|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Destination | Destination network IP address. |
| Mask length | Length of the destination network IP subnet mask. |
| Gateway | The Gateway IP address (switch from which the destination address was learned). |
| Protocol | The type of the route (Local , Rip , or Redist). |
| Out Interface | The RIP interface through which the next hop is reached. |
| Metric | Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch). |
| Status | The RIP interface status (Installed or Not Installed). |
| State | The associated state of the route (Active , Holddown , or Garbage). |
| Age | The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct). |
| Tag | The associated route tag. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip rip host-route](#)

Enables/disables a host route to an individual host on a network.

MIB Objects

```
alaRipEcmpRouteTable
  alaRipEcmpRouteDest
  alaRipEcmpRouteMask
  alaRipEcmpRouteNextHop
  alaRipEcmpRouteType
  alaRipEcmpMetric

  alaRipEcmpRouteStatus
```

show ip rip interface

Displays RIP interface status and configuration.

show ip rip interface [*interface_name*]

Syntax Definitions

interface_name The interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter an IP address to view a specific interface. Enter the basic **show ip rip interface** command to show status for all interfaces.

Examples

```
-> show ip rip interface rip-1
```

```
Interface IP Name           = rip-1,
Interface IP Address        = 11.11.11.1
IP Interface Number (VLANId) = 4,
Interface Admin status     = enabled,
IP Interface Status        = enabled,
Interface Config AuthType  = None,
Interface Config AuthKey Length = 0,
Interface Config Send-Version = v2,
Interface Config Receive-Version = both,
Interface Config Default Metric = 1,
Received Packets           = 154,
Received Bad Packets       = 0,
Received Bad Routes        = 0,
Sent Updates               = 8
```

output definitions

| | |
|----------------------------------|--------------------------------------------------------------------------------------|
| Interface IP Name | The IP Interface name. |
| Interface IP Address | Interface IP address. |
| IP Interface Number | Interface VLAN ID number. |
| Interface Admin Status | The RIP administrative status (enabled/disabled). |
| IP Interface Status | Interface status (enabled /disabled). |
| Interface Config AuthType | The type of authentication that will be used for the RIP interface (None or Simple). |

output definitions (continued)

| | |
|-----------------------------------------|--------------------------------------------------------------------------------|
| Interface Config AuthKey Length | The authentication key length used for the RIP interface. |
| Interface Config Send-Version | Interface send option (none, v1, v2, and v1 compatible). |
| Interface Config Receive-Version | Interface receive option (none, v1, v2, and both). |
| Interface Config Default Metric | Default redistribution metric. |
| Received Packets | Number of packets received on the interface. |
| Received Bad Packets | Number of bad packets received and discarded. Normally this value is zero (0). |
| Received Bad Routes | Number of bad routes received and discarded. Normally this value is zero (0). |
| Sent Updates | Number of RIP routing table updates sent. |

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

show ip rip peer [*ip_address*]

Syntax Definitions

ip_address 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

-> show ip rip peer

| IP Address | Total Recvd | Bad Packets | Bad Routes | Version | Secs since last update |
|-------------|-------------|-------------|------------|---------|------------------------|
| 100.10.10.1 | 1 | 0 | 0 | 2 | 3 |

output definitions

| | |
|-------------------------------|---------------------------------------------------------------------|
| IP Address | Peer IP address. |
| Total recvd | Total number of RIP packets received from the peer. |
| Bad Packets | Number of bad packets received from peer. |
| Bad Routes | Number of bad routes received from peer. |
| Version | Peer's RIP version as seen on the last packet received. |
| Secs since last update | Number of seconds since the last packet was received from the peer. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip rip interface](#)

Displays the RIP interface status and configuration.

MIB Objects

```
rip2PeerTable  
  rip2PeerAddress  
  rip2PeerDomain  
  rip2PeerLastUpdate  
  rip2PeerVersion  
  rip2PeerRcvBadPackets  
  rip2PeerRcvBadRoutes
```

ipv6 load rip

Lloads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

ipv6 load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the [ipv6 rip admin-state](#) command to enable RIPng on the switch.

Examples

```
-> ipv6 load rip
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|--------------------------------------|-------------------------------------------------------------|
| ipv6 rip admin-state | Enables/disables RIPng routing on the switch. |
| show ipv6 rip | Displays RIPng status and general configuration parameters. |

MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPRipngStatus
```

ipv6 rip admin-state

Enables or disables RIPng on the switch.

```
ipv6 rip admin-state {enable | disable}
```

Syntax Definitions

| | |
|---------|-----------------|
| enable | Enables RIPng. |
| disable | Disables RIPng. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

RIPng must be loaded on the switch ([ip load rip](#)) to enable RIP on the switch.

Examples

```
-> ipv6 rip admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------|-------------------------------------------------------------|
| ip load rip | Loads RIPng into memory. |
| show ipv6 rip | Displays RIPng status and general configuration parameters. |

MIB Objects

```
alaProtocolripng  
  alaRipngProtoStatus
```

ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

ipv6 rip invalid-timer *seconds*

Syntax Definitions

seconds Time, in seconds, that a route will remain in an "Active" state. Valid range is 1 - 300.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 180 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This timer is reset each time a routing update is received.

Examples

```
-> ipv6 rip invalid-timer 300
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.
[ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

MIB Objects

alaProtocolripng
alaRipngInvalidTimer

ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

ipv6 rip garbage-timer *seconds*

Syntax Definitions

seconds Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 120 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the [ipv6 rip invalid-timer](#) command to set the Invalid Timer Value.

Examples

```
-> ipv6 rip garbage-timer 180
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
- [ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

MIB Objects

alaProtocolripng
alaRipngGarbageTimer

ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

ipv6 rip holddown-timer *seconds*

Syntax Definitions

seconds Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 0 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

Examples

```
-> ipv6 rip holddown-timer 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.

MIB Objects

alaProtocolripng
alaRipngHolddownTimer

ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

ipv6 rip jitter *value*

Syntax Definitions

value Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0 - 300).

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 5 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

Examples

```
-> ipv6 rip jitter 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip update-interval](#) Configures the RIPng update interval.
[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

alaProtocolripng
alaRipngJitter

ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ipv6 rip route-tag *value*

Syntax Definitions

value Route tag value. Valid range is 0 – 65535.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

Examples

```
-> ipv6 rip route-tag 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

alaProtocolripng
alaRipngRouteTag

ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

ipv6 rip update-interval *seconds*

Syntax Definitions

seconds Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 30 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command, along with the [ipv6 rip jitter](#) command to configure RIPng updates.

Examples

```
-> ipv6 rip update-interval 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip jitter](#) Configures an offset value for RIPng updates.
[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

alaRipng
alaRipngUpdateInterval

ipv6 rip triggered-sends

Configures the behavior of triggered updates.

```
ipv6 rip triggered-sends {all | updated-only | none}
```

Syntax Definitions

| | |
|---------------------|----------------------------------------------------------------------------------------------|
| all | All RIPng routes are added to any triggered updates. |
| updated-only | Only route changes that are causing the triggered update are included in the update packets. |
| none | RIPng routes are not added to triggered updates. |

Defaults

| parameter | default |
|---------------------------|--------------|
| all updated-only none | updated-only |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

Examples

```
-> ipv6 rip triggered-sends none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng  
alaRipngTriggeredSends
```

ipv6 rip interface

Creates or deletes a RIPng interface.

ipv6 rip interface *if_name*

no ipv6 rip interface *if_name*

Syntax Definitions

if_name IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see [Chapter 5, "VLAN Management Commands"](#).
- RIPng will support a maximum of 20 interfaces.

Examples

```
-> ipv6 rip interface Test_Lab
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| ipv6 load rip | Loads RIPng into memory. |
| ipv6 rip admin-state | Enables or disables RIPng on the switch. |
| ipv6 rip interface recv-status | Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. |
| ipv6 rip interface send-status | Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface. |
| show ipv6 rip interface | Displays information for all or specified RIPng interfaces. |

MIB Objects

alaRipngInterfaceTable
 alaRipngInterfaceStatus

ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

ipv6 rip interface *if_name* **metric** *value*

Syntax Definitions

if_name IPv6 interface name.
value Metric value. Valid range is 1 - 15.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ipv6 rip Test_Lab metric 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 rip interface](#) Creates or deletes a RIPng interface.
[show ipv6 rip interface](#) Displays information for all or specified RIPng interfaces.

MIB Objects

alaRipngInterfaceTable
 alaRipngInterfaceMetric

ipv6 rip interface rcv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

ipv6 rip interface *if_name* rcv-status {enable | disable}

Syntax Definitions

| | |
|----------------|------------------------------------------------------------|
| <i>if_name</i> | IPv6 interface name. |
| enable | Enables the “Receive” status for the specified interface. |
| disable | Disables the “Receive” status for the specified interface. |

Defaults

| parameter | default |
|-------------------------|---------------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

RIPng must be loaded ([ip load rip](#)) and enabled ([ipv6 rip admin-state](#)) on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab rcv-status disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------------------|------------------------------------------------|
| ipv6 load rip | Loads RIPng into memory. |
| ipv6 rip admin-state | Enables/disables RIPng on the switch. |
| ipv6 rip interface send-status | Configures IPv6 RIPng interface “Send” status. |

MIB Objects

alaRipngInterfaceTable
 alaRipngInterfaceRecvStatus

ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is enabled, packets can be sent from this interface. When it is disabled, packets will not be sent from this interface.

ipv6 rip interface *if_name* send-status {enable | disable}

Syntax Definitions

| | |
|----------------|---------------------------------------------------------|
| <i>if_name</i> | IPv6 interface name. |
| enable | Enables the “Send” status for the specified interface. |
| disable | Disables the “Send” status for the specified interface. |

Defaults

| parameter | default |
|-------------------------|---------------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

RIPng must be loaded (**ip load rip**) and enabled (**ipv6 rip admin-state**) on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|--------------------------------------|---------------------------------------------------|
| ipv6 load rip | Loads RIPng into memory. |
| ipv6 rip admin-state | Enables/disables RIPng on the switch. |
| ipv6 rip interface rcv-status | Configures IPv6 RIPng interface “Receive” status. |

MIB Objects

```
alaRipngInterfaceTable  
  alaRipngInterfaceSendStatus
```

ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

```
ipv6 rip interface if_name horizon {none | split-only | poison}
```

Syntax Definitions

| | |
|-------------------|------------------------------------------------|
| <i>if_name</i> | IPv6 interface name. |
| none | Disables loop prevention mechanisms. |
| split-only | Enables split-horizon, without poison-reverse. |
| poison | Enables split-horizon with poison-reverse. |

Defaults

| parameter | default |
|----------------------------|---------|
| none split-only poison | poison |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

Examples

```
-> ipv6 rip interface Test_Lab none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

show ipv6 rip

Displays the RIPng status and general configuration parameters.

show ipv6 rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

-> show ipv6 rip

```
Status                = Enabled,
Number of routes      = 10,
Route tag             = 0,
Update interval      = 30,
Invalid interval     = 180,
Garbage interval     = 120,
Holddown interval    = 0,
Jitter interval      = 5,
Triggered Updates    = All Routes,
```

output definitions

| | |
|--------------------------|-----------------------------------------------------------------------|
| Status | RIPng protocol status (enabled or disabled). |
| Number of routes | Number of RIPng routes in Forwarding Information Base (FIB). |
| Route tag | Route tag value for RIP routes generated by the switch. Default is 0. |
| Invalid interval | Invalid Timer setting, in seconds. |
| Garbage interval | Garbage Timer setting, in seconds. |
| Holddown interval | Holddown Timer setting, in seconds. |
| Jitter interval | Jitter setting. |
| Triggered updates | Triggered Updates setting (All Routes, Updated Routes, and None). |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 rip admin-state | Enables or disables RIPng routing on the switch. |
| ipv6 rip route-tag | Configures the route tag value for RIP routes generated by the switch. |
| ipv6 rip update-interval | Configures the Interval, in seconds, so that RIPng routing updates are sent out. |
| ipv6 rip invalid-timer | Configures the amount of time a route remains active in RIB before being moved to the "garbage" state. |
| ipv6 rip invalid-timer | Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received. |
| ipv6 rip holddown-timer | Configures the amount of time a route is placed in a holddown state. |
| ipv6 rip jitter | Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. |

show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

show ipv6 rip interface [*if_name*]

Syntax Definitions

if_name IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If an interface name is not specified, all IPv6 RIP interfaces are displayed.

Examples

```
-> show ipv6 rip interface
```

| Interface Name | Status | Packets | | Metric |
|-------------------|--------|---------|-------|--------|
| | | Recv'd | Sent | |
| Test_Lab | Active | 12986 | 12544 | 1 |
| Test_Lab_2 | Active | 12556 | 12552 | 1 |

```
-> show ipv6 rip interface if3
```

```
Name = Test_Lab,
IPv6 interface index = 3,
Interface status = Active,
Next Update = 27 secs,
Horizon Mode = Split and Poison-reverse,
MTU size = 1500,
Metric = 1,
Send status = Enabled,
Receive status = Enabled,
Packets received = 12986,
Packets sent = 12544,
```

output definitions

| | |
|-----------------------------|----------------------------------------------|
| Interface name | Interface name. |
| IPv6 interface index | IPv6 index of this interface. |
| Status | Interface status (Active/Inactive). |
| Packets Recvd | Number of packets received by the interface. |

output definitions (continued)

| | |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Packets Sent | Number of packets sent by the interface. |
| Metric | RIPng metric (cost) configured for the interface. |
| IPv6 interface index | IPv6 interface index number. |
| Interface status | Interface status (Active/Inactive). |
| Next update | Seconds remaining until the next update on this interface. |
| Horizon mode | Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse. |
| MTU size | Maximum transmission size for RIPng packets on the interface. |
| Send status | Interface "Send" status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface. |
| Receive status | Interface "Receive" status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface. |
| Packets received | Number of packets received by the interface. |
| Packets sent | Number of packets sent by the interface. |

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

show ipv6 rip peer [*ipv6_address*]

Syntax Definitions

ipv6_address IPv6 address of the peer.

Defaults

N/A.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

Examples

```
-> show ipv6 peer
```

| Address | Seen on Interface | Packets Recv | Last Update |
|--------------------------|-------------------|--------------|-------------|
| fe80::200:39ff:fe1f:710c | vlan172 | 23 | 20 |
| fe80::2d0:95ff:fe12:da40 | bkbone20 | 33 | 2 |
| fe80::2d0:95ff:fe12:da40 | vlan150 | 26 | 25 |
| fe80::2d0:95ff:fe6a:5d41 | nssa23 | 20 | 25 |

```
-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40
```

```
Peer#1 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = bkbone20,
Last Update         = 8 secs,
Received packets    = 33,
Received bad packets = 0
Received routes     = 5,
Received bad routes = 0
```

```
Peer#2 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = vlan150,
Last Update         = 1 secs,
Received packets    = 27,
Received bad packets = 0
Received routes     = 2,
Received bad routes = 0
```

output definitions

| | |
|-----------------------------|---------------------------------------------------------------------|
| Address | IPv6 address of the peer. |
| Seen on Interface | Interface used to reach the peer. |
| Packets Recvd | Number of packets received from the peer. |
| Last Update | Number of seconds since the last update was received from the peer. |
| Peer address | Peer IPv6 address. |
| Received packets | Number of packets received from the peer. |
| Received bad packets | Number of bad packets received from the peer. |
| Received routes | Number of RIPng routes received from the peer. |
| Received bad routes | Number of bad RIPng routes received from the peer. |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |

show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

show ipv6 rip routes [**dest** *ipv6_prefix/prefix_length* | **gateway** *ipv6_addr* | **detail** *ipv6_prefix/prefix_length*]

Syntax Definitions

| | |
|----------------------------------|----------------------------------------------------------------------------------------|
| dest | Displays all routes whose destination matches the IPv6 prefix/prefix length. |
| gateway | Displays all routes whose gateway matches the specified IPv6 address. |
| detail | Displays detailed information about a single route matching the specified destination. |
| <i>ipv6_prefix/prefix length</i> | IPv6 address and prefix/prefix length. |
| <i>ipv6_addr</i> | IPv6 address. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If none of the optional parameters are entered with this command, all IPv6 RIP routes are displayed.

Examples

-> show ipv6 rip routes

Legends: State: A = Active, H = Holddown, G = Garbage

| Destination | Gateway | State | Metric | Proto |
|----------------|---------------------------|-------|--------|-------|
| 100::1/128 | +fe80::200:39ff:fe1f:710c | A | 2 | Rip |

23 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, IS-IS, OSPF, PIM, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

This implementation of BFD supports an Asynchronous control packet mode or an Asynchronous Echo function. Demand mode is not supported.

- When the Asynchronous control packet mode is activated, BFD neighbors periodically send BFD control packets to each other. A time interval for transmitting and receiving such packets is negotiated between the two BFD systems. If a neighboring system fails to receive a number of control packets continuously over a specific period of time, the session is considered down and BFD informs the appropriate routing protocol.
- The Asynchronous Echo function is used to verify the forwarding path between neighboring BFD systems. When active, a BFD system transmits Echo packets only (no control packets are sent) to a BFD neighbor, which then sends the packets back to the originating system along the forwarding path. If no Echo packets are received back from the BFD neighbor within a configured Echo time interval, the session is considered down.

MIB information for the BFD commands is as follows:

Filename: ALCATEL-IND1-BFD-MIB.mib
Module: alcatelIND1BfdMIB

A summary of the available commands is listed here:

| | |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global BFD commands | ip bfd admin-state ip bfd transmit ip bfd receive ip bfd multiplier ip bfd echo-interval show ip bfd show ip ipv6 bfd sessions show ip ipv6 bfd sessions statistics |
| BFD Interface commands | ip ipv6 bfd interface ip ipv6 bfd interface admin-state ip ipv6 bfd interface transmit ip ipv6 bfd interface receive ip ipv6 bfd interface multiplier ip ipv6 bfd interface echo-interval show ip ipv6 bfd interfaces |

ip bfd admin-state

Enables or disables the global BFD protocol status for the switch.

```
ip bfd admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|---------------|
| enable | Enables BFD. |
| disable | Disables BFD. |

Defaults

By default, BFD is disabled for the switch.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

Examples

```
-> ip bfd admin-state enable  
-> ip bfd admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bfd](#) Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalAdminStatus
```

ip bfd transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

ip bfd transmit *transmit_interval*

Syntax Definitions

transmit_interval The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

| parameter | default |
|--------------------------|------------------|
| <i>transmit_interval</i> | 300 milliseconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd transmit** command does not override the value set for the interface using the **ip bfd interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd transmit 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip|ipv6 bfd interface transmit](#) Configures the transmit time interval for a specific BFD interface.
- [show ip bfd](#) Displays the BFD global status and general configuration parameters.

MIB Objects

alaBfdGlobalTxInterval

ip bfd receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

ip bfd receive *receive_interval*

Syntax Definitions

receive_interval The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

| parameter | default |
|-------------------------|------------------|
| <i>receive_interval</i> | 300 milliseconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd receive** command does not override the value set for the interface using the **ip bfd interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd receive 500
```

Release History

Release 7.1.1; command was introduced.

MIB Objects

alaBfdGlobalRxInterval

ip bfd multiplier

Configures the global BFD detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. The detection time value that is specified determines how long to wait before declaring that the BFD session is down.

ip bfd multiplier *num*

Syntax Definitions

num The detection time multiplier number. The valid range is 3–255.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global detection time multiplier is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd multiplier** command does not override the value set for the interface using the **ip bfd interface multiplier** command.
- The global detection time multiplier serves as the default multiplier value for a BFD interface. The default multiplier value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd multiplier 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bfd](#) Displays the BFD global status and general configuration parameters.

MIB Objects

alaBfdGlobalDetectMult

ip bfd echo-interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd echo-interval *echo_interval*

Syntax Definitions

echo_interval The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

| parameter | default |
|----------------------|------------------|
| <i>echo_interval</i> | 300 milliseconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd echo-interval** command does not override the value set for the interface using the **ip bfd interface echo-interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd echo-interval 500
```

Release History

Release 7.1.1; command was introduced.

| show ip bfd | Displays the BFD global status and general configuration parameters. |

MIB Objects

alaBfdGlobalEchoRxInterval

ip|ipv6 bfd interface

Configures an IPv4 or IPv6 BFD interface.

```
{ip | ipv6} bfd interface if_name
```

```
no {ip | ipv6} bfd interface if_name
```

Syntax Definitions

if_name The name of an existing IPv4 or IPv6 interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a BFD interface.
- The interface name must be an existing IPv4 or IPv6 interface name that is configured with an IPv4 or IPv6 address.

Examples

```
-> ip bfd interface bfd-vlan-101
-> no ip bfd interface bfd-vlan-101

-> ipv6 bfd interface bfd-vlan-201
-> no ipv6 bfd interface bfd-vlan-201
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

```

ip|ipv6 bfd interface admin-state

Enables or disables the administrative status of an IPv4 or IPv6 BFD interface.

```
{ip | ipv6} bfd interface if_name admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------------------------------------------|
| <i>if_name</i> | The name of an existing IPv4 or IPv6 BFD interface. |
| enable | Enables the BFD interface. |
| disable | Disables the BFD interface. |

Defaults

By default, a BFD interface is disabled when it is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

Examples

```
-> ip bfd interface bfd-vlan-101 admin-state enable
-> ip bfd interface bfd-vlan-101 admin-state disable

-> ipv6 bfd interface bfd-vlan-201 admin-state enable
-> ipv6 bfd interface bfd-vlan-201 admin-state disable
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

```

ip|ipv6 bfd interface transmit

Configures the transmit time interval for an IPv4 or IPv6 BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

```
{ip | ipv6} bfd interface if_name transmit transmit_interval
```

Syntax Definitions

if_name The name of an existing IPv4 or IPv6 BFD interface.

transmit_interval The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

| parameter | default |
|--------------------------|------------------|
| <i>transmit_interval</i> | 300 milliseconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface transmit** or **ipv6 bfd interface transmit** command does not change the global value configured with the **ip bfd transmit** command.

Examples

```
-> ip bfd interface bfd-vlan-101 transmit 500
```

```
-> ipv6 bfd interface bfd-vlan-201 transmit 500
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1.R03; IPv6 BFD support added.

```

ip|ipv6 bfd interface receive

Configures the receive time interval for an IPv4 or IPv6 BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

```
{ip | ipv6} bfd interface if_name receive receive_interval
```

Syntax Definitions

if_name The name of an existing IPv4 or IPv6 BFD interface.

receive_interval The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

| parameter | default |
|-------------------------|------------------|
| <i>receive_interval</i> | 300 milliseconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface receive** or **ipv6 bfd interface receive** command does not change the global value configured with the **ip bfd receive** command.

Examples

```
-> ip bfd interface bfd-vlan-101 receive 500
```

```
-> ipv6 bfd interface bfd-vlan-201 receive 500
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1.R03; IPv6 BFD support added.

MIB Objects

alaBfdIntfTable
alaBfdReqMinRxInterval

ip|ipv6 bfd interface multiplier

Configures the detection time multiplier for an IPv4 or IPv6 BFD interface. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

```
{ip | ipv6} bfd interface if_name multiplier num
```

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------------|
| <i>if_name</i> | The name of an existing IPv4 or IPv6 BFD interface. |
| <i>num</i> | The detection time multiplier number. The valid range is 3–255. |

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the detection time multiplier.

Examples

```
-> ip bfd interface bfd-vlan-101 multiplier 5
-> ipv6 bfd interface bfd-vlan-201 multiplier 5
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

show ip|ipv6 bfd interfaces

Displays the BFD interface configuration table.

show {ip | ipv6} bfd interfaces [*if_name*]

Syntax Definitions

if_name The name of the IPv4 or IPv6 BFD interface.

Defaults

By default, the configuration for all IPv4 or IPv6 BFD interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Enter an interface name to display information for a specific BFD interface.

Examples

```
-> show ip bfd interfaces
```

| Interface Name | Admin Status | Tx Interval | Min Rx Interval | Min EchoRx Interval | Detect Multiplier | OperStatus |
|----------------|--------------|-------------|-----------------|---------------------|-------------------|------------|
| bfd-intf1 | enabled | 300 | 300 | 300 | 3 | UP |

show ip|ipv6 bfd sessions

Displays the IPv4 or IPv6 BFD sessions for the switch.

show {ip | ipv6} bfd sessions [*session_num*] [*slot chassis/slot*]

Syntax Definitions

session_num The BFD session number. Valid range is 1–1024.
chassis The chassis identifier.
slot The current slot position used by the switch.

Defaults

By default, all IPv4 or IPv6 BFD sessions are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Specify a session number to display information for an individual BFD session.

Examples

```
-> show ip bfd sessions
Legends: Neg.      = Negotiated
          Discr    = Discriminator
          Intvl    = Interval (in milliseconds)

```

output definitions

| | |
|----------------------------------|-------------------------------------------------------------------------------|
| Local discriminator | The local discriminator. |
| Neighbor IP address | The IPv4 or IPv6 address of the BFD neighbor. |
| Requested Session Type | The bit map of the session type that is requested. |
| Interface IP address | The IPv4 or IPv6 address of the outgoing BFD interface for this session. |
| Source UDP Port | The unique source UDP port used to send BFD packets for this session. |
| State | The state of the BFD session. |
| Session Operating Mode | The current operating mode of the BFD session. |
| Remote discriminator | The remote discriminator. |
| Negotiated Tx interval | The negotiated transmit interval. |
| Negotiated Rx interval | The negotiated receive interval. |
| Echo Rx interval | The Echo packet receive interval. |
| Detection Time Multiplier | The BFD Detection Time multiplier number. |
| Applications Registered | The bit map object of applications that are registered with this BFD session. |

show ip|ipv6 bfd sessions statistics

Displays the statistics for IPv4 or IPv6 BFD sessions.

show {ip | ipv6} bfd sessions statistics [session_num]

Syntax Definitions

session_num The BFD session number. Valid range is 1–1024.

Defaults

By default, statistics for all IPv4 or IPv6 sessions are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Specify a BFD session number to display statistics for an individual session.

Examples

```
-> show ip bfd sessions statistics
```

Legends:

```
noDiag      = noDiagnostic(0)          ctlDetExp = controlDetectionTimeExpired(1)

24 DHCP Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (the clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur. These CLI commands are applicable for all VRF instances.

MIB information for DHCP Relay commands is as follows:

Filename: ALCATEL-IND1-UDP-RELAY-MIB.mib
Module: alcatelIND1UDPRelayMIB

A summary of the available commands is listed here.

ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

ip helper address *ip_address*

no ip helper address [*ip_address*]

Syntax Definitions

ip_address DHCP server IP address (for example 21.0.0.10).

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.
- Use this command to configure DHCP Relay on switches where packets are routed between IP networks.

Examples

```
-> ip helper address 75.0.0.10  
-> no ip helper address 31.0.0.20
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip helper vlan address | Specifies or deletes DHCP Relay based on the VLAN of the DHCP request. |
| ip helper forward-delay | Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time. |
| ip helper maximum-hops | Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse. |
| show ip helper | Displays current DHCP Relay configuration information. |
| show ip helper statistics | Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations. |

MIB Objects

```
iphelperTable  
    iphelperService  
    iphelperForwAddr
```

ip helper vlan address

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when a standard relay service is used.

ip helper vlan *vlan_id*[-*vlan_id2*] **address** *ip_address*

no ip helper vlan *vlan_id*[-*vlan_id2*] **address** *ip_address*

Syntax Definitions

| | |
|-------------------------------------|--------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN ID number of the DHCP server VLAN. Use a hyphen to specify a range of VLAN IDs (3-5). |
| <i>ip_address</i> | IP address (for example 21.0.0.10) of the DHCP server VLAN. |

Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries. (for example, 10-15).
- The **ip helper vlan address** command works only if the **per-vlan-only** forwarding option is active. Use the **ip helper per-vlan-only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for the VLANs before using this command.
- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.

Examples

```
-> ip helper vlan 3 address 75.0.0.10
-> ip helper vlan 250-255 address 198.206.15.2
-> no ip helper vlan 3 address 75.0.0.1
-> no ip helper vlan 1601 address 198.206.15.20
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ip helper per-vlan-only](#)

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperTable

 iphelperService

 iphelperVlan

ip helper standard

Sets the DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

ip helper standard

Syntax Definitions

N/A

Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

To process DHCP packets on a per VLAN basis or to change the DHCP Relay forwarding option from standard to per VLAN, use the [ip helper per-vlan-only](#) command.

Examples

```
-> ip helper standard
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable  
  iphelperForwOption
```

ip helper per-vlan-only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

ip helper per-vlan-only

Syntax Definitions

N/A

Defaults

By default, the UDP forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the forwarding option is set to **per-vlan-only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.
- Using the **per-vlan-only** forwarding option requires you to specify a DHCP server IP address for each VLAN that provides a relay service. The **ip helper vlan address** command performs this function and at the same time enables relay for the specified VLAN.

Examples

```
-> ip helper per-vlan-only
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip helper vlan address | Configures a DHCP Relay service for the specified VLAN. |
| ip helper standard | Sets DHCP Relay forwarding option to standard. All DHCP packets are processed. |
| show ip helper | Displays current DHCP Relay configuration information. |
| show ip helper statistics | Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations. |

MIB Objects

iphelperStatTable
iphelperForwOption

ip helper forward-delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet sent from the client contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay does not process the packet unless the elapsed boot time value of the client is equal to or greater than the configured value of the forward delay time.

ip helper forward-delay *seconds*

Syntax Definitions

seconds Forward delay time value in seconds.

Defaults

By default, the forward delay time is set to 0 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The time specified applies to all defined IP helper addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

Examples

```
-> ip helper forward-delay 300  
-> ip helper forward-delay 120
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip helper address | Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration. |
| ip helper maximum-hops | Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse. |
| show ip helper | Displays current DHCP Relay configuration information. |
| show ip helper statistics | Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations. |

MIB Objects

iphelperStatTable
iphelperForwDelay

ip helper maximum-hops

Sets the maximum number of hops value for the DHCP Relay configuration. This value specifies the maximum number of relays a BOOTP/DHCP packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

ip helper maximum-hops *hops*

Syntax Definitions

hops The maximum number of relays.

Defaults

By default, the maximum hops value is set to 16 hops.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a packet contains a hop count equal to or greater than the *hops* value, DHCP Relay discards the packet.
- The maximum hops value only applies to DHCP Relay and is ignored by other services.

Examples

```
-> ip helper maximum-hops 1
-> ip helper maximum-hops 10
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ip helper address](#)

Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.

[ip helper forward-delay](#)

Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

iphelperStatTable
iphelperMaxHops

ip helper agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

ip helper agent-information {enable | disable}

Syntax Definitions

| | |
|----------------|------------------------------------------------------------|
| enable | Enables the relay agent Option-82 feature for the switch. |
| disable | Disables the relay agent Option-82 feature for the switch. |

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-VLAN basis.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, the packet is processed based on the agent information policy configured for the switch. This policy is configured using the **ip help agent-information policy** command.

Examples

```
-> ip helper agent-information enable  
-> ip helper agent-information disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

[ip helper agent-information policy](#)

Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

`iphelperAgentInformation`

ip helper agent-information policy

Configures a policy that determines how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

ip helper agent-information policy {drop | keep | replace}

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| drop | Drop DHCP packets that already contain an Option-82 field. |
| keep | Keep the existing Option-82 field information and continue to relay the DHCP packet. |
| replace | Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet. |

Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent does not insert the relay agent information option into the DHCP packet and forwards the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

Examples

```
-> ip helper agent-information policy drop
-> ip helper agent-information policy keep
-> ip helper agent-information policy replace
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |

| show ip helper statistics | Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations. |

MIB Objects

iphelperAgentInformationPolicy

ip helper pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

ip helper pxe-support {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------|
| enable | Enables PXE support. |
| disable | Disables PXE support. |

Defaults

By default, PXE support is disabled for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

PXE support is disabled by default and it is a user-configurable option using the **ip helper pxe-support** command.

Examples

```
-> ip helper pxe-support enable
-> ip helper pxe-support disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip helper](#) Displays current DHCP Relay configuration information.

MIB Objects

iphelperPXESupport

ip helper option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 field.

ip helper option-82 format {**base-mac** | **system-name** | **user-string** *string* / **interface-alias** | **auto-interface-alias** | **ascii** [{"**base-mac** | **cvlan** | **interface** | **interface-alias** | **system-name** | **user-string** *string* | **vlan**]} {**delimiter** *string*}}

Syntax Definitions

| | |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| base-mac | The base MAC address of the switch. |
| system-name | The system name of the switch. |
| <i>string</i> | A user defined text string. Supports up to 64 characters. |
| interface-alias | The alias configured for the interface. |
| auto-interface-alias | The switch automatically generates the interface-alias in the following format: <i>SystemName_slot_port</i> . |
| ascii | ASCII format. |
| | base-mac: The base MAC address of the switch. |
| | cvlan: The Customer VLAN ID. |
| | interface: The interface name. |
| | interface-alias: The alias configured for the interface. |
| | system-name: The system name of the switch. |
| | user-string: A user defined text string. |
| | vlan: The VLAN ID of which the client is a member. |
| | <i>string:</i> A user-defined text string. |
| | delimiter: The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space). |

Defaults

| parameter | default |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| base-mac system-name user-string <i>string</i> interface-alias auto-interface-alias ascii | base-mac |
| ascii | base-mac |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The **interface-alias** parameter will use the alias configured with the **interfaces alias** command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** and **auto-interface-alias** parameters, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID sub option. Each parameter provided with this command represents a different type of information.
 - Configuring the Circuit ID or Remote ID sub option in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
 - Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
 - To ensure that the “\” (backward slash) delimiter is parsed correctly, enter two backward slashes in quotes (for example, “\\”).

Examples

```
-> ip helper option-82 format user-string "Building B Server"  
-> ip helper option-82 format system-name  
-> ip helper option-82 format base-mac  
-> ip helper option-82 format interface-alias  
-> ip helper option-82 format auto-interface-alias  
-> ip helper option-82 format ascii user-string "Bldg A Server"  
-> ip helper option-82 format ascii vlan system-name delimiter |  
-> ip helper option-82 format ascii interface system-name delimiter "\\\""
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

ip dhcp relay admin-state

Enables or disables DHCP Relay for the Shortest Path Bridging (SPB) service domain. When enabled, DHCP packets can be relayed between a client and a server over an SPB service domain.

ip dhcp relay admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|---------------------------------------------|
| enable | Enables DHCP Relay for the service domain. |
| disable | Disables DHCP Relay for the service domain. |

Defaults

| parameter | default |
|-------------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Disabling this feature does not remove the service-based DHCP relay agent configuration from the switch. However, the configuration is not active unless the feature is enabled using this command.
- When this feature is enabled, DHCP packets are relayed on a global basis or on a per-interface basis.
 - Global DHCP Relay for services is enabled by default and requires a global destination IP address (configured through the **ip dhcp relay destination** command). All DHCP packets are forwarded by a global relay agent.
 - Per-interface DHCP Relay for services is disabled by default. To enable this mode and define a per-interface relay agent, use the **ip dhcp relay per-interface-mode** and **ip dhcp relay interface destination** commands. Only DHCP packets originating from the SPB service that is associated with the specified IP interface are forwarded by the interface relay agent.
 - The global and per-interface modes are mutually exclusive.
- Configure DHCP Relay on switches in the SPB domain where packets are routed between IP networks.
- Configuring a DHCP relay agent for an IP interface is supported only when the interface is bound to an SPB service (a service-based IP interface).

Examples

```
-> ip dhcp relay admin-state enable
-> ip dhcp relay admin-state disable
```

Release History

Release 8.5R3; command introduced.

Related Commands

| | |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| ip dhcp relay destination | Configures a global destination IP address. |
| ip dhcp relay per-interface-mode | Enables or disables the per-interface DHCP relay mode, which is used to process DHCP packets on a per-interface basis. |
| show ip dhcp relay interface | Displays the DHCP Relay configuration for the SPB service domain. |

MIB Objects

```
alaDhcpRelayGlobalConfig  
  alaDhcpRelayAdminStatus
```

ip dhcp relay destination

Configures a global destination IP address. When the global DHCP Relay for services mode is active, all DHCP client requests are forwarded to the specified destination IP address.

ip dhcp relay destination *ip_address*

no ip dhcp relay destination *ip_address*

Syntax Definitions

ip_address

The Pv4 address (for example 21.0.0.10) of the DHCP server to which packets are relayed.

Defaults

N/A

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use the **no** form of the command to remove the configured DHCP relay destination.
- Configuring a global destination IP address is required when global DHCP Relay for services is enabled for the switch.

Examples

```
-> ip dhcp relay destination 3.3.0.2
-> ip dhcp relay destination 4.4.0.2
-> no ip dhcp relay destination 3.3.0.2
```

Release History

Release 8.5R3; command introduced.

Related Commands

  alaDhcpRelayServerDestinationAddressType,
  alaDhcpRelayServerDestinationAddress,
  alaDhcpRelayServerDestinationRowStatus
```

ip dhcp relay per-interface-mode

Enables or disables the DHCP Relay per-interface mode for services. When this mode is enabled, a relay agent can be configured for a specific IP interface.

ip dhcp relay per-interface-mode

no ip dhcp relay per-interface-mode

Syntax Definitions

N/A

Defaults

By default, the global DHCP Relay mode is active when the DHCP Relay for services feature is enabled.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- When the per-interface DHCP relay mode is enabled with this command, the global DHCP relay mode is not available. These two types of relay agents are mutually exclusive.
- Use the **no** form of this command to change the DHCP Relay mode back to global (the default).
- When the per-interface mode is active, use the **ip dhcp relay interface destination** command to configure a destination IP address for each service-based IP interface that will serve as a DHCP relay agent.
- Configuring a DHCP relay agent for an IP interface is supported only when the interface is bound to an SPB service (a service-based IP interface).

Examples

```
-> ip dhcp relay per-interface-mode  
-> no ip dhcp relay per-interface-mode
```

Release History

Release 8.5R3; command introduced.

Related Commands

| | |
|--------------------------------------------|---------------------------------------------------------------------------------------------|

| ip dhcp relay interface admin-state | Enables or disables DHCP relay on a service-based IP interface. |
| ip dhcp relay admin-state | Enables or disables the DHCP relay for services feature. |
| show ip dhcp relay interface | Displays the DHCP Relay configuration for the SPB service domain. |

MIB Objects

```
alaDhcpRelayGlobalConfig  
  alaDhcpRelayPerInterfaceMode
```

ip dhcp relay interface destination

Configures a DHCP relay destination IP address for the specified interface. The specified IP interface is bound to an SPB service; packets destined for the specified IP address are relayed over the SPB service.

ip dhcp relay interface *if_name* **destination** *ip_address*

no ip dhcp relay interface *if_name* **destination** *ip_address*

Syntax Definitions

| | |
|-------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The name of an IPv4 interface that is associated with an SPB service. Specify the primary IP interface for the service. |
| <i>ip_address</i> | The Pv4 address (for example 21.0.0.10) of the DHCP server to which packets are relayed. |

Defaults

N/A

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use the **no** form of this command to remove the configured DHCP relay destination for the specified interface.
- This command works only if the per-interface DHCP mode is active. Use the **ip dhcp relay per-interface-mode** command to enable this option.
- Configure DHCP Relay on switches in the SPB domain where packets are routed between IP networks.
- The IP interface must be defined for an SPB service before using this command. Packets destined for the specified IP address are relayed over the SPB service.

Examples

```
-> ip dhcp relay interface client_traffic destination 75.0.0.10
-> ip dhcp relay interface client_traffic destination 31.0.0.20
-> no ip dhcp relay interface client_traffic destination 31.0.0.20
```

Release History

Release 8.5R3; command introduced.

Related Commands

  dhcpRelayInterfaceName  
  dhcpRelayInterfacIpAddressType  
  dhcpRelayInterfacIpAddress  
  dhcpRelayInterfacStatus
```

ip dhcp relay interface admin-state

Enables or disables the relay of DHCP packets received on the specified interface.

```
ip dhcp relay if_name admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------------------|
| <i>if_name</i> | The name of an IPv4 interface that is associated with an SPB service. |
| enable | Enables the relay of DHCP packets on the interface. |
| disable | Disables the relay of DHCP packets on the interface. |

Defaults

By default, DHCP relay is enabled for the interface when a relay destination IP address is configured for the interface.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- At least one relay destination must be configured before the DHCP relay is enabled on an interface.
- Configuring a DHCP relay agent for an IP interface is supported only when the interface is bound to an SPB service (a service-based IP interface).

Examples

```
-> ip dhcp relay client_traffic admin-state enable  
-> ip dhcp relay client-traffic admin-state disable
```

Release History

Release 8.5R3; command introduced.

Related Commands

MIB Objects

```
alaDhcpRelayInterfaceAdminStateTable  
  alaDhcpRelayInterfaceAdminStatus
```

show ip dhcp relay interface

Display the DHCP Relay configuration for the Shortest Path Bridging (SPB) service domain.

show ip dhcp relay interface

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9900

Usage Guidelines

When DHCP Relay over services is enabled, DHCP packets are relayed on a global basis or on a per-interface basis.

- Global DHCP Relay for services is enabled by default and requires a global destination IP address. Global destination IP addresses are displayed in the **Relay Destination list** field.
- Per-interface DHCP Relay for services is disabled by default. When this mode is enabled, destination IP addresses are configured for specific interfaces. The **Relay Destination list** displays these IP addresses along with the name of the IP interface associated with each address.

Examples

```
-> show ip dhcp relay interface
IP DHCP Relay :
  DHCP Relay Admin Status      = Enable,
  Forward Delay(seconds)      = 0,
  Max number of hops          = 16,
  Relay Agent Information Policy = Drop,
  DHCP Opt82 Format            = Base MAC,
  DHCP Opt82 String           = 2c:fa:a2:13:e4:02,
  PXE support                  = Disabled,
  Relay Mode                   = Global,
  Bootup Option                = Disable,
  Relay Destination list (Global Mode):
    From Interface Any to Server 128.100.16.1
```

```
-> ip dhcp relay per-interface-mode
```

```
-> show ip dhcp relay interface
IP DHCP Relay :
  DHCP Relay Admin Status      = Enable,
  Forward Delay(seconds)      = 0,
  Max number of hops          = 16,
  Relay Agent Information Policy = Drop,
  DHCP Opt82 Format            = Base MAC,
```

```

DHCP Opt82 String          = 2c:fa:a2:13:e4:02,
PXE support                = Disabled,
Relay Mode                 = Per Interface,
Bootup Option              = Disable,
Relay Destination list (Per Interface Mode):
  From Interface ipvpn1 to Server 50.3.3.1

```

output definitions

| | |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Relay Admin Status | The status (Enable or Disable) of DHCP Relay over SPB services. Configured through the ip dhcp relay admin-state command. |
| Forward Delay (seconds) | The current forward delay time. Use the ip helper forward-delay command to change this value. |
| Max number of hops | The current maximum number of hops allowed. Use the ip helper maximum-hops command to change this value. |
| Relay Agent Information Policy | The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field. Configured through the ip helper agent-information policy command. |
| DHCP Opt82 Format | The type of Option-82 information inserted. Configured through the ip helper option-82 format command. |
| DHCP Opt82 String | The Option-82 string based on the specified Option-82 format. |
| PXE support | Specifies the status (Enabled or Disabled) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the ip helper pxe-support command. |
| Relay Mode | Whether DHCP Relay over services is set to operate in the global mode or the per-interface mode. Configured through the ip dhcp relay per-interface-mode command. |
| Bootup Option | Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (Enabled or Disabled). Configured through the ip interface dhcp-client command. |
| Relay Destination list | IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the ip dhcp relay destination command (global mode) or ip dhcp relay interface destination (per-interface mode) to add or remove DHCP server IP addresses from the DHCP Relay configuration. |

Release History

Release 8.5R3; command introduced.

Related Commands

[show ip dhcp relay statistics](#) Displays DHCP Relay statistics collected for the service domain.

MIB Objects

N/A

show ip dhcp relay statistics

Displays DHCP Relay statistics collected for the service domain.

show ip dhcp relay statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- The following DHCP Relay statistics are collected for the service domain:
 - The number of packets DHCP Relay has received.
 - The number of packets dropped due to forward delay, maximum hops, relay agent, and gateway IP violations.
 - Statistics that apply to a specific DHCP server (such as the number of packets transmitted to the server and the number of invalid Option-82 DHCP server packets dropped by the relay agent).
 - The number of packets processed since the last time these statistics were displayed.
- This command applies only to a service-based DHCP Relay configuration, as defined through the **ip dhcp relay** commands.
- Use the [clear ip dhcp relay statistics](#) command to clear all DHCP Relay statistics.

