the same VSAN. This mode does not apply to FC ports configured to operate in the F\_Port proxy mode (R-NPIV) or as E2E tunnel ports.
- The World Wide Node Name (WWNN) for the switch. The WWNN is comprised of “10:00” combined with the next available increment of the switch based MAC address.

### Examples

```
-> show fibre-channel
Fibre Channel Global Configurations      :
-----
NPIV Proxy Global Load Balance Method    : Default
Local WWNN                               : 10:00:00:E0:B1:E7:09:A4
```

### Release History

Release 7.3.3; command introduced.

### Related Commands

**fibre-channel npiv-proxy load-balance** Configures the load balancing method applied to multiple FC ports that belong to the same VSAN.

**MIB Objects**

```

  alaFipsEtunnelId  
  alaFipsEtunnelVlanId  
  alaFipsEtunnelIfIndexOne  
  alaFipsEtunnelIfIndexTwo
```

---

## show fibre-channel statistics

Displays FC port statistics.

**show fibre-channel statistics** [**npiv** | **r-npiv**] [**vsan** *vsan\_id*[*vsan\_id2*] [**port** *chassis/slot/port*[-*port2*] [**e-tunnel** *port* *chassis/slot/port*[-*port2*]]

---

### Syntax Definitions

<b>npiv</b>	Displays statistics for N_Port proxy sessions.
<b>r-npiv</b>	Displays statistics for F_Port proxy sessions.
<b>e-tunnel</b> [ <i>tunnel_id</i> ]	Displays E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
<i>vsan_id</i> [ <i>vsan_id2</i> ]	An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all statistics are displayed

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vsan** parameter to display statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to display statistics for a specific FC port.

### Examples

```
-> show fibre-channel statistics vsan 46
```

```

## show fcoe statistics npiv-proxy

Displays ENode fabric login or ENode discovery statistics for FCoE interfaces or specific VLANs.

```
show fcoe statistics npiv-proxy {enode-login | enode-discovery} {interface | vlan [vlan_id[vlan_id2] |
port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<b>enode-login</b>	Displays ENode login statistics.
<b>enode-discovery</b>	Displays ENode discovery statistics.
<b>interface</b>	Display statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id[vlan_id2]</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

### Examples

## show fcoe statistics r-npiv

Displays FCF discovery fabric login or ENode discovery statistics for FCoE interfaces or specific VLANs.

```
show fcoe statistics r-npiv {node-login | fcf-discovery} {interface | vlan [vlan_id[vlan_id2] | port
chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<b>node-login</b>	Displays FC node login statistics.
<b>fcf-discovery</b>	Displays FCF discovery statistics.
<b>interface</b>	Display statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id[vlan_id2]</i>	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

### Examples

```

## show fcoe statistics e-tunnel

Displays E2E tunnel statistics.

**show fcoe statistics e-tunnel** [**ve** | **te**] [*tunnel\_id*[-*tunnel\_id*]]

---

### Syntax Definitions

<b>ve</b>	Displays VE_Port statistics.
<b>te</b>	Displays TE_Port statistics.
<i>tunnel_id</i> [- <i>tunnel_id</i> ]	The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vlan** parameter to display statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to display statistics for a specific FCoE port or link aggregate ID.

### Examples

```
-> show fcoe statistics e-tunnel
```

```
Packet Received :
```

Tunnel	ELP	SW_ACC	SW_RJT
15	7	1	6
17	5	4	1

```
Packet Sent :
```

Tunnel	ELP	SW_ACC	SW_RJT
15	7	1	6
17	5	4	1

```

---

## show fibre-channel npiv-proxy load-balance

Displays the NPIV proxy load balancing static mapping and session count.

**show fibre-channel npiv-proxy load balance {static | session-count}**

---

### Syntax Definitions

**static** Displays the static FCoE port/FC NP\_Port mapping.  
**session-count** Displays the number of sessions on each FC port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command displays information only for FC ports operating in the NP\_Port mode.
- Use the **static** parameter to display only the static mapping of FCoE ports to FC NP\_Ports.
- When the **sessions-count** parameter is used, the “FC Port” field includes all NP\_Ports.

### Examples

```
-> show fibre-channel npiv-proxy load-balance static
```

```
FCoE Port   FC port
-----+-----
 1/1         2/1
 1/2         2/1
```

```
-> show fibre-channel npiv-proxy load-balance sessions-count
```

```
FC Port   session_count
-----+-----
 2/1             2
 2/2             0
 2/3             5
```

### *output definitions*

---

<b>FCoE Port</b>	The slot/port of the FCoE port that is mapped to the FC port.
<b>FC Port</b>	The slot/port of the FC NP_Port.
<b>Session Count</b>	The number of sessions per FC port.

---

## Release History

Release 7.3.3; command introduced.

## Related Commands

**fibre-channel npiv-proxy load-balance static** Configures a static mapping between an FCoE port and an FC NP\_Port.

**fibre-channel npiv-proxy load-balance** Configures the NPIV proxy load-balancing method applied to all FC NP\_Ports on the switch.

## clear fibre-channel statistics

Clears FC port statistics.

**clear fibre-channel statistics** [**npiv** | **r-npiv**] [**port** *chassis/slot/port*[-*port2*] [**e-tunnel port** *chassis/slot/port*[-*port2*]]

---

### Syntax Definitions

<b>npiv</b>	Clears statistics for N_Port proxy sessions.
<b>r-npiv</b>	Clears statistics for F_Port proxy sessions.
<b>e-tunnel</b> [ <i>tunnel_id</i> ]	Clears E2E tunnel (E_Port proxy) statistics. Optionally enter a tunnel ID to display information for a specific tunnel.
<i>vsan_id</i> [ <i>vsan_id2</i> ]	An existing VSAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VSAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

By default, all statistics are cleared.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vsan** parameter to clear statistics for a specific VSAN ID. The **vsan** parameter is not used with the **e-tunnel** parameter, because tunnel ports are not associated with a VSAN.
- Use the **port** parameter to clear statistics for a specific FC port.

### Examples

```
-> clear fibre-channel statistics
-> clear fibre-channel statistics port 2/2/5
-> clear fibre-channel statistics npiv
-> clear fibre-channel statistics r-npiv
-> clear fibre-channel statistics e-tunnel
-> clear fibre-channel statistics npiv port 2/2/1
-> clear fibre-channel statistics r-npiv port 2/2/3
-> clear fibre-channel statistics e-tunnel port 2/2/4
```

### Release History

Release 7.3.3; command introduced.

## Related Commands

**show fibre-channel statistics**    Display FC port statistics.

```

---

## clear fibre-channel sessions

Clears the specified sessions on all FC ports.

```
clear fibre-channel sessions {npiv-proxy | r-proxy | e-tunnel | all}
```

---

### Syntax Definitions

<b>npiv-proxy</b>	Clears NP_Port proxy sessions.
<b>r-proxy</b>	Clears reverse NP_Port proxy sessions.
<b>e-tunnel</b>	Clears E-Tunnel (E2E Tunnel) sessions.
<b>all</b>	Clears all NP_Port proxy, reverse proxy, and E-Tunnel sessions.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Only the sessions associated with the specified parameter are cleared. For example, if the **npiv-proxy** parameter is used, only NPIV proxy sessions are cleared. All other session types remain active.
- When sessions are cleared on FC ports, the corresponding sessions on the FCoE ports are also cleared.

### Examples

```
-> clear fibre-channel sessions npiv-proxy
-> clear fibre-channel sessions r-mpiv
-> clear fibre-channel sessions e-tunnel
-> clear fibre-channel sessions all
```

### Release History

Release 7.3.3; command introduced.

### Related Commands

[show fibre-channel sessions](#) Displays FC sessions.

### MIB Objects

```
alaFcInfo
  alaFcConfigSessClear
```

---

## clear fcoe statistics npiv

Clears N\_Port proxy (NP\_Port) statistics for FCoE interfaces or specific FCoE VLANs.

```
clear fcoe statistics npiv-proxy {interface | vlan [vlan_id[vlan_id2] | port chassis/slot/port[-port2] / linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<b>interface</b>	Clears statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [ <i>vlan_id2</i> ]	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vlan** parameter to clear statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to clear statistics for a specific FCoE port or link aggregate ID.

### Examples

```
-> clear fcoe statistics npiv-proxy interface  
-> clear fcoe statistics npiv-proxy vlan 100  
-> clear fcoe statistics npiv-proxy vlan 200-205  
-> clear fcoe statistics npiv-proxy port 1/1  
-> clear fcoe statistics npiv-proxy port 1/5-10  
-> clear fcoe statistics npiv-proxy port 1/1/1  
-> clear fcoe statistics npiv-proxy linkagg 10
```

### Release History

Release 7.3.3; command introduced.

## Related Commands

**show fcoe statistics npiv-proxy** Displays N\_Port proxy statistics.

## MIB Objects

```
alaFipsVlanTable
  alaFipsVlanStatsFnreClear
alaFipsIntfTable
  alaFipsIntfStatsFnreClear
```

---

## clear fcoe statistics r-npiv

Clears F\_Port proxy (reverse-NPIV) statistics for FCoE interfaces or specific FCoE VLANs.

**clear fcoe statistics r-npiv** {**interface** | **vlan** [*vlan\_id*[*vlan\_id2*] | **port** *chassis/slot/port*[-*port2*] / **linkagg** *agg\_id*[-*agg\_id2*]}

---

### Syntax Definitions

<b>interface</b>	Clears statistics for all FCoE interfaces (ports and link aggregates).
<i>vlan_id</i> [ <i>vlan_id2</i> ]	An existing FCoE VLAN ID. The valid ID range is 2–4094. Use a hyphen to specify a range of VLAN IDs (100-150).
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **vlan** parameter to clear statistics for a specific FCoE VLAN ID.
- Use the **port** or **linkagg** parameters to clear statistics for a specific FCoE port or link aggregate ID.

### Examples

```
-> clear fcoe statistics r-npiv interface
-> clear fcoe statistics r-npiv vlan 100
-> clear fcoe statistics r-npiv vlan 200-205
-> clear fcoe statistics r-npiv port 1/1
-> clear fcoe statistics r-npiv port 1/5-10
-> clear fcoe statistics r-npiv port 1/1/1
-> clear fcoe statistics r-npiv linkagg 10
```

### Release History

Release 7.3.3; command introduced.

## Related Commands

[show fcoe statistics r-npiv](#) Displays F\_Port proxy statistics.

## MIB Objects

```
alaFipsVlanTable
  alaFipsVlanStatsFnreClear
alaFipsIntfTable
  alaFipsIntfStatsFnreClear
```

---

## clear fcoe statistics e-tunnel

Clears E\_Port proxy (E2E tunnel) statistics.

```
clear fcoe statistics e-tunnel [ve | te] {tunnel_id[-tunnel_id]}
```

---

### Syntax Definitions

<b>ve</b>	Clears VE_Port statistics.
<b>te</b>	Clears TE_Port statistics.
<i>tunnel_id</i> [- <i>tunnel_id</i> ]	The ID of an existing E2E tunnel. Use a hyphen to specify a range of tunnel IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **ve** parameter to clear only VE\_Port statistics for the specified tunnel ID.
- Use the **te** parameter to clear only TE\_Port statistics for the specified tunnel ID.

### Examples

```
-> clear fcoe statistics e-tunnel 1
-> clear fcoe statistics e-tunnel ve 2
-> clear fcoe statistics e-tunnel te 2
```

### Release History

Release 7.3.3; command introduced.

### Related Commands

[show fcoe statistics e-tunnel](#) Displays E\_Port proxy (E2E tunnel) statistics.

### MIB Objects

```
alaFipsEtunnelVePortStatsTable
  alaFipsEtunnelVePortStatsTunnelId
  alaFipsEtunnelVePortStatsClear
alaFipsEtunnelTePortStatsTable
  alaFipsEtunnelTePortStatsTunnelId
  alaFipsEtunnelTePortStatsClear
```

---

## clear fcoe sessions

Clears the specified sessions on all FCoE ports.

**clear fcoe sessions** [**fips** | **npiv-proxy** | **r-proxy** | **e-tunnel** | **all**]

---

### Syntax Definitions

<b>fips</b>	Clears FIP snooping sessions.
<b>npiv-proxy</b>	Clears NP_Port proxy sessions.
<b>r-proxy</b>	Clears reverse NP_Port proxy sessions.
<b>e-tunnel</b>	Clears E-Tunnel (E2E Tunnel) sessions.
<b>all</b>	Clears all FCoE, NP_Port proxy, reverse proxy, and E-Tunnel sessions.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When FIP snooping sessions are cleared, a clear virtual link (CVL) request is sent for all logged ENodes.
- When R-NPIV sessions are cleared, FIP FLOGO is sent to the FCF and FC FLOGO is sent to the HBA for each R-NPIV session created.
- Once sessions are cleared, NP\_Ports will trigger a fabric login to the connected fabric.

### Examples

```
-> clear fcoe sessions fips
-> clear fcoe sessions npiv-proxy
-> clear fcoe sessions r-mpiv
-> clear fcoe sessions e-tunnel
-> clear fcoe sessions all
```

### Release History

Release 7.3.3; command introduced.

# 45 VXLAN Snooping Commands

The OmniSwitch Virtual eXtensible LAN (VXLAN) Snooping feature attempts to detect and identify VXLAN traffic by sampling packets to determine if they are VXLAN encapsulated packets. Once this type of traffic is identified, VXLAN Snooping collects and stores information about the flow in a database on the local switch. Additional configurable options for this feature include the ability to apply QoS policy list rules to the identified flow and SNMP trap generation.

A VXLAN segment is a Layer 2 overlay network through which devices can communicate. Traffic from such devices is encapsulated into VXLAN frames and then tunneled through the VXLAN segment. Using this implementation of VXLAN Snooping, an administrator can obtain more detailed information about the traffic flow through the overlay network.

---

**Note.** Throughout this chapter, the terms “VXLAN Snooping” and “VM Snooping” are interchangeable.

---

MIB information for the VXLAN Snooping commands is as follows:

*Filename:* ALCATEL-IND1-VM-SNOOPING-MIB.mib  
*Module:* alaVMSnoopingMIB

A summary of the available commands is listed here:

---

**vm-snooping admin-state**  
**vm-snooping policy-mode**  
**vm-snooping trap**  
**vm-snooping filtering-resource trap threshold**  
**vm-snooping sampling-rate**  
**vm-snooping aging-timer**  
**vm-snooping vxlan udp-port**  
**vm-snooping static-policy rule**  
**vm-snooping logging-threshold**  
**vm-snooping port**  
**show vm-snooping config**  
**show vm-snooping port**  
**show vm-snooping database**  
**show vm-snooping virtual-machines**  
**show vm-snooping filtering-resource**  
**show vm-snooping statistics**  
**show vm-snooping static-policy**  
**clear vm-snooping database**  
**clear vm-snooping statistics**

---

## vm-snooping admin-state

Configures the global status of the VXLAN Snooping process for the switch.

**vm-snooping admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables VXLAN Snooping for the switch.
<b>disable</b>	Disables VXLAN Snooping for the switch.

### Defaults

By default, VXLAN Snooping is disabled for the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Enable VXLAN Snooping first before attempting any other VXLAN Snooping command. When enabled, the switch allocates resources for this feature. When disabled, switch resources are released for other purposes.
- This command enables or disables this feature on all VXLAN Snooping ports.

### Examples

```
-> vm-snooping admin-state enable
-> vm-snooping admin-state disable
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

**show vm-snooping config** Displays the VXLAN Snooping configuration for the switch.

### MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingAdminStatus
```

---

## vm-snooping policy-mode

Configures the allocation of hardware resources for VXLAN Snooping. Use this command to change the policy lookup mode to basic or advanced and specify the number of policies reserved for VXLAN Snooping. In addition, an optional inner header parameter is available to specify if the header of the inner Ethernet frame is tagged or untagged.

```
vm-snooping policy-mode {basic | advance} [policy-resource {extended | default}] [inner-header {tagged | untagged | default}]
```

---

### Syntax Definitions

<b>basic</b>	Reserves resources for VNI, VXLAN UDP port, inner source MAC address, and inner IPv4 source address policy conditions.
<b>advance</b>	For IPv4 packets, reserves resources for VNI, VXLAN UDP port, inner source MAC address, inner IPv4 source address, IP protocol, and Layer 4 source and destination port policy conditions.  For IPv6 packets, reserves resources for VNI, VXLAN UDP port, inner source IPv6 address, Layer 4 source and destination port for policy conditions.
<b>policy-resource extended</b>	Doubles the amount of resources for VXLAN Snooping policies.
<b>policy-resource default</b>	Reserves the minimum amount of resources for VXLAN Snooping policies.
<b>inner-header tagged</b>	The header of the inner frame is tagged.
<b>inner-header untagged</b>	The header of the inner frame is untagged.
<b>inner-header default</b>	The header of the inner frame is either tagged or untagged (basic mode) or just tagged (advance mode).

### Defaults

parameter	default
[basic   advance]	basic
[extended   default]	default

By default, the inner header option is set to the following values based on the current policy lookup mode:

- Basic mode—untagged and tagged header for the inner frame.
- Advanced mode—tagged header for the inner frame.

### Platforms Supported

OmniSwitch 6900

## Usage Guidelines

- To change the policy mode, globally disable VXLAN Snooping then make the changes and enable VXLAN Snooping again to apply the changes to the switch. This command is also allowed when the VXLAN Snooping feature is globally disabled.
- When the VXLAN Snooping policy mode is changed, all database and QoS entries are flushed.
- When the VXLAN policy mode is set to **basic**, any QoS policy rules with advanced mode policy conditions will not work. When the mode is set to **advance**, QoS policy rules with basic *and* advance policy conditions will work.
- When configuring the **inner-header** parameter for **basic** mode, specifying only tagged or only untagged may increase the number of policies allowed. In other words, specifying both tagged and untagged (the default) may reduce the number of policies allowed.
- When configuring the **inner-header** parameter for **advance** mode, specifying both tagged and untagged is not allowed. In this case, the **default** option sets the parameter to tagged.
- Other applications, such as QoS user policies, VLAN Stacking, Application Fingerprinting, DHCP Snooping, Open Flow, IP multicast, and FIP Snooping also use up system resources. Depending on which application comes first, other applications may not be able to get the required hardware resources.
- If the resources are increased by two times (**policy-resource extended**), then none of the above-mentioned applications can work simultaneously.
- Only one set of hardware resources are reserved for the VXLAN Snooping application when VXLAN Snooping is globally enabled.

## Examples

```
-> vm-snooping admin-state disable
-> vm-snooping policy-mode basic policy-resource extended inner-header tagged
-> vm-snooping admin-state enable

-> vm-snooping admin-state disable
-> vm-snooping policy-mode advance policy-resource extended inner-header untagged
-> vm-snooping admin-state enable

-> vm-snooping admin-state disable
-> vm-snooping policy-mode basic inner-header default
-> vm-snooping policy-mode advance inner-header default
-> vm-snooping admin-state enable
```

## Release History

Release 7.3.4; command was introduced.

## Related Commands

**show vm-snooping config**      Displays the VXLAN Snooping configuration for the switch.

## MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingPolicyMode
  alaVMSnoopingPolicyResource
  alaVMSnoopingVMTrafficTagged
```

---

## vm-snooping trap

Enables or disables trap generation for the VXLAN Snooping feature.

```
vm-snooping trap {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables VXLAN Snooping trap generation.
<b>disable</b>	Disables VXLAN Snooping trap generation.

### Defaults

By default, trap generation for this feature is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

A trap is generated when one of the following occurs:

- A new VXLAN database entry is learned or ages out.
- The usage of system resources allocated for VXLAN Snooping exceeds a configurable threshold value.

### Examples

```
-> vm-snooping trap enable  
-> vm-snooping trap disable
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

<a href="#">vm-snooping filtering-resource trap threshold</a>	Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.
<a href="#">show vm-snooping config</a>	Displays the VXLAN Snooping status and configuration for the switch.

### MIB Objects

```
alaVMSnoopingConfig  
alaVMSnoopingTrapStatus
```

---

## vm-snooping filtering-resource trap threshold

Configures the threshold value at which point the switch generates a trap to indicate that VXLAN Snooping has utilized the specified level of system resources.

**vm-snooping filtering-resource trap threshold** {*percentage* | **default**}

---

### Syntax Definitions

<i>percentage</i>	The percentage of system resources used by VXLAN Snooping.
<b>default</b>	Sets the trap threshold value back to 80 percent (the default).

### Defaults

By default, the filtering resource threshold is set to 80 percent.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

A trap is generated when the system resources used by VXLAN Snooping reach the specified threshold value.

### Examples

```
-> vm-snooping filtering-resource trap threshold 50
-> vm-snooping filtering-resource trap threshold default
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

<a href="#">show vm-snooping config</a>	Displays the VXLAN Snooping status and configuration for the switch.
<a href="#">show vm-snooping filtering-resource</a>	Displays the system resources used by VXLAN Snooping on a per-port basis.

### MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingFilteringResourceTrapThreshold
```

---

## vm-snooping sampling-rate

Configures the packets-per-second (pps) sampling rate for the VXLAN Snooping feature.

**vm-snooping sampling-rate** *pps*

---

### Syntax Definitions

*pps* The number of packets-per-second to sample on all VXLAN Snooping ports. The valid range is 1–1000.

### Defaults

By default, the sampling rate is set to 1000 pps.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The sampling rate value specified with this command is applied to every VXLAN Snooping port on the switch.

### Examples

```
-> vm-snooping sampling-rate 500
-> vm-snooping sampling-rate 1000
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[show vm-snooping config](#) Displays the VXLAN Snooping status and configuration for the switch.

### MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingSamplingRate
```

---

## vm-snooping aging-timer

Configures the aging time value for VXLAN packet flows learned in the VXLAN Snooping database on the local switch.

**vm-snooping aging-timer** *seconds*

---

### Syntax Definitions

*seconds*                      The number of seconds to wait before aging out a learned VM. The valid range is 60–86400 seconds.

### Defaults

By default, the aging timer is set to 300 seconds.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Set this timer to zero to prevent the learned VMs from aging out.
- Note that an inactive VXLAN packet flow (no packets received for the flow) can take up to twice as long as the aging time value specified to be removed from the VXLAN Snooping database. For example, if an aging time of 300 seconds is specified, the database entry for the flow ages out any time between 300 and 600 seconds of inactivity.

### Examples

```
-> vm-snooping aging-timer 100
-> vm-snooping aging-timer 300
-> vm-snooping aging-timer 0
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

**show vm-snooping config**            Displays the VXLAN Snooping status and configuration for the switch.

### MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingAgingTimer
```

---

## vm-snooping vxlan udp-port

Configures additional UDP destination port numbers to look for when the switch inspects packets received on VXLAN Snooping ports. This value is used to identify encapsulated VXLAN packets.

```
vm-snooping vxlan udp-port {udp_port_num[-udp_port_num2]}
```

```
no vm-snooping vxlan udp-port {udp_port_num[-udp_port_num2]}
```

---

### Syntax Definitions

*udp\_port\_num[-udp\_port\_num2]* The UDP destination port number. Use a hyphen to specify a range of port numbers. Do not specify a range that configures more than seven UDP ports.

### Defaults

By default, the well-known UDP port number 4789 is used.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a UDP destination port number. Note that the default UDP port number of 4789 is not configurable, so it can not be removed with this command. Only port numbers that were added through this command can be removed.
- Avoid using the well-known UDP ports that are already reserved by IANA for other applications.
- Including the default UDP port number (4789), up to eight UDP ports are allowed. However, configuring multiple UDP ports may slow down the VXLAN Snooping process.
- Changing the UDP port number on the fly might stop the VXLAN traffic until the VXLAN Tunnel End Points (VTEPs) in the network are configured with the same destination UDP port.

### Examples

```
-> vm-snooping vxlan udp-port 8472  
-> no vm-snooping vxlan udp-port 8472
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

### `show vm-snooping config`

Displays the destination UDP port value that is used to identify VXLAN traffic.

## MIB Objects

```

  alaVMSnoopingUDPPortIndex  
    alaVMSnoopingUDPRowStatus
```

---

## vm-snooping static-policy rule

Configures a static QoS policy rule. When configured, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.

**vm-snooping static-policy rule** *rule\_name* [**list** *list\_name*]

**no vm-snooping static-policy rule** *rule\_name* [**list** *list\_name*]

---

### Syntax Definitions

*rule\_name* The name of the policy rule (alphanumeric string up to 32 characters).

*list\_name* The name of the policy list (alphanumeric string up to 32 characters).

### Defaults

parameter	default
<i>list_name</i>	“Default”

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static VXLAN Snooping policy rule. If the rule is associated with a user-configured policy list (not the default list), then the list name must be specified as well to remove the static policy rule. If the rule is associated with the default list, then specifying a list name is not required to remove the static policy rule.
- The default policy list available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.

### Examples

```
-> vm-snooping static-policy rule r1
-> vm-snooping static-policy rule r2 list l2
-> no vm-snooping static-policy rule r1
-> no vm-snooping static-policy rule r2 list l2
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**show vm-snooping static-policy** Displays the static policy configuration.

## MIB Objects

```
alaVMSnoopingStaticPolicyTable  
  alaVMSnoopingStaticPolicyRuleName  
  alaVMSnoopingStaticPolicyListName  
  alaVMSnoopingStaticPolicyRowStatus
```

---

## vm-snooping logging-threshold

Configures the threshold value that determines how many entries for VXLAN packet flows and statistics are logged into a .csv file on the local switch.

**vm-snooping logging-threshold number-of-flows** *{flow\_num | default}*

---

### Syntax Definitions

<i>flow_num</i>	The number of VXLAN packet flows to log. The range is 1000–6000.
<b>default</b>	Sets the logging threshold value back to 5000 (the default).

### Defaults

By default, the logging threshold value is set to 5000 packet flows.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Set the logging threshold value to zero to turn off the logging function.
- When the logging function is on, setting the VXLAN Snooping aging timer to 300 seconds is recommended. If the aging timer is set to zero, no logging occurs regardless of this threshold setting.
- The packet flows and hardware statistics are logged to the **vm\_snoop\_db\_flow\_rec.csv** file and the **vm\_snoop\_hw\_stats\_rec.csv** file in the **/flash/switch/bridge/vm\_snoop/** directory on the local switch to maintain a packet flow history.
- When the number of records logged to the .csv files exceeds the logging threshold value, the corresponding files are renamed to **/flash/switch/bridge/vm\_snoop/vm\_snoop\_db\_flow\_old\_rec.csv** and to **/flash/switch/bridge/vm\_snoop\_hw\_stats\_old\_rec.csv**.
- These files are accessed and used by Alcatel-Lucent Enterprise network management tools to provide management and visibility of the overlay network traffic.

### Examples

```
-> vm-snooping logging-threshold number-of-flows 1000
-> vm-snooping logging-threshold number-of-flows 0
-> vm-snooping logging-threshold number-of-flows default
```

### Release History

Release 7.3.4; command was introduced.

**Related Commands****show vm-snooping config**

**MIB Objects**

alaVMSnoopingConfig

alaVMSnoopingLoggingThresholdFlows

---

## vm-snooping port

Configures a switch port or link aggregate as a VXLAN Snooping interface. Once the interface is configured and enabled and VXLAN Snooping is enabled for the switch, IP packets received on the interface are sampled to determine if they contain the designated UDP destination port.

```
vm-snooping {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} [admin-state {enable | disable}]
```

```
no vm-snooping {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]}
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>enable</b>	Enables the VXLAN Snooping administrative status on the port or link aggregate ID.
<b>disable</b>	Disables the VXLAN Snooping administrative status on the port or link aggregate ID.

### Defaults

By default, VXLAN Snooping is disabled on all switch ports and link aggregates.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to revert the VXLAN Snooping interface back to a regular switch port or link aggregate. This will clear the VXLAN Snooping configuration from the interface.
- Disabling the administrative status of a VXLAN Snooping interface does not remove the VXLAN Snooping configuration from the interface.
- Make sure the VXLAN Snooping feature is globally enabled for the switch to ensure that VXLAN Snooping ports will process VXLAN packets.
- VXLAN Snooping uses the sFlow mechanism to sample packets.

### Examples

```
-> vm-snooping port 1/1/1
-> vm-snooping port 1/1/5-10
-> no vm-snooping port 1/1/1
-> no vm-snooping port 1/1/5-10
-> vm-snooping port 1/1/1 admin-state enable
-> vm-snooping port 1/1/5-10 admin-state enable
```

```
-> vm-snooping port 1/1/1 admin-state disable
-> vm-snooping port 1/1/5-10 admin-state disable

-> vm-snooping linkagg 1
-> vm-snooping linkagg 5-10
-> no vm-snooping linkagg 1
-> no vm-snooping linkagg 5-10
-> vm-snooping linkagg 1 admin-state enable
-> vm-snooping linkagg 5-10 admin-state enable
-> vm-snooping linkagg 1 admin-state disable
-> vm-snooping linkagg 5-10 admin-state disable
```

## Release History

Release 7.3.4; command was introduced.

Aging-Timer                   : 300 seconds,
UDP-Port(s)                   : 4789,
Sampling-Rate                 : 1000
Logging-Threshold             : 5000
Qos Allocation Status         : Success
```

### *output definitions*

---

<b>VM-Snooping Status</b>	The global administrative status of VXLAN Snooping for the switch ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>vm-snooping admin-state</b> command.
<b>Trap</b>	The status of SNMP trap generation for the switch ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>vm-snooping trap</b> command.
<b>Trap-Threshold</b>	The percentage of switch resources used that will trigger the switch to generate a trap. Configured through the <b>vm-snooping filtering-resource trap threshold</b> command.
<b>Policy-Mode</b>	The policy mode setting that designates switch resources for VXLAN Snooping. Configured through the <b>vm-snooping policy-mode</b> command.

*output definitions (continued)*

---

<b>Policy Resource</b>	Indicates the number of VXLAN Snooping policies allowed ( <b>Default</b> or <b>Extended</b> ). Configured through the <b>vm-snooping policy-mode</b> command.
<b>VM Inner Header</b>	Whether to check tagged and/or untagged VM traffic. Configured through the <b>vm-snooping policy-mode</b> command.
<b>Aging-Timer</b>	The number of seconds before a learned VM is aged out. Configured through the <b>vm-snooping aging-timer</b> command.
<b>UDP-Port(s)</b>	The UDP port numbers to snoop for VXLAN packets. Configured through the <b>vm-snooping vxlan udp-port</b> command.
<b>Sampling-Rate</b>	The number of packets-per-second (pps) to sample. Configured through the <b>vm-snooping sampling-rate</b> command.
<b>Logging-Threshold</b>	The number of VXLAN packet flow entries and statistics logged to a .csv file on the local switch.
<b>Qos Allocation Status</b>	The status of QoS resource allocation ( <b>Success</b> , <b>inProgress</b> , or <b>Failed</b> ). This field is blank when VXLAN Snooping is disabled.

---

---

## show vm-snooping port

Displays the VXLAN Snooping port configuration for the switch.

**show vm-snooping port**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- The display output also indicates whether or not the VXLAN Snooping port is a virtual machine network profile (vNP) port.

### Examples

```
-> show vm-snooping port
Port      VM-Snooping  vNP
-----+-----+-----
1/2/1     Enable       Yes
1/2/2     Enable       No
1/2/2     Enable       Yes
1/2/2     Enable       Yes
0/12      Disable      No
```

#### *output definitions*

<b>Port</b>	The slot/port or link aggregate ID of the VXLAN Snooping interface. A “0” slot number indicates that the interface is a link aggregate.
<b>VM-Snooping</b>	The administrative status ( <b>Enable</b> or <b>Disable</b> ) of VXLAN Snooping on the port or link aggregate. Configured through the <b>vm-snooping port</b> command.
<b>vNP</b>	Whether the port is also a vNP port ( <b>Yes</b> or <b>No</b> ).

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**show vm-snooping config**      Displays the VXLAN Snooping status and configuration for the switch.

alaVMSnoopingPortTable
  alaVMSnoopingPortIndex
  alaVMSnoopingPortAdminStatus
  alaVMSnoopingPortIsVNP
  alaVMSnoopingPortRowStatus
```

---

## show vm-snooping database

Displays VXLAN Snooping database entries. When a VXLAN packet is detected and the packet contains the designated UDP destination port, VXLAN Snooping creates an entry in the local switch database to identify and track the VXLAN packet flow.

**show vm-snooping database** [**vxlan udp-port** *udp\_port\_num* | **vtep-ip** *ip\_address* | **vni** *vxlan\_id* | **vm-src-mac** *mac\_address* | **vm-ip** *ip\_address*] [**detail**] [**port** *chassis/slot/port[-port2]* | **linkagg** *agg\_id[-agg\_id2]*] [**detail**]

---

### Syntax Definitions

<i>udp_port_num</i>	The UDP destination port number used to identify VXLAN traffic.
<b>vtep-ip</b> <i>ip_address</i>	The IP address of the VXLAN Tunnel End Point (VTEP). This is the Loopback0 interface address on the OmniSwitch.
<i>vxlan_id</i>	The VXLAN Network Identifier (VNI) for the VXLAN segment on which the VM was learned.
<i>mac_address</i>	The source MAC address of a VM.
<b>vm-ip</b> <i>ip_address</i>	The source IP address of a VM.
<b>detail</b>	Displays additional information about the classified traffic flow.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, all database entries are displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.
- Each database entry is subject to a VXLAN Snooping aging period. If the database fills up, older entries are aged out before the limit (fast aging).
- When a database entry is removed due to regular aging or fast aging conditions, any corresponding QoS is also removed for that flow.

## Examples

```
-> show vm-snooping database
Total number of VM Flows: 15
```

Port	VXLAN PORT	VNI	VM SRC MAC	VM VLAN	VM SRC IP
1/1/3	4789	2000	00:12:01:00:00:01	-	200.200.200.1

## clear vm-snooping database

Clears the local database entries for each virtual machine (VM) flow.

```
clear vm-snooping database [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, all database entries are cleared for all VXLAN Snooping ports and link aggregates.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the **port** and **linkagg** parameters to clear database entries for a specific port or link aggregate.

### Examples

```
-> clear vm-snooping database
-> clear vm-snooping database port 3/1/1
-> clear vm-snooping database linkagg 10
```

### Release History

Release 7.3.4; command introduced.

### Related Commands

[show vm-snooping database](#) Displays the contents of the VXLAN Snooping database.

---

## show vm-snooping virtual-machines

Displays the port, source MAC address, and VLAN associated with Virtual Machines (VMs) discovered through the VXLAN Snooping process.

**show vm-snooping virtual-machines**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The output display of this command shows the port, source MAC address, and VLAN associated with each VM learned through the VXLAN Snooping process.

### Examples

```
-> show vm-snooping virtual-machines
Port          SRC MAC          VLAN
-----+-----+-----+
1/1/2  00:00:00:88:00:01  -
1/1/2  00:00:00:88:00:02  -
1/1/2  00:00:00:88:00:03  -
1/1/2  00:00:00:88:00:04  -
1/1/2  00:00:00:88:00:05  -
```

#### *output definitions*

<b>Port</b>	The slot/port or link aggregate ID of the VXLAN Snooping interface. A "0" slot number indicates a link aggregate.
<b>SRC MAC</b>	The source MAC address of the VM.
<b>VLAN</b>	The VLAN on which the VM is learned and forwarded.

### Release History

Release 7.3.4; command was introduced.

## Related Commands

- show vm-snooping config** Displays the VXLAN Snooping configuration for the switch.
- show vm-snooping database** Displays the contents of the local VXLAN Snooping database.

## MIB Objects

```
alaVMSnoopingLearntVMTable  
  alaVMSnoopingLearntVMIfIndex,  
  alaVMSnoopingLearntVMSrcMac,  
  alaVMSnoopingLearntVMVlanId
```

---

## show vm-snooping filtering-resource

Displays the amount of switch resources available for and used by QoS policies that contain VXLAN conditions.

```
show vm-snooping filtering-resource
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- VXLAN Snooping uses the amount of resources used to calculate the percentage of switch resources used and then determine if that percentage exceeds the value set for the filtering trap threshold. An SNMP trap is generated when the percentage used meets or exceeds the trap threshold value.
- The output display of this command shows the percentage of switch resources used by VXLAN policies on a per-slot basis.

### Examples

```
-> show vm-snooping filtering-resource
Total Filtering Resources      :256,
Chassis/Slot      Filtering Resources Used
-----+-----
 1/SLOT-1         0
 2/SLOT-1         0
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

[vm-snooping filtering-resource trap threshold](#) Configures the trap threshold value for system resources used by VXLAN Snooping.

[show vm-snooping config](#) Displays the VXLAN Snooping status and configuration for the switch.

**MIB Objects**

```
alaVMSnoopingFilterResourceTable  
  alaVMSnoopingFilterResourceChassisId  
  alaVMSnoopingFilterResourceSlotNum  
  alaVMSnoopingFilterResourceMax  
  alaVMSnoopingFilterResourceUsed
```

---

## show vm-snooping statistics

Displays statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

**show vm-snooping statistics** [**hardware** | **sampling**] [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*]]

---

### Syntax Definitions

<b>hardware</b>	Displays the VXLAN policy rule and list and the number of packets and bytes on which the policy rule was applied.
<b>sampling</b>	Displays the number of VXLAN packets that were sampled for a specific flow.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, statistics are displayed for all VXLAN Snooping ports and link aggregates.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the **port** and **linkagg** parameters to display information for a specific port or link aggregate.

### Examples

```
-> show vm-snooping statistics
Total number of Hardware Statistics: 0
```

Policy Rule	Policy List	Number of pkts	Number of Bytes
-----+-----+-----+-----+			
Total number of Sampling Statistics: 1			

Port	VXLAN UDP PORT	VXLAN VNI	VM SRC MAC	VM SRC IP	Pkts
-----+-----+-----+-----+-----+					
2/1/2	4789	43	00:00:00:88:00:01	88.0.0.1	15

```
-> show vm-snooping statistics sampling
Total number of Sampling Statistics: 1
```

Port	VXLAN UDP PORT	VXLAN VNI	VM SRC MAC	VM SRC IP	Pkts
-----+-----+-----+-----+-----+					
1/1/2	4789	43	00:00:00:99:00:01	99.0.0.1	10

```
-> show vm-snooping statistics hardware
Total number of Hardware Statistics: 1
```

Policy Rule	Policy List	Number of pkts	Number of Bytes
-----+-----+-----+-----			
r1	Default	497	45724

## Release History

Release 7.3.4; command introduced.

## Related Commands

[clear vm-snooping statistics](#) Clears VXLAN Snooping statistics.

## MIB Objects

```
alaVMSnoopingHardwareStatsTable
  alaVMSnoopingHardwareStatsPolicylist
  alaVMSnoopingHardwareStatsPolicyrule
  alaVMSnoopingHardwareStatsNumOfPackets
  alaVMSnoopingHardwareStatsNumOfBytes
```

---

## show vm-snooping static-policy

Displays the static QoS policy rule configuration for VXLAN Snooping.

**show vm-snooping static-policy**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When a static policy rule is configured for VXLAN Snooping, QoS resources are automatically allocated for the specified rule even if there is no VXLAN packet flow that matches the rule conditions.
- If the static policy rule was created with a user-configured policy list (not the default list), then the list name appears in the “Policy List” field. However, if the static policy rule was created without specifying a policy list name, then the “Default” list name appears in the “Policy List” field.

### Examples

```
-> show vm-snooping static-policy
Total number of Static-Policy: 5
```

Policy Rule	Policy List
r0	Default
r1	Default
r2	L1
r2	L3
r2	Default

#### *output definitions*

---

<b>Policy Rule</b>	The name of the QoS policy rule that was specified when the static policy rule was created.
<b>Policy List</b>	The name of the QoS policy list associated with the static policy rule.

---

### Release History

Release 7.3.4; command was introduced.

## Related Commands

**vm-snooping static-policy rule** Configures a VXLAN Snooping static policy rule.

## MIB Objects

```
alaVMSnoopingStaticPolicyTable  
  alaVMSnoopingStaticPolicyRuleName  
  alaVMSnoopingStaticPolicyListName  
  alaVMSnoopingStaticPolicyRowStatus
```

---

## clear vm-snooping statistics

Clears the collected statistics for each VXLAN packet flow on a VXLAN Snooping port or link aggregate.

```
clear vm-snooping statistics [sampling [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]]]
[hardware]
```

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>agg_id[-agg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

### Defaults

By default, statistics are cleared on all VXLAN Snooping ports and link aggregates.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the **port** and **linkagg** parameters to clear statistics for a specific port or link aggregate.

### Examples

```
-> clear vm-snooping statistics
-> clear vm-snooping statistics sampling port 3/1/1
-> clear vm-snooping statistics sampling linkagg 10
-> clear vm-snooping statistics hardware
```

### Release History

Release 7.3.4; command introduced.

### Related Commands

[show vm-snooping statistics](#) Displays VXLAN Snooping statistics.

### MIB Objects

```
alaVMSnoopingConfig
  alaVMSnoopingClearAllData
alaVMSnoopingSamplingStatsTable
  alaVMSnoopingSamplingStatsClear
```

# 46 Port Mapping Commands

Port Mapping is a security feature that controls communication between peer users. Each session comprises of a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate through network ports. In a port mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session that is configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

*Filename:* ALCATEL-IND1-PORT-MAPPING.mib  
*Module:* alcatelIND1PortMappingMIB

A summary of the available commands is listed here:

---

**port-mapping user-port network-port**  
**port-mapping** (configures port mapping status and direction)  
**port-mapping unidirectional bidirectional**  
**port-mapping unknown-unicast-flooding**  
**show port-mapping status**  
**show port-mapping**

---

## port-mapping user-port network-port

Creates a port mapping session with the user ports, network ports, or both user ports and network ports. Use the **no** form of the command to delete ports or a link aggregate group from a session.

**port-mapping** *session\_id* [**user-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg\_id*]  
[**network-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg\_id*]

**no port-mapping** *session\_id* [**user-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg\_id*]  
[**network-port** {*slot chassis/slot* | *chassis/slot/port[-port2]*} | **linkagg** *agg\_id*]

---

### Syntax Definitions

<i>session_id</i>	The port mapping session ID.
<b>user-port</b>	Specifies a user port of the mapping session.
<b>network-port</b>	Specifies a network port of the mapping session.
<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number to be assigned to the mapping session.
<i>slot/port[-port2]</i>	The slot and port number to assign to the mapping session. Use a hyphen to specify a range of ports (1/5-10).
<i>agg_id</i>	The link aggregate ID number to assign to the mapping session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- User ports that are part of one session cannot communicate with each other. The user ports can communicate only through network ports of the session to the other elements of the system.
- User ports can be part of only one port mapping session.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.

### Examples

```
-> port-mapping 3 user-port 2/3 network-port 6/4
-> port-mapping 4 user-port 2/5-8
-> port-mapping 5 user-port 2/3 network-port slot 3
-> no port-mapping 5 user-port 2/3
-> no port-mapping 6 network-port linkagg 7
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">port-mapping</a>	Enables, disables, or deletes a port mapping session.
<a href="#">port-mapping unidirectional bidirectional</a>	Configures the direction of a port mapping session.
<a href="#">port-mapping unknown- unicast-flooding</a>	Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.
<a href="#">show port-mapping</a>	Displays the configuration of one or more port mapping sessions.

## MIB Objects

```
PortMappingSessionTable
  pmapSessionNumber
portMappingTable
  pmapPortIfindex
  pmapPortType
```

---

## port-mapping

Enables, disables, or deletes a port mapping session.

**port-mapping** *session\_id* {**enable** | **disable**}

**no port-mapping** *session\_id*

---

### Syntax Definitions

<i>session_id</i>	The port mapping session ID.
<b>enable</b>	Enables a port mapping session.
<b>disable</b>	Disables a port mapping session.

### Defaults

---

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

To be enabled, a session should have a minimum of two ports.

### Examples

```
-> port-mapping 3 enable
-> port-mapping 4 disable
-> no port-mapping 5
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**port-mapping user-port  
network-port**

Creates a port mapping session with or without the user ports, network ports, or both.