Examples

```
-> show ip dhcp relay statistics
Global Statistics :
  Reception From Client :
    Total Count =      12, Delta =      12
  Forw Delay Violation :
    Total Count =       3, Delta =       3
  Max Hops Violation :
    Total Count =       0, Delta =       0
  Agent Info Violation :
    Total Count =       0, Delta =       0
  Invalid Gateway IP :
    Total Count =       0, Delta =       0
Server Specific Statistics :
  From any IP interface to Server 3.3.0.2
  Tx Server :
    Total Count =       9, Delta =       9
  InvAgentInfoFromServer:
    Total Count =       0, Delta =       0
```

output definitions

| | |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reception From Client | Number of packets DHCP Relay has received from the DHCP client. |
| Forw Delay Violation | Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value. |
| Max Hops Violation | Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value. |
| Agent Info Violation | Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to Drop or a DHCP packet has no Option-82 field and contains a non-zero giaddr. |
| Invalid Gateway IP | Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address. |
| Delta | Total number of packets processed since the last time the DHCP Relay statistics were checked during any user session. |
| Server | DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. |
| Tx Server | Number of packets DHCP Relay has transmitted to the DHCP server. |
| InvAgentInfoFromServer | Number of invalid Option-82 DHCP server packets dropped by the relay agent. |
| Delta | The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session. |

```

ip udp relay port

Enables or disables generic UDP relay for the specified UDP service port. A user-defined or well-known UDP port number is specified with this command.

ip udp relay port *port_num* [**description** *description*]

ip udp relay no port *port_num*

Syntax Definitions

port_num A UDP service port number (for example, 53, 69, 301).
description An optional description for the specified UDP service port.

Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

| parameter | default |
|--------------------|------------|
| <i>description</i> | UDP port # |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable generic UDP relay for the specified port.
- Use the **ip helper** commands to configure functionality for BOOTP/DHCP well-known ports (67/68).

Examples

```
-> ip udp relay port 54
-> ip udp relay port 54 description "Generic UDP Service"
-> ip udp relay no port 54

-> ip udp relay port 69 description "TFTP relay"
-> ip udp relay no port 69
```

```

ip udp relay service

Enables or disables generic UDP relay for the specified UDP service name (NBNS, NBDD, or other well-known UDP ports).

ip udp relay service {**tftp** | **tacacs** | **ntp** | **nbns** | **nbdd** | **dns**} [**description** *description*]

ip udp relay no service {**tftp** | **tacacs** | **ntp** | **nbns** | **nbdd** | **dns**}

Syntax Definitions

| | |
|--------------------|------------------------------------------------------------------------|
| tftp | TFTP well-known port 69. |
| tacacs | TACACS well-known port 65. |
| ntp | NTP well-known port 123. |
| nbns | NBNS well-known ports 137. |
| nbdd | NBDD well-known port 138. |
| dns | DNS well-known port 53. |
| <i>description</i> | An optional description for the specified UDP well-known service port. |

Defaults

| parameter | default |
|--------------------|-------------------------|
| <i>description</i> | service name and port # |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The *description* parameter is used with any of the **service** keywords and provides a user-defined description to identify the port service.
- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

Examples

```
-> ip udp relay service dns
-> ip udp relay service dns description dns_1
-> ip udp relay no service dns
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| ip udp relay vlan | Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded. |
| ip udp relay svc | Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP service port is forwarded |
| ip udp relay address | Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets. |
| show ip udp relay | Displays the current configuration for UDP services by service name or by service port number. |

MIB Objects

```
genericUdpServiceTable  
  genericUdpServiceUdpPort  
  genericUdpServiceDescription  
  genericUdpServiceRowStatus
```

ip udp relay vlan

Specifies a VLAN on which traffic destined for the specified UDP service port is forwarded.

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num [description description]}
vlan vlan_id[-vlan_id2]
```

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num} no vlan vlan_id[-vlan_id2]
```

Syntax Definitions

| | |
|-------------------------------------|--------------------------------------------------------------------|
| tftp | TFTP well-known port 69. |
| tacacs | TACACS well-known port 65. |
| ntp | NTP well-known port 123. |
| nbns | NBNS well-known ports 137. |
| nbdd | NBDD well-known port 138. |
| dns | DNS well-known port 53. |
| <i>port_num</i> | A user-defined port number. |
| <i>description</i> | A description of the UDP service. |
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN ID number. Use a hyphen to specify a range of VLAN IDs (3-5). |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

Examples

```
-> ip udp relay service DNS vlan 10
-> ip udp relay service DNS vlan 500-550
-> ip udp relay service DNS no vlan 10
-> ip udp relay port 3047 vlan 20
-> ip udp relay port 3047 no vlan 20
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------|
| ip udp relay port | Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers. |
| ip udp relay service | Enables or disables generic UDP relay for well-known UDP service names. |
| ip udp relay svc | Specifies a Shortest Path Bridging (SPB) service on which traffic destined for the specified UDP port is forwarded |
| ip udp relay address | Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets. |
| show ip udp relay | Displays the current configuration for UDP services by service name or by service port number. |

MIB Objects

```
genericUdpServiceDstTable  
  genericUdpServicePort  
  genericUdpServiceDstVlan  
  genericUdpServiceDstTblRowStatus
```

ip udp relay svc

Specifies a Shortest Path Bridging (SPB) service on which traffic destined for a UDP port is forwarded.

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num [description description]}
svc service_id[-service_id2]
```

```
ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num} no svc service_id[-service_id2]
```

Syntax Definitions

| | |
|-------------------------------------------|------------------------------------------------------------------------------|
| tftp | TFTP well-known port 69. |
| tacacs | TACACS well-known port 65. |
| ntp | NTP well-known port 123. |
| nbns | NBNS well-known ports 137. |
| nbdd | NBDD well-known port 138. |
| dns | DNS well-known port 53. |
| <i>port_num</i> | A user-defined port number. |
| <i>description</i> | A description of the UDP service. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID number. Use a hyphen to specify a range of service IDs (3-5). |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the SPB service association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.

Examples

```
-> ip udp relay service DNS svc 10
-> ip udp relay service DNS svc 50-55
-> ip udp relay service DNS no svc 10
-> ip udp relay port 3047 svc 20
-> ip udp relay port 3047 no svc 20
```

Release History

Release 8.5R4; command introduced.

Related Commands

| | |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------|
| ip udp relay port | Enables or disables generic UDP relay for user-defined or well-known UDP service port numbers. |
| ip udp relay service | Enables or disables generic UDP relay for well-known UDP service names. |
| ip udp relay vlan | Specifies the VLAN on which traffic destined for the specified UDP port is forwarded. |
| ip udp relay address | Specifies the UDP server IP address to which traffic destined for the specified UDP port is forwarded as unicast packets. |
| show ip udp relay | Displays the current configuration for UDP services by service name or by service port number. |

MIB Objects

```
alaGenericUdpServiceSvcTable  
  alaGenericUdpServiceSvcPort  
  alaGenericUdpServiceDstSvc  
  alaGenericUdpServiceSvcRowStatus
```

ip udp relay address

Specifies the UDP server IP address to which traffic destined for a UDP port is forwarded as unicast packets.

```
ip udp relay {service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num [description description]}
address ip_address
```

```
ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num no address ip_address
```

Syntax Definitions

| | |
|--------------------|-----------------------------------|
| tftp | TFTP well-known port 69. |
| tacacs | TACACS well-known port 65. |
| ntp | NTP well-known port 123. |
| nbns | NBNS well-known ports 137. |
| nbdd | NBDD well-known port 138. |
| dns | DNS well-known port 53. |
| <i>port_num</i> | A user-defined port number. |
| <i>description</i> | A description of the UDP service. |
| <i>ip_address</i> | The IPv4 address of a UDP server. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IP address association with the UDP service port.
- The UDP port must be created before using this command.
- Only one IP address can be configured for a UDP port (multiple IP addresses for the same UDP port is not supported).
- Use the **service** keyword to specify a well-known UDP service name. Use the **port** keyword to specify a user-defined or well-known UDP service port number.
- When the specified UDP port is associated with an IP address, the relay is operating at the Layer 3 level; any attempt to then assign a VLAN or SPB service to that UDP port is blocked. UDP ports associated with a VLAN or SPB service are operating at the Layer 2 level.

Examples

```
-> ip udp relay service dns address 10.2.2.1
-> ip udp relay service tftp address 20.2.2.1
-> ip udp relay service dns no address 10.2.2.1
```

```
-> ip udp relay port 3047 address 10.2.2.1
-> ip udp relay port 3047 address 10.2.2.1

-> ip udp relay port 54 address 30.2.2.1
-> ip udp relay port 54 vlan 200
ERROR: UDP port configured in L3 mode

-> ip udp relay port 64 vlan 200
-> ip udp relay port 64 address 40.2.2.1
ERROR: UDP port configured in L2 mode
```

Release History

Release 8.3.1; command introduced.

```

show ip helper

Displays the current DHCP Relay and Relay Agent Information.

show ip helper

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Displays information for all IP addresses configured.

Examples

```
-> show ip helper
Ip helper :
  Forward Delay(seconds)           = 300,
  Max number of hops                = 5,
  Relay Agent Information           = Enabled,
  Relay Agent Information Policy    = Keep,
  DHCP Opt82 Format                 = Base MAC,
  DHCP Opt82 String                = 2c:fa:a2:13:e4:02,
  PXE support                       = Enabled,
  Forward option                   = standard mode,
  Bootup Option                    = Disable,
  Bootup Packet Option              = DHCP
  Forwarding address list (Standard mode):
    128.100.16.1
```

output definitions

| | |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forward Delay | The current forward delay time (default is three seconds). Use the ip helper forward-delay command to change this value. |
| Max number of hops | The current maximum number of hops allowed (default is four hops). Use the ip helper maximum-hops command to change this value. |
| Relay Agent Information | Indicates the status (Enabled or Disabled) of the DHCP relay agent information option feature. Configured through the ip helper agent-information command. |
| Relay Agent Information Policy | The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field. Configured through the ip helper agent-information policy command. |

output definitions

| | |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCP Opt82 Format | The type of option-82 information inserted. Configured through the ip helper option-82 format command. |
| DHCP Opt82 String | The option-82 string based on the specified Option-82 format. |
| PXE support | Specifies the status (Enabled or Disabled) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the ip helper pxe-support command. |
| Forward option | The current forwarding option setting: standard mode . |
| Bootup Option | Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (Enabled or Disabled). Configured through the ip interface dhcp-client command. |
| Bootup Packet Option | Indicates if the Bootup Option broadcasts a DHCP or BOOTP packet to obtain an IP address for default VLAN 1. |
| Forwarding Addresses | IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the ip helper address command to add or remove DHCP server IP addresses from the DHCP Relay configuration. |

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip helper statistics](#) Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
  iphelperService
  iphelperForwAddr
  iphelperForwDelay
  iphelperMaxHops
iphelperAgentInformation
iphelperAgentInformationPolicy
iphelperStatTable
  iphelperBootupOption
  iphelperBootupPacketOption
```

show ip helper statistics

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations. It also displays the number of packets processed since the last time these statistics were displayed. It includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

show ip helper statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no ip helper statistics** command to clear DHCP Relay statistics.

Examples

```
-> show ip helper statistics
```

```
Global Statistics :
  Reception From Client :
    Total Count =      12, Delta =      12,
  Forw Delay Violation :
    Total Count =       3, Delta =       3,
  Max Hops Violation :
    Total Count =       0, Delta =       0,
  Agent Info Violation :
    Total Count =       0, Delta =       0,
  Invalid Gateway IP :
    Total Count =       0, Delta =       0,
Server Specific Statistics :
  From any Vlan to Server 5.5.5.5
  Tx Server :
    Total Count =       9, Delta =       9
  InvAgentInfoFromServer:
    Total Count =       0, Delta =       0
```

output definitions

| | |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reception From Client | Number of packets DHCP Relay has received from the DHCP client. |
| Forw Delay Violation | Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value. |

output definitions (continued)

| | |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Hops Violation | Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value. |
| Agent Info Violation | Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to Drop or a DHCP packet has no Option-82 field and contains a non-zero giaddr. |
| Invalid Gateway IP Server | Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address. |
| Tx Server | DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the ip helper address command to add or remove DHCP server IP addresses from DHCP Relay configuration. |
| Delta | Number of packets DHCP Relay has transmitted to the DHCP server. |
| Invalid Agent Info From Server | The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session. |
| Delta | Number of invalid Option-82 DHCP server packets dropped by the relay agent. |
| Delta | Total number of packets processed since the last time the ip helper statistics were checked during any user session. |

Release History

Release 7.1.1; command introduced.

```

show ip helper option-82 error-count

Displays the Option-82 related error statistics on a per-port and per-VLAN basis.

show ip helper option-82 error-count [**port** *chassis/slot/port* | **vlan** *vlan_id* | **port** *chassis/slot/port* **vlan** *vlan_id*]

no ip helper option-82 error-count [**port** *chassis/slot/port* | **vlan** *vlan_id* | **port** *chassis/slot/port* **vlan** *vlan_id*]

Syntax Definitions

chassis/slot/port The chassis, slot and port number of the interface for which the error count statistics are displayed.

vlan_id The VLAN ID for which the error count statistics are displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to clear all Option-83 error statistics.
- To clear the statistics for a specific port, specify the **port** *chassis/slot/port* with the **no** form of the command.
- To clear the statistics for a specific VLAN, specify the **vlan** *vlan_id* with the **no** form of the command.

Examples

```
-> show ip helper option-82 error-count port 1/1/3
Slot/Port | Vlan ID | Agent Info Violation | Invalid Gateway IP
-----+-----+-----+-----
1/1/3      | 100     | 500                   | 0
1/1/3      | 200     | 0                     | 10
1/1/3      | 1100    | 500                   | 0
1/1/3      | 3100    | 500                   | 0
```

```
-> show ip helper option-82 error-count vlan 100
Slot/Port | Vlan ID | Agent Info Violation | Invalid Gateway IP
-----+-----+-----+-----
1/1/1     | 100     | 400                   | 0
2/1/3     | 100     | 500                   | 0
```

output definitions

| | |
|------------------|---------------------------------------------------------------------------------------|
| Slot/port | The chassis, slot, and port number for which the error count statistics is displayed. |
| Vlan ID | The VLAN ID number associated with the interface. |

output definitions (continued)

| | |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Agent Info Violation | Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to Drop or a DHCP packet has no Option-82 field and contains a non-zero giaddr. |
| Invalid Gateway IP | Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address. |

Release History

Release 8.1.1; command introduced.

Related Commands

| | |

```

show ip udp relay

Displays the generic UDP relay service configuration.

```
show ip udp relay [service {tftp | tacacs | ntp | nbns | nbdd | dns} | port port_num]
```

Syntax Definitions

| | |
|-----------------|-------------------------------------------|
| tftp | TFTP well-known port 69. |
| tacacs | TACACS well-known port 65. |
| ntp | NTP well-known port 123. |
| nbns | NBNS well-known ports 137. |
| nbdd | NBDD well-known port 138. |
| dns | DNS well-known port 53. |
| <i>port_num</i> | A user-defined or well-known port number. |

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-defined or well-known port.

Examples

```
-> show ip udp relay
Service Name      Port   IP Address      Vlans      Services
-----+-----+-----+-----+-----
DNS port          53     40.2.2.1
UDP port 54       54     20.2.2.1
UDP port 55       55
UDP port 56       56
TFTP port         69     200              10
                  200              20

-> show ip udp relay port 54
Service Name      Port   IP Address      Vlans      Services
-----+-----+-----+-----+-----
UDP port 54       54     20.2.2.1

-> show ip udp relay service tftp
Service Name      Port   IP Address      Vlans      Services
-----+-----+-----+-----+-----
TFTP port         69     200              20
```

output definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Name | The active UDP service name. |
| Port | The UDP service port number. |
| IP Address | The destination IP address assigned to the UDP service port. Configured through the ip udp relay address command. |
| Vlans | The destination VLANs assigned to the UDP service port. Configured through the ip udp relay vlan command. |
| Services | The destination Shortest Path Bridging (SPB) service assigned to the UDP service port. Configured through the ip udp relay svc command. |

Release History

Release 7.1.1; command introduced.

Release 8.5R4; **IP Address** and **Services** field added.

Related Commands

show ip udp relay statistics Displays the current statistics for each UDP port relay service.

MIB Objects

N/A

show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLANs, Shortest Path Bridging (SPB) services, or an IP address configured for that service, and the number of packets the service has sent and received.

```
show ip udp relay statistics [service {tftp | tacacs | ntp | nbns | nbdd | dns}] [port [port_num]]
```

Syntax Definitions

| | |
|-----------------|-------------------------------------------------------|
| tftp | TFTP well-known port 69. |
| tacacs | TACACS well-known port 65. |
| ntp | NTP well-known port 123. |
| nbns | NBNS well-known ports 137. |
| nbdd | NBDD well-known port 138. |
| dns | DNS well-known port 53. |
| <i>port_num</i> | A user-defined or well-known UDP service port number. |

Defaults

By default, the statistics for all UDP services is shown.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Enter a UDP service name with the **service** parameter to display information about a specific service.
- Enter a UDP service port number with the **port** parameter to display information about a specific user-define or well-known port.
- Use the **ip udp relay no statistics** command to reset statistics counters.

Examples

```
-> show ip udp relay statistics
Port  Service          Pkts Recvd    Pkts Sent    Dst Vlan/IP Address  Svc
-----+-----+-----+-----+-----+-----
  53  DNS port          0             0             10.1.1.2              10
  54  UDP port 54       0             0              200                   20
  55  UDP port 55       0             0              200                   20
  56  UDP port 56       0             0              200                   20
  56  UDP port 56       0             0              200                   20
  69  TFTP port         0             0              1                     20

```

output definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port | The active UDP port number. |
| Service | The active UDP service name. |
| Pkts Recvd | The number of packets received by this service port from a client. |
| Pkts Sent | The number of packets sent from this service port to the server. |
| Dst Vlan/Ip Address | The VLAN or IP address assigned to the UDP service port that forwards traffic destined for the port. Configured through the ip udp relay vlan or ip udp relay address command. |
| Svc | The SPB service assigned to the UDP service port that forwards traffic destined for the port. Configured through the ip udp relay svc command. |

Release History

Release 7.1.1; command introduced.
 Release 8.5R4; **Dst Vlan/IP Address** and **Svc** fields added.

Related Commands

- show ip udp relay** Displays current configuration for UDP services by service name or by service port number.
- ip udp relay no statistics** Resets all the generic UDP Relay service statistics.

MIB Objects

N/A

no ip helper statistics

Resets the IP helper statistics for the specified VRF instances.

no ip helper statistics [**global-only** | **server-only** | **address** *ip_address* / **vlan** *vlan_id* {**address** *ip_address*}]

Syntax Definitions

| | |
|--------------------|-----------------------------------------------------------------------------------|
| global-only | Specifies that only the global IP helper statistics must be reset. |
| server-only | Specifies that only the IP helper statistics related to the server must be reset. |
| <i>ip_address</i> | Specifies the IP address for the flat mode instance. |
| <i>vlan_id</i> | Specifies the VLAN ID for the per-VLAN mode instance. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command works only for VRF instances.
- To reset all the IP helper related statistics, use this command without the additional keywords.
- To reset the IP helper statistics for the flat mode instance, provide the related IP address with the **address** keyword
- To reset the IP helper statistics for the per-vlan mode instance, provide the VLAN ID with the **vlan** keyword and the related IP address with the **address** keyword.

Examples

```
-> no ip helper statistics
-> no ip helper statistics global-only
-> no ip helper statistics server-only
-> no ip helper statistics address 172.6.5.1
-> no ip helper statistics vlan 20 address 172.6.5.1
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip helper statistics](#) Displays the current statistics for each UDP port relay service.

MIB Objects

```
iphelperStatsTable  
  iphelperResetAllStats  
  iphelperResetSrvStats
```

ip udp relay no statistics

Resets all the generic UDP Relay service statistics.

ip udp relay no statistics

Syntax Definitions

N/A

Defaults

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When this command is applied, the UDP relay statistics are cleared and the **show ip udp relay statistics** command displays no information.

Examples

```
-> ip udp relay no statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

[show ip udp relay statistics](#) Displays the current statistics for each UDP port relay service.

MIB Objects

```
genericUdpServiceTable  
  genericUdpServiceStatReset
```

ipv6 dhcp relay admin-state

Enables or disables the DHCPv6 Relay feature on a per-VRF basis.

ipv6 dhcp relay admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|------------------------------------|
| enable | Enables the DHCPv6 Relay feature. |
| disable | Disables the DHCPv6 Relay feature. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900 , except 6900-C32, 6900-V72

Usage Guidelines

DHCPv6 Relay must be explicitly enabled on the interfaces from which received DHCP client messages are to be relayed.

Examples

```
-> ipv6 dhcp relay admin-state enable
-> ipv6 dhcp relay admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

| | |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| ipv6 dhcp relay interface admin-state | Enables or disables the relay of DHCPv6 client messages received on an interface. |
| show ipv6 dhcp relay | Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay. |

MIB Objects

```
alaDHCPv6Config
  alaDHCPv6RelayAdminStatus
```

ipv6 dhcp relay interface admin-state

Enables or disables the relay of DHCPv6 client messages received on an interface.

```
ipv6 dhcp relay if_name admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------|
| <i>if_name</i> | IPv6 interface name. |
| enable | Enables the relay of DHCPv6 client messages on an interface. |
| disable | Disables the relay of DHCPv6 client messages on an interface. |

Defaults

| parameter | default |
|-------------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

At least one relay destination must be configured before enabling the DHCPv6 relay on an interface.

Examples

```
-> ipv6 dhcp relay int1 admin-state enable
-> ipv6 dhcp relay int1 admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

| | |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| ipv6 dhcp relay destination | Configures the DHCPv6 relay destination. |
| show ipv6 dhcp relay | Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay. |

MIB Objects

```
alaDHCPv6RelayInterfaceTable
  alaDHCPv6RelayInterfaceAdminStatus
```

ipv6 dhcp relay destination

Configures the DHCPv6 relay destination.

ipv6 dhcp relay *if_name* **destination** *ip6_address* *scope_if_name*

no ipv6 dhcp relay *if_name* **destination** *ip6_address* *scope_if_name*

Syntax Definitions

| | |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | IPv6 interface name. |
| <i>ip6_address</i> | The IPv6 address of the relay destination. |
| <i>scope_if_name</i> | Name of the interface for the local-link. This must be specified if the relay destination is a link-local. Not required if the destination address is not a link-local address. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- Maximum five relay destinations can be configured for an interface.
- If the relay destination is a link-local address, the name of the interface used to reach the destination must be specified.
- Use the **no** form of the command to remove the configured DHCPv6 relay destination for an interface.

Examples

```
-> ipv6 dhcp relay int1 destination 2001:DB8:3001::3
-> ipv6 dhcp relay int1 destination fe80::64 int1
-> no ipv6 dhcp relay int1 destination 3001::3
```

Release History

Release 7.3.4; command introduced.

Related Commands

`show ipv6 dhcp relay`

Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayDestinationTable  
  alaDHCPv6RelayDestinationAddressType  
  alaDHCPv6RelayDestinationAddress  
  alaDHCPv6RelayDestinationRowStatus
```

ipv6 dhcp guard

Enables or disables the DHCPv6 Guard on an IPv6 VLAN interface.

```
ipv6 dhcp guard if_name admin-state {enable | disable}
```

```
no ipv6 dhcp guard if_name
```

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The name of the IPv6 interface on which the DHCPv6 Guard is to be configured. |
| enable | Enables the DHCPv6 guard. DHCPv6 messages sent to the DHCPv6 clients are filtered. The DHCPv6 messages are allowed only on the configured trusted ports. |
| disable | Disables the DHCPv6 Guard. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6560, 6860

Usage Guidelines

- It is recommended to configure the ports on which the DHCPv6 messages must be allowed. Configure the trusted ports using the **ipv6 dhcp guard trusted** command to allow DHCPv6 messages only from trusted servers.
- To prevent any DHCPv6 server messages from reaching clients on the VLAN, enable DHCPv6 guard without configuring any trusted ports.
- A maximum of 64 DHCPv6 Guard interfaces can be configured on the switch.
- Use the **no** form of the command to remove the DHCPv6 Guard configuration. It also removes the configured trusted ports for the VLAN.

Examples

```
-> ipv6 dhcp guard v6vlan-23 admin-state enable
-> ipv6 dhcp guard v6vlan-23 admin-state disable
-> no ipv6 dhcp guard v6vlan-23
```

Release History

Release 8.5R2; command introduced.

Related Commands

ipv6 dhcp guard trusted

Configures the DHCPv6 Guard trusted source ports.

show ipv6 dhcp guard

Displays the DHCPv6 Guard configuration for an IPv6 interface.

MIB Objects

```
alaDHCPv6GuardInterfaceTable  
  alaDHCPv6GuardInterfaceEntry  
  alaDHCPv6GuardInterfaceAdminStatus  
  alaDHCPv6GuardInterfaceRowStatus
```

ipv6 dhcp guard trusted

Configures the DHCPv6 Guard trusted source ports.

```
ipv6 dhcp guard if_name trusted [port chassis/slot/port | linkagg id]
```

```
no ipv6 dhcp guard if_name trusted [port chassis/slot/port | linkagg id]
```

Syntax Definitions

| | |
|-------------------------------|-----------------------------------------------------------------------------------------|
| <i>if_name</i> | The name of the IPv6 interface on which the DHCPv6 Guard is configured. |
| port <i>chassis/slot/port</i> | Enter the <i>chassis/slot/port</i> on which the DHCPv6 server messages must be allowed. |
| linkagg <i>id</i> | Enter the linkagg ID on which the DHCPv6 server messages must be allowed. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860

Usage Guidelines

- It is recommended to configure the ports on which the DHCPv6 messages must be allowed. Configure the trusted ports using the **ipv6 dhcp guard trusted** command to allow DHCPv6 messages only from trusted servers.
- To prevent any DHCPv6 server messages from reaching clients on the VLAN, enable DHCPv6 guard without configuring any trusted ports.
- Use the **no** form of the command to remove the DHCPv6 Guard trusted source on the interface.

Examples

```
-> ipv6 dhcp guard v6vlan-23 trusted port 2/1/11
-> ipv6 dhcp guard v6vlan-25 trusted linkagg 7
-> no ipv6 dhcp guard v6vlan-23 trusted port 2/1/11
```

Release History

Release 8.5R2; command introduced.

Related Commands

ipv6 dhcp guard

Enables or disables the DHCPv6 Guard on an IPv6 VLAN interface.

show ipv6 dhcp guard

Displays the DHCPv6 Guard configuration for an IPv6 interface.

MIB Objects

alaDHCPv6GuardTrustedSourceTable

alaDHCPv6GuardTrustedSourceIfIndex

alaDHCPv6GuardTrustedSourceRowStatus

show ipv6 dhcp guard

Displays the DHCPv6 Guard configuration for an IPv6 interface.

show ipv6 dhcp guard [*if_name*]

Syntax Definitions

if_name Displays the DHCPv6 Guard configuration for only the specified IPv6 interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860

Usage Guidelines

- By default, a summary table of information about all interfaces on which DHCPv6 Guard is configured is displayed.
- Specify the interface name (*if_name*) to view the information of DHCPv6 Guard on that specific interface.

Examples

```
-> show ipv6 dhcp guard
```

```
Interface      Status   Trusted Ports
-----+-----+-----
v6vlan-23     enabled
v6vlan-25     disabled agg 7, 2/1/11, 2/1/12, 2/1/13+
```

output definitions

| | |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Displays the interface on which the DHCPv6 Guard is configured. |
| Status | Displays the status of DHCPv6 Guard on the interface. The interfaces on which the DHCPv6 Guard is disabled appear only if one or more ports or linkagg is configured as trusted ports for the interface. |
| Trusted Ports | Displays the DHCPv6 Guard trusted sources for the interface. A '+' will appear at the end of the list to indicate that there are more trusted sources configured which cannot be displayed in a single line. To view the full list of configured trusted sources, specify the interface name in the show command. |

```
-> show ipv6 dhcp guard v6vlan-25
```

```
DHCPv6 Guard = disabled
Trusted sources
  linkagg 7
  2/1/11
  2/1/12
  2/1/13
  2/1/22
```

output definitions

| | |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| DHCPv6 Guard | Displays the status of DHCPv6 Guard on the interface. |
| Trusted sources | Displays the DHCPv6 Guard trusted sources, if any, on the interface. Ports are displayed as chassis/slot/port. Linkaggs are displayed as linkagg ID. |

Release History

Release 8.5R2; command introduced.

Related Commands

| | |
|--------------------------------|-----------------------------------------------------------------|
| ipv6 dhcp guard | Enables or disables the DHCPv6 Guard on an IPv6 VLAN interface. |
| ipv6 dhcp guard trusted | Allows to configure the DHCPv6 Guard trusted source ports. |

MIB Objects

```
alaDHCPv6GuardInterfaceTable
  alaIPv6InterfaceName
  alaDHCPv6GuardInterfaceAdminStatus
  alaDHCPv6GuardTrustedSourceIfIndex
```

show ipv6 dhcp relay

Displays all the interfaces on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

show ipv6 dhcp relay

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

Interfaces on which DHCPv6 relay is disabled and which have no relay destinations configured will not be shown in the output.

Examples

```
-> show ipv6 dhcp relay
```

```
DHCPv6 Relay: Enabled
```

| Interface | Relay Destination(s) | Status |
|-----------|------------------------------------------|----------|
| vlan-41 | ff02::1:2 | Enabled |
| vlan-103 | 2001:dbc8:8003::17 2001:dbc8:8004::99 | Disabled |
| vlan-200 | fe80::cd0:deff:fe28:1ca5 vlan-201 | Enabled |
| tunnel-2 | 2001:dbc8:a23::ea77 | Enabled |

output definitions

| | |
|-----------------------------|------------------------------------------------------------------------|
| DHCPv6 Relay | Specifies if the DHCPv6 Relay feature is enabled in the current VRF. |
| Interface | Displays the interface on which DHCPv6 Relay is enabled. |
| Relay Destination(s) | Displays the configured DHCPv6 Relay destination(s) for the interface. |
| Status | Displays the status of DHCPv6 Relay on the interface. |

Release History

Release 7.3.4; command introduced.

Related Commands

- ipv6 dhcp relay admin-state** Enables or disables the DHCPv6 Relay feature on a per-VRF basis.
- ipv6 dhcp relay interface admin-state** Enables or disables the relay of DHCPv6 client messages received on an interface.
- ipv6 dhcp relay destination** Configures the DHCPv6 relay destination.

MIB Objects

```
alaDHCPv6RelayAdminStatus  
alaDHCPv6RelayInterfaceEntry  
alaDHCPv6RelayDestinationAddress  
alaDHCPv6RelayInterfaceAdminStatus
```

dhcp-server

Enables or disables the DHCP server operation.

dhcp-server {enable | disable}

Syntax Definitions

| | |
|----------------|---------------------------|
| enable | Enables the DHCP server. |
| disable | Disables the DHCP server. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When DHCP server is enabled on the switch, DHCP relay and DHCP snooping will not be supported on the default VRF of the switch.
- DHCP server must be restarted when changes are made to the `dhcpd.conf` or `dhcpd.pcy` file. Use the [dhcp-server restart](#) command to restart the DHCP server.

Examples

```
-> dhcp-server enable
-> dhcp-server disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

| | |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| show dhcp-server leases | Displays the leases offered by the DHCP server. |
| dhcp-server restart | Allows to restart the DHCP server when the <code>dhcpd.conf</code> or <code>dhcpd.pcy</code> file is modified. |
| clear dhcp-server statistics | Clears the statistics of the DHCP server. |

MIB Objects

alaDhcpSrvGlobalConfigStatus

dhcp-server restart

Allows to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

dhcp-server restart

Syntax Definitions

restart Restarts the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The command can be used to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

Examples

```
-> dhcp-server restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show dhcp-server leases

Displays the leases offered by the DHCP server.

show dhcp-server leases [**ip-address** *ip_address* | **mac-address** *mac_address*] [**type** {**static** | **dynamic**}] [**count**]

Syntax Definitions

| | |
|--------------------|---------------------------------------------------------------------|
| <i>ip_address</i> | Specifies IP address of the interface configured with DHCP server. |
| <i>mac_address</i> | Specifies MAC address of the interface configured with DHCP server. |
| static | Displays only static leases. |
| dynamic | Displays only dynamic leases. |
| count | Count of DHCP messages recorded. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

DHCP server should be enabled before using this command.

Examples

```
-> show dhcp-server leases
```

```
Total leases: 8
```

| IP Address | MAC address | Lease Granted | Lease Expiry | Type |

show dhcp-server statistics

Displays the statistics of the DHCP server.

show dhcp-server statistics [packets | hosts | subnets | all]

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| packets | Displays general statistical information along with specific information about data packets received, dropped, and transmitted. |
| hosts | Displays general statistical information along with specific information about leases related to the DHCP server. |
| subnets | Displays general statistical information along with specific information about all the subnets. |
| all | Displays all statistical information related to the DHCP server. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

DHCP server should be enabled before using this command.

output definitions

| | |
|-----------------------------------|------------------------------------------------------------------------------------------------|
| General stats | Denotes general DHCP Server statistics. |
| Name | Specifies the name assigned to the DHCP server. |
| Status | Specifies up or down status of the DHCP server. |
| Total subnets used | Specifies the total number of subnets being used. |
| Total subnets managed | Specifies the total number of subnets being managed by the DHCP server. |
| Total subnets unused | Specifies the total number of subnets being unused. |
| Total subnets full | Specifies the total number of subnets where all the IP addresses are used. |
| DHCP Server System Up Time | Shows the DHCP Server System Up Time Performance Monitor counter. |
| Sync time | Specifies the time for DHCP server to contact and synchronize with the designated time server. |
| Last sync time | Specifies the last time the synchronization occurred. |
| Next sync time | Specifies the next time the synchronization should be scheduled. |
| Packet stats | Denotes statistical information about the data packet transmission. |

output definitions (continued)

| | |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total DHCP Discovers | Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server. |
| Total DHCP Offers | Specifies the total number of DHCPOFFER packets sent by the server to the clients. |
| Total DHCP Requests | Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets. |
| Total DHCP Request Grants | Specifies the total number of DHCP request grants provided by the server to the clients. |
| Total DHCP Request Renewals | Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server. |
| Total DHCP Declines | Specifies the total number of DHCP requests declined by the DHCP server. |
| Total DHCP Acks | Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients. |
| Total DHCP Nacks | Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST. |
| Total DHCP Releases | Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients. |
| Total DHCP Informs | Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server. |
| Total Bootp requests | Specifies the total number of BOOTP requests sent by the clients to the DHCP server. |
| Total Bootp response | Specifies the total number of BOOTP response packets sent by the DHCP server to the clients. |
| Total Unknown packets | Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server. |
| Leases stats | Denotes statistical information about leases provided by the DHCP server. |
| Hosts Managed | Specifies the total number of clients managed by the DHCP server. |
| Hosts used | Specifies the total number of clients using the IP addresses provided by the DHCP server. |
| Hosts unused | Specifies the total number of clients managed by the DHCP server which are not being used. |
| Hosts Pending | Specifies the total number of DHCP IP address requests which are pending by the DHCP server. |
| Hosts unavailable | Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired. |
| Static DHCP | Denotes statistical information about the hosts configured with Static DHCP. |
| Automatic DHCP | Denotes statistical information about the hosts configured with Automatic DHCP. |

output definitions (continued)

| | |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static BootP | Denotes statistical information about the hosts configured under Static BootP. Note: BootP Relay is disabled when DHCP server is enabled on the switch. |
| Automatic BootP | Denotes statistical information about the hosts configured with Automatic BootP. |
| Subnet statistics | Denotes all DHCP related statistical information for individual subnets. |
| Range | Specifies the range of IP addresses in the individual subnet. |
| Mask | Specifies the subnet mask. |
| Type | Specifies whether the type of IP address allocation is dynamic or static. |

Release History

Release 7.3.4; command introduced.

Related Commands

[clear dhcp-server statistics](#) Clears the DHCP Server lease statistics.

MIB Objects

N/A

clear dhcp-server statistics

Clears the packet counters of DHCP server statistics.

`clear dhcp-server statistics`

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to clear the packet counters of DHCP server statistics.

Examples

```
-> clear dhcp-server statistics
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show dhcp-server statistics](#) Displays the DHCP Server lease statistics.

MIB Objects

N/A

dhcpv6-server

Enables or disables the DHCPv6 server operation.

dhcpv6-server {enable | disable}

Syntax Definitions

enable Enables the DHCPv6 server.
disable Disables the DHCPv6 server.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- The dhcpdv6.conf and dhcpdv6.pcy files will be parsed when the DHCPv6 status is enabled for the first time.
- There will be one instance of DHCPv6 for the default VRF.

Examples

```
-> dhcpv6-server enable  
-> dhcpv6-server disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show dhcpv6-server leases Displays the leases offered by the DHCPv6 server.
dhcpv6-server restart Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.
clear dhcpv6-server statistics Displays the statistics of the DHCPv6 server.

MIB Objects

alaDhcpv6SrvGlobalConfigStatus

dhcpv6-server restart

Allows to restart the DHCPv6 server when the dhcpdv6.conf or dhcpdv6.pcy file is modified.

dhcpv6-server restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> dhcpv6-server restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[dhcpv6-server](#) Enables or disables the DHCPv6 server operation.

MIB Objects

```
alaDhcpv6SrvGlobalRestart
```

show dhcpv6-server leases

Displays the leases offered by the DHCPv6 server.

show dhcpv6-server leases [**ip- address** *ipv6_address* | **type** {**static** | **dynamic**}] [**count**]

Syntax Definitions

| | |
|---------------------|------------------------------------------------------------------------|
| <i>ipv6_address</i> | Specifies IPv6 address of the interface configured with DHCPv6 server. |
| static | Displays only static leases. |
| dynamic | Displays only dynamic leases. |
| count | Count of DHCPv6 messages recorded. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-server leases
```

```
Total leases: 8
```

| IP Address | Lease Granted | Pref Lease Expiry | Valid Lease Expiry | Type |
|-------------|----------------------|----------------------|----------------------|---------|
| 2001:100::2 | DEC 15 14:10:59 2009 | DEC 19 01:30:59 2009 | DEC 19 05:30:59 2009 | STATIC |
| 2001:100::3 | DEC 15 14:11:05 2009 | DEC 19 01:31:05 2009 | DEC 19 05:31:05 2009 | DYNAMIC |

  alaDhcpv6SrvLeaseType
```

show dhcpv6-server statistics

Displays the statistics of the DHCPv6 server.

show dhcpv6-server statistics [packets | hosts | subnets | all]

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| packets | Displays general statistical information along with specific information about data packets received, dropped, and transmitted. |
| hosts | Displays general statistical information along with specific information about leases related to the DHCPv6 server. |
| subnets | Displays general statistical information along with specific information about all the subnets. |
| all | Displays all statistical information related to the DHCPv6 server. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

DHCPv6 server should be enabled before using this command.

Examples

```
-> show dhcpv6-server statistics
```

```

| | |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------|
| General | Denotes general DHCPv6 Server statistics. |
| DHCPv6 Server Name | Specifies the name assigned to the DHCPv6 server. |
| DHCPv6 Server Status | Specifies up or down status of the DHCPv6 server. |
| Total subnets used | Specifies the total number of subnets being used. |
| Total subnets managed | Specifies the total number of subnets being managed by the DHCPv6 server. |
| Total subnets unused | Specifies the total number of subnets being unused. |
| Total subnets full | Specifies the total number of subnets where all the IP addresses are used. |
| DHCP Server System Up Time | Shows the DHCPv6 Server System Up Time Performance Monitor counter. |
| Sync time | Specifies the time for DHCPv6 server to contact and synchronize with the designated time server. |
| Last sync time | Specifies the last time the synchronization occurred. |
| Next sync time | Specifies the next time the synchronization should be scheduled. |
| Packet stats | Denotes statistical information about the data packet transmission. |
| Total DHCP Discovers | Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCPv6 server. |
| Total DHCP Offers | Specifies the total number of DHCPOFFER packets sent by the server to the clients. |
| Total DHCP Requests | Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets. |
| Total DHCP Request Grants | Specifies the total number of DHCPv6 request grants provided by the server to the clients. |

output definitions (continued)

| | |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total DHCP Request Renews | Specifies the total number of DHCPv6 lease renew requests sent by the clients to the DHCPv6 server. |
| Total DHCP Declines | Specifies the total number of DHCPv6 requests declined by the DHCPv6 server. |
| Total DHCP Acks | Specifies the total number of DHCPACK acknowledgement packets sent by the DHCPv6 server to the clients. |
| Total DHCP Nacks | Specifies the total number of DHCPv6 Negative acknowledgements sent from the DHCPv6 server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST. |
| Total DHCP Releases | Specifies the total number of DHCPRELEASE packets sent by the DHCPv6 server to release IP addresses from its clients. |
| Total DHCP Informs | Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCPv6 options from the DHCPv6 server. |
| Total Bootp requests | Specifies the total number of BOOTP requests sent by the clients to the DHCPv6 server. |
| Total Bootp response | Specifies the total number of BOOTP response packets sent by the DHCPv6 server to the clients. |
| Total Unknown packets | Specifies the total number of unknown or badly formatted DHCPv6 packets received by the DHCPv6 server. |
| Leases stats | Denotes statistical information about leases provided by the DHCPv6 server. |
| Hosts Managed | Specifies the total number of clients managed by the DHCPv6 server. |
| Hosts used | Specifies the total number of clients using the IP addresses provided by the DHCPv6 server. |
| Hosts unused | Specifies the total number of clients managed by the DHCPv6 server which are not being used. |
| Hosts Pending | Specifies the total number of DHCPv6 IP address requests which are pending by the DHCPv6 server. |
| Hosts unavailable | Specifies the total number of DHCPv6 hosts which are unavailable (for example, hosts whose lease period has expired). |
| Static DHCP | Denotes statistical information about the hosts configured with Static DHCPv6. |
| Automatic DHCP | Denotes statistical information about the hosts configured with Automatic DHCPv6. |
| Static BootP | Denotes statistical information about the hosts configured under Static BootP. Note: BootP Relay is disabled when DHCPv6 server is enabled on the switch. |
| Automatic BootP | Denotes statistical information about the hosts configured with Automatic BootP. |
| Subnet statistics | Denotes all DHCPv6 related statistical information for individual subnets. |
| Range | Specifies the range of IP addresses in the individual subnet. |

output definitions (continued)

| | |
|-------------|---------------------------------------------------------------------------|
| Mask | Specifies the subnet mask. |
| Type | Specifies whether the type of IP address allocation is dynamic or static. |

Release History

Release 7.3.4; command introduced.

Related Commands

[clear dhcpv6-server statistics](#) Clears the DHCPv6 Server lease statistics.

MIB Objects

N/A

clear dhcpv6-server statistics

Clears the packet counters of DHCPv6 server statistics.

```
clear dhcpv6-server statistics
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

Use this command to clear the packet counters of DHCPv6 server statistics.

Examples

```
-> clear dhcpv6-server statistics
```

Release History

Release 7.3.4; command introduced.

Related Commands

[show dhcpv6-server statistics](#) Displays the DHCPv6 Server lease statistics.

MIB Objects

N/A

dhcp-message-service

Enable or disable the message service operation.

dhcp-message-service {enable | disable}

Syntax Definitions

| | |
|----------------|---------------------------------------------------------|
| enable | Enables the operational status of the message service. |
| disable | Disables the operational status of the message service. |

Defaults

By default, the operational status of the message service is disabled.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **conf** and **pcy** files are parsed when message service is enabled.
- There is one instance of the message service for the default VRF in the switch that can be enabled or disabled.

Examples

```
-> dhcp-message-service enable
-> dhcp-message-service disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-message-service restart Restarts the message service after the msgd.conf file is modified.

[show dhcp-snooping](#) Displays the current DHCP Snooping configuration for the switch.

MIB Objects

dhcpSnoopingTable
 dhcpSnoopingMode

dhcp-snooping mac-address-verification

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

dhcp-snooping mac-address-verification admin-state {enable | disable}

Syntax Definitions

enable Enables DHCP MAC address verification for the switch.
disable Disables DHCP MAC address verification for the switch.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.
- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping mac-address-verification admin-state enable  
-> dhcp-snooping mac-address-verification admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[dhcp-snooping admin-state](#) .Globally enables or disables DHCP Snooping for the switch.