**port-mapping unidirectional  
bidirectional**

Configures the direction of a port mapping session.

**show port-mapping status**

Displays the status of one or more port mapping sessions.

**show port-mapping**

Displays the configuration of one or more port mapping sessions.

## MIB Objects

PortMappingSessionTable

    pmapSessionNumber

    pmapSessionStatus

---

## port-mapping unidirectional bidirectional

Configures the direction of a port mapping session.

**port-mapping** *session\_id* [**unidirectional** | **bidirectional**]

---

### Syntax Definitions

<i>session_id</i>	The port mapping session ID.
<b>unidirectional</b>	Specifies unidirectional port mapping.
<b>bidirectional</b>	Specifies bidirectional port mapping.

### Defaults

---

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<b>unidirectional</b>   <b>bidirectional</b>	<b>bidirectional</b>

---

### Platform Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.
- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session that is in the unidirectional mode.
- To change the directional mode of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

### Examples

```
-> port-mapping 5 enable unidirectional
-> port-mapping 5 disable unidirectional
-> port-mapping 6 enable bidirectional
-> port-mapping 5 disable bidirectional
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**port-mapping user-port  
network-port**

Creates a port mapping session with or without the user ports, network ports or both.

**port-mapping**

Enables, disables, or deletes a port mapping session.

**show port-mapping**

Displays the configuration of one or more port mapping sessions.

## MIB Objects

PortMappingSessionTable

  PmapSessionNumber

  PmapSessionDirection

---

## port-mapping unknown-unicast-flooding

Enables or disables flooding of unicast traffic from all the switch ports to the user ports related to a particular session.

**port-mapping *session\_id* unknown-unicast-flooding {enable | disable}**

---

### Syntax Definitions

<i>session_id</i>	The port mapping session ID.
<b>enable</b>	Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
<b>disable</b>	Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>enable</b>

---

### Platform Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Configuring unknown unicast flooding creates a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration is applied to all the member ports of the aggregate.

### Examples

```
-> port-mapping 1 unknown-unicast-flooding enable
-> port-mapping 2 unknown-unicast-flooding disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>port-mapping user-port network-port</b>	Creates a port mapping session with or without the user ports, network ports or both.
<b>port-mapping</b>	Enables, disables, or deletes a port mapping session.
<b>show port-mapping</b>	Displays the configuration of one or more port mapping sessions.
<b>show port-mapping status</b>	Displays the status of one or more port mapping sessions.

## MIB Objects

portMappingSessionTable  
pmapSessionUnknownUnicastFloodStatus

---

## show port-mapping status

Displays the status of one or more port mapping sessions.

**show port-mapping** [*session\_id*] **status**

---

### Syntax definitions

*session\_id*                      The port mapping session ID.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If you do not specify the port mapping session ID, then the status of all the port mapping sessions are displayed.

### Examples

```
-> show port-mapping status
```

SessionID	Direction	Status	Unknown Unicast
1	bi	enable	drop
2	bi	disable	flood

### output definitions

---

<b>SessionID</b>	Displays the port mapping session ID.
<b>Direction</b>	Displays the direction of a port mapping session.
<b>Status</b>	Displays status of a port mapping session.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

**port-mapping user-port

pmapSessionStatus

---

## show port-mapping

Displays the configuration of one or more port mapping sessions.

**show port-mapping** [*session\_id*]

---

### Syntax Definitions

*session\_id*                      The port mapping session ID.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If you do not specify the port mapping session ID, then the user port and network port information are displayed for all the port mapping sessions active on the switch.

### Examples

```
-> show port-mapping 3
```

SessionID	USR-PORT	NETWORK-PORT
1	1/2	1/3
1	1/6	
1	1/7	

#### *output definitions*

---

<b>SessionID</b>	Displays the port mapping session ID.
<b>USR-PORT</b>	Displays the set of user ports of a port mapping session.
<b>NETWORK-PORT</b>	Displays the set of network ports of a port mapping session.

---

### Release History

Release 7.1.1; command introduced.

# 47 Learned Port Security Commands

Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

*Filename:* ALCATEL-IND1-LPS-MIB.mib  
*Module:* alcatelIND1LearnedPortSecurityMIB

A summary of the available commands is listed here:

---

**port-security**  
**port-security learning-window**  
**port-security convert-to-static**  
**port-security mac**  
**port-security maximum**  
**port-security port max-filtering**  
**port-security mac-range**  
**port-security port violation**  
**port-security learn-trap-threshold**  
**show port-security**  
**show port-security brief**  
**show port-security learning-window**

---

## port-security

Enables or disables Learned Port Security (LPS) on the switch port(s). When LPS is enabled, only devices that have a source MAC address that complies with LPS restrictions are learned on the port(s).

**port-security** {**port** *chassis/slot/port[-port2]* | **chassis**} [**admin-state** {**enable** | **disable** | **locked**}]

**no port-security port** *chassis/slot/port[-port2]*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>chassis</b>	Specifies all LPS ports.
<b>enable</b>	Administratively enables LPS on the specified port(s).
<b>disable</b>	Administratively disables LPS on the specified port(s). All bridged and filtered MAC addresses are cleared, but the static MAC address and LPS configuration for the port is retained. Learning is unrestricted.
<b>locked</b>	Administratively disables all learning on the port. Existing MAC addresses are retained but no additional learning of addresses, except for static MAC addresses, is allowed.

### Defaults

By default, LPS functionality is disabled on all ports.

The following default value applies if the **admin-state** parameter is *not* specified with this command:

parameter	default
<b>admin-state</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove the LPS configuration from the specified port *and* clear all MAC addresses learned on the port. Note that the **chassis** parameter is not supported when using the **no** form of this command.
- The **admin-state disable** option disables LPS on the port but does not clear the LPS configuration.
- Use the **chassis** parameter to administratively disable or enable all active LPS ports with one command. This option does not apply to ports on which LPS was not previously enabled.
- LPS is supported on Ethernet fixed and 802.1Q-tagged ports. However, LPS is *not* supported on ports that are configured as service access ports.

- LPS is not supported on link aggregates, 802.1Q tagged (trunked) link aggregates, or link aggregate member ports.
- Note that when LPS is enabled on an active port, all MAC addresses previously learned on that port are cleared from the source learning MAC address table.
- LPS is also supported on ports that have Universal Network Profile (UNP) functionality enabled, with the following conditions:
  - When LPS is enabled or disabled on a UNP bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
  - UNP authentication and classification is applied first, then LPS rules.
  - If UNP classifies a MAC address as forwarding but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
  - When a MAC address is filtered by LPS, the `show unp user status` command will display “LPS-B” as the profile classification source for that MAC address.
- LPS allows for the configuration of the following source MAC address learning restrictions:
  - A source learning time limit window to specify the length of time learning is allowed on a port.
  - A maximum number of bridged and filtered MAC addresses allowed on a specific port
  - A list of MAC addresses (individual or range of addresses) allowed on a port.
  - How a port handles traffic that is unauthorized.

## Examples

```
-> port-security port 4/8 admin-state enable
-> port-security port 2/1-10 admin-state enable
-> port-security chassis admin-state disable
-> no port-security port 1/1-12
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<code>port-security mac-range</code>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<code>port-security maximum</code>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<code>port-security learning-window</code>	Configures the amount of time, in minutes, to allow source learning on all LPS ports.
<code>port-security port violation</code>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

## MIB Objects

```
learnedPortSecurityTable
  lpsAdminStatus
```

## port-security learning-window

Configures the amount of time, in minutes, to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of *new* MAC addresses is stopped on all LPS ports. Only authorized MAC addresses are allowed to be associated on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

**port-security learning-window** *minutes* [**convert-to-static** {**enable** | **disable**}] [**no-aging** {**enable** | **disable**}] [**learn-as-static** {**enable** | **disable**}] [**mac-move** {**enable** | **disable**}] [**boot-up** {**enable** | **disable**}]

**no port-security learning-window**

---

### Syntax Definitions

<i>minutes</i>	The number of minutes during which LPS allows source learning across all LPS ports. This amount of time defines the LPS learning window. The valid range is 0–2880. When this value is set to zero, the learning window time is set to infinity (no source learning time restriction on LPS ports).
<b>convert-to-static enable</b>	Enables the <b>convert-to-static</b> option for the learning window. Dynamically learned bridged (not filtered) MAC addresses are automatically converted to static addresses when the learning window closes. This option is automatically disabled when the LPS learning window is set to infinity (zero).
<b>convert-to-static disable</b>	Disables the <b>convert-to-static</b> option for the learning window. Dynamically learned MAC addresses are not converted to static addresses and will start to age out when the learning window closes.
<b>no-aging enable</b>	Enables the <b>no-aging</b> option for the learning window. Dynamic bridged MAC addresses are learned as <i>pseudo-static</i> MACs, which do not age out but are not saved in the switch configuration.
<b>no-aging disable</b>	Disables the <b>no-aging</b> option for the learning window. MAC addresses are learned as dynamic addresses that will age out.
<b>learn-as-static enable</b>	Enables the <b>learn-as-static</b> option for the learning window. Bridged MAC addresses are learned as static MAC addresses during the learning window time and regardless of whether or not the <b>convert-to-static</b> option is enabled.
<b>learn-as-static disable</b>	Disables the <b>learn-as-static</b> option for the learning window. Learned bridged MAC addresses are not converted to static until the window is closed <i>and</i> the <b>convert-to-static</b> option is enabled.
<b>mac-move enable</b>	Enables the <b>mac-move</b> option. Allows a pseudo-static MAC address to move to a different port in the same VLAN without getting dropped. Enabling the <b>no-aging</b> option is required to support the <b>mac-move</b> option.
<b>mac-move disable</b>	Disables the <b>mac-move</b> option. Frames from a duplicate pseudo-static MAC address are dropped.

<b>boot-up enable</b>	Enables the automatic start of the LPS learning window timer when the switch restarts.
<b>boot-up disable</b>	Disables the automatic start of the LPS learning window timer when the switch restarts.

## Defaults

By default, the LPS source learning time limit is not set for the switch; the learning window defaults to infinity (source learning is not limited to a specific time frame).

parameter	default
<b>convert-to-static</b>	<b>disable</b>
<b>no-aging</b>	<b>disable</b>
<b>learn-as-static</b>	<b>disable</b>
<b>mac-move</b>	<b>disable</b>
<b>boot-up</b>	<b>enable</b>

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Use the **no** form of this command to clear the learning window time (no learning window time limit is applied to the port).
- The LPS source learning time window is started and/or reset each time the **port-security learning-window** command is issued or when the **port-security learning-window boot-up** option is enabled and the switch restarts.
- Setting the LPS learning window time to 0 (zero) configures an infinite source learning time period for all LPS ports. The learning of MAC addresses on LPS ports never times out.
- When the LPS learning window time is set to zero, all options except the **convert-to-static** option are still valid. For example, the **no-aging** option setting still applies.
- After the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.
- If the **no-aging** option is enabled, then all new bridged MAC addresses are learned as pseudo-static MAC addresses during the learning window time period. Pseudo-static addresses do not age out but are not saved to the switch configuration.
- When the **no-aging** option is enabled and the learning window starts, any MAC addresses that were learned prior to the learning window time period are retained as dynamic addresses; they are not converted to pseudo-static MAC addresses.
- Enabling the **mac-move** option is not allowed unless the **no-aging** option is also enabled. When the **mac-move** option is enabled, disabling the **no-aging** option is *not* allowed.

- If the **convert-to-static** option is enabled, then all dynamic bridged and pseudo-static MAC addresses are converted to static MAC addresses when the learning window closes. Static MAC addresses do not age out and are saved to the switch configuration.

---

**Note.** When UNP is enabled on any one LPS port, the **convert-to-static**, **no-aging**, and **boot-up** parameter options are not supported on *all* LPS-enabled ports. This is because the learning window configuration is global and applies to all LPS ports.

---

## Examples

```
-> port-security learning-window 25
-> port-security learning-window 2 convert-to-static enable
-> port-security learning-window 60 no-aging enable mac-move enable
-> port-security learning-window 0 learn-as-static enable
-> port-security learning-window 500 boot-up disable
-> port-security learning-window 2 convert-to-static enable no-aging enable
-> port-security learning-window 2 no-aging enable convert-to-static enable boot-up
enable learn-as-static enable mac-move enable
-> no port-security learning-window
```

## Release History

Release 7.1.1; command introduced.

Release 7.2.1.R02; **no-aging** and **boot-up** parameters added.

Release 8.2.1; **learn-as-static** and **mac-move** parameters added.

```

---

## port-security convert-to-static

Converts all MAC addresses dynamically learned on the LPS port(s) to static MAC addresses. This command does not apply to MAC addresses that are filtered.

**port-security {port chassis/slot/port[-port2] / chassis} convert-to-static**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>chassis</b>	Specifies all the LPS ports on the chassis.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Converting dynamic MAC addresses to static MAC addresses is not supported on Universal Network Profile (UNP) ports.
- You can stop the aging out of dynamic MAC addresses on the LPS port(s) by converting them to static MAC addresses.
- The number of converted static MAC addresses cannot exceed the maximum number of MAC addresses allowed on the port(s).

---

**Note.** The **port-security convert-to-static** command is not supported on UNP ports.

---

### Examples

```
-> port-security port 4/8 convert-to-static  
-> port-security chassis convert-to-static
```

### Release History

Release 7.2.1.R02; command was introduced.

**Related Commands****port-security**

Enables or disables Learned Port Security (LPS) on the switch port(s).

**port-security maximum**

Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

**MIB Objects**

learnedPortSecurityGlobalGroup

lpsConvertToStatic

---

## port-security mac

Configures a static MAC address on the specified LPS port. This command also enables LPS on the specified port, if LPS is not already active on the port.

**port-security port** *chassis/slot/port[-port2]* **mac** *mac\_address* [**vlan** *vlan\_id*]

**no port-security port** *chassis/slot/port[-port2]* **mac** [**all** | *mac\_address*] [**vlan** *vlan\_id*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>mac_address</i>	MAC address to configure as a static MAC address on the specified LPS port (for example, 00:20:95:00:10:2A).
<b>vlan</b>	The VLAN ID to associate with the specified LPS port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to remove a specific static MAC address or all of the static MAC addresses configured on the specified LPS port. Note that even when all statically configured MAC addresses are removed, LPS remains active on the port.
- A VLAN-port association (VPS) must exist between the specified VLAN and the LPS port. If no VLAN ID is specified with this command, the default VLAN for the LPS port is used.
- The following conditions will display an error or warning message:
  - A VLAN ID is specified that is not associated with the LPS port:
  - An attempt is made to configure a MAC address more than once on the same LPS port with the same VLAN association.
  - A duplicate MAC address is configured on different LPS ports.
- Configuring a multicast MAC address, an all zero MAC address, or a broadcast MAC address is not allowed with this command.
- Use this command instead of the **mac-learning static mac-address** command to create a static MAC address on an LPS port.

### Examples

```
-> port-security port 1/1/20 mac 00:20:95:00:fa:5c
-> port-security port 1/1/1-15 mac 00:da:95:00:00:10
-> no port-security port 1/1/20 mac 00:20:95:00:fa:5c
```

```
-> no port-security port 1/1/1-15 mac 00:da:95:00:00:10

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
ERROR: Vlan 200 is not valid on this port

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
ERROR: Mac 00:2a:95:11:22:10 ALREADY exists on Vlan 200 for port 1/1/20

-> port-security port 1/1/20 mac 00:2a:95:11:22:10 vlan 200
-> port-security port 1/1/21 mac 00:2a:95:11:22:10 vlan 200
WARNING: LPS Static MAC 00:2a:95:11:22:10 already exists on vlan 200 on a different
port
```

## Release History

Release 8.4.1; command introduced.

## Related Commands

## MIB Objects

```
learnedPortSecurityAgL2MacAddressTable
  lpsAgL2MacAddress
  lpsAgL2VlanId
  lpsAgL2MacAddressRowStatus
```

---

## port-security maximum

Specifies the maximum number of bridged MAC addresses that an LPS port(s) is allowed to learn.

**port-security port *chassis/slot/port[-port2]* maximum *number***

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>number</i>	The number of source MAC addresses that are allowed on this port. The valid range is 1–1000.

### Defaults

By default, the number of MAC addresses allowed is set to 1.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

### Examples

```
-> port-security port 2/14 maximum 25
-> port-security port 4/10-15 maximum 100
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>port-security learn-trap-threshold</b>	Configures the number of bridged MAC addresses to learn before sending a SNMP trap.
<b>port-security port violation</b>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

learnedPortSecurityTable  
lpsMaxMacNum

---

## port-security learn-trap-threshold

Configures the number of bridged MAC addresses to learn before sending a SNMP trap.

**port-security port *chassis/slot/port[-port2]* learn-trap-threshold *number***

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>number</i>	The number of bridged MAC addresses to learn before sending a trap. The valid range is 0–1000.

### Defaults

By default, the number of bridged MAC addresses to learn before sending a trap is set to the same value as the maximum number of bridged MAC addresses allowed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.
- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.
- If this threshold value is set to zero, a trap is sent for every MAC address learned on the LPS port.

### Examples

```
-> port-security port 1/10 learn-trap-threshold 6  
-> port-security port 1/10-13 learn-trap-threshold 18
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****port-security maximum**

Configures the maximum number of source MAC addresses that an LPS port is allowed to learn.

**show port-security**

Displays Learned Port Security (LPS) configuration and table entries.

**MIB Objects**

learnedPortSecurityTable

lpsLearnTrapThreshold

---

## port-security port max-filtering

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

**port-security port** *chassis/slot/port[-port2]* **max-filtering** *number*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>number</i>	The maximum number of filtered MAC addresses that are allowed on this port. The valid range is 0–100.

### Defaults

By default, the maximum number of MAC addresses that can be filtered on an LPS port is 5.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the number of filtered MAC addresses learned on the port reaches the maximum, the violation mode (restrict, discard, or shutdown) configured for the port is applied.
- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Even after the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

### Examples

```
-> port-security port 1/10 max-filtering 6  
-> port-security port 1/10-13 max-filtering 18
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

## MIB Objects

learnedPortSecurityTable  
lpsMaxFilteredMacNum

---

## port-security mac-range

Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port. This command also enables LPS on the specified port, if LPS is not already active on the port.

**port-security port chassis/slot/port[-port2] mac-range [low mac\_address / high mac\_address]**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>low mac_address</b>	MAC address that defines the low end of a range of MACs (for example, 00:20:95:00:10:2A).
<b>high mac_address</b>	MAC address that defines the high end of a range of MACs (for example, 00:20:95:00:10:2F).

### Defaults

parameter	default
<b>high mac_address</b>	ff:ff:ff:ff:ff:ff
<b>low mac_address</b>	00:00:00:00:00:00

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If **low** and **high** end MAC addresses are not specified with this command, then the range is set back to the default range value (00:00:00:00:00:00– ff:ff:ff:ff:ff:ff).
- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
- Any additional source MAC addresses received that do not match the configured authorized addresses are not allowed (filtered) on the port, regardless of the LPS learning window time limit or the maximum number of bridged addresses allowed. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.

### Examples

```
-> port-security port 4/20 mac-range low 00:20:95:00:fa:5c
-> port-security port 5/11-15 mac-range low 00:da:95:00:00:10 high
00:da:95:00:00:1f
-> port-security port 5/16-20 mac-range high 00:da:95:00:00:1f
-> port-security port 5/11-15 mac-range
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

```

---

## port-security port violation

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

**port-security port *chassis/slot/port*[-*port2*] violation {**shutdown** | **restrict** | **discard**}**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>shutdown</b>	The port is administratively disabled when the port receives unauthorized traffic. No further traffic is allowed on the port.
<b>restrict</b>	Filters (blocks) unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port. The port remains administratively enabled.
<b>discard</b>	Disables learning on the port when unauthorized traffic is received or the configured maximum number of MAC addresses is reached. The port remains administratively enabled.

### Defaults

By default, the security violation mode is set to **restrict** when LPS is enabled on the port.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When a traffic violation occurs on an LPS port, a notice is sent to the switch log.
- If the violation mode is set to **restrict**, unauthorized source MAC addresses are not learned in the LPS table, but they are recorded in the source learning MAC address table with a filtered operational status. This allows the user to view MAC addresses attempting unauthorized access to the LPS port.

### Examples

```
-> port-security port 2/14 violation restrict
-> port-security port 4/10-15 violation shutdown
-> port-security port 1/37 violation discard
```

### Release History

Release 7.1.1; command introduced.  
Release 7.2.1.R02; **discard** parameter added.

**Related Commands**

```

---

## show port-security

Displays the Learned Port Security (LPS) configuration and table entries.

**show port-security** {**port** [*chassis/slot/port*[-*port2*] / **slot** *chassis/slot*]}

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port2</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<i>slot</i>	Enter the slot number for a module to specify that the command should include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).

### Defaults

By default, all ports with an LPS configuration are displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the **port** parameter with this command to display the LPS configuration for a specific port or a range of ports.
- Use the **slot** parameter with this command to display the LPS configuration for all the ports on a specific slot.
- In addition, MAC addresses learned on the LPS enabled port that are within the specified MAC address range appear as a separate entries in the LPS table as dynamic MAC type addresses.
- The MAC Type field is blank if an authorized MAC address range is configured for the LPS port.

### Examples

```
-> show port-security port 1/1/20
Legend: Mac Address: * = address not valid,
          Mac Address: & = duplicate static address,

Port: 1/1/20
Admin-State      :          ENABLED,
Operation Mode   :          ENABLED,
Max MAC bridged  :              3,
Trap Threshold   :              1,
Violation        :          RESTRICT
Max MAC filtered :              5,
Low MAC Range    :      00:00:00:00:00:00,
High MAC Range   :      ff:ff:ff:ff:ff:ff,
```

Violating MAC MAC	VLAN	NULL MAC TYPE	OPERATION
00:11:22:22:22:21	1	STATIC	bridging
00:11:22:22:22:22	1	STATIC	bridging
00:11:22:22:22:23	1	PSEUDO-STATIC	bridging

*output definitions*

<b>Port</b>	The module slot number and the physical port number on that module.
<b>Admin-State</b>	The LPS administrative state for the port ( <b>Enabled</b> , <b>Disabled</b> , or <b>Locked</b> ). Configured through the <b>port-security</b> command.
<b>Operation Mode</b>	The LPS operational mode for the port ( <b>Enabled</b> , <b>Disabled</b> , <b>Restricted</b> , <b>Shutdown</b> , <b>Discard</b> , <b>Locked</b> , or <b>Filtered-only</b> ).
<b>Max MAC bridged</b>	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the <b>port-security maximum</b> command.
<b>Trap Threshold</b>	The number of bridged MACs to learn before sending a trap. After this number is reached, a trap is sent out for every MAC learned thereafter. If <b>disabled</b> is displayed in this field, the trap threshold is not in force. Configured through the <b>port-security learn-trap-threshold</b> command.
<b>Violation</b>	The security violation mode for the port ( <b>restrict</b> , <b>shutdown</b> , or <b>discard</b> ). Configured through the <b>port-security port violation</b> command.
<b>Max MAC filtered</b>	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the <b>port-security port max-filtering</b> command.
<b>Low MAC Range</b>	MAC address that defines the lower end of a MAC address range. Configured through the <b>port-security mac-range</b> command.
<b>High MAC Range</b>	MAC address that defines the higher end of a MAC address range. Configured through the <b>port-security mac-range</b> command.
<b>Violating MAC MAC</b>	The MAC Address that caused the violation on this port. The MAC address learned dynamically or configured statically on the LPS port. Static MAC addresses configured through the <b>port-security mac</b> command.
<b>VLAN</b>	The VLAN to which the LPS port belongs.
<b>MAC TYPE</b>	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port.
<b>OPERATION</b>	The operational status of the MAC address ( <b>bridging</b> or <b>filtering</b> ).

**Release History**

Release 7.1.1; command introduced.

Release 7.2.1.R02: **Admin-State** and **Violating MAC** fields added.

Release 8.4.1; **MAC Address: \*** = **address not valid** and **MAC Address: &** = **duplicate static address** legend added.

## show port-security brief

Displays the LPS port configuration for all the LPS ports.

**show port-security brief**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The LPS port parameter values are displayed even if the LPS is disabled on the port.
- The operation mode displayed for the LPS port is based on a combination of the existing administrative status and the operational status of the port, the result of which is one of the following values:
  - Enabled
  - Restricted (only when the administrative status is enabled)
  - Shutdown (only when the administrative status is enabled)
  - Discard (only when the administrative status is enabled)
  - Disabled
  - Locked
  - Filtered\_only

### Examples

```
-> show port-security brief
```

Slot/ Port	Operation Mode	Max Bridge	Max Filter	Nb Macs Dyn Br	Nb Macs Dyn Fltr	Nb Macs Static Br	Nb Macs Static Fltr
1/1	ENABLED	5	100	5	10	0	0
1/2	ENABLED	5	100	0	10	5	0
1/3	RESTRICTED	5	100	5	100	0	0
1/4	SHUTDOWN	5	100	-	-	-	0
1/5	DISABLED	5	100	-	-	-	0
1/6	LOCKED	5	100	-	-	3	0

#### *output definitions*

---

<b>Slot/Port</b>	The slot number for the module and the physical port number on that module (e.g., 1/2 specifies port 2 on slot 1).
<b>Operation Mode</b>	Displays the status of the LPS port.

*output definitions*

---

<b>Max Bridge</b>	The maximum number of bridged MAC addresses that are allowed on the LPS port. Configured through the <b>port-security maximum</b> command.
<b>Max Filter</b>	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the <b>port-security port max-filtering</b> command.
<b>Nb Macs Dyn Br</b>	Total number of bridged MAC addresses learned on the LPS port.
<b>Nb Macs Dyn Fltr</b>	Total number of filtered MAC addresses learned on the LPS port.
<b>Nb Macs Static Br</b>	Total number of bridged static MAC addresses (configured static and MAC addresses learned as pseudo-static) on the LPS port.
<b>Nb Macs Static Fltr</b>	Total number of filtered static MAC addresses configured on the LPS port.

## show port-security learning-window

Displays the source learning window configuration.

**show port-security learning-window**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the learning window time is not set, then no source learning time limit is applied to LPS ports.
- Even after the LPS learning window time expires, dynamic MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

### Examples

```
-> show port-security learning-window
Learning-Window           = 2 min,
Convert-to-static         = DISABLE,
No Aging                  = DISABLE,
Boot Up                   = ENABLE,
Remaining Learning Window = 120 sec
Learn As Static           = ENABLE,
Mac Move                  = ENABLE,
```

### *output definitions*

---

#### **Learning-Window**

The configured amount of time during which the LPS port can learn new MAC addresses. This value of this field is set to **INFINITY** when the learning time window is set to zero (no source learning time restriction on LPS ports).

#### **Convert-to-static**

Indicates whether or not dynamic bridged or pseudo-static MACs are converted to static MACs (**ENABLED** or **DISABLED**). This option is always disabled when the LPS learning window is set to infinity (zero).

*output definitions*

---

<b>No Aging</b>	Indicates whether or not bridged MAC addresses are learned as pseudo-static MAC addresses, which do not age out during the LPS learning window time period ( <b>DISABLED</b> or <b>ENABLED</b> ).
<b>Boot Up</b>	Indicates whether or not the LPS learning window automatically starts when the switch boots up ( <b>enabled</b> or <b>disabled</b> ).
<b>Learn As Static</b>	Indicates whether or not dynamic MAC addresses are automatically learned as static MAC addresses during the LPS learning window time period.
<b>Mac Move</b>	Indicates whether or not pseudo-static MAC addresses are allowed to move to a different port in the same VLAN during the LPS learning window time period.
<b>Remaining Learning Window</b>	The remaining amount of time during which the LPS port can learn MAC addresses. If the learning time window is set to <b>INFINITY</b> (zero), this field does not display in the show command output.

---

**Release History**

Release 7.1.1; command introduced.

Release 7.2.1.R02; **LPS Shutdown Config** field changed to **Learning-Window**, **No Aging** and **Boot Up** fields added.

Release 8.2.1; **Learn As Static** and **Mac Move** fields added.

**Related Commands**

# 48 Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the inbound and outbound traffic of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or “mirrored,” port transmits and receives network traffic normally and the “mirroring” port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to capture and examine the data traffic to and from a monitored Ethernet port.

MIB information for the Port Mirroring commands is as follows:

*Filename:* ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB.mib  
*Module:* alcatelIND1PortMirrorMonitoringMIB

The following table summarizes the available commands:

<b>Port Mirroring Commands</b>	<a href="#">port-mirroring source destination</a> <a href="#">port-mirroring</a> <a href="#">show port-mirroring status</a>
<b>Port Monitoring Commands</b>	<a href="#">port-monitoring source</a> <a href="#">port-monitoring</a> <a href="#">show port-monitoring status</a> <a href="#">show port-monitoring file</a>

## port-mirroring source destination

Defines the port to mirror and the port that is to receive data from the mirrored port. Also, enables or disables remote port mirroring.

**port-mirroring** *port\_mirror\_sessionid* **source** {*chassis/slot/port[-port2]* [*chassis/slot/port[-port2]*,...]  
**destination** *chassis/slot/port* [**rpmir-vlan** *vlan\_id*] [**bidirectional** | **inport** | **outport**] [**unblocked** *vlan\_id*]  
[**enable** | **disable**]

**port-mirroring** *port\_mirror\_sessionid* **no source** [*chassis/slot/port[-port2]*] [*chassis/slot/port[-port2]*,...]

---

### Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
<b>source</b>	Specifies source port, or range of ports desired to be mirrored.
<b>destination</b>	Specifies the destination port, that receives all the mirrored packets.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports.
<b>rpmir-vlan</b> <i>vlan_id</i>	Specifies a reserved VLAN to carry the mirroring traffic.
<b>bidirectional</b>	Specifies bidirectional port mirroring.
<b>inport</b>	Specifies incoming unidirectional port mirroring.
<b>outport</b>	Specifies outgoing unidirectional port mirroring.
<b>unblocked</b> <i>vlan_id</i>	Specifies the VLAN that is to be protected from Spanning Tree changes when port mirroring is active. Ports in this VLAN remain unblocked.
<b>enable</b>	Enables port mirroring status.
<b>disable</b>	Disables port mirroring status.

### Defaults

parameter	default
<b>bidirectional</b>   <b>inport</b>   <b>outport</b>	<b>bidirectional</b>
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Port mirroring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same network interface module.
- A mirroring port can not be assigned to a tagged VLAN port.
- When a port is configured as a mirroring port, it does not belong to any VLAN. Inbound traffic to the mirroring port is dropped since it does not belong to any VLAN.
- Spanning tree is disabled by default on a mirroring port.
- Port mirroring is not supported on logical link aggregate ports. However, it is supported on individual ports that are members of a link aggregate.
- Use the **port mirroring source destination** command to define the mirrored port and enable port mirroring status. Use the **port mirroring** command to enable the port mirroring session.
- Specify the *vlan\_id* number of the mirroring port that is to remain **unblocked** when the command is executed. The **unblocked** VLAN becomes the default VLAN for the mirroring port. This VLAN handles the inbound traffic for the mirroring port. Spanning Tree remains disabled on the unblocked VLAN.

## Usage Guidelines - Remote Port Mirroring

- Use the **rpmir-vlan** parameter and VLAN ID with this command to configure remote port mirroring and to assign the VLAN ID for remote port mirroring. Note that remote port mirroring is *not* supported on the OmniSwitch 9900.
- The VLAN ID assigned for remote port mirroring cannot be assigned to a general port mirroring port.
- There must not be any physical loop present in the remote port mirroring VLAN.
- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.
- The QoS redirect feature can be used to override source learning.
- The **mac-learning** command can also be used to disable learning on the RPMIR VLAN ID.

## Examples

```
-> port-mirroring 6 source 2/2
-> port-mirroring 6 source 2/3-5
-> port-mirroring 6 destination 1/12 rpmir-vlan 7
-> port-mirroring 6 no source 2/2-5

-> port-mirroring 7 source 2/3 destination 6/4 unblocked 750

-> port-mirroring 8 source 1/7 bidirectional
-> port-mirroring 8 no source 1/7

-> port-mirroring 9 source 1/23 inport
-> port-mirroring 9 destination 1/24
-> port-mirroring 9 disable
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[port-mirroring](#)

Enables, disables, or deletes a port mirroring session.

[show port-mirroring status](#)

Displays the status of mirrored ports. This value may be enabled or disabled.

## port-mirroring

Enables, disables, or deletes a port mirroring session.

**port-mirroring** *port\_mirror\_sessionid* {**enable** | **disable**}

**no port-mirroring** *port\_mirror\_sessionid*

---

### Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
<b>enable</b>	Enables port mirroring.
<b>disable</b>	Disables port mirroring.

### Defaults

---

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to delete a port mirroring session.
- Use the [port-mirroring source destination](#) command to specify the mirrored ports and destination port. before using this command to enable or disable port mirroring activity for the particular port mirroring session.

### Examples

```
-> port-mirroring 6 enable
-> port-mirroring 6 disable
-> no port-mirroring 6
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[port-mirroring source destination](#)

Defines a port to mirror and the port that is to receive data from the mirrored port, and enables or disables port mirroring status.

[show port-mirroring status](#)

Displays the status of mirrored ports. This value may be enabled or disabled.

## MIB Objects

mirrorTable

mirrorMirroringIfindex

## port-monitoring source

Configures a port monitoring session.

**port-monitoring** *port\_monitor\_sessionid* **source** *chassis/slot/port* [**file** *filename* [**size** *filesize*] | **no file** | **overwrite** {**on** | **off**}] [**inport** | **outport** | **bidirectional**] [**timeout** *seconds*] [**enable** | **disable**] [**capture-type** {**full** | **brief**}]

---

### Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	The slot and port number (3/1).
<i>filename</i>	Specifies a file name and pathname for capturing information related to the monitoring session (for example, <b>/flash/port2.enc</b> ).
<i>filesize</i>	Specifies the size of the file in 64K byte increments. For example, a value of 3 would specify a size of (3 x 64K) bytes.
<b>no file</b>	<i>This option is not supported at this time.</i>
<b>on</b>	Specifies that capturing of data packets into the port monitoring file continues and old information is overwritten if the total data exceeds the specified file size.
<b>off</b>	Specifies that capturing of data packets into the port monitoring file is stopped when the maximum file size is reached.
<b>inport</b>	Specifies incoming unidirectional port monitoring.
<b>outport</b>	Specifies outgoing unidirectional port monitoring.
<i>seconds</i>	Specifies the number of seconds after which the session is disabled.
<b>enable</b>	Enables the port monitoring status.
<b>disable</b>	Disables the port monitoring status.
<b>full</b>	Captures port monitoring information in detail.
<b>brief</b>	Captures only the concise port monitoring data transmitted.

## Defaults

parameter	default
<i>filesize</i>	1
<b>on   off</b>	<b>on</b>
<b>bidirectional   inport   outport</b>	<b>bidirectional</b>
<i>seconds</i>	0
<b>enable   disable</b>	<b>disable</b>
<b>capture-type</b>	<b>brief</b>

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Port monitoring cannot be configured on an AppMon enabled port.
- You can configure a port mirroring and a port monitoring session on the same NI.
- If the port monitoring capture-type is set to **brief**, the first 64 bytes of the traffic is captured. If the port-monitoring capture-type is set to **full**, the entire packet is captured.
- By default, a file called **pmonitor.enc** is created in the **/flash** directory when you configure and enable a port monitoring session. Use the **file** option to create a user-specified file.
- The **/flash** directory is the default and the only directory used to capture the port monitoring files.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).
- By default, the recent frames overwrite the older frames in a port monitoring file if the total data exceeds the specified file size. Use the **overwrite off** option to prevent this from occurring.

## Examples

```
-> port-monitoring 6 source 2/3
-> port-monitoring 6 source 2/3 file /flash/user_port size 2 enable
-> port-monitoring 6 source 2/3 file /flash/user_port capture-type full
```

## Release History

## port-monitoring

Disables, pauses, resume, or deletes an existing port monitoring session.

**port-monitoring** *port\_monitor\_sessionid* {**disable** | **pause** | **resume**}

**no port-monitoring** *port\_monitor\_sessionid*

---

### Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<b>disable</b>	Disables the port monitoring session.
<b>pause</b>	Pauses the port monitoring session.
<b>resumes</b>	Resumes the port monitoring session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **no** form of this command to delete a port monitoring session.

### Examples

```
-> port-monitoring 6 pause
-> port-monitoring 6 disable
-> port-monitoring 6 resume
-> no port-monitoring 6
```

### Release History

Release 7.1.1; command introduced.

## show port-mirroring status

Displays the status of mirrored ports.

**show port-mirroring status** [*port\_mirror\_sessionid*]

---

### Syntax Definitions

*port\_mirror\_sessionid*                      Mirroring session identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If a port mirroring session identifier is not specified with this command, then all port mirroring sessions are displayed.

### Examples

-> show port-mirroring status

Session	Mirror Destination	Mirror Direction	Unblocked Vlan	Config Status	Oper Status
6.	1/41	-	NONE	Enable	Off
	Mirror Source				
6.	1/20	bidirectional	-	Enable	Off
6.	1/21	bidirectional	-	Enable	Off

**show port-monitoring status** [*port\_monitor\_sessionid*]

---

### Syntax Definitions

*port\_monitor\_sessionid*            Monitoring session identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If a port monitoring session identifier is not specified with this command, then all port monitoring sessions are displayed.

### Examples

-> show port-monitoring status

Sess	Mon.	Mon.	Over	Oper.	Admin	Capt.	Max.	File
	Src	Dir	write	Stat	Stat	Type	Size	Name
1.	1/2	Out	OFF	OFF	OFF	Brief	64K	/flash/pm.enc

#### *output definitions*

---

<b>Sess</b>	<b>Session</b> - The port monitoring session identifier.
<b>Mon. Src</b>	<b>Monitor Source</b> - The source ports that are monitored.
<b>Mon Dir</b>	<b>Monitor Direction</b> - The direction of the monitoring session, which can be <b>bidirectional</b> (the default), <b>inport</b> , or <b>outport</b> .
<b>Overwrite</b>	Whether files created by a port monitoring session can be overwritten. The default is ON.
<b>Oper Stat</b>	<b>Operating Status</b> - The current operating status of the port monitoring session (on/off).
<b>Admin Stat</b>	<b>Admin Status</b> - The current administrative status of the port monitoring session (on/off).
<b>Capt Type</b>	<b>Capture type:</b> <b>Brief</b> - captures only 64 bytes of data per traffic data packet. <b>Full</b> - captures the entire packet.
<b>Max Size</b>	<b>Maximum Size</b> - The maximum size of the port monitoring file.
<b>File Name</b>	The name of the port monitoring file.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">port-monitoring source</a>	Configures a port monitoring session.

  monitorDirection
```

---

## show port-monitoring file

Displays port monitoring data.

**show port-monitoring file** *port\_monitor\_sessionid*

---

### Syntax Definitions

*port\_monitor\_sessionid*                      Monitoring session identifier.

### Defaults

A single line from the captured packet is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Only a single line from the captured packet is displayed, even though the full packet is captured. To view the entire packet, download the file and view it using compatible network analyzer tool.

### Examples

-> show port-monitoring file 1

Destination	Source	Type	Data
01:80:C2:00:00:00	00:20:DA:8F:92:C6	BPDU	00:26:42:42:03:00:00:00:00:00

# 49 sFlow Commands

sFlow is a network monitoring technology that gives visibility in to the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn't add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

*Filename:* ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB.mib  
*Module:* alcatelIND1PortMirrorMonitoringMIB

*Filename:* SFLOW-MIB.MIB.mib  
*Module:* sFlow

A summary of the available commands is listed here:

---

**sflow agent**  
**sflow receiver**  
**sflow sampler**  
**sflow poller**  
**show sflow agent**  
**show sflow receiver**  
**show sflow sampler**  
**show sflow poller**

---

## sflow agent

Configures a specific sFlow agent IP address.

**sflow agent ip** *ip\_address*

**no sflow agent ip** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      The sFlow agent IP address.

### Defaults

parameter	default
<i>ip-address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete the IP address.
- If no IP address is configured, 0.0.0.0 is used.
- If no IP address is configured but the Loopback0 address is configured, the Loopback0 address is used.

### Examples

```
-> sflow agent ip 192.168.1.1  
-> no sflow agent ip 192.168.1.1
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.4; command deprecated. Use **ip service source-ip**.

### Related Commands

[show sflow agent](#)                      Displays the agent table.

### MIB Objects

```
mirmonSFlowObjects  
  alasFlowAgentConfigType  
  alasFlowAgentAddressType  
  alasFlowAgentAddress
```

---

## sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination has an instance of the receiver. All these receivers are attached to the sFlow manager instance and to an associated sampler/poller.

**sflow receiver** *receiver\_index* {**name** *string* | **timeout** {*seconds* | **forever**} | **address** {*ip\_address* | *ipv6\_address*} | **udp-port** *port* | **packet-size** *size* **version** *num* | **release**}

---

### Syntax Definitions

<i>receiver_index</i>	Specifies the receiver index.
<i>string</i>	Specifies the name.
<i>seconds</i> / <b>forever</b>	Specifies the timeout value.
<i>ip_address</i>	Specifies the 32-bit IPv4 address.
<i>ipv6_address</i>	Specifies the 128-bit IPv6 address.
<i>port</i>	Specifies the UDP (destination) port.
<i>size</i>	Specifies the maximum number of data bytes ( <i>size</i> ) that can be sent.
<i>num</i>	Specifies the version number.

### Defaults

parameter	default
<i>string</i>	empty
<i>seconds</i>	0
<i>ip_address</i>	0.0.0.0(ipv4)
<i>port</i>	6343
<i>size</i>	1400
<i>version num</i>	5

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **release** form at the end of the command to delete a receiver.

### Examples

```
-> sflow receiver 1 name Golden Rcvr1 address 198.206.181.3
-> sflow receiver 1 release
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[show sflow receiver](#) Displays the receiver table.

## MIB Objects

```
sFlowRcvrTable
  sFlowRcvrIndex
  sFlowRcvrOwner
  sFlowRcvrTimeout
  sFlowRcvrMaximumDatagramSize
  sFlowRcvrAddressType
  sFlowRcvrAddress
  sFlowRcvrPort
  sFlowRcvrDatagramVersion
```

---

## sflow sampler

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

**sflow sampler** *num* **port** *chassis/slot/port[-port]* {**receiver** *receiver\_index* | **rate** *value* | **sample-hdr-size** *size*}

**no sflow sampler** [*chassis\_id*]/*slot/port*[-*port*]

---

### Syntax Definitions

<i>num</i>	Specifies the instance ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i> [- <i>port</i> ]	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the rate value for packet sampling.
<i>size</i>	Specifies the maximum number of bytes (size) that can be copied from a sampled packet.

### Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0
<i>size</i>	128

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.

### Examples

```
-> sflow sampler 1 2/1 receiver 1 rate 5 sample-hdr-size 64
-> no sflow sampler 1 2/1-5
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show sflow sampler**                      Displays the sampler table.