MIB Objects

dhcpSnoopingTable
dhcpSnoopingMacAddrVerificationStatus

dhcp-snooping option-82-data-insertion

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

dhcp-snooping option-82-data-insertion admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------|
| enable | Enables inserting the DHCP Option-82 field into DHCP packets. |
| disable | Disables inserting the DHCP Option-82 field into DHCP packets. |

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, Option-82-data-insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

Examples

```
-> dhcp-snooping option-82-data-insertion admin-state enable
-> dhcp-snooping option-82-data-insertion admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

| | |

MIB Objects

dhcpSnoopingTable
 dhcpSnoopingOpt82InsertionStatus

dhcp-snooping bypass option-82-check

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

dhcp-snooping bypass option-82-check admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|----------------------------------------------|
| enable | Bypasses the Option-82 field check. |
| disable | Checks DHCP packets for the Option-82 field. |

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.
- When this feature is enabled, DHCP packets ingressing on untrusted ports are *not* checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.
- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

Examples

```
-> dhcp-snooping bypass option-82-check admin-state enable
-> dhcp-snooping bypass option-82-check admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

MIB Objects

```
dhcpSnoopingTable
  dhcpSnoopingBypassOpt82CheckStatus
```

dhcp-snooping option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 field.

dhcp-snooping option-82 format [**base-mac** | **system-name** | **user-string** *string* / **interface-alias** | **auto-interface-alias** | **ascii** [{ **remote-id** | **circuit-id** } {**base-mac** | **cvlan** | **interface** | **interface-alias** | **system-name** | **user-string** *string* | **vlan** } {**delimiter** *string*}]]

no dhcp-snooping option-82 format ascii {**remote-id** | **circuit-id**}

Syntax Definitions

| | |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| base-mac | The base MAC address of the switch. |
| system-name | The system name of the switch. |
| <i>string</i> | A user defined text string. Supports up to 64 characters. |
| interface-alias | The alias configured for the interface. |
| auto-interface-alias | The switch automatically generates the interface-alias in the following format: SystemName_slot_port. ascii ASCII format. |
| ascii | ASCII format. remote-id circuit-id : Select the sub-id fields of option-82 to configure ASCII. base-mac : The base MAC address of the switch. cvlan : The Customer VLAN ID. interface : The interface name. interface-alias : The alias configured for the interface. system-name : The system name of the switch. user-string : A user defined text string. vlan : The VLAN ID of which the client is a member. <i>string</i> : A user-defined text string. delimiter : The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space). |

Defaults

| parameter | default |
|-----------------------------------------------------------------------------------------------------------------------------------------------|----------|
| user-string <i>string</i> system-name interface-alias base-mac auto-interface-alias ascii | base-mac |
| ascii | base-mac |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a string for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the string “Building B Server” requires quotes because of the spaces between the words.
- The interface-alias parameter will use the alias configured with the interfaces alias command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the interface-alias and auto-interface-alias commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID sub option. Each parameter provided with this command represents a different type of information.
- Configuring the Circuit ID or Remote ID sub option in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- In order for the backward slash “\” delimiter to be parsed correctly it must be entered as “\\”.
- Use the **no** form of this command to remove the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 fields option-82-check admin-state disable.

Examples

```
-> dhcp-snooping option-82 format user-string "Building B Server"  
-> dhcp-snooping option-82 format system-name  
-> dhcp-snooping option-82 format base-mac  
-> dhcp-snooping option-82 format interface-alias  
-> dhcp-snooping option-82 format auto-interface-alias  
-> no dhcp-snooping option-82 format ascii remote-id  
-> no dhcp-snooping option-82 format ascii circuit-id  
-> dhcp-snooping option-82 format ascii circuit-id cvlan cvlan delimiter "\\\""
```

```

dhcp-snooping option-82 policy

Specifies whether to keep, replace, or drop the Option-82 field from DHCP packets entering the switch.

dhcp-snooping option-82 policy [replace | keep | drop]

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------|
| replace | Replaces Option-82 field in the incoming DHCP packets. |
| keep | Keeps Option-82 field in the incoming DHCP packets. |
| drop | Drops the packet with Option-82 in the incoming DHCP packets. |

Defaults

By default, the Option-82 field is replaced in the DHCP packets.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> dhcp-snooping option-82 policy replace
-> dhcp-snooping option-82 policy keep
-> dhcp-snooping option-82 policy drop
```

Release History

Release 8.5R2; command introduced.

Related Commands

| | |

MIB Objects

```
dhcpSnoopingTable
  dhcpSnoopingOption82Policy
```

dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

dhcp-snooping vlan *vlan_id*[-*vlan_id2*] [**mac-address-verification** {**enable** | **disable**}] [**option-82-data-insertion** {**enable** | **disable**}] [**admin-state**]

Syntax Definitions

| | |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | The VLAN identification number. Valid range is 1–4094. Use a hyphen to specify a range of VLANs (10-15). |
| mac-address verification | Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet. |
| option-82 data-insertion | Enables or disables inserting Option-82 information into DHCP packets. |
| admin-state | Enables or disables DHCP snooping feature for specified VLAN. |

Defaults

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

| parameter | default |
|---------------------------------|---------|
| mac-address verification | Enabled |
| option-82 data-insertion | Enabled |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **no** form of this command to disable DHCP Snooping for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- Note that disabling the Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

Examples

```
-> dhcp-snooping vlan 100 admin-state enable
-> dhcp-snooping vlan 100 admin-state disable
-> dhcp-snooping vlan 100 admin-state enable mac-address-verification enable
-> dhcp-snooping vlan 200-205 admin-state enable
-> dhcp-snooping vlan 200-205 admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

```

dhcp-snooping port

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

```
dhcp-snooping port chassis/slot1/port[-port2] {block | client-only | trust}
```

Syntax Definitions

| | |
|---------------------------|--------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot1/port[-port2]</i> | The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). |
| block | Blocks all DHCP traffic on the port. |
| client-only | Allows only DHCP client traffic on the port. |
| trust | Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled. |

Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.
- Use the **dhcp-snooping port** command to display the current trust mode for a port and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping port 1/1/24 trust
-> dhcp-snooping port 1/1/1-10 block
-> dhcp-snooping port 1/1/8 client-only
```

dhcp-snooping linkagg

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

```
dhcp-snooping linkagg agg_id {block | client-only | trust}
```

Syntax Definitions

| | |
|--------------------|----------------------------------------------------------------------------------------------------------------|
| <i>agg_id</i> | The link aggregate ID number. |
| block | Blocks all DHCP traffic on the link aggregate. |
| client-only | Allows only DHCP client traffic on the link aggregate. |
| trust | Allows all DHCP traffic on the link aggregate. The link aggregate behaves as if DHCP Snooping was not enabled. |

Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the [show dhcp-snooping port](#) command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping linkagg 1 trust
-> dhcp-snooping linkagg 2 block
-> dhcp-snooping linkagg 3 client-only
```

Release History

Release 7.3.4; command introduced.

Related Commands

|-------------------------------------------|------------------------------------------------------------|
| dhcp-snooping admin-state | Globally enables or disables DHCP Snooping for the switch. |
| dhcp-snooping vlan | Enables or disables DHCP Snooping on a per-VLAN basis. |

MIB Objects

```
dhcpSnoopingPortTable
  dhcpSnoopingPortIfIndex
  dhcpSnoopingPortTrustMode
```

dhcp-snooping ip-source-filter

Enables or disables the IP source filtering capability at a port, link aggregation, or VLAN level. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

dhcp-snooping ip-source-filter {vlan *vlan_id* | port *chassis/slot/port[-port2]* | linkagg *agg_id*} admin-state {enable | disable}

Syntax Definitions

| | |
|----------------------------|---------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN identification number (1–4094). |
| <i>chassis</i> | The chassis identifier. |
| <i>slot1/port[-port2]</i> | The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8). |
| <i>agg_id</i> | The link aggregate ID number. |
| admin-state enable | Enables IP source filtering for the specified port, link aggregation, or VLAN. |
| admin-state disable | Disables IP source filtering for the specified port, link aggregation, or VLAN level. |

Defaults

By default, IP source filtering is disabled for a port or link aggregate, or VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering command support port ranges, to reduce the number of lines of configuration.
- Source filtering can be enabled as follows:
 - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
 - on all the ports when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping ip-source-filter port 1/1/1 admin-state enable
-> dhcp-snooping ip-source-filter port 1/1/1-5 admin-state enable
-> dhcp-snooping ip-source-filter linkagg 2 admin-state enable
-> dhcp-snooping ip-source-filter vlan 10 admin-state enable
-> dhcp-snooping ip-source-filter vlan 20 admin-state disable
```

Release History

Release 7.3.4; command introduced.
Release 8.5R2; support for port ranges added.

Related Commands

show dhcp-snooping ip-source-filter Displays the ports or VLANs on which IP source filtering is enabled.

MIB Objects

```
dhcpSnoopingPortIpSourceFiltering  
  dhcpSnoopingPortIfIndex  
  dhcpSourceFilterVlanNumber  
  dhcpSourceFilterVlanFilteringStatus
```

dhcp-snooping binding admin-state

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch.

dhcp-snooping binding admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|-------------------------------------------------|
| enable | Enables the creation of binding table entries. |
| disable | Disables the creation of binding table entries. |

Defaults

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.

Examples

```
-> dhcp-snooping binding admin-state disable
-> dhcp-snooping binding admin-state enable
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding timeout Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

dhcp-snooping binding action Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingTable
  dhcpSnoopingBindingStatus
```

dhcp-snooping binding timeout

Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

dhcp-snooping binding timeout *seconds*

Syntax Definitions

seconds The number of seconds to wait before the next save. The valid range is 60–600.

Defaults

By default, the timeout value is set to 300 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- The timeout value is only valid if the DHCP Snooping binding table functionality is enabled.
- The contents of the binding table is saved to the **dhcpBinding.db** file in the **/flash/switch** directory.
- The **dhcpBinding.db** file is time stamped when a save of the binding table contents is successfully completed.

Examples

```
-> dhcp-snooping binding timeout 600  
-> dhcp-snooping binding timeout 250
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding admin-state .Enables or disables the DHCP Snooping binding table functionality.

dhcp-snooping binding action Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingTable  
  iphelperDhcpSnoopingBindingDatabaseSyncTimeout
```

dhcp-snooping binding action

Triggers a purge or renew action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the **dhcpBinding.db** file.

dhcp-snooping binding action {purge | renew}

Syntax Definitions

| | |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| purge | Clears all binding table entries that are maintained in switch memory. |
| renew | Populates the binding table with entries saved in the dhcpBinding.db file located in the /flash/switch directory on the switch. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpBinding.db** file on the switch. Use the **purge** and **renew** options available with this command to sync the binding table contents with the contents of the **dhcpBinding.db** file.

Examples

```
-> dhcp-snooping binding action purge
-> dhcp-snooping binding action renew
```

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping binding admin-state .Enables or disables the DHCP Snooping binding table functionality.

dhcp-snooping binding timeout Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

dhcpSnoopingBindingDatabaseAction

dhcp-snooping binding persistency

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

dhcp-snooping binding persistency admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|---------------------------------------------|
| enable | Enables DHCP Snooping binding persistency. |
| disable | Disables DHCP Snooping binding persistency. |

Defaults

By default, DHCP Snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- With this option disabled, the entry will be removed if the MAC address is missing from the MAC address table when the database is synchronized.
- Use the [show dhcp-snooping](#) command to display the current status.

Examples

```
-> dhcp-snooping binding persistency admin-state enable
-> dhcp-snooping binding persistency admin-state disable
```

Release History

Release 7.3.4; command introduced.

Related Commands

[dhcp-snooping binding admin-state](#) Enables or disables the DHCP Snooping binding table functionality.

[dhcp-snooping binding timeout](#) Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

dhcpSnoopingBindingPersistencyStatus

dhcp-snooping binding

Creates a static entry in the binding table.

dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

no dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

Syntax Definitions

| | |
|---------------------------|------------------------------------------------------------|
| <i>mac_address</i> | The client MAC address. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot1/port[-port2]</i> | The slot and port number (3/1). |
| <i>ip_address</i> | The IP address that the DHCP server offered to the client. |
| <i>vlan_id</i> | The VLAN identification number (1–4094). |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.
- Use the **no** form of this command to remove a static entry from the DHCP Snooping binding table.

Examples

```
-> dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan 200
-> no dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan
200
```

Release History

Release 7.3.4; command introduced.

Related Commands

- dhcp-snooping binding timeout** Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
- dhcp-snooping binding action** Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.
- show dhcp-snooping binding** Displays the contents of the DHCP Snooping binding table (database).

MIB Objects

 dhcpSnoopingBindingMacAddress
 dhcpSnoopingBindingIfIndex
 dhcpSnoopingBindingIpAddress
 dhcpSnoopingBindingVlan
 dhcpSnoopingBindingRowStatus

show dhcp-snooping

Displays the global DHCP Snooping configuration.

show dhcp-snooping

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> show dhcp-snooping
DHCP Snooping:
DHCP Snooping Status           = Disabled,
DHCP Snooping Bypass Opt82-Check = Disabled,
DHCP Snooping Opt82 Format      = Base MAC,
DHCP Snooping Opt82 string     = e8:e7:32:1e:78:11,
DHCP Snooping Binding DB Status = Disabled,
DHCP Snooping Option-82 Policy  = Replace,
```

output definitions

| | |
|-----------------------------------------|------------------------------------------------------------|
| DHCP Snooping Status | Displays if the administrative status of DHCP Snooping. |
| DHCP Snooping Bypass Opt82-Check | Displays the DHCP Snooping bypass option-82 check status. |
| DHCP Snooping Opt82 Format | Displays the type of option-82 information inserted. |
| DHCP Snooping Opt82 string | Displays the option-82 string. |
| DHCP Snooping Binding DB Status | Displays the DHCP Snooping data base table status. |
| DHCP Snooping Option-82 Policy | Displays the DHCP Snooping option-82 policy configuration. |

Release History

Release 7.3.4; command introduced.

Related Commands

- dhcp-snooping admin-state** Enables or disables DHCP Snooping for the switch.
- dhcp-snooping bypass option-82-check** Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.
- dhcp-snooping option-82 policy** Specifies whether to keep, replace, or drop the Option-82 field from DHCP packets entering the switch.

MIB Objects

dhcpSnoopingTable

dhcpSnoopingOption82FormatType
dhcpSnoopingOption82Policy

show dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

show dhcp-snooping ip-source-filter {vlan | port}

Syntax Definitions

| | |
|-------------|-------------------------------------------------------------|
| vlan | Displays the VLANs on which IP source filtering is enabled. |
| port | Displays the ports on which IP source filtering is enabled. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

Examples

```
-> show dhcp-snooping ip-source-filter port
Slot  IP Src
Port  Filtering
-----+-----
1/7   Enabled
1/12  Enabled
```

output definitions

| | |
|-------------------------|------------------------------------------------------------------------------|
| Slot/Port | Specifies the slot and port number. |
| IP Src Filtering | Specifies if IP source filtering status. Enabled or Disabled . |

```
-> show dhcp-snooping ip-source-filter vlan
Vlan ID IP Src Filtering
-----+-----
10      Enabled
11      Enabled
12      Enabled
13      Enabled
```

output definitions

| | |
|-------------------------|------------------------------------------------------------------------------|
| Vlan ID | VLAN number. |
| IP Src Filtering | Specifies if IP source filtering status. Enabled or Disabled . |

Release History

Release 7.3.4; command introduced.

Related Commands

dhcp-snooping ip-source-filter Enables or disables the IP source filtering at a port, link aggregation, or VLAN level.

MIB Objects

dhcpSnoopingPortIpSourceFiltering
 dhcpSnoopingPortIfIndex
 dhcpSourceFilterVlanNumber
 dhcpSourceFilterVlanFilteringStatus

show dhcp-snooping vlan

Displays a list of VLANs that have DHCP Snooping enabled and whether or not MAC address verification and Option-82 data insertion is enabled for each VLAN.

show dhcp-snooping vlan

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the **show dhcp-snooping** command to determine the status of DHCP Snooping at the switch level.

Examples

```
-> show dhcp-snooping vlan
VLAN      Opt82      MAC Addr
ID        Insertion  Verification
-----+-----+-----
50         Enabled    Enabled
60         Enabled    Enabled
100        Disabled   Enabled
200        Enabled    Disabled
1500       Disabled   Disabled
```

output definitions

| | |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID | The VLAN identification number for the DHCP Snooping VLAN. |
| MAC Address Verification | Indicates whether or not MAC address verification is enabled for the VLAN (Enabled or Disabled). Configured through the dhcp-snooping vlan command. |
| Opt-82 Data Insertion | Indicates whether or not Option-82 data insertion is enabled for the VLAN (Enabled or Disabled). Configured through the dhcp-snooping option-82-data-insertion command. |

Release History

Release 7.3.4; command introduced.

Related Commands

[show dhcp-snooping](#)

Displays the current DHCP Snooping configuration.

[show dhcp-snooping port](#)

Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

MIB Objects

dhcpSnoopingVlanTable

 dhcpSnoopingVlanNumber

 dhcpSnoopingVlanMacVerificationStatus

 dhcpSnoopingVlanOpt82DataInsertionStatus

show dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports that are filtered by DHCP Snooping.

show dhcp-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports is displayed.
- If DHCP Snooping is operating at the VLAN level, then information for only those ports that are associated with a DHCP Snooping VLAN is displayed.
- The violation statistics displayed only apply to ports that are in the client only trust mode. When the trust mode for a port is changed from **client-only** to **trusted** or **blocked**, the violation counters are set to zero (0).

Examples

```
-> show dhcp-snooping port
Slot      Trust      IP Src      Opt82      MAC      Server      Relay      Binding
Port      Mode       Filtering  Violation  Violation Violation  Violation  Violation
-----+-----+-----+-----+-----+-----+-----+-----
1/1       Blocked   Disabled    0          0          0          0          0
1/2       Client-Only Enabled    0          0          0          0          0
1/3       Client-Only Enabled    0          0          0          0          0
1/4       Client-Only Enabled    0          0          0          0          0
1/5       Client-Only Enabled    0          0          0          0          0

Release History

Release 8.5R2; command introduced.

Related Commands

[dhcp-snooping clear counters](#) Clears the global counters for DHCP snooping/Relay.

MIB Objects

N/A

dhcp-snooping clear counters

Clears the global and per NI counters for DHCP snooping/Relay.

dhcp-snooping clear counters

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

Use this command to clear the global counters for DHCP snooping/Relay.

Examples

```
-> dhcp-snooping clear counters
```

Release History

Release 8.5R2; command introduced.

Related Commands

[show dhcp-snooping counters](#) Displays the DHCP snooping/Relay global counters. NI counters display the cumulative value from requested NIs.

MIB Objects

N/A

show dhcp-snooping isf-statistics

Displays the IP source filter (ISF) drop counters.

show dhcp-snooping isf-statistics [**vlan** *vlan_id*]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

Use the **vlan** parameter to display counters for a specific VLAN ID.

Examples

```
-> show dhcp-snooping isf-statistics
```

```
Mode: Vlan based ISF
```

```
Chassis Slot Vlan Packets Dropped
```

```
-----+-----+-----+-----
1       1       10         300
1       2       10         400
1       3       11         500
1       4       11         600
```

```
-> show dhcp-snooping isf-statistics vlan 10
```

```
Mode: Vlan based ISF
```

```
Chassis Slot Vlan Packets Dropped
```

```
-----+-----+-----+-----
1       1       10         300
1       2       10         400
```

```
-> show dhcp-snooping isf-statistics
```

```
Mode: Port based ISF
```

```
Chassis Slot Vlan Packets Dropped
```

```
-----+-----+-----+-----
1       1       NA         300
1       2       NA         400
2       1       NA         500
2       2       NA         600
```

N/A

Examples

```
-> dhcp-snooping clear isf-statistics
```

Release History

Release 8.5R2; command introduced.

Related Commands

[show dhcp-snooping isf-statistics](#)

Displays the ISF drop counters.

MIB Objects

N/A

show dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

show dhcp-snooping binding [snapshot] [static | dynamic]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the [dhcp-snooping binding](#) command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

Examples

```
-> show dhcp-snooping binding
      MAC          Slot      IP          Lease   VLAN   Binding
      Address      Port      Address     Time    ID     Type
-----+-----+-----+-----+-----+-----
00:ae:22:e4:00:08  1/4     10.255.11.23  2000    5     Dynamic
10:fe:a2:e4:32:08  2/15    10.255.91.53  2000    2     Dynamic

-> show dhcp-snooping binding snapshot static
dhcp-snooping binding 11:22:33:44:00:00 port 1/1 address 1.1.1.1 vlan 10
dhcp-snooping binding 11:22:33:44:11:11 port 1/2 address 1.1.1.2 vlan 10
dhcp-snooping binding 11:22:33:44:22:22 port 1/3 address 1.1.1.3 vlan 10
dhcp-snooping binding 11:22:33:44:33:33 port 1/4 address 1.1.1.4 vlan 10

-> show dhcp-snooping binding snapshot dynamic
dhcp-snooping binding 11:22:33:44:00:44 port 1/1 address 1.1.1.11 vlan 10
dhcp-snooping binding 11:22:33:44:11:55 port 1/2 address 1.1.1.12 vlan 10
dhcp-snooping binding 11:22:33:44:22:66 port 1/3 address 1.1.1.13 vlan 10
dhcp-snooping binding 11:22:33:44:33:77 port 1/4 address 1.1.1.14 vlan 10
```

output definitions

| | |
|--------------------|-----------------------------------------------------------------------------------------------|
| MAC Address | The MAC address of the client. |
| Slot/Port | The slot/port designation for the switch port that received the DHCP request |
| IP Address | The IP address offered by the DHCP server. |
| Lease Time | The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry. |

output definitions (continued)

| | |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN ID | The VLAN ID of the VLAN to which the client belongs. |
| Binding Type | Indicates whether the binding table entry is dynamic or static . Static entries are created using the dhcp-snooping binding command. |

Release History

Release 7.3.4; command introduced.

Release 8.5R2; **snapshot**, **static**, **dynamic** parameters added.

Related Commands

| | |

```

dhcpv6-snooping vlan admin-state

Enables or disables DHCPv6 Snooping on a per-VLAN basis.

dhcpv6-snooping vlan *vlan_id* admin-state {enable | disable}

no dhcpv6-snooping vlan *vlan_id*

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID on which DHCPv6 Snooping must be enabled or disabled. |
| enable | Enables DHCPv6 Snooping on the specified VLAN. |
| disable | Disables DHCPv6 Snooping on the specified VLAN. |

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- DHCPv6 Snooping can be enabled on per-VLAN or globally on the switch.
- The global DHCPv6 Snooping must be disabled before enabling the per-VLAN DHCPv6 Snooping.
- When DHCPv6 Snooping is configured on a per-VLAN basis, DHCPv6 snooping is limited to a maximum of 64 VLANs.
- DHCPv6 snooping must not be enabled in configurations where a DHCPv6 server assigns multiple addresses to a client. In such situations, only the first address will be stored in the binding table.
- To completely remove DHCPv6 snooping configuration from a VLAN, use the **no** form of the command.

Examples

```
-> dhcpv6-snooping vlan 1 admin-state enable
-> dhcpv6-snooping vlan 1 admin-state disable
-> no dhcpv6-snooping vlan 2
```

Release History

Release 8.5R3; command introduced.

  alaDhCPv6SnoopingInterfaceRowStatus
```

dhcpv6-snooping global admin-state

Enables or disables DHCPv6 Snooping globally on the switch.

dhcpv6-snooping global admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|--------------------------------------------------------------------|
| global | The DHCPv6 Snooping is enabled or disabled globally on the switch. |
| enable | Enables DHCPv6 Snooping for the switch. |
| disable | Disables DHCPv6 Snooping for the switch. |

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- DHCPv6 Snooping can be enabled on per-VLAN or globally on the switch.
- The per-VLAN DHCPv6 Snooping must be disabled before enabling global DHCPv6 Snooping.
- DHCPv6 snooping must not be enabled in configurations where a DHCPv6 server assigns multiple addresses to a client. In such situations only the first address will be stored in the binding table.

Examples

```
-> dhcpv6-snooping global admin-state enable
-> dhcpv6-snooping global admin-state disable
```

Release History

Release 8.5R3; command introduced.

 alaDHCPv6SnoopingInterfaceIndex

 alaDHCPv6SnoopingInterfaceAdminStatus

 alaDHCPv6SnoopingInterfaceRowStatus

dhcpv6-snooping binding

Configures a static entry in the binding table.

```
dhcpv6-snooping binding vlan vlan_id link-local ipv6_address [global-address ipv6_address] [mac-address mac_address] [port chassis/slot/port | linkagg agg_id]
```

```
no dhcpv6-snooping binding vlan vlan_id link-local ipv6_address
```

Syntax Definitions

| | |
|------------------------------|----------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID on which the DHCPv6 client is configured. |
| link-local | The clients link-local IPV6 address. |
| global-address | The IPV6 global unicast address assigned by the DHCPv6 lease server. |
| mac-address | The clients MAC address. |
| port linkagg | The port or link aggregation used to reach the DHCPv6 client. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- When a new binding entry is added or an existing entry is modified using this command, the entry's lease lifetime is changed to indefinite.
- While adding a new binding entry the values for all the parameters must be specified. Else, the binding entry will not be added.
- When a VLAN is deleted, all binding entries on the VLAN including the manually added binding entry is also removed.

Examples

```
-> dhcpv6-snooping binding vlan 1 link-local fe80::eae7:32ff:fea4:6321 global-  
address 2001:db8:1000::2b0:d0ff:fe86:880e mac-address 00:00:01:1d:4f:7d linkagg 1  
-> no dhcpv6-snooping binding vlan 1 link-local fe80::eae7:32ff:fea4:6321
```

Release History

Release 8.5R3; command introduced.

Related Commands

dhcpv6-snooping global admin-state Enables or disables DHCPv6 Snooping globally on the switch.

dhcpv6-snooping vlan admin-state Enables or disables DHCPv6 Snooping on a per-VLAN basis.

show dhcpv6-snooping binding Displays the DHCPv6 Snooping binding table information.

MIB Objects

```
alaIDHCPv6BindingTable
  alaDHCPv6SnoopingInterfaceIndex
  alaDHCPv6BindingLinkLocalAddress
  alaDHCPv6BindingGlobalAddress
  alaDHCPv6BindingPhysAddress
  alaDHCPv6BindingPortIfIndex
```

dhcpv6-snooping binding timeout

Configures the amount of time between each automatic save of the DHCPv6 Snooping binding table contents maintained in memory to a file on the switch.

dhcpv6-snooping binding timeout *seconds*

Syntax Definitions

seconds

The time interval in seconds between automatic save of the DHCPv6 Snooping binding table to file on the switch. The time interval range is 1 to 600 seconds.

Defaults

The default value is 1 second.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

The timeout value is only valid if the DHCPv6 Snooping binding table functionality is enabled.

Examples

```
-> dhcpv6-snooping binding timeout 5
```

Release History

Release 8.5R3; command introduced.

Related Commands

[dhcpv6-snooping binding](#) Configures a static entry in the binding table.

MIB Objects

```
alaDHCPV6BindingConfig  
  alaDHCPv6BindingTimeout
```

dhcpv6-snooping binding action

Allows to manually purge, renew or save the DHCPv6 Snooping binding table.

dhcpv6-snooping binding action {purge | renew | save}

Syntax Definitions

| | |
|--------------|------------------------------------------------------------------------------------------------------|
| purge | Clears the content of the DHCPv6 binding table. |
| renew | Restores the DHCPv6 binding table entries with the previously saved values in the permanent storage. |
| save | Saves the DHCPv6 binding table entries to permanent storage. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- The DHCPv6 Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the file on the switch. Use the purge, renew, and save options available with this command to sync the binding table contents with the contents of the file.
- While using binding table action commands ensure the binding timeout interval is set greater than 10 seconds from the default interval 1 second to avoid quick timeout.

Examples

```
-> dhcpv6-snooping binding action purge
-> dhcpv6-snooping binding action renew
-> dhcpv6-snooping binding action save
```

Release History

Release 8.5R3; command introduced.

Related Commands

- [dhcpv6-snooping binding](#) Configures a static entry in the binding table.

MIB Objects

```
alaDHCPV6BindingConfig
alaDHCPV6BindingAction
```

dhcpv6-snooping binding persistency

Configures whether to retain or not retain the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

dhcpv6-snooping binding persistency {enable | disable}

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable | Enables DHCPv6 Snooping binding persistency. The DHCPv6 Snooping binding table entries will be retained even if the MAC address is deleted from the switch's MAC cache. |
| disable | Disables DHCPv6 Snooping binding persistency. The DHCPv6 Snooping binding table entries will be deleted if the MAC address is deleted from the switch's MAC cache. |

Defaults

By default, DHCPv6 snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- If the binding table is restored from permanent storage when the DHCPv6 Snooping binding persistency is enabled, all entries will be added to the binding table, even if the MAC address is not in the switch's MAC cache.
- If the binding table is restored from permanent storage when the DHCPv6 Snooping binding persistency is disabled, only entries for which there is a corresponding entry in the switch's MAC cache will be restored.
- The binding entries will get deleted upon lease time expiry and also during link down or MAC address deletion unless persistency is enabled on the switch.

Examples

```
-> dhcpv6-snooping binding persistency enable
-> dhcpv6-snooping binding persistency disable
```

Release History

Release 8.5R3; command introduced.

Related Commands

[show dhcpv6-snooping binding](#) Displays the DHCPv6 Snooping binding table information.

MIB Objects

```
alaDHCPV6BindingConfig  
  alaDHCPv6BindingPersistency
```

dhcpv6-snooping ipv6-source-filter

Enables or disables the IPv6 source filtering capability at a port, link aggregation, or VLAN level using the DHCPv6 Snooping binding table.

dhcpv6-snooping ipv6-source-filter {**vlan** *vlan_id* | **port** *chassis/slot/port* | **linkagg** *agg_id*} **admin-state** {**enable** | **disable**}

Syntax Definitions

| | |
|--------------------------|-----------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID on which the IPv6 source filtering needs to be enabled or disabled. |
| <i>chassis/slot/port</i> | The port number on which the IPv6 source filtering needs to be enabled or disabled. |
| <i>agg_id</i> | The linkagg ID on which the IPv6 source filtering needs to be enabled or disabled. |
| enable | Enables IPv6 source filtering for the specified port, link aggregation, or VLAN. |
| disable | Disables IPv6 source filtering for the specified port, link aggregation, or VLAN level. |

Defaults

By default, IPv6 source filtering is disabled on port, link aggregation, or VLAN level.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- DHCPv6 Snooping must be enabled for IPv6 source filtering to be enabled.
- IPv6 source filtering can be enabled per-VLAN or per-port (linkagg).
- If DHCPv6 Snooping is enabled on switch level, then IPv6 source filtering can be enabled on any port, linkagg or VLAN.
- If DHCPv6 Snooping is enabled on VLAN, then IPv6 source filtering can only be enabled on ports which are part of that VLAN, or on the same VLAN.
- If a static host is connected to IPv6 source filtering enabled port or VLAN, then all the packets coming from this host is dropped. A static binding entry must be created to allow the packets coming from this host to pass.

Examples

```
-> dhcpv6-snooping ipv6-source-filter vlan 1 admin-state enable
-> dhcpv6-snooping ipv6-source-filter port 1/1/2 admin-state enable
-> dhcpv6-snooping ipv6-source-filter linkagg 2 admin-state enable
-> dhcpv6-snooping ipv6-source-filter port 1/1/2 admin-state disable
-> dhcpv6-snooping ipv6-source-filter vlan 1 admin-state disable
```

Release History

25 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the IPv4 or IPv6 VRRP routers on the LAN. The VRRP router that controls the IPv4 or IPv6 address associated with a virtual router is called the master router and is responsible for forwarding packets to that IPv4 or IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The OmniSwitch implementation of VRRP also supports the collective management of virtual routers on a switch.

The VRRP commands comply with RFC 3768 for VRRP version 2 (IPv4) and RFC 5798 for VRRP version 3 (IPv4 and IPv6).

MIB information is as follows:

Filename: VRRP-MIB.mib
Module: vrrpMIB

Filename: VRRPV3-MIB.mib

show vrrp group
show vrrp group-association

vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

{ip | ipv6} vrrp vrid interface if_name admin-state [enable | disable] [priority priority] [preempt | no preempt] [accept | no accept] [interval centiseconds] [version {v2 | v3}]

no {ip | ipv6} vrid interface if_name

Syntax Definitions

| | |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip | Configures an IPv4 virtual router. |
| ipv6 | Configures an IPv6 virtual router. |
| <i>vrid</i> | The virtual router ID. The valid range is 1–255. |
| <i>if_name</i> | The name of an existing IPv4 or IPv6 interface on which the virtual router is configured. |
| enable | Enables the virtual router. An IPv4 virtual router may only be enabled if an IP address is configured for the virtual router (not required to enable an IPv6 virtual router). |
| disable | Disables the virtual router. Cannot be combined on the same line with other parameters. |
| <i>priority</i> | The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address. |
| preempt | Specifies that a higher priority router may preempt a lower priority master router. However, the virtual router's actual IP address owner will always preempt another master router regardless of whether preempt is enabled. |
| no preempt | Specifies that a higher priority router may not preempt a lower priority master router. |
| accept | Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. <i>This parameter applies only to IPv4 version 3 and IPv6 virtual routers.</i> |
| no accept | Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. <i>This parameter applies only to IPv4 version 3 and IPv6 virtual routers.</i> |
| <i>centiseconds</i> | The interval in centiseconds after which the master router will send VRRP advertisements. The advertising interval must be the same for all VRRP routers configured with the same VRID. The range is 1–4095 centiseconds in increments of 10 (for example, 10, 20, 30). |
| v2 | Converts an IPv4 VRRP router to a version 2 virtual router. <i>This parameter applies only to IPv4 virtual routers; IPv6 virtual routers are always version 3.</i> |

- v3** Converts an IPv4 VRRP router to a version 3 virtual router. *This parameter applies only to IPv4 virtual routers; IPv6 virtual routers are always version 3.*

Defaults

| parameter | default |
|-----------------------------|----------------|
| enable disable | disable |
| <i>priority</i> | 100 |
| preempt no preempt | preempt |
| accept no accept | accept |
| <i>centiseconds</i> | 100 |
| v2 v3 | v2 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **ip vrrp address** command to configure an IPv4 address for the virtual router. This must be done before the IPv4 virtual router can be enabled (not required to enable an IPv6 virtual router).
- To disable the virtual router, rather than remove it, use the **admin-state disable** option. Note that this option cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- A priority value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 255. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.
- The maximum number of virtual routers supported is based on the 100 centisecond advertising interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval for IPv4 and IPv6 virtual routers
- The advertising interval for IPv4 and IPv6 virtual routers cannot be less than 10 centiseconds and must increment by 10 (for example, 10, 20, 30) up to the maximum allowed.

Examples

```
-> ip vrrp 23 interface ipv4-100 priority 75
-> ip vrrp 23 interface ipv4-100 address 192.168.173.1
-> ip vrrp 23 interface ipv4-100 admin-state enable

-> ip vrrp 23 interface ipv4-100 admin-state disable
-> ip vrrp 23 interface ipv4-100 priority 255
-> ip vrrp 23 interface ipv4-100 admin-state enable

-> no ip vrrp 23 interface ipv4-100

-> ipv6 vrrp 33 interface ipv6-200 priority 75
-> ipv6 vrrp 33 interface ipv6-200 admin-state enable

-> ipv6 vrrp 33 interface ipv6-200 admin-state disable
-> ipv6 vrrp 33 interface ipv6-200 priority 50
-> ipv6 vrrp 33 interface ipv6-200 admin-state enable

-> no ipv6 vrrp 33 interface ipv6-200
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; **interface** and **version** parameter added; *vlan_id* parameter deprecated.

Related Commands

| | |
|------------------------------|-----------------------------------------------------------------------------------------------------|
| vrrp address | Configures an IPv4 or an IPv6 address for a virtual router. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router. |

MIB Objects

```

  alaVrrpv3OperVersion
```

vrrp address

Configures an IPv4 or IPv6 address for a VRRP virtual router.

```
{ip | ipv6} vrrp vrid interface if_name address {ipv4_address | ipv6_address}
```

```
{ip | ipv6} vrrp vrid interface if_name no address {ipv4_address | ipv6_address}
```

Syntax Definitions

| | |
|---------------------|-------------------------------------------------------------------------------------------|
| ip | Configures an IPv4 address for a virtual router. |
| ipv6 | Configures an IPv6 address for a virtual router. |
| <i>vrid</i> | The virtual router ID. The valid range is 1–255. |
| <i>if_name</i> | The name of an existing IPv4 or IPv6 interface on which the virtual router is configured. |
| <i>ipv4_address</i> | The virtual IPv4 address to associate with the specified virtual router. |
| <i>ipv6_address</i> | The virtual IPv6 address to associate with the specified virtual router. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An IPv4 address must be configured for an IPv4 virtual router before the virtual router can be enabled (not required to enable an IPv6 virtual router).

Examples

```
-> ip vrrp 23 interface ipv4-100 address 192.168.173.1
-> ip vrrp 23 interface ipv4-100 address 192.168.173.2
-> ip vrrp 23 interface ipv4-100 no address 192.168.173.1

-> ipv6 vrrp 33 interface ipv6-200 213:100:1::56
-> ipv6 vrrp 33 interface ipv6-200 213:100:1::57
-> ipv6 vrrp 33 interface ipv6-200 no address 213:100:1::56
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; **interface** parameter added; *vlan_id* and optional **ip** parameter deprecated.

Related Commands

| | |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| vrrp | Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router |
| show vrrp statistics | Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router. |

MIB Objects

```
vrrpv3AssociatedIpAddrTable  
  vrrpv3AssociatedIpAddrRowStatus
```

vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

ip vrrp track *track_id* [**admin-state** [enable | disable] | **priority** *priority* | **ipv4-interface** *if_name* / **ipv6-interface** *if_name* | **port** *chassis/slot/port* | **address** *ip_address* [**bfd-state** {enable | disable} | **delay** *seconds*]]

no ip vrrp track *track_id*

Syntax Definitions

| | |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>track_id</i> | The ID of the tracking policy. The valid range is 1–255. |
| admin-state enable | Enables the tracking policy. |
| admin-state disable | Disables the tracking policy. |
| <i>priority</i> | The decrement priority value. A virtual router monitoring this tracking policy will have its priority decremented by this value when the conditional state of the tracking policy entity is down. The valid range is 0–255. |
| <i>if_name</i> | The name of the IPv4 or IPv6 interface that this policy will track. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot/port number that this policy will track. |
| <i>ip_address</i> | The remote IPv4 or IPv6 address that this policy will track. |
| bfd-state enable | Enables Bidirectional Forwarding Detection (BFD) for an address tracking policy. <i>This parameter is not supported on the OmniSwitch 6560.</i> |
| bfd-state disable | Disables BFD for an address tracking policy. <i>This parameter is not supported on the OmniSwitch 6560.</i> |
| <i>seconds</i> | The amount of time to wait after a VRRP address track is detected as operationally up and before the associated virtual router's priority value is incremented by the tracking policy's priority value. The valid range is 0–60 seconds. |

Defaults

| parameter | default |
|-------------------------------------|----------------|
| admin-state enable disable | enable |
| <i>priority</i> | 25 |
| bfd-state enable disable | disable |
| <i>seconds</i> | 0 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **admin-state disable** option to disable the tracking policy, rather than removing it from the switch.
- Registering VRRP with BFD is required at the protocol level before VRRP can interact with BFD. Once VRRP is a registered protocol with BFD, then BFD can be enabled for a specific VRRP address tracking policy.
- Enabling BFD for an address tracking policy requires a Loopback0 interface on the local switch. The IP address of this interface will serve as the source IP address of BFD packets. For more information about configuring a Loopback0 interface, see the “IP Commands” or “IPv6 Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- Configuring the delay time for an IPv4 address or IPv6 address tracking policy helps to prevent the loss of device connectivity that may occur before a virtual router prematurely becomes the master. For example, configuring a delay time allows the switch routing tables to stabilize before the master router resumes the master role.

Examples

```
-> ip vrrp track 2 admin-state enable priority 50 ipv4-interface Marketing
-> ip vrrp track 3 admin-state enable priority 60 ipv6-interface Sales
-> ip vrrp track 2 address 10.1.1.1 bfd-state enable
-> ip vrrp track 3 address 10.1.1.2 delay 30
-> ip vrrp track 4 address 20.1.1.2 bfd-state enable delay 45
-> ip vrrp track 5 address 213:100:1::56 bfd-state enable
-> ip vrrp track 2 address 10.1.1.1 bfd-state disable
-> ip vrrp track 5 address 213:100:1::56 bfd-state disable
-> ip vrrp track 3 admin-state disable
-> no ip vrrp track 2
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **delay** parameter added.

Related Commands

| | |
|----------------------------------------|-------------------------------------------------------------|
| vrrp track-association | Associates a VRRP tracking policy with a virtual router. |
| vrrp bfd-state | Enables or disables the BFD protocol for VRRP. |
| show vrrp track | Displays information about tracking policies on the switch. |

MIB Objects

```
alaVRRPTrackTable  
  alaVrrpTrackId  
  alaVrrpTrackState  
  alaVrrpTrackAdminState  
  alaVrrpTrackPriority  
  alaVrrpTrackEntityType  
  alaVrrpTrackEntityPort  
  alaVrrpTrackEntityIpAddrType  
  alaVrrpTrackEntityIpAddress  
  alaVrrpTrackEntityIpv6Interface  
  alaVrrpTrackEntityInterface  
  alaVrrpTrackBfdStatus  
  alaVrrpTrackDelay  
  alaVrrpTrackRowStatus
```

vrrp bfd-state

Enables or disables the registration of VRRP with the BFD protocol.

```
ip vrrp bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|------------------------|
| enable | Enables BFD for VRRP. |
| disable | Disables BFD for VRRP. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD interaction with VRRP is supported only for VRRP tracking policies that track a remote IP address.
- BFD must be globally enabled for the switch *and* VRRP must be registered with BFD at the protocol level before VRRP can interact with BFD.

Examples

```
-> ip bfd admin-state enable
-> ip vrrp bfd-state enable
-> ip vrrp bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------|----------------------------------------------------------------------------------------------------|
| vrrp track | Configures an address tracking policy. |
| ip bfd admin-state | Enables or disables the global BFD protocol status for the switch. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router |

MIB Objects

```
alaVrrpConfig
  alaVrrpBfdStatus
```

vrrp track-association

Associates an IPv4 or IPv6 VRRP tracking policy with a virtual router.

```
{ip | ipv6} vrrp vrid interface if_name track-association track_id
```

```
{ip | ipv6} vrrp vrid interface if_name no track-association track_id
```

Syntax Definitions

| | |
|-----------------|-----------------------------------------------------------------------------------------------|
| ip | Associates a tracking policy with an IPv4 virtual router. |
| ipv6 | Associates a tracking policy with an IPv6 virtual router. |
| <i>vrid</i> | The virtual router ID. The valid range is 1–255. |
| <i>if_name</i> | The name of an existing IPv4 or IPv6 interface on which the virtual router is configured. |
| <i>track_id</i> | The ID of the tracking policy to associate with the virtual router. The valid range is 1–255. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- The tracking policy ID must already exist in the switch configuration. Use the **vrrp track** command to create a tracking policy.

Examples

```
-> ip vrrp 23 interface ipv4-100 track-association 1
-> ip vrrp 23 interface ipv4-100 no track-association 1

-> ipv6 vrrp 33 interface ipv6-200 track-association 1
-> ipv6 vrrp 33 interface ipv6-200 no track-association 1
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; **interface** parameter added; *vlan_id* parameter deprecated.

Related Commands

| | |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| vrrp | Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router. |
| vrrp track | Configures a VRRP or VRRP3 tracking policy. |
| show vrrp track-association | Displays the tracking policies associated with virtual routers. |

MIB Objects

```
alaVrrp3AssoTrackTable  
  alaVrrp3AssoTrackId  
  alaVrrp3TrackRowStatus
```

vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

ip vrrp delay *seconds*

Syntax Definitions

seconds The amount of time after a reboot that virtual routers will wait before they go active. The valid range is 0–180 seconds.

Defaults

| parameter | default |
|----------------|------------|
| <i>seconds</i> | 45 seconds |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

Examples

```
-> ip vrrp delay 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

vrrp Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

show vrrp Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVRRPConfig
 alaVRRPStartDelay

vrrp version

Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch. The VRRP version for IPv6 virtual routers is not configurable (IPv6 virtual routers support only version 3).

```
ip vrrp version [v2 | v3]
```

Syntax Definitions

| | |
|----|-------------------------------------------------------|
| v2 | Assigns version 2 by default to IPv4 virtual routers. |
| v3 | Assigns version 3 by default to IPv4 virtual routers. |

Defaults

| parameter | default |
|-----------|---------|
| v2 v3 | v2 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default VRRP version will affect the version assigned by default to any new IPv4 virtual routers that are created.
- To apply the new default value to the existing IPv4 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set version** command and enable the virtual routers again.
- If any of the IPv4 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set version** command with the **override** option and enable the virtual routers again.
- There is no interoperability between VRRP version 2 and 3. A version 3 virtual router will not acknowledge version 2 advertisements.

Examples

```
-> ip vrrp version v3
-> ip vrrp version v2

-> ip vrrp admin-state disable
-> ip vrrp set version
-> ip vrrp set version override
-> ip vrrp admin-state enable
```

Release History

Release 8.5R2; command introduced.