## MIB Objects

```
sFlowFsTable
  sFlowFsDataSource
  sFlowFsInstance
  sFlowFsReceiver
  sFlowFsPacketSamplingRate
  sFlowFsMaximumHeaderSize
```

---

## sflow poller

Gets counter samples from ethernet driver and fills up the counter part of the UDP datagram.

**sflow poller** *num* **port** *chassis/slot/port[-port]* {**receiver** *receiver\_index* | **interval** *value*}

**no sflow poller** *num* [*chassis\_id*]/*slot/port[-port]*

---

### Syntax Definitions

<i>num</i>	Specifies the instance ID.
<i>chassis</i>	The chassis identifier.
<i>slot/port[-port]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-5).
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the maximum number of seconds between successive samples (interval value).

### Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Use the **no** form of this command to delete a poller.

### Examples

```
-> sflow poller 1 1/1 receiver 2 interval 20
-> sflow poller 1 2/6-10 receiver 1 interval 30
-> no sflow poller 1 2/6-10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show sflow poller](#) Displays the poller table.

**MIB Objects**

sFlowCpTable

    sFlowCpDataSource

    sFlowCpInstance

    sFlowCpReceiver

    sFlowCpInterval

---

## show sflow agent

Displays the sFlow agent table.

**show sflow agent**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- It is necessary to execute the **ip interface** command to make a loopback0 IP address as the fixed primary address of the switch to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.
- The loopback address should be an IP interface configured on the switch.

### Examples

```
-> ip interface loopback0 address 198.206.181.100
-> show sflow agent
Agent Version = 1.3; Alcatel; 6.1.1
Agent IP      = 127.0.0.1
```

#### *output definitions*

---

<b>Agent Version</b>	Identifies the version which includes the MIB version, organization name, and the specific software build of the agent.
<b>Agent address</b>	IP address associated with the agent. Configured through the <b>sflow agent</b> command.

---

### Release History

Release 7.1.1; command was introduced.

    sFlowAgentAddress

---

## show sflow receiver

Displays the sFlow receiver table.

**show sflow receiver** [*num*]

---

### Syntax Definitions

*num* Specifies the receiver index.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show sflow receiver
Receiver 1
Name      = Golden
Address   = IP_V4  198.206.181.3
UDP Port  = 6343
Timeout   = 65535
Packet Size= 1400
DatagramVer= 5
```

#### *output definitions*

---

<b>Name</b>	Name of the entry to claim.
<b>Address</b>	IP address of the sFlow collector.
<b>UDP Port</b>	Destination port for sFlow datagrams.
<b>Timeout</b>	Time remaining before the sampler is released and stops sampling.
<b>Packet size</b>	Maximum number of data bytes that can be sent in a single sample datagram.
<b>Datagram ver</b>	Version of sFlow datagrams that should be sent.

---

### Release History

Release 7.1.1; command was introduced.

# 50 RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

*Filename:* RMON-MIB.mib  
*Module:* rmonMibModule

The following table summarizes the available commands:

---

**rmon probes**  
**show rmon probes**  
**show rmon events**

---

## rmon probes

This command enables or disables types of RMON probes.

```
rmon probes {stats | history | alarm} [entry_number] {enable | disable}
```

---

### Syntax Definitions

<b>stats</b>	Ethernet Statistics Table probe entries.
<b>history</b>	History Control Table probe entries.
<b>alarm</b>	Alarm Table probe entries.
<i>entry_number</i>	The entry number in the list of probes ( <i>optional</i> ).
<b>enable</b>	Enables the RMON probe.
<b>disable</b>	Disables the RMON probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

### Examples

```
-> rmon probes stats 4012 enable
-> rmon probes history 10240 disable
-> rmon probes alarm 11235 enable
-> rmon probes stats enable
-> rmon probes history disable
-> rmon probes alarm enable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[show rmon probes](#)

Displays a list of RMON probes or a single RMON probe.

[show rmon events](#)

Displays a list of RMON logged events or a single RMON event.

## MIB Objects

ETHERSTATSTABLE

etherStatsStatus

HISTORYCONTROLTABLE

historyControlStatus

ALARMTABLE

alarmStatus

---

## show rmon probes

Displays a list of RMON probes or a single RMON probe.

**show rmon probes** [**stats** | **history** | **alarm**] [*entry\_number*]

---

### Syntax Definitions

<b>stats</b>	Ethernet Statistics Table probe entries.
<b>history</b>	History Control Table probe entries.
<b>alarm</b>	Alarm Table probe entries.
<i>entry_number</i>	The entry number in the list of probes ( <i>optional</i> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe's *entry\_number* in the command line.
- The **show rmon probes** command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The **show rmon probes entry-number** command displays the following information: Probe's Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

### Examples

```
-> show rmon probes stats
```

Entry	Slot/Port	Flavor	Status	Duration	System Resources
4001	4/1	Ethernet	Active	00:25:00	275 bytes
4008	4/8	Ethernet	Active	00:25:00	275 bytes
4005	4/5	Ethernet	Active	00:25:00	275 bytes

-> show rmon probes history

Entry	Slot/Port	Flavor	Status	Duration	System Resources
1	4/1	History	Active	00:25:00	9063 bytes
10240	4/5	History	Active	00:14:00	601 bytes
10325	4/8	History	Active	00:14:00	601 bytes

-> show rmon probes alarm

Entry	Slot/Port	Flavor	Status	Duration	System Resources
11235	4/8	Alarm	Active	00:07:00	835 bytes

-> show rmon probes stats 4005

Probe's Owner: OmniSwitch Auto Probe on Slot 4, Port 5  
 Entry 4005  
 Flavor = History, Status = Active  
 Time = 48 hrs 54 mins,  
 System Resources (bytes) = 275

-> show rmon probes history 10325

Probe's Owner: Analyzer-p:128.251.18.166 on Slot 4, Port 5  
 History Control Buckets Requested = 2  
 History Control Buckets Granted = 2  
 History Control Interval = 30 seconds  
 History Sample Index = 5859  
 Entry 10325  
 Flavor = History, Status = Active  
 Time = 48 hrs 53 mins,  
 System Resources (bytes) = 601

-> show rmon probes alarm 11235

Probe's Owner: Analyzer-t:128.251.18.166 on Slot 4, Port 8  
 Alarm Rising Threshold = 5  
 Alarm Falling Threshold = 0  
 Alarm Rising Event Index = 26020  
 Alarm Falling Event Index = 0  
 Alarm Interval = 10 seconds  
 Alarm Sample Type = delta value  
 Alarm Startup Alarm = rising alarm  
 Alarm Variable = 1.3.6.1.2.1.16.1.1.1.5.4008  
 Entry 11235  
 Flavor = Alarm, Status = Active  
 Time = 48 hrs 48 mins,  
 System Resources (bytes) = 1677

**output definitions**

---

<b>Probe's Owner</b>	Description and interface (location) of the probe.
<b>Slot/Port</b>	The Slot/Port number (interface) that this probe is monitoring.
<b>Entry</b>	The Entry number in the list of probes.
<b>Flavor</b>	Whether the probe type is Ethernet, History, or Alarm.

*output definitions (continued)*

---

<b>Status</b>	The status of the probe— <b>Creating</b> (the probe is under creation), <b>Active</b> (the probe is Active), or <b>Inactive</b> (the probe is inactive).
<b>Duration</b>	Elapsed time (hours/minutes/seconds) since the last change in status.
<b>System Resources</b>	Amount of memory that has been allocated to this probe.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

    etherStatsIndex  
HISTORYCONTROLTABLE  
    historyControlIndex  
ALARMTABLE  
    alarmIndex

---

## show rmon events

Displays RMON events (actions that take place based on alarm conditions detected by the RMON probe).

**show rmon events** [*entry\_number*]

---

### Syntax Definitions

*entry\_number*                      The entry number in the list of probes (*optional*).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To display a list of logged events, omit the *entry\_number* from the command line.
- To display statistics for a particular event, include the *entry\_number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events** *entry\_number* command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

### Examples

```
-> show rmon events
```

Entry	Time	Description
1	00:08:00	etherStatsPkts.4008: [Falling trap] "Falling Event"
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

```
-> show rmon events 2
```

Entry	Time	Description
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

#### *output definitions*

---

<b>Entry</b>	The entry number in the list of probes.
<b>Time</b>	Time (hours, minutes, and seconds) since the last change in status.
<b>Description</b>	Description of the Alarm condition detected by the probe.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

# 51 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

A summary of the available commands is listed here.

---

**swlog**  
**swlog syslog-facility-id**  
**swlog appid**  
**swlog output**  
**swlog output flash-file-size**  
**swlog advanced**  
**swlog size-trap-threshold**  
**swlog clear**  
**show log swlog**  
**show swlog**

---

## swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

**swlog** {**enable** | **disable** | **preamble** | **hash-time-limit** *seconds* | **duplicate-detect** | **console level** *num* | **gmt-time** {**enable** | **disable**}}

**no swlog** [**preamble** | **duplicate-detect**]

---

### Syntax Definitions

<b>enable</b>	Enables the switch logging functionality.
<b>disable</b>	Disables the switch logging functionality.
<b>preamble</b>	Enables or disables the display of the preamble to the console.
<b>hash-time-limit</b> <i>seconds</i>	Configures the amount of elapsed time for an entry to no longer be considered a duplicate entry.
<b>duplicate-detect</b>	Enables or disables the duplicate detection capability.
<b>console level</b> <i>num</i>	The severity level filter keyword or numeric value for the application ID. (see table for <b>swlog appid</b> command).
<b>gmt-time enable</b>	Enables the logging of entries in Greenwich Mean Time (GMT) time.
<b>gmt-time disable</b>	Disables the logging of entries in GMT time.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<b>preamble</b>	<b>enable</b>
<b>hash-time-limit</b> <i>num</i>	<b>60 seconds</b>
<b>duplicate-detect</b>	<b>enable</b>
<b>console level</b> <i>num</i>	<b>5 (info)</b>
<b>gmt-time</b> { <b>enable</b>   <b>disable</b> }	<b>disable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to enable or disable the **preamble** and **duplicate-detect** setting.
- The syslog preamble includes the level, appid, and timestamp that precedes the actual log messages.
- If duplicate entries are received within the configured **hash-time-limit**, only a single entry will be logged along with the number of times duplicated.

## Examples

```
-> swlog enable
-> swlog hash-time-limit 30
-> no swlog preamble
```

## Release History

Release 7.1.1; command was introduced.  
Release 8.3.1.R02; **gmt-time** parameter added.

## Related Commands

<a href="#">swlog appid</a>	Defines the level at which switch logging information will be filtered for the specified application.
<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

## MIB Objects

```
systemSwitchLogging
  systemSwitchLoggingEnable
  systemSwitchLoggingPreamble
  systemSwitchLoggingHashAgeLimit
  systemSwitchLoggingDuplicateDetect
  systemSwitchLoggingConsoleLevel
  systemSwitchLoggingGmtTime
```

---

## swlog syslog-facility-id

Specifies a facility ID that switch logging includes in the priority (PRI) section of the event message.

**swlog syslog-facility-id** {*facility\_id* | *num*}

---

### Syntax Definitions

<i>facility_id</i>	A facility identification keyword. Current facility IDs are listed in the table below.
<i>num</i>	A numerical equivalent value for the facility ID. The range is 0–23. Current numeric equivalent values are listed in the table below.

---

### Supported Facility IDs with Numerical Equivalents

kernel - 0	NTP - 12
user - 1	log-audit - 13
mail - 2	log-alert - 14
system - 3	clock2 - 15
sec-auth1-2	local0 - 16
syslog - 5	local1 - 17
lptr - 6	local2 - 18
net-news - 7	local3 - 19
UUCP - 8	local4 - 20
clock1 - 9	local5 - 21
sec-auth2 - 10	local6 - 22
FTP - 11	local7 - 23

### Defaults

parameter	default
<i>facility_id</i>	local0
<i>num</i>	16

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the ID name (**system**) or the numeric equivalent to specify the facility ID.

### Examples

```
-> swlog syslog-facility-id system
-> swlog syslog-facility-id 3
-> swlog syslog-facility-id user
-> swlog syslog-facility-id 1
```

## Release History

Release 8.3.1; command introduced.

## Related Commands

<a href="#">swlog</a>	Enables or disables switch logging.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

## MIB Objects

systemSwitchLogging  
systemSwitchLoggingSysLogFacilityId

---

## swlog appid

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured.

**swlog appid** {all | *string*} {library {all | *string*} | subapp {all | *num*} | exclude {all | *num*}} {disable | enable | level {*level* | *num*} [*vrf num*]}

---

### Syntax Definitions

<i>string</i>	An application or library identification keyword. Enter a question mark (?) on the command line to get a list of application or library IDs.
<b>subapp</b> <i>num</i>	A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.
<b>exclude</b> <i>num</i>	A numerical equivalent value for the subapp ID. Enter a question mark (?) on the command line to get a list of subapp IDs.
<b>disable</b>	Enables the logging of the associated application.
<b>enable</b>	Disables the logging of the associated application.
<b>level</b> <i>level</i>   <i>num</i>	The severity level filter keyword or numerical equivalent value for the application ID ( <i>see table below</i> ). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.
<b>vrf</b> <i>num</i>	The VRF ID.

Supported Levels	Numeric Equivalents	Description
<b>off</b>	<b>0</b>	Disabled
<b>alarm</b>	<b>1</b>	Highest severity. The system is about to crash and reboot.
<b>error</b>	<b>2</b>	System functionality is reduced.
<b>alert</b>	<b>3</b>	A violation has occurred.
<b>warning</b>	<b>4</b>	A unexpected, non-critical event has occurred.
<b>info</b>	<b>5</b>	Any other non-debug message (default).
<b>debug1</b>	<b>6</b>	A normal event debug message.
<b>debug2</b>	<b>7</b>	A debug-specific message.
<b>debug3</b>	<b>8</b>	All debug messages.

### Defaults

Default severity level is **info**.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

Use the **show swlog appid** command to display available registered applications.

## Examples

```
-> swlog appid all subid all enable
-> swlog appid mvrpNi subapp 1 level 8
-> show swlog appid mvrpNi
```

```
Application Name           : mvrpNi,
```

SubAppl ID	Sub Application Name	Level	VRF	Level
1	main	error	VRF	1-64 info

```
-> swlog appid ?
```

## Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **exclude** parameter added.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog output</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>show log swlog</b>	Displays stored switch logging information from flash.
<b>show swlog</b>	Displays switch logging information.

## MIB Objects

```
systemSwitchLogging
  systemSwitchLoggingAppName
  systemSwitchLoggingLibraryName
  systemSwitchLoggingLevel
```

---

## swlog output

Enables or disables switch logging output to the console, file, or data socket (remote session).

**swlog output** {tty {enable | disable} | console | flash | socket *ip\_address* [remote command-log] [vrf-name *name*]}

**no swlog output** {console | flash | socket *ip\_address*}

---

### Syntax Definitions

<b>tty enable</b>	Enables switch logging to a connected Telnet session.
<b>tty disable</b>	Disables switch logging to a connected Telnet session.
<b>console</b>	Specifies console output. When enabled, switch logging output is printed to the user console.
<b>flash</b>	Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system.
<b>socket</b>	Specifies data socket output. When enabled, switch logging output is printed to a remote session.
<i>ip_address</i>	The IPv4 or IPv6 address for the remote session host.
<b>remote command-log</b>	Enables command logging to a remote session host.
<i>name</i>	Specifies the VRF to be used to access the remote syslog server.

### Defaults

parameter	default
console   flash   socket	flash and console

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- You can send output to a syslog server using the **socket** keyword, followed by the IP address of the remote host. Up to 12 servers can be configured.
- VRF name must either be 'default' or a pre-defined VRF (user-defined).

### Examples

```
-> swlog output console
-> no swlog output flash
-> swlog output socket 14.1.1.1
-> swlog output socket 14.1.1.1 vrf-name vrf1
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf-name** parameter added.

Release 8.3.1; **remote command-log** parameter added.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid</b>	Defines the level at which switch logging information will be filtered for the specified application.
<b>show log swlog</b>	Displays stored switch logging information from flash.
<b>show swlog</b>	Displays switch logging information.

## MIB Objects

```
systemSwitchLogging
  systemSwitchLoggingTty
  systemSwitchLoggingFlash
  systemSwitchLoggingSocket
  systemSwitchLoggingSocketIpAddr
  systemSwitchLoggingConsole
systemSwitchLoggingHostTable
  systemSwitchLoggingHostIpAddr
  systemSwitchLoggingHostPort
  systemSwitchLoggingHostStatus
  systemSwitchLoggingHostUserCommandHost
  systemSwitchLoggingHostVrfName
```

---

## swlog output flash-file-size

Configures the size of the switch logging file.

**swlog output flash-file-size** *kilobytes*

---

### Syntax Definitions

*kilobytes*

The size of the switch logging file in kilobytes. The range is 125–12500.

### Defaults

parameter	default
<i>kilobytes</i>	1250

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the [show hardware-info](#) command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog output flash-file-size 256
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[swlog advanced](#)

Clears the files that store switch logging data.

[show log swlog](#)

Displays stored switch logging information from flash.

[show swlog](#)

Displays switch logging information.

### MIB Objects

systemSwitchLogging

systemSwitchLoggingFileSize

---

## swlog advanced

Enable or disable switch logging in RFC5424 format.

`swlog advanced {enable | disable}`

---

### Syntax Definitions

**enable** Enable switch logging in RFC5424 format.  
**disable** Disable switch logging in RFC5424 format.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- By default, the switch logs the messages in BSD syslog format (RFC3164) to files and remote syslog servers.
- When switch logging RFC5424 format is enabled, the old RFC3164 syslog messages are reformatted to comply with the RFC5424 before writing to files or sending to remote syslog servers.

### Examples

```
-> swlog advanced enable  
-> swlog advanced disable
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

[show swlog](#) Displays switch logging information.

### MIB Objects

systemSwitchLoggingSyslogProtocol

---

## swlog size-trap-threshold

Configures the threshold limit of the storage space used for swlog record storage. When the storage reaches the configured threshold limit a notification is displayed in the swlog message.

**swlog size-trap-threshold** *threshold*

---

### Syntax Definitions

*threshold*                      The percentage of storage space to be set as threshold limit. The valid range is 50–90.

### Defaults

parameter	default
<i>threshold</i>	90

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to configure the threshold limit of the storage space used for swlog record storage.
- Use the [swlog clear](#) command to clear the files that store switch logging data.

### Examples

```
-> swlog size-trap-threshold 90
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

<a href="#">swlog clear</a>	Clears the files that store switch logging data.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

systemSwitchLoggingSizeTrapThreshold

---

## swlog clear

Clears the files that store switch logging data.

**swlog clear**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

```
systemSwitchLogging  
  systemSwitchLoggingClear
```

---

## show log swlog

Displays stored switch logging information.

**show log swlog**

**show log swlog [timestamp *mm/dd/yyyy hh:mm:ss*] [slot *num*]**

---

### Syntax Definitions

*mm/dd/yyyy hh:mm:ss*

Specify the starting time for the switch logging information to be displayed. Use the format *mm/dd/yyyy hh:mm:ss* where *mm* represents the month, *dd* is the day, *yyyy* is the year, *hh* is the hour, *mm* is the minutes and *ss* is the seconds. Use four digits to specify the year.

*num*

The slot number to display the logging information for. *Currently not supported.*

### Default

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the switch logging display is too long, you may use the **swlog advanced** command to clear all of the switch logging information.
- The use of **grep** and the **timestamp** parameter can be used to filter the log files.
- When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command. Only those users who provide the valid ASA credentials are allowed to view the data. For more information on Authenticated Switch Access - Enhanced Mode mode, refer to the “Managing Switch Security” chapter in *OmniSwitch AOS Release 8 Switch Management Guide*.

### Examples

```
-> show log swlog timestamp 09/30/2011 13:27:00
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
-> show log swlog | grep ChassisSupervisor
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>
```

```
Sep 28 13:25:15 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
Sep 30 13:26:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

```
Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

When the switch is in ASA enhanced mode, both user name and password is prompted to view the SWLOG data using **show log swlog** command.

```
-> show log swlog
Username: test
Password:  *****
```

**show log swlog | grep error** and **show log swlog | grep more** commands are not supported in enhanced mode.

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid</b>	Adds or removes a filter level for a specified subsystem.
<b>swlog output</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>swlog advanced</b>	Clears the files that store switch logging data.
<b>show swlog</b>	Displays switch logging information.

## MIB Objects

N/A

---

## show swlog

Displays switch logging information (for example, switch logging status, log devices, application IDs with non-default severity level settings).

**show swlog [library | appid {all | string} | dying-gasp-station]**

---

### Syntax Definitions

<b>library</b>	Displays the entire library for all application IDs.
<i>string</i>	The name of the application ID to display. Enter a question mark (?) on the command line to get a list of application IDs.
<b>dying gasp-station</b>	Displays switch logging information for Dying Gasp entries.

### Defaults

By default, the switch logging configuration for the switch is displayed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> show swlog
Operational Status           : Running,
File Size per file           : 1250 Kbytes,

# 52 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

*Filename:* ALCATEL-IND1-HEALTH-MIB.mib  
*Module:* alcatelIND1HealthMonitorMIB

A summary of the available commands is listed here:

---

**health threshold**  
**health interval**  
**show health configuration**  
**show health**  
**show health all**

---

## health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and flash usage.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user.

**health threshold** {*rx percent* | *txrx percent* | **memory percent** | **cpu percent** | **flash percent**}

---

### Syntax Definitions

<b>rx</b>	Specifies the maximum input (RX) traffic threshold.
<b>txrx</b>	Specifies the maximum output/input (TX/RX) traffic threshold.
<b>memory</b>	Specifies the maximum RAM memory usage threshold.
<b>cpu</b>	Specifies the maximum CPU usage threshold.
<b>flash</b>	Specifies the maximum flash usage threshold.
<i>percent</i>	The new threshold value, in percent, for the corresponding resource ( <b>rx</b> , <b>txrx</b> , <b>memory</b> , <b>cpu</b> , <b>flash</b> ). The valid range is 1–100.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>percentage</i>	80

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to [page 52-5](#), or refer to the chapter titled “Diagnosing Switch Problems” in the *OmniSwitch AOS Release 8 Network Configuration Guide*.
- To view the current health threshold values, use the [show health configuration](#) command.

## Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show health configuration](#)      Displays the current health threshold settings.

## MIB Objects

```
HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
  healthThreshFlashLimit
```

---

## health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

**health interval** *seconds*

---

### Syntax Definitions

*seconds* Sampling interval (in seconds). Valid entries are 10, 12, 15, 20, 30.

### Defaults

parameter	default
<i>seconds</i>	10

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

Decreasing the polling interval may impact switch performance.

### Examples

```
-> health interval 20
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show health](#) Displays the current health sampling interval.

### MIB Objects

HealthThreshInfo  
healthSamplingInterval

---

## show health configuration

Displays current health configuration settings.

**show health configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show health configuration
Rx Threshold                = 80,
TxRx Threshold              = 80,
CPU Threshold               = 80,
Memory Threshold           = 80,
Flash Threshold            = 80,
Sampling Interval (Secs)   = 10
```

### *output definitions*

---

#### **Rx Threshold**

The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for *incoming traffic* on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the [health threshold](#) command.

#### **TxRx Threshold**

The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for *all incoming and outgoing traffic*. As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the [health threshold](#) command.

#### **CPU Threshold**

Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the [health threshold](#) command.

*output definitions (continued)*

---

<b>Memory Threshold</b>	Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the <b>health threshold</b> command.
<b>Flash Threshold</b>	Displays the current flash usage threshold. The default value is 80 percent and can be changed using the <b>health threshold</b> command.
<b>Sampling Interval</b>	Displays the sampling interval time period in seconds. Sampling interval can be changed using the <b>health interval</b> command.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>health threshold</b>	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage and CPU usage.
<b>health interval</b>	Configures the sampling interval between health statistics checks.

**MIB Objects**

```
HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
```

---

## show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

**show health** [*port chassis/slot/port* | *slot chassis/slot[-slot2]*] [*statistics*]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	To view a specific port, enter the slot and port number (3/1) along with the <b>port</b> keyword (port 3/1).
<i>slot[-slot2]</i>	To view a series of slots, enter the range of slot numbers along with the <b>slot</b> keyword (1-10).
<b>statistics</b>	Optional command syntax. It displays the same information as the <b>show health</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

### Examples

```
-> show health
```

CMM Resources	Current	1 Min Avg	1 Hr Avg	1 Day Avg
CPU	0	0	0	0
Memory	30	30	24	24

```
-> show health port 4/3
```

Port 04/03 Resources	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
Receive	80	01	01	01	01
Transmit/Receive	80	01	01	01	01

---

<b>Receive</b>	Traffic received by the switch.
<b>Transmit/Receive</b>	Traffic transmitted and received by the switch.
<b>Memory</b>	Switch memory.
<b>CPU</b>	Switch CPU.
<b>Limit</b>	Currently configured device threshold levels.
<b>Curr</b>	Current device bandwidth usage.
<b>1 Min Avg</b>	Average device bandwidth usage over a 1-minute period.
<b>1 Hr Avg</b>	Average device bandwidth usage over a 1-hour period.
<b>1 Hr Max</b>	Maximum device bandwidth usage over a 1-hour period (the maximum of the 1 minute averages).

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [show health all](#)

Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

## MIB Objects

```

  healthModuleCpu1HrAvg
  healthModuleCpu1HrMax
```

---

## show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

**show health all {memory | cpu | rx | txrx}**

---

### Syntax Definitions

<b>memory</b>	Displays the RAM memory health statistics for all active NI modules in the switch.
<b>cpu</b>	Displays the CPU health statistics for all active NI modules.
<b>rx</b>	Displays the health statistics for traffic <i>received</i> on all active NI modules.
<b>txrx</b>	Displays the health statistics for traffic both <i>transmitted and received</i> on all active NI modules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show health all memory
```

```
* - current value exceeds threshold
```

Memory	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
01	80	40	40	40	40
02	80	40	40	40	40
03	80	40	40	40	40
04	80	40	40	40	40
05	80	40	40	40	40
06	80	40	40	40	40
07	80	40	40	40	40
13	80	40	40	40	40

*output definitions*

---

<b>Memory (Cpu, TXX, RX)</b>	A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if <b>show health all cpu</b> is entered, <b>Cpu</b> is used as the column header.
<b>Limit</b>	Current usage threshold for the specified resource type, on the corresponding slot (in percent). The usage threshold refers to the maximum amount of the resource's total bandwidth that can be used by switch applications before a notification is sent to the user. The default value for all resource types is 80 percent. This threshold can be changed using the <b>health threshold</b> command.
<b>Curr</b>	Current usage of the resource on the corresponding slot, in percent (the amount of the total resource bandwidth actually being used by the switch applications).
<b>1 Min Avg</b>	Average usage of the resource on the corresponding slot over a one minute period.
<b>1 Hr Avg</b>	Average usage of the resource on the corresponding slot over a one hour period.
<b>1 Hr Max</b>	The highest average hourly usage for the resource on the corresponding slot.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**show health**

Displays the health statistics for the switch.

**health threshold**

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, and CPU usage.

# 53 Ethernet OAM Commands

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

*Filename:* Alcatel-IND1-ETHERNET-OAM-MIB.mib  
*Module:* alcatelIND1EoamMIB

*Filename:* IEEE8021-CFM-MIB.mib  
*Module:* ieee8021CfmMib

A summary of the available commands is listed here:

---

## ethoam vlan

Creates an association between Primary VID and Non-Primary VID(s).

**ethoam vlan** *vlanid\_list* **primary-vlan** *vlan\_id*

**no ethoam vlan** *vlanid\_list*

---

### Syntax Definitions

*vlanid\_list*                      A list of VLAN Identifiers (e.g., '10 30-40' or '10').  
*vlan\_id*                            VLAN Identifier (e.g., '20').

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either 'mhf' is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan *vlan\_id*) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the **no** form of this command to dissociate Primary VID from the Non-Primary VID(s).

### Examples

```
-> ethoam vlan 10 primary-vlan 20
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam vlan](#)

Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

## MIB Objects

```
dotlagCfmVlanTable  
  dotlagCfmVlanComponentId  
  dotlagCfmVlanVid  
  dotlagCfmVlanPrimaryVid  
  dotlagCfmVlanRowStatus
```

---

## ethoam domain

Creates an Ethernet domain with a specific name.

**ethoam domain** *md\_name* **format** {**none** | **dnsname** | **mac-address-uint** | **string**} **level** *num*

**no ethoam domain** *name*

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<b>none</b>	This format is supported for the inter-op with ITU-T Y.1731.
<b>dnsname</b>	Domain Name like string, globally unique text string derived from a DNS name.
<b>mac-address-uint</b>	MAC address + 2-octet (unsigned) integer.
<b>string</b>	Character String.
<i>num</i>	MD Level and it ranges from 0 to 7.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Maximum domain length is 43.
- Use format as 'none' for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs, and MIPs configured in the MD.

### Examples

```
-> ethoam domain MD format none level 3
-> ethoam domain MD1 format string level 4
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam](#)

Displays the information of all the Management Domains (MD) configured on the bridge.

### [show ethoam domain](#)

Displays the information of a specific Management Domain configured on the bridge.

## MIB Objects

dot1agCfmMdTable

dot1agCfmMdName

dot1agCfmMdFormat

dot1agCfmMdLevel

---

## ethoam domain mhf

Configure the Message Handling Function (MHF) value for MD entry.

```
ethoam domain md_name mhf {none | explicit | default}
```

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	No MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.
<b>default</b>	MHFs can be created.

### Defaults

---

parameter	default
<b>none   explicit   default</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Domain must be created before it is modified.

### Examples

```
-> ethoam domain MD mhf default
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam](#) Displays the information of all the Management Domains (MD) configured on the bridge.

### MIB Objects

```
dotlagCfmMdTable  
  dotlagCfmMdName  
  dotlagCfmMdMhfCreation
```

---

## ethoam domain id-permission

Configures the ID-permission value for MD entry.

**ethoam domain** *md\_name* **id-permission** {none | chassisid}

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present. System name shall be filled as Chassis ID.

### Defaults

parameter	default
none   chassisid	none

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Domain must be created before it is modified.

### Examples

```
-> ethoam domain MD id-permission chassisid
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

<a href="#">show ethoam default-domain configuration</a>	Displays the values of scalar Default-MD objects.
<a href="#">show ethoam domain</a>	Displays the information of a specific Management Domain configured on the bridge.

### MIB Objects

```
dotlagCfmMdTable
  dotlagCfmMdName
  dotlagCfmMdIdPermission
```

---

## ethoam association

Creates Maintenance Association (MA) entry.

**ethoam association** *ma\_name* **format** {*vpnid* | **unsignedint** | **string** | **primaryvid** | **icc-based**} **domain** *md\_name* **primary-vlan** *vlan\_id*

**no ethoam association** *ma\_name* **domain** *md\_name*

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<b>vpnid</b>	As specified in RFC 2685 VPN ID.
<b>unsignedint</b>	2-octet unsigned integer.
<b>string</b>	Character String.
<b>primaryvid</b>	Primary VLAN ID (12 bits represented in a 2-octet integer).
<b>icc-based</b>	This format is supported for inter-op with ITU-T.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<i>vlan_id</i>	Primary VLAN Identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as 'icc-based' to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.

### Examples

```
-> ethoam association MA format string domain MD primary-vlan 100
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

[show ethoam domain association](#)

Displays the information of a specified MA in a Management Domain configured on the bridge.

## MIB Objects

dotlagCfmMaNetTable

dotlagCfmMaNetFormat

dotlagCfmMaNetName

dotlagCfmMaNetRowStatus

dotlagCfmMaCompTable

dotlagCfmMaComponentId

dotlagCfmMaCompPrimaryVid

dotlagCfmMaCompRowStatus

---

## ethoam association mhf

Configures the MIP Half Function (MHF) value for MA Entry.

**ethoam association** *ma\_name* **domain** *md\_name* **mhf** {**none** | **default** | **explicit** | **defer**}

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.
<b>defer</b>	The creation of MHFs is determined by the corresponding MD object 'dot1agCfmMdmhfCreation'.

### Defaults

parameter	default
<b>none</b>   <b>explicit</b>   <b>default</b>   <b>defer</b>	<b>defer</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- MA must be created before it is modified.
- On modification of 'mhf' for any MA, Automip shall also be invoked for all VLANs associated with this primary VID.

### Examples

```
-> ethoam association MA domain MD mhf-creation defer
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

**show ethoam domain association** Displays the information of a specified MA in a Management Domain configured on the bridge.

**show ethoam default-domain** Displays the information of the default MA.

## MIB Objects

dot1agCfmMaNetTable

dot1agCfmMaNetName

dot1agCfmMaCompTable

dot1agCfmMaCompMhfCreation

---

## ethoam association id-permission

Configure id-permission value for MA Entry.

**ethoam association** *ma\_name* **domain** *md\_name* **id-permission** {**none** | **chassisid** | **defer**}

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name used while creating the management domain for which this management association is created.
<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
<b>defer</b>	The contents of the Sender ID TLV are determined by the corresponding MD object 'dot1agCfmMdIdPermission'.

### Defaults

parameter	default
<b>none  chassisid   defer</b>	<b>defer</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

MA must be created before it is modified.

### Examples

```
-> ethoam association MA domain MD id-permission defer
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

**show ethoam domain association**

Displays the information of a specified MA in a Management Domain configured on the bridge.

**show ethoam domain**

Displays the information of a specific Management Domain configured on the bridge.

## MIB Objects

dot1agCfmMaNetTable

dot1agCfmMaNetName

dot1agCfmMaCompTable

dot1agCfmMaCompMidPermission

---

## ethoam association ccm-interval

Modifies the Continuity Check Message (CCM) transmission interval of an Ethernet OAM Maintenance Association.

**ethoam association** *ma\_name* **domain** {*md\_name* | *mac\_address*} **ccm-interval** {**interval-invalid** | **interval100ms** | **interval1s** | **interval10s** | **interval1m** | **interval10m**}

---

### Syntax Definitions

<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 53-5</a> .
<b>interval-invalid</b>	Specifies that no CCMs are sent by a MEP.
<b>interval100ms</b>	Specifies the CCMs are sent every 100 milli seconds.
<b>interval1s</b>	Specifies that CCMs are sent every 1 second.
<b>interval10s</b>	Specifies that CCMs are sent every 10 seconds.
<b>interval1m</b>	Specifies that CCMs are sent every minute.
<b>interval10m</b>	Specifies that CCMs are sent every 10 minutes.

### Defaults

parameter	default
<b>interval-invalid</b>   <b>interval100ms</b>   <b>interval1s</b>   <b>interval10s</b>   <b>interval1m</b>   <b>interval10m</b>	<b>interval10s</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The *ma\_name* should be unique amid all those used by or available to the service provider within a domain.

### Examples

```
-> ethoam association MA domain MD ccm-interval interval10s
```

### Release History

Release 7.3.1; command was introduced.

## Related Commands

### [show ethoam domain](#)

Displays the information of a specific Management Domain configured on the bridge.

## MIB Objects

```
dotlagCfmMaNetTable
  dotlagCfmMaNetName
dotlagCfmMaCompTable
  dotlagCfmMaCompMIdPermission
```

---

## ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

**ethoam association** *ma\_name* **domain** {*md\_name* | *mac\_add*} **endpoint-list** *mep\_id*[-*mep\_id2*]

**no ethoam association** *ma\_name* **domain** {*md\_name* | *mac\_add*} **endpoint-list** *mep\_id*[-*mep\_id2*]

---

### Syntax Definitions

<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain command on page 53-5</a> .
<i>mac_add</i>	Specifies the CFM system MAC address.
<i>mep_id</i> [- <i>mep_id2</i> ]	Specifies the MEP number. Use a hyphen to specify a range of MEP numbers.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The *ma\_name* should be unique within a domain.

### Examples

```
-> ethoam association MA domain MD endpoint-list 100-200
-> no ethoam association MA domain MD endpoint-list 100-200
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam domain association](#) Displays the information of a specified MA in a Management Domain configured on the bridge.

**MIB Objects**

dotlagCfmMdTable

    dotlagCfmMdName

dotlagCfmMaNetTable

    dotlagCfmMaNetName

DotlagCfmMaMepList

    dotlagCfmMaMepListIdentifier

    dotlagCfmMaMepListRowStatus

---

## clear ethoam statistics

Clear statistics for all MEPs or for a particular MEP.

**clear ethoam statistics** [**domain** *md\_name* **association** *ma\_name* **endpoint** *mep\_id*]

---

### Syntax Definitions

<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mep_id</i>	MEP Identifier. Valid Range is 1-8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

Statistics are cleared for all MEPs if a specific MEP is not entered with this command.

### Examples

```
-> clear ethoam statistics
-> clear ethoam statistics domain MD association MA endpoint 10
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam statistics](#) Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

### MIB Objects

```
dotlagCfmMdTable
  dotlagCfmMdName
dotlagCfmMaNetTable
  dotlagCfmMaNetName
dotlagCfmMepTable
  dotlagCfmMepIdentifier
  alaCfmMepClearStats
  alaCfmGlobalClearStats
```

---

## ethoam default-domain level

Configure the effective level of all default domain entries with the level value set to **no level**.

**ethoam default-domain level** *num*

**no ethoam default-domain**

---

### Syntax Definitions

*num* The MD level value. The valid range is 0-7.

### Defaults

Default value is 0.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The MD level specified with this command applies to all default domain values that are currently set to **no level**.

### Examples

```
-> ethoam default-domain level 1
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam default-domain configuration](#) Displays the values of scalar Default-MD objects.

### MIB Objects

Dot1agCfmDefaultMdLevel

---

## ethoam default-domain mhf

Configure the effective MHF value for all default domain entries with MHF value set to **defer**.

```
ethoam default-domain mhf {none | default | explicit}
```

```
no ethoam default-domain
```

---

### Syntax Definitions

<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.

### Defaults

Default value is none.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ethoam default-domain mhf default
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam default-domain configuration](#) Displays the values of scalar Default-MD objects.

### MIB Objects

```
dot1agCfmDefaultMdDefMhfCreation
```

---

## ethoam default-domain id-permission

Configures the effective ID permission value for all default domain entries with the ID permission value set to **defer**.

**ethoam default-domain id-permission {none | chassisid}**

**no ethoam default-domain**

---

### Syntax Definitions

<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

### Defaults

Default value is none.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> ethoam default-domain id-permission chassisid
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[show ethoam default-domain configuration](#) Displays the default domain configuration.

### MIB Objects

```
dot1agCfmDefaultMdDefIdPermission
```

---

## ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

**ethoam default-domain primary-vlan** {*vlan\_id*} [**level** {**no-level** | *num*}] [**mhf** {**none** | **default** | **explicit** | **defer**}] [**id-permission** {**none** | **chassisid** | **defer**}]

**no ethoam default-domain**

---

### Syntax Definitions

<i>vlan_id</i>	VLAN Identifier.
<b>no-level</b>	MD level is inherited from the default domain level.
<i>num</i>	MD Level. Valid range is 0 to 7.
<b>none</b>	No MHFs can be created.
<b>default</b>	MHFs can be created.
<b>explicit</b>	MHFs can be created only if a MEP is created at some lower MD Level.
<b>defer</b>	MHF defers to the default domain MHF value.
<b>none</b>	Sender ID TLV is not to be sent.
<b>chassisid</b>	Chassis ID Length, Chassis ID Subtype, and Chassis ID TLV are to be present.
<b>defer</b>	ID permission defers to the default domain ID permission value.

### Defaults

parameter	default
<b>no-level</b> / <i>num</i>	<b>no-level</b>
<b>none</b>   <b>explicit</b>   <b>default</b>   <b>defer</b>	<b>defer</b>
<b>none</b>   <b>chassisid</b>   <b>defer</b>	<b>defer</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANs associated with this primary VID.

## Examples

```
-> ethoam default-domain primary-vlan 10 id-permission chassisid level 3 mhf default.  
-> ethoam default-domain primary-vlan 10 id-permission chassisid  
-> ethoam default-domain primary-vlan 10 level 3  
-> ethoam default-domain primary-vlan 10 mhf default  
-> ethoam default-domain primary-vlan 10 level 3 mhf default
```

## Release History

Release 7.3.1; command was introduced..

## Related Commands

[show ethoam default-domain](#) Displays the information of all the default MD.

## MIB Objects

```
dotlagCfmDefaultMdTable  
  dotlagCfmDefaultMdComponentId  
  dotlagCfmDefaultMdPrimaryVid  
  dotlagCfmDefaultMdLevel
```

---

## ethoam endpoint

Creates a Maintenance End Point (MEP) and virtual MEP.

**ethoam endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name* **direction** {**up** | **down**} {**port** *chassis/slot/port* | **virtual** | **linkagg** *agg\_id*} [**primary-vlan** *vlan\_id*]

**no ethoam endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Association name for the created Ethernet OAM Association.
<b>up</b>	For UP MEP.
<b>down</b>	For DOWN MEP.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Physical slot and port number on which MEP needs to be created.
<b>virtual</b>	Keyword for creating virtual MEP.
<i>agg_id</i>	Linkagg Identifier on which MEP needs to be created.
<i>vlan_id</i>	VLAN Identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to delete a maintenance endpoint.
- The *mep\_id* must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.
- For creating a virtual MEP the value of port must be given the keyword “virtual”.

## Examples

```
-> ethoam endpoint 10 domain MD association MA direction up port 1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-
vlan 100
-> no ethoam endpoint 10 domain MD association MA
```

## Release History

Release 7.3.1; command was introduced.

```

---

## ethoam endpoint admin-state

Configures the administrative state of MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name admin-state  
{enable | disable}
```

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<b>enable</b>	Administratively enables MEP.
<b>disable</b>	Administratively disables MEP.

### Defaults

The default value is disable.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The *mep\_id* specified must already exist in the switch configuration.

### Examples

```
-> ethoam endpoint 100 domain MD association MA admin-state enable
```

### Release History

Release 7.3.1; command was introduced.

## ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name rfp {enable | disable}
```

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<b>enable</b>	Administratively enables RFP on MEP.
<b>disable</b>	Administratively disables RFP on MEP.

### Defaults

The default value of RFP is disable.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The *mep\_id* specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.

### Examples

```
-> ethoam endpoint 1 domain md1 association ma1 rfp enable
```

## ethoam endpoint ccm

Configures the MEP to generate Continuity Check Messages (CCM).

```
ethoam endpoint mep_id domain {md_name | mac_address} association ma_name ccm {enable | disable}
```

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM association. Up to 48 (minus the domain name length) characters may be used.
<b>enable</b>	Enables MEP to generate CCMs.
<b>disable</b>	Disables MEP to generate CCMs.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain MD association MA ccm enable
```

### Release History

## ethoam endpoint priority

Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **priority**  
*ccm\_ltm\_priority*

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>ccm_ltm_priority</i>	Priority value for CCMs and LTMs transmitted by the MEP. The valid range is 0–7.

### Defaults

parameter	default
<i>ccm_ltm_priority</i>	7

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain MD association MA priority 6
```

## ethoam endpoint lowest-priority-defect

Configures the lowest priority fault alarm for the lowest priority defect for a MEP.