Related Commands

vrrp admin-state

Changes the administrative status of all the virtual routers on the switch.

vrrp set

Sets the new default parameter values to existing virtual routers on the switch.

show vrrp

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPv3IPv4Config  
  alaVRRPv3IPv4DefaultVersion
```

vrrp interval

Modifies the default advertising interval value assigned to the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp interval *centiseconds*

Syntax Definitions

| | |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| ip | Modifies the default advertising interval value assigned to IPv4 virtual routers. |
| ipv6 | Modifies the default advertising interval value assigned to IPv6 virtual routers. |
| <i>centiseconds</i> | The default advertising interval for IPv4 or IPv6 virtual routers. The valid range is 1–4095 <i>centiseconds</i> . |

Defaults

| parameter | default |
|---------------------|---------|
| <i>centiseconds</i> | 100 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default value to existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set interval** or **ipv6 vrrp set interval** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set interval** or **ipv6 vrrp set interval** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp interval 50
-> ip vrrp admin-state disable
-> ip vrrp set interval
-> ip vrrp set interval override
-> ip vrrp admin-state enable

-> ipv6 vrrp interval 75
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set interval
-> ipv6 vrrp set interval override
-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added.

```

vrrp priority

Modifies the default priority value assigned to the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp priority *priority*

Syntax Definitions

| | |
|-----------------|--------------------------------------------------------------------------------------------|
| ip | Modifies the default priority value assigned to IPv4 virtual routers. |
| ipv6 | Modifies the default priority value assigned to IPv6 virtual routers. |
| <i>priority</i> | The default priority value for the IPv4 or IPv6 virtual routers. The valid range is 1–255. |

Defaults

| parameter | default |
|-----------------|---------|
| <i>priority</i> | 100 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set priority** or **ipv6 vrrp set priority** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set priority** or **ipv6 vrrp set priority** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp priority 50
-> ip vrrp admin-state disable
-> ip vrrp set priority
-> ip vrrp set priority override
-> ip vrrp admin-state enable

-> ipv6 vrrp priority 75
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set priority
-> ipv6 vrrp set priority override
-> ipv6 vrrp admin-state enable
```

alaVRRPv3IPv6Config

 alaVRRPv3IPv6DefaultPriority

vrrp preempt

Modifies the default preempt mode assigned to the IPv4 or IPv6 virtual routers on the switch.

```
{ip | ipv6} vrrp [preempt | no preempt]
```

Syntax Definitions

| | |
|-------------------|----------------------------------------------------------------------------------------------------|
| ip | Modifies the default preempt mode assigned to IPv4 virtual routers. |
| ipv6 | Modifies the default preempt mode assigned to IPv6 virtual routers. |
| preempt | Specifies that a higher priority router may preempt a lower priority master router by default. |
| no preempt | Specifies that a higher priority router may not preempt a lower priority master router by default. |

Defaults

| parameter | default |
|----------------------|---------|
| preempt no preempt | preempt |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set preempt** or **ipv6 vrrp set preempt** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set preempt** or **ipv6 vrrp set preempt** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp preempt
-> ip vrrp no preempt

-> ip vrrp admin-state disable
-> ip vrrp set preempt
-> ip vrrp set preempt override
-> ip vrrp admin-state enable

-> ipv6 vrrp preempt
-> ipv6 vrrp no preempt
```

```
-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set preempt
-> ipv6 vrrp set preempt override
-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added.

Related Commands

| | |
|----------------------------------|-----------------------------------------------------------------------------------------------------|
| vrrp admin-state | Changes the administrative status of all the virtual routers on the switch. |
| vrrp set | Sets the new default parameter values to existing virtual routers on the switch. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router. |

MIB Objects

```
alaVRRPv3IPv4Config
  alaVRRPv3IPv4DefaultPreemptMode
alaVRRPv3IPv6Config
  alaVRRPv3IPv6DefaultPreemptMode
```

vrrp accept

Modifies the default accept mode assigned to the IPv4 (version 3) or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp [accept | no accept]

Syntax Definitions

| | |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| ip | Modifies the default accept mode assigned to IPv4 virtual routers. |
| ipv6 | Modifies the default accept mode assigned to IPv6 virtual routers. |
| accept | Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. |
| no accept | Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. |

Defaults

| parameter | default |
|--------------------|---------|
| accept no accept | accept |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Modifying the default accept mode will affect the mode assigned by default to any new IPv4 or IPv6 virtual routers that are created.
- To apply the new default accept mode value to the existing IPv4 or IPv6 virtual routers, first disable the virtual routers, then apply the new default value using the **ip vrrp set accept** or **ipv6 vrrp set accept** command and enable the virtual routers again.
- If any of the IPv4 or IPv6 virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set accept** or **ipv6 vrrp set accept** command with the **override** option and enable the virtual routers again.
- The accept mode is not a configurable option for IPv4 virtual routers running VRRP version 2; this command only applies to IPv4 virtual routers running VRRP version 3 and IPv6 virtual routers.

Examples

```
-> ip vrrp accept
-> ip vrrp no accept

-> ip vrrp admin-state disable
-> ip vrrp set accept
-> ip vrrp set accept override
-> ip vrrp admin-state enable
```

```
-> ipv6 vrrp accept
-> ipv6 vrrp no accept

-> ipv6 vrrp admin-state disable
-> ipv6 vrrp set accept
-> ipv6 vrrp set accept override
-> ipv6 vrrp admin-state enable
```

Release History

Release 8.5R2; command was introduced.

Related Commands

alaVRRPv3IPv6Config
  alaVRRPv3IPv6DefaultAcceptMode
```

vrrp admin-state

Changes the administrative status of all the IPv4 or IPv6 virtual routers on the switch.

{ip | ipv6} vrrp admin-state [disable | enable | enable-all]

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip | Changes the administrative status of all IPv4 virtual routers. |
| ipv6 | Changes the administrative status of all IPv6 virtual routers. |
| disable | Disables all the IPv4 or IPv6 virtual routers on the switch. |
| enable | Enables the IPv4 or IPv6 virtual routers that have not previously been disabled individually or collectively through the ip vrrp group all or ipv6 vrrp group all command. |
| enable-all | Enables all the IPv4 or IPv6 virtual routers on the switch including those virtual routers that have been disabled individually or collectively through the ip vrrp group all or ipv6 vrrp group all command. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command changes the administrative status of all the IPv4 or IPv6 virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual IPv4 or IPv6 virtual router.

Examples

```
-> ip vrrp admin-state disable
-> ip vrrp admin-state enable
-> ip vrrp admin-state enable-all

-> ipv6 vrrp admin-state disable
-> ipv6 vrrp admin-state enable
-> ipv6 vrrp admin-state enable-all
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; IPv6 virtual router support added.

Related Commands

| | |
|----------------------|-----------------------------------------------------------------------------------------------------|
| vrrp version | Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch. |
| vrrp interval | Modifies the default advertising interval value assigned to the virtual routers on the switch. |
| vrrp priority | Modifies the default priority value assigned to the virtual routers on the switch. |
| vrrp preempt | Modifies the default preempt mode assigned to the virtual routers on the switch. |
| vrrp accept | Modifies the default accept mode assigned to the virtual routers on the switch. |
| vrrp set | Sets the new default parameter values to existing virtual routers on the switch. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router. |

MIB Objects

```
alaVRRPv3IPv4Config  
  alaVRRPv3IPv4AdminState  
alaVRRPv3IPv6Config  
  alaVRRPv3IPv6AdminState
```

vrrp set

Applies the global default parameter values to IPv4 or IPv6 virtual routers on the switch. When this command is used, IPv4 or IPv6 virtual routers revert to using the default parameter values.

{ip | ipv6} vrrp set {interval | priority | preempt | accept | version | all | none} [override]

Syntax Definitions

| | |
|-----------------|---------------------------------------------------------------------------------|
| ip | Applies the default parameter values to IPv4 virtual routers. |
| ipv6 | Applies the default parameter values to IPv6 virtual routers. |
| interval | Sets the VRRP advertisement interval value to the default value. |
| priority | Sets the priority value to the default value. |
| preempt | Sets the preempt mode to the default mode. |
| accept | Sets the accept mode to the default mode. |
| version | Sets the VRRP version for IPv4 virtual routers to the default value. |
| all | Sets all the parameters value to the new default value. |
| none | Resets all the parameter values to their default values. |
| override | Overrides the specified parameters configured value with the new default value. |

Defaults

| parameter | default |
|---------------------------------------------------------------|------------|
| interval priority preempt accept version all | all |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- All the IPv4 or IPv6 virtual routers must be disabled before using this command.
- When a new IPv4 or IPv6 virtual router is created, pre-defined default values for the advertising interval, priority, preempt mode, accept mode, and version (IPv4 only) parameters are applied to the new virtual router. These default parameter values are configurable. For example, the **ip vrrp interval** or **ipv6 vrrp interval** command is used to change the default interval value that is applied to IPv4 or IPv6 virtual routers.
- When a default parameter value is changed, however, it is not automatically applied to *existing* virtual routers. To apply default values that have changed to existing virtual routers, do the following:
 - 1 Administratively disable all the virtual routers.
 - 2 Use the **ip vrrp set** or **ipv6 vrrp set** command to apply the changed parameter value.
 - 3 Administratively enable all the virtual routers.

- If any of the IPv4 or IPv6 virtual routers are running with their own individually configured value or group value, then that value takes priority over the default parameter value. To override the configured value with the new default value, first disable the virtual routers, then override the configured value using the **ip vrrp set** or **ipv6 vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> ip vrrp admin-state disable

-> ip vrrp set priority
-> ip vrrp set priority override

-> ip vrrp admin-state enable

-> ipv6 vrrp admin-state disable

-> ipv6 vrrp set interval
-> ipv6 vrrp set interval override

-> ipv6 vrrp admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

Related Commands

| | |
|----------------------------------|-----------------------------------------------------------------------------------------------------|
| vrrp version | Modifies the default VRRP version assigned to the IPv4 virtual routers on the switch. |
| vrrp interval | Modifies the default advertising interval value assigned to the virtual routers on the switch. |
| vrrp priority | Modifies the default priority value assigned to the virtual routers on the switch. |
| vrrp preempt | Modifies the default preempt mode assigned to the virtual routers on the switch. |
| vrrp accept | Modifies the default accept mode assigned to the virtual routers on the switch. |
| vrrp admin-state | Changes the administrative status of all the virtual routers on the switch. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router. |

MIB Objects`alaVRRPv3IPv4Config``alaVRRPv3IPv4SetParam``alaVRRPv3IPv4Override``alaVRRPv3IPv6Config``alaVRRPv3IPv6SetParam``alaVRRPv3IPv6Override`

vrrp group

Creates a new IPv4 or IPv6 virtual router group or modifies the configuration parameters of an existing IPv4 or IPv6 virtual router group.

{ip | ipv6} vrrp group vrgid [interval centiseconds] [priority priority] [preempt | no preempt] [accept | no accept] [version {v2 | v3}]

no {ip | ipv6} vrrp group vrgid

Syntax Definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip | Configures an IPv4 virtual router group. |
| ipv6 | Configures an IPv6 virtual router group. |
| <i>vrgid</i> | The virtual router group ID. The valid range is 1–255. |
| <i>centiseconds</i> | The interval in centiseconds after which the master router will send VRRP advertisements. The valid range is 1–4095 centiseconds. |
| <i>priority</i> | The default priority value for the virtual router group. The valid range is 1–255. |
| preempt | Specifies that a higher priority router may preempt a lower priority master router. |
| no preempt | Specifies that a higher priority router may not preempt a lower priority master router by default. |
| accept | Specifies that the master router, which is not the IP address owner, will accept the packets addressed to the IP address owner as its own. <i>This parameter applies only to IPv4 version3 and IPv6 virtual routers.</i> |
| no accept | Specifies that the master router, which is not the IP address owner, will not accept the packets addressed to the IP address owner as its own. <i>This parameter applies only to IPv4 version3 and IPv6 virtual routers.</i> |
| v2 | Converts an IPv4 VRRP router as a version 2 virtual router. <i>This parameter applies only to IPv4 virtual routers.</i> |
| v3 | Converts an IPv4 VRRP router to a version 3 virtual router. <i>This parameter applies only to IPv4 virtual routers.</i> |

Defaults

| parameter | default |
|-----------------------------|----------------|
| <i>centiseconds</i> | 100 |
| <i>priority</i> | 100 |
| preempt no preempt | preempt |
| accept no accept | accept |
| v2 v3 | v2 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default values to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **ip vrrp group set** or **ipv6 vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their individually configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **ip vrrp group set** or **ipv6 vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

Examples

```
-> ip vrrp group 25 interval 50 priority 50 no preempt version v3
-> no ip vrrp group 25
```

```
-> ipv6 vrrp group 30 interval 200 priority 75 preempt no accept
-> no ipv6 vrrp group 30
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

Related Commands

| | |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------|
| vrrp group admin-state | Changes the administrative status of all the virtual routers in a virtual router group using a single command. |
| vrrp group set | Sets the new modified default value to all the virtual routers in a virtual router group. |
| vrrp group-association | Adds a virtual router to a virtual router group. |
| show vrrp group | Displays the default parameter values for all the virtual router groups or a specific virtual router group. |

MIB Objects

```
alaVrrpv3GroupTable
  alaVrrpv3GroupId
  alaVrrpv3GroupInterval
  alaVrrpv3GroupPriority
  alaVrrpv3GroupPreemptMode
  alaVrrpv3GroupAcceptMode
  alaVrrpv3GroupVersion
  alaVrrpv3GroupRowStatus
```

vrrp group admin-state

Changes the administrative status of all the IPv4 or IPv6 virtual routers in an IPv4 or IPv6 virtual router group using a single command.

{ip | ipv6} vrrp group *vrgid* admin-state [disable | enable | enable-all]

Syntax Definitions

| | |
|-------------------|--------------------------------------------------------------------------------------------------------------------|
| ip | Changes the administrative status of all IPv4 virtual routers in the IPv4 group. |
| ipv6 | Changes the administrative status of all IPv6 virtual routers in the IPv6 group. |
| <i>vrgid</i> | The virtual router group ID. The valid range is 1–255. |
| disable | Disables all the virtual routers in the group. |
| enable | Enables those virtual routers that have not previously been disabled individually in the group. |
| enable-all | Enables all the virtual routers in the group including those virtual routers that have been disabled individually. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If an IPv4 or IPv6 virtual router in a group is disabled on an individual basis, it can only be re-enabled by using the **enable-all** option in this command.
- This command will not affect the ability to change the administrative status of an individual IPv4 or IPv6 virtual router.

Examples

```
-> ip vrrp group 25 admin-state disable
-> ip vrrp group 25 admin-state enable
-> ip vrrp group 25 admin-state enable-all

-> ipv6 vrrp group 30 admin-state disable
-> ipv6 vrrp group 30 admin-state enable
-> ipv6 vrrp group 30 admin-state enable-all
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added.

Related Commands

| | |
|------------------------|------------------------------------------------------------------------------------------------------------------|
| vrrp group | Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group. |
| vrrp group set | Sets the new modified default value to all the virtual routers in a virtual router group. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router. |
| show vrrp group | Displays the default parameter values for all the virtual router groups or a specific virtual router group. |

MIB Objects

alaVrrpv3GroupTable
alaVrrpv3GroupAdminState

vrrp group set

Applies the group default parameter values to all virtual routers in an IPv4 or IPv6 virtual router group. When this command is used, IPv4 or IPv6 virtual routers revert to using the group default parameter values.

```
{ip | ipv6} vrrp group vrgid set [interval | priority | preempt | accept | version | all] [override]
```

Syntax Definitions

| | |
|-----------------|--------------------------------------------------------------------------|
| ip | Applies the default parameter values to IPv4 virtual routers. |
| ipv6 | Applies the default parameter values to IPv6 virtual routers. |
| <i>vrgid</i> | The virtual router group ID, in the range from 1–255. |
| interval | Sets the VRRP advertisement interval value to the default value. |
| priority | Sets the priority value to the default value. |
| preempt | Sets the preempt mode to the default mode. |
| accept | Sets the accept mode to the default mode. |
| version | Sets the VRRP version for IPv4 virtual routers to the default value. |
| all | Sets all the parameters' value to the new default value. |
| override | Overrides the parameter's configured value with the group default value. |

Defaults

| parameter | default |
|--------------------------------------------------------|---------|
| interval priority preempt accept version all | all |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- All the virtual routers in an IPv4 or IPv6 group must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, first disable the virtual router group, then apply the group default value using the **ip vrrp group set** or **ipv6 vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, first disable the virtual router group, then override the configured value by using the **ip vrrp group set** or **ipv6 vrrp group set** command with the **override** option and enable the virtual router group again.

Examples

```
-> ip vrrp group 10 admin-state disable
-> ip vrrp group 10 set priority
-> ip vrrp group 10 set priority override
-> ip vrrp group 10 admin-state disable

-> ipv6 vrrp group 20 admin-state disable
-> ipv6 vrrp group 20 set interval
-> ipv6 vrrp group 20 set interval override
-> ipv6 vrrp group 20 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added; **accept** and **version** parameters added.

Related Commands

| | |
|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| vrrp group | Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group. |
| vrrp group admin-state | Changes the administrative status of all the virtual routers in a virtual router group using a single command. |
| show vrrp | Displays the virtual router configuration for all virtual routers or for a specific virtual router. |
| show vrrp group | Displays the default parameter values for all the virtual router groups or a specific virtual router group. |

MIB Objects

```
alaVrrpv3GroupTable
  alaVrrpv3GroupSetParam
  alaVrrpv3GroupOverride
```

vrrp group-association

Adds an IPv4 or IPv6 virtual router to an IPv4 or IPv6 virtual router group.

```
{ip | ipv6} vrrp vrid interface if_name group-association vrgid
```

```
{ip | ipv6} vrrp vrid interface if_name no group-association vrgid
```

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------------------------------------|
| ip | Adds an IPv4 virtual router to an IPv4 virtual router group. |
| ipv6 | Adds an IPv6 virtual router to an IPv6 virtual router group. |
| <i>vrid</i> | The virtual router ID. The valid range is 1–255. |
| <i>if_name</i> | The name of an existing IPv4 or IPv6 interface on which the virtual router is configured. |
| <i>vrgid</i> | An existing virtual router group ID. The valid range is 1–255. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the IPv4 or IPv6 virtual router from the virtual router group.
- It is not necessary to disable an IPv4 or IPv6 virtual router before adding the virtual router to a group. However, the virtual router will not adopt the group's default parameter values until it is re-enabled.
- It is not necessary to disable an IPv4 or IPv6 virtual router before removing the virtual router from a group.
- Create separate groups for each combination of protocol and version. For example, if IPv4 group 10 specifies VRRP version 2, then only assign IPv4 version 2 virtual routers to group 10.
 - The first virtual router assigned to the group will determine the protocol and version of the group.
 - IPv6 virtual router groups will always be version 3.
 - IPv4 version 3 virtual routers cannot be assigned to a version 2 group and vice versa. However, the version for an IPv4 group can be changed.

Examples

```
-> ip vrrp 25 interface ipv4-100 group-association 10
-> ip vrrp 25 interface ipv4-100 no group-association 10

-> ipv6 vrrp 30 interface ipv6-200 group-association 20
-> ipv6 vrrp 30 interface ipv6-200 no group-association 20
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support and **interface** parameter added; *vlan_id* parameter deprecated.

Related Commands

[show vrrp group-association](#) Displays the virtual routers that are associated with a group.

MIB Objects

alaVrrpv3AssoGroupTable
 alaVrrpv3AssoGroupRowStatus

show vrrp

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

```
show {ip | ipv6} vrrp [vrid]
```

Syntax Definitions

| | |
|-------------|-------------------------------------------------|
| ip | Displays the IPv4 virtual router configuration. |
| ipv6 | Displays the IPv6 virtual router configuration. |
| <i>vrid</i> | The virtual router ID, in the range from 1–255. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show ip vrrp** command to display information about configuration parameters, which may be set through the **ip vrrp** command. Use the **show ip vrrp statistics** command to get information about IPv4 VRRP packets.
- Use the **show ipv6 vrrp** command to display information about configuration parameters, which may be set through the **ipv6 vrrp** command. Use the **show ipv6 vrrp statistics** command to get information about IPv6 VRRP packets.

Examples

```
-> show ip vrrp
VRRP default advertisement interval: 100 centiseconds
VRRP default priority: 100
VRRP default preempt: Yes
VRRP default accept: Yes
VRRP default version: V2
VRRP startup delay: 45 (expired)
VRRP BFD-STATE : Disabled
```

| VRID | Interface Name | IPv4 Address(es) | Version | Admin Status | Priority | Preempt | Accept | Adv. Interval |
|------|----------------|------------------------------|---------|--------------|----------|---------|--------|---------------|
| 10 | ipv4-100 | 192.60.170.2 192.60.170.3 | V2 | Disabled | 100 | Yes | NA | 100 |
| 20 | ipv4-200 | 30.3.3.1 | V2 | Enabled | 100 | Yes | NA | 100 |

```
-> show ip vrrp 10
Virtual Router VRID = 10 on INTERFACE = ipv4-100
Version           = V2
Admin. Status    = Disabled
Priority          = 100
```

```

Preempt      = Yes
Adv. Interval = 100
Virtual MAC  = 00-00-5E-00-01-0A
IP Address(es)
  192.60.170.2
  192.60.170.3

-> show ipv6 vrrp
VRRP default advertisement interval: 100 centiseconds
VRRP default priority: 100
VRRP default preempt: Yes
VRRP default accept: Yes
VRRP startup delay: 50 (expired)
VRRP BFD-STATE : Disabled

```

| VRID | Interface Name | IPv6 Address(es) | Admin Status | Priority | Preempt | Accept | Adv. Interval |
|------|----------------|-------------------------|--------------|----------|---------|--------|---------------|
| 1 | ipv6-100 | fe80::200:5eff:fe00:201 | Enabled | 100 | Yes | Yes | 100 |
| 2 | ipv6-200 | fe80::200:5eff:fe00:202 | Enabled | 100 | Yes | Yes | 100 |
| 3 | ipv6-300 | fe80::200:5eff:fe00:203 | Enabled | 100 | Yes | Yes | 100 |

```

-> show ipv6 vrrp 3
Virtual Router VRID = 3 on INTERFACE = ipv6-300
Version      = V3
Admin. Status = Enabled
Priority      = 100
Preempt      = Yes
Accept       = Yes
Adv. Interval = 100
Virtual MAC  = 00-00-5E-00-02-36
IP Address(es)
  fe80::200:5eff:fe00:203

```

output definitions

| | |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VRRP default advertisement interval | The default advertising interval for all virtual routers on the switch. Configured through the vrrp interval command. |
| VRRP default priority | The default priority value for all virtual routers on the switch. Configured through the vrrp priority command. |
| VRRP default preempt | The default preempt mode for all virtual routers on the switch. Configured through the vrrp preempt command. |
| VRRP default accept | The default accept mode for all virtual routers on the switch. Configured through the vrrp accept command. |
| VRRP default version | The default VRRP version assigned to all IPv4 virtual routers. IPv6 virtual routers support only version 3. Configured through the vrrp version command. |
| VRRP startup delay | The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the vrrp delay command. |
| VRRP BFD-STATUS | Indicates whether or not (Enabled or Disabled) VRRP is registered to interact with the Bidirectional Forwarding Detection (BFD) protocol. Configured through the vrrp bfd-state command. |

output definitions (continued)

| | |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VRID | Virtual router identifier. Configured through the vrrp command. |
| Interface Name | The IPv4 or IPv6 interface associated with the VRRP instance. Configured through the vrrp command. |
| IPv4 Address(es) IPv6 Address(es) | The assigned IPv4 or IPv6 addresses. Configured through the vrrp address command. |
| Version | The VRRP version assigned to the virtual router (V2 or V3). Configured for IPv4 virtual routers through the vrrp command. This value is always set to V3 for IPv6 virtual routers. |
| Admin Status | The administrative status of this virtual router instance (Enabled allows the virtual router instance to operate; Disabled disables the virtual router instance without deleting it). Configured through the vrrp command. |
| Priority | Indicates the VRRP router's priority for the virtual router. Configured through the vrrp command. |
| Preempt | Indicates whether or not (Yes or No) a higher priority virtual router will preempt a lower priority master router: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if it is available. Configured through the vrrp command. |
| Accept | Indicates whether or not (Yes or No) a master router that is not the IP address owner will accept packets addressed to the IP address owner as its own. Configured through the vrrp command. <i>This parameter applies only to IPv4 version 3 and IPv6 virtual routers.</i> |
| Adv. Interval | Indicates the time interval (in centiseconds) between sending advertisement messages. Only the master router sends advertisements. Configured through the vrrp command. |
| Virtual MAC | Displays the virtual MAC address for the virtual router. <ul style="list-style-type: none"> • The first 5 bytes for IPv4 and IPv6 version 3 virtual routers is always 00-00-5E-00-02. • The first 5 bytes for IPv4 version 2 virtual routers is always 00-00-5E-00-01. • The last byte indicates the VRID. |

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; "VLAN" field replaced with "Interface Name" field; "Accept" and "Version" fields added.

Related Commands

[show vrrp statistics](#)

Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```

show vrrp statistics

Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

show {ip | ipv6} [vrid] statistics

Syntax Definitions

ip Displays VRRP packet statistics for IPv4 virtual routers.
ipv6 Displays VRRP packet statistics for IPv6 virtual routers.
vrid The virtual router ID. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **show ip vrrp statistics** command to display information about IPv4 VRRP packets. Use the **show ip vrrp** command to display information about the IPv4 virtual router configuration.
- Use the **show ipv6 vrrp statistics** command to display information about IPv6 VRRP packets. Use the **show ipv6 vrrp** command to display information about the IPv6 virtual router configuration.

Examples

```
-> show ip vrrp statistics
```

```
Checksum Errors :      0,
Version Errors  :      0,
VRID Errors     :      0
```

| VRID | Interface Name | State | UpTime | Become Master | Adv. Rcvd |
|------|----------------|------------|--------|---------------|-----------|
| 1 | ipv4-100 | Master | 378890 | 1 | 0 |
| 2 | ipv4-15 | Backup | 4483 | 0 | 44 |
| 7 | ipv4-200 | Initialize | 0 | 0 | 0 |

```
-> show ipv6 vrrp statistics
```

```
Checksum Errors :      0,
Version Errors  :      0,
VRID Errors     :      0
```

| VRID | Interface Name | State | UpTime | Become Master | Adv. Rcvd |
|------|----------------|--------|--------|---------------|-----------|
| 1 | ipv6-101 | Master | 2983 | 1 | 0 |
| 2 | ipv6-102 | Master | 60675 | 1 | 0 |
| 3 | ipv6-103 | Master | 60675 | 1 | 0 |

output definitions

| | |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Checksum Errors | The total number of VRRP packets received with an invalid checksum value. |
| Version Errors | The total number of VRRP packets received with an invalid version number. |
| VRID Errors | The total number of VRRP packets received with invalid VRIDs. |
| VRID | The virtual router identifier. |
| Interface Name | The name of the IPv4 or IPv6 interface associated with the VRRP instance. |
| State | The operational state of the VRRP router instance: <ul style="list-style-type: none"> • initialize—the interface is either disabled or down, or the startup delay timer has not expired. • backup—this instance is monitoring the availability and state of the master router. • master—this instance is functioning as the master router. |
| UpTime | Time interval (in hundredths of a second) since this virtual router was last initialized. |
| Become Master | The total number of times this virtual router's state has transitioned from backup to master. |
| Adv. Rcvd | The total number of VRRP advertisements received by this instance. |

```
-> show ip vrrp 1 statistics
```

```
Virtual Router VRID = 1 on INTERFACE = ipv4-100,
  State = Master,
  UpTime (1/100th second) = 378890,
  Become master = 1,
  Advertisements received = 0,
  Type errors = 0,
  Advertisement interval errors = 0,
  IP TTL errors = 0,
  IP address list errors = 0,
  Packet length errors = 0,
  Zero priority advertisements sent = 0,
  Zero priority advertisements received = 0,
  New Master Reason = 0,
  Protocol Error Reason = 0,
  Discontinuity Time = 0,
  Refresh Rate (milliseconds) = 1000
```

```
-> show ipv6 vrrp 5 statistics
```

```
Virtual Router VRID = 3 on INTERFACE = ipv6-103,
  State = Master,
  UpTime (1/100th second) = 60675,
  Become master = 1,
  Advertisements received = 0,
  Type errors = 0,
  Advertisement interval errors = 0,
  IP TTL errors = 0,
  IP address list errors = 0,
  Packet length errors = 0,
  Zero priority advertisements sent = 0,
  Zero priority advertisements received = 0,
  New Master Reason = 0,
```

```

Protocol Error Reason           = 0,
Discontinuity Time             = 0,
Refresh Rate (milliseconds)    = 1000

```

output definitions

| | |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VRID | The virtual router identifier. |
| INTERFACE | The name of the IPv4 or IPv6 interface associated with the VRRP instance. |
| State | The operational state of the VRRP router instance: <ul style="list-style-type: none"> • initialize—the interface is either disabled or down, or the startup delay timer has not expired. • backup—this instance is monitoring the availability of the master router. • master—this instance is functioning as the master router. |
| UpTime | Time interval (in hundredths of a second) since this virtual router was last initialized. |
| Become master | The total number of times this virtual router's state has transitioned from backup to master. |
| Advertisements received | The total number of VRRP advertisement packets received by this instance. |
| Type errors | The total number of VRRP packets received with an invalid value in the VRRP type field. |
| Advertisement interval errors | The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router. |
| IP TTL errors | The total number of VRRP packets received with a TTL (Time-To-Live) value other than 255. |
| IP address list errors | The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router. |
| Packet length errors | The total number of VRRP packets received with a length less than the length of the VRRP header. |
| Zero priority advertisements sent | The total number of VRRP advertisements with a priority of 0 sent by the virtual router. |
| Zero priority advertisements received | The total number of VRRP advertisements with a priority of 0 received by the virtual router. |
| New Master Reason | The reason the virtual router transitioned to master state. A value of 0 indicates that the virtual router never transitioned to a master state. |
| Protocol Error Reason | The reason for the last protocol error. A value of 0 indicates that no protocol errors have occurred. |
| Discontinuity Time | Indicates what the system up time value was when one or more of the statistics counters experienced a discontinuity. A value of 0 indicates that no discontinuities have occurred since the last reboot. |
| Refresh Rate (milliseconds) | The minimum polling time interval required to update statistics counters. |

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; “VLAN” field replaced with “Interface Name” field; “New Master Reason”, “Protocol Error Reason”, “Discontinuity Time”, and “Refresh Rate” fields added.

Related Commands

show vrrp track

Displays information about tracking policies on the switch.

```
show ip vrrp track [track_id]
```

Syntax Definitions

track_id The ID of the tracking policy to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

Examples

```
-> show ip vrrp track
```

| Track ID | Policy | Admin State | Oper State | Pri | BFD Status |
|----------|---------------|-------------|------------|-----|------------|
| 1 | PORT 1/1/1 | Enabled | Up | 25 | Enabled |
| 2 | 192.10.150.42 | Enabled | Down | 25 | Disabled |
| 3 | INTF02-01 | Enabled | Up | 25 | Enabled |

```
-> show ip vrrp track 2
```

```
Tracking Policy TRACKID = 2
Policy = 192.10.150.42
Dec. Priority = 25
Admin. Status = Enabled
Oper. Status = Down
BFD Status = Disabled
Delay: 0
```

output definitions

| | |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Track ID | The ID of the tracking policy. |
| Policy | The IP interface, chassis/slot/port, or IP address tracked by the policy. |
| Dec. Priority | The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down. |
| Admin. Status | Whether the tracking policy is administratively Enabled or Disabled . |
| Oper. Status | Indicates whether the operating state of the tracking policy is Up or Down . |

output definitions

| | |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BFD Status | The status (Enabled or Disabled) of Bidirectional Forwarding Detection (BFD) interaction with the VRRP tracking policy. |
| Delay | The amount of time, in seconds, to wait after a VRRP address track is detected as operationally up and before the associated virtual router's priority value is incremented by the tracking policy's priority value. |

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **Delay** field added.

Related Commands

| | |
|---------------------------------------------|------------------------------------------------------------------------|
| vrrp track | Creates a new tracking policy or modifies an existing tracking policy. |
| show vrrp track-association | Displays the tracking policies associated with virtual routers |

MIB Objects

```

show vrrp track-association

Displays the tracking policies associated with virtual routers.

show {ip | ipv6} [vrid] track-association [track_id]

Syntax Definitions

| | |
|-----------------|----------------------------------------------------------------------|
| ip | Displays the tracking policies associated with IPv4 virtual routers. |
| ipv6 | Displays the tracking policies associated with IPv6 virtual routers. |
| <i>vrid</i> | The virtual router ID. The valid range is 1–255. |
| <i>track_id</i> | The ID of the tracking policy to display. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show ip vrrp track-association
      Interface Conf  Cur  Track
VRID  Name      Pri  Pri  ID      Policy      Admin   Oper   Track
-----+-----+-----+-----+-----+-----+-----+-----+-----

      State      State State
      Enabled    Up    25

```

output definitions

| | |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VRID | The virtual router identifier. |
| Interface Name | The name of the IPv4 or IPv6 interface associated with the virtual router. |
| Conf Pri | The priority configured for the virtual router. |
| Cur Pri | The current priority for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise, the current priority will be equal to the configured priority. |
| Track ID | The ID of the tracking policy. |
| Policy | The IPv4 interface, IPv6 interface, port, IPv4 address, or IPv6 address that this policy is tracking. |
| Admin State | The administrative status (Enabled or Disabled) of the tracking policy. |
| Oper State | The operational status (Up or Down) of the tracking policy. |
| Track Pri | The amount to be decremented from the configured virtual router priority when the tracking policy is applied. |

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; "VLAN" field replaced with "Interface Name" field.

Related Commands

| | |

show vrrp group

Displays the default parameter values for all the virtual router groups or for a specific virtual router group.

show {ip | ipv6} vrrp group [*vrgid*]

Syntax Definitions

| | |
|--------------|-----------------------------------------------------------|
| ip | Displays the IPv4 virtual routers that belong to a group. |
| ipv6 | Displays the IPv6 virtual routers that belong to a group. |
| <i>vrgid</i> | The virtual router group ID, in the range from 1–255. |

Defaults

By default, the default parameter values are displayed for all the virtual router groups.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *vrgid* parameter with this command to display the default values for a specific virtual router group.

Examples

```
-> show ip vrrp group
Group  Adv          Preempt  Accept
  ID   Interval  Priority  Mode     Mode     Version
-----+-----+-----+-----+-----+-----
   10    200         75      Yes     No       V3
   20    150         75      Yes     No       V2
```

```
-> show ip vrrp group 20
Virtual Router Group GROUPID = 20
  Interval = 150
  Priority = 75
  Preempt Mode = Yes
  Accept Mode = No
  Version = V2
  2 Associated Virtual Routers
```

```
-> show ipv6 vrrp group
Group  Adv          Preempt  Accept
  ID   Interval  Priority  Mode     Mode     Version
-----+-----+-----+-----+-----+-----
   30    100         75      Yes     No       V3
   40    125         75      Yes     Yes      V3
```

```
-> show ipv6 vrrp group 30
Virtual Router Group GROUPID = 30
  Interval = 100
  Priority = 75
```

```

Preempt Mode = Yes
Accept Mode = No
Version = V3
2 Associated Virtual Routers

```

output definitions

| | |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group ID | The virtual router group identifier. |
| Adv Interval | The default advertisement time interval, in centiseconds, for the VRRP group. Only the master router sends advertisements. |
| Priority | The default priority value for the VRRP group. |
| Preempt Mode | The default preempt mode (Yes or No) for the VRRP group. |
| Accept Mode | The default accept mode (Yes or No) for the VRRP group. |
| Version | The default VRRP version (V2 or V3) for an IPv4 VRRP group. IPv6 virtual routers support only version 3, so IPv6 VRRP groups are automatically set to V3. |

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added; “Accept Mode” and “Version” parameters added.

Related Commands

| | |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------|
| vrrp group | Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group. |
| vrrp group admin-state | Changes the administrative status of all the virtual routers in a virtual router group using a single command. |

MIB Objects

```

alaVrrpv3GroupTable

  alaVrrpv3GroupInterval
  alaVrrpv3GroupPriority
  alaVrrpv3GroupPreemptMode
  alaVrrpv3GroupAcceptMode
  alaVrrpv3GroupVersion

```

show vrrp group-association

Displays the virtual routers that are associated with a virtual router group.

```
show {ip | ipv6} vrrp group-association [vrgid]
```

Syntax Definitions

| | |
|--------------|-----------------------------------------------------------|
| ip | Displays the IPv4 virtual routers that belong to a group. |
| ipv6 | Displays the IPv6 virtual routers that belong to a group. |
| <i>vrgid</i> | The virtual router group ID, in the range from 1–255. |

Defaults

By default, all virtual router group associations are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the *vrgid* parameter with this command to display the association details of a specific virtual router group.

Examples

```
-> show ip vrrp group-association
                               Interface
GROUPID VRID                   Name                               Version
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
   10    5  ipv4-100                               V2
           6  ipv4-200                               V2
   20   21  ipv4-300                               V3
           22  ipv4-400                               V3
```

```
-> show ip vrrp group-association 20
                               Interface

    30   31  ipv6-500
           32  ipv6-600
                                V3
                                V3
```

output definitions

| | |
|-----------------------|---------------------------------------------------------------|
| GROUPID | The virtual router group identifier. |
| VRID | The virtual router identifier. |
| Interface Name | The IPv4 or IPv6 interface associated with the VRRP instance. |
| Version | The VRRP version for the group (V2 or V3) |

Release History

Release 7.1.1; command was introduced.

Release 8.5R2; IPv6 virtual router support added; “Interface Name” and “Version” fields added; “VLAN” field deprecated.

Related Commands

26 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib

Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-OSPF-MIB.mib

Module: alcatelIND1OSPFMIB

Filename: OSPF-MIB.mib

Module: OSPF

The following is a list of the commands for configuring OSPF:

| | |

ip load ospf

Loads the OSPF software on the router.

ip load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> ip load ospf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaVrConfigTable  
  alaVrConfigOspfStatus
```

ip ospf admin-state

Enables or disables the administration status of OSPF on the router.

```
ip ospf admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|----------------|
| enable | Enables OSPF. |
| disable | Disables OSPF. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

Examples

```
-> ip ospf admin-state enable
-> ip ospf admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
  ospfAdminStat
```

ip ospf asbr

Configures the router as an Autonomous System Border Router (ASBR). A router running multiple protocols or acting as a gateway to other exterior routers is an ASBR.

ip ospf asbr

no ip ospf asbr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Autonomous System Border Routers (ASBRs) are routers that exchange information with routers from another autonomous system (AS).
- The **no** variant of this command removes the ASBR classification of the selected router.

Examples

```
-> ip ospf asbr  
-> no ip ospf asbr
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfAsBdRtr
```

ip ospf exit-overflow-interval

This command sets the overflow interval value.

ip ospf exit-overflow-interval *seconds*

Syntax Definitions

seconds The number of seconds the router waits before attempting to leave the overflow state.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The overflow interval is the time whereby the routing router will wait before attempting to leave the database overflow state; the interval begins upon the routing router's arrival into this state.
- When the routing router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

Example

```
-> ip ospf exit-overflow-interval 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays the OSPF status and general configuration parameters.

MIB Objects

ospfGeneralGroup
ospfExitOverflowInterval

ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

ip ospf extlsdb-limit *limit*

Syntax Definitions

limit The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

Defaults

| parameter | default |
|--------------|---------|
| <i>limit</i> | -1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

Example

```
-> ip ospf extlsdb-limit 25
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

ospfGeneralGroup
ospfExtLsdbLimit

ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

```
ip ospf host ip_address tos tos [metric metric]
```

```
no ip ospf host ip_address tos tos
```

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information. |
| <i>tos</i> | The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time. |
| <i>metric</i> | The cost metric value assigned to the specified host. The valid range is 0 and up. |

Defaults

| parameter | default |
|---------------|---------|
| <i>metric</i> | 0 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.

Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10  
-> no ip ospf host 172.22.2.115 tos 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf host](#)

ospfHostStatus

ospfHostIpAddress

ospfHostTOS

ospfHostMetric

ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ip ospf mtu-checking

no ip ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ip ospf mtu-checking
-> no ip ospf mtu-checking
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
  alaOspfMTUcheck
```

ip ospf default-originate

Configures a default external route into the OSPF routing domain.

```
ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric value]
```

```
no ip ospf default-originate
```

Syntax Definitions

| | |
|---------------|-------------------------------------------------------------------------------------------|
| only | Advertises only when there is a default route in the routing table. |
| always | Advertises the default route regardless of whether the routing table has a default route. |
| type1 | Sets the external route as type1. |
| type2 | Sets the external route as type2. |
| <i>value</i> | The metric value. The valid range is 1-65535. |

Defaults

| parameter | default |
|----------------------|--------------|
| type1 type2 | type2 |
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf

Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfDefaultOriginate  
  alaOspfDefaultOriginateMetricType  
  alaOspfDefaultOriginateMetric
```

ip ospf route-tag

Configures a tag value that is applied to internal routes for potential redistribution.

ip ospf route-tag *tag*

Syntax Definitions

tag The set tag value. The valid range is 0–2147483647.

Defaults

| parameter | default |
|------------|---------|
| <i>tag</i> | 0 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

A 32-bit value tagged to each OSPF internal route that is redistributed into other routing protocol domains. The lower 16-bits typically indicate the autonomous system number.

Example

```
-> ip ospf route-tag 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfRedistRouteTag
```

ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ip ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

Syntax Definitions

| | |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <i>delay_seconds</i> | Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation. |
| <i>hold_seconds</i> | Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations. |

Defaults

| parameter | default |
|----------------------|---------|
| <i>delay_seconds</i> | 5 |
| <i>hold_seconds</i> | 10 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to-back SPF calculations can take place with no break in-between the two.

Example

```
-> ip ospf spf-timer delay 20 hold 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf

Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf  
  alaOspfTimerSpfDelay  
  alaOspfTimerSpfHold
```

ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

ip ospf virtual-link *area_id* *router_id* [**auth-type** {**none** | **simple** | **md5**}] [**auth-key** *key_string*] [**dead-interval** *seconds*] [**hello-interval** *seconds*] [**retrans-interval** *seconds*] [**transit-delay** *seconds*]

no ip ospf virtual-link *area_id* *router_id*

Syntax Definitions

| | |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>router_id</i> | A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System. |
| none | Sets the virtual link authorization type to no authentication. |
| simple | Sets the virtual link authorization type to simple authentication. If simple is selected, a key must be specified as well. |
| md5 | Sets the virtual link authorization type to MD5 authentication. |
| <i>key_string</i> | Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details. |
| dead-interval <i>seconds</i> | Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647. |
| hello-interval <i>seconds</i> | Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535. |
| retrans-interval <i>seconds</i> | Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600. |
| transit-delay <i>seconds</i> | Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600. |

Defaults

| parameter | default |
|------------------------------------------|-------------|
| none simple md5 | none |
| <i>key_string</i> | null string |
| dead-interval <i>seconds</i> | 40 |
| hello-interval <i>seconds</i> | 10 |
| retrans-interval <i>seconds</i> | 5 |
| transit-delay <i>seconds</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf virtual-link](#) Displays the virtual link information.

MIB Objects

```
ospfVirtIfTable
  ospfVirtIfAreaId
  ospfVirtIfNeighbor
  ospfVirtIfAuthKey
  ospfVirtIfStatus
  ospfVirtIfAuthType
  ospfVirtIfRtrDeadInterval
  ospfVirtIfHelloInterval
  ospfVirtIfRetransInterval
  ospfVirtIfTransitDelay
```

ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

```
ip ospf neighbor neighbor_id {eligible | ineligible}
```

```
no ip ospf neighbor neighbor_id
```

Syntax Definitions

| | |
|---------------------|---------------------------------------------------------------------------|
| <i>neighbor_id</i> | A unique 32-bit IP address identical to the neighbor's interface address. |
| eligible | Sets this router as eligible to be the DR. |
| non-eligible | Sets this router as not eligible to be the DR. |

Defaults

| parameter | default |
|-----------------------|----------|
| eligible ineligible | eligible |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

Examples

```
-> ip ospf neighbor 1.1.1.1 ineligible  
-> no ip ospf neighbor 1.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands**ip ospf interface type**

Configures the OSPF interface type.

show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

MIB Objects

ospfNbrTable

ospfNbrPriority

ospfNbmaNbrStatus

ip ospf area

Assigns an OSPF interface to a specified area.

ip ospf area *area_id* [summary {enable | disable}] | [type {normal | stub | nssa}]

no ip ospf area *area_id*

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| enable | Enables summarization. |
| disable | Disables summarization. |
| normal | Sets the area as a regular OSPF area. <i>This parameter is not supported on an OmniSwitch 6560.</i> |
| stub | Configures an OSPF area as a stub area. |
| nssa | Configures an OSPF area as a Not So Stubby Area (NSSA). <i>This parameter is not supported on an OmniSwitch 6560.</i> |

Defaults

| parameter | default |
|----------------------|---------|
| enable disable | enable |
| normal stub nssa | normal |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.
- Consider the following when configuring an OSPF area ID on an OmniSwitch 6560:
 - Only one non-zero stub area is supported (configuring a 0.0.0.0 area ID is not allowed).
 - Only two IP OSPF interfaces can be associated with the area.

Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| ip ospf area default-metric | Creates or deletes an OSPF default metric. |
| ip ospf area range | Creates a route summarization instance whereby a range of addresses will be advertised as a single route. |
| show ip ospf area | Displays either all OSPF areas, or a specified OSPF area. |

MIB Objects

```
ospfAreaTable  
  ospfImportAsExtern  
  ospfAreaSummary  
  ospfAreaId
```

ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

ip ospf area *area_id* **default-metric** *tos* [[**cost** *cost*] | [**type** {**ospf** | **type 1** | **type 2**}]

no ip ospf area *area_id* **default-metric** *tos*

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>tos</i> | Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time. |
| <i>cost</i> | The numerical cost of this area and ToS. Only 0 is supported in the current release. |
| ospf | Advertises external routes as OSPF autonomous system external (ASE) routes. |
| type1 | Advertises external routes as a Type 1 (non-OSPF) metric. |
| type2 | Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric. |

Defaults

| parameter | default |
|-------------------------------|-------------|
| <i>tos</i> | 0 |
| ospf type 1 type 2 | ospf |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS. To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ospfStubAreaTable  
  ospfStubAreaId  
  ospfStubTOS  
  ospfStubStatus  
  ospfStubMetric  
  ospfStubMetricType
```

ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

```
ip ospf area area_id range {summary | nssa} ip_address subnet_mask [effect {admatching | noMatching}]
```

```
no ip ospf area area_id range {summary | nssa} ip_address subnet_mask
```

Syntax Definitions

| | |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| summary | Advertises the address range as a summary link state advertisement (LSA). |
| nssa | Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement. <i>This parameter is not supported on an OmniSwitch 6560.</i> |
| <i>ip_address</i> | A 32-bit IP address for the range's area. |
| <i>subnet_mask</i> | A 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| admatching | Determines that routes specified falling within the specified range will be advertised. |
| noMatching | Determines that any route falling within the specified range will not be advertised. |

Defaults

| parameter | default |
|-------------------------|------------|
| summary nssa | summary |
| admatching noMatching | admatching |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.
- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.

- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------|------------------------------------------------------------|
| ip ospf area | Creates or deletes an OSPF area. |
| ip ospf area default-metric | Creates or deletes an OSPF default metric. |
| show ip ospf area range | Displays all or specified route summaries in a given area. |

MIB Objects

```
ospfAreaAggregateTable
  ospfAreaAggregateAreaId
  ospfAreaAggregateLsdbType
  ospfAreaAggregateNet
  ospfAreaAggregateMask
  ospfAreaAggregateEffect
  ospfAreaAggregateStatus
```

ip ospf interface

Creates and deletes an OSPF interface.

ip ospf interface {*interface_name*}

no ip ospf interface {*interface_name*}

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
  ospfIfIpAddress
alaOspfIfAugTable
  alaOspfIfIntfName
```

ip ospf interface admin-state

Enables or disables the administrative status on an OSPF interface.

```
ip ospf interface {interface_name} admin-state {enable | disable}
```

```
no ip ospf interface {interface_name} admin-state {enable | disable}
```

Syntax Definitions

| | |
|-----------------------|------------------------------|
| <i>interface_name</i> | The name of the interface. |
| enable | Enables the OSPF interface. |
| disable | Disables the OSPF interface. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

Examples

```
-> ip ospf interface vlan-101 admin-state enable
-> ip ospf interface vlan-101 admin-state disable
-> no ip ospf interface vlan-101 admin-state enable
-> no ip ospf interface vlan-101 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfAdminStat

ip ospf interface area

Configures an OSPF area identifier for this interface.

```
ip ospf interface {interface_name} area area_id
```

Syntax Definitions

| | |
|-----------------------|---------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>area_id</i> | A unique 32-bit value in IP address format. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------------------|---------------------------------------------------------------|
| show ip ospf area | Displays either all the OSPF areas, or a specified OSPF area. |
| show ip ospf interface | Displays the status and statistics of an OSPF interface. |

MIB Objects

```
ospfIfTable  
ospfIfAreaId
```

ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

```
ip ospf interface {interface_name} auth-key key_string
```

Syntax Definitions

| | |
|-----------------------|-----------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>key_string</i> | An authentication key (8 characters maximum). |

Defaults

The default for the authentication key string is a null string.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on [page 26-30](#), set to **simple**.

Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------|----------------------------------------------------------|
| ip ospf interface auth-type | Sets the authentication type. |
| show ip ospf interface | Displays the status and statistics of an OSPF interface. |

MIB Objects

```
ospfIfTable  
  ospfIfAuthKey
```

ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

ip ospf interface {*interface_name*} **auth-type** {**none** | **simple** | **md5** | **key-chain** *key-chain-id*}

Syntax Definitions

| | |
|-----------------------|------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| none | No authentication. |
| simple | Simple, clear text authentication. |
| md5 | MD5 encrypted authentication. |
| <i>key-chain-id</i> | The configured keychain ID. |

Defaults

| parameter | default |
|-------------------------------------------------------------|-------------|
| none simple md5 key-chain | none |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on [page 26-29](#).
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conjunction with the commands described on [page 26-34](#) and [page 26-36](#). One command enables MD5 and the other sets the key identification number.
- Use **keychain** to configure a keychain authentication type for an interface. When the OSPF interface receives a packet, the authentication information is carried in the hello packet. If the authentication succeeds, then adjacency is formed. The two remote machines must have the same active current key ID and same authentication type. Use **ip ospf interface auth-type none** to disassociate the keychain from the interface.

Examples

```
-> ip ospf interface vlan-101 auth-type simple
-> ip ospf interface vlan-101 auth-type key-chain 1
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip ospf interface auth-key Sets the password for simple authentication.
show ip ospf interface Displays the status and statistics of an OSPF interface.
show ip ospf interface auth-info Displays authentication information for the interface.

MIB Objects

```
ospfIfTable  
  ospfIfAuthType  
  alaOspfIfKeyChainId
```

ip ospf interface dead-interval

Configures the OSPF interface dead interval.

```
ip ospf interface {interface_name} dead-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The dead interval, in seconds. The valid range is 1–65535.

Defaults

| parameter | default |
|--------------------------------------------------|---------|
| <i>seconds</i> (broadcast and point-to-point) | 40 |
| <i>seconds</i> (NBMA and point-to-multipoint) | 120 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf interface hello-interval](#) Configures the OSPF interface hello interval.

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable  
ospfIfRtrDeadInterval
```

ip ospf interface hello-interval

Configures the OSPF interface hello interval.

```
ip ospf interface {interface_name} hello-interval seconds
```

Syntax Definitions

| | |
|-----------------------|------------------------------------------------------------------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>seconds</i> | The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface. |

Defaults

| parameter | default |
|--------------------------------------------------|---------|
| <i>seconds</i> (broadcast and point-to-point) | 10 |
| <i>seconds</i> (NBMA and point-to-multipoint) | 30 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable  
ospfIfHelloInterval
```

ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

ip ospf interface {*interface_name*} **md5** *key_id* [**enable** | **disable**]

Syntax Definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>key_id</i> | A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255. |
| enable | Enables the interface key. |
| disable | Disables the interface key. |

Defaults

| parameter | default |
|--------------------------------|---------------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on [page 26-30](#) and [page 26-36](#).
- The **no** variant deletes the key ID number.

Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------|----------------------------------------------------------|
| ip ospf interface auth-type | Sets the OSPF interface authentication type. |
| ip ospf interface md5 key | Configures the OSPF key ID and key. |
| show ip ospf interface | Displays the status and statistics of an OSPF interface. |

MIB Objects

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId
```

ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

```
ip ospf interface {interface_name} md5 key_id key key_string
```

Syntax Definitions

| | |
|-----------------------|---------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>key_id</i> | The key ID. The valid range is 1–255. |
| <i>key_string</i> | A key string. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used in conjunction with the commands described above on [page 26-30](#) and [page 26-34](#).
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------|-----------------------------------------------------------------------|
| ip ospf interface auth-type | Sets the OSPF interface authentication type. |
| ip ospf interface md5 | Creates and deletes the OSPF interface MD5 key identification number. |
| show ip ospf interface | Displays the status and statistics of an OSPF interface. |

MIB Objects

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId  
  alaOspfIfMd5Key
```

ip ospf interface type

Configures the OSPF interface type.

ip ospf interface {*interface_name*} **type** {**point-to-point** | **point-to-multipoint** | **broadcast** | **non-broadcast**}

Syntax Definitions

| | |
|----------------------------|----------------------------------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| point-to-point | Sets the interface to be a point-to-point OSPF interface. |
| point-to-multipoint | Sets the interface to be a point-to-multipoint OSPF interface. |
| broadcast | Sets the interface to be a broadcast OSPF interface. |
| non-broadcast | Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface. |

Defaults

| parameter | default |
|----------------------------------------------------------------------------------------------|------------------|
| broadcast non-broadcast point-to-point point-to-multipoint | broadcast |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------|-----------------------------------------------------------------------------|
| ip ospf neighbor | Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface. |
| show ip ospf interface | Displays the status and statistics of an OSPF interface. |

MIB Objects

ospfIfTable
ospfIfType

ip ospf interface cost

Configures the OSPF interface cost.

```
ip ospf interface {interface_name} cost cost
```

Syntax Definitions

| | |
|-----------------------|-------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>cost</i> | The interface cost. The valid range is 0–65535. |

Defaults

| parameter | default |
|-------------|---------|
| <i>cost</i> | 1 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

Examples

```
-> ip ospf interface vlan-101 cost 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfMetricTable  
  ospfIfMetricIpAddress  
  ospfIfMetricValue
```

ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

```
ip ospf interface {interface_name} poll-interval seconds
```

Syntax Definitions

interface_name The name of the interface.
seconds The poll interval, in seconds. The valid range is 1–2147483647.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 120 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfPollInterval

ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

```
ip ospf interface {interface_name} priority priority
```

Syntax Definitions

interface_name The name of the interface.
priority The interface priority. The valid range is 0–255.

Defaults

| parameter | default |
|-----------------|---------|
| <i>priority</i> | 1 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ip ospf interface vlan-101 priority 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfRtrPriority

ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

```
ip ospf interface {interface_name} retrans-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The retransmit interval, in seconds. The valid range 0–3600.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 5 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfRetransInterval

ip ospf interface transit-delay

Configures the OSPF interface transit delay.

```
ip ospf interface {interface_name} transit-delay seconds
```

Syntax Definitions

interface_name The name of the interface.
seconds The transit delay, in seconds. The valid range is 0–3600.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 1 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

MIB Objects

ospfIfTable
ospfIfTransitDelay

ip ospf bfd-state

Enables or disables the registration of OSPF with the BFD protocol.

```
ip ospf bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|------------------------|
| enable | Enables BFD for OSPF. |
| disable | Disables BFD for OSPF. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and OSPF must be registered with BFD at the protocol level before OSPF can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of OSPF with the BFD protocol:

```
-> ip ospf bfd-state enable  
-> ip ospf bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |

| ip ospf interface bfd-state | Enables or disables BFD for a specific OSPF interface. |
| ip ospf interface bfd-state drs-only | Establishes BFD sessions only on neighbors in full state. |
| ip ospf interface bfd-state all-neighbors | Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state. |
| show ip ospf | Displays OSPF status and general configuration parameters. |

MIB Objects

```
alaProtocolospf  
  alaOspfBfdStatus
```

ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

```
ip ospf bfd-state all-interfaces {enable | disable}
```

Syntax Definitions

| | |
|----------------|-------------------------------------------|
| enable | Enables BFD for all the OSPF interfaces. |
| disable | Disables BFD for all the OSPF interfaces. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf bfd-state all-interfaces enable  
-> ip ospf bfd-state all-interfaces disable
```

Release History

Release 7.1.1; command was introduced.

```

Syntax Definitions

| | |
|----------------|-----------------------------------------|
| <i>if_name</i> | The name of an existing OSPF interface. |
| enable | Enables BFD for the OSPF interface. |
| disable | Disables BFD for the OSPF interface. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state enable  
-> ip ospf interface int2 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

    alaOspfIfBfdStatus
```

ip ospf interface bfd-state drs-only

Establishes BFD sessions only with neighbors that are in the full state.

ip ospf interface *if_name* bfd-state drs-only

Syntax Definitions

if_name The name of an existing OSPF interface.

Defaults

| parameter | default |
|-----------|---------|
| drs-only | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state drs-only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
alaOspfIfAugEntry
  ospfIfIpAddress
  alaOspfIfBfdDrsOnly
```

ip ospf interface bfd-state all-neighbors

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

ip ospf interface *if_name* bfd-state all-neighbors {enable | disable}

Syntax Definitions

| | |
|----------------|-------------------------------------------|
| <i>if_name</i> | The name of an existing OSPF interface. |
| enable | Enables BFD sessions with all neighbors. |
| disable | Disables BFD sessions with all neighbors. |

Defaults

| parameter | default |
|-------------------------|---------------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state all-neighbors enable  
-> ip ospf interface int1 bfd-state all-neighbors disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------|-------------------------------------------------------------|
| ip ospf bfd-state | Enables or disables the BFD status for OSPF protocol. |
| ip ospf bfd-state all-interfaces | Enables or disables BFD for all OSPF interfaces configured. |
| ip ospf interface bfd-state | Enables or disables BFD for a specific OSPF interface. |
| ip ospf interface bfd-state drs-only | Establishes BFD sessions only on neighbors in full state. |
| show ip ospf interface | Displays configuration information for an OSPF interface. |

MIB Objects

```
alaOspfIfAugEntry  
  ospfIfIpAddress  
  alaOspfIfBfdDrsOnly
```

ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

ip ospf restart-support {planned-unplanned | planned-only}

no ip ospf restart-support

Syntax Definitions

| | |
|--------------------------|-------------------------------------------------------|
| planned-unplanned | Specifies support for planned and unplanned restarts. |
| planned-only | This parameter is currently not supported. |

Defaults

Graceful restart is disabled by default.

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
  alaOspfRestartSupport
```

ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

ip ospf restart-interval [*seconds*]

Syntax Definitions

seconds The hitless restart timeout interval. The valid range is 0–1800 seconds.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 120 |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Example

```
-> ip ospf restart-interval 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf restart-support](#) Administratively enables and disables support for the graceful restart feature on an OSPF router.

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf  
  alaOspfRestartInterval
```

ip ospf restart-helper admin-state

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

ip ospf restart-helper [admin-state {enable | disable}]

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------------|
| enable | Enables the capability of an OSPF router to operate in helper mode. |
| disable | Disables the capability of an OSPF router to operate in helper mode. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-helper admin-state disable
-> ip ospf restart-helper admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| ip ospf restart-support | Administratively enables and disables support for the graceful restart feature on an OSPF router. |
| ip ospf restart-helper strict-lsa-checking admin-state | Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router. |
| show ip ospf restart | Displays the OSPF graceful restart related configuration and status. |

MIB Objects

```
alaProtocolOspf
  alaOspfRestartHelperSupport
```

ip ospf restart-helper strict-lsa-checking admin-state

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------------------------------------------------------|
| enable | Enables whether or not a changed LSA will result in termination of graceful restart by a helping router. |
| disable | Disables whether or not a changed LSA will result in termination of graceful restart by a helping router. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-helper strict-lsa-checking admin-state disable
-> ip ospf restart-helper strict-lsa-checking admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
alaProtocolOspf
  alaOspfRestartHelperSupport
```

ip ospf restart initiate

Initiates a planned graceful restart.

ip ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration.

Example

```
-> ip ospf restart initiate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf  
  alaOspfRestartInitiate
```

show ip ospf

Displays the OSPF status and general configuration parameters.

show ip ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command is used to display the general configuration parameters of the OSPF router. See the Related Commands section below for commands that are used to modify the displayed parameters.

Examples

```
-> show ip ospf
Router Id                = 10.255.11.242,
OSPF Version Number     = 2,
Admin Status            = Enabled,
Area Border Router ?   = No,
AS Border Router Status = Enabled,
Route Tag                = 0,
SPF Hold Time (in seconds) = 10,
SPF Delay Time (in seconds) = 5,
MTU Checking            = Disabled,
# of Routes              = 124,
# of AS-External LSAs   = 60,
# of self-originated LSAs = 1,
# of LSAs received      = 118,
External LSDB Limit     = -1,
Exit Overflow Interval  = 0,
# of SPF calculations done = 38395,
# of Incr SPF calculations done = 0,
# of Init State Nbrs    = 0,
# of 2-Way State Nbrs   = 0,
# of Exchange State Nbrs = 0,
# of Full State Nbrs    = 1,
# of attached areas     = 1,
# of Active areas       = 1,
# of Transit areas      = 0,
# of attached NSSAs     = 0,
Default Route Origination = none,
Default Route Metric-Type/Metric = type2 / 1,
BFD Status              = Disabled
Opaque Transit Capability = Enabled
```

output definitions

| | |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Router Id | The unique identification for the router. |
| OSPF Version Number | The version of OSPF the router is running. |
| Admin Status | Whether OSPF is currently enabled or disabled on the router. |
| Area Border Router? | Whether the router status is an area router or not. |
| AS Border Router Status | Whether the area Autonomous System Border Router status of this router is enabled or disabled. |
| Route Tag | Shows the route tag for this router. |
| SPF Hold Time | Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation. |
| SPF Delay Time | Shows the time in seconds between consecutive SPF calculations. |
| MTU Checking | Shows whether Maximum Transfer Unit checking is enabled or disabled. |
| # of Routes | The total number of OSPF routes known to this router. |
| # of AS-External LSAs | The number of external routes learned from outside the router's Autonomous System (AS). |
| # of self-originated LSAs | The number of times a new Link State Advertisement has been sent from this router. |
| # of LSAs received | The number of times a new Link State Advertisement has been received by this router. |
| External LSDB Limit | The maximum number of entries allowed in the external Link State Database. |
| Exit Overflow Interval | The number of seconds the router remains in the overflow state before attempting to leave it. |
| # of SPF calculations done | The number of SPF calculations that have occurred. |
| # of Incr SPF calculations done | The number of incremental SPF calculations done. |
| # of Init State Nbrs | The number of neighbors in the initialization state. |
| # of 2-Way State Nbrs | The number of OSPF 2-way state neighbors on this router. |
| # of Exchange State Nbrs | The number of neighbors in the exchange state. |
| # of Full State Nbrs | The number of neighbors in the full state. |
| # of attached areas | The number of areas that are configured on the router. |
| # of Active areas | The number of areas that are active. |
| # of Transit areas | The number of transit areas that are configured on the router. |
| # of attached NSSAs | The number of Not So Stubby Areas that are configured on the router. |
| Default Route Origination | Whether route redistribution is enabled or disabled on the router. |
| Default Route Metric-Type/ Metric | The default metric for stub or Not So Stubby Area (NSSA) areas. Specifies the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA). |
| BFD Status | Whether BFD monitoring is enabled or disabled for OSPF. |
| Opaque Transit Capability | Whether the opaque LSA accept and retransmit capability for OSPF is enabled or disabled. |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------|---------------------------------------------------------------------------------------------------|
| ip router router-id | Configures the router ID for the router. |
| ip ospf admin-state | Enables or disables the administration of OSPF on the router. |
| ip ospf route-tag | Configures a tag value for Autonomous System External (ASE) routes created. |
| ip ospf spf-timer | Configures timers for SPF calculation. |
| ip ospf mtu-checking | Enables or disables the use of Maximum Transfer Unit (MTU) checking. |
| ip ospf extlsdb-limit | Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned. |
| ip ospf exit-overflow-interval | This command sets the overflow interval value. |
| ip ospf default-originate | Enables or disables OSPF redistribution |
| ip ospf area default-metric | Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. |
| ip ospf bfd-state | Enables or disables the registration of OSPF with the BFD protocol. |

show ip ospf border-routers

Displays information regarding all or specified border routers.

show ip ospf border-routers [*area_id*] [*router_id*] [*tos*] [*gateway*]

Syntax Definitions

| | |
|------------------|--------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>router_id</i> | A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System. |
| <i>tos</i> | The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time. |
| <i>gateway</i> | The 32-bit IP address of the gateway for the border router being displayed. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

Examples

```
-> show ip ospf border-routers 10.0.0.0
```

| Router Id | Area Id | Gateway | TOS | Metric |
|-----------|---------|---------------|-----|--------|
| 10.0.0.0 | 1.0.0.1 | 143.209.92.71 | 1 | 1 |

output definitions

| | |
|------------------|--------------------------------------------------------------------------------------------------------------|
| Router ID | The unique identification for the router. |
| Area ID | A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System. |
| Gateway | The next hop interface on which the border router has been learned. |
| ToS | The Type of Service. Only ToS value 0 is supported at this time. |
| Metric | The cost to the border router. |

Release History

Release 7.1.1; command was introduced.

Related Commands

```

show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

```
show ip ospf ext-lsdb [linkstate-id ls_id] [router-id router_id]
```

Syntax Definitions

| | |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>ls_id</i> | The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database. |
| <i>router_id</i> | The Router ID. The ID is a unique 32-bit value such as an IP address. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf ext-lsdb
```

```

      LS Id           Orig Router-Id      SeqNo      Age      Protocol
-----+-----+-----+-----+-----
 198.168.100.100    198.168.100.100     10         100     STATIC

```

output definitions

| | |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| LS Id | The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database. |
| Orig Router-Id | The router ID of the router that originated the external LSDB. |
| SeqNo | The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements). |
| Age | The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database. |
| Protocol | The type of protocol, if any. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf extlsdb-limit](#)

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

show ip ospf host

Displays information on the configured OSPF hosts.

```
show ip ospf host [ip_address]
```

Syntax Definitions

ip_address A 32-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf host 172.22.2.115
```

| Host Address | TOS | Metric | Status | AreaId |
|---------------|-----|--------|--------|---------|
| 143.209.92.12 | 1 | 0 | Up | 0.0.0.0 |

output definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------|
| Host Address | A 32-bit IP address for a directly attached host. This can be set using the ip ospf host command. |
| ToS | The Type of Service traffic from the host is labeled as. ToS is set using the ip ospf host command. |
| Metric | The metric assigned to the host. Metric is set using the ip ospf host command. |
| Status | Whether the host is enabled or disabled. |
| AreaId | The area identification for the host's area. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf host](#)

Creates and deletes an OSPF entry for directly attached hosts.

MIB Objects

show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

```
show ip ospf lsdb [area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

Syntax Definitions

| | |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| rtr | Specifies router LSAs. |
| net | Specifies network LSAs. |
| netsum | Specifies network summary LSAs. |
| asbrsum | Specifies Autonomous System Border Router summary LSAs. |
| <i>ls_id</i> | The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database. |
| <i>router_id</i> | The Router ID. The ID is a unique 32-bit value such as an IP address. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

Examples

```
-> show ip ospf lsdb
  Area Id      Type      LS Id      Orig Router-Id  SeqNo  Age
-----+-----+-----+-----+-----+-----
0.0.0.1      OSPF     198.168.100.100  198.168.100.100    1      100
```

output definitions

| | |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Area Id | The area identification for the area to which the record belongs. |
| Type | The protocol type from where the route was learned. |
| LS Id | The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database. |
| Orig Router-Id | The router ID of the router that originated the external LSDB. |

output definitions (continued)

| | |
|--------------|-----------------------------------------------------------------------------------------------------------------|
| SeqNo | The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements). |
| Age | The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database. |

Release History

show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

```
show ip ospf neighbor [ip_address]
```

Syntax Definitions

ip_address A 32-bit IP address of the neighboring router.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf neighbor
```

| IP Address | Area Id | Router Id | Vlan | State | Mode |
|------------|-----------------|-----------|------|-------|--------|
| 1.1.1.1 | 255.255.255.255 | 0.0.0.0 | 0 | Down | Static |

output definitions

| | |
|-------------------|----------------------------------------------------------------------------------------------------------------|
| IP Address | The IP address of the neighbor. |
| Area Id | A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System. |
| Router Id | The unique identification for the neighboring router. |
| VlanId | The VLAN corresponding to this interface on which the neighbor is reachable. |
| State | The state of the OSPF neighbor adjacency. |
| Mode | What type of neighbor, either Dynamic (learned) or Static . |

```

-> show ip ospf neighbor 1.1.1.1
Neighbor's IP Address           = 1.1.1.1,
Neighbor's Router Id           = 0.0.0.0,
Neighbor's Area Id             = 255.255.255.255,
Neighbor's DR Address          = 0.0.0.0,
Neighbor's BDR Address         = 0.0.0.0,
Neighbor's Priority             = 1,
Neighbor's State                = Down,
Hello Suppressed ?             = No,
Neighbor's type                 = Static,
DR Eligible                     = Yes,
# of State Events               = 0,
Mode                            = Slave,
MD5 Sequence Number            = 0,
Time since Last Hello          = 0 sec,
# of Outstanding LS Requests   = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status          = Not Restarting,
Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

output definitions

| | |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor's IP Address | The IP address of the neighbor. |
| Neighbor's Router Id | The identification number for the selected host's record. It is most often the router's IP address. |
| Neighbor's Area Id | Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area. |
| Neighbor's DR Address | The address of the neighbors Designated Router. |
| Neighbor's BDR Address | The address of the neighbors Backup Designated Router. |
| Neighbor's Priority | The priority value for this neighbor becoming the DR. |
| Neighbor's State | The condition of the OSPF neighbor's state machine. |
| Hello Suppressed | Whether sending hello messages to this neighbor is suppressed. |
| Neighbor's type | What type of neighbor this is, either dynamic or static. |
| DR Eligible | Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as No . Otherwise, if configured as Eligible (the default), it shows up as Yes . |
| # of State Events | The number of state events restricted for this neighbor and the local router. |
| Mode | The role the neighbor has with the local router during DD Exchange, which can be Master or Slave. |
| MD5 Sequence Number | The sequence number of the MD5 authorization key. |
| Time since Last Hello | The amount of time (in seconds) since the last HELLO messages was received from this neighbor. |
| # of Outstanding LS Requests | The number of Link State requests to this neighbor that have not received a response from this neighbor. |
| # of Outstanding LS Acknowledgements | Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor. |

output definitions (continued)

| | |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| # of Outstanding LS Retransmissions | The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router. |
| Restart Helper Status | Indicates whether the router is acting as a hitless restart helper for the neighbor. |
| Restart Age | The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor. |
| Last Restart Helper Exit Reason | The outcome of the last attempt at acting as a hitless restart helper for the neighbor. |

Release History

Release 7.1.1; command was introduced.

show ip ospf routes

Displays the OSPF routes known to the router.

show ip ospf routes [*ip_address mask tos gateway*]

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------|
| <i>ip_address</i> | A 32-bit IP address of the route destination in dotted decimal format. |
| <i>mask</i> | The IP subnet mask of the route destination. |
| <i>tos</i> | The Type of Service of the route. |
| <i>gateway</i> | The next hop IP address for this router. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

-> show ip ospf routes

| Destination/Mask | Gateway | Metric | Vlan | Type |
|-------------------------------|-----------|--------|------|--------|
| -----+-----+-----+-----+----- | | | | |
| 198.168.100.100 | 195.5.2.8 | 0 | 5 | AS-Ext |

output definitions

| | |
|-------------------------|-------------------------------------------------------------------------------------------------------------|
| Destination/Mask | The destination address of the route. This can also display the destination IP address mask if it is known. |
| Gateway | The gateway address of the route. |
| Metric | The cost of the route. |
| Vlan | The VLAN number on which the gateway can be routed. |
| Type | The type of OSPF route. |

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ip ospf`

Displays the OSPF status and general configuration parameters.

show ip ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPF backbone routers that are not physically contiguous.

```
show ip ospf virtual-link [router_id]
```

Syntax Definitions

router_id The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-link
```

| Transit AreaId | Router-id | State Link / Adjacency | AuthType | OperStatus |
|----------------|------------|---------------------------|----------|------------|
| 1.1.1.1 | 172.17.1.1 | P2P / Full | none | up |

output definitions

| | |
|------------------------|--------------------------------------------------------------------|
| Transit AreaId | The area identification for the area assigned to the virtual link. |
| Router-Id | The destination router identification for the virtual link. |
| State Link | The state of the virtual link with regards to the local router. |
| State Adjacency | The state of the virtual link adjacency. |
| AuthType | The type of authorization employed by the virtual link. |
| OperStatus | Displays whether the virtual link is enabled or disabled. |

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip ospf virtual-link** Creates or deletes a virtual link.

```

show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router through a virtual link rather than a physical one.

show ip ospf virtual-neighbor *area_id* *router_id*

Syntax Definitions

area_id A unique 32-bit value in IP address format.
router_id The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1
```

| AreaId | RouterId | Priority | Events | RxmtQlen | LastHello | State |
|---------|----------|----------|--------|----------|-----------|-------|
| 0.0.0.0 | 10.0.0.0 | 1 | 10 | 100 | 323 | INIT |

output definitions

| | |
|------------------|------------------------------------------------------------------------------------------------------------|
| AreaId | The area identification for the area of which the virtual neighbor is a part. |
| RouterId | The router identification of the virtual neighbor. |
| Priority | The number used to determine whether the virtual neighbor will become the designated router for its area. |
| Events | The number of OSPF control message sent by the neighbor to the router. |
| RxmtQlen | The length (in number of packets) of the retransmit queue. |
| LastHello | The last Hello message sent by the neighbor |
| State | The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full. |

```

-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254
Neighbor's IP Address           = 2.0.0.254,
Neighbor's Router Id           = 2.0.0.254,
Neighbor's Area Id             = 0.0.0.1,
Neighbor's DR Address          = 2.0.0.1,
Neighbor's BDR Address         = 2.0.0.254,
Neighbor's Priority             = 1,
Neighbor's State                = Full,
Hello Suppressed ?             = No,
Neighbor's type                 = Dynamic,
# of State Events              = 6,
Mode = Master,
MD5 Sequence Number           = 0,
Time since Last Hello          = 5 sec,
Last DD I_M_MS                =
# of Outstanding LS Requests   = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status          = Not Restarting,
Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

output definitions

| | |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor's IP Address | The IP address of the virtual neighbor. |
| Neighbor's Router Id | The identification number for the selected host's record. It is most often the router's IP address. |
| Neighbor's Area Id | Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area. |
| Neighbor's DR Address | The address of the virtual neighbor's Designated Router. |
| Neighbor's BDR Address | The address of the virtual neighbor's Backup Designated Router. |
| Neighbor's Priority | The priority value for this virtual neighbor becoming the DR. |
| Neighbor's State | The condition of the OSPF virtual neighbor's state machine. |
| Hello Suppressed | Whether sending hello messages to this virtual neighbor is suppressed. |
| Neighbor's type | What type of virtual neighbor this is, either dynamic or static. |
| DR Eligible | Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as No . Otherwise, if configured as Eligible (the default), it shows up as Yes . |
| # of State Events | The number of state events restricted for this virtual neighbor and the local router. |
| Mode | The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave. |
| MD5 Sequence Number | The sequence number of the MD5 authorization key. |
| Time since Last Hello | The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor. |
| Last DD I_M_MS | The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not. |

output definitions (continued)

| | |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| # of Outstanding LS Requests | The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor. |
| # of Outstanding LS Acknowledgements | Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor. |
| # of Outstanding LS Retransmissions | The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router. |
| Restart Helper Status | Indicates whether the router is acting as a hitless restart helper for the virtual neighbor. |
| Restart Age | The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor. |
| Last Restart Helper Exit Reason | The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor. |

show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

show ip ospf area [*area_id*]

Syntax Definitions

area_id A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

Examples

-> show ip ospf area

| Area Id | AdminStatus | Type | OperStatus |
|---------|-------------|--------|------------|
| 1.1.1.1 | disabled | normal | down |
| 0.0.0.1 | disabled | normal | down |

-> show ip ospf area 0.0.0.0

```
Area Identifier           = 1.1.1.1,
Admin Status             = Disabled,
Operational Status      = Down,
Area Type                = normal,
Area Summary             = Enabled,
Time since last SPF Run  = 00h:00m:27s,
# of Area Border Routers known  = 0,
# of AS Border Routers known    = 0,
# of LSAs in area          = 0,
# of SPF Calculations done     = 0,
# of Incremental SPF Calculations done = 0,
# of Neighbors in Init State   = 0,
# of Neighbors in 2-Way State  = 0,
# of Neighbors in Exchange State = 0,
# of Neighbors in Full State   = 0,
# of Interfaces attached     = 0
Attached Interfaces       = vlan-213
```

output definitions

| | |
|------------------------------------------|--------------------------------------------------------------------------------------------------|
| Area Identifier | The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS. |
| Admin Status | Whether the area is enabled or disabled. |
| Operational Status | Whether the area is active. |
| Area Type | The area type. This field will be normal , stub , or NSSA . |
| Area Summary | Whether Area Summary is enabled or disabled. |
| Time since last SPF Run | The last time the Shortest Path First calculation was performed. |
| # of Area Border Routers known | The number of Area Border Routers in the area. |
| # of AS Border Routers known | The number of Autonomous System Border Routers in the area. |
| # of LSAs | The total number of Link State Advertisements for the Area. |
| # of SPF Calculations | The number of times the area has calculated the Shortest Path. |
| # of Incremental SPF Calculations | The number of incremental Shortest Path First calculations that have been performed in the area. |
| # of Neighbors in Init State | The number of OSPF neighbors that are in initialization. |
| # of Neighbors in 2-Way State | The number of OSPF 2-way state neighbors in this area. |
| # of Neighbors in Exchange State | The number of OSPF neighbors that are currently establishing their status. |
| # of Neighbors in Full State | The number of OSPF neighbors. |
| # of Interfaces attached | The number of OSPF interfaces. |
| Attached Interfaces | The names of the OSPF interfaces attached to this area. |

show ip ospf area range

Displays all or specified route summaries in a given area.

```
show ip ospf area area_id range [{summary | nssa} ip_address ip_mask]
```

Syntax Definitions

| | |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| summary | Specifies that routes are summarized. |
| nssa | Specifies the Not So Stubby Area (NSSA) routers are summarized. <i>This parameter is not supported on an OmniSwitch 6560.</i> |
| <i>ip_address</i> | A 32-bit IP address. |
| <i>ip_mask</i> | A 32-bit subnet mask. |

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area 0.0.0.0 range
```

| AreaId | Type | Destination | Advertise |
|---------|---------|------------------|------------|
| 0.0.0.0 | Summary | 192.168.12.1/24 | Matching |
| 0.0.0.0 | NSSA | 143.209.92.71/24 | noMatching |

output definitions

| | |
|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| AreaId | The area identification for the area range. |
| Type | The type of area the range is associated with. |
| Destination | The destination address of the range. |
| Advertise | Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching). |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf area range](#)

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

```

show ip ospf area stub

Displays stub default area metrics, if configured.

show ip ospf area *area_id* stub

Syntax Definitions

area_id A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip ospf area 0.0.0.1 stub
```

| Area Id | TOS | Metric | MetricType |
|---------|-----|--------|------------|
| 0.0.0.1 | 1 | 1 | ospf |

output definitions

| | |
|-------------------|----------------------------------------------------------------------------------------------------|
| Area Id | The identification number of the stub area. |
| TOS | The Type of Service assignment. |
| Metric | The metric assignment of the default router in the stub area. |
| MetricType | The metric type of the stub area. It will be either ospf , type1 , or type2 . |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip ospf area](#) Creates or deletes an OSPF area.

```

show ip ospf interface

Displays OSPF interface information.

show ip ospf interface [*interface_name*]

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

Examples

No interface name is specified:

```
-> show ip ospf interface
```

| Interface Name | DR Address | Backup DR Address | Admin Status | Oper Status | State | BFD Status |
|-------------------|---------------|----------------------|-----------------|----------------|-------|---------------|
| vlan-213 | 213.10.10.1 | 213.10.10.254 | enabled | up | DR | disabled |
| vlan-215 | 215.10.10.254 | 215.10.10.1 | enabled | up | BDR | enabled |

output definitions

| | |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the interface. |
| DR Address | The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, “VLAN Management Commands,” for more information.) |
| Backup DR Address | The IP address of the backup designated router. |
| Admin Status | The current administration status of the interface, either enabled or disabled . |
| Oper Status | Whether the interface is an active OSPF interface. |
| State | The current state of the OSPF interface. It will be down , up , dp , dr , or other . |
| BFD Status | The current status of BFD for the OSPF interface. |

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                    = 3,
Interface IP Address       = 100.10.10.2,
Interface IP Mask          = 255.255.255.0,
Admin Status               = Enabled,
Operational Status         = Up,
OSPF Interface State       = BDR,
Interface Type              = Broadcast,
Area Id                    = 0.0.0.2,
Designated Router IP Address = 100.10.10.88,
Designated Router RouterId  = 100.10.10.88,
Backup Designated Router IP Address = 100.10.10.2,
Backup Designated Router RouterId  = 192.169.1.2,
MTU (bytes)                = 1500,
Metric Cost                 = 1,
Priority                    = 1,
Hello Interval (seconds)   = 10,
Transit Delay (seconds)    = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)    = 40,
Poll Interval (seconds)    = 120,
Link Type                   = Broadcast,
Authentication Type         = md5,
#   Id   Key   Status   StartAccept   StopAccept   StartGen   StopGen
---+---+---+-----+-----+-----+-----+
1  1     Set  Enabled     0             0             0           0
# of Events                  = 2,
# of Init State Neighbors    = 0,
# of 2-Way State Neighbors   = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors    = 1
BFD status                   = Disabled,
DR-Only Option for BFD      = Disabled
```

Note. See the table of the following page for output definitions.

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                     = 3,
Interface IP Address        = 100.10.10.2,
Interface IP Mask           = 255.255.255.0,
Admin Status                = Enabled,
Operational Status         = Up,
OSPF Interface State       = DR,
Interface Type              = Broadcast,
Area Id                     = 0.0.0.2,
Designated Router IP Address = 100.10.10.2,
Designated Router RouterId  = 192.169.1.2,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId  = 0.0.0.0,
MTU (bytes)                 = 1500,
Metric Cost                  = 1,
Priority                     = 1,
Hello Interval (seconds)    = 10,
Transit Delay (seconds)     = 1,
Retrans Interval (seconds)  = 5,
Dead Interval (seconds)     = 40,
Poll Interval (seconds)    = 120,
Link Type                   = Broadcast,
Authentication Type         = simple,
Authentication Key          = Set,
# of Events                  = 3,
# of Init State Neighbors   = 0,
# of Exchange State Neighbors = 0,
# of 2-Way State Neighbors  = 0,
# of Full State Neighbors   = 0,
BFD Status                  = Disabled,
DR-Only Option for BFD     = Disabled
```

The following is an example of keychain authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-20-int
Interface IP Name           = vlan-20-int,
VLAN Id                    = 20,
Interface IP Address       = 10.10.20.1,
Interface IP Mask         = 255.255.255.0,
Admin Status              = Enabled,
Operational Status        = Up,
OSPF Interface State      = DR,
Interface Type            = Broadcast,
Area Id                   = 0.0.0.0,
Designated Router IP Address = 10.10.20.1,
Designated Router RouterId = 10.10.10.1,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes)              = 1500,
Metric Cost               = 1,
Priority                   = 1,
Hello Interval (seconds)  = 10,
Transit Delay (seconds)   = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)   = 40,
Poll Interval (seconds)   = 120,
Link Type                 = Broadcast,
Authentication Type       = Keychain(1),
# of Events                = 2,
# of Init State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors = 0,
# of type-9 LSAs on this interface = 0,
BFD status                 = Disabled,
DR-Only Option for BFD    = Disabled
```

Output fields when an interface name is specified are described below:

output definitions

| | |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IP Name | The name of the VLAN to which the interface is assigned. |
| VLAN Id | The VLAN to which the interface is assigned. |
| Interface IP Address | The IP address assigned to the interface. |
| Interface IP Mask | The IP mask associated with the IP address assigned to the interface. |
| Admin Status | The current administration status of the interface, either enabled or disabled . |
| Operational Status | Whether the interface is an active OSPF interface. |
| OSPF Interface State | The current state of the OSPF interface. It will be down , up , dp , dr , or other . |
| Interface Type | The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint. |
| Area Id | The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area. |
| Designated Router IP Address | The designated router IP address. |

output definitions (continued)

| | |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Designated Router RouterId | The identification number of the designated router. |
| Backup Designated Router IP Address | The IP address of the backup designated router. |
| Backup Designated Router RouterId | The identification number of the backup designated router. |
| MTU | The Maximum Transfer Unit (in bytes) for the interface. |
| Metric Cost | The cost added to routes learned on this interface. |
| Priority | The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority. |
| Hello Interval | The number of seconds between hello messages sent out on the interface. |
| Transit Delay | The estimated number of seconds required to transmit a link state update over this interface. |
| Retrans Interval | The number of seconds the interface waits before resending hello messages. |
| Dead Interval | The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead. |
| Poll Interval | The larger time interval, in seconds, between hello messages sent to inactive neighbors. |
| Link Type | The IP interface type, either broadcast or non broadcast . |
| Authentication Type | The type of authentication used by this interface: None , Simple , MD5 , or Keychain |
| # | The indexing of the MD5 key. (This field is only displayed for MD5 authentication.) |
| Id | A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.) |
| Key | Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.) |
| Status | The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.) |
| StartAccept | The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.) |
| StopAccept | The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.) |
| StartGen | The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.) |
| StopGen | The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.) |
| Authentication Key | This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.) |
| # of Events | The number of interface state machine events. |

output definitions (continued)

| | |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| # of Init State Neighbors | The number of OSPF neighbors in the initialization state. |
| # of 2-Way State Neighbors | The number of OSPF 2-way state neighbors on this interface. |
| # of Exchange State Neighbors | The number of OSPF neighbors in the exchange state. |
| # of Full State Neighbors | The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface. |
| # of type-9 LSAs on this interface | Number of type-9 LSA on this interface. (This field is only displayed for keychain authentication.) |
| BFD Status | The status of BFD on this interface. |
| DR-Only Option for BFD | The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors. |

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip ospf interface auth-info

Displays authentication information for the interface.

show ip ospf interface auth-info [*interface_name*]

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Not specifying an interface name displays all known interfaces for the OSPF router.
- When keychain authentication type is used for the interface, only the keychain ID is displayed. To view the keys associated with the keychain, use the keychain commands. For more information keychain management commands, refer to the “Chassis Management and Monitoring Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.

Examples

```
-> show ip ospf interface auth-info
```

| Interface Name | Key-chain | KeyId | Key | Status | AuthMode |
|----------------|-----------|-------|-----|---------|-----------|
| vlan-30-int | 1 | -- | -- | Enabled | keychain |
| vlan-20-int | -- | 10 | Set | Enabled | Keyed-MD5 |

output definitions

| | |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the interface. |
| Key-chain | The keychain associated with the interface. |
| KeyId | A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.) |
| Key | Indicates whether the key has been set or not. |
| Status | The current administration status of the interface, either enabled or disabled . |
| AuthMode | The type of authentication used by this interface. |

Release History

Release 8.4.1; command introduced.

Related Commands**ip ospf interface auth-type**

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

MIB Objects

N/A

show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

show ip ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> show ip ospf restart
Restart Support                = Enabled,
Restart Interval (in seconds) = 120,
Restart Status                 = Not Restarting,
Restart Age (in seconds)      = 0,
Last Restart Exit Reason      = None,
Restart Helper Support        = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Mode           = NotHelping
```

output definitions

| | |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart Support | The administrative status of OSPF graceful restart, which can be Enabled or Disabled . |
| Restart Interval | The configured OSPF hitless restart timeout interval, in seconds. Use the ip ospf restart-interval command to modify this parameter. |
| Restart Status | The current status of OSPF graceful restart, which can be Not Restarting , Unplanned Restart (after a CMM takeover), or Planned Restart (before CMM takeover). |
| Restart Age | The remaining time, in seconds, for the current OSPF graceful restart interval. |
| Last Restart Exit Reason | The outcome of the last attempt at a graceful restart. If the value is None , then no restart has yet been attempted. If the value is In Progress , then a restart attempt is currently underway. Other possible values include Completed (successfully completed), Timed Out (timed out), and Topology Changed (aborted due to topology change). |

output definitions (continued)

| | |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart Helper Support | The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be Enabled or Disabled . Use the ip ospf restart-helper admin-state command to modify this parameter. |
| Restart Helper Strict Checking | The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be Enabled or Disabled . Use the ip ospf restart-helper strict-lsa-checking admin-state command to modify this parameter. |
| Restart Helper Mode | Whether this OSPF router is operating as a helper to a restarting router. |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------|------------------------------------------------------------------------|
| ip ospf restart-support | Configures support for the graceful restart feature on an OSPF router. |
| ip ospf restart initiate | Initiates a planned graceful restart. |

MIB Objects

N/A

27 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

The OmniSwitch version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-OSPF3-MIB.mib
Module: alcatelIND1OSPF3MIB

Filename: OSPFV3-MIB.mib
Module: ospfv3MIB

The following is a list of the commands for configuring OSPFv3:

ipv6 load ospf

Loads the OSPFv3 software on the router.

ipv6 load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Example

```
-> ipv6 load ospf
```

Release History

Release 7.1.1; command was introduced.

Related Commands

N/A

MIB Objects

alaVrConfigTable

 alaVrConfigOspf3Status

ipv6 ospf admin-state

Enables or disables the OSPFv3 administrative status for the router.

ipv6 ospf admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|------------------|
| enable | Enables OSPFv3. |
| disable | Disables OSPFv3. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

Examples

```
-> ipv6 ospf admin-state enable
-> ipv6 ospf admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3GeneralGroup
  ospfv3AdminStat
```

ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

```
ipv6 ospf host ipv6_address [area area_id] [metric metric]
```

```
no ipv6 ospf host ipv6_address area area_id
```

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IP address of the OSPFv3 host. |
| <i>area_id</i> | Area to which the host route belongs. |
| <i>metric</i> | The cost metric value assigned to the specified host. The valid range is 0–65535. |

Defaults

| parameter | default |
|---------------|---------|
| <i>metric</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

Examples

```
-> ipv6 ospf host 2001::1/64 metric 10  
-> no ipv6 ospf host 2001::1/64 metric 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf host](#) Displays information on the configured OSPFv3 hosts.

MIB Objects

ospfv3HostTable

- ospfv3HostStatus
- ospfv3HostAreaID
- ospfv3HostAddress
- ospfv3HostMetric

ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ipv6 ospf mtu-checking

no ipv6 ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ipv6 ospf mtu-checking
-> no ipv6 ospf mtu-checking
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf](#) Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
  alaOspf3MTUCheck
```

ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ipv6 ospf route-tag tag

Syntax Definitions

tag The set tag value. The valid range is 0–2, 147, 483, 647.

Defaults

| parameter | default |
|------------|---------|
| <i>tag</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPFv3 router. The tag value allows for quick identification.
- OSPFv3 ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Examples

```
-> ipv6 ospf route-tag 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3  
alaOspf3RedistRouteTag
```

ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ipv6 ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

Syntax Definitions

| | |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>delay_seconds</i> | Specifies time (from 0 to 65535 seconds) between the reception of an OSPFv3 topology change and the start of an SPF calculation. |
| <i>hold_seconds</i> | Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations. |

Defaults

| parameter | default |
|----------------------|---------|
| <i>delay_seconds</i> | 5 |
| <i>hold_seconds</i> | 10 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show ipv6 ospf**

Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3  
  alaOspf3TimerSpfDelay  
  alaOspf3TimerSpfHold
```

ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

ipv6 ospf virtual-link area *area_id* **router** *router_id* [**dead-interval** *seconds*] [**hello-interval** *seconds*] [**retrans-interval** *seconds*] [**transit-delay** *seconds*]

no ipv6 ospf virtual-link area *area_id* **router** *router_id*

Syntax Definitions

| | |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>router_id</i> | A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System. |
| dead-interval <i>seconds</i> | Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647. |
| hello-interval <i>seconds</i> | Sets the virtual link hello interval, which is the time interval between OSPFv3 hellos sent on this virtual link. The valid range is 1–65535. |
| retrans-interval <i>seconds</i> | Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPFv3 packets. The valid range is 0–3600. |
| transit-delay <i>seconds</i> | Sets the virtual link transit delay, which is the number of seconds to transmit OSPFv3 packets over this link. The valid range is 0–3600. |

Defaults

| parameter | default |
|----------------------------------------|---------|
| dead-interval <i>seconds</i> | 40 |
| hello-interval <i>seconds</i> | 10 |
| retrans-interval <i>seconds</i> | 5 |
| transit-delay <i>seconds</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a

virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.

- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf virtual-link](#) Displays the virtual link information.

MIB Objects

```
ospfv3VirtIfTable
  ospfv3VirtIfAreaId
  ospfv3VirtIfNeighbor
  ospfv3VirtIfStatus
  ospfv3VirtIfRtrDeadInterval
  ospfv3VirtIfHelloInterval
  ospfv3VirtIfRetransInterval
  ospfv3VirtIfTransitDelay
```

ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

ipv6 ospf area *area_id* [**type** {**normal** | **stub** [**default-metric** *metric*] | **nssa** [**default-metric** *metric*]}] | [**summarize** [**filter**]

no ipv6 ospf area *area_id*

Syntax Definitions

| | |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format or a unique identification number in the range 0 to 4294967295. |
| normal | Sets the area as a regular OSPFv3 area. |
| stub | Configures an OSPFv3 area as a stub area. |
| nssa | Configures an OSPFv3 area as a NSSA (Not-So-Stubby Area). |
| <i>metric</i> | Defines the metric to be used for default routes injected into the stub or NSSA. The range is 0 to 4294967295. |
| summarize | Configures the inter-area route summarization. Prefixes that fall within the summary range can be shared with another area through the summary prefix. |
| filter | Configure to filter the routes specified in the summarization range. These filtered routes are not advertised into another area. |

Defaults

| parameter | default |
|-------------------------------------------|---------------|
| normal stub nssa | normal |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- To change the area type, first delete the area, and then recreate it with the new type.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub or NSSA.

Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub default-metric 15
-> ipv6 ospf area 0.0.0.1 type normal
-> ipv6 ospf area 0.0.0.1 type nssa
-> ipv6 ospf area 0.0.0.1 summarize 2001:1::/64
-> no ipv6 ospf area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **nssa** keyword added.

Related Commands

ospfv3AreaSummary

ospfv3StubMetric

ospfv3AreaId

ospfv3AreaImportAsExtern

ipv6 ospf area area-summary

Configures whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs.

```
ipv6 ospf area area_id [area-summary {noareasummary / sendareasummary}]
```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | The area ID configured for a stub or NSSA. |
| noareasummary | When set to this option, inter-area LSAs will neither originate or propagate into the NSSA. Only a default route will be advertised into the NSSA. |
| sendareasummary | When set to this option, inter-area LSAs will be summarized and propagated into the NSSA. |

Defaults

| parameter | default |
|---------------------------------|-----------------|
| noareasummary sendareasummary | sendareasummary |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 ospf area 0.0.0.1 area-summary noAreaSummary
```

Release History

Release 8.4.1; command introduced.

Related Commands

| | |
|-------------------------------------|-------------------------------------------------------------------|
| ipv6 ospf area | Assigns an OSPFv3 interface to a specified area. |
| show ipv6 ospf area | Displays either all the OSPFv6 areas, or a specified OSPFv6 area. |

MIB Objects

ospfv3AreaSummary

ipv6 ospf area nssa-translator-role

Configures whether or not an NSSA border router will unconditionally translate Type-7 LSAs into Type-5 LSAs.

ipv6 ospf area *area_id* [nssa-translator-role {always | candidate}]

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| always | When set to this option, NSSA border router always translates Type-7 LSAs into Type-5 LSAs regardless of the translator state of other NSSA border routers. |
| candidate | When set to this option, NSSA border router participates in the translator election process. |

Defaults

| parameter | default |
|--------------------|-----------|
| always candidate | candidate |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When translator role is set to **candidate**, NSSA border router invokes a translator election process. The translator is then established by the NSSA border router whose router LSA has the greatest router ID.

Examples

```
-> ipv6 ospf area 0.0.0.1 nssa-translator role always
```

Release History

Release 8.4.1; command introduced.

Related Commands

| | |
|-------------------------------------|-------------------------------------------------------------------|

| show ipv6 ospf area | Displays either all the OSPFv6 areas, or a specified OSPFv6 area. |

MIB Objects

ospfv3AreaNssaTranslatorRole

ipv6 ospf area nssa-translator-stab-interval

Configures the duration for which a Type-7 translator will continue in the translator role after another NSSA border router translator has assumed the role.

```
ipv6 ospf area area_id [nssa-translator-stab-interval interval]
```

Syntax Definitions

| | |
|-----------------|------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>interval</i> | NSSA translator stability interval value in seconds. The range is 0 to 4294967295. |

Defaults

The default value is 40 seconds.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 ospf area 0.0.0.1 nssa-translator-stab-interval 60
```

```

ipv6 ospf area nssa-summarize

Configures an NSSA summary of IPv6 prefix in the given area. Any NSSA LSAs within the area subsumed by IPv6 prefix will be summarized into other areas as an external LSA with a prefix of IPv6 prefix.

```
ipv6 ospf area area_id nssa-summarize ipv6_address_prefix [filter]
```

Syntax Definitions

| | |
|----------------------------|-------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>ipv6_address_prefix</i> | The 128-bit IPv6 address in hexadecimal format. |
| filter | Use filter option to suppress the external LSA. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ipv6 ospf area 2 nssa-summarize c000::/64
```

Release History

Release 8.4.1 R03; command introduced.

Related Commands

| | |
|-------------------------------------|-------------------------------------------------------------------|
| ipv6 ospf area | Assigns an OSPFv3 interface to a specified area. |
| show ipv6 ospf area | Displays either all the OSPFv6 areas, or a specified OSPFv6 area. |

MIB Objects

ospfv3AreaAggregateTable

ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

ipv6 ospf interface *interface_name*

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

Examples

```
-> ipv6 ospf interface vlan-101  
-> no ipv6 ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex
```

ipv6 ospf interface admin-state

Enables or disables the administration status on an OSPFv3 interface.

ipv6 ospf interface *interface_name* **admin-state** {enable | disable}

no ipv6 ospf interface *interface_name*

Syntax Definitions

| | |
|-----------------------|--------------------------------|
| <i>interface_name</i> | The name of the interface. |
| enable | Enables the OSPFv3 interface. |
| disable | Disables the OSPFv3 interface. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfAdminStat
```

ipv6 ospf interface suppress-link-lsa

Allows to suppress the announcements of the Link State Advertisements (LSAs).

```
ipv6 ospf interface interface_name suppress-link-lsa
```

```
no ipv6 ospf interface interface_name suppress-link-lsa
```

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of the command to disable LSA suppression.

Examples

```
-> ipv6 ospf interface vlan-101 suppress-link-lsa  
-> no ipv6 ospf interface vlan-101 suppress-link-lsa
```

Release History

Release 8.1.1; command introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```

```

ipv6 ospf interface type

Allows to configure the type of OSPFv3 interface.

```
ipv6 ospf interface interface_name type {broadcast | point-to-point | point-to-multipoint | nbma}
```

Syntax Definitions

| | |
|----------------------------|---------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| broadcast | The interface is a broadcast interface. |
| point-to-point | The interface is a point-to-point interface. |
| point-to-multipoint | The interface is a point-to-multipoint interface. |
| nbma | The interface is a NBMA interface. |

Defaults

| parameter | default |
|----------------------------------------------------------------|------------------|
| broadcast point-to-point point-to-multipoint nbma | broadcast |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 type nbma
-> ipv6 ospf interface vlan-101 type point-to-point
-> ipv6 ospf interface vlan-101 type point-to-multipoint
-> ipv6 ospf interface vlan-101 type broadcast
```

Release History

Release 8.1.1; command introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
  ospfv3IfStatus
  ospfv3IfType
```

ipv6 ospf neighbor

Allows to configure OSPFv3 neighbor on non-broadcast interface type. The neighbor configuration is required on NBMA and point-to-multipoint interface to run OSPFv3.

ipv6 ospf neighbor *nbr_ipv6_address* **interface** *interface_name* {**eligible** | **ineligible**}

no ipv6 ospf neighbor *nbr_ipv6_address*

Syntax Definitions

| | |
|-------------------------|-----------------------------------------------------------------------|
| <i>nbr_ipv6_address</i> | Link-local address of the neighbor to be linked. |
| <i>interface_name</i> | The name of the interface on which the neighbor is reachable. |
| eligible | Indicates the neighbor is eligible to become the designated router. |
| ineligible | Indicates the neighbor is ineligible to become the designated router. |

Defaults

| parameter | default |
|-------------------------------------|-----------------|
| eligible ineligible | eligible |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to delete the neighbor configuration.
- The OSPFv3 interface must be configured before configuring the OSPFv3 neighbor.
- This command is not applicable for broadcast interface type and is optional for point-to-point interface type.

Examples

```
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 eligible
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 ineligible
-> no ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101
```

Release History

Release 8.1.1; command introduced.

Related Commands

- show ipv6 ospf interface** Displays the status and statistics of an OSPFv3 interface.
- ipv6 ospf interface admin-state** Allows to configure the type of OSPFv3 interface.

MIB Objects

```
ospfv3NbrTable  
  ospfv3NbrPriority  
  ospfv3NbmaNbrStatus
```

ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

```
ipv6 ospf interface interface_name area area_id
```

Syntax Definitions

| | |
|-----------------------|---------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>area_id</i> | A unique 32-bit value in IP address format. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------------|-------------------------------------------------------------------|
| show ipv6 ospf area | Displays either all the OSPFv3 areas, or a specified OSPFv3 area. |
| show ipv6 ospf interface | Displays the status and statistics of an OSPFv3 interface. |

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfAreaId
```

ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

```
ipv6 ospf interface interface_name dead-interval seconds
```

Syntax Definitions

interface_name The name of the interface.

seconds The dead interval, in seconds. The valid range is 1–65535.

Defaults

| parameter | default |
|--------------------------------------------------|---------|
| <i>seconds</i> (broadcast and point-to-point) | 40 |
| <i>seconds</i> (NBMA and point-to-multipoint) | 120 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 ospf interface hello-interval](#)

Configures the OSPFv3 interface hello interval.

[show ipv6 ospf interface](#)

Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfRtrDeadInterval
```

ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

```
ipv6 ospf interface interface_name hello-interval seconds
```

Syntax Definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| <i>seconds</i> | The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPFv3 interface. |

Defaults

| parameter | default |
|--------------------------------------------------|---------|
| <i>seconds</i> (broadcast and point-to-point) | 10 |
| <i>seconds</i> (NBMA and point-to-multipoint) | 30 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------------------------|------------------------------------------------------------|
| ipv6 ospf interface dead-interval | Configures the OSPFv3 interface dead interval. |
| show ipv6 ospf interface | Displays the status and statistics of an OSPFv3 interface. |

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfHelloInterval
```

ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

```
ipv6 ospf interface interface_name cost cost
```

Syntax Definitions

interface_name The name of the interface.
cost The interface cost. The valid range is 0–65535.

Defaults

| parameter | default |
|-------------|---------|
| <i>cost</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfMetricValue
```

ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface *interface_name* **priority** *priority*

Syntax Definitions

interface_name The name of the interface.
priority The interface priority. The valid range is 0–255.

Defaults

| parameter | default |
|-----------------|---------|
| <i>priority</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

 ospfv3IfIndex
 ospfv3IfRtrPriority

ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

```
ipv6 ospf interface interface_name retrans-interval interval
```

Syntax Definitions

interface_name The name of the interface.

seconds The retransmit interval, in seconds. The valid range 0–3600.

Defaults

| parameter | default |
|-----------------|---------|
| <i>interval</i> | 5 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfRetransInterval
```

ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

```
ipv6 ospf interface interface_name transit-delay delay
```

Syntax Definitions

interface_name The name of the interface.
delay The transit delay, in seconds. The valid range is 0–3600.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

MIB Objects

ospfv3IfTable
 ospfv3IfIndex
 ospfv3IfTransitDelay

ipv6 ospf bfd-state

Enables or disables the registration of OSPFv3 with the BFD protocol.

```
ipv6 ospf bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|--------------------------|
| enable | Enables BFD for OSPFv3. |
| disable | Disables BFD for OSPFv3. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and OSPFv3 must be registered with BFD at the protocol level before OSPFv3 can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the OSPFv3 protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPFv3 will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of OSPFv3 with the BFD protocol:

```
-> ipv6 ospf bfd-state enable  
-> ipv6 ospf bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

| | |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| ip bfd admin-state | Enables or disables the global BFD protocol status for the switch. |
| ipv6 ospf bfd-state all-interfaces | Enables or disables BFD for all OSPFv3 interfaces configured. |
| ipv6 ospf interface bfd-state | Enables or disables BFD for a specific OSPFv3 interface. |
| ipv6 ospf interface bfd-state drs-only | Establishes BFD sessions only on neighbors in full state. |
| ipv6 ospf interface bfd-state all-neighbors | Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state. |
| show ipv6 ospf | Displays OSPFv3 status and general configuration parameters. |

MIB Objects

```
alaProtocolOspf3  
  alaOspf3BfdStatus
```

ipv6 ospf bfd-state all-interfaces

Enables or disables BFD for all OSPFv3 interfaces in the switch configuration.

```
ipv6 ospf bfd-state all-interfaces {enable | disable}
```

Syntax Definitions

| | |
|----------------|---------------------------------------------|
| enable | Enables BFD for all the OSPFv3 interfaces. |
| disable | Disables BFD for all the OSPFv3 interfaces. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf bfd-state all-interfaces enable  
-> ipv6 ospf bfd-state all-interfaces disable
```

Release History

Release 8.4.1.R03; command was introduced.

ipv6 ospf interface *if_name* bfd-state {enable | disable}

Syntax Definitions

| | |
|----------------|-------------------------------------------|
| <i>if_name</i> | The name of an existing OSPFv3 interface. |
| enable | Enables BFD for the OSPFv3 interface. |
| disable | Disables BFD for the OSPFv3 interface. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf interface int1 bfd-state enable
-> ipv6 ospf interface int2 bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

```

ipv6 ospf interface bfd-state drs-only

Establishes BFD sessions only with neighbors that are in the full state.

ipv6 ospf interface *if_name* **bfd-state drs-only**

Syntax Definitions

if_name The name of an existing OSPFv3 interface.

Defaults

| parameter | default |
|-----------|---------|
| drs-only | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The specified OSPFv3 interface must be enabled to interact with BFD.
- The BFD status for OSPFv3 must be enabled before OSPFv3 can interact with BFD.

Examples

```
-> ipv6 ospf interface int1 bfd-state drs-only
```

Release History

Release 8.4.1.R03; command was introduced.

alaOspf3IfDrsOnly

show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

show ipv6 ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used to display the general configuration parameters of the OSPFv3 router. See the Related Commands section below for commands that are used to modify the displayed parameters.

Examples

```
-> show ipv6 ospf
Status                    = Enabled,
Router ID                 = 30.1.1.2,
# Areas                   = 1,
# Interfaces              = 3,
Area Border Router       = No,
AS Border Router         = No,
External Route Tag       = 0,
SPF Hold (seconds)      = 10,
SPF Delay (seconds)     = 5,
MTU checking              = Enabled,
BFD Status                = Disabled,
# SPF calculations performed = 34,
Last SPF run (seconds ago) = N/A,
# of routes               = 1,
# of AS external LSAs    = 0,
# of neighbors that are in:
  Full state              = 1,
  Loading state           = 0,
  Exchange state         = 0,
  Exstart state          = 0,
  2way state              = 0,
  Init state              = 0,
  Attempt state          = 0,
  Down state              = 0,
Restart Support           = Enabled,
Restart Status            = Restating,
Restart Helper Support    = Enabled,
Restart Helper Status     = NotHelping
```

output definitions

| | |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Status | Displays whether OSPFv3 is currently enabled or disabled on the router. |
| Router Id | The unique identification for the router. |
| # Areas | Number of areas to which the router belongs. |
| # Interface | Number of interfaces participating in OSPFv3. |
| Area Border Router | Displays whether the router status is an area router or not. |
| AS Border Router | Displays whether the area Autonomous System Border Router status of this router is enabled or disabled. |
| External Route Tag | Displays the route tag for this router. |
| SPF Hold (seconds) | Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation. |
| SPF Delay (seconds) | Displays the time in seconds between consecutive SPF calculations. |
| MTU Checking | Displays whether Maximum Transfer Unit checking is enabled or disabled. |
| BFD Status | Displays whether BFD monitoring is enabled or disabled for OSPF. |
| # SPF calculations performed | Displays the number of SPF calculation performed. |
| Last SPF run (seconds ago) | N/A |
| # of routes | The total number of OSPFv3 routes known to this router. |
| # of AS external LSAs | The number of external routes learned from outside the router's Autonomous System (AS). |
| # of neighbors that are in: | |
| Full state | Displays the number of neighbor routers that are in Full state. |
| Loading state | Displays the number of neighbor routers that are in Loading state. |
| Exchange state | Displays the number of neighbor routers that are in Exchange state. |
| Exstart state | Displays the number of neighbor routers that are in Exstart state. |
| 2way state | Displays the number of neighbor routers that are in 2way state. |
| Init state | Displays the number of neighbor routers that are in Init state. |
| Attempt state | Displays the number of neighbor routers that are in Attempt state. |
| Down state | Displays the number of neighbor routers that are in Down state. |
| Restart Support | Indicates if graceful restart feature is enabled or disabled on an OSPFv3 router. |
| Restart Status | Displays the OSPFv3 graceful restart status. |
| Restart Helper Support | Indicates whether the router is acting as a restart helper for the neighbor. |
| Restart Helper Status | Displays the OSPFv3 graceful restart helper status. |

Release History

Release 7.1.1; command was introduced.

Release 8.4.1: OSPFv3 graceful restart fields added.

Related Commands

| | |
|---------------------------------|-----------------------------------------------------------------------------|
| ipv6 ospf admin-state | Enables or disables the administration of OSPFv3 on the router. |
| ip router router-id | Configures the router ID for the router. |
| ipv6 ospf route-tag | Configures a tag value for Autonomous System External (ASE) routes created. |
| ipv6 ospf spf-timer | Configures timers for SPF calculation. |
| ipv6 ospf mtu-checking | Enables or disables the use of Maximum Transfer Unit (MTU) checking. |
| ipv6 ospf bfd-state | Enables or disables the registration of OSPFv3 with the BFD protocol. |
| ipv6 ospf restart | Configures graceful restart feature on an OSPFv3 router. |
| ipv6 ospf restart-helper | Enables the graceful restart helper functionality. |

show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

show ipv6 ospf border-routers [**area** *area_id*] [**router** *router_id*]

Syntax Definitions

| | |
|------------------|--------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| <i>router_id</i> | A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

Examples

```
-> show ipv6 ospf border-routers
```

```
Router ID          Area          Metric    Type
-----+-----+-----+-----
6.6.6.6           0.0.0.0       2         INTRA
6.6.6.6           0.0.0.1       2         INTRA
    fe80::2d0:95ff:fee2:6bda -> pseudo1
    fe80::2d0:95ff:fee2:6bda -> pseudo2
```

output definitions

| | |
|------------------|--------------------------------------------------------------------------------------------------------------|
| Router ID | The unique identification for the router. |
| Area | A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System. |
| Metric | The metric used by the routes. |
| Type | The type of routes specified (intra or inter). |

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 ospf](#)

Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A

show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

show ipv6 ospf host [*ipv6_address*]

Syntax Definitions

ipv6_address A 128-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf host
```

```
Area           Metric   Address
-----+-----+-----
0.0.0.1        1       2001::1/64
```

output definitions

| | |
|----------------|------------------------------------------------------------------------------------------------------------|
| Area | A 32-bit IP address for a directly attached host. This can be set using the ipv6 ospf host command. |
| Metric | The metric assigned to the host. Metric is set using the ipv6 ospf host command. |
| Address | IPV6 address of the host. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 ospf host](#)

Creates or deletes an OSPFv3 entry for directly attached hosts.

```

show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

```
show ipv6 ospf lsdb [area area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

Syntax Definitions

| | |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>area_id</i> | A unique 32-bit value in IP address format. |
| rtr | Specifies router LSAs. |
| net | Specifies network LSAs. |
| netsum | Specifies network summary LSAs. |
| asbrsum | Specifies Autonomous System Border Router summary LSAs. |
| <i>ls_id</i> | The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database. |
| <i>router_id</i> | The Router ID. The ID is a unique 32-bit value such as an IP address. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display the LSDB of the OSPFv3 router. It can be used for OSPFv3 debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

Examples

```
-> show ipv6 ospf lsdb
```

| Area | Type | Link ID | Advertising Rtr | Sequence # | Age |
|---------|--------|---------|-----------------|------------|------|
| 0.0.0.0 | Router | 0 | 1.1.1.1 | 8000020f | 1117 |
| 0.0.0.0 | Router | 0 | 3.3.3.3 | 80000208 | 1121 |
| 0.0.0.0 | Router | 0 | 5.5.5.5 | 800001f1 | 1117 |

```
0.0.0.0          Router      0          30.30.30.30    800000da     1115
```

output definitions

| | |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Area | The identification of the area to which the router belongs. |
| Type | The protocol type from where the route was learned. |
| Link Id | The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database. |
| Advertising Rtr | The ID of the router that advertises the routes. |
| Sequence # | The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements). |
| Age | The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database. |

Release History

Release 7.1.1; command was introduced.

```

show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

show ipv6 ospf neighbor [**router** *ipv4_address*][**interface** *interface_name*]

Syntax Definitions

ipv4_address A 32-bit router ID of the neighboring router.
interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPFv3 router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf neighbor
```

| Router ID | Area/Transit Area | State | Interface |
|-------------|-------------------|-------|-----------|
| 1.1.1.1 | 0.0.0.0 | FULL | vlan-2071 |
| 3.3.3.3 | 0.0.0.0 | FULL | vlan-2071 |
| 5.5.5.5 | 0.0.0.0 | FULL | vlan-2071 |
| 23.23.23.23 | 0.0.0.1 | FULL | vlan-2055 |
| 23.23.23.23 | 0.0.0.1 | FULL | vlan-2056 |
| 24.24.24.24 | 0.0.0.1 | FULL | vlan-2065 |
| 24.24.24.24 | 0.0.0.1 | FULL | vlan-2066 |

output definitions

| | |
|--------------------------|---------------------------------------------|
| Router ID | The unique identification for the router. |
| Area/Transit Area | The area identifier. |
| State | The state of the OSPFv3 neighbor adjacency. |
| Interface | The name of the interface. |

```
-> show ipv6 ospf neighbor router 24.24.24.24
```

| Router ID | Area/Transit Area | State | Interface |
|-------------|-------------------|-------|-----------|
| 24.24.24.24 | 0.0.0.1 | FULL | vlan-2070 |
| 24.24.24.24 | 0.0.0.1 | FULL | vlan-2073 |

output definitions

| | |
|--------------------------|---------------------------------------------|
| Router ID | The unique identification for the router. |
| Area/Transit Area | The area identifier. |
| State | The state of the OSPFv3 neighbor adjacency. |
| Interface | The name of the interface. |

```
-> show ipv6 ospf neighbor router 1.1.1.1 interface v14
Details for Neighbor 1.1.1.1
State                = FULL,
Type                 = Dynamic,
Interface            = v14,

Restart Age           = 0 sec,
Last Restart Helper Exit Reason = None
Neighbor options:
                    V6 bit is set
                    E bit is set
                    MC bit is not set
                    N bit is not set
                    R bit is set
                    DC bit is not set
```

output definitions

| | |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| State | The state of the OSPFv3 neighbor adjacency. |
| Type | Specifies the type of neighbor. |
| Interface | The name of the interface. |
| Neighbor i/f index | The unique value assigned to the neighbor. |
| Priority | The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority. |
| Address | The IPv6 address of the host. |
| Neighbor is reporting DR as | The address of the neighbors designated router. |
| Neighbor is reporting BDR as | The address of the neighbors Backup Designated Router. |
| Neighbor is Master/Slave | The role the neighbor has with the local router during DD Exchange, which can be Master or Slave. |
| Seconds since last Hello seen | The amount of time (in seconds) since the last HELLO messages was received from this neighbor. |
| # of LSAs on retransmit list | The number of Link State updates to the neighbor that need to be retransmitted by the OSPFv3 router. |
| # of LSAs on request list | The number of Link State requests to this neighbor that have not received a response from this neighbor. |

output definitions (continued)

| | |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| # of State Changes | The number of times this OSPFv3 interface has changed its state. |
| Restart Helper Status | Indicates whether the router is acting as a restart helper for the neighbor. |
| Restart Age | The remaining time, in seconds, for the current OSPFv3 restart interval if the router is acting as a restart helper for the neighbor. |
| Last Restart Helper Exit Reason | The outcome of the last attempt at acting as a restart helper for the neighbor. |
| Neighbor options | If set: V6 - V6 support R - If clear, a node can participate in OSPFv3 topology distribution without being used to forward transit traffic N - Type 7 LSA support MC - Multicast support E - External routes support DC - Demand circuit support |

Release History

Release 7.1.1; command was introduced.

Release 8.4.1: OSPFv3 graceful restart fields added.

Related Commands

show ipv6 ospf Displays the OSPFv3 status and general configuration parameters.

```

show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

show ipv6 ospf routes [**prefix** *ipv6_address_prefix*][**gateway** *gateway*]

Syntax Definitions

ipv6_address_prefix The 128-bit IPv6 address of the route destination in hexadecimal format.
gateway The next hop IPv6 address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ipv6 ospf routes
```

| Prefix | Path Type | Metric |
|---------------------------------------|-----------|--------|
| | | 1 : 2 |
| ::/ 0 | INTER | 2 : - |
| fe80::2d0:95ff:fee0:710c -> vlan-2071 | | |
| 2051::/64 | INTRA | 2 : - |
| fe80::2d0:95ff:feac:a59f -> vlan-2055 | | |
| fe80::2d0:95ff:feac:a59f -> vlan-2056 | | |
| fe80::2d0:95ff:fed7:747e -> vlan-2065 | | |
| fe80::2d0:95ff:fed7:747e -> vlan-2066 | | |

output definitions

| | |
|------------------|----------------------------------------------------------------------|
| Prefix | The destination address of the IPv6 route in the hexadecimal format. |
| Path Type | The type of routes specified (intra or inter). |
| Metric | The cost of the route. |

Release History

Release 7.1.1; command was introduced.

Related Commands[ipv6 ospf admin-state](#)

MIB ObjectsN/A

show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

show ipv6 ospf virtual-link [*router_id*]

Syntax Definitions

router_id The router ID of the remote end of the virtual link.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 ospf virtual-link
```

| Transit Area | Peer Router ID | Intf State | Nbr State | Cost |
|--------------|----------------|------------|-----------|------|
| 0.0.0.1 | 6.6.6.6 | P2P | FULL | 2 |

output definitions

| | |
|-----------------------|--------------------------------------------------------------------|
| Transit Area | The area identification for the area assigned to the virtual link. |
| Peer Router ID | The destination router identification for the virtual link. |
| Intf State | The state of the virtual link with regards to the local router. |
| Nbr State | The state of the virtual link adjacency. |
| Cost | The cost metric of the route. |

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

```
show ipv6 ospf area [area_id]
```

Syntax Definitions

area_id A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPFv3 area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ipv6 ospf area
```

```
Area ID           Type         Stub      Number of

NSSA Translator State = Elected
# NSSA Translator State Changes = 1,
```

output definitions

| | |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Area Type | The area type. This field will be normal , stub , or NSSA . |
| Area Stub Metric | Indicates whether the area is enabled or disabled. |
| # Router LSAs | The total number of Link State Advertisements for the Area. |
| # Network LSAs | The total number of inter-area Link State Advertisements. |
| # of SPF calculations | The number of times the area has calculated the Shortest Path. |
| # Interfaces | The number of OSPFv3 interfaces. |
| # Intra-area-prefix LSAs | The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA. |
| # Inter-area-prefix LSAs | The number of inter-area-prefix LSAs. Corresponds to Type 3 summary-LSA of OSPFv3. |

output definitions (continued)

| | |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| # Inter-area-router LSAs | The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPFv3. |
| # hosts | The number of directly attached hosts. |
| # ABRs | Number of Area Border Routers in the area. |
| # ASBRs | Number of Autonomous System Border Routers in the area. |
| Summarization ranges | The range of prefixes summarized in to the area. |
| Import Area Summaries | Specifies whether or not summary routes are imported into the stub or NSSA as Type-3 summary-LSAs. |
| NSSA Translator Role | Specifies the NSSA translator role: Candidate or Always |
| NSSA Translator State | Indicates if and how an NSSA border router is performing NSSA translation (ipv6 ospf area nssa-translator-role) of NSSA-LSAs into AS-External-LSAs: Enabled, Elected, Disabled. Enabled indicates that the NSSA border router's translator role has been set to 'always'. Elected indicates that a candidate NSSA border router is translating NSSA-LSAs into AS-External-LSAs. Disabled indicates that a candidate NSSA Border router is not translating NSSA-LSAs into AS-External-LSAs. |
| # NSSA Translator State Changes | Indicates the number of translator state changes that have occurred since the last start-up of the OSPFv3 routing process. |

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; NSSA related fields added.

Related Commands

show ipv6 ospf interface

Displays OSPFv3 interface information.

show ipv6 ospf interface [*interface_name*]

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

Examples

-> show ipv6 ospf interface

| Name | DR Router ID | BDR Router ID | Admin Status | IPv6 | | | BFD Status |
|-----------|--------------|---------------|--------------|-------------|-----------|------------|------------|
| | | | | Intf Status | Intf Type | Intf State | |
| vlan-2071 | 5.5.5.5 | 0.0.0.0 | Enabled | Up | BCAST | DR | Enabled |
| vlan-2055 | 7.7.7.7 | 5.5.5.5 | Enabled | Up | BCAST | BDR | Enabled |
| vlan-2056 | 7.7.7.7 | 5.5.5.5 | Enabled | Up | BCAST | BDR | Disabled |

output definitions

| | |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name | The name of the interface. |
| DR Router ID | The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, “VLAN Management Commands,” for more information.) |
| BDR Router ID | The IP address of the backup designated router. |
| Admin Status | The current administration status of the interface, either enabled or disabled . |
| IPv6 Intf Status | Indicates whether the interface is an active OSPFv3 interface. |
| Intf Type | Whether the interface is assigned to a VLAN or tunnel. |
| Intf State | The current state of the OSPFv3 interface. It will be DR , BDR , other . |
| BFD Status | The current status of BFD for the OSPFv3 interface. |

```
-> show ipv6 ospf interface vlan-2071
Details for Intf 'vlan-2071'
```

```

```

Output fields when an IP address or interface name is specified are described below:

output definitions

| | |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type | The OSPFv3 interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint. |
| Admin Status | The current administrative status of the interface, either enabled or disabled . |
| IPv6 Interface Status | The current administrative status of the IPv6 interface, either up or down . |
| Oper Status | Indicates whether the interface is an active OSPFv3 interface. |
| State | The current state of the OSPFv3 interface. It will be down , up , dp , dr , or other . |
| Area | The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area. |
| Priority | The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority. |
| Cost | The cost added to routes learned on this interface. |
| Designated Router | The identification number of the designated router. |
| Backup Designated Router | The identification number of the backup designated router. |
| Hello Interval | The number of seconds between hello messages sent out on the interface. |
| Router Dead Interval | The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead. |

output definitions (continued)

| | |
|--------------------------------|----------------------------------------------------------------------------------------------------------------|
| Retransmit Interval | The number of seconds the interface waits before resending hello messages. |
| Transit Delay | The estimated number of seconds required to transmit a link state update over this interface. |
| Ifindex | The unique value assigned to an interface. |
| IPv6 'ifindex' | The unique value assigned to an IPv6 interface. |
| MTU | The Maximum Transfer Unit (in bytes) for the interface. |
| Link LSA suppression | Whether or not (enabled or disabled) link LSA origination is suppressed for broadcast or NBMA interface types. |
| BFD Status | The status of BFD on this interface. |
| # of attached neighbors | The number of OSPFv3 neighbors in the initialization state. |
| # of state changes | The number of times this OSPFv3 interface has changed its state. |
| Link-local address | A globally unique IPv6 address. |

Release History

Release 7.1.1; command was introduced.
 Release 8.4.1.R03; **bfd status** field added.

Related Commands

ipv6 ospf restart

Configures graceful restart feature on an OSPFv3 router.

ipv6 ospf restart

Syntax Definitions

N/A

Defaults

Graceful restart is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPFv3 router.
- The minimum hardware configuration for this command is a dual CMM configuration. The chassis based products (OmniSwitch 9900) running in a standalone or VC-1 mode must have dual CMMs. Stackable switches (OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900) or chassis based switches running with single CMM must have two or more chassis in the VC.
- This command enables both planned and unplanned restarts.

Examples

```
-> ipv6 ospf restart  
-> no ipv6 ospf restart
```

Release History

Release 8.4.1; command introduced

Related Commands

| show ipv6 ospf restart | Displays the OSPFv3 graceful restart related configuration and status. |
| show ipv6 ospf | Displays the OSPFv3 status and general configuration parameters. |
| show ipv6 ospf neighbor | Displays information on OSPFv3 non-virtual neighbors. |

MIB Objects

ospfv3RestartSupport
ospfv3RestartStatus
ospfv3RestartAge
ospfv3RestartExitReason
ospfv3RestartTime

ipv6 ospf restart initiate

Initiates a planned OSPFv3 graceful restart.

ipv6 ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be executed before executing the **takeover** or **vctakeover** command.

Example

```
-> ipv6 ospf restart initiate
```

Release History

Release 8.4.1; command introduced

Related Commands

[show ipv6 ospf restart](#) Displays the OSPFv3 graceful restart related configuration and status.

MIB Objects

```
alaOspf3RestartInitiate
```

ipv6 ospf restart interval

Configures the grace period for achieving a graceful OSPFv3 restart.

ipv6 ospf restart interval [*seconds*]

Syntax Definitions

seconds Restart timeout interval. The valid range is 1–1800 seconds.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 120 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Restart interval must be configured based on the databases size, number of neighbors, and number of OSPFv3 areas of the restarting router. If this is configured too low, there is a chance that graceful restart may fail prematurely.

Example

```
-> ipv6 ospf restart interval 180
-> no ipv6 ospf restart interval
```

Release History

Release 8.4.1; command introduced

Related Commands

| show ipv6 ospf restart | Displays the OSPFv3 graceful restart related configuration and status. |

MIB Objects

ospfv3RestartInterval

ipv6 ospf restart-helper

Enables the graceful restart helper functionality.

ipv6 ospf restart-helper

Syntax Definitions

N/A

Defaults

By default, graceful restart helper functionality is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to disable restart helper functionality.
- A router that has configured as a helper may reject helping or stop helping in the half way if there is any topology change in the OSPFv3 network.
- The graceful restart helper does not have a requirement of having dual CMMs.

Examples

```
-> ipv6 ospf restart-helper  
-> no ipv6 ospf restart-helper
```

Release History

Release 8.4.1; command introduced

Related Commands

| | |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 ospf restart | Configures graceful restart feature on an OSPFv3 router. |
| ipv6 ospf restart-helper strict-lsa-check | Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router. |
| show ipv6 ospf restart | Displays the OSPFv3 graceful restart related configuration and status. |

```

ipv6 ospf restart-helper strict-lsa-check

Enables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ipv6 ospf restart-helper strict-lsa-check

Syntax Definitions

N/A

Defaults

By default, strict-lsa-checking is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the no form of the command to disable this functionality.
- Disabling this functionality may create sub-optimal or black hole routes during the graceful restart period.
- This functionality does not have a requirement of having dual CMMs.

Examples

```
-> ipv6 ospf restart-helper strict-lsa-check  
-> no ipv6 ospf restart-helper strict-lsa-check
```

Release History

show ipv6 ospf restart

Displays the OSPFv3 graceful restart related configuration and status.

show ipv6 ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 ospf restart
Restart Support           = Enabled (planned-unplanned),
Restart Status           = Not Restarting,
Restart Interval         = 120,
Restart Age              = 0,
Last Restart Exit Reason = None,
Restart Helper Support   = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Status    = NotHelping,
Time Since Exit Reason Updated = 21:09:58
```

output definitions

| | |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart Support | The administrative status of OSPFv3 graceful restart. |
| Restart Status | The current status of OSPFv3 graceful restart, which can be Not Restarting , Unplanned Restart (after a CMM takeover), or Planned Restart (before CMM takeover). |
| Restart Interval | The configured OSPFv3 restart timeout interval, in seconds. |
| Restart Age | The remaining time, in seconds, for the current OSPFv3 graceful restart interval. |
| Last Restart Exit Reason | The outcome of the last attempt at a graceful restart. If the value is None , then no restart has yet been attempted. If the value is In Progress , then a restart attempt is currently underway. Other possible values include Completed (successfully completed), Timed Out (timed out), and Topology Changed (aborted due to topology change). |
| Restart Helper Support | The administrative status of the capability of an OSPFv3 router to operate in helper mode in response to a router performing a graceful restart. |

output definitions (continued)

| | |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart Helper Strict Checking | The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router. |
| Restart Helper Status | Indicates whether the router is acting as a graceful restart helper for the neighbor. |
| Time Since Exit Reason Updated | The value of system up time on the most recent occasion at which the last restart exit reason was updated. |

28 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP (IPv4 and IPv6) as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (that is, the usable interfaces of the router and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

The OmniSwitch version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-ISIS-MIB.mib
Module: timetraIsisMIBModule

Filename: ISIS-MIB.mib
Module: isisMIB

A summary of the available commands is listed here:

Global IS-IS Commands

ip load isis
ip isis admin-state
ip isis area-id
ip isis level-capability
ip isis auth-check
ip isis auth-type
ip isis csnp-auth
ip isis hello-auth
ip isis psnp-auth
ip isis lsp-lifetime
ip isis lsp-wait
ip isis spf-wait
ip isis summary-address
ip isis overload
ip isis overload-on-boot
ip isis graceful-restart
ip isis graceful-restart helper
ip isis strict-adjacency-check
ip isis level auth-type
ip isis level hello-auth
ip isis level csnp-auth
ip isis level psnp-auth
ip isis level wide-metrics-only

IPv4 and IPv6 Commands

ip isis activate-ipv6|ipv4
ip isis vlan
ip isis vlan admin-state
ip isis vlan interface-type
ip isis vlan csnp-interval
ip isis vlan hello-auth-type
ip isis vlan level-capability
ip isis vlan lsp-pacing-interval
ip isis vlan passive
ip isis vlan retransmit-interval
ip isis vlan default-type
ip isis vlan level hello-auth-type
ip isis vlan level hello-interval
ip isis vlan level hello-multiplier
ip isis vlan level metric
ip isis vlan level passive
ip isis vlan level priority
ip isis summary-address6

IS-IS BFD Commands

ip isis bfd-state
ip isis bfd-state all-vlans
ip isis vlan bfd-state

|-----------------------------------------|-------------------------------------|

ip load isis

Loads the IS-IS software on the router.

ip load isis

Syntax Definitions

N/A

Defaults

By default, IS-IS is not loaded on the switch.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

Examples

```
-> ip load isis
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip protocols](#) Displays switch routing protocol information and status.

MIB Objects

```
alaVrConfigTable  
  alaVrConfigIsisStatus
```

ip isis admin-state

Enables or disables the administrative status of IS-IS on the switch.

```
ip isis admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------|
| enable | Enables IS-IS. |
| disable | Disables IS-IS. |

Defaults

| parameter | default |
|------------------|---------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis admin-state enable
-> ip isis admin-state disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

```
isisSysTable
  isisSysAdminState
```

ip isis area-id

Configures the area ID for the switch.

ip isis area-id *area address*

no ip isis area-id *area address*

Syntax Definitions

area address A 1–13 byte variable length integer, which specifies the area address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the area ID.
- The area ID is part of the Network Service Access Point (NSAP) address.
- Other parts of NSAP address (system ID and selector ID) are not configurable. System ID is derived from router ID and selector ID remains always as 00.
- You can configure a maximum of three area addresses.

Examples

```
-> ip isis area-id 49.0001
-> no ip isis area-id 49.0001
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

```
isisManAreaAddrTable
isisManAreaAddrExistState
```

ip isis level-capability

Configures the router level of the IS-IS protocol globally.

```
ip isis level-capability {level-1 | level-2 | level-1/2}
```

Syntax Definitions

| | |
|------------------|--------------------------------------------------------------------|
| level-1 | Specifies that the router can operate at Level-1 only. |
| level-2 | Specifies that the router can operate at Level-2 only. |
| level-1/2 | Specifies that the router can operate at both Level-1 and Level-2. |

Defaults

| parameter | default |
|-------------------------------|-----------|
| level-1 / level-2 / level-1/2 | level-1/2 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- Configuring the level capability at the IS-IS circuit level is also possible.

Examples

```
-> ip isis level-capability level-1  
-> ip isis level-capability level-2
```

Release History

Release 7.3.3; command was introduced.