**ethoam endpoint** *mep\_id* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* **lowest-priority-defect** *lowest\_priority\_defect*

---

### Syntax Definitions

<i>mep_id</i>	Specifies the Maintenance Association End Point. The range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>lowest_priority_defect</i>	The lowest priority defect that can generate a Fault alarm. Possible values are <b>xcon</b> , <b>rem-err-xcon</b> , <b>no-defect</b> , <b>mac-rem-err-xcon</b> , <b>err-xcon</b> , and <b>all-defect</b> .

### Defaults

parameter	default
<i>lowest_priority_defect</i>	mac-rem-err-xcon

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

The *mep\_id* should be unique amid all those used by or available to the service provider in the specified MA.

### Examples

```
-> ethoam endpoint 100 domain esd.ale.com association ale-sales lowest-priority-defect all-defect
```

### Release History

## ethoam linktrace

Enables the maintenance entity to initiate transmitting Link Trace Messages (LTM).

**ethoam linktrace** {**target-macaddress** *mac\_address* | **target-endpoint** *t\_mepid*} **source-endpoint** *s\_mepid* **domain** {*md\_name* | *mac\_address*} **association** *ma\_name* [**flag** [**fdb-mpdb** | **fdbonly**]] [**hop-count** *hop\_count*]

---

### Syntax Definitions

<i>mac_address</i>	Target MAC address to be transmitted.
<i>t_mepid</i>	Specifies the MEP for which the Loopback message is targeted.
<i>s_mepid</i>	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<b>domain</b> <i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<b>fdbonly</b>	Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.
<i>hop_count</i>	Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2 <sup>32</sup> .

### Defaults

parameter	default
<b>flag</b>	<b>fdbonly</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.

## Examples

```
-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD
association flag fdbonly hop-count 32
Transaction Id: 6943
```

```
-> ethoam linktrace target-endpoint 15 source 4 domain MD association
Transaction Id: 6934
```

## Release History

Release 7.3.1; command was introduced.

```

---

## ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

**ethoam loopback** {**target-endpoint** *t\_mepid* | **target-macaddress** *mac\_address*} **source-endpoint** *s\_mepid* **domain** *md\_name* **association** *ma\_name* [**number** *num*] [**data** *string*] [**vlan-priority** *vlan\_priority*] [**drop-eligible** {**true** | **false**}]

---

### Syntax Definitions

<i>t_mepid</i>	Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.
<i>mac_address</i>	Target MAC address to be transmitted.
<i>s_mepid</i>	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>num</i>	Number of loopback messages. The valid range is 1-10.
<i>string</i>	Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1–255.
<i>vlan_priority</i>	VLAN Priority. The valid range is 0-7.
<b>true</b>	Sets the drop eligibility bit in the VLAN tag to true.
<b>false</b>	Sets the drop eligibility bit in the VLAN tag to false.

### Defaults

parameter	default
<i>num</i>	1
<i>vlan_priority</i>	CCM priority
<b>drop-eligible</b> { <b>true</b>   <b>false</b> }	<b>true</b>

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

## Examples

```
-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA
number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms
Reply form 00:0E:B1:6B:43:89: bytes=64 seq=0 time=112ms
Request timed out.
----00:E0:B1:6B:43:89 ETH-LB Statistics----
3 packets transmitted, 2 packets received, 33% packet loss

```

---

## ethoam fault-alarm-time

Configures the timeout value for the Fault Notification Generation Alarm time that specifies the time interval during which one or more defects should be detected before the fault alarm is issued.

**ethoam fault-alarm-time** *centiseconds* **endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name*

**no ethoam fault-alarm-time** **endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

<i>centiseconds</i>	The Fault Notification Generation Alarm timeout value, in centiseconds. The valid range is 250–1000.
<i>mep_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

### Defaults

parameter	default
<i>centiseconds</i>	250

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

### Examples

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.ale.com association
ale_sales
-> no ethoam fault-alarm-time endpoint 100 domain esd.ale.com association ale_sales
```

### Release History

## MIB Objects

DotlagCfmMep

dotlagCfmMepFngAlarmTime

---

## ethoam fault-reset-time

Configures the timer value for the Fault Notification Generation Reset time that specifies the time interval during which the fault alarm is re-enabled to process faults. The fault alarm will only be re-enabled if no new faults are received during this time interval.

**ethoam fault-reset-time** *centiseconds* **endpoint** *mep\_id* **domain** *md\_name* **association** *ma\_name*

**no ethoam fault-reset-time endpoint** *mep\_id* **domain** *ma\_name* **association** *ma\_name*

---

### Syntax Definitions

<i>centiseconds</i>	The Fault Notification Generation Reset timer value, in centi seconds. The valid range is 250–1000.
<i>mep_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

### Defaults

parameter	default
<i>centiseconds</i>	1000

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Reset timeout value to the default value.
- The Fault Notification Generation Reset timer value is configurable per MEP.

### Examples

```
-> ethoam fault-reset-time 250 end-point 100 domain esd.ale.com association
ale_sales
-> no ethoam fault-reset-time end-point 100 domain esd.ale.com association
ale_sales
```

### Release History

## ethoam one-way-delay

Initiates a one-way-delay measurement (1DM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

**ethoam one-way-delay** {**target-endpoint** *t\_mepid* | **target-macaddress** *mac\_address*} **source-endpoint** *s\_mepid* **domain** *md\_name* **association** *ma\_name* [**vlan-priority** *vlan\_priority*]

---

### Syntax Definitions

<i>t_mepid</i>	Target MEP ID. The valid range is 1-8191.
<i>mac_address</i>	Target MAC address.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>vlan_priority</i>	VLAN Priority. The valid range is 0-7.

### Defaults

parameter	default
<i>vlan_priority</i>	7

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating 1DM.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if its status is RMEP\_OK or RMEP\_FAILED, before initiating 1DM. So **target-macaddress** can be used to bypass such a restriction.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- If the 1DM is initiated with a **target-macaddress** and an egress port is found for this MAC address, then the 1DM frames are transmitted from that port. Otherwise, 1DM frames are flooded in the MEP's VLAN.
- One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

## Examples

```
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
-> ethoam one-way-dealy target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

```

---

## ethoam two-way-delay

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

**ethoam two-way-delay** {**target-endpoint** *t\_mepid* | **target-macaddress** *mac\_address*} **source-endpoint** *s\_mepid* **domain** *md\_name* **association** *ma\_name* [**vlan-priority** *vlan\_priority*]

---

### Syntax Definitions

<i>t_mepid</i>	Target MEP ID. The valid range is 1-8191.
<i>mac_address</i>	Target MAC address.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>vlan_priority</i>	VLAN Priority. The valid range is 0-7.

### Defaults

parameter	default
<i>vlan_priority</i>	7

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if the status is RMEP\_OK or RMEP\_FAILED, before initiating two-way-delay. So **target-macaddress** can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.
- If the DMM is initiated by UP MEP with a **target-macaddress** and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP's VLAN.
- Two-way delay measurement does *not* require NTP clock synchronization on the sending and receiving MEPs.

- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure an SAA for continuous two-way frame delay measurement.

## Examples

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
Reply from 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

[show ethoam two-way-delay](#) Displays the two-way-delay delay and jitter parameters for all entries or for the MAC address of a specific MEP.

## MIB Objects

    alaCfmMepTWDTMacAddress
    alaCfmMepTWDTMepIdentifier
    alaCfmMepTWDTPriority
```

---

## clear ethoam

Delete all the one-way-delay or two-way-delay entries.

```
clear ethoam {one-way-delay-table | two-way-delay-table}
```

---

### Syntax Definitions

**one-way-delay-table** Clears the one-way delay measurement table.

**two-way-delay-table** Clears the two-way delay measurement table.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> clear ethoam one-way-delay-table  
-> clear ethoam two-way-delay-table
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[ethoam one-way-delay](#) Initiates the two one-way-delay messages from a particular MEP to an RMEP.

### MIB Objects

```

---

## show ethoam

Displays the information of all the Management Domains (MD) configured on the bridge.

**show ethoam**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

This command displays all the MAs for all the MDs.

### Examples

```
-> show ethoam
System Configuration
  Ethernet OAM system mac address: 00:D0:95:EC:84:B0,
  Number of Maintenance Domains: 1
  Maintenance Domain: esd.ale.com
  Maintenance Association: ale-sales
```

### *output definitions*

---

<b>Ethernet OAM system mac address</b>	The MAC address of the Ethernet OAM system.
<b>Number of Maintenance Domains</b>	The number of maintenance domains configured on the bridge.
<b>Maintenance Domain</b>	The name of the maintenance domain.
<b>Maintenance Association</b>	The name of the maintenance association.

---

## show ethoam domain

Displays the information of a specific Management Domain configured on the bridge.

**show ethoam domain** *md\_name*

---

### Syntax Definitions

*md\_name* Specifies the management domain name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam domain MD
Total number of MAs configured in this MD = 1
MD Attributes
  MD-Format : string,
  MD-Level : level-3,
  MD-MHFstatus : mhfNone,
  MD-IdPermission : sendIdNone
  Maintenance Association : MA
    MA-Format : string,
    Primary Vlan : 199,
    Associated Vlan-list : none,
    Total Number of Vlans : 1,
    MA-MHFstatus : mhfNone,
    MA-IdPermission : sendIdNone,
    CCM-interval : interval10s,
    MEP-List(MEP-Id) : 10
```

#### *output definitions*

---

<b>MD-level</b>	The level at which the MD was created.
<b>MD-MHFstatus</b>	Indicates whether the maintenance entity can create MHFs for this MD. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> .
<b>Maintenance Association</b>	The name of the maintenance association.
<b>Vlan</b>	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
<b>MA-MHFstatus</b>	Indicates whether the maintenance entity can create MHFs for this MA. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> .

*output definitions (continued)*

---

<b>CCM-interval</b>	The interval between the CCM transmissions.
<b>MEP-Id</b>	Indicates the Maintenance End Point.

---

**Release History**

## show ethoam domain association

Displays the information of a specific MA in a Management Domain configured on the bridge.

**show ethoam domain** *md\_name* **association** *ma\_name*

---

### Syntax Definitions

*md\_name* Specifies the management domain name.  
*ma\_name* Specifies the name of the Ethernet OAM Association.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam domain MD association MA
Total number of MEPs configured in this MA = 1
MA-Format : string,
Primary Vlan : 100,
Associated Vlan-list : none,
Total Number of Vlans : 1,
MA-MHFstatus : mhfDefer,
MA-IdPermission : sendIdDefer,
CCM-interval : interval10s,
MEP-List(MEP-Id) : 1-5,
```

Legend: MEP-Id: \* = Inactive Endpoint

MEP-ID	Admin State	Direction	Mac-Address	Port	Primary Vlan
1	disable	up	00:E0:B1:A0:78:A3	virtual	100

### output definitions

---

<b>Primary Vlan</b>	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
<b>MA-MHFstatus</b>	Indicates whether the maintenance entity can create MHFs for this MA. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> .
<b>CCM-interval</b>	The interval between the CCM transmissions.
<b>MEP-ID</b>	Indicates the Maintenance End Point.
<b>Admin State</b>	Indicates the administrative state ( <b>up</b> or <b>down</b> ) of the MEP.

*output definitions (continued)*

---

<b>Direction</b>	The direction of the MEP.
<b>MAC Address</b>	The MAC address of the MEP.
<b>Port</b>	The slot/port number of the Bridge port to which the MEP is attached.

## show ethoam domain association end-point

Displays the information of a specific MEP in a Management Domain configured on the bridge.

**show ethoam domain** *md\_name* **association** *ma\_name* **end-point** *mep\_id*

---

### Syntax Definitions

<i>md_name</i>	Specifies the management domain name.
<i>ma_name</i>	Specifies the name of the Ethernet OAM Association.
<i>mep_id</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam domain MD association MA endpoint 10
Admin State : disable,
Direction : up,
Slot/Port: virtual,
MacAddress: 00:E0:B1:A0:78:A3,
Fault Notification : FNG_RESET,
CCM Enabled : disabled,
RFP Status : enabled,
CCM Linktrace Priority : 7,
CCM Not Received : false,
CCM Error defect : false,
CCM Xcon defect : false,
MEP RDI defect : false,
MEP Last CCM Fault : not specified,
MEP Xcon Last CCM Fault : not specified,
MEP Error Mac Status : false,
MEP Lbm NextSeqNumber : 0,
MEP Ltm NextSeqNumber : 32157,
Fault Alarm Time : 250,
Fault Reset Time : 1000,
Lowest PrDefect Allowed : DEF_MAC_REM_ERR_XCON,
Highest PrDefect Present : DEF_NONE
```

#### *output definitions*

---

<b>Admin State</b>	Indicates the administrative state ( <b>up</b> or <b>down</b> ) of the MEP.
<b>Direction</b>	The direction of the MEP.

*output definitions (continued)*

---

<b>Slot/Port</b>	The slot/port number of the Bridge port to which the MEP is attached. If the value is virtual, it indicates a virtual port.
<b>MAC Address</b>	The MAC address of the MEP.
<b>Fault Notification</b>	Indicates the current state of the MEP Fault Notification Generator State Machine, which can be <b>FNG_RESET</b> , <b>FNG_DEFECT</b> , <b>FNG_REPORT_DEFECT</b> , <b>FNG_DEFECT_REPORTED</b> , or <b>FNG_DEFECT_CLEARING</b> .
<b>RFP Status</b>	Indicates the status of the RFP.
<b>CCM Enabled</b>	Indicates whether the MEP generates CCMs ( <b>enabled</b> ) or not ( <b>disabled</b> ).
<b>CCM Linktrace Priority</b>	Indicates the priority value for CCMs and LTMs transmitted by the MEP.
<b>CCM Not Received</b>	Indicates if CCMs are not being received ( <b>true</b> ) or received ( <b>false</b> ) from at least one of the configured remote MEPs.
<b>CCM Error defect</b>	Indicates if a stream of erroneous CCMs is being received ( <b>true</b> ) or not ( <b>false</b> ) from a MEP in this MA.
<b>CCM Xcon defect</b>	Indicates if a stream of CCMs is being received ( <b>true</b> ) or not ( <b>false</b> ) from a MEP that belongs to another MA.
<b>MEP RDI Received</b>	Indicates that any other MEP in this MA is transmitting the RDI bit. Options include <b>true</b> or <b>false</b> .
<b>MEP Last CCM Fault</b>	The last-received CCM that triggered a MA fault.
<b>MEP Xcon Last CCM Fault</b>	The last-received CCM that triggered a cross-connect fault.
<b>MEP Error Mac Status</b>	Indicates a port status TLV. Options include <b>true</b> or <b>false</b> .
<b>MEP Lbm NextSeqNumber</b>	The next Transaction Identifier or Sequence Number to be sent in an LBM.
<b>MEP Ltm NextSeqNumber</b>	The next Transaction Identifier or Sequence Number to be sent in an LTM.
<b>Fault Alarm Time</b>	The time interval during which one or more defects should be detected before the fault alarm is issued
<b>Fault Reset Time</b>	The time interval during which the fault alarm is re-enabled to process faults
<b>Lowest PrDefect Allowed</b>	The lowest priority defect that allowed to generate fault alarm.
<b>Highest PrDefect Present</b>	The highest priority defect since the MEPs Fault Notification Generator in reset state.

## show ethoam default-domain configuration

Displays the level, MHF, and ID permission values for the default domain.

**show ethoam default-domain configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam default-domain configuration
Level : 3,
MHF-Creation : mhfdefault,
ID-Permission : sendIdnone
```

### *output definitions*

---

<b>Level</b>	The level assigned to the default domain. Configured through the <a href="#">ethoam default-domain level</a> command.
<b>MHF-creation</b>	Indicates the MHF value for a VLAN that is part of the default MD. Options include <b>none</b> , <b>explicit</b> , or <b>default</b> . Configured through the <a href="#">ethoam default-domain mhf</a> command.
<b>ID-Permission</b>	The ID permission of the default domain. Configured through the <a href="#">ethoam default-domain id-permission</a> command.

---

### Release History

## show ethoam remote-endpoint domain

Displays the information of all remote MEPs learned as a part of the CCM message exchange.

**show ethoam remote-endpoint domain** *md\_name* **association** *ma\_name* **end-point** *s\_mepid* [**remote-mep** *r\_mepid*]

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>ma_name</i>	Specifies the name of the Ethernet OAM Association.
<i>s_mepid</i>	Specifies the MEP of a specific MA. The valid range is 1–8191.
<i>r_mepid</i>	The remote MEP. The valid range is 1–8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam remote-endpoint domain MD association MA endpoint 10
Legends: PortStatusTlv: 1 = psBlocked, 2 = psUp, 0 = psNoTlv
         InterfaceStatusTlv: 1 = ifUp, 2 = ifDown, 4 = ifUnknown, 0=ifNoTlv
```

RMEP-ID	RMEP Status	OkFailed Time	Mac Address	port Tlv	I/f Tlv	RDI value	Ch-id Subtype	Ch-id
20	RMEP_OK	634600	00:E0:B1:6E:41:65	2	1	false	LCL-ASND	DUT-1
30	RMEP_OK	334600	00:E0:B1:6E:41:64	2	1	false	LCL-ASND	DUT-2

#### output definitions

---

<b>MEP-ID</b>	Indicates the Maintenance End Point.
<b>RMEP Status</b>	The operational state of the remote MEP Remote State machines for this MEP, which can be <b>RMEP_IDLE</b> , <b>RMEP_START</b> , <b>RMEP_FAILED</b> , or <b>RMEP_OK</b> .
<b>OkFailed Time</b>	The time (SysUpTime) when the Remote MEP state machine last entered either the <b>RMEP_FAILED</b> or <b>RMEP_OK</b> .
<b>MacAddress</b>	The MAC address of the remote MEP.
<b>Port Status Tlv</b>	The MAC status TLV last received.
<b>I/f Status Tlv</b>	The interface status TLV last received.

---

**Note:** Output shown above is not accurate as it is adjusted to display it in the single row. Following are modified:

P/S Tlv - Port Status Tlv  
I/F Tlv - I/F Status Tlv  
Ch-id Subtype - Chassis ID Subtype  
Ch-id - Chassis ID  
LCL-ASND - LOCALLY\_ASSIGNED

## Release History

Release 7.3.1; command was introduced.

## show ethoam linktrace-reply

Displays the content of the Linktrace reply (LTR) returned by a previously transmitted LTM. This command displays the LTR based on the transaction identifier or sequence number of the LTM for which the LTR is to be displayed.

**show ethoam linktrace-reply domain *md\_name* association *ma\_name* endpoint *s\_mepid* tran-id *num***

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>s_mepid</i>	Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.
<i>num</i>	Specifies the Transaction ID or sequence number returned from a previously transmitted LTM.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- “LTM operation successful. Target is reachable.” – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- “LTM operation unsuccessful. Target not reachable.” – This message suggests that LTM is successfully initiated but the target is not reachable.
- “LTM operation unsuccessful. Target is reachable.” – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- “LTM operation in progress.” – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- “LTM Timed out.”- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.

### Examples

```
-> show ethoam linktrace-reply domain MD association MA endpoint 10 tran-id 1256
LTM operation successful. Target is reachable.
Ttl : 63,
  LTM Forwarded : yes,
  Terminal MEP : no,
  Last Egress Identifier : 00-00:00:D0:95:EA:79:62,
  Next Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
  Relay Action : RLY_FDB,
  Chassis ID Subtype : LOCALLY_ASSIGNED,
```

```

Chassis ID : DUT-2,
Ingress Action : ING_OK,
Ingress Mac : 00:D0:95:EA:9E:D4,
Ingress Port ID Subtype : LOCALLY_ASSIGNED,
Ingress Port ID : 1/1,
Egress Action : EGR_OK,
Egress Mac : 00:D0:95:EA:9E:D5,
Egress Port ID Subtype : LOCALLY_ASSIGNED,
Egress Port ID : 1/2

Ttl : 62,
LTM Forwarded : no,
Terminal MEP : yes,
Last Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
Next Egress Identifier : 00-00:00:00:00:00:00:00,
Relay Action : RLY_HIT,
Chassis ID Subtype : LOCALLY_ASSIGNED,
Chassis ID : DUT-3,
Ingress Action : ING_OK,
Ingress Mac : 00:D0:95:EA:AB:D2,
Ingress Port ID Subtype : LOCALLY_ASSIGNED,
Ingress Port ID : 1/1,
Egress Action : EGR_NONE,
Egress Mac : 00:00:00:00:00:00,
Egress Port ID Subtype : NONE,
Egress Port ID : none

```

### *output definitions*

---

<b>Ttl</b>	Time to live field for the returned LTR.
<b>LTM Forwarded</b>	Indicates whether the LTM was forwarded or not.
<b>Terminal MEP</b>	Indicates whether the MP reported in the reply Ingress/Egress TLV is a MEP.
<b>Last Egress Identifier</b>	Identifies the MEP linktrace initiator that originated, or the responder that forwarded, the LTM to which this LTR is the response.
<b>Next Egress Identifier</b>	Identifies the linktrace responder that transmitted this LTR, and can forward the LTM to the next hop.
<b>Relay Action</b>	Indicates how the dataframe targeted by the LTM would be passed to Egress bridge port. Options include <b>RLY_HIT</b> , <b>RLY_FDB</b> , or <b>RLY_MPDB</b> .
<b>Ingress Action</b>	Indicates how the dataframe targeted by the LTM would be received on the receiving MP. Options include <b>ING_NONE</b> , <b>ING_OK</b> , <b>ING_DOWN</b> , <b>ING_BLOCKED</b> , or <b>ING_VID</b> .
<b>Ingress Mac</b>	The MAC address returned in the ingress MAC address field.
<b>Egress Action</b>	Indicates how the dataframe targeted by the LTM would be passed through Egress bridge port. Options include <b>ING_NONE</b> , <b>ING_OK</b> , <b>ING_DOWN</b> , <b>ING_BLOCKED</b> , or <b>ING_VID</b> .
<b>Egress Mac</b>	The MAC address returned in the egress MAC address field.

---

## show ethoam linktrace-tran-id

Displays the transaction identifiers returned by previously generated LTMs from a specified MEP.

**show ethoam linktrace-tran-id domain** {*md\_name* / *mac\_address*} **association** *ma\_name* **endpoint** *mep\_id*

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Name of the Ethernet OAM Association.
<i>mep_id</i>	Specifies the MEP for which the LTR is to be displayed. The valid range is 1-8191.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam linktrace-tran-id domain esd.ale.com association ale-sales endpoint
3
S.No   Transaction Id
-----+-----
      1    13357,
      2    13358,
      3    13359,
```

#### output definitions

---

<b>S.No</b>	Indicates the sequence number.
<b>Transaction Id</b>	Indicates the Transaction Identifier returned from a previously transmitted LTM.

---

### Release History

Release 7.3.1; command was introduced.

**Related Commands****ethoam linktrace**

Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

**MIB Objects**

DotlagCfmLtr

dotlagCfmLtrSeqNumber

---

## show ethoam vlan

Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

**show ethoam vlan** *vlan\_id*

---

### Syntax Definitions

*vlan\_id* VLAN ID, primary or non-primary VID (e.g. '10').

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam vlan 10
Primary Vlan : 10,
Associated Vlan-list : 15-20 25 50-80
```

```
-> show ethoam vlan 15
Primary Vlan : 10,
Associated Vlan-list : 15-20 25 50-80
```

### Release History

Release 7.3.1; command was introduced.

### Related Commands

[ethoam endpoint](#) Enables the maintenance entity to initiate transmitting loopback messages (LBMs) and obtaining loopback replies.

### MIB Objects

## show ethoam statistics

Displays the Ethernet OAM of all the Management Domains configured on the bridge. Also, displays the statistics of all the MAs and matching MEPs for all the MDs.

**show ethoam statistics domain** {*md\_name* / *mac\_address*} [**association** *ma\_name*] [**end-point** *mep\_id*]

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name.
<i>mac_address</i>	Specifies the CFM system MAC address.
<i>ma_name</i>	Specifies the name of Ethernet OAM Association.
<i>mep_id</i>	Specifies a MEP for a specific MA.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam statistics domain MD
MEP-ID  CCM  CCM Seq  LBR  LBR Out  LBR  LBR Bad  Unexpected  MA
        Out   Error   In   of order  Out   MSDU    LTR In
-----+-----+-----+-----+-----+-----+-----+-----+-----
          3    105      0      0          0      0          0          0  MA
```

```
-> show ethoam statistics domain MD association MA
MEP-ID  CCM  CCM Seq  LBR  LBR Out  LBR  LBR Bad  Unexpected
        Out   Error   In   of order  Out   MSDU    LTR In
-----+-----+-----+-----+-----+-----+-----+-----+-----
          3    105      0      0          0      0          0          0
```

```
-> show ethoam statistics domain MD association MA endpoint 3
MEP-ID  CCM  CCM Seq  LBR  LBR Out  LBR  LBR Bad  Unexpected

          3    105      0      0          0      0          0          0
```

### output definitions

---

<b>MEP-Id</b>	The MEP ID configured in the specified MA.
<b>CCM Out</b>	The total number of CCMs transmitted.
<b>CCM Seq Error</b>	The total number of out-of-sequence CCMs received from all remote MEPs.

---

*output definitions*

---

<b>LBR In</b>	The total number of valid, in-order LBRs received.
<b>LBR Out of order</b>	The total number of valid, out-of-order LBRs received.
<b>LBR Out</b>	The total number of LBRs transmitted.
<b>LBR Bad MSDU</b>	The total number of LBRs received whose mac_service_data_unit did not match.
<b>Unexpected LTR In</b>	The total number of unexpected LTRs received.

---

## show ethoam config-error

Displays the configuration error for a specified VLAN and port or linkagg.

**show ethoam config-error** [**vlan** *vlan\_id*] [{**port** *chassis/slot/port* | **linkagg** *agg\_id*}]

---

### Syntax Definitions

<i>vlan_id</i>	VLAN Identifier.
<i>chassis</i>	The chassis identifier.
<i>slot/port</i>	Physical slot and port number.
<i>agg_id</i>	Logical link aggregate ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show ethoam config-error
Vlan    Port    Error-type
-----+-----
10      1/2     CFMleak
10      1/10    CFMleak

---

## show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

**show ethoam one-way-delay domain** *md\_name* **association** *ma\_name* **endpoint** *s\_mepid* [**mac-address** *mac\_address*]

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>mac_address</i>	MAC Address of the remote MEP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Dash ('-') in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when IDM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

### Examples

```
-> show ethoam one-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value
```

Remote Mac address	Delay (us)	Jitter (us)
00:d0:95:ef:44:44	2369	1258
00:d0:95:ef:66:88	5896	282
00:d0:95:ef:88:88	2584	-
00:d0:95:ef:66:55	2698	4782

```
-> show ethoam one-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value
```

Remote Mac address	Delay (us)	Jitter (us)
00:d0:95:ef:44:44	2369	1258

*output definitions*

---

<b>Remote Mac address</b>	Remote MAC address.
<b>Delay</b>	Physical slot and port number.
<b>eJitter</b>	Type of an error.

---

**Release History**

Release 7.3.1; command was introduced.

**Related Commands**

[ethoam one-way-delay](#) Initiates one-way-delay messages from a particular MEP to an RMEP.

**MIB Objects**

```

dotlagCfmMdTable
  dotlagCfmMdName
dotlagCfmMaNetTable
  dotlagCfmMaNetName
dotlagCfmMepTable
  dotlagCfmMepIdentifier

  alaCfmMepDelayTestType
  alaCfmMepDelayTestDelay
  alaCfmMepDelayVariation

```

---

## show ethoam two-way-delay

Displays the two-way ETH-DM delay and jitter parameters for a specific remote MAC-Address or for all the MAC-Addresses for which two-way-delay was initiated for a particular source MEP-ID.

**show ethoam two-way-delay domain** *md\_name* **association** *ma\_name* **endpoint** *s\_mepid* [**mac-address** *mac\_address*]

---

### Syntax Definitions

<i>md_name</i>	Specifies the domain name. For more information on the different formats of the domain name, refer to <a href="#">ethoam domain</a> .
<i>ma_name</i>	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
<i>s_mepid</i>	Source MEP ID. The valid range is 1–8191.
<i>mac_address</i>	MAC Address of the remote MEP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If '0' appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.
- If a dash ('-') appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.
- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.

### Examples

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 mac-address
```

```
00:d0:95:ef:44:44
```

```
Legend: Jitter: - = undefined value
```

```

# 54 Service Assurance Agent Commands

Service Assurance Agent (SAA) enables customers to assure new business-critical applications, as well as services that utilize data, voice, and video. Use SAAs to verify service guarantees, increase network reliability by validating network performance, proactively identify network issues, and increase return on investment (ROI) by easing the deployment of new services. The SAA feature uses active monitoring to generate traffic in a continuous, reliable, and predictable manner, thus enabling the measurement of network performance and health.

IP SAAs enhance the service level monitoring to become IP application-aware by measuring both end-to-end and at the IP layer. IP SAA would allow performance measurement against any IP addresses in the network (switch, server, pc). Use ETH-LB/DMM to measure delay and jitter by sending out frames with DM information to the peer MEP and receiving frames with DM information from the peer MEP.

MIB information for the SAA commands is as follows:

*Filename:* Alcatel-IND1-ETHERNET-OAM-MIB.mib  
*Module:* alcatelIND1EoamMIB

*Filename:* IEEE8021-CFM-MIB.mib  
*Module:* ieee8021CfmMib

*Filename:* ALCATEL-IND1-SAA-MIB.mib  
*Module:* alcatelIND1SaaMIB

A summary of the available commands is listed here:

<b>SAA Commands</b>	<b>saa</b> <b>saa start</b> <b>saa stop</b>
<b>EthOAM SAA Commands</b>	<b>saa type ethoam-loopback</b> <b>saa type ethoam-two-way-delay</b>
<b>IP SAA Command</b>	<b>saa type ip-ping</b>
<b>Layer 2 SAA Command</b>	<b>saa type mac-ping</b>
<b>SPB SAA Commands</b>	<b>saa spb</b> <b>saa spb reset</b> <b>saa spb flush</b> <b>show saa spb</b>
<b>XML SAA Commands</b>	<b>saa xml</b> <b>show saa xml</b>
<b>SAA Show Commands</b>	<b>show saa</b> <b>show saa type config</b> <b>show saa statistics</b>

**saa**

Configures a Service Assurance Agent (SAA).

**saa** *string* [**desc** *description*] [**interval** *interval*] [**jitter-threshold** *jitter\_thresh*] [**rtt-threshold** *rtt\_thresh*]

**no** *saa string*

**Syntax Definitions**

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if SAA ID contains multiple words with spaces between them (for example “SAA 10”).
<i>description</i>	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example, “ALE Marketing SAA”).
<i>interval</i>	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10 to 1500.
<i>jitter_thresh</i>	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
<i>rtt_thresh</i>	The round-trip time threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

**Defaults**

<b>parameter</b>	<b>default</b>
<i>description</i>	DEFAULT
<i>interval</i>	150 minutes
<i>jitter_thresh</i>	0 (disabled)
<i>rtt_thresh</i>	0 (disabled)

**Platforms Supported**

OmniSwitch 6900, 6860, 6865

**Usage Guidelines**

- Use the **no** form of this command to remove an SAA from the switch configuration. Note that the SAA must be stopped before it can be deleted.
- The **desc** and **interval** parameters are optional. If these values are specified, the SAA is created with those values. If these values are not specified, the SAA is created with the default values.
- If the **desc** and/or **interval** parameters are specified for an existing SAA, then the values of the existing parameters are updated with those specified.
- If the session time interval is changed for an SAA that is already running and active, the interval value is immediately updated in the database but is not applied to the SAA until after the next iteration.

- If none of the optional parameters are specified and the given SAA exists, the CLI will return an error message, as duplicate entries are not allowed.
- Any number of SAAs can be configured (MAX 127). It is recommended not to start many aggressive SAAs (having session interval  $\leq 10$ ). To achieve proper scheduling of all the started SAA (aggressive and relaxed) it is recommended not to start more than 50 SAAs.
- When SAA processes an iteration of a session, it will compare the results against the following criteria to see if an SNMP trap should be sent. A trap with the session name is sent if:
  - At least one packet is lost.
  - Warning: Average RTT/Jitter within 10% of threshold.
  - Critical: Average RTT/Jitter at or above threshold.

## Examples

```
-> saa saa1 descr "saa for ip-ping"  
-> saa saa1 jitter-threshold 100 rtt-threshold 500  
-> saa saa2 descr "Monitoring Default VRF-interface" interval 160  
-> saa saa2 interval 120  
-> no saa saa1
```

## Release History

Release 7.3.1; command was introduced.

Release 7.3.2; **jitter-threshold** and **rtt-threshold** parameters added.

  alaSaaCtrlDescr  
  alaSaaCtrlInterval  
  alaSaaCtrlJitterThreshold  
  alaSaaCtrlRTTThreshold
```

---

## saa type ip-ping

Configure SAA for IP including the number of packets and inter-packet delay parameters.

```
saa string type ip-ping destination-ip ip_address source-ip ip_address type-of-service tos [num-pkts count] [inter-pkt-delay delay] [payload-size size]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<b>destination-ip</b> <i>ip_address</i>	The IPv4 address of the destination to ping.
<b>source-ip</b> <i>ip_address</i>	The IPv4 address of the source.
<i>tos</i>	The type of service. Valid range is 0 – 255.
<i>count</i>	The number of packets to send in one ping iteration. The valid range is 1–100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 24–1472 bytes.

### Defaults

parameter	default
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	24 bytes

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets \* inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.

- Do not specify a broadcast or multicast address for the source or destination IP. In addition, do not use 0.0.0.0 as the destination IP address.
- The timeout for each ping request packet is 1 sec. This value is not configurable.

## Examples

```
-> saa saa1 type ip-ping destination-ip 123.32.45.76 source-ip 123.35.42.124 type-  
of-service 4  
-> saa saa2 type ip-ping destination-ip 123.32.45.77 source-ip 123.35.42.124 type-  
of-service 5  
-> saa saa3 type ip-ping destination-ip 123.32.55.27 source-ip 123.35.42.125 type-  
of-service 8 inter-pkt-delay 1000  
-> saa saa4 type ip-ping destination-ip 123.46.45.77 source-ip 123.35.42.125 type-  
of-service 2 num-pkts 5  
-> saa saa5 type ip-ping destination-ip 12.53.45.77 source-ip 123.35.42.125 type-  
of-service 35 payload-size 1518  
-> saa saa6 type ip-ping destination-ip 123.22.45.66 source-ip 123.35.42.125 type-  
of-service 5 inter-pkt-delay 1500 num-pkts 8 pkt-size 1000
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

<a href="#">show saa</a>	Displays SAA configuration information.
<a href="#">show saa statistics</a>	Displays SAA statistics.

## MIB Objects

```

  alaSaaIpCtrlNumPkts
```

---

## saa type mac-ping

Configure SAA for a MAC address including the VLAN, VLAN ID, number of packets and inter-packet delay parameters.

```
saa string type mac-ping destination-mac mac_address vlan vlan_id [vlan-priority vlan_priority]
[drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size]
[isid-check isid]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<i>mac_address</i>	The destination MAC address to ping.
<i>vlan_id</i>	The VLAN on which the L2 SAA Packets will be sent out. Valid range is 1-4094.
<i>vlan_priority</i>	Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
<b>true</b>	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
<b>false</b>	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
<i>data</i>	User specified string to be included in the packet (Data TLV).
<i>count</i>	The number of packets to send in one ping iteration. The valid range is 1–100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 36–1500 bytes.
<i>isid</i>	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

### Defaults

parameter	default
<i>vlan_priority</i>	0
<b>true   false</b>	false
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	36 bytes

### Platforms Supported

OmniSwitch 6900, 6860, 6865

## Usage Guidelines

- The **num-pkts**, **inter-pkt-delay**, and **payload-size** are optional parameters. If these values are specified, the SAA is created with the values entered. If none of them are specified, the SAA is created with the default values. The **num-pkts** and **inter-pkt-delay** can be modified, but **payload-size** cannot be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets \* inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return an error.
- The timeout for each ping request packet is 1 sec. This value is not configurable.
- If data-TLV is specified & payload size is not specified, then payload size will be increased internally to accommodate the data TLV.
- If data TLV & payload size both are specified and payload size is less than [dataTLV + 36] bytes (for time-stamping and other packet info), then the CLI will be rejected.
- Destination-MAC cannot be broadcast/multicast address.
- Timeout for each ping request packet is 1 sec. This value is non-configurable.

## Examples

```
-> saa saa1 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10
-> saa saa3 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 drop-eligible
true
->saa saa4 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 inter-pkt-delay
100
-> saa saa5 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 num-pkts 10
-> saa saa6 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 payload-size
400
-> saa saa7 type mac-ping destination-mac 00:11:11:11:11:11 vlan 10 vlan-priority 3
-> saa saa8 type mac-ping destination-mac 00:11:11:11:11:11 vlan 1001 isid-check
1002
```

## Release History

## saa spb

Configures session parameters for the Shortest Path Bridging (SPB) SAA. The SPB feature dynamically discovers SPB-enabled switches. Each discovered switch is identified by the pairing of a SPB VLAN (BVLAN) and the backbone MAC address (BMAC) for the switch. SPB advertises these BVLAN-BMAC pairs to the SAA feature, which in turn creates and starts MAC ping sessions based on the parameters configured with this command.

```
saa spb [auto-create] [auto-start] [interval interval] [vlan-priority vlan_priority] [drop-eligible {true | false}] [data data] [num-pkts count] [inter-pkt-delay delay] [payload-size size] [jitter-threshold jitter_thresh] [rtt-thresh rtt_thresh] [keep]
```

---

### Syntax Definitions

<b>auto-create</b>	Automatically creates a SPB SAA session for each discovered BVLAN-BMAC pair.
<b>auto-start</b>	Automatically starts each SPB SAA session.
<i>interval</i>	The amount of time, in minutes, between two iterations of the SAA test. Valid range is from 1, 2, 5, 10–1500.
<i>vlan_priority</i>	Specifies both the internal priority of the MAC ping and the 802.1p value on the VLAN tag header. Valid range is 0-7.
<b>true</b>	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to true.
<b>false</b>	Sets both the internal drop precedence of the MAC ping and the CFI bit on the VLAN tag header to false.
<i>data</i>	User specified string to be included in the packet (Data TLV).
<i>count</i>	The number of packets to send in one ping iteration of the test. Valid range is 1–100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.
<i>size</i>	The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.
<i>jitter_thresh</i>	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
<i>rtt_thresh</i>	The round-trip time threshold value, in microseconds. A trap is generate when this value is crossed. The valid range is 0–1000000.
<b>keep</b>	Retains SPB SAA session information even when SPB signals that a BMAC or BVLAN no longer exists.

## Defaults

parameter	default
<b>auto-create</b>	off
<b>auto-start</b>	off
<i>interval</i>	150 minutes
<i>vlan-priority</i>	0
<b>drop-eligible {true   false}</b>	false
<i>data</i>	null
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	32 bytes
<i>jitter_thresh</i>	0 (disabled)
<i>rtt-thresh</i>	0 (disabled)
<b>keep</b>	off

## Platforms Supported

OmniSwitch 6900, 6860, 6865

## Usage Guidelines

- The **auto-create** and **auto-start** parameters enable the SPB SAA functionality required to automatically create and start this type of SAA session.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets \* inter-pkt-delay) is less than 10 sec.
- SPB SAA sessions cannot be modified but are automatically configured with “SPB” as the owner of the session so they can be easily identified within the applicable SAA **show** command displays.
- The SAA ID for an SPB SAA is the prefix SPB- combined with the BVLAN and BMAC pairing used to generate the session. For example, SPB-*bvlan-bmac* (SPB-4000-e8-e7-32-07-98-cd).

## Examples

```
-> saa spb auto-create auto-start interval 160 num-pkts 50 inter-pkt-delay 100 keep
-> saa spb auto-create vlan-priority 3 drop-eligible true payload-size 400
-> saa spb auto-create auto-start jitter-threshold 100 rtt-threshold 500
-> saa spb keep
```

## Release History

Release 7.3.2; command was introduced.

## Related Commands

**show saa spb**

Displays the SAA configuration for the SPB SAA.

saa spb reset

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

When this command is used, the SPB SAA session parameters are set to the following default values:

<b>parameter</b>	<b>default</b>
<b>auto-create</b>	off
<b>auto-start</b>	off
<i>interval</i>	150 minutes
<i>vlan-priority</i>	0
<i>drop-eligible</i>	false
<i>data</i>	null
<i>count</i>	5
<i>delay</i>	1000 ms
<i>size</i>	32 bytes
<i>jitter_thresh</i>	0 (disabled)
<i>rtt_thresh</i>	0 (disabled)
<b>keep</b>	off

### Examples

```
-> saa spb reset
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

### MIB Objects

alaSaaSpbFeature  
alaSaaSpbReset

---

## saa type ethoam-loopback

Configures the SAA for ETH-LB, including the number of packets and inter-packet delay parameters.

```
saa string type ethoam-loopback {target-endpoint t_mepid | target-mac address mac_address} source-
endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [drop-eligible
{true | false}] [data data] [num-pkts num] [inter-pkt-delay delay]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<i>t_mepid</i>	The ID of the destination MEP.
<i>mac_address</i>	The MAC address of the destination.
<i>s_mepid</i>	The ID of the source MEP.
<i>md_name</i>	The domain to which the source MEP belongs.
<i>ma_name</i>	The association to which the source MEP belongs.
<i>vlan_priority</i>	The VLAN priority to be used for the outgoing packet. The valid range is 0-7.
<b>true</b>	Sets the drop eligibility bit in the VLAN tag to true.
<b>false</b>	Sets the drop eligibility bit in the VLAN tag to false.
<i>data</i>	User specified string that is included in the packet.
<i>num</i>	The number of packets to send during loopback. Valid range is 1– 100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

### Defaults

parameter	default
<b>drop-eligible {true   false}</b>	false
<b>num-pkts <i>num</i></b>	5
<i>delay</i>	1000

### Platforms Supported

OmniSwitch 6900, 6860, 6865

## Usage Guidelines

- The SAA must exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- Source MEP-ID, MD and MA must be created before initiating loopback.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When **target-endpoint** is specified then it must be learned before initiating loopback.
- When **target-endpoint** is specified and learned, Ethernet Loopback will be transmitted irrespective of whether the RMEP state is OK or failed.
- The **drop-eligible**, **data**, **num-pkts**, and **inter-pkt-delay** are optional parameters. If these values are specified, the entry will be created with these values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** can be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets \* inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- The Target MEP/MAC, source MEP, domain, association, and priority parameters are mandatory. If they are not specified, the CLI will return an error.
- The **data** parameter is optional. If this parameter is not specified, then it is not sent in the loopback message.
- The timeout value for each LB packet is one second. This value is not configurable.

## Examples

```
-> saa saa1 type ethoam-loopback target-endpoint 10 source endpoint 1 domain md1
association mal vlan-priority 5 drop-eligible false
-> saa saa2 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal vlan-priority 5 drop-eligible true data « monitor association mal »
num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-loopback target-endpoint 15 source endpoint 1 domain md1
association mal vlan-priority 5 drop-eligible false data « monitor association mal
» num-pkts 6
-> saa saa4 type ethoam-loopback target-endpoint 10 source endpoint 2 domain md1
association mal vlan-priority 5 drop-eligible true inter-pkt-delay 500
```

## Release History

## saa type ethoam-two-way-delay

Configures SAA for ETH-DMM, including the number of packets and inter-packet delay parameters.

```
saa string type {ethoam-two-way-delay} {target-endpoint t_mepid | target-mac address mac_address}
source-endpoint s_mepid domain md_name association ma_name vlan-priority vlan_priority [num-
pkts num] [inter-pkt-delay delay]
```

---

### Syntax Definitions

<i>string</i>	SAA ID string up to 32 characters. Use quotes around string if the SAA ID contains multiple words with spaces between them (for example, "SAA 10").
<i>t_mepid</i>	The ID of the destination MEP.
<i>mac_address</i>	The MAC address of the destination.
<i>s_mepid</i>	The ID of the source MEP.
<i>md_name</i>	The domain to which the source MEP belongs.
<i>ma_name</i>	The association to which the source MEP belongs.
<i>vlan_priority</i>	The VLAN priority to be used for the outgoing packet. The valid range is 0-7.
<i>num</i>	The number of packets to send during loopback. Valid range is 1– 100.
<i>delay</i>	The delay between packets sent during a ping iteration, in milliseconds. Valid range is 100–1000 ms in multiples of 100 ms.

### Defaults

parameter	default
<i>num</i>	5
<i>delay</i>	1000

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- The SAA should exist before issuing the CLI. If the SAA does not exist, the CLI will return error.
- The source MEP-ID, MD, and MA must be created before initiating DMM.
- If the source MEP-Id/MA/MD does not exist, the configuration will be accepted and no error will be returned.
- When the **target-endpoint** parameter is specified, then it must be learned before initiating DMM.
- When the **target-endpoint** parameter is specified and learned, ETH-DMM will be transmitted irrespective of whether the RMEP state is OK or failed.

- The **num-pkts** and **inter-pkt-delay** parameters are optional. If these values are specified, the entry will be created with those values. If none of them are specified, the SAA will be created with default values. The **num-pkts** and **inter-pkt-delay** values can be modified, but the **pkt-size** value cannot be modified later.
- The **num-pkts** and **inter-pkt-delay** parameters can be configured only if the total execution time (number of packets \* inter-pkt-delay) is less than 10 sec.
- The SAA must not be in a 'started' state at the time the **num-pkts** or **inter-pkt-delay** parameters are modified. Make sure the SAA is stopped before attempting to modify these parameters.
- Target MEP/MAC, source MEP, domain, association, and priority parameters are mandatory. If they are not specified, the CLI will return an error.
- The timeout for each DMM packet is 1 sec. This value is not configurable.

## Examples

```
-> saa saa1 type ethoam-two-way-delay target-endpoint 10 source endpoint 1 domain
md1 association mal vlan-priority 5
-> saa saa2 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association mal vlan-priority 5 num-pkts 6 inter-pkt-delay 500
-> saa saa3 type ethoam-two-way-delay target-endpoint 15 source endpoint 1 domain
md1 association mal vlan-priority 5 num-pkts 6
-> saa saa4 type ethoam-two-way-delay target-endpoint 10 source endpoint 2 domain
md1 association mal vlan-priority 5 inter-pkt-delay 500
```

## Release History

  alaSaaEthoamCtrlTestIndex
  alaSaaEthoamCtrlRowStatus
  alaSaaEthoamCtrlTestMode
  alaSaaEthoamCtrlTgtMAC
  alaSaaEthoamCtrlSrcMepId
  alaSaaEthoamCtrlDomainName
  alaSaaEthoamCtrlAssociationName
  alaSaaEthoamCtrlNumPkts
  alaSaaEthoamCtrlInterPktDelay
  alaSaaEthoamCtrlVlanPriority
```

---

## saa start

Starts the SAA test.

```
saa string start [at yyyy-mm-dd,hh:mm:ss.ds]
```

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<i>yyyy-mm-dd,hh:mm:ss.ds</i>	The date and time to start the SAA.

### Defaults

By default, the SAA test is started immediately.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- Use the **saa stop** command to stop an SAA test that is already running.
- Use the **at** option to specify a date and time for the test to start.
- If an SAA is scheduled to start at a specified time and another **saa start** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.
- If the **saa start** command is given after an SAA is started, then the CLI will return error.
- If the SAA type is configured with a source IP that does not exist or is not active, then the packet will not be transmitted and no error will be returned. Swlogs will be updated.
- ICMP must be enabled on the switch. If ICMP is disabled and an SAA of type 'ip-ping' is started, then the iteration will timeout and will be treated as failed iteration.
- Immediately after a CMM restart (reboot or takeover), the command to start SAA will be accepted, but the actual execution of the iteration will start 5 minutes after the CMM restart.
- If the SAA type is configured with a source MEP that does not exist or is not active (admin down), then the packet will not be transmitted and no error will be returned on the CLI console. Swlogs will be updated.
- It is recommended that all the SAAs be rescheduled if the system time is being changed.

### Examples

```
-> saa saa2 start at 2009-09-12,09:00:00  
-> saa saa4 start
```

## Release History

Release 7.3.1; command was introduced.

## Related Commands

[show saa](#)

Displays SAA configuration information.

Displays SAA statistics.

## MIB Objects

alaSaaCtrlTable

  alaSaaCtrlTestIndex

  alaSaaCtrlStartAt

---

## saa stop

Stops the SAA test.

```
saa string stop [never | at yyyy-mm-dd,hh:mm:ss.ds]
```

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<b>never</b>	Specifies that the SAA test will not be stopped unless the <b>saa stop</b> command is used with the <b>at</b> option.
<i>yyyy-mm-dd,hh:mm:ss.ds</i>	The date and time to start the SAA.

### Defaults

By default, the test is stopped immediately.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- An existing SAA with the SAA type configured must be specified with this command.
- The SAA must be in a 'started' state before giving the command unless the start and stop times are scheduled. If the SAA is not in a 'started' state, the CLI will return an error.
- Use the **at** option to specify a date and time for the test to stop.
- If the **never** option is specified, the SAA test will keep on running until the **saa stop** command is entered again with the **at** option.
- If SAA test is stopped while it is running an iteration, the current iteration is pre-empted. The statistics and history are updated for the partial iteration run.
- If an SAA is scheduled to stop at a specified time and another **saa stop** command with a different value is given before the specified time, the subsequent command will over-ride the previous command.

### Examples

```
-> saa saa1 stop  
-> saa saa2 stop never
```

## saa xml

Configures SAA XML parameters that determine when and where an SAA XML history file is created.

**saa spb** [*file-name xml\_filename*] [**interval** *interval*] [**admin-state** {**enable** | **disable**}]

---

### Syntax Definitions

<i>xml_filename</i>	The name of the file where SAA history entries are stored. This file must reside in the <b>/flash/network</b> directory on the local switch.
<i>interval</i>	The amount of time, in minutes, between each generation of the XML history file. Valid range is from 5–15000.
<b>enable</b>	Enables XML history file generation.
<b>disable</b>	Disables XML history file generation.

### Defaults

parameter	default
<i>xml_filename</i>	saa.xml
<i>interval</i>	20 minutes
<b>admin-state</b> { <b>enable</b>   <b>disable</b> }	Disabled

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

When this function is enabled, SAA will periodically generate an XML file containing the following entries:

- SAA name and ID
- Iteration number
- Last run time
- Reason
- Packets sent/Received
- RTT min/avg/max
- Jitter min/avg/max
- Subports

### Examples

```
-> saa xml interval 60 admin-state enable
-> saa xml file-name switch1_saa.xml interval 120 admin-status enable
```

### Release History

Release 7.3.2; command was introduced.

## Related Commands

[show saa xml](#)

Displays the SAA XML file generation parameters.

  alaSaaXmlStatus  
  alaSaaXmlFilename  
  alaSaaXmlInterval
```

---

## show saa

Displays SAA session information.

**show saa** [*string* / {**descr** *description*}] [**owner** *saa\_owner*]

---

### Syntax Definitions

<i>string</i>	An existing SAA ID.
<i>description</i>	An existing SAA description string.
<i>saa_owner</i>	The owner name associated with the SAA session.

### Defaults

By default, information is displayed for all SAA sessions.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the *string* or **descr** *description* parameter to display information for a specific SAA.
- Use the **owner** *saa\_owner* parameter to display only those sessions initiated by a specific owner. The owner of an SAA session is not user configurable, but identifies the entity that created the session.
- When an SAA is created, an owner name is assigned to the agent. This name is based on the Alcatel-Lucent Enterprise application that generated the SAA and is not configurable. For example:
  - CLI SAA owner name = “USER”
  - OmniVista owner name = “OV”
  - Shortest Path Bridging owner name = “SPB” (SAA ID is SPB-*bvlan-bmac*)

### Examples

```
-> show saa
Legend: eth-lb = ethoam-loopback
        eth-dmm = ethoam-two-way-delay

## show saa type config

Displays the SAA configuration for the specified SAA type.

```
show saa [string] type {mac-ping | ip-ping | ethoam-loopback | ethoam-two-way-delay} config
```

---

### Syntax Definitions

<i>string</i>	An existing SAA ID.
<b>mac-ping</b>	Displays MAC Ping SAAs.
<b>ip-ping</b>	Displays IP Ping SAAs.
<b>ethoam-loopback</b>	Displays ETH-LB SAAs.
<b>ethoam-two-way-delay</b>	Displays ETH-DMM SAAs.

### Defaults

By default, all SAAs with the specified type are displayed.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- Use the *string* parameter to display information for a specific SAA
- If the SAA ID string specified does not match the specified SAA type, the CLI will return an error.

### Examples

```
-> show saa type ip-ping config
SAA : saa20
  SAA-type           : ip-ping,
  Status             : started,
  Start At           : -
  Stop At            : 2010-02-08,12:00:00.0
  Description        : datacenter1,
  Interval(minutes)  : 130,
  Jitter Threshold (ms) : 0,
  RTT Threshold (ms) : 0,
  Source-IP          : 0.0.0.0,
  Destination-IP     : 172.21.161.65,

## show saa spb

Displays the SAA configuration for the Shortest Path Bridging (SPB) SAA.

**show saa spb**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

This command displays the SAA parameters that are applied to SPB SAA sessions. Use the **show saa** command to get specific session status and information.

### Examples

```
-> show saa spb
```

```
SPB creation parameters:
```

```
Auto-create           : Disabled,  
Auto-start            : Disabled,  
Interval(minutes)    : 150,  
Jitter Threshold (ms) : 0,  
RTT Threshold (ms)   : 0,  
Payload-Size (bytes) : 32,  
Num-pkts              : 5,  
Inter-pkt-delay      : 1000,  
Drop Eligible        : False,  
Vlan-priority         : 0,  
Keep                  : Disabled,  
Data                  : ""
```

### Release History

Release 7.3.2; command was introduced.

## show saa xml

Displays the SAA XML file generation parameter configuration.

**show saa xml**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show saa xml
```

```
XML file creation parameters:  
Admin status   : Disabled,  
File           : saa.xml,  
Interval       : 20
```

### *output definitions*

---

<b>Admin status</b>	The status (Enabled or Disabled) of SAA XML history file generation.
<b>File</b>	The name of the XML file to which SAA writes session history entries.
<b>Interval</b>	The amount of time, in minutes, between each generation of the XML history file.

---

### Release History

Release 7.3.2; command was introduced.

### Related Commands

[saa xml](#) Configures SAA XML file generation parameters.

---

## show saa statistics

Display SAA statistics.

**show saa** [*string*] **statistics** [**aggregate** | **history**]

---

### Syntax Definitions

<i>string</i>	An existing SAA ID string.
<b>aggregate</b>	Displays aggregate results for the specified SAA.
<b>history</b>	Displays a results history for the specified SAA.

### Defaults

By default, statistics are displayed for all SAAs and only for the most recent SAA test run.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If the **aggregate** parameter is specified, then only the aggregate results are displayed.
- If the **history** parameter is specified, then only the history results are displayed.
- Since results are only kept for the last five iterations, using the **history** option displays only the last five iterations of each SAA test and in each SAA history, iteration information of first 20 received packets are stored.
- Specify the SAA ID to display statistics for a specific SAA.
- Statistics and history do not persist across a switch reboot or takeover.

### Examples

```
-> show saa statistics
Legend: eth-lb = ethoam-loopback
       eth-dmm = ethoam-two-way-delay
       - = Delay or jitter value not available
```

Aggregate Record:

# 55 CMM Commands

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

*Filename:* ALCATEL-IND1-CHASSIS-MIB.mib  
*Module:* alcatelIND1ChassisMIB

*Filename:* ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS.mib  
*Module:* alcatelIND1ConfigMgrMIB

A summary of available commands is listed here:

---

**reload secondary**  
**reload slot**  
**reload all**  
**reload from**  
**issu from**  
**write memory**  
**issu slot**  
**reload chassis-id**  
**copy running certified**  
**modify running-directory**  
**copy flash-synchro**  
**takeover**  
**show running-directory**  
**show reload**  
**show microcode**  
**show issu status**  
**usb**  
**usb auto-copy**  
**mount**  
**umount**  
**show usb statistics**  
**auto-config-abort**  
**image integrity check**  
**image integrity get-key**

---

## reload secondary

Reloads the secondary CMM from the *certified* directory.

**reload** [*chassis-id chassis*] **secondary** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* / *day month*]]

**reload secondary cancel**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<i>month day</i> / <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
<b>cancel</b>	Cancels a pending time delayed reboot.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

### Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**reload from** Reloads both CMMs from the specified directory.

## MIB Objects

```
chasEntPhysicalTable
  csEntPhysicalIndex
  chasEntPhysAdminStatus
chasControlRedundantTable
  chasControlDelayedRebootTimer
```

---

## reload all

Reloads both Chassis Management Modules (CMMs) from the *certified* directory.

**reload** [**chassis-id** *chassis*] **all** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* | *day month*]]

**reload all cancel**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<i>month day</i>   <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.
<b>cancel</b>	Cancels a pending time delayed reload.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Can be issued from the Primary CMM only.

### Examples

```
-> reload all
-> reload all in 1:30
-> reload all at 12:00 july 25
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**reload slot** Reloads a specific NI module.

## MIB Objects

```
chasEntPhysicalTable
  chasEntPhysAdminStatus
chasGlobalControl
  chasGlobalControlDelayedResetAll
```

---

## reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

**reload** [**chassis-id** *chassis*] **from** *image\_dir* {**rollback-timeout** *minutes* | **no rollback-timeout** [**in** [*hours:*] *minutes* | **at** *hour:minute*] [**redundancy-time** *minutes*]}

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier when running in virtual chassis mode.
<i>image_dir</i>	The directory that contains the image files to be loaded onto the switch.
<b>rollback-timeout</b> <i>minutes</i>	Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the <i>certified</i> directory. The valid range of rollback timeout minutes is 1–15.
<b>no rollback-timeout</b>	Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<b>redundancy-time</b> <i>minutes</i>	Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the <i>certified</i> directory.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Can be issued from Primary CMM only.
- This command is used to reload the switch from the specified directory.
- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.
- The image directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.

- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the **certified** directory. The reboot can be halted by issuing a cancel order as described in the **reload all** command.
- If the **redundnacy-time** parameter is entered, any reboot of the Primary CMM prior to the redundancy timer expiring will cause the switch to reboot. If the Primary CMM reboots after the redundancy timer expires, the secondary CMM will take over without a reboot.

## Examples

```
-> reload working rollback-timeout 5
-> reload working no rollback-timeout
-> reload working no rollback-timeout in 50
-> reload working rollback-timeout 10 at 12:50
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**reload all** Reboots both CMMs from the *certified* directory.

## MIB Objects

```
chasControlModuleTable
  chasControl
  chasControlVersionMngt
  chasControlActivateTimeout
  chasControlRedundancyTime
  chasControlDelayedActivateTimer
  chasControlWorkingVersion
  chasControlNextRunningVersion
```

---

## reload slot

Reloads the NI in the specified slot using the current running image.

**reload slot** *chassis/slot*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The slot number to be reloaded.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Can be issued from Primary CMM only.

### Examples

```
-> reload slot 1/2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[reload from](#) Reloads both CMMs from the specified directory.

### MIB Objects

chasEntPhysicalTable  
  chasEntPhysAdminStatus

---

## reload chassis-id

Reloads the specified chassis id when running in virtual chassis mode.

**reload chassis-id** *chassis* [**all**] [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* / *day month*]]

**reload chassis-id cancel**

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<i>month day</i> / <i>day month</i>	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
<b>cancel</b>	Cancels a pending time delayed reboot.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

### Examples

```
-> reload chassis-id 1
-> reload chassis-id 1 in 15:25
-> reload chassis-id 1 at 15:25 august 10
-> reload chassis-id 1 at 15:25 10 august
-> reload chassis-id 1 cancel
```

### Release History

Release 7.3.1; command introduced.

## Related Commands

### **reload from**

Reloads both CMMs from the specified directory.

## MIB Objects

chasEntPhysicalTable

    csEntPhysicalIndex

    chasEntPhysAdminStatus

chasControlRedundantTable

    chasControlDelayedRebootTimer

---

## copy certified

Copies the contents of the *certified* directory to the specified directory.

**copy certified** *image\_dir* [**make-running-directory**]

---

### Syntax Definitions

<i>image_dir</i>	The directory that the contents of the <i>certified</i> directory will be copied to.
<b>make-running-directory</b>	Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Using the **make-running-directory** parameter changes the RUNNING DIRECTORY allowing changes to be saved using the **write memory** command.
- This command does not delete any extra files in the target directory.

### Examples

```
-> copy certified mydir  
-> copy certified mydir make-running-directory
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[copy flash-synchro](#) Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

### MIB Objects

```
chasControlModuleTable  
  chasControlVersionMngt  
  chasControlWorkingVersion
```

---

## issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

**issu from** *image\_dir* [**redundancy-time** *minutes*]

---

### Syntax Definitions

*image\_dir* Specifies the pathname for the directory that contains the image files.  
**redundancy-time** *minutes* This parameter is not supported with the **issu** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The new code must support ISSU with the current running version of code.
- A text file named '*issu\_version*' is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

### Examples

```
-> issu from myissu
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[issu slot](#) Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

### MIB Objects

```
chasEntModuleTable  
  chasControlWorkingVersion  
  chasControlRedundancyTime
```

---

## issu slot

Causes a reset of the NI in the specified slot after an ISSU upgrade.

**issu slot** *num*

---

### Syntax Definitions

*num* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900

### Usage Guidelines

Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

### Examples

```
-> issu slot 2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[issu from](#) Upgrades the system with the images stored in the specified directory without disruption to traffic.

### MIB Objects

chasEntPhysicalTable  
entPhysicalIndex

---

## write memory

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

**write memory** [**flash-synchro**]

---

### Syntax Definitions

**flash-synchro** Synchronizes the primary and secondary CMM.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM certified directory.
- This command is only valid if the switch isn't running from the *certified* directory. Use the [show running-directory](#) command to check where the switch is running from.
- During flash synchronization configuration changes may time out causing error messages to be displayed. Once the synchronization is complete configuration changes can resume.

### Examples

```
-> write memory
-> write memory flash-synchro
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[copy flash-synchro](#) Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

### MIB Objects

```
configManager
  configWriteMemory
```

---

## copy running certified

Copies the current *running* directory configuration to the *certified* directory on both CMMs.

**copy running certified [flash-synchro]**

---

### Syntax Definitions

**flash-synchro** Synchronizes the primary and secondary CMM.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command is used to overwrite the contents of the *certified* directory with the configuration from the *running* directory. This should only be done if the *running* configuration has been verified.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM *certified* directory. Beginning in 7.3.1 the flash-synchro functionality is done automatically; entering the **flash-synchro** parameter is no longer required.
- In 7.3.3 the flash-synchro parameter will display an error on the OS6900 if there is no secondary CMM.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the *certified* directory. To view where the switch is running from, see the **show running-directory** command.
- This command may take up to two minutes to complete.

### Examples

```
-> copy running certified
```

### Release History

Release 7.1.1; command introduced.

Release 7.3.1; **flash-synchro** parameter no affect; the functionality is performed automatically.

## Related Commands

### [copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

## MIB Objects

```
chasControlModuleTable
  chasControlVersionMngt
  chasControlWorkingVersion
```

---

## modify running-directory

Changes the RUNNING DIRECTORY to the specified directory.

**modify running-directory** *image\_dir*

---

### Syntax Definitions

*image\_dir*                      The directory name to become the new RUNNING DIRECTORY.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to change the RUNNING DIRECTORY and allow configuration changes to be saved to the new RUNNING DIRECTORY.

### Examples

```
-> modify running-directory user-config1  
-> write memory
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[write memory](#)                      Copies the running primary RAM version of the CMM software to the RUNNING DIRECTORY.

### MIB Objects

chasControlModuleTable  
  CurrentRunningVersion

---

## copy flash-synchro

Copies the *certified* directory version of the primary CMM software to the *certified* directory of the secondary CMM.

**copy flash-synchro**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- This command is used to synchronize the *certified* directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.
- This command is a shorter version of the ‘**copy running certified flash-synchro**’ command. Beginning in 7.3.1 the flash-synchro functionality is done automatically; this command is no longer required.

### Examples

```
-> copy flash-synchro
-> configure copy flash-synchro
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[copy running certified](#)

Copies the RUNNING DIRECTORY configuration to the *certified* directory on the primary CMM.

### MIB Objects

```
chasControlModuleTable
  chasControlVersionMngt
```

---

## takeover

Forces the current secondary CMM to assume the role of the primary CMM.

**takeover** [*chassis*]

---

### Syntax Definitions

*chassis*                                      The chassis identifier.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

- This command causes the secondary CMM to take over the functions of the primary CMM. After this command, the old primary CMM is the new secondary CMM.
- Be sure that the secondary CMM has all software (i.e., image and configuration files) required to continue CMM operations, before issuing the **takeover** command.
- For information on synchronizing the primary and secondary CMM software before issuing the **takeover** command, see the [copy flash-synchro](#) command.

### Examples

-> takeover

### Release History

Release 7.1.1; command introduced.

### Related Command

[reload all](#)                                      Reboots the switch.

### MIB Objects

chasEntPhysicalTable  
    chasEntPhysAdminStatus

---

## show running-directory

Shows the current state of version and configuration management for a CMM.

**show running-directory**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Once a switch boots up and is running, it runs either from the *working*, *certified*, or a *user-defined* directory. If the switch is running from the *certified* directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.
- Depending on the switch configuration there may be a small delay before the information is displayed.

### Examples

```
-> show running-directory
```

```
CONFIGURATION STATUS
  Running CMM           : PRIMARY,
  CMM Mode              : MONO CMM,
  Current CMM Slot     : A,
  Running configuration : CERTIFIED,
  Certify/Restore Status : CERTIFIED,
SYNCHRONIZATION STATUS
  Flash Between CMMs   : SYNCHRONIZED
  Running Configuration : SYNCHRONIZED
BOOT STATUS
  Machine State        : SHUTDOWN
```

#### *output definitions*

---

<b>Running CMM</b>	The CMM currently controlling the switch, either PRIMARY or SECONDARY.
<b>CMM Mode</b>	Whether there are one or two CMMs installed or Virtual Chassis mode.
<b>Current CMM Slot</b>	The slot of the primary CMM, A or B.
<b>Running Configuration</b>	The current RUNNING DIRECTORY.
<b>Certify/Restore Status</b>	Indicates if the CMM has been certified.

*output definitions (continued)*

---

<b>Flash Between CMMs</b>	<b>SYNCHRONIZED:</b> Flash between CMMs is identical. <b>NOT SYNCHRONIZED:</b> Flash between CMMs is not identical.
<b>Running Configuration</b>	<b>SYNCHRONIZED:</b> RUNNING CONFIGURATION has been saved to the RUNNING DIRECTORY. <b>NOT SYNCHRONIZED:</b> RUNNING CONFIGURATION has not been saved to the RUNNING DIRECTORY.
<b>Machine State</b>	<b>SHUTDOWN</b> - When in VC mode, this indicates the chassis has shutdown due to the 'virtual-chassis shutdown' command or when the chassis has shutdown due to a VC error. It is only displayed if the chassis is in the shutdown state.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">reload all</a>	Reboots the switch.
<a href="#">copy flash-synchro</a>	Copies the <i>certified</i> directory version of the primary CMM software to the <i>certified</i> directory of the secondary CMM.

**MIB Objects**

```

chasControlModuleTable
  chasControlSynchronizationStatus
  chasControlCertifyStatus
  chasControlRunningVersion
chasEntPhysicalTable
  chasEntPhysOperStatus
  entPhysicalIndex
chasControlReloadTable
  chasControlReloadStatus

```

---

## show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

**show reload** [[*chassis-id chassis*] [*status | all status*]]

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<b>status</b>	Displays whether or not either of the CMMs are scheduled for a reload.
<b>all status</b>	Displays whether or all the modules are scheduled for a reload.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot is going to occur.
- If the **reload from** command is used, and a rollback timeout is set, the rollback occurs and is shown using the **show reload** command.

### Examples

```
-> show reload status
Primary   Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">reload secondary</a>	Reboots the primary or secondary CMM to its startup software configuration.
<a href="#">reload from</a>	Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

**MIB Objects**

chasControlModuleTable

    chasControlDelayedActivateTimer

chasGlobalControl

    chasGlobalControlDelayedResetAll

---

## show microcode

Displays microcode versions installed on the switch.

**show microcode** [**working** | **certified** | **loaded** | **issu** | *image\_dir*]

---

### Syntax Definitions

<b>working</b>	Specifies the <i>working</i> directory.
<b>certified</b>	The chassis identifier when running in virtual chassis mode.
<b>loaded</b>	Specifies the loaded (i.e., currently-active) microcode versions.
<b>issu</b>	Specifies the <i>issu</i> directory.
<i>image_dir</i>	Specifies the <i>user-defined</i> directory.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If no additional parameters are entered microcode information for the RUNNING CONFIGURATION is displayed.

### Examples

```
-> show microcode
Package           Release           Size           Description
-----+-----+-----+-----
Ros.img           7.1.1.403.R01    1828255        Alcatel-Lucent OS
Reni.img          7.1.1.403.R01    1359435        Alcatel-Lucent NI
```

#### *output definitions*

---

<b>Package</b>	File name.
<b>Release</b>	Version number.
<b>Size</b>	File size.
<b>Description</b>	File description.

---

### Release History

Release 7.1.1; command introduced.

**Related Commands****usb**

Displays the archive history for microcode versions installed on the switch.

**MIB Objects**N/A

---

## usb

Enables access to the device connected to the USB port.

**usb {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 6900, 6860, 6865, 6560

### Usage Guidelines

- Must use an Alcatel-Lucent Enterprise certified USB device.
- If an Alcatel-Lucent Enterprise certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

### Examples

```
-> usb enable
-> cp /flash/working/boot.cfg /uflash/boot.cfg
-> ls /uflash
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### MIB Objects

##### **usb auto-copy**

Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected

#### MIB Objects

```
systemServices
  systemServicesUsbEnable
```

---

## usb auto-copy

Allows the image files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

**usb auto-copy {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 6900, 6860, 6865, 6560

### Usage Guidelines

- If the automatic copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/10000/working* or */uflash/6900/working* directory to be copied to the */flash/working* directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.

### Examples

```
-> usb auto-copy enable  
-> usb auto-copy disable
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****usb**

Enables access to the device connected to the USB interface.

**MIB Objects**

---

## umount

Unmounts the /uflash file system from AOS.

**umount /uflash**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865, 6560

### Usage Guidelines

This command unmounts the USB drive and should be used prior to unplugging the USB drive to prevent possible data corruption.

### Examples

```
-> umount /uflash
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**mount** Mounts the /uflash file system from AOS.

### MIB Objects

```

## show usb statistics

Displays the status USB setting and features.

**show usb statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show usb statistics
Filesystem          1K-blocks      Used Available Use% Mounted on
/dev/sdb1           500732         261216    239516   52% /vroot/uflash
  Host scsi6: usb-storage
    Vendor: Alcatel-Lucent
    Product: USB
  Serial Number: AA04012700031693
    Protocol: Transparent SCSI
    Transport: Bulk
      usb: enabled
usb auto-copy: disable
auto-copy in progress: No
```

### *output definitions*

---

<b>usb</b>	Status of USB device interface.
<b>usb auto-copy</b>	Status of USB auto-copy feature.
<b>auto-copy in progress</b>	Is the switch currently in the process of performing an auto-upgrade.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>usb</b>	Enables access to the device connected to the USB interface.
<b>usb auto-copy</b>	Allows backup files from the USB device to be automatically copied to the switch immediately after the USB device is connected.
<b>mount</b>	Mounts the /uflash file system.

## MIB Objects

```

```

---

## show issu status

Displays the status of ISSU.

**show issu status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show issu status
Slot      ISSU-Status
-----+-----+
 1         ISSU Pending
 2         ISSU Pending
 3         ISSU Pending
```

```
-> show issu status
Slot      ISSU-Status
-----+-----+
 1         ISSU Complete
 2         ISSU Complete
 3         ISSU Complete
```

### *output definitions*

---

<b>Slot</b>	Specifies the slot number.
<b>ISSU-Status</b>	Indicates the ISSU status for a slot: <b>Pending</b> - Slot has not been reset; upgrade is not complete. <b>Complete</b> - Slot has been reset; upgrade is complete.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****issu from**

Upgrades the system with the images stored in the specified directory without disruption to traffic.

**MIB Objects**

N/A

---

## auto-config-abort

Aborts the Automatic Remote Configuration download process.

**auto-config-abort**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to stop the Automatic Remote Configuration download process.

### Examples

```
-> auto-config-abort
```

### Release History

Release 7.3.4; command was introduced.

### Related Commands

N/A

### MIB Objects

N/A

---

## image integrity check

Verifies whether the SHA256 hash key of an image file located in the specified directory matches the SHA256 hash key in the specified key file.

**image integrity check** *image\_dir* **key-file** *filename*

---

### Syntax Definitions

<i>image_dir</i>	The directory on the switch that contains the image file to verify. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).
<i>filename</i>	The name of the file that contains the key for the image file in the specified directory. Enter the name of the key file or include the full path (for example, “hash.txt” or “/flash/hash.txt”).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the name of the key file is specified without the directory path, the switch will look for the key file in the same directory specified for the image file.
- The following format is used to store the hash key values in the key file:  
Uos.img:f0ff173eff38e43e0598663da2185a363fcba5bd407201d7537d0a6b9f58670e

### Example

```
-> image integrity check /flash/working key-file /flash/hash.txt  
This operation may take several minutes...
```

```
Success: Key matched.
```

### Release History

Release 8.3.1; command introduced.

**Related Commands****[image integrity get-key](#)**

Calculates and displays the SHA256 key for image files.

**MIB Objects**

```
systemServicesAction  
systemServicesArg1  
systemServicesArg2
```

---

## image integrity get-key

Displays the SHA256 hash key of the image present in the specified location.

**image integrity get-key** *image\_dir*

---

### Syntax Definitions

*image\_dir*                      The directory on the switch that contains the image file. Enter the name of the directory in “/flash” or include the full path (for example, “working” or “/flash/working”).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When this command is entered, the SHA256 hash of the image files in the specified directory is calculated and displayed. It can be manually verified against the hash provided in the file.
- To store the hash key value in a text file that can be used with the **image file integrity check** command, use the following format:  
Uos.img:f0ff173eff38e43e0598663da2185a363fcb5bd407201d7537d0a6b9f58670e

### Example

```
-> image integrity get-key /working
This operation may take several minutes...
```

```
Image Name                      SHA256 Key
-----+-----
Uos.img                      c64d6b23312a6f9c4b99642b31ed0e87e600bce58d6fdd089d09e1f8077bd208
```

```
-> image integrity get-key /flash/certified
This operation may take several minutes...
```

```
Image Name                      SHA256 Key
-----+-----
Uos.img                      3d4d488a73eb798325bacb5793ef0d67bdf377527278a6732270d3a4801bb44b
```

### Release History

Release 8.3.1; command introduced.

**Related Commands****[image integrity check](#)**

Verifies the SHA256 hash key for the image file matches the key specified in a text file.

# 56 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

---

**Additional Information.** Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

---

MIB information for the Chassis Management and Monitoring commands is as follows:

*Filename:* ALCATEL-IND1-CHASSIS-MIB.mib  
*Module:* alcatelIND1ChassisMIB

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

A summary of available commands is listed here:

---

<b>Management Commands</b>	<code>system contact</code> <code>system name</code> <code>system location</code> <code>system date</code> <code>system time</code> <code>system timezone</code> <code>system daylight-savings-time</code> <code>update uboot</code> <code>update fpga-cpld</code> <code>reload slot</code> <code>power slot</code> <code>temp-threshold</code> <code>powersupply enable</code> <code>powersupply powersave</code> <code>hash-control</code> <code>bluetooth</code>
<b>Monitoring Commands</b>	<code>license</code> <code>show system</code> <code>show hardware-info</code> <code>show chassis</code> <code>show cmm</code> <code>show slot</code> <code>show module</code> <code>show module long</code> <code>show module status</code> <code>show powersupply</code> <code>show fan</code> <code>show fantray</code> <code>show temperature</code> <code>show hash-control</code> <code>show bluetooth status</code> <code>show me</code> <code>show tcam utilization</code> <code>show tcam utilization detail</code> <code>show tcam app-groups</code>
<b>Licensing Commands</b>	<code>license</code> <code>show license-info</code>
<b>Key Management Commands</b>	<code>security key</code> <code>security key-chain</code> <code>security key-chain key</code> <code>show security key-chain</code> <code>show security key</code>

---

## system contact

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

**system contact** *text\_string*

---

### Syntax Definitions

*text\_string*

The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **“Jean Smith Ext. 477 jsmith@company.com”**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"
-> system contact engineering-test@company.com
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">system name</a>	Modifies the current system name of the switch.
<a href="#">system location</a>	Specifies the current physical location of the switch.
<a href="#">license</a>	Displays the basic system information for the switch.

### MIB Objects

system  
systemContact

---

## system name

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

**system name** *text\_string*

---

### Syntax Definitions

*text\_string*

The new system name. The system name can range from 1 to 32 characters in length. No spaces are allowed in the system name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Spaces are not allowed in the system name.

### Examples

```
-> system name OmniSwitch6900
-> system name OS6900
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system contact](#)

Specifies the administrative contact of the switch (for example, an individual or a department).

[system location](#)

Specifies the current physical location of the switch.

[license](#)

Displays the basic system information for the switch.

### MIB Objects

system

systemName

---

## system location

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

**system location** *text\_string*

---

### Syntax Definitions

*text\_string*

The physical location of the switch. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, “**NMS Test Lab**”.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> system location "NMS Test Lab"  
-> system location TestLab
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system contact](#)

Specifies the administrative contact of the switch (for example, an individual or a department).

[system name](#)

Modifies the current system name of the switch.

[license](#)

Displays the basic system information for the switch.

### MIB Objects

system  
systemLocation

---

## system date

Displays or modifies the current system date on the switch.

**system date** [*mm/dd/yyyy*]

---

### Syntax Definitions

*mm/dd/yyyy*

The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the [system timezone command on page 56-8](#).

### Examples

```
-> system date 08/08/2010
-> system date
08/08/2010
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system time](#)

Displays or modifies the current system time on the switch.

[system timezone](#)

Displays or modifies the time zone for the switch.

### MIB Objects

```
systemServices
  systemServicesDate
```

---

## system time

Displays or modifies the switch current system time.

**system time** [*hh:mm:ss*]

---

### Syntax Definitions

*hh:mm:ss*

The new time being specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If you do not specify a new system time in the command line, the current system time is displayed.
- Setting the year to 1970 is not supported. The system interprets 1970 as meaning the internal clock has never been set and will reset to the year 2014.

### Examples

```
-> system time 14:30:00
-> system time
14:30:08
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system date](#)

Displays or modifies the current system date on the switch.

[system timezone](#)

Displays or modifies the time zone for the switch.

### MIB Objects

systemServices

systemServicesTime

---

## system timezone

Displays or modifies the time zone for the switch.

**system timezone** [*timezone\_abbrev*]

---

### Syntax Definitions

*timezone\_abbrev* Specifies a time zone for the switch and sets the system clock to run on UTC. If you specify a time zone abbreviation, the hours offset from UTC is automatically calculated by the switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax **system timezone**.
- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of time zone abbreviations.

### Examples

```
-> system timezone mst
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system date](#) Displays or modifies the current system date on the switch.  
[system time](#) Displays or modifies the current system time on the switch.

- systemServicesTimezoneEndTime
- systemServicesEnabledDST

---

## system daylight-savings-time

Displays the Daylight Savings Time (DST) setting for the configured timezone.

**system daylight-savings-time** [enable | disable]

---

### Syntax Definitions

**enable | disable**                      enable

### Defaults

parameter	default
Timezone supports DST	enabled
Timezone does not support DST	disabled

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If the configured timezone supports DST it is automatically enabled.
- If the configured timezone does not support DST it is automatically disabled.

### Examples

```
-> system daylight-savings-time
Daylight Savings Time (DST) is ENABLED.
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">system time</a>	Displays or modifies the current system time on the switch.

```

---

## update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

**update uboot** {cmm *slot* | ni {all | *slot*} file *filename*}

---

### Syntax Definitions

<b>cmm</b>	Specifies that the update is performed for the Chassis Management Module (CMM).
<b>all</b>	Specifies that the update is performed for all slots within a chassis.
<i>slot</i>	Specifies the slot number of the module within a chassis.
<i>filename</i>	Specifies the path and name of the upgrade file.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

### Examples

```
-> update uboot ni all file 9999.tar.gz
-> update uboot cmm 1 file /flash/temp/9999.tar.gz
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[reload slot](#) Reloads the specified NI module.

### MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## update fpga-cpld

Updates the FPGA/CPLD versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

```
update fpga-cpld {cmm slot| ni {daughter | slot } file filename}
```

---

### Syntax Definitions

<b>cmm</b>	Specifies that the update is performed for the Chassis Management Module (CMM).
<b>daughter</b>	Specifies the number of the daughter board on the NI module.
<i>slot</i>	Specifies the slot number of the module within a chassis.
<i>filename</i>	Specifies the path and name of the upgrade file.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

### Examples

```
-> update fpga-cpld ni 4 file 9999.vme  
-> update fpga-cpld cmm 1 file /flash/temp/9999.vme
```

### Release History

Release 7.1.1; command introduced.  
Release 7.3.4; **fpga** parameter changed to **fpga-cpld**.

### Related Commands

**reload slot** Reloads the specified NI module.

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## reload slot

Reloads or reboots a specified Network Interface (NI) module.

**reload slot** *slot*

---

### Syntax Definitions

*slot* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The **reload slot** command reboots only the specified NI. Other modules installed on the chassis, including primary and secondary CMMs, are not affected

### Examples

```
-> reload slot 2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">reload slot</a>	Reloads the specified NI module.
<a href="#">power slot</a>	Turns the power on or off for a specified Network Interface (NI) module.
<a href="#">show slot</a>	Shows the hardware information and the current status for Network Interface (NI) modules currently running in the chassis.

### MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  reset
```

---

## power slot

Turns the power on or off for a specified Network Interface (NI) module.

**power slot** *chassis/slot*

**no power slot** *chassis/slot*

---

### Syntax Definitions

<i>chassis</i>	The chassis identifier.
<i>slot</i>	The chassis slot number containing the NI module being powered on or off.

### Defaults

N/A

### Platforms Supported

Not supported in this release.

### Usage Guidelines

Use the **no** form of this command to power off an NI module.

### Examples

```
-> power slot 1
-> power slot 7
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">reload slot</a>	Reloads the specified NI module.
<a href="#">show slot</a>	Shows the hardware information and current status for Network Interface (NI) modules currently running in the chassis.

### MIB Objects

```
chasEntPhysicalTable
  chasEntPhysAdminStatus
  powerOn
  powerOff
```

---

## temp-threshold

Sets the warning temperature threshold for the switch.

**temp-threshold** *temp*

---

### Syntax Definitions

*temp* The new temperature threshold value, in Celsius.

### Defaults

parameter	default
<i>temp</i>	67 (OS6900)

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

N/A

### Examples

```
-> temp-threshold 45
```

### Release History

Release 7.1.1; command introduced.

Release 7.3.1; command deprecated.

### Related Commands

[show temperature](#) Displays the ambient temperature of the current operating chassis, as well as current temperature threshold settings.

### MIB Objects

  chasTempThreshold

---

## **powersupply enable**

Enables the power supply unit identified by the PSU-ID.

**powersupply enable** [*slot*]

**no powersupply enable** [*slot*]

---

### **Syntax Definitions**

*slot* Slot number of power supply.

### **Defaults**

N/A

### **Platforms Supported**

Not supported in this release.

### **Usage Guidelines**

N/A

### **Release History**

Release 7.1.1; command introduced.

### **Related Commands**

**power slot** Turns the power on or off for a specified Network Interface (NI) module.

### **MIB Objects**

N/A

---

## **powersupply powersave**

Enables the power saving functionality on the switch.

**powersupply powersave {enable | disable}**

---

### **Syntax Definitions**

**enable | disable**                      Enables or disables the power saving functionality.

### **Defaults**

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	enable

### **Platforms Supported**

Not supported in this release.

### **Usage Guidelines**

- When enabled unneeded power-supplies are shut down to conserve energy, only the power supplies required to provide N+1 redundancy remain on.
- If enabled and power is lost to all active power supplies simultaneously the switch will lose power since N+1 redundancy applies only to the active power supplies.
- If the power-save mode is disabled, all available power supplies are switched on at all times.

### **Release History**

Release 7.1.1; command introduced.

### **Related Commands**

[show powersupply](#)                      Displays the hardware information and current status for chassis power supplies.

### **MIB Objects**

chasEntPhysicalTable  
  chasEntPhysAdminStatus

---

## hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

**hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}**

**hash-control extended no udp-tcp-port**

---

### Syntax Definitions

<b>brief</b>	Sets hashing to brief mode.
<b>extended</b>	Sets hashing to extended mode.
<b>udp-tcp-port</b>	Sets extending hashing to use UDP/TCP ports.
<b>enable   disable</b>	Enables or disables the load balancing of non-unicast traffic on a link aggregate.

### Defaults

parameter	default
hash-control	brief
udp-tcp-port	disabled
non-ucast	disabled

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

## Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

## Release History

Release 7.2.1; command introduced.

## Related Commands

[show hash-control](#) Displays the current hash control setting for the switch.

## MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUHashControl
```

---

## bluetooth

Enables or disables bluetooth connectivity and configures bluetooth power level.

**bluetooth {admin-state [enable | disable] | transmit-power [low | high]}**

---

### Syntax Definitions

**enable | disable** Enables or disables the bluetooth interface.  
**low | high** Configures the bluetooth power level to low or high.

### Defaults

---

parameter	default
enable / disable	enable
low   high	low

---

### Platforms Supported

OmniSwitch 6860

### Usage Guidelines

This command will configure all bluetooth interfaces in a virtual chassis.

### Examples

```
-> bluetooth admin-state enable  
-> bluetooth transmit-power high
```

### Release History

Release 8.1.1; command was introduced.

### Related Commands

**show bluetooth status** Displays the current bluetooth settings.  
**show me** Executes an LED blink pattern for 10 seconds that is used by the bluetooth application to identify the connected switch.

### MIB Objects

```
systemServices  
  systemServicesUsbEnable  
  systemServicesBluetoothTxPower
```

---

## license

Activates the license for licensed protocols on the switch.