Related Commands

| | |
|-----------------------------------------------|------------------------------------------------------|
| ip isis vlan level-capability | Configures the IS-IS level on the specified circuit. |
| show ip isis status | Displays the IS-IS status. |

MIB Objects

```
isisSysTable  
isisSysType
```

ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

ip isis auth-check {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------------|
| enable | Enables authentication check for IS-IS PDUs. |
| disable | Disables authentication check for IS-IS PDUs. |

Defaults

By default, authentication check is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

Release History

Release 7.3.3; command was introduced;

Related Commands

| | |
|-----------------------------------------|-------------------------------------------------------------------------------------------|
| ip isis auth-type | Enables authentication and configures the authentication type of IS-IS protocol globally. |
| ip isis level auth-type | Enables authentication and configures the authentication types for specific IS-IS levels. |
| show ip isis status | Displays the IS-IS status. |

MIB Objects

```
vRtrIsisTable
vRtrIsisAuthCheck
```

ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

ip isis auth-type {**simple** {**key** *key* | **encrypt-key** *encrypt_key*} | **md5** {**key** *key* | **encrypt-key** *encrypt_key*} | **key-chain** *key-chain-id* | **none**}

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| simple | Simple authentication will be used. |
| md5 | Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication. |
| <i>key</i> | Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them. |
| <i>encrypt_key</i> | The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. |
| <i>key-chain-id</i> | The configured keychain ID. |
| none | No authentication will be used. |

Defaults

| parameter | default |
|----------------------------------------|-------------|
| simple / md5 key-chain / none | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command configures the authentication type of IS-IS protocol globally. These settings can be overridden at each level.
- By default, the authentication is disabled and no authentication type is configured.
- If a keychain is applied globally, the authentication algorithm of its active key will be used for adjacency formation with all peers. Use **ip isis auth-type none** to remove the keychain from IS-IS adjacency configurations.

Examples

```
-> ip isis auth-type simple key rachel
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis auth-type key-chain 2
```

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

| | |
|-----------------------------------------|-------------------------------------------------------------------------------------------|
| ip isis level auth-type | Enables authentication and configures the authentication types for specific IS-IS levels. |

  vRtrIisisAuthKeyChainId
```

ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

ip isis csnp-auth

no ip isis csnp-auth

Syntax Definitions

N/A

Defaults

CSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

Examples

```
-> ip isis csnp-auth  
-> no ip isis csnp-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

```

ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

ip isis hello-auth

no ip isis hello-auth

Syntax Definitions

N/A

Defaults

Authentication check of Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

Examples

```
-> ip isis hello-auth
-> no ip isis hello-auth
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis level hello-auth](#) Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

```

ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

ip isis psnp-auth

no ip isis psnp-auth

Syntax Definitions

N/A

Defaults

PSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

Examples

```
-> ip isis psnp-auth  
-> no ip isis psnp-auth
```

Release History

Release 7.3.3; command was introduced.

```

ip isis lsp-lifetime

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

ip isis lsp-lifetime *seconds*

no ip isis lsp-lifetime

Syntax Definitions

seconds Validity interval in seconds. The valid range is 350–65535.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 1200 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to restore the default value.

Examples

```
-> ip isis lsp-lifetime 760
-> no ip isis lsp-lifetime
```

Release History

Release 7.3.3; command was introduced.

Related Commands

- [ip isis vlan lsp-pacing-interval](#) Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
- [show ip isis status](#) Displays the IS-IS status.

ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

ip isis lsp-wait {**max-wait** | **initial-wait** | **second-wait**} *seconds*

no ip isis lsp-wait {**max-wait** | **initial-wait** | **second-wait**}

Syntax Definitions

| | |
|---------------------|----------------------------------------------------------------------------------------------------------------|
| max-wait | Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120. |
| initial-wait | Specifies the initial LSP generation delay, in seconds. The valid range is 0–100. |
| second-wait | Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100. |
| <i>seconds</i> | Specifies the time interval. |

Defaults

| parameter | default |
|----------------------------------------|---------|
| <i>seconds</i> (max-wait) | 5 |
| <i>seconds</i> (initial-wait) | 0 |
| <i>seconds</i> (second-wait) | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan lsp-pacing-interval Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

show ip isis status Displays the IS-IS status.

MIB Objects

ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

```
ip isis spf-wait {max-wait seconds | initial-wait milliseconds| second-wait milliseconds}
```

```
no ip isis spf-wait {max-wait | initial-wait | second-wait}
```

Syntax Definitions

| | |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| max-wait <i>seconds</i> | Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds. |
| initial-wait <i>milliseconds</i> | Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds. |
| second-wait <i>milliseconds</i> | Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds. |

Defaults

| parameter | default |
|-----------------------------------------|---------|
| max-wait <i>seconds</i> | 10 |
| initial-wait <i>milliseconds</i> | 1000 |
| second-wait <i>milliseconds</i> | 1000 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis spf-wait max-wait 25  
-> no ip isis spf-wait initial-wait
```

Release History

Release 7.3.3; command was introduced.

ip isis summary-address

Adds or deletes the summary address.

ip isis summary-address {*ip_prefix/mask* | *ip_prefix* [*/netmask*]} {**level-1** | **level-2** | **level-1/2**}

no ip isis summary-address {*ip_prefix/mask* | *ip_prefix* [*/netmask*]}

Syntax Definitions

| | |
|-----------------------|-------------------------------------------------------------------------|
| <i>ip_prefix/mask</i> | Specifies the IP prefix in dotted decimal notation and the mask length. |
| <i>ip_prefix</i> | Specifies the IP prefix in dotted decimal notation. |
| <i>/netmask</i> | Specifies the subnet mask in dotted decimal notation. |
| level-1 | Specifies the IS-IS level as Level-1. |
| level-2 | Specifies the IS-IS level as Level-2. |
| level-1/2 | Specifies the IS-IS level as Level-1/2. |

Defaults

| parameter | default |
|----------------------------------------------------|------------------|
| level-1 level-2 level-1/2 | level-1/2 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarized by default.

Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis summary-address Displays the IS-IS summary address database.

MIB Objects

ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

ip isis overload [*timeout seconds*]

no ip isis overload [*timeout*]

Syntax Definitions

timeout *seconds* Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> ip isis overload timeout 70  
-> no ip isis overload timeout
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state during bootup for a specified time period.

show ip isis status

Displays the IS-IS status.

MIB Objects

isisSysTable

 isisSysSetOverload

vRtrIsisTable

 vRtrIsisOverloadTimeout

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

ip isis overload-on-boot [*timeout seconds*]

no ip isis overload-on-boot [*timeout seconds*]

Syntax Definitions

timeout seconds Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS router will not be in the overload state.

| parameter | default |
|------------------------|---------|
| <i>timeout seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

Examples

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

Release History

Release 7.3.3; command was introduced.

ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

ip isis graceful-restart

no ip isis graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is disabled on the router by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

Examples

```
-> ip isis graceful-restart  
-> no ip isis graceful-restart
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis graceful-restart helper](#) Configures the helper mode of routers for graceful restart.

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

```
vRtrIisisTable  
vRtrIisisGracefulRestart
```

ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

ip isis graceful-restart helper {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------|
| enable | Enables the helper mode on the router. |
| disable | Disables the helper mode on the router. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

Examples

```
-> ip isis graceful-restart helper disable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

|------------------------------------------|--------------------------------------------|
| ip isis graceful-restart | Configures graceful restart on the router. |
| show ip isis status | Displays the IS-IS status. |

MIB Objects

vRtrIisisTable
vRtrIisisGRHelperMode

ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

ip isis strict-adjacency-check {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------|
| enable | Enables the adjacency check configuration on the router. |
| disable | Disables the adjacency check configuration on the router. |

Defaults

By default, the adjacency check configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

Examples

```
-> ip isis strict-adjacency-check enable
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis status](#) Displays the IS-IS status.

MIB Objects

ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

ip isis level {1 | 2} auth-type {simple {key *key* | encrypt-key *encrypt_key*} | md5 {key *key* | encrypt-key *encrypt_key*} | key-chain *key-chain-id* | none}

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |
| simple | Simple authentication will be used. |
| md5 | Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication. |
| <i>key</i> | Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them. |
| <i>encrypt_key</i> | The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. |
| <i>key-chain-id</i> | The configured keychain ID. |
| none | No authentication will be used. |

Defaults

| parameter | default |
|----------------------------------------|-------------|
| simple / md5 key-chain / none | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the **key** parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- Use **key-chain** parameter to apply a keychain to IS-IS adjacency at the capability level. Use **ip isis level auth-type none** to remove the capability level keychain authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis level 2 auth-type simple key rachel
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis level 2 auth-type key-chain 1
-> ip isis level 2 auth-type none
```

Release History

Release 7.3.3; command was introduced.

Release 8.4.1; **key-chain** parameter added.

ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

ip isis level {1 | 2} hello-auth

no ip isis level {1 | 2} hello-auth

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

Authentication check of Level Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

Examples

```
-> ip isis level 1 hello-auth  
-> no ip isis level 1 hello-auth
```

Release History

Release 7.3.3; command was introduced.

ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} csnp-auth

no ip isis level {1 | 2} csnp-auth

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

Release History

Release 7.3.3; command was introduced.

ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} psnp-auth

no ip isis level {1 | 2} psnp-auth

Syntax Definitions

| | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

Examples

```
-> ip isis level 1 psnp-auth  
-> no ip isis level 1 psnp-auth

ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

ip isis level {1 | 2} wide-metrics-only

no ip isis level {1 | 2} wide-metrics-only

Syntax Definitions

- | | |
|---|---------------------------------------|
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

By default, wide metrics is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

Examples

```
-> ip isis level 1 wide-metrics-only  
-> no ip isis level 1 wide-metrics-only
```

Release History

Release 7.3.3; command was introduced.

Configures the IPv6 or IPv4 routing in IS-IS.

```
ip isis {activate-ipv6 | activate-ipv4}
```

```
no ip isis {activate-ipv6 | activate-ipv4}
```

Syntax Definitions

activate-ipv6 Enables IPv6 routing in IS-IS.

activate-ipv4 Enables IPv4 routing in IS-IS.

Defaults

By default, both IPv4 and IPv6 routing is enabled in IS-IS.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The **no** form of this command disables the IPv4/IPv6 routing in IS-IS.

Examples

```
-> ip isis activate-ipv6
-> ip isis activate-ipv4
-> no ip isis activate-ipv4
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis vlan

Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN. This command enables IS-IS routing on a particular VLAN. This is used to add both the IPv4 and IPv6 interfaces on a particular VLAN to the IS-IS circuit.

```
ip isis vlan vlan_id [address-family {v4 | v6 | v4v6}]
```

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN on which IS-IS is to be enabled. |
| v4 v6 v4v6 | The address family extension. The type of interface (IPv4 or IPv6) is controlled by the address-family extension. |

Defaults

By default, both address families (IPv4 and IPv6) are disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The **no** form of this command disables IPv4/IPv6 IS-IS circuit on a particular VLAN.

Examples

```
-> ip isis vlan 10
-> ip isis vlan 10 address-family v6
-> no ip isis vlan 10 address-family v6
```

Release History

Release 7.3.3; command was introduced.

ip isis vlan admin-state

Enables or disables IS-IS on a circuit.

```
ip isis vlan vlan_id admin-state {enable / disable}
```

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN on which IS-IS routing is to be enabled. |
| enable | Administratively enables IS-IS on the VLAN. |
| disable | Administratively disables IS-IS on the VLAN. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis vlan 10 admin-state enable  
-> ip isis vlan 10 admin-state disable
```

Release History

Release 7.3.3; command was introduced.

ip isis vlan csnp-interval

Configures the time interval in seconds to send Complete Sequence Number PDUs (CSNP) PDUs from the specified VLAN circuit.

ip isis vlan *vlan_id* **csnp-interval** *seconds*

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| <i>seconds</i> | The time interval in seconds between successive CSNP PDUs sent on an interface after which IS-IS must generate a CSNP PDU on the specified circuit. The valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|------------------------------------------------------------------------|
| <i>seconds</i> | Broadcast interface: 10 seconds Point-to-Point interface: 5 seconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The **no** form of this command reverts the time interval to the default value.

Examples

```
-> ip isis vlan 10 csnp-interval 10
-> no ip isis vlan 10 csnp-interval
```

Release History

Release 7.3.3; command was introduced.

ip isis vlan hello-auth-type

Configures the authentication settings for the hello protocol at a circuit level.

```
ip isis vlan vlan_id hello-auth-type {simple {key key | encrypt-key encrypt_key} | md5 {key key | encrypt-key encrypt_key} | key-chain key-chain-id | none}
```

Syntax Definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| simple | Simple authentication will be used. |
| md5 | Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication. |
| <i>key</i> | Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them. |
| <i>encrypt_key</i> | The key in hexadecimal format to provide security considerations on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. |
| <i>key-chain-id</i> | The configured keychain ID. |
| none | No authentication will be used. |

Defaults

| parameter | default |
|----------------------------------------|-------------|
| simple / md5 key-chain / none | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the *encrypt_key*. The Configuration snapshot always displays the password in the encrypted form. You must use only this *key* parameter during the CLI configuration.
- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as *encrypt_key*.

- Use **key-chain** parameter to apply a keychain at a circuit level. Use **ip isis vlan hello-auth-type none** to remove the circuit level keychain authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 hello-auth-type md5 key asddfgfhno
-> ip isis vlan 10 hello-auth-type simple key sdsdff
-> ip isis vlan 100 hello-auth-type key-chain 1
-> ip isis vlan 100 hello-auth-type none
```

Release History

Release 7.3.3; command was introduced.
Release 8.4.1; **key-chain** parameter added.

Related Commands

ip isis vlan level hello-auth-type Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

show ip isis vlan Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIisisIfHelloAuthKey
vRtrIisisIfHelloAuthType
vRtrIisisIfHelloAuthKeyChainId
```

ip isis vlan level-capability

Configures the IS-IS level on the specified circuit.

```
ip isis vlan vlan_id level-capability [level-1 | level-2 | level-1/2]
```

Syntax Definitions

| | |
|------------------|-----------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| level-1 | Specifies that the interface can operate at Level-1 only. |
| level-2 | Specifies that the interface can operate at Level-2 only. |
| level-1/2 | Specifies that the interface can operate at both Level-1 and Level-2. |

Defaults

| parameter | default |
|-------------------------------|-----------|
| level-1 level-2 level-1/2 | level-1/2 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

Examples

```
-> ip isis vlan 10 level-capability level-1  
-> ip isis vlan 10 level-capability level-1/2
```

Release History

Release 7.3.3; command was introduced.

Related Commands

| | |
|------------------------------------------|-----------------------------------------------------------------------------------------|
| ip isis level-capability | Configures the router level of the IS-IS protocol globally. |
| show ip isis vlan | Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database. |

MIB Objects

```
isisCircTable  
  isisCircLevel
```

ip isis vlan lsp-pacing-interval

Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

ip isis vlan *vlan_id* **lsp-pacing-interval** *milliseconds*

no ip isis vlan *vlan_id* **lsp-pacing-interval**

Syntax Definitions

| | |
|---------------------|-------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| <i>milliseconds</i> | The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>milliseconds</i> | 100 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

Examples

```
-> ip isis vlan 10 lsp-pacing-interval 1000  
-> no ip isis vlan 10 lsp-pacing-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis lsp-lifetime](#)

Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.

[ip isis lsp-wait](#)

Configures the time interval between successively generated LSPs.

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIisisIfTable

vRtrIisisIfLspPacingInterval

ip isis vlan passive

Configures the IS-IS circuit as passive.

ip isis vlan *vlan_id* **passive**

no ip isis vlan *vlan_id* **passive**

Syntax Definitions

vlan_id The VLAN ID of a given VLAN.

Defaults

By default, the interface is not passive.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS PDUs (Protocol Data Unit) and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 passive  
-> no ip isis vlan 10 passive
```

Release History

Release 7.3.3; command was introduced.

Related Commands

| | |
|--------------------------------------------|-----------------------------------------------------------------------------------------|
| ip isis vlan level passive | Configures the IS-IS circuit as passive at the specified IS-IS level. |
| show ip isis vlan | Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database. |

MIB Objects

```
isisCircTable  
  isisCircPassiveCircuit
```

ip isis vlan retransmit-interval

Configures the minimum time interval between LSP (Link State Packet) retransmissions on a point-to-point interface.

ip isis vlan *vlan_id* **retransmit-interval** *seconds*

no ip isis vlan *vlan_id* **retransmit-interval**

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| <i>seconds</i> | The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 5 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- The retransmit interval should be greater than the expected round-trip delay between two devices to avoid any needless retransmission of PDUs.

Examples

```
-> ip isis vlan 10 retransmit-interval 130
-> no ip isis vlan 10 retransmit-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTbale
vRtrIsisIfRetransmitInterval
```

ip isis vlan default-type

Sets the interface type to default, that is, broadcast.

ip isis vlan *vlan_id* default-type

Syntax Definitions

vlan_id The VLAN ID of a given VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip isis vlan 10 default-type
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis vlan interface-type](#) Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

MIB Objects

```
vRtrIsisIfTable
vRtrIsisIfTypeDefault
```

ip isis vlan level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

ip isis vlan *vlan_id* **level** {1 | 2} **hello-auth-type** {**simple** {**key** *key* / **encrypt-key** *encrypt_key*} | **md5** {**key** *key* | **encrypt-key** *encrypt_key*} | **key-chain** *key-chain-id* / **none**}

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |
| simple | Simple authentication will be used. |
| md5 | Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication. |
| <i>key</i> | Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them. |
| <i>encrypt_key</i> | The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form. |
| <i>key-chain-id</i> | The configured keychain ID. |
| none | No authentication will be used. |

Defaults

| parameter | default |
|----------------------------------------|-------------|
| simple / md5 key-chain / none | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt_key* parameter to configure the password by supplying the encrypted form of the password as the **encrypt-key**. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt_key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done at an interface level.
- Use **key-chain** parameter to apply a keychain at the capability level per circuit. Use **ip isis vlan level hello-auth-type none** to remove the capability level keychain authentication per circuit.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 level 1 hello-auth-type md5 key xyz123
-> ip isis vlan 10 level 2 hello-auth-type none
-> ip isis vlan 100 level 2 hello-auth-type key-chain 1
-> ip isis vlan 100 level 2 hello-auth-type none
```

Release History

Release 7.3.3; command was introduced.

Release 8.4.1; **key-chain** parameter added.

Related Commands

| | |
|----------------------------------------------|-----------------------------------------------------------------------------------------|
| ip isis vlan hello-auth-type | Configures the authentication settings for the hello protocol at a circuit level. |
| show ip isis vlan | Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database. |

MIB Objects

```
vRtrIisisIfLevelTable
  vRtrIisisIfLevelHelloAuthType
  vRtrIisisIfLevelHelloAuthKey
  vRtrIisisIfLevel
  vRtrIisisIfLevelHelloAuthKeyId
```

ip isis vlan level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level on a circuit.

ip isis vlan *vlan_id* level {1 | 2} **hello-interval** *seconds*

no ip isis vlan *vlan_id* level {1 | 2} **hello-interval**

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |
| <i>seconds</i> | The hello interval, in seconds. The valid range is 1–20000. |

Defaults

| parameter | default |
|-----------------------------------------|---------|
| <i>seconds</i> (designated routers) | 3 |
| <i>seconds</i> (non-designated routers) | 9 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-interval 50
-> no isis vlan 10 level 2 hello-interval
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIisisIfLevelTable
  vRtrIisisIfLevelHelloTimer
```

ip isis vlan level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

ip isis vlan *vlan_id* level {1 | 2} **hello-multiplier** *number*

no ip isis vlan *vlan_id* level {1 | 2} **hello-multiplier**

Syntax Definitions

| | |
|----------------|-----------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |
| <i>number</i> | The multiplier (2–100) of the hello interval. |

Defaults

| parameter | default |
|---------------|---------|
| <i>number</i> | 3 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-multiplier 10
-> no ip isis vlan 10 level 2 hello-multiplier
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#) Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircLevelTable
  isisCircLevelHelloMultiplier
```

ip isis vlan level metric

Configures the metric value of the specified IS-IS level of the circuit.

ip isis vlan *vlan_id* level {**1** | **2**} metric *number*

no ip isis vlan *vlan_id* level {**1** | **2**} metric

Syntax Definitions

| | |
|----------------|--------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |
| <i>number</i> | The metric value (1–16777215) assigned for the specified level of the circuit. |

Defaults

| parameter | default |
|---------------|---------|
| <i>number</i> | 10 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each circuit must have a cost. The costs for each level on a circuit may be different. If the metric is not configured, the default of 10 is used.

Examples

```
-> ip isis vlan 10 level 1 metric 25
-> no ip isis vlan 10 level 2 metric
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIisisIfLevelTable
vRtrIisisIfLevelAdminMetric

ip isis vlan level passive

Configures the IS-IS circuit as passive at the specified IS-IS level.

ip isis vlan *vlan_id* level {1 | 2} **passive**

no ip isis vlan *vlan_id* level {1 | 2} **passive**

Syntax Definitions

| | |
|----------------|---------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |

Defaults

By default, the interface level passive configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit at the given level to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol PDUs and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 level 1 passive  
-> no ip isis vlan 10 level 1 passive
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis vlan passive](#)

Configures the IS-IS circuit as passive.

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIisisIfLevelTable  
  vRtrIisisIfLevelPassive
```

ip isis vlan level priority

Configures the priority of the IS-IS circuit for the designated router election on a multi-access network.

ip isis vlan *vlan_id* level [1 | 2] **priority** *number*

no ip isis vlan *vlan_id* level [1 | 2] **priority**

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| 1 | Specifies the IS-IS level as Level-1. |
| 2 | Specifies the IS-IS level as Level-2. |
| <i>number</i> | The priority value of the IS-IS circuit at this level. The valid range is 0–127. |

Defaults

| parameter | default |
|------------------|----------------|
| <i>number</i> | 64 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- This priority is included in hello PDUs transmitted by the circuit on a multi-access network.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

Examples

```
-> ip isis vlan 10 level 1 priority 4
-> ip isis vlan 10 level 2 priority 4
-> no ip isis vlan 10 level 1 priority
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis vlan](#)

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIisisIfLevelTable
vRtrIisisIfLevelISPriority

ip isis summary-address6

Configures the IPv6 summary address.

```
ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}
```

```
no ip isis summary-address6 {ipv6_prefix/prefix_length | ipv6_address} {level-1 | level-2 | level-1/2}
```

Syntax Definitions

| | |
|----------------------------------|--------------------------------------------------------------------------|
| <i>ipv6_prefix/prefix_length</i> | IPv6 prefix and prefix length. |
| <i>ipv6_address</i> | IPv6 address. |
| level-1 | Specifies that the routes can be summarized at Level-1 only. |
| level-2 | Specifies that the routes can be summarized at Level-2 only. |
| level-1/2 | Specifies that the routes can be summarized at both Level-1 and Level-2. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to remove an already configured summary address.

Examples

```
-> ip isis summary-address6 4001::/16 level-1  
-> no ip isis summary-address6 4001::/16
```

Release History

Release 7.3.3; command was introduced.

Related Commands

[show ip isis summary-address6](#) Displays the IS-IS IPv6 summary address database.

MIB Objects

```
vRtrIisisInetSummLevel  
vRtrIisisInetSummRowStatus
```

ip isis bfd-state

Enables or disables the registration of IS-IS with the BFD protocol.

```
ip isis bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-------------------------|
| enable | Enables BFD for IS-IS. |
| disable | Disables BFD for IS-IS. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and IS-IS must be registered with BFD at the protocol level before IS-IS can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and IS-IS acts based upon the BFD message.
- Whenever a neighbor goes down, IS-IS will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of IS-IS with the BFD protocol:

```
-> ip isis bfd-state enable  
-> ip isis bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

| | |
|------------------------------------|----------------------------------------------------------------------------------------|
| ip bfd admin-state | Enables or disables the global BFD protocol status for the switch. |
| ip isis bfd-state all-vlans | Enables or disables BFD monitoring for all PIM interfaces in the switch configuration. |
| ip isis vlan bfd-state | Enables or disables BFD monitoring on a specific PIM interface. |
| show ip isis status | Displays the IS-IS status. |

MIB Objects

vRtrIisisIfTable
vRtrIisisBfdStatus

ip isis bfd-state all-vlans

Enables or disables BFD monitoring for all IS-IS VLANs in the switch configuration.

```
ip isis bfd-state all-vlans {enable | disable}
```

Syntax Definitions

| | |
|----------------|---------------------------------------|
| enable | Enables BFD for all the IS-IS VLANs. |
| disable | Disables BFD for all the IS-IS VLANs. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for IS-IS must be enabled before IS-IS can interact with BFD.

Examples

```
-> ip isis bfd-state all-vlans enable  
-> ip isis bfd-state all-vlans disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

| | |
|----------------------------------------|-----------------------------------------------------------------------------------------|
| ip isis bfd-state | Enables or disables the registration of IS-IS with the BFD protocol. |
| ip isis vlan bfd-state | Enables or disables BFD monitoring on a specific IS-IS VLAN. |
| show ip isis vlan | Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database. |

MIB Objects

```
vRtrIisisTable  
  vRtrIisisBfdAllVlanStatus
```

ip isis vlan bfd-state

Enables or disables BFD monitoring for a specific IS-IS VLAN.

```
ip isis vlan vlan_id bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|--------------------------------------------|
| <i>vlan_id</i> | The VLAN ID of a given VLAN. |
| enable | Enables BFD for the specified IS-IS VLAN. |
| disable | Disables BFD for the specified IS-IS VLAN. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Registering IS-IS with BFD is required at the protocol level before IS-IS can interact with BFD.
- When BFD is enabled on the specified IS-IS VLAN, BFD is applied to all IPv4 and IPv6 interfaces configured for the VLAN.
- A single IS-IS adjacency covers both IPv4 and IPv6 interfaces, but the interfaces are treated independently within the adjacency. If an IS-IS adjacency has both interface types, there will be two BFD sessions (one for each interface). When one interface goes down, only the routes learned through that interface are removed.

Examples

```
-> ip isis vlan 10 bfd-state enable  
-> ip isis vlan 10 bfd-state disable
```

Release History

Release 8.4.3.R03; command was introduced.

Related Commands

ip isis bfd-state

Enables or disables the registration of IS-IS with the BFD protocol.

ip isis bfd-state all-vlans

Enables or disables BFD monitoring for all IS-IS interfaces in the switch configuration.

show ip isis vlan

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

vRtrIisisIfTable

vRtrIisisIfBfdStatus

show ip isis adjacency

Displays information about IS-IS adjacent routers.

show ip isis adjacency [{system-id *nbr_sys_id* | vlan *vlan_id*] [detail]

Syntax Definitions

nbr_sys_id The system ID of the neighbor router.
vlan_id The VLAN ID of a given VLAN.

Defaults

By default adjacency information for all the neighbor routers are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use *the nbr_sys_id* or *vlan_id* parameter with this command to view the adjacency information for a specific neighbor.

Examples

```
-> show ip isis adjacency
=====
ISIS Adjacency
=====
System ID           Type      State    Hold    VlanID   MT IDs   Hostname
-----
0000.0000.0001     L1        UP       25      20       0, 2    Router-A

=====
```

output definitions

| | |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System ID | The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID. |
| Type | The level (L1 , L2 , or L1/L2) of the adjacent router. |
| State | The state of the adjacent router (Up or Down). |
| Hold | The Hold time of the adjacent router. |
| VlanID | The VLAN ID of the adjacent router. |
| MT IDs | MT IDs sent by MT enabled ISIS neighbour. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbour. |

output definitions

| | |
|--------------------|---------------------------------------|
| Hostname | The host name of the adjacent router. |
| Adjacencies | The total number of adjacent routers. |

output definitions

| | |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SystemID | The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID. |
| VLAN | The Vlan ID in which the adjacency is present. |
| MT IDs | MT IDs sent by MT enabled ISIS neighbor. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbor. |
| NLPIDs | The IP address families supported by IS-IS neighbor: IPv4 or IPv6 |
| State | The state of the adjacent router (Up or Down). |
| Adj Level | The adjacency level (L1 or L2) of the router. |
| Nbr Sys Type | The type of the neighboring router(L1 , L2 or L1L2) |
| Hold Time | The Hold time of the adjacent router. |

output definitions

| | |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv4 Neighbor | The 32-bit IP address of the neighbor. |
| IPv6 Neighbor | The 32-bit IPv6 address of the neighbor |
| Restart Support | Indicates if graceful restart is enabled or disabled . |
| Restart Status | Indicates whether the router is currently helping an adjacent router to restart. |
| Restart Suppressed | Indicates whether the advertisement of LSPs are suppressed (enabled) or not (disabled) as per the request of adjacent router. |
| SNPA | The SNPA address of the adjacent router. |
| Up Time | Indicates the time period in seconds, during which the router was in the adjacency. |
| Priority | The priority of the adjacent router. |
| Host-name | The host name of the adjacent router. |
| L. CircType | Indicates the level circuit type (L1 , L2 or L1L2) of the adjacent router. |
| Max Hold | Indicates the maximum Hold time of the adjacent router. |

Release History

Release 7.3.3; command was introduced.

Related Commands

show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

show ip isis database [{*system_id system_id* | *lsp_id lsp_id*}] [**detail**] [**level** {**1** | **2**}]

Syntax Definitions

| | |
|------------------|--------------------------------------------------------------|
| <i>system_id</i> | The system ID of the router. |
| <i>lsp_id</i> | The LSP ID. |
| detail | Indicates that the output is displayed in a detailed manner. |
| level | Indicates the IS-IS level, either 1 or 2 . |

Defaults

By default, the entire LSP database is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use *system_id* or *lsp_id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

Examples

```
-> show ip isis database
Legends : P           = The Partition repair bit is set
OV          = The overload bit is set
ATT         = The Attach bit is set
L1          = Specifies a Level 1 IS type
L2          = Specifies a Level 2 IS type

output definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LSP ID | The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router. |
| Sequence | The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs. |
| Checksum | The checksum value of the LSP. |
| Lifetime | The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers. |
| Attributes | The level capability of the router. |
| LSP Count | The number of LSPs in the Link State Database. |

```

=====

output definitions

| | |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LSP ID | The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router. |
| Sequence | The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs. |
| Checksum | The checksum value of the LSP. |
| Lifetime | The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers. |
| Version | The version of the IS-IS protocol that has generated the LSP. |
| Pkt Type | The IS-IS PDU type number derived from the PDU header, which can be 18 or 20 . The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type. |
| Pkt Ver | The version of the IS-IS protocol that has generated the packet. |
| Attributes | The level capability of the router. |
| Max Area | The Maximum number of areas supported by the originating router of the LSP. |
| SysID Len | The length of the system-id as used by the originating router. |
| Used Len | The length used by the LSP. |
| Alloc Len | The length allocated for the LSP to be stored. |
| Area Address | The area ID of the router. |
| Supp protocols | The network layer protocols that are supported. |
| IS-Host Name | The host name of the router. |
| System ID | The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID. |
| IS Neighbors | The list of reachable IS-IS neighbors. |
| IPv4 Internal Reach | The list of IS-IS internal routes. |
| IPv6 Reach | The list of IS-IS IPv6 internal routes. |
| IP Prefix | The IP address and subnet mask of the destination. |
| Metrics | The metric value to reach the destination. |
| IPv4 External Reach | The list of external IS-IS routes. |
| IPv6 Reach | The list of external IS-IS IPv6 routes. |
| level-1 LSP Count | The number of Level-1 LSPs. |
| level-2 LSP Count | The number of Level-2 LSPs. |

Release History

Release 7.3.3; command was introduced.

Related Commands

output definitions

| | |
|------------------------------|----------------------------------------------------------------------------------------------------------------|
| SpfTimeStamp | The timestamp when the SPF run started on the system. |
| spfRunTime | The time (in hundredths of a second) required to complete the SPF run. |
| Spf Involved L1 Nodes | The number of Level-1 nodes involved in the SPF calculation. |
| Spf Involved L2 Nodes | The number of Level-2 nodes involved in the SPF calculation. |
| Spf Event-count | The number of SPF events that triggered the SPF calculation. |
| Last TriggeredLspId | The LSP ID of the last LSP processed before the SPF run. |
| Spf trigger Reason | Indicates the reasons (newAdjacency , lspExpired , or lspChanged) for SPF calculations. |
| Log Entries | The number of SPF logs. |

Release History

Release 7.3.3; command was introduced.

output definitions

| | |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System Id | The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID. |
| Admin State | The state of the router (Up or Down). |
| Protocols Enabled | The protocol enabled on the router: IPv4 or IPv6 |
| Last Enabled | The date and time when the router is enabled. |
| Level Capability | The level capability of the router (L1 , L2 , or L1L2). |
| Authentication Check | Indicates the status of the authentication (true or false). |
| Authentication Type | The type of authentication (simple , md5 , keychain , none). |
| Graceful Restart | Indicates if graceful restart is Enabled or Disabled . |
| GR helper-mode | Indicates if the helper mode of graceful restart is Enabled or Disabled . |
| LSP Lifetime | The Lifetime of the LSP (in seconds). |
| LSP Wait | The Wait time of the LSP (in seconds). |
| Adjacency Check | The adjacency check configuration on the router |
| L1 Auth Type | The authentication type (simple , md5 , keychain , none) for Level-1 adjacency. |
| L2 Auth Type | The authentication type (simple , md5 , keychain , none) for Level-2 adjacency. |
| L1 Wide Metrics-only | Indicates whether wide metrics is Enabled or Disabled for Level-1 adjacency. |
| L2 Wide Metrics-only | Indicates whether wide metrics is Enabled or Disabled for Level-2 adjacency. |
| L1 LSDB Overload | Indicates whether LSDB Overload is Enabled or Disabled for Level-1 adjacency. |
| L2 LSDB Overload | Indicates whether LSDB Overload is Enabled or Disabled for Level-2 adjacency. |
| L1 LSPs | The number of LSPs for Level-1 adjacency. |
| L2 LSPs | The number of LSPs for Level-2 adjacency. |
| Last SPF | The date and duration of the last SPF calculation. |
| SPF Wait | The Wait time for the SPF calculation. |
| Hello-Auth Check | Indicates the status of global Hello authentication check (Enabled or Disabled). |
| Csnp-Auth Check | Indicates the status of global CSNP authentication check (Enabled or Disabled). |

output definitions (continued)

| | |

show ip isis summary-address

Displays the IS-IS summary address database.

show ip isis summary-address [*ip_address* [/i>mask]]

Syntax Definitions

ip_address The 32-bit IP address.
/mask The netmask value. The valid range is 1–32.

Defaults

By default summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ip_address* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address
=====
ISIS Summary Address
=====
Address                                    Level
-----
1.0.0.0/8                                 L1
2.1.0.0/24                                L1L2
3.1.2.3/32                                L2
-----

Summary Address : 3
```

output definitions

| | |
|------------------------|----------------------------------------------------|
| Address | The summary address for a range of IPv4 addresses. |
| Level | The capability level of the router. |
| Summary Address | The number of summarized addresses. |

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis summary-address](#) Adds or deletes the summary address.

show ip isis vlan

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

show ip isis vlan [*vlan_id*] [**detail**]

Syntax Definitions

| | |
|----------------|--------------------------------------------------------------|
| <i>vlan_id</i> | The VLAN ID. |
| detail | Indicates that the output is displayed in a detailed manner. |

Defaults

By default, the interface information for all the interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *vlan_id* parameter with this command to view information for a specific VLAN.

Examples

```
-> show ip isis vlan
=====
ISIS Vlan
=====
Interface   Address-family  Level  VlanID  Oper-state  Admin-state  L1/L2-Metric
-----
ospf        ipv4             L1L2   11      DOWN       UP           10/10

```

output definitions

| | |
|------------------------|----------------------------------------------------|
| Address | The summary address for a range of IPv6 addresses. |
| Level | The capability level of the router. |
| Summary Address | The number of summarized addresses. |

Release History

Release 7.3.3; command was introduced.

Related Commands

[ip isis summary-address6](#) Configures the IPv6 summary address.

MIB Objects

N/A

clear ip isis adjacency

Clears and resets the IS-IS adjacency database information.

```
clear ip isis adjacency [system-id nbr_sys_id]
```

Syntax Definitions

nbr_sys_id The system ID of the neighbor router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the *nbr_sys_id* parameter is specified, only the entries specific to that system ID are removed from the database.

Examples

```
-> clear ip isis adjacency system-id 1122.3344.5566
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip isis multi-topology

Enables M-ISIS (multi-topology) capability support for IS-IS. If enabled, IPv6 SPF computation is performed separate from the IPv4 SPF computation.

ip isis multi-topology

no ip isis multi-topology

Syntax Definitions

N/A

Defaults

By default, multi-topology is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Changing the multi-topology mode with this command results in internal disabling and re-enabling of the IS-IS protocol with the new mode of operation. This will cause IS-IS adjacencies to be reset.

Examples

```
-> ip isis multi-topology
-> no ip isis multi-topology
```

Release History

Release 7.3.4; command was introduced.

Related Commands

| | |
|----------------------------------------|----------------------------------------------------|
| show ip isis status | Displays the IS-IS status. |
| show ip isis adjacency | Displays information about IS-IS adjacent routers. |

MIB Objects

```
vRtrIisisEntry

```

29 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The OmniSwitch implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545.

Note. In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

MIB information for BGP is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-BGP-MIB.mib
Module: alcatelIND1BGPMIB

Filename: BGP4-MIB.mib
Module: bgp

The following table summarizes the available commands:

| | |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

ip load bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the [ip bgp admin-state](#) to start the BGP protocol.

Examples

```
-> ip load bgp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|------------------------------------------|--------------------------------------------------------------|
| ip bgp autonomous-system | Configures the Autonomous system number for this BGP router. |
| ip bgp admin-state | Administratively enables or disables BGP. |

MIB Objects

```
alaVrConfigTable  
  alaVrConfigBgpStatus
```

ip bgp admin-state

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

ip bgp admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|---------------|
| enable | Enables BGP. |
| disable | Disables BGP. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You must first load the BGP software into running memory using the [ip load bgp](#) command before initiating this command.
- Many BGP commands require that the protocol be disabled ([ip bgp admin-state](#)) before issuing them.

Examples

```
-> ip bgp admin-state enable  
-> ip bgp admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip load bgp](#) Loads the BGP software.

MIB Objects

```
alaBgpGlobal  
  alaBgpProtoStatus
```

ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route's AS path.

ip bgp autonomous-system *value*

Syntax Definitions

value The AS number in the asplain, asdot+, or asdot formats.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- The 4-octet ASN is represented in one of three ways:
 - asplain (simple decimal notation)
 - asdot+ (two 16-bit values as low-order and high-order)
 - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp autonomous-system 64724
```

The following examples show how to configure the local BGP ASN as 65535 in the three different formats:

```
-> ip bgp autonomous-system 65535          (asplain format)
-> ip bgp autonomous-system 0.65535        (asdot+ format)
-> ip bgp autonomous-system 65535          (asdot format)
```

The following examples show how to configure the local BGP ASN as 65538 in the three different formats:

```
-> ip bgp autonomous-system 65538          (asplain format)
-> ip bgp autonomous-system 1.2            (asdot+ format)
-> ip bgp autonomous-system 1.2            (asdot format)
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.3; support for 4-octet ASN was added.

Related Commands

- | | |
|-------------------------------------------|----------------------------------------|
| ip bgp admin-state | Enables and disables the BGP protocol. |
| ip bgp neighbor remote-as | Assigns an AS number to this BGP peer. |

MIB Objects

alaBgpGlobal
 alaBgpAutonomousSystemNumber

ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

ip bgp bestpath as-path ignore

no ip bgp bestpath as-path ignore

Syntax Definitions

N/A

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath as-path ignore  
-> no ip bgp bestpath as-path ignore
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address as-set Specifies whether AS path aggregation is to be performed or not.

ip bgp policy aspath-list Creates or removes an AS path list.

ip bgp default local-preference Configures the default local preference (lpref) value to be used when advertising routes.

MIB Objects

alaBgpGlobal

alaBgpASPathCompare

ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

ip bgp cluster-id *ip_address*

Syntax Definitions

ip_address 32-bit IP address that is the Cluster ID of the router acting as a route reflector.

Defaults

| parameter | default |
|-------------------|---------|
| <i>ip_address</i> | 0.0.0.0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

Examples

```
-> ip bgp cluster-id 1.2.3.4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state Enables and disables BGP.

ip bgp client-to-client reflection Enables route reflection and sets this speaker as the route reflector.

MIB Objects

alaBgpGlobal
 alaBgpClusterId

ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

ip bgp default local-preference *value*

Syntax Definitions

value The default local preference value for this router. The valid range is 0–4294967295.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 100 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp default local-preference 200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp aggregate-address local-preference Sets the local preference for a BGP aggregate.

ip bgp network local-preference Sets the local preference for a BGP network.

MIB Objects

alaBgpGlobal
 alaBgpDefaultLocalPref

ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

ip bgp fast-external-failover

no ip bgp fast-external-failover

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp fast-external-failover
-> no ip bgp fast-external-failover
```

Release History

Release 7.1.1; command was introduced.

Related Commands**ip bgp neighbor clear**

Restarts a BGP peer.

ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart.

ip bgp neighbor timers

Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

MIB Objects`alaBgpFastExternalFailOver`

ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

ip bgp always-compare-med

no ip bgp always-compare-med

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

Examples

```
-> ip bgp always-compare-med
-> no ip bgp always-compare-med
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp bestpath med missing-as-worst](#) Configures the MED parameter when it is missing in a BGP path.

MIB Objects

```
alaBgpGlobal
  alaBgpMedAlways
```

ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

ip bgp bestpath med missing-as-worst

no ip bgp bestpath med missing-as-worst

Syntax Definitions

N/A

Defaults

By default this command is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst ($2^{32}-1$) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp always-compare-med Forces BGP to consider MED values from external routes.

MIB Objects

```
alaBgpGlobal
  alaBgpMissingMed
```

ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

ip bgp client-to-client reflection

no ip bgp client-to-client reflection

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp admin-state Administratively disables BGP in this router.

ip bgp neighbor route-reflector-client Configures a BGP peer to be a client to the this route reflector.

MIB Objects

alaBgpGlobal
alaBgpRouteReflection

ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

ip bgp as-origin-interval *seconds*

no ip bgp as-origin-interval

Syntax Definitions

seconds The update interval in seconds. The valid range is 1–65535.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 15 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

Examples

```
-> ip bgp as-origin-interval 15
-> no ip bgp as-origin-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor advertisement-interval](#) Set the route advertisement interval for external peers.

MIB Objects

```
alaBgpGlobal
  alaBgpAsOriginInterval
```

ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

ip bgp synchronization

no ip bgp synchronization

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp synchronization  
-> no ip bgp synchronization
```

Release History

Release 7.1.1; command was introduced.

Related Commands**show ip bgp**

Displays the current global settings for the local BGP speaker.

MIB Objects

alaBgpGlobal

alaBgpIgpSynchStatus

ip bgp confederation identifier

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

ip bgp confederation identifier *value*

Syntax Definitions

value The confederation identification value. The valid range is 0–65535.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Use this command in conjunction with the **ip bgp confederation neighbor** command to specify those peers that are a members of the same confederation as the local BGP speaker.

Examples

```
-> ip bgp confederation identifier 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp autonomous-system Sets the AS number for this router.

ip bgp confederation neighbor Specifies peers that are members of a confederation.

MIB Objects

alaBgpGlobal
alaBgpConfedId

ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

ip bgp maximum-paths

no ip bgp maximum-paths

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp Displays the current global settings for the local BGP speaker.

MIB Objects

```

ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

ip bgp log-neighbor-changes

no ip bgp log-neighbor-changes

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

Examples

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp admin-state](#) Disables BGP within the router.

MIB Objects

```
alaBgpGlobal
  alaBgpPeerChanges
```

ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

ip bgp dampening [**half-life** *half_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max_suppress_time*]

no ip bgp dampening

Syntax Definitions

| | |
|--------------------------|--------------------------------------------------------------------------------------|
| <i>half_life</i> | The half-life duration, in seconds. The valid range is 0–65535. |
| <i>reuse</i> | The number of route withdrawals set for the re-use value. The valid range is 1–9999. |
| <i>suppress</i> | The dampening cutoff value. The valid range is 1–9999. |
| <i>max_suppress_time</i> | The maximum number of seconds a route can be suppressed. The valid range is 0–65535. |

Defaults

| parameter | value |
|--------------------------|-------|
| <i>half_life</i> | 300 |
| <i>reuse</i> | 200 |
| <i>suppress</i> | 300 |
| <i>max_suppress_time</i> | 1800 |

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals.
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

ip bgp dampening clear

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

Examples

```
-> ip bgp dampening clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp dampening](#) Enables or disables route dampening.

MIB Objects

ip bgp asn-format

Configures the display format to be used when displaying 4-octet ASNs.

```
ip bgp asn-format {asdot | asplain}
```

Syntax Definitions

| | |
|----------------|----------------------------------|
| asdot | A mixture of asplain and asdot+. |
| asplain | Simple decimal notation. |

Defaults

The default is **asplain**.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command configures the display format to be used when displaying 4-octet ASNs. This configuration changes only the output format. The input format can be in any mode.