**license apply file** *file\_name*

---

### Syntax Definitions

*file\_name*                                      The name of the license file containing the license keys.

### Defaults

By default licensed protocols are not activated on the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The license file can have any name.
- The license file is only used to activate the licensed features and does not need to remain on the switch.
- The switch must be rebooted to reflect the licensed feature set.
- The module type will continue to display as 'U16L' even after upgrading a 'U16' to a 'U16E'.

### Examples

```
-> license apply file /flash/swlicense.txt
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y
```

### Release History

Release 7.2.1; command was introduced.

Release 7.3.1; **key** and **deactivate** parameters deprecated.

### Related Commands

**show license-info**                              Displays all the licensed applications installed on the switch.

### MIB Objects

```
alaCapManVcSwLicensingAction
  alaCapManSwLicensingActionArg
```

---

## show system

Displays basic system information for the switch. Information includes a user-defined system description, name, administrative contact, location, object ID, up time, and system services.

**show system**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show system
System:
  Description:  Alcatel-Lucent Enterprise OS6900-X40 8.3.1.313.R01 GA, August 31,

## show cmm

Displays basic hardware and status information for the CMM modules in a standalone switch.

**show cmm** [*slot*]

---

### Syntax Definitions

*slot* Specifies the CMM by slot number or letter.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

On chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B.

### Examples

```
-> show cmm
Chassis ID 1 Module in slot CMM-A
  Model Name:           OS99-CMM,
  Module Type:          0x7100101,
  Description:           MGMT MODULE,
  Part Number:          903754-90,
  Hardware Revision:    C06,
  Serial Number:        U1820028,
  Manufacture Date:     May 10 2016,
  FPGA - Control:       2.0.0,
  FPGA - Power:         0.8,
  Admin Status:         POWER ON,
  Operational Status:   UP,
  Max Power:            64,
  CPU Model Type:       Intel Atom C2518,
  MAC Address:          2c:fa:a2:13:e4:02,
  Coreboot Version:     8.3.1.103.R01
```

#### *output definitions*

---

<b>Model Name</b>	The model name of the switch.
<b>Model Type</b>	A unique module ID specific to the type of module.
<b>Description</b>	A factory-defined description of the associated board.
<b>Part Number</b>	The part number for the board.
<b>Hardware Revision</b>	The hardware revision level for the board.
<b>Serial Number</b>	The serial number for the board.
<b>Manufacture Date</b>	The date the board was manufactured.

*output definitions (continued)*

---

<b>FPGA - Control</b>	FPGA version.
<b>FPGA - Power</b>	FPGA version
<b>Admin Status</b>	The current power status of the CMM. Information is obtained from a running CMM. Hence the value is always POWER ON.
<b>Operational Status</b>	The current operational status of the CMM.
<b>Max Power</b>	The maximum power for the CMM.
<b>CPU Model Type</b>	The CPU Model type.
<b>MAC Address</b>	The MAC address assigned to the chassis.
<b>Coreboot Version</b>	The boot version number for the CMM.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>show chassis</b>	Displays the basic configuration and status information for the switch chassis.
<b>show slot</b>	Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the switch.
<b>show module</b>	Displays the basic information for either a specified module or all the modules installed in the chassis.
<b>show module long</b>	Displays the detailed information for either a specified module or all modules installed in the chassis.
<b>show module status</b>	Displays the basic status information for either a specified module or all modules installed in the chassis.
<b>license</b>	Displays the status and configuration of Switch Fabric Modules (SFMs) on chassis-based switches.

**MIB Objects**

---

## show slot

Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the chassis.

**show slot** [*slot*]

---

### Syntax Definitions

*slot* The slot number for a specific NI module installed in the chassis. If no slot number is specified, information for all the NI modules is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as 'UNKNOWN'.

### Examples

```
-> show slot 1
Module in slot 1
  Model Name:           OS10-GNI-C48,
  Description:         10-1000 RJ45,
  Part Number:         902434-90,
  Hardware Revision:   A07,
  Serial Number:       H03Q0008,
  Manufacture Date:    JAN 31 2007,
  FPGA - Physical 1:   007,
  Daughter FPGA - Physical 1: 002,
  Daughter FPGA - Physical 2: 002,
  Admin Status:        POWER ON,
  Operational Status:  UP,
  Power Consumption:   200,
  CPU Model Type   :   Motorola MPC854
  MAC Address:       00:d0:95:01:04:
  ASIC - Physical 1:  BCM56620_A1,
  ASIC - Physical 2:  BCM56620_A1,
  ASIC - Physical 3:  BCM56620_A1,
  ASIC - Physical 4:  BCM56620_A1,
  ASIC - Physical 5:  BCM56620_A1,
  ASIC - Physical 6:  BCM56620_A1,
  UBOOT Version:     7.1.1.412.R01,
```

*output definitions*

---

<b>Model Name</b>	The NI module name. For example, OS9-GNI-C24 indicates a twenty four-port 10/100/1000BaseT Ethernet module.
<b>Description</b>	A general description of the NI. For example, 24pt 10/100/1000BaseT Mod indicates a twenty four-port 10/100/1000BaseT Ethernet module.
<b>Part Number</b>	The part number for the NI.
<b>Hardware Revision</b>	The hardware revision level for the NI.
<b>Serial Number</b>	The serial number for the NI printed circuit board (PCB).
<b>Manufacture Date</b>	The date the NI was manufactured.
<b>FPGA/Daughter FPGA</b>	The FPGA versions.
<b>Admin Status</b>	The current power status of the NI. Options include POWER ON or POWER OFF.
<b>Operational Status</b>	The operational status of the NI. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
<b>Power Consumption</b>	The current power consumption for the module.
<b>CPU Model Type</b>	The CPU model type.
<b>MAC Address</b>	The MAC address assigned to the NI.
<b>ASIC - Physical</b>	General information regarding the NI module ASICs.
<b>UBOOT Version</b>	UBOOT version of the NI.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>reload slot</b>	Reloads the specified NI module.
<b>power slot</b>	Turns the power on or off for a specified Network Interface (NI) module.
<b>show module</b>	Displays the basic information for either a specified module or all modules installed in the chassis.
<b>show module long</b>	Displays the detailed information for either a specified module or all modules installed in the chassis.

## show module status

Displays the basic status information for either a specified module or all modules installed in a standalone switch chassis.

**show module status** [*slot*]

---

### Syntax Definitions

*slot* The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, information for all modules is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

When this command is entered from the secondary CMM, the Operational and Admin Status for NIs will display as 'UNKNOWN'.

### Examples

```
-> show module status
      Operational          Firmware
Slot   Status      Admin-Status  Rev      MAC
-----+-----+-----+-----+-----
CMM-A  UP            POWER ON     N/A     00:d0:95:a3:e5:09
SLOT-1 UP            POWER ON     N/A     00:d0:95:a3:e5:0b
```

### output definitions

---

<b>Slot</b>	The chassis slot position of the module. For detailed slot numbering information, refer to the “Chassis and Power Supplies” chapter of the <i>Hardware User Guide</i> . Refer to <a href="#">page 56-28</a> for additional information on CMM callouts.
<b>Operational Status</b>	The operational status of the module. Options include UP or DOWN. For NI and secondary CMM modules, the operational status can be DOWN while the power status is on, indicating a possible software issue.
<b>Admin-Status</b>	The current power status of the module. Options include POWER ON or POWER OFF.
<b>Firmware Rev</b>	The firmware version for module ASICs.
<b>MAC</b>	For the CMM, the base chassis MAC address is displayed. For NI modules, the MAC address for the corresponding NI is displayed.

N/A

---

## show fantray

Displays the current operating status of chassis fantrays.

**show fantray** [*slot*]

---

### Syntax Definitions

*slot* Specifies the slot number of the fantray.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guideline

N/A

### Examples

```
-> show fantray
      | Working | Fan
Tray | Status | Fans | Load %
-----+-----+-----+-----
  1   |  ON   |   4  |   50
```

### output definitions

---

<b>Chassis/Tray</b>	The chassis/Tray ID.
<b>Status</b>	The current operational status of the fantray.
<b>Working Fans</b>	The number of working fans.
<b>Fan Load %</b>	The load of the fantray.

---

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show fantray](#) Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

### MIB Objects

N/A

---

## show temperature

Displays the ambient temperature of the current operating chassis, as well as current temperature threshold settings.

**show temperature** [**fabric** *[index]*] | **slot** *[index]*] | **fantray** *[index]*] | **cmm** *[index | cmm\_letter]*] | **chassis-id** *chassis]*

---

### Syntax Definitions

<i>index</i>	Specifies the index number.
<i>cmm_letter</i>	Specifies the CMM letter.
<i>chassis</i>	The ID number of the chassis.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Refer to the appropriate *Hardware Users Guide* for detailed information about temperature thresholds for a specific OmniSwitch model.

### Examples

```
-> show temperature
Chassis/Device | Current | Range | Danger | Thresh | Status
-----+-----+-----+-----+-----+-----
1/CMM          | 25      | 15-89 | 89     | 64     | UNDER THRESHOLD
```

#### *output definitions*

---

<b>Chassis/Device</b>	The device being measured (CMM, Fabric, or NI)
<b>Current</b>	The current CPU temperature in Celsius.
<b>Range</b>	The supported threshold range.
<b>Danger</b>	The danger threshold value. This value is based on the switch model and is not configurable.
<b>Thresh</b>	The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user.
<b>Status</b>	Whether the current temperature has reached the threshold.

---

### Release History

Release 7.1.1; command introduced.

```

---

## show license-info

Displays all the licensed applications installed on the switch.

**show license-info**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.
- The module type will continue to display as 'U16L' even after upgrading a 'U16' to a 'U16E'.

### Examples

```
->show license-info
```

VC	Device	License	Type	Time (Days) Remaining
0	0	Advanced	Permanent	NA

#### *output definitions*

---

<b>VC</b>	Virtual chassis identifier.
<b>Device</b>	Slot number of NI.
<b>License</b>	Displays the feature license installed on the switch. Advanced, Data Center, U16L
<b>Type</b>	The type of license: Demo or Permanent.
<b>Time (Days) Remaining</b>	Time of days remaining for a demo license. Display as 'NA' for permanent licenses.

---

### Release History

Release 7.2.1; command was introduced.

### Related Commands

[license](#) Activates the license for licensed protocols on the switch.

## show bluetooth status

Displays the current bluetooth configuration.

**show bluetooth status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guideline

N/A

### Examples

```
-> show bluetooth status
Admin Status      : disabled,
Transmit Power    : low,

Chassis          Operational Status
-----+-----
1                Not Present
```

### *output definitions*

---

<b>Admin Status</b>	Whether bluetooth is enabled or disabled.
<b>Transmit Power</b>	Whether transmit power is high or low.
<b>Chassis</b>	The chassis identifier.
<b>Operational Status</b>	notPresent - No bluetooth device present. connectionInactive - Bluetooth device present but inactive. connectionActive - Bluetooth device present and active.

---

### Release History

Release 8.1.1; command introduced.

**Related Commands****bluetooth**

Enables or disables bluetooth connectivity and configures bluetooth power level.

**MIB Objects**

N/A

---

## show me

Executes an LED blink pattern for 10 seconds that is used by the bluetooth application to identify the connected switch.

show me

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6860

### Usage Guideline

Use this command in a virtual chassis to identify which switch currently has bluetooth connectivity.

### Examples

```
-> show me
The Chassis ID LED will blink for 10 seconds.
```

### Release History

Release 8.1.1; command introduced.

### Related Commands

[bluetooth](#) Enables or disables bluetooth connectivity and configures bluetooth power level.

### MIB Objects

---

## show tcam utilization

Displays runtime information about the Ternary Content Addressable Memory (TCAM) utilization for each stage of each TCAM on each slot of the switch.

**show tcam utilization** [*chassis/slot*] [*chassis/slot/tcam*]

---

### Syntax Definitions

*chassis/slot* A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.

*chassis/slot/tcam* A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

### Defaults

By default, TCAM utilization is displayed for the entire switch.

### Platforms Supported

OmniSwitch 9900, 6560

### Usage Guidelines

- The utilization is represented in terms of the minimum-sized entry supported by the TCAM.
- This command replaces the **show qos slice** command only on the OmniSwitch 9900; the **show qos slice** command is still available on the other OmniSwitch platforms.

### Examples

```
-> show tcam utilization
```

Legend:

C/S/T = Chassis/Slot/TCAM

```

## show tcam utilization detail

Displays the Ternary Content Addressable Memory (TCAM) utilization of each application (or application group) for each stage of each TCAM on each slot of the switch.

**show tcam utilization** [*chassis/slot*] [*chassis/slot/tcam*] **detail**

---

### Syntax Definitions

*chassis/slot* A chassis ID and slot number. Use this parameter to display TCAM utilization for a specific slot.

*chassis/slot/tcam* A chassis ID, slot, and TCAM number. Use this parameter to display utilization for a specific TCAM.

### Defaults

By default, the detailed TCAM utilization is displayed for the entire switch.

### Platforms Supported

OmniSwitch 9900, 6560

### Usage Guidelines

The utilization is represented in terms of the minimum-sized entry supported by the TCAM.

### Examples

```
-> show tcam utilization detail
```

Legend:

C/S/T = Chassis/Slot/TCAM  
 PI = Pre-Ingress  
 I = Ingress  
 E = Egress

C/S/T	App Group Name	App Name	Resource Name	Stage	Entry Size	Used Entries	Reserved Entries	Available Entries

## security key

This command creates an authentication key into the system.

**security key** *key-id* **algorithm** sha256 {**encrypt-key** *encrypt-key* | **key** *simple-key*} **start-time** *mm/dd/yyyy* [*hh:mm*] [**lifetime** *days* [*hh:mm*]]

**no security key** *key-id* [-*key-id2*]

---

### Syntax Definitions

<i>key-id</i>	The key ID. This can be in the range 1-256.
<i>encrypt-key</i>	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. The key can range from 16 to 512 characters in length.
<i>simple-key</i>	Key will be plain text ASCII up to 118 characters. Use quotes (") around the string if the key contains multiple words with spaces between them. Plain text key can range from 16 to 118 characters in length.
<i>mm/dd/yyyy</i>	Key activation time. Granularity is up to minutes. Enter the start time in the format mm/dd/yyyy hh:mm where mm is the month, dd is the day, yyyy is the year, hh is the hour, mm is the minutes. For example, 08/08/2005 14:30
<i>days</i>	Validity duration of the key in terms of days and time. Lifetime can be in the range 1 - 9125 days.

### Defaults

parameter	default
<b>lifetime</b> <i>days</i>	180 days

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The switch can have a maximum of 256 keys.
- Current active key is determined based on the lowest numerical key ID. When the current active key expires, if the keychain has multiple active keys, the switch will switchover to active key having lowest key ID.
- When the current active key expires, if the keychain does not have any other active key, the switch will bring down all the adjacencies formed using that keychain.
- Parameters of a key can be modified if the key is not in use. Once the key is attached to any of the keychains, no more modification is allowed.
- Use the **no** form of this command to delete a key.

- To delete a key, first disassociate the keychain from a user application, and detach the key from the keychain.
- The show commands will always display the key-string in an encrypted format.

### Examples

```
-> security key 5 algorithm sha256 key "passwordstring123" start-time 1/31/2017
00:00 life-time 180 10:30
-> security key 5 algorithm sha256 key "passwordstring123" start-time 5/2/2017
life-time 150
-> no security key 5
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

[show security key](#)

This command displays the configured keys in the system.

### MIB Objects

```
alaSecKeyId
alaSecKeyAlgorithm
alaSecKeyType
alaSecKeyAuthKey
alaSecKeyStartTime
alaSecKeyLifeTime
alaSecKeyRowStatus
```

---

## security key-chain

This command creates a system level security keychain.

**security key-chain** *key-chain-id* [**name** *key-chain-name*]

**no security key-chain** *key-chain-id1* [-*key-chain-id2*]

---

### Syntax Definitions

*key-chain-id*

The keychain ID. This can be in the range 1-32.

*key-chain-name*

The keychain name. The keychain name can range from 1 to 16 characters in length.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- There can be a maximum of 32 keychains in the device, and each of them can hold multiple keys.
- Use the **no** form of this command to delete a keychain.
- To delete a keychain, first disassociate the keychain from the user application.
- Deleting a keychain will not delete the keys associated with the keychain. Keys will subsequently remain configured, but will not be associated to any keychain, until reassociation.
- The keychain ID is associated to user applications such as ISIS, OSPF. The authentication information is carried in the Hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines should have same current key ID and same authentication type.
- Changing the switch system clock impacts the status of the keys.

### Examples

```
-> security key-chain 1 globalKeyChain
-> no security key-chain 1-3
-> no security key-chain 4
```

### Release History

Release 8.4.1; command introduced.

**Related Commands**

**show security key-chain** This command displays the configured keychains in the system.

**MIB Objects**

alaSecKeyChainId  
alasecKeyChainName

---

## security key-chain key

This command associates a key into the specified keychain.

**security key-chain** *key-chain-id* **key** *key-id* [-*key-id2*]

**no security key-chain** *key-chain-id1* [-*key-chain-id2*]

---

### Syntax Definitions

*key-chain-id*                      The keychain ID.  
*key-id*                              The key ID.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disassociate a key from a security keychain.
- To disassociate a key from the keychain, first disassociate the keychain from the user application, and detach the key from the keychain.

### Examples

```
-> security key-chain 1 key 5  
-> no security key-chain 1
```

### Release History

Release 8.4.1; command introduced.

### Related Commands

# 57 Chassis MAC Server (CMS) Commands

The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:

- Base chassis MAC address
- Ethernet Management Port (EMP)
- VLAN router ports

Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address *range*.

The MAC address range is stored on the switch's EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses.

MIB information for the Chassis MAC Server commands is as follows:

*Filename:* ALCATEL-IND1-MAC-SERVER-MIB.mib  
*Module:* alcatelIND1MacServerMIB

A summary of the available commands is listed here:

---

**mac-range eeprom**  
**show mac-range**  
**show mac-range alloc**

---

## mac-range eeprom

Modifies the default MAC range on the switch's EEPROM.

---

**Note.** Use caution when modifying the default MAC range. Improper use of this command can disable your system and adversely affect your network. Contact Alcatel-Lucent Enterprise Customer Support for further assistance.

---

**mac-range eeprom** *start\_mac\_address count*

---

### Syntax Definitions

<i>start_mac_address</i>	The first MAC address in the modified range. Enter the MAC address in the following format: <b>xx:xx:xx:xx:xx:xx</b> , where <b>x</b> is a hex value (0–f).
<i>count</i>	Specifies the number of MAC addresses in the range (1–256).

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Because the factory-installed 32 MAC addresses are sufficient for most network configurations, this command should only be used by qualified network administrators for special network requirements.
- After modifying a MAC address range by using the **mac-range eeprom** command, you must reboot the switch. Otherwise, MAC addresses for existing VLAN router ports will not be allocated properly.
- All MAC addresses in a range must be contiguous (i.e., there cannot be any gaps in the sequence of MAC addresses).

### Examples

```
-> mac-range eeprom 00:20:da:23:45:35 32
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show mac-range](#) Displays the MAC range table.

**MIB Objects**

chasMacAddressRangeTable

  chasMacRangeIndex

  chasGlobalLocal

  chasMacAddressStart

  chasMacAddressCount

---

## show mac-range

Displays the MAC range table.

**show mac-range** [*index*]

---

### Syntax Definitions

*index* Identifies the MAC range by referring to its position in the MAC range table.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Because the switch currently supports one MAC address range only, index position 1 displays.

### Examples

-> show mac range

Mac Range	Row Status	Local/Global	Start Mac Addr	End Mac Addr
01	ACTIVE	GLOBAL	00:d0:95:6a:79:6e	00:d0:95:6a:79:8d

#### output definitions

---

<b>Mac Range</b>	The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.
<b>Row Status</b>	The current status of the MAC range. The status <b>ACTIVE</b> refers to MAC addresses that are available for allocation to VLAN router ports and other applications.
<b>Local/Global</b>	The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as <i>EEPROM</i> MAC addresses) have the global bit set in the first byte of the address and are stored on the switch's EEPROM. Because the switch's default MAC range is stored on EEPROM, the status GLOBAL displays.
<b>Start Mac Addr</b>	The first MAC address in the MAC address range.
<b>End Mac Addr</b>	The last MAC address in the MAC address range.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **mac-range eeprom**

Modifies the default MAC range on the switch's EEPROM.

## MIB Objects

```
chasMacAddressRangeTable
  chasMacRangeIndex
  chasGlobalLocal
  chasMacAddressStart
  chasMacAddressCount
  chasMacRowStatus
```

---

## show mac-range alloc

Displays all allocated addresses from the MAC range table.

**show mac-range** [*index*] **alloc**

---

### Syntax Definitions

*index* Identifies the MAC range by referring to its position in the MAC range table. Currently, index position 1 only is supported.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show mac-range alloc
Range      Mac Address           Application      Id
-----+-----+-----+-----
01         00:d0:95:6b:09:40 CHASSIS          0
01         00:d0:95:6b:09:41 802.1X           0
01         00:d0:95:6b:09:5f CHASSIS          1
```

### output definitions

---

<b>Range</b>	The MAC range's index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to <a href="#">page 57-4</a> for more information.
<b>Mac Address</b>	Current MAC address allocated for a specific application.
<b>Application</b>	The application for which the allocated MAC address is being used. Current options include <b>VLAN</b> , <b>802.1X</b> , and <b>CHASSIS</b> . <b>VLAN</b> refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. <b>CHASSIS</b> refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP).

*output definitions (continued)*

---

<b>Id</b>	An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0.

# 58 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

*Filename:* ALCATEL-IND1-NTP-MIB.mib  
*Module:* alcatelIND1NTPMIB

A summary of available commands is listed here:

---

**ntp server**  
**ntp server synchronized**  
**ntp server unsynchronized**  
**ntp client**  
**ntp src-ip preferred**  
**ntp broadcast**  
**ntp broadcast-client**  
**ntp broadcast-delay**  
**ntp key**  
**ntp key load**  
**ntp authenticate**  
**ntp master**  
**ntp interface**  
**ntp max-associations**  
**ntp broadcast**  
**ntp peer**  
**ntp vrf-name**  
**show ntp status**  
**show ntp client**  
**show ntp client server-list**  
**show ntp server client-list**  
**show ntp server status**  
**show ntp keys**  
**show ntp peers**  
**show ntp server disabled-interfaces**

---

## ntp server

Specifies an NTP server from which the switch will receive updates.

**ntp server** {*ip\_address*} [**key** *key\_id*] [**minpoll** *poll*] [**version** *version*] [**prefer**]

**no ntp server** {*ip\_address*}

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the NTP server to be added or deleted to the client's server list.
<i>key_id</i>	The key identification number that corresponds to the specified NTP server. The value ranges from 1 to 65534.
<i>poll</i>	It specifies the minimum polling interval for NTP message. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The maximum poll interval is fixed at 10 (1,024 s). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 4 (16 s), or increase to the maximum limit of 10.
<i>version</i>	The version of NTP being used. This will be 1, 2, 3, or 4.
<b>prefer</b>	Marks this server as the preferred server. A preferred server's timestamp will be used before another server.

### Defaults

Parameter	Default
<i>version</i>	4
<i>exponent</i>	6
<b>prefer</b>	not preferred

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 12 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.

- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The client will poll the server for a time update when the **minpoll** time is exceeded.
- NTP authentication must be disabled before adding or removing an NTP server.

## Examples

```
-> ntp server 1.1.1.1
-> ntp server spartacus
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server spartacus minpoll 5
-> no ntp server 1.1.1.1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ntp client](#) Enables or disables NTP operation on the switch.

  alaNtpPeerType
  alaNtpPeerAuth
  alaNtpPeerMinpoll
  alaNtpPeerVersion
  alaNtpPeerPrefer
  alaNtpPeerAddress
```

---

## ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

**ntp server synchronized**

---

### Syntax Definitions

N/A

### Defaults

By default, NTP synchronization is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

### Examples

```
-> ntp server synchronized
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp server unsynchronized](#) Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

### MIB Objects

```
alaNtpConfig  
  alaNtpPeerTests
```

---

## ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

**ntp server unsynchronized**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

### Examples

```
-> ntp server unsynchronized
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp server synchronized](#)

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

### MIB Objects

alaNtpConfig

alaNtpPeerTests

---

## ntp client

Enables or disables NTP time synchronization discipline.

**ntp client admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables NTP.
<b>disable</b>	Disables NTP.

### Defaults

NTP protocol is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the [ntp server](#) command. Up to 12 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.

### Examples

```
-> ntp client enable
-> ntp client disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp server](#) Specifies an NTP server from which the switch will receive updates.

### MIB Objects

alaNtpEnable

---

## ntp src-ip preferred

Configures a source IP address to use as the source for NTP packets.

```
ntp src-ip preferred {default | no-loopback0 | ip_address}
```

```
no ntp src-ip preferred
```

---

### Syntax Definitions

<b>default</b>	The Loopback0 address, if configured, will be used for the source IP address field. If no Loopback0 is configured, the EMP-VC IP address will be used. If no EMP-VC IP address is configured, the preferred IP address will be used. If no preferred IP address is configured the first available IP address on the switch will be used.
<b>no-loopback0</b>	The Loopback0 address will not be used for the source IP address field and either the preferred IP address (if configured) or the first available IP address on the switch will be used.
<i>ip_address</i>	The IP address to be used in the source IP field.

### Defaults

By default, the NTP source IP preferred setting is set to the **default** parameter.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- By default The Loopback0 address, if configured, will be used for the source IP address.
- If no Loopback0 is configured, the VC-EMP IP address will be used for the source IP address.
- If no VC-EMP IP address is configured, the preferred IP address will be used for the source IP address.
- If no preferred IP address is configured the first available IP address on the switch will be used as the source IP address.
- When configuring a preferred IP address, that address must already exist on the switch.
- If the configured preferred IP address is the same as the IP address that would have been automatically chosen by the switch, then the 'ntp src-ip preferred' command will not be included in the output of the 'configuration snapshot' command since only non-default settings are included in the output.
- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

### Examples

```
-> ntp src-ip preferred 192.168.10.1
-> ntp src-ip preferred no-loopback0
-> ntp src-ip preferred default
```

## Release History

Release 7.1.1; command was introduced.

Release 7.3.4; command deprecated. Use **ip service source-ip**.

## Related Commands

[show ntp status](#)

Displays the NTP configuration and status.

## MIB Objects

N/A

---

## ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

**ntp broadcast-client** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Enables the client broadcast mode.
<b>disable</b>	Disables the client broadcast mode.

### Defaults

Broadcast mode is disabled by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

### Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp broadcast-delay](#) Sets the broadcast delay time in microseconds.

### MIB Objects

alaNtpBroadcastEnable

---

## ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

**ntp broadcast-delay** *microseconds*

---

### Syntax Definitions

*microseconds*                      The number of microseconds for the broadcast delay.

### Defaults

parameter	default
<i>microseconds</i>	4000

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

### Examples

```
-> ntp broadcast-delay 1000
-> ntp broadcast-delay 10000
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp broadcast](#)                      Enables or disables the client's broadcast mode.

### MIB Objects

alaNtpBroadcastDelay

---

## ntp key

Labels the specified authentication key identification as trusted or untrusted.

**ntp key** *key* [**trusted** | **untrusted**]

---

### Syntax Definitions

<i>key</i>	The key number matching an NTP server.
<b>trusted</b>	Signifies that the specified key is trusted and can be used for authentication.
<b>untrusted</b>	Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

### Defaults

By default, all authentication key are untrusted.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used. The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to 'trusted' status to allow NTP to use the key for authentication.

### Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ntp key** Sets the public key the switch uses when authenticating with the specified NTP server.

**ntp client** Enables or disables NTP operation on the switch.

**MIB Objects**

```
alaNtpAccessKeyIdTable  
  alaNtpAccessKeyIdKeyId  
  alaNtpAccessKeyIdTrust
```

---

## ntp key load

Loads the current key file into memory.

**ntp key load**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

### Examples

```
-> ntp key load
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |                   |   |
|-------------------|---|
| <b>ntp key</b>    | Labels the specified authentication key identification as trusted or untrusted. |
| <b>ntp server</b> | Specifies an NTP server from which this switch will receive updates.            |

### MIB Objects

alaNtpAccessRereadkeyFile

---

## ntp authenticate

Enables or disables the authentication on a configured NTP server.

**ntp authenticate {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables authentication for NTP server.
<b>disable</b>	Disables authentication for NTP server.

### Defaults

By default, NTP authentication is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using [ntp client](#) command.
- Before enabling the NTP operation, NTP server must be specified using the [ntp server](#) command.
- NTP authentication must be disabled before adding or removing an NTP server.

### Examples

```
-> ntp authenticate enable  
-> ntp authenticate disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays the information about the current NTP status.

### MIB Objects

alaNtpAuthenticate

---

## ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

**ntp master** *stratum\_number*

---

### Syntax Definitions

*stratum\_number* Integer value ranging from 2 to 16.

### Defaults

Parameter	Default
<i>stratum_number</i>	16

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

### Examples

```
-> ntp master 4
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

alaNtpConfig  
alaNtpSysStratum

---

## ntp interface

Enables or Disables NTP server functionality for an interface.

```
ntp interface {interface_ip} {enable | disable}
```

---

### Syntax Definitions

<i>interface_ip</i>	IP address of an interface on which NTP server functionality is to be disabled.
<b>enable</b>	Enables NTP server functionality on an interface.
<b>disable</b>	Disables NTP sever functionality on an interface.

### Defaults

By default, NTP server functionality is enabled on all the interfaces.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

### Examples

```
-> ntp interface 10.10.10.1 disable  
-> ntp interface 10.10.10.1 enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

```
alaNtpAccessRestrictedTable  
  alaNtpAccessRestrictedIpAddress
```

---

## ntp max-associations

Configures the maximum number of associations on the switch.

**ntp max-associations** *number*

---

### Syntax Definitions

*number* Maximum no of client/server and peer associations. Integer value ranging from 0 to 128.

### Defaults

By default, 32 associations are allowed on the switch.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 32 to any value between 0 to 128.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

### Examples

```
-> ntp max-associations 20
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

```
alaNtpConfig  
  alaNtpMaxAssociation
```

---

## ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

**ntp broadcast** {*broadcast\_addr*} [**version** *version*] [**minpoll** *poll interval*]

**no ntp broadcast** {*broadcast\_addr*}

---

### Syntax Definitions

<i>broadcast_addr</i>	Subnet for which broadcast updates are regularly sent.
<i>version</i>	NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
<i>poll interval</i>	Polling interval for NTP broadcast message. This value is measured in seconds.

### Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers. This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to be defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

### Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ntp broadcast](#)

Enables or disables the client's broadcast mode.

[ntp broadcast-delay](#)

Sets the broadcast delay time in microseconds

## MIB Objects

alaNtpPeerTable

  alaNtpPeerType

  alaNtpPeerVersion

  alaNtpPeerMinpoll

---

## ntp peer

Configures NTP to operate in the symmetric active peering mode. This also enables the establishment of an active symmetric association with the specified remote peer.

**ntp peer** {*ip\_address*} [**key** *key\_id*] [**version** *version*] [**minpoll** *poll interval*]

**no ntp peer** {*ip\_address*}

---

### Syntax Definitions

<i>ip_address</i>	IP address of the remote peer.
<i>key_id</i>	Authentication key for the remote peer.
<i>version</i>	NTP packet version to be used for the peer association.
<i>poll interval</i>	Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

### Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode. This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x).
- *ip-address* is the mandatory parameter to be entered in the command while key id is the optional parameter. If key id is not specified, then peering will not be authenticated.

### Examples

```
-> ntp peer 172.18.16.112
-> no ntp peer 172.18.16.112
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[show ntp peers](#)

Displays current NTP peer association.

## MIB Objects

  alaNtpPeerType

  alaNtpPeerAuth

  alaNtpPeerVersion

  alaNtpPeerMinpoll

---

## show ntp status

Displays the information about the current NTP status.

**show ntp status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

### Example

```
-> show ntp status
Current time:                Thu, Jun 14 2012 21:05:46.313 (UTC),
Last NTP update:            -,
Server reference:           0.0.0.0,
Client mode:                disabled,
Broadcast client mode:      disabled,
Broadcast delay (microseconds): 4000,
Server qualification:        synchronized,
Stratum:                    16,
Maximum Associations Allowed: 32,
Authentication:            disabled,
Source IP Configuration:    default
VRF Name:                   default
```

---

<b>Current time</b>	The current time for the NTP client.
<b>Last NTP update</b>	The time of the last synchronization with an NTP server.
<b>Server reference</b>	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
<b>Client mode</b>	Whether the NTP client software is enabled or disabled.
<b>Broadcast client mode</b>	What NTP mode the client is running in, either client or broadcast.
<b>Broadcast delay</b>	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
<b>Server qualification</b>	Server qualification status.

---

<b>Stratum</b>	The stratum of the server. The stratum number is the number of hops from a UTC time source.
<b>Max-Association</b>	Maximum association on the switch that restricts the number of client/server and peer association
<b>Authentication</b>	Whether Authentication is enabled or disabled
<b>Source IP Configuration</b>	Source IP Configuration type which is configured.
<b>Source IP</b>	Source IP address for NTP that send updates to clients. Note: This field is displayed only if the value of "Source IP Configuration" is set to "Preferred".
<b>VRF Name</b>	Name of the VRF.

---

## show ntp client

Displays information about the current client NTP configuration.

**show ntp client**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

### Examples

```
-> show ntp client
Current time:                Tue, Jun 26 2012 17:52:47.619 (UTC),
Last NTP update:            (null),
Server reference:           0.0.0.0,
Client mode:                 disabled,
Broadcast client mode:      disabled,
Broadcast delay (microseconds): 4000,
Server qualification:        synchronized
VRF Name:                   default
```

### *output definitions*

---

<b>Current time</b>	The current time for the NTP client.
<b>Last NTP update</b>	The time of the last synchronization with an NTP server.
<b>Server reference</b>	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
<b>Client mode</b>	Whether the NTP client software is enabled or disabled.
<b>Broadcast client mode</b>	What NTP mode the client is running in, either client or broadcast.
<b>Broadcast delay</b>	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
<b>Server Qualification</b>	Indicates whether the server must be synchronized or not.
<b>VRF Name</b>	Name of the VRF.

---

**Release History**

Release 7.1.1; command was introduced.

## show ntp client server-list

Displays a list of the servers with which the NTP client synchronizes.

**show ntp client server-list**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to display tabular information on the current NTP client to server association status.

### Examples

```
-> show ntp client server-list
```

```
IP Address      Ver  Key  St    Delay      Offset      Disp
=====+====+=====+====+=====+=====+=====
*198.206.181.70  4    0    2     0.167      0.323      0.016
=198.206.181.123 4    0    16    0.000      0.000      0.000
```

#### *output definitions*

---

<b>IP Address</b>	The server IP address. "+" indicates an active peer "-" indicates a pasive peer "=" indicates a client "*" indicates current system peer "^" indicates a broadcast server "^" indicates a broadcast client
<b>Ver</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>St</b>	The stratum of the server.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Disp</b>	The dispersion value received from the server in its timestamp.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Command**

[ntp client](#)

Enables or disables NTP operation on the switch.

**MIB Objects**

alaNtpPeerListTable

---

## show ntp server client-list

Displays the information about the current NTP clients connected to the server.

**show ntp server client-list**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to display the tabular information on the current NTP client connected to the server (switch).

### Examples

```
-> show ntp server client-list
IP Address          Ver      Key
-----+-----+-----
172.23.0.201        4         0
10.255.24.121       4         0
```

### *output definitions*

---

<b>IP Address</b>	The client IP address.
<b>Ver</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.

---

### Release History

Release 7.1.1; command was introduced.

**Related Command****show ntp status**

Displays information about the current client NTP configuration

**ntp client**

Enables or disables NTP operation on the switch.

**MIB Objects**

alaNtpPeerListAddress

alaNtpPeerVersion

    alaNtpPeerAuth

---

## show ntp server status

Displays the basic server information for a specific NTP server or a list of NTP servers.

**show ntp server status** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      The IP address of the NTP server to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command displays information on the status of any or all configured NTP servers/peers.
- To display a specific server, enter the command with the server's IP address. To display all servers, enter the command with no server IP address.

### Examples

```
-> show ntp server status
IP address           = 172.18.16.147,
Host mode            = server,
Peer mode           = unspec,
Prefer               = no,
Version             = 4,
Key                 = 0,
Stratum             = 16,
Minpoll             = 4 (16 seconds),
Maxpoll             = 10 (1024 seconds),
Delay               = 0.000 seconds,
Offset              = 0.000 seconds,
Dispersion          = 0.000 seconds
Root distance       = 0.000,
Precision           = -6,
Reference IP        = 0.0.0.0,
Status              = not configured,
Uptime count        = 28250 seconds,
Reachability        = 0,
Unreachable count   = 5,
Stats reset count   = 27829 seconds,
Packets sent        = 0,
Packets received    = 0,
Duplicate packets   = 0,
Bogus origin        = 0,
Bad authentication  = 0,
Bad dispersion      = 0
```

```

-> show ntp server status 198.206.181.139
IP address      = 198.206.181.139,
Host mode       = client,
Peer mode       = server,
Prefer          = no,
Version         = 4,
Key             = 0,
Stratum         = 2,
Minpoll        = 6 (64 seconds),
Maxpoll        = 10 (1024 seconds),
Delay           = 0.016 seconds,
Offset          = -180.232 seconds,
Dispersion     = 7.945 seconds
Root distance   = 0.026,
Precision       = -14,
Reference IP    = 209.81.9.7,
Status          = configured : reachable : rejected,
Uptime count    = 1742 seconds,
Reachability    = 1,
Unreachable count = 0,
Stats reset count = 1680 seconds,
Packets sent    = 1,
Packets received = 1,
Duplicate packets = 0,
Bogus origin    = 0,
Bad authentication = 0,
Bad dispersion  = 0,
Last Event      = peer changed to reachable,

```

### *output definitions*

---

<b>IP address</b>	The server IP address.
<b>Host mode</b>	The host mode of this remote association.
<b>Peer mode</b>	The peer mode of this remote association.
<b>Prefer</b>	Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.
<b>Version</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>Stratum</b>	The stratum of the server. The stratum number is the number of hops from a UTC time source.
<b>Minpoll</b>	The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded.
<b>Maxpoll</b>	The maximum poll time.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Dispersion</b>	The dispersion value received from the server in its timestamp.
<b>Root distance</b>	The total round trip delay (in seconds) to the primary reference source.
<b>Precision</b>	The advertised precision of this association.

*output definitions (continued)*

---

<b>Reference IP</b>	The IP address identifying the peer's primary reference source.
<b>Status</b>	The peer selection and association status.
<b>Uptime count</b>	The time period (in seconds) during which the local NTP server was associated with the switch.
<b>Reachability</b>	The reachability status of the peer.
<b>Unreachable count</b>	Number of times the NTP entity was unreachable.
<b>Stats reset count</b>	The time delay (in seconds) since the last time the local NTP server was restarted.
<b>Packets sent</b>	Number of packets sent.
<b>Packets received</b>	Number of packets received.
<b>Duplicate packets</b>	Number of duplicated packets received.
<b>Bogus origin</b>	Number of bogus packets.
<b>Bad authentication</b>	Number of NTP packets rejected for not meeting the authentication standards.
<b>Bad dispersion</b>	Number of bad dispersions.
<b>Last Event</b>	The last event.

## show ntp keys

Displays information about all authentication keys.

**show ntp keys**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays the information on the current set of trusted authentication keys.

### Examples

```
-> show ntp keys
Key      Status
=====+=====
1        untrusted
2        untrusted
3        trusted
4        trusted
5        untrusted
6        untrusted
7        trusted
8        trusted
```

#### *output definitions*

---

<b>Key</b>	The key number corresponding to a key in the key file.
<b>Status</b>	Whether the key is trusted or untrusted.

---

### Release History

Release 7.1.1; command was introduced.

**Related Command**

**ntp key** Labels the specified authentication key identification as trusted or untrusted.

**ntp key load** Loads the current key file into memory.

**MIB Objects**

alaNtpAccessKeyIdTable

---

## show ntp peers

Displays the information about the current status on the NTP peer association.

**show ntp peers**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

### Examples

```
-> show ntp peers
```

IP Address	Ver	Key	St	Delay	Offset	Disp
172.23.0.202	4	0	3	0.300	0.404	0.0024
10.255.24.120	4	0	3	0.016	0.250	0.0017

### *output definitions*

---

<b>IP Address</b>	Peer IP Address
<b>Ver</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>St</b>	The stratum of the server.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Disp</b>	The dispersion value received from the server in its timestamp.

---

### Release History

Release 7.1.1; command was introduced.

**Related Command****ntp client**

Enables or disables NTP operation on the switch.

**show ntp status**

Displays the information about the current NTP status.

**show ntp server status**

Displays the basic server information for a specific NTP server or a list of NTP servers.

**MIB Objects**

```

  alaNtpPeerListAddress
  alaNtpPeerVersion
  alaNtpPeerAuth
  alaNtpPeerStratum
  alaNtpPeerListDelay
  alaNtpPeerShowOffset
  alaNtpPeerListDispersion
```

---

## show ntp server disabled-interfaces

Displays the ip addresses of the interfaces on which NTP server is not enabled.

**show ntp server disabled-interfaces**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command displays ip interfaces on which currently NTP server functionality is disabled.

### Examples

```
-> show ntp server disabled-interfaces
IP Address
-----
172.23.0.202
10.255.24.120
```

### *output definitions*

# 59 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

	OmniSwitch
<b>Telnet(v4)</b>	6
<b>FTP(v4)</b>	4
<b>SSH + SFTP(v4)</b>	8
<b>HTTP</b>	4

MIB information for commands in this chapter are as follows:

*Filename:* ALCATEL-IND1-SESSION-MGR-MIB.mib  
*Module:* alcatelIND1SessionMgrMIB

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

*Filename:* ALCATEL-IND1-IP-MIB.mib  
*Module:* alcatelIND1IPMIB

A summary of the available commands is listed here:

---

**session login-attempt**  
**session login-timeout**  
**session banner**  
**session timeout**  
**session prompt**  
**session xon-xoff**  
**show prefix**  
**user profile save**  
**user profile reset**  
**history**  
**command-log**  
**kill**  
**exit**  
**who**  
**whoami**  
**show session config**  
**show session xon-xoff**  
**more**  
**telnet**  
**ssh**  
**ssh login-grace-time**  
**ssh enforce-pubkey-auth**  
**ssh strong-ciphers**  
**ssh strong-hmacs**  
**show command-log status**  
**show telnet**  
**show ssh**

---

## session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

**session login-attempt** *integer*

---

### Syntax Definitions

*integer*                      The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

### Defaults

Default is 3 login attempts.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> session login-attempt 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show session config</a>	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.
<a href="#">session login-timeout</a>	Sets or resets the amount of time the user can take to accomplish a successful login to the switch.
<a href="#">session timeout</a>	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

### MIB Objects

sessionMgr  
    sessionLoginAttempt

---

## session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

**session login-timeout** *seconds*

---

### Syntax Definitions

*seconds* The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

### Defaults

Login timeout default is 55 seconds.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> session login-timeout 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show session config</a>	Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.
<a href="#">session login-attempt</a>	Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.
<a href="#">session timeout</a>	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

### MIB Objects

```
sessionMgr  
  sessionLoginTimeout
```

---

## session banner

Sets or resets the file name of the user-defined banner. The banner is a welcome banner that appears after the user successfully logs onto the switch.

**session** {cli | ftp | http} banner *file\_name*

**no session** {cli | ftp | http} banner

---

### Syntax Definitions

<b>cli</b>	Creates/modifies the CLI banner file name.
<b>ftp</b>	Creates/modifies the FTP banner file name.
<b>http</b>	Creates/modifies the HTTP banner file name.
<i>file_name</i>	Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters.

### Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.

### Examples

```
-> session cli banner /switch/banner.txt
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

  SessionType

  SessionBannerFileName

---

## session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

```
session {cli | http | ftp} timeout minutes
```

---

### Syntax Definitions

<b>cli</b>	Sets the inactivity timeout for CLI sessions.
<b>http</b>	Sets the inactivity timeout for HTTP sessions.
<b>ftp</b>	Sets the inactivity timeout for FTP sessions.
<i>minutes</i>	Inactivity timeout value (in minutes). Valid range 1 to 596523.

### Defaults

---

parameter	default
<i>minutes</i>	4

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

### Examples

```
-> session cli timeout 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show session config](#) Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

### MIB Objects

```
SessionConfigTable  
  SessionType  
  SessionInactivityTimerValue
```

---

## session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

**session prompt default** [*string*]

---

### Syntax Definitions

*string* Prompt string. Maximum length 31 characters.

### Defaults

parameter	default
<i>string</i>	->

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The new prompt will not take effect until you log off and back onto the switch.

### Examples

```
-> session prompt default -->
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show session config](#) Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

### MIB Objects

```
SessionConfigTable  
  SessionType  
  sessionDefaultPromptString
```

---

## session xon-xoff

Enables/disables the XON-XOFF protocol on the console port.

```
session xon-xoff {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables XON-XOFF on the console port.
<b>disable</b>	Disables XON-XOFF on the console port.

### Defaults

---

parameter	default
enable / disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

### Examples

```
-> session xon-xoff enable  
-> session xon-xoff disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>show session xon-xoff</b>	Displays whether the console port is enabled or disabled for XON-XOFF.
------------------------------	--

### MIB Objects

```
sessionXonXoffEnable
```

---

## show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

`show prefix`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

### Examples

```
-> show prefix
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show prefix](#)

This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

### MIB Objects

N/A

---

## user profile save

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

**user profile save**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to save prompt definitions and more mode screen settings for use in future login sessions for the current user account.
- Use the **user profile reset** command to set values to their factory defaults.

### Examples

```
-> user profile save
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |                                    |  |
|------------------------------------|--|
| <a href="#">show prefix</a>        | Defines substitute command text for the switch's CLI command keywords. |
| <a href="#">user profile reset</a> | Resets the alias, prompt and more values to their factory defaults.    |

### MIB Objects

N/A

---

## user profile reset

Resets the alias, prompt, and more values to their factory defaults.

**user profile reset**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> user profile reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### [show prefix](#)

Defines substitute command text for the switch's CLI command keywords.

#### [user profile save](#)

Saves the user account settings for aliases, prompts and the more screen.

### MIB Objects

N/A

---

**!**

Recalls commands listed in the history buffer and displays them at the CLI prompt.

!**{!** | *n*}

---

## Syntax Definitions

- !** Recalls the last command listed in the history buffer and displays that command at the CLI prompt.
- n* Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

## Defaults

N/A

## Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- You can use the [history](#) command to list all commands in the history buffer, then use the **!*n*** syntax to issue a single command from the list.
- When you use **!*n*** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

## Examples

```
-> history
1* show ip interface
2 show vlan
3 show arp
4 clear arp
->!2
show vlan
vlan  type  admin  oper  ip    mtu   name
-----+-----+-----+-----+-----+-----+-----
   1   std    Ena    Ena   Dis   1500  VLAN 1
  10   std    Ena    Ena   Ena   1500  VLAN 10
  12   std    Ena    Ena   Ena   1500  VLAN 12
  14   std    Ena    Ena   Ena   1500  VLAN 14
  30   vip    Ena    Ena   Ena   1500  VIP VLAN 30
  40   vip    Ena    Ena   Ena   1500  VIP VLAN 40
4094  mcm    Ena    Ena   Dis   9198  MCM IPC
```

## Release History

Release 7.1.1; command was introduced.

---

**Related Commands****history**

Sets the number of commands that will be stored in the CLI history buffer.

**MIB Objects**

N/A

---

## command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

**command-log {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Creates a file called <b>command.log</b> in the switch's <b>/flash</b> directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.
<b>disable</b>	Disables logging of current session commands to the <b>command.log</b> file.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

### Examples

```
-> command-log enable
-> command-log disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show command-log</a>	Displays the contents of the <b>command.log</b> file.
<a href="#">show command-log status</a>	Shows the current status of the command logging function (i.e., enabled or disabled).

### MIB Objects

sessionCliCommandLogEnable

---

## kill

Kills an active session. The command takes effect immediately.

**kill** *session\_number*

---

### Syntax Definitions

*session\_number*                      Number of the session you want to kill.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

### Examples

```
-> kill 3
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**who**                                      Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

### MIB Objects

SessionMgr  
    sessionIndex  
    sessionRowStatus

---

## exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> exit
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[kill](#) Kills an active session. The command takes effect immediately.

### MIB Objects

```
SessionMgr  
  sessionIndex  
  sessionRowStatus
```

---

## whoami

Displays the current user session.

**whoami**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the **who** command to display all sessions on the switch.

### Examples

```
-> whoami
Session number = 5
  User name     = admin,
  Access type   = telnet,
  Access port   = NI,
  IP address    = 121.251.17.76,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
```

#### *output definitions*

---

<b>Session Number</b>	The session number assigned to the user.
<b>User name</b>	User name.
<b>Access type</b>	Type of access protocol used to connect to the switch.
<b>Access port</b>	Switch port used for access during this session.
<b>Ip Address</b>	User IP address.
<b>Read-only domains</b>	The command domains available with the user's read-only access.
<b>Read-only families</b>	The command families available with the user's read-only access.
<b>Read-Write domains</b>	The command domains available with the user's read-write access.
<b>Read-Write families</b>	The command families available with the user's read-write access.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- who** Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).
- kill** Kills another user's session.

## MIB Objects

SessionActive

```
sessionIndex  
sessionAccessType  
sessionPhysicalPort  
sessionUserName  
sessionUserReadPrivileges  
sessionUserWritePrivileges  
sessionUserProfileNumber  
sessionUserIpAddress  
sessionRowStatus
```

---

## who

Displays all active login sessions.

**who**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- You can identify your current login session by using the IP address.
- This command applies to the following session types: Console, Telnet, SSH, FTP, SFTP, HTTP, HTTPS, SNMP.

### Examples

```
-> who
Session number = 0
  User name   = (at login),
  Access type = console,
  Access port = Local,
  IP address  = 0.0.0.0,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = None,
  Read-Write families = ,

Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 128.251.17.176,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
```

### *output definitions*

---

<b>Session Number</b>	The session number assigned to the user.
<b>User name</b>	User name.
<b>Access type</b>	Type of access protocol used to connect to the switch.

---

*output definitions (continued)*

---

<b>Access port</b>	Switch port used for access during this session.
<b>Ip Address</b>	User IP address.
<b>Read-only domains</b>	The command domains available with the user's read-only access.
<b>Read-only families</b>	The command families available with the user's read-only access.
<b>Read-Write domains</b>	The command domains available with the user's read-write access.
<b>Read-Write families</b>	The command families available with the user's read-write access.

---

Possible values for command domains and families are listed here:

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">whoami</a>	Displays current user session.
<a href="#">kill</a>	Kills another user's session.

## MIB Objects

```
SessionActive
  sessionIndex
  sessionAccessType
  sessionPhysicalPort
  sessionUserName
  sessionUserReadPrivileges
  sessionUserWritePrivileges
  sessionUserProfileNumber
  sessionUserIpAddress
  sessionRowStatus
```

---

## show session config

Displays session manager configuration information (e.g., default prompt, banner file name, inactivity timer, login timer, and login attempts).

**show session config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Use the configuration commands detailed in this section to modify any of the values displayed.

### Examples

```
-> show session config
```

```
Cli Default Prompt           = ->
Cli Banner File Name        = ,
Cli Inactivity Timer in minutes = 60
Ftp Banner File Name        = ,
Ftp Inactivity Timer in minutes = 60
Http Inactivity Timer in minutes = 60
Login Timer in seconds       = 60
Maximum number of Login Attempts = 2
```

#### *output definitions*

---

<b>Cli Default Prompt</b>	Default prompt displayed for CLI sessions.
<b>Cli Banner File Name</b>	Name of the file that contains the banner information that will appear during a CLI session.
<b>Cli Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.
<b>Ftp Banner File Name</b>	Name of the file that contains the banner information that will appear during an FTP session.
<b>Ftp Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.
<b>Http Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.

---

*output definitions (continued)*

---

<b>Login Timer in seconds</b>	The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.
<b>Maximum number of Login Attempts</b>	The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">session prompt</a>	Configures the default CLI prompt for console and Telnet sessions.
<a href="#">session banner</a>	Sets the file name of the user-defined banner.
<a href="#">session timeout</a>	Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface.
<a href="#">session login-attempt</a>	Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
<a href="#">session login-timeout</a>	Sets the amount of time the user can take to accomplish a successful login to the switch.

**MIB Objects**

```
SessionConfigTable
  sessionType
  sessionBannerFileName
  sessionInactivityTimerValue
  sessionDefaultPromptString
```

---

## show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

```
show session xon-xoff
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the [session xon-xoff](#) command), traffic to the console port may be stopped.

### Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[session xon-xoff](#) Enables/disables the XON-XOFF protocol on the console port.

### MIB Objects

```
sessionXonXoffEnable
```

---

## more

Enables the more mode for your console screen display.

**more** *filename*

---

### Syntax Definitions

*filename*                      The file to display.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This parameter can also be used to pipe output from the CLI.
- This command is case sensitive.

### Examples

```
-> more textfile.txt
-> write terminal | more
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

---

## telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```
[vrf name] telnet {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

---

### Syntax Definitions

<i>name</i>	Name of the VRF.
<b>default</b>	Sets the port back to the default of 23.
<i>service_port</i>	The TCP service port number. Must be 23 or between 20000-20999.
<b>enable   disable</b>	Enables or disables telnet access.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for the Telnet session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The default directory for Telnet is **/flash**.

### Examples

```
-> telnet port 20999
-> telnet admin-state disable
-> telnet 172.17.6.228
-> vrf vrfl telnet admin-state enable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[ssh](#) Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.

[show telnet](#) Displays the current configuration specifying the ports the telnet daemons are listening on.

**MIB Objects**

SystemServices

- systemServicesArg1
- systemServicesAction
- alaIpTelnetAdminStatus

---

## ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

```
[vrf name] ssh {port [default | service_port] | admin-state [enable | disable] | ip_address}
```

---

### Syntax Definitions

<i>name</i>	Name of the VRF.
<b>default</b>	Sets the port back to the default of 23.
<i>service_port</i>	The TCP service port number. Must be 23 or between 20000-20999.
<b>enable   disable</b>	Enables or disables Secure Shell.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for the Secure Shell.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

You must have a valid username and password for the specified host.

### Examples

```
-> ssh port 20000
-> ssh admin-state disable
-> ssh 172.155.11.211
login as:

-> vrf vrf1 ssh admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">telnet</a>	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.
<a href="#">ssh enforce-pubkey-auth</a>	Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.
<a href="#">show command-log</a>	Displays the status of Secure Shell, SCP/SFTP on the switch.
<a href="#">show ssh</a>	Displays the current configuration specifying the ports SSH daemons are listening on.

**MIB Objects**`alaIpSshConfig``alaIpSshAdminStatus``alaIpSshPort`

---

## ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

```
ssh enforce-pubkey-auth {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enforces only SSH public key authentication.
<b>disable</b>	Enforces both SSH public key and password authentication.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> ssh enforce-pubkey-auth enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">telnet</a>	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.
------------------------	---

### MIB Objects

```
alaIpSshConfig  
  alaIpSshPubKeyEnforceAdminStatus
```

---

## ssh strong-ciphers

Enables or disables the enforcement of a Secure Shell (SSH) cipher configuration across a switch reboot.

`ssh strong-ciphers {enable | disable}`

---

### Syntax Definitions

<b>enable</b>	Enables the enforcement of an SSH cipher configuration.
<b>disable</b>	Disables the enforcement of an SSH cipher configuration.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> ssh strong-ciphers enable
-> ssh strong-ciphers disable
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

[show ssh](#) Displays the current SSH configuration for the switch.

### MIB Objects

alaIpSshConfig  
alaIpSshStrongCiphersAdminStatus

---

## ssh strong-hmacs

Enables or disables the enforcement of a Secure Shell (SSH) HMAC configuration across a switch reboot.

`ssh strong-hmacs {enable | disable}`

---

### Syntax Definitions

**enable** Enables the enforcement of an HMAC configuration.  
**disable** Disables the enforcement of an HMAC configuration.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

SSH HMAC refers to message authentication codes that use cryptographic hash functions (such as MD5 and SHA1).

### Examples

```
-> ssh strong-hmacs enable
-> ssh strong-hmacs disable
```

### Release History

Release 8.3.1; command was introduced.

### Related Commands

[show ssh](#) Displays the current SSH configuration for the switch.

### MIB Objects

```
alaIpSshConfig
  alaIpSshStrongHmacsAdminStatus
```

---

## show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to [page 59-16](#).

**show command-log**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The most recent commands are listed first.
- The command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

### Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date      : FRI JAN 09 00:20:01
  Ip Addr   : 128.251.19.240
  Result    : SUCCESS

Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date      : FRI JAN 09 00:19:44
  Ip Addr   : 128.251.19.240
  Result    : ERROR: Ip Address must not belong to IP VLAN 44 subnet

Command : command-log enable
  UserName : admin
  Date      : FRI JAN 09 00:18:49
  Ip Addr   : 128.251.19.240
  Result    : SUCCESS
```

*output definitions*

---

<b>Command</b>	The exact syntax of the command, as entered by the user.
<b>UserName</b>	The name of the user session that entered the command. For more information on different user session names, refer to the <a href="#">user command on page 38-48</a> , or the “Managing Switch User Accounts” chapter in the <i>OmniSwitch AOS Release 8 Switch Management Guide</i> .
<b>Date</b>	The date and time, down to the second, when the command was entered.
<b>IpAddr</b>	The IP address of the terminal from which the command was entered.
<b>Result</b>	The outcome of the command entry. Options include <b>SUCCESS</b> and <b>ERROR</b> . For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">command-log</a>	Enables or disables command logging on the switch.
<a href="#">show command-log status</a>	Shows the current status of the command logging function (i.e., enabled or disabled).

**MIB Objects**

sessionCliCommandLogEnable

---

## show command-log status

Shows the current status of the command logging function (i.e., enabled or disabled).

`show command-log status`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show command-log status
CLI command logging : Enable
```

### *output definitions*

---

<b>CLI command logging</b>	The current status of command logging on the switch. Options include <b>Disable</b> and <b>Enable</b> .
----------------------------	---

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[command-log](#) Enables or disables command logging on the switch.

### MIB Objects

`sessionCliCommandLogStatus`

---

## show telnet

Displays the current configuration specifying the ports the telnet daemons are listening on.

`[vrf name] show telnet`

---

### Syntax Definitions

*name* Name of the VRF.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If VRF is specified, the current status of the telnet daemon for the specified VRF is displayed.

### Examples

```
vrfl::-> show telnet
Telnet Admin-State = Enabled
Telnet Port = 23
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[command-log](#) Enables or disables command logging on the switch.

### MIB Objects

```
alaIpTelnetAdminStatus
alaIpTelnetPort
```

---

## show ssh

Displays the current configuration specifying the ports on which the SSH daemons are listening.

**[vrf name] show ssh**

---

### Syntax Definitions

*name* Name of the VRF.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

If VRF is specified, the current status of the SSH daemon for the specified VRF is displayed.

### Examples

```
vrfl::-> show ssh
Ssh Admin-State = Enabled
Ssh Port = 22
Ssh Enforce-Pubkey-Auth = Disabled
Ssh Strong-Ciphers = Disabled
Ssh Strong-Hmacs = Disabled
Ssh login-grace-time = 600 seconds
```

### Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **Ssh Strong-Ciphers** and **Ssh Strong-Hmacs** fields added.

Release 8.3.1.R02; **Ssh login-grace-time** field added.

### Related Commands

[command-log](#) Enables or disables command logging on the switch.

### MIB Objects

```
alaIpSshConfig
  alaIpSshAdminStatus
  alaIpSshPort
  alaIpSshPubKeyEnforceAdminStatus
  alaIpSshStrongCiphersAdminStatus
  alaIpSshStrongHmacsAdminStatus
  alaIpSshLoginGraceTime
```

---

# 60 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

*Filename:* ALCATEL-IND1-SYSTEM-MIB.mib  
*Module:* alcatelIND1SystemMIB

*Filename:* ALCATEL-IND1-CHASSIS-MIB.mib  
*Module:* alcatelIND1ChassisMIB

A summary of the available commands is listed here:

---

<b>File System</b>	<b>cd</b> <b>pwd</b> <b>mkdir</b> <b>rmdir</b> <b>ls</b> <b>rm</b> <b>cp</b> <b>sep</b> <b>mv</b> <b>chmod</b> <b>freespace</b> <b>fck</b> <b>newfs</b>
<b>System Services</b>	<b>vi</b> <b>tty</b> <b>show tty</b> <b>tftp</b> <b>sftp</b> <b>ftp</b> <b>show ftp</b>

---

## cd

Changes the current working directory of the switch.

`cd [path]`

---

### Syntax Definitions

*path* Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

### Defaults

The default working directory of the switch is `/flash`.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

### Examples

```
-> cd
-> cd /flash/certified
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<code>pwd</code>	Displays the current working directory of the switch.
<code>mkdir</code>	Creates a new directory.
<code>rmdir</code>	Deletes an existing directory.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.
<code>rm</code>	Deletes the contents of a specified directory or the current working directory.

### MIB Objects

```
systemServices
  systemServicesWorkingDirectory
```

---

## pwd

Displays the current working directory of the switch.

**pwd**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

The **pwd** command can also be used on the secondary CMM.

### Examples

```
-> pwd  
/flash
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>cd</b>	Changes the current working directory of the switch.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>rm</b>	Deletes the contents of a specified directory or the current working directory.

### MIB Objects

```
systemServices  
  systemServicesWorkingDirectory
```

---

## mkdir

Creates a new directory.

**mkdir** [*options*] [*path*] /*dirname*

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>path</i>	The path or location in which the new directory is to be created. If no path name is specified, the new directory is created in the current directory.
<i>dirname</i>	A user-defined name for the new directory.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The **mkdir** command can also be used on the secondary CMM.

### Examples

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mkdir [OPTIONS] DIRECTORY...
```

```
Create DIRECTORY
```

```
Options:
```

```
  -m      Mode
  -p      No error if exists; make parent directories as needed
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>cd</b>	Changes the current working directory of the switch.
<b>pwd</b>	Displays the current working directory of the switch.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>rm</b>	Deletes the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## rmdir

Deletes an existing directory.

**rmdir** [*options*] *dirname*

---

### Syntax Definitions

*options*                      Use the '?' on the command line for a list of options.  
*dirname*                      The name of the existing directory to be removed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> rmdir ./working
-> rmdir flash/working
-> rmdir ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: rmdir [OPTIONS] DIRECTORY...

Remove DIRECTORY if it is empty

Options:

```
-p|--parents      Include parents
--ignore-fail-on-non-empty
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<code>cd</code>	Changes the current working directory of the switch.
<code>pwd</code>	Displays the current working directory of the switch.
<code>mkdir</code>	Creates a new directory.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## ls

Displays the contents of a specified directory or the current working directory.

**ls** [*options*] [*path/filename*]

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>filename</i>	Specifies the file or directory path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

### Examples

```
-> ls
-> ls -l /flash/certified
-> ls ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: ls [-lAacCdeFilnpLRrSsTtuvwxXhk] [FILE]...

List directory contents

Options:

```
-l      List in a single column
-A      Don't list . and ..
-a      Don't hide entries starting with .
-C      List by columns
-c      With -l: sort by ctime
--color[={always,never,auto}] Control coloring
-d      List directory entries instead of contents
-e      List full date and time
-F      Append indicator (one of */=@|) to entries
-i      List inode numbers
-l      Long listing format
-n      List numeric UIDs and GIDs instead of names
-p      Append indicator (one of */=@|) to entries
-L      List entries pointed to by symlinks
-R      Recurse
-r      Sort in reverse order
-S      Sort by file size
-s      List the size of each file, in blocks
-T N    Assume tabstop every N columns
```

```
-t      With -l: sort by modification time
-u      With -l: sort by access time
-v      Sort by version
-w N    Assume the terminal is N columns wide
-x      List by lines
-X      Sort by extension
-h      List sizes in human readable format (1K 243M 2G)
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>cd</b>	Changes the current working directory of the switch.
<b>pwd</b>	Displays the current working directory of the switch.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>rm</b>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## rm

Permanently deletes an existing file.

**rm** [*options*] [*path/filename*]

---

### Syntax Definitions

*options*                      Use the '?' on the command line for a list of options.  
*filename*                    Specifies the file or directory path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

### Examples

```
-> rm test_config_file
-> rm flash/test_config_file
-> rm ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: rm [OPTIONS] FILE...
```

```
Remove (unlink) FILEs
```

```
Options:
```

```
-i        Always prompt before removing
-f        Never prompt
-R, -r    Recurse
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****cp**

Copies an existing file or directory.

**MIB Objects**

systemServices

systemServicesArg1

    systemServicesAction

---

## cp

Copies an existing file. This command can also copy a directory if the `-r` keyword is used.

`cp [options] source destination`

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>source</i>	The name of the existing file to be copied.
<i>destination</i>	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- You should verify that the **/flash** directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
-> cp ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: cp [OPTIONS] SOURCE DEST

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:

<code>-a</code>	Same as <code>-dpR</code>
<code>-R, -r</code>	Recurse
<code>-d, -P</code>	Preserve symlinks (default if <code>-R</code> )
<code>-L</code>	Follow all symlinks

```
-H      Follow symlinks on command line
-p      Preserve file attributes if possible
-f      Force overwrite
-i      Prompt before overwrite
-l,-s   Create (sym)links
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[mv](#) Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## scp

Copies an existing file in a secure manner.

```
scp [options] user_name@remote_ip_addr:[path/]source [path/]target
```

```
scp [options] [path/]source user_name@remote_ip_addr:[path/]target
```

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>user_name@remote_ip_addr:</i>	The username along with the IPv4 or IPv6 address of the remote switch.
<i>path/</i>	Specifies the path containing the file to be copied and the path where the file will be copied.
<i>source</i>	The name of the file(s) to be copied.
<i>target</i>	The new user-defined file name for the resulting file copy.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

### Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
-> scp ?
usage: scp [-l246BCpqrvt] [-c cipher] [-F ssh_config] [-i identity_file]
          [-l limit] [-o ssh_option] [-P port] [-S program]
          [[user@]host1:]file1 ... [[user@]host2:]file2
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**mv** Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## mv

Moves an existing file or directory to a new location.

**mv** [*options*] *source destination*

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>source</i>	The name of the existing file to be copied.
<i>destination</i>	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY
```

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:

```
-f      Don't prompt before overwriting
-i      Interactive, prompt before overwrite
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

- rm** Renames an existing file or directory.  
**cp** Copies an existing file or directory.

**MIB Objects**

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## chmod

Changes the write privileges for a specified file.

```
chmod {+w | -w} [path/]file
```

---

### Syntax Definitions

<code>+w</code>	Enables read-write privileges for the file.
<code>-w</code>	Disables write privileges for the file—i.e., the file becomes read-only.
<code>path/</code>	The path containing the file for which privileges are being changed.
<code>file</code>	The name of the file for which read-write privileges are being changed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> chmod +w vlan.config  
-> chmod -w flash/backup_configs/vlan.config
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[freespace](#) Changes the write privileges for a specified file.

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## freespace

Displays the amount of free space available in the **/flash** directory.

**freespace** [**/flash** | **/uflash**]

---

### Syntax Definitions

**/flash** The amount of free space is shown for the **/flash** directory.

**/uflash** The amount of free space is shown for the **/uflash** directory.

### Defaults

N/A

### Usage Guidelines

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Examples

```
-> freespace /flash
/flash 3143680 bytes free
```

```
-> freespace
/flash 3143680 bytes free
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [fsck](#)

Performs a file system check, including diagnostic information in the event of file corruption. If the **fsck** command detects a problem with the **/flash** file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

### MIB Objects

SystemFileSystemTable  
systemFileSystemFreespace

---

## fsck

Performs a file system check, including diagnostic information in the event of file corruption.

**fsck /uflash {repair | no-repair}**

---

### Syntax Definitions

<b>/uflash</b>	Indicates that the file system check will be performed on the <b>/uflash</b> directory.
<b>repair</b>	Attempt to repair any problems found.
<b>no-repair</b>	Do not attempt to repair any problems found.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

This command provides the option to automatically repair errors.

### Examples

```
-> fsck /uflash repair
```

```
/uflash/ - disk check in progress ..  
/uflash/ - Volume is OK
```

```
total # of clusters: 14,773  
# of free clusters: 4,132  
# of bad clusters: 0  
total free space: 8,264 Kb  
max contiguous free space: 5,163,008 bytes  
# of files: 46  
# of folders: 3  
total bytes in files: 21,229 Kb  
# of lost chains: 0  
total bytes in lost chains: 0
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****freespace**

Displays the amount of free space available in the **/flash** directory.

**MIB Objects**

systemServices

    systemServicesArg1

    systemServicesAction

---

## newfs

Deletes the complete **/uflash** file system and all files within it, replacing it with a new, empty **/uflash** file system. Use this command when you want to reload all files in the file system or in the unlikely event that the **/uflash** file system becomes corrupt.

**newfs /uflash**

---

### Syntax Definitions

**/uflash** This indicates that the complete file system will be replaced.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.

### Examples

```
-> newfs /uflash
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

N/A

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## vi

Launches the switch's Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

**vi** [*options*] [*path*]/*filename*

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>path</i> /	The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.
<i>filename</i>	The name of the existing file being viewed or edited.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

### Examples

```
-> vi test_config_file
-> vi ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: vi [OPTIONS] [FILE]...
```

```
Edit FILE
```

```
Options:
```

```
-c      Initial command to run ($EXINIT also available)
-R      Read-only
-H      Short help regarding available features
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

**tty** Displays current TTY settings.

**MIB Objects**

```
systemServices
  systemServicesTtyLines
  systemServicesTtyColumns
```

---

## tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

**tty** *lines columns*

---

### Syntax Definitions

*lines* The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.

*columns* The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

### Defaults

parameter	default
<i>lines</i>	24
<i>columns</i>	80

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the **vi** or **tftp** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

### Examples

```
-> tty 10 60
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show tty**

Displays current TTY settings.

**MIB Objects**

systemServices

systemServicesTtyLines

    systemServicesTtyColumns

---

## show tty

Displays current TTY settings.

```
show tty
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Shows the settings made with the `tty` command.
- This command can also be used on the secondary CMM.

### Examples

```
-> show tty  
lines = 24, columns = 80
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

`tty` Specifies the number of TTY lines and columns to be displayed.

### MIB Objects

```
systemServices  
  systemServicesTtyLines  
  systemServicesTtyColumns
```

---

## tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

**tftp** [*options*] *host* [*port*]

---

### Syntax Definitions

<i>options</i>	Enter a question mark (?) to get a list of options.
<i>host</i>	Specifies the IP address of the TFTP server.
<i>port</i>	Specifies the port for the TFTP transfer.

### Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

### Examples

```
-> tftp -g -l local_file -r remote_file 198.51.100.100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>cd</b>	Changes the current working directory of the switch.
<b>pwd</b>	Displays the current working directory of the switch.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.

### MIB Objects

N/A

---

## sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

**sftp** [*options*] {*ip\_address*}

---

### Syntax Definitions

*options* Enter a question mark (?) to get a list of options.  
*ip\_address* Specifies the IPv4 or IPv6 address for the SFTP session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

<b>cd path</b>	Change remote path to 'path'.
<b>lcd path</b>	Change local directory to 'path'.
<b>chmod mode path</b>	Change permissions of file 'path' to 'mode'.
<b>help</b>	Display command help information.
<b>get remote-path [local path]</b>	Download a file from the remote path to the local path.
<b>lls [path]</b>	Display local directory listing.
<b>ln oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>symlink oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>mkdir path</b>	Create local directory.
<b>lpwd</b>	Print local working directory.
<b>ls [path]</b>	Display remote directory listing.
<b>mkdir path</b>	Create remote directory.
<b>put local-path [remote-path]</b>	Upload file.
<b>pwd</b>	Display remote working directory.
<b>exit</b>	Quit the sftp mode.
<b>quit</b>	Exit the sftp mode.
<b>rename oldpath newpath</b>	Rename a remote file.

---

<b>rmdir path</b>	Remove remote directory.
<b>rm path</b>	Delete remote file.
<b>version</b>	Show the current SFTP version.
<b>?</b>	Synonym for help. Displays command help information.

---

## Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
usage: sftp [-lCv] [-B buffer_size] [-b batchfile] [-F ssh_config]
          [-o ssh_option] [-P sftp_server_path] [-R num_requests]
          [-S program] [-s subsystem | sftp_server] host
sftp [[user@]host[:file [file]]]
sftp [[user@]host[:dir[/]]]
sftp -b batchfile [user@]host
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ftp** Starts an FTP session.

**ssh** Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

## MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

---

## ftp

Starts an FTP session.

**ftp** {port [default | *service\_port*] | admin-state [enable | disable] | *ip\_address*}

[vrf *name*] ftp admin-state [enable | disable]

---

### Syntax Definitions

<i>name</i>	The name of the VRF.
<b>default</b>	Sets the port back to the default of 21.
<i>service_port</i>	The TCP service port number. Must be 21 or between between 20000-20999.
<b>enable   disable</b>	Enables or disables FTP access.
<i>ip_address</i>	Specifies the IPv4 address for the FTP session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- You must have a valid username and password for the specified host.
- The default FTP directory is **/flash**.

### Examples

```
-> ftp port 20000
-> ftp admin-state disable
-> ftp 172.17.6.228
-> vrf vrf1 ftp admin-state enable
```

### Release History

Release 7.1.1; command introduced.

Release 7.3.1; **vrf** parameter added.

## Related Commands

<code>cd</code>	Changes the current working directory of the switch.
<code>pwd</code>	Displays the current working directory of the switch.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.

# 61 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

*Filename:* ALCATEL-IND1-WEBMGT-MIB.mib  
*Module:* alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

---

**webview server**  
**webview access**  
**webview force-ssl**  
**webview http-port**  
**webview https-port**  
**webview wlan cluster-virtual-ip precedence**  
**webview wlan cluster-virtual-ip**  
**show webview**  
**show webview wlan config**

---

## webview server

Enables or disables the web management server on the switch.

[*vrf name*] **webview server** {**enable** | **disable**}

---

### Syntax Definitions

<i>name</i>	The name of the VRF.
<b>enable</b>	Enables the web management server on the switch.
<b>disable</b>	Disables the web management server on the switch.

### Defaults

---

<b>parameter</b>	<b>default</b>
WebView Server	Enabled

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If the WebView Server is disabled, WebView Access is automatically disabled.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

### Examples

```
-> webview server enable
-> webview server disable
-> vrf vrf1 webview server enable
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

### Related Commands

<a href="#">webview access</a>	Enables/disables webview access on the switch.
<a href="#">show webview</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtServerStatus
```

---

## webview access

Enables or disables web management access on the switch.

```
[vrf name] webview access {enable | disable}
```

---

### Syntax Definitions

<i>name</i>	The name of the VRF.
<b>enable</b>	Enables the web management access on the switch.
<b>disable</b>	Disables the web management access on the switch.

### Defaults

---

<b>parameter</b>	<b>default</b>
WebView Access	Enabled

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

- If Web Access is enabled, the WebView Server is automatically enabled.
- VRF name must either be 'default' or pre-defined VRF (user-defined).

### Examples

```
-> webview access enable
-> webview access disable
-> vrf vrf1 webview access enable
```

### Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

### Related Commands

<a href="#">webview server</a>	Enables/disables the web server on the switch.
<a href="#">show webview</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtAdminStatus
```

---

## webview force-ssl

Enables or Disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients.

**webview force-ssl {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the requirement to use SSL to access the switch when using WebView.
<b>disable</b>	Disables the requirement to use SSL to access the switch when using WebView.

### Defaults

---

parameter	default
Force SSL	Enabled

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

The switch contains a self-signed certificate that may prompt a certificate warning.

### Examples

```
-> webview force-ssl enable
-> webview force-ssl disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">webview access</a>	Enables/disables webview access on the switch.
<a href="#">show webview</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtSsl
```

---

## webview http-port

Changes the port number for the embedded web management server.

```
webview http-port {default | port port}
```

---

### Syntax Definitions

<b>default</b>	Restores the port to its default (80) value.
<i>port</i>	The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

---

parameter	default
<i>port</i>	80

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> webview http-port port 1025
-> webview http-port default
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">webview access</a>	Enables/disables webview access on the switch.
<a href="#">show webview</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaIND1WebMgtHttpPort
```

---

## webview https-port

Changes the default secure (HTTPS) port for the embedded web management server.

```
webview https-port {default | port port}
```

---

### Syntax Definitions

<b>default</b>	Restores the port to its default (443) value.
<i>port</i>	The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

---

parameter	default
<i>port</i>	443

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> webview https-port port 1026
-> webview https https-port default
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">webview access</a>	Enables/disables webview access on the switch.
<a href="#">show webview</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaIND1WebMgtHttpsPort
```

---

## webview wlan cluster-virtual-ip precedence

Sets the preference for obtaining the cluster virtual IP address for WebView re-direct. The WLAN cluster virtual IP address can be obtained from LLDP or configured manually. The precedence allows to set the preference between the LLDP and manual configuration in case when both are available.

**webview wlan cluster-virtual-ip precedence {lldp | configured}**

---

### Syntax Definitions

<b>lldp</b>	The preference to obtain the WLAN cluster virtual IP address is set to LLDP.
<b>configured</b>	The preference to obtain the WLAN cluster virtual IP address is set to the manually configured WLAN cluster virtual IP address.

### Defaults

---

parameter	default
lldp   configured	lldp

---

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Use this command to set the preference for obtaining the cluster virtual IP address for WebView re-direct.
- If more than one cluster virtual IP address is obtained through LLDP on the same port, the recently obtained IP is considered.
- If more than one cluster virtual IP is obtained through LLDP on different ports, the recently obtained IP is considered.
- If the precedence is set for LLDP obtained IP address, but there is no LLDP obtained cluster virtual IP address, then the manually configured cluster virtual IP address will be considered if configured.
- If the precedence is set for manually configured cluster virtual IP address, but there is no configured IP address present, then the LLDP obtained cluster virtual IP address will be considered if received.

### Examples

```
-> webview wlan cluster-virtual-ip precedence lldp
-> webview wlan cluster-virtual-ip precedence configured
```

### Release History

Release 8.4.1 R02; command was introduced.

**Related Commands**

[show webview wlan config](#) Displays the AP cluster virtual IP configured on the switch.

**MIB Objects**

alaIND1WebMgtWlanIpPrecedence

---

## webview wlan cluster-virtual-ip

Configures the cluster virtual IP address of the Access Point (AP) in the switch. The WebView server on the switch redirects the URL to the AP (Virtual IP Address) URL when the WLAN Management is accessed from WebView.

**webview wlan cluster-virtual-ip** *virtual-ip-address-of-wlan-cluster*

---

### Syntax Definitions

*virtual-ip-address-of-wlan-cluster*      Virtual IP address (IPV4) of the AP cluster.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

Use this command to configure the AP cluster virtual IP address to access the OAW-AP web interface from the webview.

### Examples

```
-> webview wlan cluster-virtual-ip 10.25.6.8
```

### Release History

Release 8.4.1 R02; command was introduced.

### Related Commands

[show webview wlan config](#)      Displays the AP cluster virtual IP configured on the switch.

### MIB Objects

alaIND1WebMgtWlanConfiguredIpAddress

---

## show webview wlan config

Displays the cluster virtual IP precedence configuration, WLAN AP cluster virtual IP configured on the switch, and WLAN AP cluster virtual IP obtained through LLDP.

**show webview wlan config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show webview wlan config
WebView WLAN Cluster-Virtual-IP Precedence = LLDP
WebView WLAN Cluster-Virtual-IP configured address = 0.0.0.0
WebView WLAN Cluster-Virtual-IP LLDP address = 1.1.1.1
```

### *output definitions*

---

<b>WebView WLAN Cluster-Virtual-IP Precedence</b>	The precedence set for obtaining the cluster virtual IP address of the AP.
<b>WebView WLAN Cluster-Virtual-IP configured address</b>	The manually configured cluster virtual IP address.
<b>WebView WLAN Cluster-Virtual-IP LLDP address</b>	The cluster virtual IP address obtained from the LLDP packets.

---

### Release History

Release 8.4.1R02; command was introduced.

## Related Commands

- webview wlan cluster-virtual-ip precedence** Allows to set the preference for the choice of cluster virtual IP address for WebView re-direct.
- webview wlan cluster-virtual-ip** Configures the virtual IP address of the Access Point (AP) clusters in the switch.

## MIB Objects

```
alaIND1WebMgtWlanIpPrecedence
  alaIND1WebMgtWlanConfiguredIpAddressType
  alaIND1WebMgtWlanConfiguredIpAddress
  alaIND1WebMgtWlanLldpIpAddressType
  alaIND1WebMgtWlanLldpIpAddress
```

---

## show webview

Displays web management configuration information.

`[vrf name] show webview`

---

### Syntax Definitions

*name*                                      The name of the VRF.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865

### Usage Guidelines

If a VRF name is specified, the enabled/disabled state for WebView Server and WebView Access for the specified VRF is displayed.

### Examples

```
-> show webview
```

```
WebView Server = Disabled
WebView Access = Disabled
WebView Force-SSL = Enabled
WebView HTTP-Port = 80
WebView HTTPS-Port = 4433
```

```
vrf1::-> show webview
WebView Server = Enabled,
WebView Access = Enabled,
WebView Force-SSL = Enabled,
WebView HTTP-Port = 80,
WebView HTTPS-Port = 443
```

### *output definitions*

---

<b>WebView Server</b>	Indicates whether web management server is enabled or disabled.
<b>WebView Access</b>	Indicates whether web management access is enabled or disabled.
<b>Force SSL</b>	Indicates whether Force SSL is enabled or disabled. If this is enabled it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server.
<b>Web Management Http Port</b>	The port configured for the HTTP connection.
<b>Web Management Https Port</b>	The port configured for a secure HTTP connection (SSL enabled).

---

## Release History

Release 7.1.1; command was introduced.

Release 7.3.1; **vrf** parameter added.

## Related Commands

```

---

# 62 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

*Filename:* ALCATEL-IND1-CONFIG-MGR-MIB.mib  
*Module:* alcatelIND1ConfigMgrMIB

A summary of the available commands is listed here:

---

**configuration apply**  
**configuration error-file-limit**  
**show configuration status**  
**configuration cancel**  
**configuration syntax-check**  
**configuration snapshot**  
**show configuration snapshot**  
**write terminal**

---

## configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

**configuration apply** *filename* [**at** *hh:mm month dd* [*year*]] | [**in** *hh[:mm]*] [**verbose**]

---

### Syntax Definitions

<i>filename</i>	The name of the configuration text file to be applied to the switch (e.g., <b>newfile1</b> ).
<b>at</b> <i>hh:mm</i> { <i>dd month   month dd</i> } [ <i>year</i> ]	Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59. Values for <i>dd</i> range from 01 through 31. Values for month range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.
<b>in</b> <i>hh[:mm]</i>	Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59.
<b>verbose</b>	When verbose is entered, information is displayed on your workstation's console as each command in the configuration file is applied.

### Defaults

By default, **verbose** error checking is not performed.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **boot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.
- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword

represents a login password that has been encrypted *twice*. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to [page 38-52](#).

## Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

---

**Note.** When the **configuration apply** command is entered *without at or in* syntax information, one or more dots “.” is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**configuration syntax-check** Performs a syntax and authorization check of all CLI commands contained in a configuration file.

## MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
  configFileName
  configFileMode
  configFileAction
  configTimerFileName
  configTimerFileTime
```

---

## configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their **.err** extension. When the maximum number of **.err** files is exceeded, any new error file will overwrite the **.err** file with the oldest timestamp.

**configuration error-file-limit** *number*

---

### Syntax Definitions

*number* Indicate the number of error files allowed in the **/flash** directory. The valid range is from 1 to 25 files.

### Defaults

parameter	default
<i>number</i>	1

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the **.err** extension.
- If you want to save an error file, you may change the file name so that it does not have the **.err** extension, or you can move it from the **/flash** directory.

### Examples

```
-> configuration error-file-limit 2
-> configuration error-file-limit 1
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

**configuration cancel** Cancels a pending timer session for a configuration file.

**MIB Objects**

alcatelIND1ConfigMgrMIBObjects  
configErrorFileMaximum

---

## show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

**show configuration status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- A timer session can be scheduled using the **configuration apply** command. For more information, refer to [page 62-2](#).
- The screen output **File configuration </path/filename>: scheduled at dd/mm hh:mm** indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration </path/filename>: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the **write memory** command.

### Examples

```
-> show configuration status
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
- configuration cancel** Cancels a pending timer session for a configuration file.
- configuration error-file-limit** Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory.
- write memory** Copies the running configuration (RAM) to the working directory.

## MIB Objects

```
configTimerFileGroup  
  configTimerFileStatus
```

---

## configuration cancel

Cancels a pending timer session for a configuration file.

**configuration cancel**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> configuration cancel
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |   |  |
|---|--|
| <a href="#">configuration apply</a>       | Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file. |
| <a href="#">show configuration status</a> | Displays whether there is a pending timer session scheduled for a configuration file.                          |

### MIB Objects

```
configTimerFileGroup  
configTimerClear
```

---

## configuration syntax-check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

**configuration syntax-check** *path/filename* [**verbose**]

---

### Syntax Definitions

<i>path/filename</i>	The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, <b>/flash/working/asc.1.snap</b> .
<b>verbose</b>	When <b>verbose</b> is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When <b>verbose</b> is <i>not</i> specified in the command line, cursory information (number of errors and error log file name) will be printed to the console <i>only if a syntax or configuration error is detected</i> .

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax-check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

### Examples

```
-> configuration syntax-check vlan_file1
..
```

---

**Note.** When the **configuration syntax-check** command is entered, one or more dots “.” is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- |   |  |
|---|--|
| <a href="#">configuration apply</a>       | Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file. |
| <a href="#">show configuration status</a> | Displays whether there is a pending timer session scheduled for a configuration file.                          |

## MIB Objects

```
configFileGroup
  configErrorFileName
  configErrorFileMaximum
  configFileMode
  configFileStatus
```

---

## configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

**configuration snapshot** *feature\_list* [*path/filename*]

---

### Syntax Definitions

<i>feature_list</i>	The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Current snapshot-supported network features are listed below.
<i>path/filename</i>	A user-defined name for the resulting snapshot file. For example, <b>test_snmp_snap</b> . You may also enter a specific path for the resulting file. For example, the syntax <b>/flash/working/test_snmp_snap</b> places the <b>test_snmp_snap</b> file in the switch's <b>/flash/working</b> directory.

---

#### snapshot-supported features

<b>802.1q</b>	<b>ipmr</b>	<b>rdp</b>
<b>aaa</b>	<b>ipms</b>	<b>rip</b>
<b>aip</b>	<b>ipx</b>	<b>ripng</b>
<b>all</b>	<b>ipv6</b>	<b>session</b>
<b>bgp</b>	<b>linkagg</b>	<b>slb</b>
<b>bridge</b>	<b>module</b>	<b>snmp</b>
<b>chassis</b>	<b>ntp</b>	<b>stp</b>
<b>health</b>	<b>ospf</b>	<b>system</b>
<b>interface</b>	<b>ospf3</b>	<b>vlan</b>
<b>ip</b>	<b>pmm</b>	<b>vrrp</b>
<b>ip-helper</b>	<b>policy</b>	<b>webmgt</b>
<b>ip-routing</b>	<b>qos</b>	<b>udld</b>
<b>netsec</b>		

---

### Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

## Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

## Examples

```
-> configuration snapshot all
-> configuration snapshot new_file1 qos health aggregation
-> configuration snapshot snmp_snapshot snmp
-> configuration snapshot 802.1q
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show configuration snapshot](#) Displays the switch's current running configuration.

## show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

**show configuration snapshot** [*feature\_list*]

---

### Syntax Definitions

*feature\_list* Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma.

---

#### snapshot-supported features

802.1q	ipmr	rdp
aaa	ipms	rip
aip	ipx	ripng
all	ipv6	session
bgp	linkagg	slb
bridge	module	snmp
chassis	ntp	stp
health	ospf	system
interface	ospf3	vlan
ip	pmm	vrrp
ip-helper	policy	webmgmt
ip-routing	qos	udld
netsec		

---

### Defaults

By default, this command shows configuration information for *all* features.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use this command to view the current configuration for any feature shown in the table.
- To show a list of features on the switch, use the **show configuration snapshot ?** syntax.
- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

## Examples

```
-> show configuration snapshot
-> show configuration snapshot aaa bridge
! Bridging :

! AAA :
aaa authentication default "local"
aaa authentication console "local"
user "public" read All write All no auth authkey 391b0e74dbd13973d703ccea4a8e30
```

## Release History

Release 7.1.1; command was introduced.

# 63 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

*Filename:* SNMP-COMMUNITY-MIB.mib  
*Module:* snmpCommunityMIB

MIB information for Trap Manager commands is as follows:

*Filename* ALCATEL-IND1-TRAP-MGR-MIB.mib  
*Module:* alcatelIND1TrapMgrMIB

MIB information for SNMP Agent commands is as follows:

*Filename:* ALCATEL-IND1-SNMP-AGENT-MIB.mib  
*Module:* alcatelIND1SNMPAgentMIB

A summary of the available commands is listed here:

---

<b>SNMP station commands</b>	<b>snmp station</b> <b>show snmp station</b>
<b>SNMP engine ID commands</b>	<b>snmp snmp-engineid-type</b> <b>show snmp snmp-engineid</b>
<b>SNMP community map commands</b>	<b>snmp community-map</b> <b>snmp community-map mode</b> <b>show snmp community-map</b>
<b>SNMP security commands</b>	<b>snmp security</b> <b>show snmp security</b> <b>show snmp statistics</b> <b>show snmp mib-family</b>
<b>SNMP trap commands</b>	<b>snmp-trap absorption</b> <b>snmp-trap to-webview</b> <b>snmp-trap replay-ip</b> <b>snmp-trap filter-ip</b> <b>snmp authentication-trap</b> <b>show snmp-trap replay-ip</b> <b>show snmp-trap filter-ip</b> <b>show snmp authentication-trap</b> <b>show snmp-trap config</b>
<b>Event commands</b>	<b>event-action</b> <b>show event-action</b>

---

## snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

**snmp station** {*ip\_address* | *ipv6\_address*} [{*udp\_port*] [*username*] [**v1** | **v2** | **v3**] [**enable** | **disable**]

**no snmp station** {*ip\_address* | *ipv6\_address*}

---

### Syntax Definitions

<i>ip_address</i>	The IP address to which SNMP unicast traps will be sent.
<i>ipv6_address</i>	The IPv6 address to which SNMP unicast traps will be sent.
<i>udp_port</i>	A UDP destination port.
<i>username</i>	The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
<b>v1</b>	Specifies that traps are sent using SNMP version 1.
<b>v2</b>	Specifies that traps are sent using SNMP version 2.
<b>v3</b>	Specifies that traps are sent using SNMP version 3.
<b>enable</b>	Enables the specified SNMP station.
<b>disable</b>	Disables the specified SNMP station.

### Defaults

parameter	default
<i>udp_port</i>	162
<b>v1</b>   <b>v2</b>   <b>v3</b>	<b>v3</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of the command to remove an existing SNMP station.
- When adding an SNMP station, you must specify an IP address *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- When modifying an SNMP station, you must specify an IP address *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.

## Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
-> snmp station 300::1 enable
-> no snmp station 300::1
```

## snmp snmp-engineid-type

Configures a unique engine ID for the OmniSwitch SNMP agent.

```
snmp snmp-engineid-type {text | mac-address | ipv4-address | ipv6-address} snmp-engineid  
{text_string | mac_address | ipv4_address | ipv6_address}
```

```
snmp snmp-engineid-type mac-address snmp-engineid default
```

---

### Syntax Definitions

<i>text_string</i>	A text string that will be converted to a hexadecimal value. The valid range is 1–27 characters.
<i>mac_address</i>	A specific MAC Address (for example, 00:00:39:59:f1:0c).
<i>ipv4_address</i>	An IPv4 address that will be converted to a hexadecimal value.
<i>ipv6_address</i>	An IPv6 address that will be converted to a hexadecimal value.

### Defaults

By default, the SNMP engine ID is set to the base MAC address for the switch appended to the enterprise value for OmniSwitch platforms (for example, if the enterprise value is “8000195603” and the switch base MAC address is “2c:fa:a2:13:e4:02”, then the default engine ID is set to “80001956032cfaa213e402”).

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To set the engine ID back to the default value, specify the **mac-address** parameter and the **default** parameter with this command. For example, **snmp snmp-engineid-type mac-address snmp-engineid default**.
- Note that the **snmp-engineid** keyword is entered after the parameter that specifies the type of engine ID format to use and before the actual value that matches the specified parameter type. For example, if the **ipv4-address** parameter is specified, enter the IPv4 address value after the **snmp-engineid** keyword (**snmp snmp-engineid-type ipv4-address snmp-engineid 10.2.2.1**).
- When a text string, an IPv4 address, or an IPv6 address is specified, the value is automatically converted to a hexadecimal value that is then appended to the OmniSwitch enterprise value to form the SNMP engine ID for the switch.

### Examples

```
-> snmp snmp-engineid-type text snmp-engineid "test lab"  
-> snmp snmp-engineid-type mac-address snmp-engineid 00:2a:95:01:02:03  
-> snmp snmp-engineid-type ipv4-address snmp-engineid 168.22.2.2 111  
-> snmp snmp-engineid-type mac-address snmp-engineid default
```

### Release History

## show snmp snmp-engineid

Displays the current SNMP engine ID value for the switch.

```
show snmp snmp-engineid
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guideline

N/A

### Examples

```
-> show snmp snmp-engineid
snmp engineId type          snmp engineId
-----+-----
    default Mac              80001956032cfaa213e402
```

#### *output definitions*

---

<b>snmp engineId type</b>	The type of engine ID ( <b>default Mac, Text, Ipv4, or Ipv6</b> ).
<b>snmp engineId</b>	The SNMP engine ID value that uniquely identifies the OmniSwitch SNMP agent. This value is comprised of the OmniSwitch enterprise ID plus the configured SNMP engine ID value, in hexadecimal format.

---

### Release History

Release 8.3.1.R02; command was introduced.

### Related Commands

[snmp snmp-engineid-type](#) Configures the type and value of the SNMP engine ID for the switch.

### MIB Objects

```
snmpAgtEngineIdType
snmpAgtEngineId
```

---

## snmp community-map

Configures and enables a community string on the switch and maps it to an existing user account name.

```
snmp community-map community_string [{user useraccount_name] | {enable | disable}}
```

```
no snmp community-map community_string
```

---

### Syntax Definitions

<i>community_string</i>	A community string in the form of a text string. This string must be between 1 and 32 characters.
<i>useraccount_name</i>	A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
<b>enable</b>	Enables SNMP community string mapping.
<b>disable</b>	Disables SNMP community string mapping.

### Defaults

By default, SNMP community map authentication is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.
- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.

### Examples

```
-> snmp community-map community1 user testname1  
-> snmp community-map community1 enable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**snmp community-map mode** Enables the local community strings database.

## MIB Objects

```
SNMPCommunityTable  
  snmpCommunityIndex  
  snmpCommunitySecurityName  
  snmpCommunityStatus
```

---

## snmp community-map mode

Enables the local community strings database.

**snmp community-map mode {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables SNMP community map database.
<b>disable</b>	Disables SNMP community map database.

### Defaults

---

parameter	default
Community mode	disabled

---

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name with SNMP privileges in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the [snmp community-map](#) command.

### Examples

```
-> snmp community-map mode enable  
-> snmp community-map mode disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp community-map](#) Configures and enables a community string on the switch and maps it to an existing user account name.

### Examples

```
-> show snmp community-map  
Community mode : enabled
```

```
status  community string                user name  
-----+-----+-----  
enabled test_string1                    bb_username  
enabled test_string2                    rr_username  
disabled test_string3                   cc_username  
disabled test_string4                   jj_username
```

#### *output definitions*

---

<b>Status</b>	The Enabled/Disabled status of the community string.
<b>Community String</b>	The text that defines the community string.
<b>User Name</b>	The user account name.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****snmp community-map**

Configures and enables a community string on the switch and maps it to an existing user account name.

**MIB Objects**

N/A

---

## snmp security

Configures SNMP security settings.

**snmp security {no-security | authentication set | authentication all | privacy set | privacy all | trap-only}**

---

### Syntax Definitions

<b>no-security</b>	The switch will accept all SNMP v1, v2, and v3 requests.
<b>authentication set</b>	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.
<b>authentication all</b>	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.
<b>privacy set</b>	The switch will accept <i>only</i> authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.
<b>privacy all</b>	The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.
<b>trap-only</b>	All SNMP get, get-next, and set requests will be rejected.

### Defaults

By default, the SNMP security default is set to **privacy all**, which is the highest level of security.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Refer to the table below for a quick-reference list of security parameter and the SNMP request allowances for each parameter.

	v1 set v2 set v3 non-auth set	v1 get v2 get v3 non-auth get/ get-next	v3 auth set	v3 auth get/ get-next	v3 encryp set	v3 encryp get/ get-next
<b>no-security</b>	accepted	accepted	accepted	accepted	accepted	accepted
<b>authentication set</b>	rejected	accepted	accepted	accepted	accepted	accepted
<b>authentication all</b>	rejected	rejected	accepted	accepted	accepted	accepted
<b>privacy set</b>	rejected	rejected	rejected	accepted	accepted	accepted
<b>privacy all</b>	rejected	rejected	rejected	rejected	accepted	accepted
<b>trap-only</b>	rejected	rejected	rejected	rejected	rejected	rejected

## Examples

```
-> snmp security no-security
-> snmp security authentication set
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap-only
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show snmp security](#) Displays the current SNMP security status.

## MIB Objects

```
SNMPAgtConfig
  SntpAgtSecurityLevel
```

---

## show snmp security

Displays the current SNMP security status.

```
show snmp security
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

Refer to the command on page [63-15](#) for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.

### Examples

```
-> show snmp security
snmp security = no security
```

```
-> show snmp security
snmp security = authentication set
```

```
-> show snmp security
snmp security = authentication all
```

```
-> show snmp security
snmp security = privacy set
```

```
-> show snmp security
snmp security = privacy all
```

```
-> show snmp security
snmp security = trap only
```

```

***output definitions***

---

<b>From RFCxxxx</b>	Displays the RFC number that defines the SNMP MIB objects listed.
<b>MIB Objects</b>	Name of the MIB object listed as an SNMP statistic.
<b>= (integer)</b>	The number of times the MIB object has been reported to the SNMP management station since the last reset.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[snmp security](#) Configures the SNMP security settings.

**MIB Objects**

N/A

---

## show snmp mib-family

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

**show snmp mib-family** [*table\_name*]

---

### Syntax Definitions

*table\_name*                      The name of the MIB table to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

### Examples

```
-> show snmp mib-family trapStationTable
MIP ID   MIB TABLE NAME                               FAMILY
-----+-----+-----
 73733   trapStationTable                             snmp
```

#### *output definitions*

---

<b>MIP ID</b>	Identification number for the MIP associated with this MIB Table.
<b>MIB Table Name</b>	Name of the MIB table.
<b>Family</b>	Command family to which this MIB table belongs.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

[show snmp-trap filter-ip](#) Displays the SNMP trap filter information.

**MIB Objects**

N/A

---

## snmp-trap absorption

Enables or disables the trap absorption function.

**snmp-trap absorption {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.
<b>disable</b>	Disables SNMP trap absorption.

### Defaults

By default, trap absorption is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

To view the current trap absorption status, use the **show snmp-trap config** command.

### Examples

```
-> snmp-trap absorption enable
-> snmp-trap absorption disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show snmp-trap config](#) Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

### MIB Objects

```
trapFilterTable
  trapAbsorption
```

---

## snmp-trap to-webview

Enables the forwarding of traps to WebView.

`snmp-trap to-webview {enable | disable}`

---

### Syntax Definitions

<b>enable</b>	Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
<b>disable</b>	Disables WebView forwarding.

### Defaults

By default, WebView forwarding is enabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

To view the current WebView forwarding status, use the **show snmp-trap config** command.

### Examples

```
-> snmp-trap to-webview enable
-> snmp-trap to-webview disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show snmp-trap config</a>	Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.
---------------------------------------	--

### MIB Objects

```
trapFilterTable
  trapToWebView
```

---

## snmp-trap replay-ip

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

```
snmp-trap replay-ip {ip_address | ipv6_address} [seq_id]
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station to which traps will be replayed from the switch.
<i>ipv6_address</i>	The IPv6 address for the SNMP station to which traps will be replayed from the switch.
<i>seq_id</i>	The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the [show snmp station](#) command on page [page 63-5](#) to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

### Examples

```
-> snmp-trap replay-ip 172.12.2.100
-> snmp-trap replay-ip 300::1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

  alaTrapInetStationReplay
  alaTrapInetStationNextSeq
```

---

## snmp-trap filter-ip

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

**snmp-trap filter-ip** {*ip\_address* | *ipv6\_address*} *trap\_id\_list*

**no snmp-trap filter-ip** {*ip\_address* | *ipv6\_address*} *trap\_id\_list*

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station for which trap filtering is being enabled or disabled.
<i>ipv6_address</i>	The IPv6 address for the SNMP station for which trap filtering is being enabled or disabled.
<i>trap_id_list</i>	Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

### Defaults

By default, SNMP trap filtering is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- To *enable* trap filtering, use the syntax **snmp-trap filter-ip** *ip\_address* *trap\_id\_list*.
- To *disable* trap filtering, use the syntax **no snmp-trap filter-ip** *ip\_address* *trap\_id\_list*.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

### Examples

```
-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> no snmp-trap filter-ip 300::1 1 3
```

## snmp authentication-trap

Enables or disables SNMP authentication failure trap forwarding.

**snmp authentication-trap {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables authentication failure trap forwarding. When enabled, the standard authentication failure trap is sent each time an SNMP authentication failure is detected.
<b>disable</b>	Disables authentication failure trap forwarding.

### Defaults

By default, authentication failure trap forwarding is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> snmp authentication-trap enable
-> snmp authentication-trap disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show snmp authentication-trap](#) Displays the current authentication failure trap forwarding status.

### MIB Objects

```
snmpGroup
  snmpEnableAuthenTraps
```

---

## show snmp-trap replay-ip

Displays SNMP trap replay information.

**show snmp-trap replay-ip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show snmp-trap replay-ip
ipAddress      : oldest replay number
-----
199.199.101.200 :      1234
199.199.105.202 :       578
199.199.101.203 :     1638
199.199.101.204 :     2560
```

#### *output definitions*

---

<b>IPAddress</b>	IP address of the SNMP station manager that replayed the trap.
<b>Oldest Replay Number</b>	Number of the oldest replayed trap.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp-trap replay-ip](#)      Replays stored traps from the switch to a specified SNMP station.

## show snmp-trap filter-ip

Displays the current SNMP trap filter status.

```
show snmp-trap filter-ip
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

To display a list of traps and their ID numbers, use the [show snmp-trap config](#) command.

### Examples

```
-> show snmp-trap filter-ip
ipAddress      : trapId list
-----
199.199.101.200 :   0   1   2   3
199.199.101.201 : no filter
199.199.105.202 :   0   1   2   3   4   5   6   7   8   9  10  11  12  13  14
                  15  16  17  18  19
199.199.101.203 :  20  22  30
199.199.101.204 : no filter
```

#### *output definitions*

---

<b>IPAddress</b>	IP address of the SNMP management station that recorded the traps.
<b>TrapId List</b>	Identification number for the traps being filtered.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[snmp-trap filter-ip](#)

Enables or disables SNMP trap filtering.

[show snmp-trap config](#)

Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

## MIB Objects

## show snmp authentication-trap

Displays the current authentication failure trap forwarding status (i.e., enable or disable).

**show snmp authentication-trap**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show snmp authentication-trap
snmp authentication trap = disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp authentication-trap](#) Enables or disables SNMP authentication failure trap forwarding.

### MIB Objects

sessionAuthenticationTrap

---

## show snmp-trap config

Displays SNMP trap information. Information includes trap ID numbers, trap names, command families, and absorption rate. This command also displays the Enabled/Disabled status of SNMP absorption and the Traps to WebView service.

**show snmp-trap config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

N/A

### Examples

```
-> show snmp-trap config
Absorption service : enabled
Traps to WebView : enabled
```

Id	trapName	family	absorption
0	coldStart	chassis	15 seconds
1	warmStart	chassis	15 seconds
2	linkDown	interface	15 seconds
3	linkUp	interface	15 seconds
4	authenticationFailure	snmp	15 seconds
5	entConfigChange	module	15 seconds
30	slPesudoCAMStatusTrap	bridge	15 seconds
31	slbTrapException	loadbalancing	15 seconds
32	slbTrapConfigChanged	loadbalancing	15 seconds
33	slbTrapOperStatus	loadbalancing	15 seconds
34	ifMauJabberTrap	interface	15 seconds
35	sessionAuthenticationTrap	session	15 seconds

### output definitions

---

<b>Id</b>	Identification number for the trap.
<b>Trap Name</b>	Name of the trap.
<b>Family</b>	Family to which the trap belongs.
<b>Absorption</b>	Time needed for the trap to process.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show snmp mib-family](#)

Displays SNMP MIB information.

[snmp-trap absorption](#)

Enables or disables the trap absorption function.

[snmp-trap to-webview](#)

Enables or disables the forwarding of SNMP traps to WebView.

## MIB Objects

trapConfigTable

    trapConfigEntry

---

## event-action

This command will cause the specified script to be run when the specified event occurs.

**event-action** {**trap** *trigger\_string* **script** *script\_string* / **script-time-limit** *num*}

**no event-action trap** *name*

---

### Syntax Definitions

<i>trigger_string</i>	The name of the trigger. In the case of a trap, this is the trap name.
<i>script_string</i>	The path and the name of the script to run.
<i>num</i>	The maximum amount of time a script can run (30-600).
<i>name</i>	The name of the trap to remove the event from.

### Defaults

parameter	default
<b>script-time-limit</b>	60 seconds.

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

- If the prefix for the script is not **/flash/python**, the path will be assumed to be under that directory.
- Each event can only be assigned a single script but a script can be assigned to multiple events.
- Only users that have write privileges for the AAA partition management family can create scripts in the **/flash/python** directory.
- The **show snmp-trap config** command can be used to view the list of traps available on the switch.

### Examples

```
-> event-action trap linkDown script /flash/python/link_event.py
-> event-action trap stpNewRoot script stp_event.py
```

### Release History

Release 7.3.4; command was introduced.

## Related Commands

### [show event-action](#)

Shows the scripts and statistics associated with the events.

## MIB Objects

```
alaEventActionTable  
  alaEventActionType  
  alaEventActionName  
  alaEventActionScriptName  
  alaEventActionRowStatus
```

---

## show event-action

Shows the scripts and statistics associated with the events.

**show event-action** [**statistics** | **trap** *name* [**statistics**]]

---

### Syntax Definitions

**name** The name of the trap to display statistics for.

**statistics** Displays the statistics for all configured events or a specific trap.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show event-action
```

```

type          name          script (/flash/python/...)
-----+-----+-----+-----+
trap   linkDown          link_event.py
trap   stpNewRoot        stp_event.py
trap   sessionAuthenticationTrap catchAll.py

```

```
-> show event-action statistics
```

```

Type          Name          Script Last Launched          Launch
-----+-----+-----+-----+-----+
trap   linkDown          2014-10-23 13:45:34          2

```

### output definitions

---

<b>Type</b>	The type of event trigger.
<b>Name</b>	The name of the event. In the case of a trap, this is the trap name.
<b>Script</b>	The name and location of the script associated with the event.
<b>Script Last Launched</b>	The date and time the script was last run.
<b>Launch Count</b>	The number of times the script has been launched by the event.

---

### Release History

Release 7.3.4; command was introduced.

## Related Commands

### [event-action](#)

This command will cause the specified script to be run when the specified event occurs.

## MIB Objects

alaEventActionTable  
  alaEventActionType  
  alaEventActionName  
  alaEventActionScriptName
```

---

# 64 OpenFlow Commands

OpenFlow is a communications interface defined between the control and forwarding layers that is used in a Software Defined Network (SDN). OpenFlow separates the control plane and the data plane in the switch. Traditionally, switches and routers have made decisions on where packets should travel based on rules local to the device. With OpenFlow, only the data plane exists on the switch itself, and all control decisions are communicated to the switch from a central Controller. The OmniSwitch can operate in AOS or OpenFlow mode, including a modified OpenFlow mode known as Hybrid mode.

MIB information for the Web Management commands is as follows:

*Filename:* ALCATEL-IND1-OPENFLOW-MIB.mib  
*Module:* alcatelIND1OpenflowMIB

A summary of the available commands is listed here:

---

<b>OpenFlow Commands</b>	<a href="#">openflow back-off-max</a> <a href="#">openflow idle-probe-timeout</a> <a href="#">openflow logical-switch</a> <a href="#">openflow logical-switch controller</a> <a href="#">openflow logical-switch interfaces</a> <a href="#">show openflow</a> <a href="#">show openflow logical-switch</a>
--------------------------	--

---

## openflow logical-switch

Configures an OpenFlow Logical Switch. An OpenFlow Logical Switch consists of a portion of the switch's resources that are managed by an OpenFlow Controller (or set of Controllers) via the OpenFlow Agent.

**openflow logical-switch** *name* [**probe-time** *num* / **failure-detect-time** *num* | **tcp-buffer-size** *num* | **dpid** *string*] [**admin-state** {**enable** | **disable**}] [**mode** {**normal** | **api** | **pfc-channel**}] [**version** {**1.0** | **1.3.1**}+] [**learned-mac-update** {**enable** | **disable**}] [**vlan** *vlan\_id*]

**no openflow logical-switch** *<name>*

---

### Syntax Definitions

<i>name</i>	The Logical Switch name (up to 32 characters).
<b>probe-time</b> <i>num</i>	Configures probe-time for a logical switch in the pfc-channel mode which will override the existing global idle-probe-time for sending echo-requests to the OpenFlow Controller. (1-60)
<b>failure-detect-time</b> <i>num</i>	Configures the failure-detect-time for a logical switch in the pfc-channel mode for detecting a disconnection to the OpenFlow Controller if there was no echo reply or message from the controller. (1-60)
<b>tcp-buffer-size</b> <i>num</i>	Configures the TCP buffer size for socket connection to OpenFlow controllers configured for the logical-switch in pfc-channel mode. (2-32)
<b>dpid</b> <i>string</i>	Configures a unique 8-byte Datapath Identifier (DPID) for a logical switch in pfc-channel mode. Value must be entered in hex format only (starting with 0x) and must be less than 8-bytes.
<b>admin-state enable</b>	Enables the Logical Switch.
<b>admin-state disable</b>	Disables the Logical Switch.
<b>normal</b>	Configures the Logical Switch to run in Normal Mode.
<b>api</b>	Configures the Logical Switch to run in Hybrid (API) Mode. Only one (1) Logical Switch can be configured in Hybrid Mode.
<b>pfc-channel</b>	Configures the Logical Switch for NEC pfc-channel mode.
<b>1.0</b>	Configures the Logical Switch to run OpenFlow Version 1.0.
<b>1.3.1</b>	Configures the Logical Switch to run OpenFlow Version 1.3.1.
<b>learned-mac-update</b>	Forwards new source learned MAC addresses to a WLAN controller.
<i>vlan_id</i>	The Default VLAN for all ports assigned to the Logical Switch. Traffic on this VLAN on these ports will not carry an 802.1q tag. Traffic on all other VLANs on these ports will carry an 802.1q tag. The valid range is 2 - 4093.

## Defaults

parameter	default
<b>probe-time</b> <i>num</i>	5 seconds
<b>failure-detect-time</b> <i>num</i>	4 seconds
<b>tcp-buffer-size</b> <i>num</i>	2 KB
<b>dpid</b> <i>string</i>	Top 16-bit unique index of logical switch and bottom 48 bits of router MAC
<b>enable   disable</b>	enable
<b>normal   api</b>	normal
<b>1.0   1.3.1</b>	1.0, 1.3.1

## Platforms Supported

OmniSwitch 9900, 6860, 6865

## Usage Guidelines

- Up to three (3) OpenFlow Logical Switches can be configured on an OmniSwitch.
- Use the no form of the command to delete an OpenFlow Logical Switch and all Controller/port configurations for that Logical Switch.
- When a Logical Switch is disabled, all Controllers for that Logical Switch are operationally disabled, and flows added by those Controllers are removed.
- In Normal Mode, the switch operates as per the OpenFlow standards. In Hybrid mode, OpenFlow operates as an interface through which the Controller may add over-ride policies to the switch much like QoS. In Hybrid mode, no traffic is forwarded to the Controller(s) and AOS operates normally.
- OpenFlow versions 1.0 and 1.3.1 are both enabled by default. At least one version must be enabled.
- “vlan” is not valid if the configured mode for the Logical Switch is API. An API Logical Switch implicitly operates on all ports, link aggregates, and VLANs not assigned to other OpenFlow Logical Switches.
- OpenFlow version 1.0 and 1.3.1 use TCP port 6633.

## Examples

```
-> openflow logical-switch vswitch1
-> openflow logical-switch vswitch1 admin-state enable
-> openflow logical-switch vswitch1 mode normal version 1.0 vlan 5
-> openflow logical-switch vswitchnec mode pfc-channel
-> no openflow logical-switch vswitch1
```

## Release History

Release 7.3.4; command introduced

## Related Commands

**show openflow logical-switch** Displays information about all of the configured OpenFlow Logical Switches.

## MIB Objects

```
alaOpenflowLogicalSwitchTable  
  alaOpenflowLogicalSwitch  
  alaOpenflowLogicalSwitchAdminState  
  alaOpenflowLogicalSwitchMode  
  alaOpenflowLogicalSwitchVersions  
  alaOpenflowLogicalSwitchVlan
```

---

## openflow logical-switch controller

Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.

**openflow logical-switch** *name* **controller** *ip\_address* [:*port*] [**priority** *num*] **admin-state** {**enable** | **disable**}

**no openflow logical-switch** *name* **controller** *ip\_address* [:*port*]

---

### Syntax Definitions

<i>name</i>	The Logical Switch name (up to 32 characters).
<i>ip_address</i>	The IP address of Controller.
<i>port</i>	The Controller IP Port (1 - 65535).
<b>priority</b> <i>num</i>	Configure the priority to a controller for a logical-switch in pfc-channel mode (0-2). 0 = highest, 2 = lowest.
<b>enable</b>	Enables the connection to the Controller.
<b>disable</b>	Disables the connection to the Controller.

### Defaults

parameter	default
<i>port</i>	6633
<b>enable</b>   <b>disable</b>	enable
<b>priority</b> <i>num</i>	2

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Only IPv4 addresses are supported.
- If a Logical Switch cannot connect to any of its Controllers, it runs in “Fail Secure Mode”. All flow aging, etc. continues unaffected while the Controllers are disconnected.
- Use the priority parameter to configure the priority for a specified controller. If controllers have the same priority the one configured first will have priority.

### Examples

```
-> openflow logical-switch vswitch1 controller 1.2.3.4
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634 admin-state enable
-> openflow logical-switch vswitch1 controller 1.2.3.4:6634
-> openflow logical-switch vswitchnec controller 2.2.2.2 priority 1
-> no openflow logical-switch vswitch1 controller 1.2.3.4
```

## Release History

Release 7.3.4; command introduced.

## Related Commands

**show openflow logical-switch** Displays information about all of the configured OpenFlow Logical Switches.

## MIB Objects

```
alaOpenflowControllerTable
  alaOpenflowControllerLogicalSwitch
  alaOpenflowControllerIpType
  alaOpenflowControllerIp
  alaOpenflowControllerPort
  alaOpenflowControllerAdminState
```

---

## openflow logical-switch interfaces

Configures a range of interfaces to/from a Logical Switch.

**openflow logical-switch** *name* **interfaces** {**port** *chassis/slot/port1*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*] | **type** {**trunk** | **access**}} | [**native-vlan** *vlan*] | [**vlan-tag** *vlan*[-*vlan2*]]}

**no openflow logical-switch** *name* **interfaces** {**port** *chassis/slot/port1*[-*port2*] | **linkagg** *agg\_id*[-*agg\_id2*]}

---

### Syntax Definitions

<i>name</i>	The Logical Switch name (up to 32 characters).
<i>chassis/slot/port</i> [- <i>port2</i> ]	The chassis ID, slot, and port number.
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number.
<b>trunk</b>	Configures the interface type as trunk.
<b>access</b>	Configures the interface type as access.
<b>native-vlan</b> <i>vlan</i>	The default VLAN for an interface in the logical switch. Traffic on this port will be untagged for the native vlan. Traffic on all other VLANs on this port will be tagged. (2-4093)
<b>vlan-tag</b> <i>vlan</i> [- <i>vlan2</i> ]	The list of allowed tagged VLANs for an interface. Traffic on these allowed VLAN(s) of the ports and Untagged traffic will not carry an 802.1q tag. Traffic on all other VLANs on the port will be dropped. (2-4093)

### Defaults

parameter	default
<b>type</b>	<b>access</b>

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

Native-vlan and vlan-tag are valid parameters only if the logical switch mode is pfc-channel.

### Examples

```
-> openflow logical-switch vswitch1 interfaces port 1/1/1
-> no openflow logical-switch vswitch1 interfaces port 1/1/1
-> openflow logical-switch vswitch2 interfaces linkagg 5
-> no openflow logical-switch vswitch2 interfaces linkagg 5
-> openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> no openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> openflow logical-switch vswitchnec interfaces port 1/1/20 type trunk
-> openflow logical-switch vswitchnec interfaces port 1/1/20 native-vlan 3
-> openflow logical-switch vswitchnec interfaces port 1/1/20 vlan-tag 4-5
```

## Release History

Release 7.3.4; command introduced

## Related Commands

**show openflow logical-switch** Displays information about all of the configured Logical Switches.

## MIB Objects

```
alaOpenflowInterfaceTable  
  alaOpenflowInterfaceLogicalSwitch  
  alaOpenflowInterface
```

---

## show openflow

Displays global OpenFlow configuration parameters.

**show openflow**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

N/A

### Examples

```
-> show openflow
Back-off Max      : 60,
Idle Probe Timeout : 15
```

#### *output definitions*

---

<b>Back-off Max</b>	The configured maximum back off time, in seconds, for Controller connection attempts (Range = 1 - 60, Default = 60).
<b>Idle Probe Timeout</b>	The configured idle probe timeout value, in seconds (Range = 1– 60, Default = 15).

---

### Release History

Release 7.3.4; command introduced

### Related Commands

- [openflow back-off-max](#) Configures the maximum amount of time allowed for Controller connection attempts.
- [openflow idle-probe-timeout](#) Configures the idle probe timeout value.

### MIB Objects

```
alaOpenflowGlobalBackoffMax
alaOpenflowGlobalIdleProbeTimeout
```

---

## show openflow logical-switch

Displays information about configured OpenFlow Logical Switches.

**show openflow logical-switch** [*name* | **controllers** | **interfaces** [**vlan**s | **port** | **linkagg**] | **details**]

---

### Syntax Definitions

<b>name</b>	The Logical Switch name (up to 32 characters).
<b>controllers</b>	The controllers assigned to this logical switch.
<b>interfaces</b>	The interfaces assigned to this logical switch.
<b>details</b>	The details of the logical switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6860, 6865

### Usage Guidelines

- Enter a Logical Switch name to display only information about a specific Logical Switch.
- The DPID, TCP-Buffer-Size, Probe-Time, and Failure-Detect-Time are only applicable for a logical switch in PFC mode.

### Examples

```
-> show openflow logical-switch
```

Logical Switch	Admin State	Mode	Versions	VLAN	Ctrlrs	Intf	Flows
vswitch1	Ena	Norm	1.0	1	1	4	0
vswitch2	Dis	Norm	1.0, 1.3.1	5	3	4	2
vswitchnec	Ena	PFC	1.0, 1.3.1	N/A	1	0	0

```
-> show openflow logical-switch details
```

```
Logical-Switch: vswitchnec
DPID           = 0x1234567890123456
TCP-Buffer-Size = 2 Kilobytes
Probe-Time     = 5 Sec
Failure-Detect-Time = 4 Sec
```

### output definitions

---

<b>Logical Switch</b>	The Logical Switch name
<b>Admin State</b>	The Logical Switch administrative state (Enabled/Disabled).
<b>Mode</b>	The Logical Switch operational Mode (Normal/API/PFC).

*output definitions*

---

<b>Versions</b>	The OpenFlow versions enabled on the Logical Switch (1.0/1.3.1).
<b>VLAN</b>	The default VLAN for all ports assigned to the Logical Switch. Zero (0) indicates no VLAN configured.
<b>Ctrlrs</b>	The number of Controllers configured for the Logical Switch (up to three (3) Controllers can be configured per Logical Switch).
<b>Intf</b>	The number of interfaces (ports and link aggregations) configured for the Logical Switch.
<b>Flows</b>	The number of flows pushed to the Logical Switch by its Controllers.
<b>Controller</b>	The controller IP address and port.
<b>Role</b>	Current role of the controller. Equal, Master, or Slave.
<b>Oper State</b>	Current connection state of the controller (invalid, operDisabled, sendError, init, connecting, backoff, exchangingHello, active, idle, disconnected).
<b>DPID</b>	The DPID configured for the logical switch.
<b>TCP-Buffer-Size</b>	TCP Send Buffer size for socket towards controller for the logical switch.
<b>Probe-Time</b>	The probe-time configured for the logical switch name.
<b>Failure-Detect-Time</b>	The failure-detect-time configured for the logical switch.

---

**Release History**

Release 7.3.4; command introduced

**Related Commands**

# 65 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

*Filename:* ALCATEL-IND1-SYSTEM.mib  
*Module:* alcatelIND1SystemMIB

A summary of the available commands is listed here.

---

[ip domain-lookup](#)  
[ip name-server](#)  
[ipv6 name-server](#)  
[ip domain-name](#)  
[show dns](#)

---

## ip domain-lookup

Enables or disables the DNS resolver.

**ip domain-lookup**

**no ip domain-lookup**

---

### Syntax Definitions

N/A

### Defaults

By default, the DNS resolver is disabled.

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

### Examples

```
-> ip domain-lookup  
-> no ip domain-lookup
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip name-server</a>	Specifies the IP addresses of up to three servers to query on a host lookup.
<a href="#">ipv6 name-server</a>	Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
<a href="#">ip domain-name</a>	Sets or deletes the default domain name for DNS lookups.
<a href="#">show dns</a>	Displays the current DNS resolver configuration and status.

### MIB Objects

```
systemDNS  
  systemDNSEnableDnsResolver
```

---

## ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

```
ip name-server server_address1 [server_address2 [server_address3]]
```

---

### Syntax Definitions

<i>server_address1</i>	The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
<i>server_address2</i>	The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
<i>server_address3</i>	The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

### Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1  
-> ip name-server 10.255.11.66
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip domain-lookup](#)

Enables or disables the DNS resolver.

[ip domain-name](#)

Sets or deletes the default domain name for DNS lookups.

[show dns](#)

Displays the current DNS resolver configuration and status.

---

## ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

```
ipv6 name-server server_ipv6_address1 [server_ipv6_address2 [server_ipv6_address3]]
```

---

### Syntax Definitions

<i>server_ipv6_address1</i>	The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
<i>server_ipv6_address2</i>	The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
<i>server_ipv6_address3</i>	The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IPv6 addresses of the IPv6 DNS servers by using the **ipv6 name-server** command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

### Examples

```
-> ipv6 name-server fec0::2d0:d3:f3fc  
-> ipv6 name-server fe2d::2c f302::3de1:1 f1bc::202:fd40:f3
```

### Release History

## ip domain-name

Sets or deletes the default domain name for DNS lookups.

**ip domain-name** *name*

**no ip domain-name**

---

### Syntax Definitions

*name*                                      The default domain name for host lookups.

### Defaults

N/A

### Platforms Supported

OmniSwitch 9900, 6900, 6860, 6865, 6560

### Usage Guidelines

- Use the **no** form of this command to delete the default domain name.
- Use this command to set the default domain name for DNS lookups.

### Examples

```
-> ip domain-name company.com  
-> no ip domain-name
```

### Release History

                  : f1bc::202:fd40:f3
```

#### *output definitions*

---

<b>Resolver is</b>	Indicates whether the DNS resolver is enabled or disabled.
<b>domainName</b>	Indicates the default domain name assigned to the DNS lookups. This value is set using the <b>ip domain-name</b> command.
<b>IPv4 nameServer(s)</b>	Indicates the IP address(es) of the IPv4 DNS server(s). These addresses are set using the <b>ip name-server</b> command.
<b>IPv6 nameServer(s)</b>	Indicates the IPv6 address(es) of the IPv6 DNS server(s). These addresses are set using the <b>ipv6 name-server</b> command.

# A Software License and Copyright Statements

This appendix contains ALE USA, Inc. and third-party software vendor license and copyright statements.

## ALE USA, Inc. License Agreement

### ALE USA, INC. SOFTWARE LICENSE AGREEMENT

---

**IMPORTANT.** Please read the terms and conditions of this license agreement carefully before opening this package.

---

**By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.**

1. **License Grant.** This is a license, not a sales agreement, between you (the “Licensee”) and ALE USA, Inc. ALE USA, Inc. hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the “Licensed Files”) and the accompanying user documentation (collectively the “Licensed Materials”), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee’s system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that ALE USA, Inc. products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **ALE USA, Inc.’s Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of ALE USA, Inc. and its licensors (herein “its licensors”), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with ALE USA, Inc. and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** ALE USA, Inc. considers the Licensed Files to contain valuable trade secrets of ALE USA, Inc., the unauthorized disclosure of which could cause irreparable harm to ALE USA, Inc.. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold ALE USA, Inc. harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation ALE USA, Inc.'s reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** ALE USA, Inc. warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. ALE USA, Inc. further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to ALE USA, Inc. for either replacement or, if so elected by ALE USA, Inc., refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALE USA, INC. AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** ALE USA, Inc.'s cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to ALE USA, Inc. for the Licensed Materials. IN NO EVENT SHALL ALE USA, INC. BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALE USA, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between ALE USA, Inc. and Licensee, if any, ALE USA, Inc. is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and ALE USA, Inc. has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to ALE USA, Inc. and certifying to ALE USA, Inc. in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. ALE USA, Inc. may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by

ALE USA, Inc., Licensee agrees to return to ALE USA, Inc. or destroy the Licensed Materials and all copies and portions thereof.

**10. Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

**11. Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

**12. No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

**13. Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with ALE USA, Inc.'s reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

**14. Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to ALE USA, Inc. by certain third party licensors. Some third party licensors are third party beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "[Third Party Licenses and Notices](#)" on page -4 for the third party license and notice terms.

## Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains, are contained in files within the software itself located at: **/flash/foss**.

Also, if needed, we provide all FOSS (Free and Open Source Software) source code used into this release at the following URL: <https://service.esd.alcatel-lucent.com/portal/page/portal/EService/release>

## SNMP Commands

```

snmp station {ip_address | ipv6_address} {[udp_port] [username] [v1 | v2 | v3] [enable |
disable]}
no snmp station {ip_address | ipv6_address}
show snmp station

```

```

snmp snmp-engineid-type {text | mac-address | ipv4-address | ipv6-address} snmp-engineid
{text_string | mac_address | ipv4_address | ipv6_address}
snmp snmp-engineid-type mac-address snmp-engineid default
show snmp snmp-engineid
snmp community-map community_string {[user useraccount_name] | {enable | disable}}
no snmp community-map community_string
snmp community-map mode {enable | disable}
show snmp community-map
snmp security {no-security | authentication set | authentication all | privacy set | privacy all |
trap-only}
show snmp security
show snmp statistics
show snmp mib-family [table_name]
snmp-trap absorption {enable | disable}
snmp-trap to-webview {enable | disable}
snmp-trap replay-ip {ip_address | ipv6_address} [seq_id]
snmp-trap filter-ip {ip_address | ipv6_address} trap_id_list
no snmp-trap filter-ip {ip_address | ipv6_address} trap_id_list
snmp authentication-trap {enable | disable}
show snmp-trap replay-ip
show snmp-trap filter-ip
show snmp authentication-trap
show snmp-trap config
event-action {trap trigger_string script script_string | script-time-limit num}
no event-action trap name
show event-action [statistics | trap name [statistics]]

```

## OpenFlow Commands

```

openflow back-off-max seconds
openflow idle-probe-timeout seconds
openflow logical-switch name [probe-time num | failure-detect-time num | tcp-buffer-size
num | dpid string] [admin-state {enable | disable}] [mode {normal | api | pfc-channel}]
[version {1.0 | 1.3.1}+] [learned-mac-update {enable | disable}] [vlan vlan_id]
no openflow logical-switch <name>
openflow logical-switch name controller ip_address [:port] [priority num] admin-state
{enable | disable}
no openflow logical-switch name controller ip_address [:port]
openflow logical-switch name interfaces {port chassis/slot/port1[-port2] | linkagg agg_id[-
agg_id2] | [type {trunk | access}] | [native-vlan vlan] | [vlan-tag vlan[-vlan2]]}
no openflow logical-switch name interfaces {port chassis/slot/port1[-port2] | linkagg agg_id[-
agg_id2]}
show openflow
show openflow logical-switch [name | controllers | interfaces [vlans | port | linkagg] | details]

```

## DNS Commands

```
ip domain-lookup
no ip domain-lookup
ip name-server server_address1 [server_address2 [server_address3]]
ipv6 name-server server_ipv6_address1 [server_ipv6_address2 [server_ipv6_address3]]
ip domain-name name
no ip domain-name
show dns
```