Examples

```
-> ip bgp asn-format asdot
```

Release History

Release 7.3.3; command was introduced.

```

ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

ip bgp aggregate-address *ip_address ip_mask*

[**admin-state** {**enable** | **disable**}]

[**as-set**]

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**summary-only**]

no ip bgp aggregate-address *ip_address ip_mask*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address to be used as the aggregate address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.
- Only the aggregate is advertised unless aggregate summarization is disabled using the **ip bgp aggregate-address summary-only** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0  
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp aggregate-address
summary-only](#)

Enables or disables aggregate summarization, which suppresses more-specific routes.

MIB Objects

alaBgpAggrMask
```

ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

ip bgp aggregate-address *ip_address ip_mask* **admin-state** {enable | disable}

Syntax Definitions

| | |
|-------------------|----------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address for this aggregate route. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the network address denote the network number. |
| enable | Enables this aggregate route. |
| disable | Disables this aggregate route. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the [ip bgp asn-format](#) command to configure individual aggregate parameters.
- The [show ip bgp path](#) command displays every aggregate currently defined.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-----------------------------------|-----------------------------|
| ip bgp asn-format | Creates an aggregate route. |
| show ip bgp path | Displays aggregate routes. |

MIB Objects

```
alaBgpAggrTable  
  alaBgpAggrAddr  
  alaBgpAggrMask
```

ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

ip bgp aggregate-address *ip_address ip_mask as-set*

no ip bgp aggregate-address *ip_address ip_mask as-set*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp asn-format Creates and deletes a BGP aggregate route.

MIB Objects

  alaBgpAggrAddr  
  alaBgpAggrMask  
  alaBgpAggrSet
```

ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

ip bgp aggregate-address *ip_address ip_mask* **community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

Syntax Definitions

| | |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the aggregate route. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| none | Removes the community restrictions on the community section of the route map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997. |

Defaults

| parameter | default |
|----------------------------------------------------------------------------------------------------|---------|
| none no-export no-advertise no-export-subconfed <i>num:num</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the aggregate community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

Related Commands

ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

ip bgp aggregate-address *ip_address ip_mask local-preference value*

no ip bgp aggregate-address *ip_address ip_mask local-preference value*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | An IP address for the aggregate route. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| <i>value</i> | The local preference attribute. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the [ip bgp default local-preference](#) command).

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp default local-preference](#) Sets the default local preference value for this AS.

MIB Objects

alaBgpAggrAddr

alaBgpAggrMask

 alaBgpAggrLocalPref

ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

ip bgp aggregate-address *ip_address ip_mask metric value*

no ip bgp aggregate-address *ip_address ip_mask metric value*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | A 32-bit IP address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| <i>value</i> | The MED attribute. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst Configures the MED for paths that do not contain a MED value.

ip bgp always-compare-med Forces BGP to use the MED for comparison of external routes.

MIB Objects

  alaBgpAggrMetric
```

ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which suppresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

ip bgp aggregate-address *ip_address ip_mask* **summary-only**

no ip bgp aggregate-address *ip_address ip_mask* **summary-only**

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | IP address for the aggregate route. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
ip bgp network ip_address ip_mask  
    [community string]  
    [local-preference value]  
    [metric metric]  
    [admin-state {enable | disable}]
```

```
no ip bgp network ip_address ip_mask
```

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network admin-state** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0  
-> no ip bgp network 172.22.2.115 255.255.255.0
```

Release History

Release 7.1.1; command was introduced.

ip bgp network admin-state

Enables or disables a BGP network.

ip bgp network *ip_address ip_mask* **admin-state** {**enable** | **disable**}

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| enable | Enables this network. |
| disable | Disables this network. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up to 200 network entries. The **show ip bgp path** command displays every network currently defined.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

ip bgp network *ip_address ip_mask* **community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

Syntax Definitions

| | |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the network. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| none | Removes the community restrictions on the community section of the route map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997. |

Defaults

| parameter | default |
|----------------------------------------------------------------------------------------------------|---------|
| none no-export no-advertise no-export-subconfed <i>num:num</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- To revert the network community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ip bgp network *ip_address ip_mask local-preference value*

no ip bgp network *ip_address ip_mask local-preference value*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| <i>value</i> | The local preference attribute value. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bgp network** Creates or deletes a BGP network.
- ip bgp default local-preference** Sets the default local preference for this AS.

MIB Objects

alaBgpNetworkTable
 alaBgpNetworkAddr
 alaBgpNetworkMask
 alaBgpNetworkLocalPref

ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

ip bgp network *ip_address ip_mask metric value*

no ip bgp network *ip_address ip_mask metric value*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address. |
| <i>ip_mask</i> | 32-bit subnet mask that determines how many bits of the IP address denote the network number. |
| <i>value</i> | A MED attribute value. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp network](#)

Creates or deletes a BGP network.

[ip bgp bestpath med missing-as-worst](#)

Specifies the MED value when it is missing.

MIB Objects

 alaBgpNetwrokMetric

ip bgp neighbor

Creates or deletes a BGP peer.

ip bgp neighbor *ip_address*

no ip bgp neighbor *ip_address*

Syntax Definitions

ip_address 32-bit IP address of the new BGP peer.

Defaults

No peers configured.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- You must still enable a BGP peer after creating it. A BGP peer is enabled using the **ip bgp neighbor admin-state** command.
- Once created, a BGP peer cannot be enabled until it is assigned an autonomous system number using the **ip bgp neighbor remote-as** command.

Examples

```
-> ip bgp neighbor 172.22.2.115
-> no ip bgp neighbor 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------|---------------------------------------|
| ip bgp neighbor admin-state | Enable or disable a BGP peer. |
| ip bgp neighbor remote-as | Configure the AS number for the peer. |

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr

ip bgp neighbor ttl-security

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

ip bgp neighbor *ip_address* ttl-security *num*

ip bgp neighbor *ip_address* no ttl-security

Syntax Definitions

| | |
|-------------------|---------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>num</i> | The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255. |

Defaults

By default GTSM is disabled for communication with the peer.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vice-versa.
- Use the **no** form of this command to disable GTSM.

Examples

```
-> ip bgp neighbor 172.22.2.115 ttl-security 6  
-> ip bgp neighbor 172.22.2.115 no ttl-security
```

Release History

Release 8.4.1; command was introduced.

ip bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

ip bgp neighbor *ip_address* [**activate-ipv4**]

no ip bgp neighbor *ip_address* [**activate-ipv4**]

Syntax Definitions

ip_address

32-bit IP address of the BGP peer.

activate-ipv4

Enable the advertisement of IPv4 unicast capability to the IPv4 BGP peer.

Defaults

By default, the command is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv4 BGP peer.

Examples

```
-> ip bgp neighbor 172.22.2.115 activate-ipv4
-> no ip bgp neighbor 172.22.2.115 activate-ipv4
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerActivateIpv4
```

ip bgp neighbor admin-state

Enables or disables a BGP peer.

```
ip bgp neighbor ip_address admin-state {enable | disable}
```

Syntax Definitions

| | |
|-------------------|------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| enable | Enables this peer. |
| disable | Disables this peer. |

Defaults

| parameter | default |
|-------------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable  
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------|---------------------------|
| ip bgp neighbor | Creates a BGP peer. |
| show ip bgp neighbors | Displays peer parameters. |

MIB Objects

```
alaBgpPeerTable  
alaBgpPeerAddr
```

ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

ip bgp neighbor *ip_address* **advertisement-interval** *value*

Syntax Definitions

ip_address 32-bit IP address of the neighbor.
value An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 30 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp neighbors](#) Displays BGP peer main status.

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr
 bgpPeerMinRouteAdvertisementTinterval

ip bgp neighbor clear

Restarts a BGP peer. The peer will be unavailable during this restart.

ip bgp neighbor *ip_address* **clear**

Syntax Definitions

ip_address 32-bit IP address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
 - **ip bgp neighbor remote-as**
 - **ip bgp neighbor md5 key**
 - **ip bgp neighbor passive**
 - **ip bgp neighbor ebgp-multihop**
 - **ip bgp neighbor maximum-prefix**
 - **ip bgp neighbor update-source**
 - **ip bgp neighbor next-hop-self**
 - **ip bgp neighbor soft-reconfiguration**
 - **ip bgp neighbor route-reflector-client**
 - **ip bgp confederation neighbor**
 - **ip bgp neighbor remove-private-as**
 - **ip bgp neighbor update-source.**
- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor auto-restart Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr
 alaBgpPeerRestart

ip bgp neighbor route-reflector-client

Configures this peer as a client to the local route reflector.

ip bgp neighbor *ip_address* **route-reflector-client**

no ip bgp neighbor *ip_address* **route-reflector-client**

Syntax Definitions

ip_address 32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove this peer as a client to the local route reflector.
- This command configures this peer as one of the clients to the local route reflector.
- All of the peers configured using this command become part of the client group. The remaining peers are members of the non-client group for the local route reflector.
- When route reflection is configured all of the internal BGP speakers in an autonomous system need not be fully meshed. The route reflector take responsibility for passing internal BGP-learned routes to its peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-reflector-client
-> no ip bgp neighbor 172.22.2.115 route-reflector-client
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp client-to-client reflection Configures the local BGP speaker as a route reflector

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerClientStatus
```

ip bgp neighbor default-originate

Enables or disables BGP peer default origination.

ip bgp neighbor *ip_address* **default-originate**

no ip bgp neighbor *ip_address* **default-originate**

Syntax Definitions

ip_address 32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- When this command is enabled, the local BGP speaker advertises itself as a default to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route 0.0.0.0 does not need to exist on the local router.

Examples

```
-> ip bgp neighbor 172.22.2.115 default-originate  
-> no ip bgp neighbor 172.22.2.115 default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

MIB Objects

```

    alaBgpPeerAddr  
    alaBgpPeerDefaultOriginate
```

ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

ip bgp neighbor *ip_address* **timers** *keepalive holdtime*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address for the BGP peer. |
| <i>keepalive</i> | The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845. |
| <i>holdtime</i> | The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535. |

Defaults

| parameter | default |
|------------------|----------------|
| <i>keepalive</i> | 30 |
| <i>holdtime</i> | 90 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  bgpPeerHoldTimeConfigured
  bgpPeerKeepAliveConfigured
```

ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

ip bgp neighbor *ip_address* **conn-retry-interval** *seconds*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address for the neighbor. |
| <i>seconds</i> | The time interval (in seconds) between retries. The valid range is 0–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 120 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the [ip bgp neighbor auto-restart](#) command).
- You must restart the peer (using the [ip bgp neighbor clear](#) command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bgp neighbor auto-restart** Enable automatic session restart after a session termination.
- ip bgp neighbor clear** Restarts the peer.

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr
 bgpPeerConnectRetryInterval

ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

ip bgp neighbor *ip_address* auto-restart

Syntax Definitions

ip_address 32-bit IP address for the neighbor.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

Examples

```
-> ip bgp neighbor 172.22.2.115 auto-restart
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip bgp neighbor** Creates a BGP peer.

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr
 alaBgpPeerAutoRestart

ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

ip bgp neighbor *ip_address* **maximum-prefix** *maximum* [**warning-only**]

Syntax Definitions

ip_address 32-bit IP address for the BGP peer.
maximum The maximum number of prefixes. The valid range is 0–4294967295.

Defaults

| parameter | default |
|------------------|---------|
| <i>threshold</i> | 5000 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000  
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear Restarts the BGP peer.

MIB Objects

alaBgpPeerTable

 alaBgpPeerAddr

 alaBgpPeerMaxPrefixWarnOnly

 alaBgpPeerMaxPrefix

ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

ip bgp neighbor *ip_address* **md5 key** {*string* | **none**}

Syntax Definitions

| | |
|-------------------|------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | The MD5 public key. Maximum character length is 200. |
| none | Removes the MD5 public key. |

Defaults

| parameter | default |
|------------------|----------------|
| <i>string</i> | no password |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used in snapshot files is as follows:

```
ip bgp neighbor ip_address md5 key-encrypt encrypted_string
```

However, you should not use this syntax to actually set an MD5 password; it will not work.

- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor clear Restarts the BGP peer.

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr
 alaBgpPeerMD5Key

ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

ip bgp neighbor *ip_address* **ebgp-multihop** [*tth*]

no ip bgp neighbor *ip_address* **ebgp-multihop**

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>tth</i> | The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255. |

Defaults

| parameter | default |
|------------|---------|
| <i>tth</i> | 255 |

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vice-versa.

Examples

```
-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250  
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor

Creates or deletes a BGP peer.

ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior.

MIB Objects

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerMultiHop

ip bgp neighbor description

Configures the BGP peer name.

ip bgp neighbor *ip_address* **description** *string*

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.
string Peer name (1–20 characters).

Defaults

| parameter | default |
|---------------|------------------|
| <i>string</i> | peer(ip_address) |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ip bgp neighbor 172.22.2.115 description "peer for building 3"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp neighbor Sets the IP address for the peer.

MIB Objects

alaBgpPeerTable
 alaBgpPeerAddr
 alaBgpPeerName

ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

ip bgp neighbor *ip_address* next-hop-self

no ip bgp neighbor *ip_address* next-hop-self

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self  
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

Release History

Release 7.1.1; command was introduced.

Related Commands**ip bgp neighbor**

Creates or deletes a BGP peer.

MIB Objects

alaBgpPeerAddr

 alaBgpPeerNextHopSelf

ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ip bgp neighbor *ip_address* **passive**

no ip bgp neighbor *ip_address* **passive**

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 passive  
-> no ip bgp neighbor 172.22.2.115 passive
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

MIB Objects

```

  alaBgpPeerAddr  
  alaBgpPeerPassive
```

ip bgp neighbor remote-as

Assigns an AS number to this BGP peer.

ip bgp neighbor *ip_address* **remote-as** *value*

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.
value Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A BGP peer created with the **ip bgp neighbor** command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.
- The 4-octet ASN is represented in one of three ways:
 - asplain (simple decimal notation)
 - asdot+ (two 16-bit values as low-order and high-order)
 - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp neighbor 172.22.2.115 remote-as 100
```

The following examples show how to configure the BGP neighbor ASN as 65535 in the three different formats:

```
-> ip bgp neighbor 2.2.2.2 remote-as 65535                    (asplain format)  
-> ip bgp neighbor 2.2.2.2 remote-as 0.65535                (asdot+ format)  
-> ip bgp neighbor 2.2.2.2 remote-as 65535                   (asdot format)
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.3; support for 4-octet ASN was added.

Related Commands

alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerAS
```

ip bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ip bgp neighbor *ip_address* **remove-private-as**

no ip bgp neighbor *ip_address* **remove-private-as**

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 remove-private-as
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor remote-as](#) Configures the AS number for this peer.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerRemovePrivateAs
```

ip bgp neighbor soft-reconfiguration

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ip bgp neighbor *ip_address* soft-reconfiguration

no ip bgp neighbor *ip_address* soft-reconfiguration

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ip bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

Examples

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor clear](#)

Restarts this BGP peer.

[ip bgp neighbor clear soft](#)

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

MIB Objects

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerSoftReconfig

ip bgp neighbor stats-clear

Clears the statistics for a peer.

ip bgp neighbor *ip_address* stats-clear

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ip bgp neighbors statistics](#).

Examples

```
-> ip bgp neighbor 172.22.2.115 stats-clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp neighbors statistics](#) Displays peer statistics.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerClearCounter
```

ip bgp confederation neighbor

Configures this peer as a member of the same confederation as the local BGP speaker.

ip bgp confederation neighbor *ip_address*

no ip bgp confederation neighbor *ip_address*

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp confederation neighbor 172.22.2.115  
-> no ip bgp confederation neighbor 172.22.2.115
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp confederation identifier Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerConfedStatus
```

ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

```
ip bgp neighbor ip_address update-source [interface_name]
```

Syntax Definitions

ip_address 32-bit IP address of the BGP peer.
interface_name The name of the interface.

Defaults

| parameter | default |
|--------------------------|---------|
| <i>interface_address</i> | 0.0.0.0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the [ip bgp neighbor](#) command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117  
-> ip bgp neighbor 172.22.5.115 update-source vlan-22  
-> ip bgp neighbor 172.22.5.115 update-source
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor](#)

Sets the router identification for a BGP peer.

MIB Objects

```
alaBgpPeerTable

```

ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

```
ip bgp neighbor ip_address in-aspathlist {string / none}
```

Syntax Definitions

| | |
|-------------------|-------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | Inbound AS path list (0 to 70 characters). This name is case sensitive. |
| none | Removes this AS path list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath  
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAspathListIn
```

ip bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ip bgp neighbor ip_address in-communitylist {string / none}
```

Syntax Definitions

| | |
|-------------------|-------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | Input community list (0 to 70 characters. This name is case sensitive). |
| none | Removes this community list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The community filter list name (**InboundCommList** in the example below) is created using the **ip bgp policy community-list** command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- To deassign an input community filter list, use this command to assign a value of “**none**.”

Examples

```
-> ip bgp neighbor 172.22.2.115 in-communitylist InboundCommList  
-> ip bgp neighbor 172.22.2.115 in-communitylist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy community-list Creates or deletes a community list.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerCommunityListIn
```

ip bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address in-prefixlist {string / none}
```

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | Input prefix filter list (0 to 70 characters). This name is case sensitive. |
| none | Removes this prefix list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- To deassign an input prefix filter list, use this command to assign a value of “**none.**”

Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefixlist InboundPrefix  
-> ip bgp neighbor 172.22.2.115 in-prefixlist none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

MIB Objects

```

```

ip bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

```
ip bgp neighbor ip_address in-prefix6list {string / none}
```

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | Input prefix6 filter list (0 to 70 characters). This name is case sensitive. |
| none | Removes this prefix6 list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of “**none**.”

Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefix6list InboundPrefix6
-> ip bgp neighbor 172.22.2.115 in-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

```

ip bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

```
ip bgp neighbor ip_address out-aspathlist {string / none}
```

Syntax Definitions

| | |
|-------------------|--------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | Outbound AS path list (0 - 70 characters). |
| none | Removes the AS path list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- To deassign an output AS path filter list, use this command to assign a value of “**none**”.

Examples

```
-> ip bgp neighbor 172.22.2.115 out-aspathlist OutboundASpath
-> ip bgp neighbor 172.22.2.115 out-aspathlist none
```

Release History

  alaBgpPeerPrefixListOut
```

ip bgp neighbor out-prefix6list

Assigns an outbound prefix6 filter list to a BGP peer.

```
ip bgp neighbor ip_address out-prefix6list {string / none}
```

Syntax Definitions

| | |
|-------------------|-------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| <i>string</i> | Output prefix6 filter list (0 - 70 characters). |
| none | Removes the prefix6 list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**OutboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any outbound IPv6 routes from the BGP peer must match this prefix6 filter before being advertised or passed to outbound policy.
- To deassign an output prefix6 filter list, use this command to assign a value of “**none**”.

Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefix6list OutboundPrefix6  
-> ip bgp neighbor 172.22.2.115 out-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix6-list](#) Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

ip bgp neighbor route-map

Assigns a policy map (inbound or outbound) to a BGP peer.

```
ip bgp neighbor ip_address route-map {string | none} {in | out}
```

```
no ip bgp neighbor ip_address route-map {in | out}
```

Syntax Definitions

| | |
|-------------------|--------------------------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the peer. |
| <i>string</i> | Policy map name (0 to 70 characters). This name is case sensitive. |
| none | Deletes the route map if entered rather than a text string. |
| in | Designates this route map policy as an inbound policy. |
| out | Designates this route map policy as an outbound policy. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to deassign an inbound or an outbound policy.
- The policy route map name (**InboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- The policy route map name (**OutboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any outbound routes for the BGP peer must match this route map filter before being advertised or passed to outbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerRouteMapOut  
  alaBgpPeerRouteMapIn
```

ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

ip bgp neighbor *ip_address* **clear soft** {**in** | **out**}

Syntax Definitions

| | |
|-------------------|---------------------------------------------------|
| <i>ip_address</i> | 32-bit IP address of the BGP peer. |
| in | Applies reconfiguration to the inbound policies. |
| out | Applies reconfiguration to the outbound policies. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor soft-reconfiguration](#) Enables or disables BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerReconfigureInBound
  alaBgpPeerReconfigureOutBound
```

ip bgp bfd-state

Enables or disables the registration of BGP with the BFD protocol.

```
ip bgp bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------------|
| enable | Enables BFD for BGP. |
| disable | Disables BFD for BGP. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and BGP must be registered with BFD at the protocol level before BGP can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of BGP with the BFD protocol:

```
-> ip bgp bfd-state enable  
-> ip bgp bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip|ipv6 bgp neighbor bfd-state

Enables or disables BFD for a specific IPv4 or IPv6 BGP neighbor.

```
{ip | ipv6} bgp neighbor {ipv4_address | ipv6_address} bfd-state {enable | disable}
```

Syntax Definitions

| | |
|---------------------|---------------------------------------|
| <i>ipv4_address</i> | The IPv4 address of the BGP neighbor. |
| <i>ipv6_address</i> | The IPv6 address of the BGP neighbor. |
| enable | Enables BGP neighbor. |
| disable | Disables BGP neighbor. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp neighbor 135.10.10.2 bfd-state enable
-> ip bgp neighbor 135.10.10.2 bfd-state disable

-> ipv6 bgp neighbor fe80::2efa:a2ff:fe13:e402 bfd-state enable
-> ipv6 bgp neighbor fe80::2efa:a2ff:fe13:e402 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R03; IPv6 BFD support added.

Related Commands

ip bgp policy aspath-list

Creates or removes an AS path list.

ip bgp policy aspath-list *name* “*regular_expression*”

no ip bgp policy aspath-list *name* “*regular_expression*”

Syntax Definitions

| | |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive. |
| <i>regular_expression</i> | Regular expression, for example, “^100 200\$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks. |

Defaults

No IP BGP peer policy AS path-list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Valid regular expression characters (metacharacters) are shown in the table below. See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

| Symbol | Description |
|--------|-----------------------------------------------------------------------------------------------------------------------|
| ^ | Matches the beginning of the AS path list. |
| 123 | Matches the AS number 123. |
| . | Matches any single AS number. |
| ? | Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range. |
| + | Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range. |
| * | Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range. |
| (| Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence. |
| | Separates AS numbers in an alternation sequence. |

| Symbol | Description |
|--------|-----------------------------------------------------------------------------------------------------------------------------|
|) | Ends an alternation sequence of AS numbers |
| [| Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range. |
| - | Separates the endpoints of a range. |
|] | Ends a range pair. |
| \$ | Matches the end of the AS path list. |
| ,_ | Commas, underscores and spaces are ignored. |

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-*aspathlist***, **ip bgp neighbor out-*aspathlist***, **ipv6 bgp neighbor in-*aspathlist***, and **ipv6 bgp neighbor out-*aspathlist*** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp policy aspath-list** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"  
-> ip bgp policy aspath-list OutboundAspath "^300 400$"  
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

alaBgpAspathMatchListRowStatus

ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

ip bgp policy aspath-list *name* "*regular_expression*" **action** {**permit** | **deny**}

Syntax Definitions

| | |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive. |
| <i>regular_expression</i> | Regular expression, e.g., "^100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks. |
| permit | Allows matching routes to pass. |
| deny | Stops matching routes from passing. |

Defaults

| parameter | default |
|----------------------|---------|
| permit deny | permit |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 29-108 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp policy aspath-list](#) command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" action permit
-> ip bgp policy aspath-list OutboundAspath "^300 400$" action deny
```

Release History

Release 7.1.1; command was introduced.

| ip bgp policy aspath-list | Creates or removes an AS path list. |
| ip bgp policy aspath-list priority | Configures priority for processing regular expressions in an AS path list. |
| ipv6 bgp neighbor in-ashpathlist | Assigns an inbound AS path list filter to an IPv6 BGP peer. |
| ipv6 bgp neighbor out-ashpathlist | Assigns an outbound AS path filter list to an IPv6 BGP peer. |

MIB Objects

alaBgpAspathMatchListTable
alaBgpAspathMatchListAction

ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

ip bgp policy aspath-list *name* “*regular_expression*” **priority** *value*

Syntax Definitions

| | |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive. |
| <i>regular_expression</i> | Regular expression, e.g., “^100 200\$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks. |
| <i>value</i> | A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Refer to [ip bgp policy aspath-list](#) on page 29-108 for a table of valid regular expression characters (metacharacters). See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer’s inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#), [ip bgp neighbor out-aspathlist](#), [ipv6 bgp neighbor in-aspathlist](#), and [ipv6 bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp policy aspath-list](#) command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|

MIB Objects

alaBgpAspathMatchListTable
alaBgpAspathMatchListPriority

ip bgp policy community-list

Creates or deletes a community list.

ip bgp policy community-list *name* {*num:num* / *num.num:num* / *num*}

no ip bgp policy community-list *name* {*num:num* / *num.num:num* / *num*}

Syntax Definitions

| | |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive. |
| <i>num:num</i> | The community number, given in the form of the AS number in the asplain format and the community number, separated by a colon. |
| <i>num.num:num</i> | The community number, given in the form of the AS number in the asdot or asdot+ format and the community number, separated by a colon. |

Defaults

No IP BGP peer policy community-list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist**, **ip bgp neighbor out-communitylist**, **ipv6 bgp neighbor in-communitylist** and **ipv6 bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp policy community-list** command.

Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> no ip bgp policy community-list CommListAIn 40:40
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ip bgp neighbor in-communitylist | Assigns an inbound AS community list filter to a BGP peer. |
| ip bgp neighbor out-communitylist | Assigns an outbound AS community list filter to a BGP peer. |
| ip bgp policy community-list action | Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found. |
| ip bgp policy community-list match-type | Configures type of matching to be performed with a community string list. |
| ip bgp policy community-list priority | Configures priority for processing multiple items in a community list filter. |
| ipv6 bgp neighbor in-communitylist | Assigns an inbound community list filter to an IPv6 BGP peer. |
| ipv6 bgp neighbor out-communitylist | Assigns an outbound community filter list to an IPv6 BGP peer. |

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListRowStatus

ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

ip bgp policy community-list *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}
action {**permit** | **deny**}

Syntax Definitions

| | |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive. |
| none | Removes the community restrictions on the community section of the route map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997. |
| permit | Allows matching routes to pass. |
| deny | Stops matching routes from passing. |

Defaults

| parameter | default |
|----------------------|---------------|
| permit deny | permit |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, this command allows routes that match the criteria specified in the community list to pass.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4; syntax added to **community** string.

Related Commands

| ip bgp neighbor out-communitylist | Assigns an outbound AS community list filter to a BGP peer. |
| ip bgp policy community-list match-type | Configures type of matching to be performed with a community string list. |
| ip bgp policy community-list priority | Configures priority for processing multiple items in a community list filter. |
| ipv6 bgp neighbor in-communitylist | Assigns an inbound community list filter to an IPv6 BGP peer. |
| ipv6 bgp neighbor out-communitylist | Assigns an outbound community filter list to an IPv6 BGP peer. |

MIB Objects

alaBgpCommunityMatchListTable
alaBgpCommunityMatchListAction

ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

ip bgp policy community-list *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}
match-type {**exact** | **occur**}

Syntax Definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive. |
| none | Removes the community restrictions on the community section of the route map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997. |
| exact | Checks for an exact match of the community string and the community attribute. |
| occur | Checks for an occurrence of the community string anywhere in the community attribute. |

Defaults

| parameter | default |
|-----------------------------|---------|
| exact occur | exact |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

alaBgpCommunityMatchListType

ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

ip bgp policy community-list *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}
priority *value*

Syntax Definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive. |
| none | Removes the community restrictions on the community section of the route map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997. |
| <i>value</i> | Priority value in the range 0 - 255. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; syntax added to **community** string.

Related Commands

| | |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ip bgp policy community-list | Creates or deletes a community list. |
| ip bgp policy community-list action | Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found. |
| ip bgp policy community-list match-type | Configures type of matching to be performed with community string list. |

MIB Objects

```
alaBgpCommunityMatchListTable  
  alaBgpCommunityMatchListPriority
```

ip bgp policy prefix-list

Creates or deletes a prefix match list.

ip bgp policy prefix-list *name ip_address ip_mask*

no ip bgp policy prefix-list *name ip_address ip_mask*

Syntax Definitions

| | |
|-------------------|---------------------------------|
| <i>name</i> | Prefix list name. |
| <i>ip_address</i> | IP address for the prefix list. |
| <i>ip_mask</i> | Mask for the prefix list. |

Defaults

No IP BGP policy prefix-list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the [ip bgp neighbor in-prefixlist](#), [ip bgp neighbor out-prefixlist](#), [ipv6 bgp neighbor in-prefixlist](#) and [ipv6 bgp neighbor out-prefixlist](#) commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the [show ip bgp policy prefix-list](#) command.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| ip bgp policy prefix-list ge | Configures lower limit on length of prefix to be matched. |
| ip bgp policy prefix-list le | Configures upper limit on length of prefix to be matched. |
| ipv6 bgp neighbor in-prefixlist | Assigns an inbound prefix filter list to an IPv6 BGP peer. |
| ipv6 bgp neighbor out-prefixlist | Assigns an outbound prefix filter list to an IPv6 BGP peer. |

MIB Objects

alaBgpPrefixMatchListTable
 alaBgpPrefixMatchListRowStatus

ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

```
ip bgp policy prefix-list name ip_address ip_mask action {permit | deny}
```

Syntax Definitions

| | |
|-------------------|-------------------------------------|
| <i>name</i> | Prefix list name. |
| <i>ip_address</i> | IP address for the prefix list. |
| <i>ip_mask</i> | Mask for the prefix list. |
| permit | Allows matching routes to pass. |
| deny | Stops matching routes from passing. |

Defaults

| parameter | default |
|---------------|---------|
| permit deny | permit |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------------------------|-----------------------------------------------------------|
| ip bgp policy prefix-list | Creates or deletes a prefix match list. |
| ip bgp policy prefix-list ge | Configures lower limit on length of prefix to be matched. |
| ip bgp policy prefix-list le | Configures upper limit on length of prefix to be matched. |

MIB Objects

```
alaBgpPrefixMatchListTable  
  alaBgpPrefixMatchListAction
```

ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask ge value*

Syntax Definitions

| | |
|-------------------|-------------------------------------------|
| <i>name</i> | Prefix list name. |
| <i>ip_address</i> | IP address for the prefix list. |
| <i>ip_mask</i> | Mask for the prefix list. |
| <i>value</i> | The lower limit value in the range 0 –32. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the **ip bgp policy prefix-list le** command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 7.1.1; command was introduced.

alaBgpPrefixMatchListGE

ip bgp policy prefix-list le

Configures the upper limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask le value*

Syntax Definitions

| | |
|-------------------|------------------------------------------------|
| <i>name</i> | Prefix list name. |
| <i>ip_address</i> | Prefix list IP address for the prefix list. |
| <i>ip_mask</i> | Prefix list mask for the prefix list. |
| <i>value</i> | The upper limit value in the range of 0 to 32. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched. This command is used in conjunction with **ip bgp policy prefix-list ge** to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 7.1.1; command was introduced.

Configures a BGP prefix6-list policy for filtering IPv6 prefixes.

```
ip bgp policy prefix6-list pxf_list_name prefix6/pxf_length [action {permit | deny}] [admin-state
{enable | disable}] [ge [{masklength}] ] [le [{masklength}] ]
```

```
no ip bgp policy prefix6-list pxf_list_name prefix6/pxf_length [action {permit | deny}] [admin-state
{enable | disable}] [ge [{mask_length}] ] [le [{mask_length}] ]
```

Syntax Definitions

| | |
|--------------------------------|----------------------------------------------------------------------|
| <i>pxf_list_name</i> | Prefix list name. |
| <i>prefix6</i> | Prefix list IPv6 address for the prefix list. |
| <i>pxf_length</i> | Prefix length. Prefix length should be in the range of 0 to 128. |
| <i>value</i> | The upper limit value in the range of 0 to 32. |
| permit deny | Action to be taken which can be either permit or deny. |
| enable disable | Row Status can be either enabled or disabled. |
| <i>mask_length</i> | Minimum length of the prefix to be matched. The valid range is 0–32. |

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- This command creates prefix6 lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefix6list**, **ip bgp neighbor out-prefix6list**, **ipv6 bgp neighbor in-prefix6list** and **ipv6 bgp neighbor out-prefix6list**.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit
-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

Release History

Release 7.1.1; command was introduced.

```

ip bgp policy route-map

Creates or deletes a policy route map.

ip bgp policy route-map *name sequence_number*

Syntax Definitions

| | |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | Route map name. Case-sensitive. |
| <i>sequence_number</i> | Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
 1. **ip bgp policy route-map aspath-list**
 2. **ip bgp policy route-map prefix-list**
 3. **ip bgp policy route-map prefix6-list**
 4. **ip bgp policy route-map community-list**
 5. **ip bgp policy route-map match-regexp**
 6. **ip bgp policy route-map match-prefix**
 7. **ip bgp policy route-map match-mask**
 8. **ip bgp policy route-map match-prefix6**
 9. **ip bgp policy route-map match-community**
- The route maps which apply to a specific address family (IPv4 or IPv6) are only applied to routes of the same address family. In other words, the prefix-list filter and match-prefix/match-mask route-maps are only applied to IPv4 routes and are ignored for IPv6 routes. The prefix6-list filter and match-prefix6 route-maps are only applied to IPv6 routes and are ignored for IPv4 routes.

- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
 - **ip bgp policy route-map community**
 - **ip bgp policy route-map community-mode**
 - **ip bgp policy route-map lpref**
 - **ip bgp policy route-map lpref-mode**
 - **ip bgp policy route-map med**
 - **ip bgp policy route-map med-mode**
 - **ip bgp policy route-map origin**
 - **ip bgp policy route-map weight**
- Route maps can be referenced as a filtering mechanism for displaying paths using the **show ip bgp path** command. They are also referenced in filtering inbound and outbound routes for BGP peers using the **ip bgp neighbor route-map** commands.

Examples

```
-> ip bgp policy route-map routemap1 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map action Configures action to be taken for a route when a match is found.

MIB Objects

```

  alaBgpRouteMapRowStatus
```

ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

```
ip bgp policy route-map name sequence_number action {permit | deny}
```

Syntax Definitions

| | |
|------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | A route map name. |
| <i>sequence_number</i> | A route map sequence number. The valid range is 1–255. |
| permit | Allows matching routes to pass. |
| deny | Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined. |

Defaultst

| parameter | default |
|----------------------|---------------|
| permit deny | permit |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapAction
```

ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

ip bgp policy route-map *name sequence_number aspath-list as_name*

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>as_name</i> | The AS path list name or “none”. |

Defaults

| parameter | default |
|----------------|---------|
| <i>as_name</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The **ip bgp policy aspath-list** and **ip bgp policy aspath-list action** commands are used to create and set permit/deny actions for an AS path list.

Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1  
-> ip bgp policy route-map routemap1 1 aspath-list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map Creates or deletes a policy route map.

MIB Objects

alaBgpRouteMapTable  
  alaBgpRouteMapAsPathMatchListId
```

ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

ip bgp policy route-map *name* *sequence_number* **asprepend** *path*

Syntax Definitions

| | |
|------------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>path</i> | The AS path to prepend or “none”. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”). |

Defaults

| parameter | default |
|-------------|---------|
| <i>path</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none”.

Examples

```
-> ip bgp policy route-map routemap1 1 asprepend "700 800 900"
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

ip bgp policy route-map *name sequence_number* **community** [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

Syntax Definitions

| | |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| none | Removes the community restrictions on the community section of the route map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon (AS:NN), as defined in RFC 1997. |

Defaults

| parameter | default |
|----------------------------------------------------------------------------------------------------|---------|
| none no-export no-advertise no-export-subconfed <i>num:num</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to “**none**”.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map community-list

Assigns a community matching list to the route map.

ip bgp policy route-map *name* *sequence_number* **community-list** [*list_name* / **none**]

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>list_name</i> | The community list name. |
| none | No community list name is specified. |

Defaults

| parameter | default |
|--------------------------------|---------|
| <i>list_name</i> / none | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to **none**.

Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
-> ip bgp policy route-map routemap1 1 community-list none
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax **none** added to **community-list** string.

ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

ip bgp policy route-map *name sequence_number* **community-mode** {**add** | **replace**}

Syntax Definitions

| | |
|------------------------|---------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| add | Adds the community string specified in the command ip bgp policy route-map community . |
| replace | Replaces the community string specified in the command ip bgp policy route-map community . |

Defaults

| parameter | default |
|-----------------------------|------------|
| add replace | add |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map lpref

Configures the local preference value for the route map.

ip bgp policy route-map *name sequence_number lpref value*

Syntax Definitions

| | |
|------------------------|--------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>value</i> | The local preference value. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used in conjunction with [ip bgp policy route-map lpref-mode](#). The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

ip bgp policy route-map *name sequence_number* **lpref-mode** {**none** | **inc** | **dec** | **rep**}

Syntax Definitions

| | |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| none | Do not set the local preference attribute. |
| inc | Increment the local preference attribute in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no local preference attribute is found in the matching route. |
| dec | Decrement the local preference attribute in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no local preference attribute is found in the matching route. |
| rep | Replace the local preference attribute in the matching route by the value specified in the ip bgp policy route-map med command even if no local preference attribute is found in the matching route. |

Defaults

| parameter | default |
|----------------------------------------------------|-------------|
| none inc dec rep | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 7.1.1; command was introduced.

ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

ip bgp policy route-map *name sequence_number match-community* [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

Syntax Definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| none | Removes the community match from the route-map. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes matching the community restricting advertisement to any peer. |
| no-export-subconfed | Routes matching the community restricting advertisement to any external BGP peer. |
| <i>num:num</i> | The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997. |

Defaults

| parameter | default |
|----------------------------------------------------------------------------------------------------|---------|
| none no-export no-advertise no-export-subconfed <i>num:num</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a matching community string primitive to be placed directly in the route map.
- By default, no community string is specified. The default behavior can be reset by changing the value to **none**.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

```
ip bgp policy route-map name sequence_number match-mask ip_address
```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>ip_address</i> | The 32-bit IP address of the matching mask or “none”. |

Defaults

| parameter | default |
|-------------------|---------|
| <i>ip_address</i> | 0.0.0.0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-prefix](#) command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>ip_address</i> | The 32-bit IP address of the matching prefix. |

Defaults

| parameter | default |
|-------------------|---------|
| <i>ip_address</i> | 0.0.0.0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-mask](#) command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

ip bgp policy route-map match-prefix6

Configures a matching prefix6 primitive in the route map.

```
ip bgp policy route-map name sequence_number match-prefix6 ipv6_address/mask_length
```

Syntax Definitions

| | |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>ipv6_address/mask_length</i> | The 128-bit IPv6 address of the matching prefix. The length in bits of the IPv6 prefix to be matched in the Route Map. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command allows a matching prefix6 primitive to be placed directly in the route map. By default, no prefix6 primitive is assigned to the route map. The default behavior can be reset by changing the value to “none”.

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix6 2001:1218:103::/64
-> ip bgp policy route-map routemap1 1 match-prefix6 none
```

Release History

```

ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

```
ip bgp policy route-map name sequence_number match-regexp "regular_expression"
```

Syntax Definitions

| | |
|---------------------------|-------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>regular_expression</i> | Regular expression or “none”. The regular expression must be enclosed by quotation marks. |

Defaults

| parameter | default |
|---------------------------|---------|
| <i>regular_expression</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in [ip bgp policy aspath-list](#) on page 29-108.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to “none”.
- See the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

```
ip bgp policy route-map name sequence_number med value
```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>value</i> | The MED value. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med-mode](#) command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

Release History

Syntax Definitions

| | |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>value</i> | The MED value. The valid range is 0–4294967295. |
| none | Do not set the MED. |
| inc | Increment the MED in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no MED is found in the matching route. |
| dec | Decrement the MED in the matching route by the value specified in the ip bgp policy route-map med command. No action is taken if no MED is found in the matching route. |
| rep | Replace the MED in the matching route by the value specified in the ip bgp policy route-map med command even if no MED is found in the matching route. |

Defaults

| parameter | default |
|----------------------------------------------------|-------------|
| none inc dec rep | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med](#). The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map med Configures action to take when setting Multi-Exit Discriminator (MED) attribute for a matching route.

ip bgp policy route-map Creates or deletes a policy route map.

MIB Objects

alaBgpRouteMapTable
 alaBgpRouteMapMedMode

ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

ip bgp policy route-map *name sequence_number* **origin** {**igp** | **egp** | **incomplete** | **none**}

Syntax Definitions

| | |
|------------------------|-------------------------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| igp | Sets the origin attribute to remote internal BGP (IGP). |
| egp | Sets the origin attribute to local external BGP (EGP). |
| incomplete | Sets the origin attribute to incomplete, meaning the origin is unknown. |
| none | Sets the origin attribute to “none”. |

Defaults

| parameter | default |
|-----------------------------------------------------------|-------------|
| igp egp incomplete none | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “**none**”.

Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip bgp policy route-map origin](#) Configures action to take on origin attribute when a match is found.
- [ip bgp policy route-map](#) Creates or deletes a policy route map.

ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

ip bgp policy route-map *name sequence_number prefix-list prefix_name*

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>prefix_name</i> | The prefix list name or “none”. |

Defaults

| parameter | default |
|--------------------|---------|
| <i>prefix_name</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.
- The [ip bgp policy prefix-list](#), [ip bgp policy prefix-list action](#), [ip bgp policy prefix-list ge](#), and [ip bgp policy prefix-list le](#) commands are used to create and set permit/deny actions for a prefix path list.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|--------------------------------------------------|------------------------------------------------------------------------|
| ip bgp policy prefix-list | Assigns a prefix matching list to the route map. |
| ip bgp policy prefix-list action | Configures action to be taken for a prefix list when a match is found. |
| ip bgp policy route-map | Creates or deletes a policy route map. |

MIB Objects

alaBgpRouteMapTable
alaBgpRouteMapPrefixMatchListId

ip bgp policy route-map prefix6-list

Assigns a prefix6 matching list to the route map, which identifies the matching criteria list of IPv6 prefixes.

ip bgp policy route-map *name* *sequence_number* **prefix6-list** *prefix6_name*

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>prefix_name</i> | The prefix6 list name or “none”. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>prefix6_name</i> | none |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6-list policy name is created using the [ip bgp policy prefix6-list](#) command.
- By default, no prefix6 list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix6-list listB
-> ip bgp policy route-map routemap1 1 prefix6-list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

ip bgp policy route-map *name sequence_number weight value*

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>value</i> | The weight value. The valid range is 0–65535. |

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

```
ip bgp policy route-map name sequence_number community-strip community_list
```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------|
| <i>name</i> | The route map name. |
| <i>sequence_number</i> | The route map sequence number. The valid range is 1–255. |
| <i>community_list</i> | The community list name. |

Defaults

No IP BGP policy route-map community list exists.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

Examples

```
-> ip bgp policy route-map routemap1 1 community_strip communitylist
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp

Displays the current global settings for the local BGP speaker.

show ip bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

Examples

```
-> show ip bgp
Admin Status                = disabled,
Operational Status         = up,
Autonomous system Number   = 1,
BGP Router Id               = 111.1.1.1,
Confederation Identifier    = 0,
IGP Synchronization Status  = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference   = 100,
Route Reflection            = disabled,
Cluster Id                  = 0.0.0.0,
Missing MED Status         = Best,
Aspath Comparison          = enabled,
Always Compare MED         = disabled,
Fast External Fail Over    = disabled,
Log Neighbor Changes       = disabled,
Multiple path               = disabled,
Graceful Restart            = enabled,
Graceful Restart Status    = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast                = enabled,
IPv6 Unicast                = disabled,
BFD Status                  = disabled,
ASN Output Format           = asplain
```

output definitions

| | |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin Status | Indicates whether the BGP protocol has been enabled or disabled through the ip bgp admin-state command. |
| Operational Status | Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements. |
| Autonomous system Number | The AS assigned to the local BGP speaker through the ip bgp autonomous-system command. |
| BGP Router Id | The IP address for the local BGP speaker. |
| Confederation Id | Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the ip bgp confederation identifier command. |
| IGP Synchronization Status | Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). Configured through the ip bgp synchronization command. |
| Minimum AS origin interval | The frequency, in seconds, at which routes local to the autonomous system are advertised. Configured through the ip bgp as-origin-interval command. |
| Default Local Preference | The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the ip bgp default local-preference command. |
| Route Reflection | Indicates whether the local BGP speaker is acting as a route reflector for its AS. Configured through the ip bgp client-to-client reflection command. |
| Cluster Id | The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. Configured through the ip bgp cluster-id command. |
| Missing MED Status | Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value ($2^{32}-1$) or the best possible value (0). This value is set using the ip bgp bestpath med missing-as-worst command. By default, missing MED values are treated as best . |
| Aspath Comparison | Indicates whether the AS path will be in used in determining the best route. Configured through the ip bgp bestpath as-path ignore command. |
| Always Compare MED | Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. Configured through the ip bgp always-compare-med command. |
| Fast External Fail Over | Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. Configured through the ip bgp fast-external-failover command. |
| Log Neighbor Changes | Indicates whether logging of peer state changes is enabled or disabled. Configured through the ip bgp log-neighbor-changes command. |
| Multi path | Indicates whether support for multiple equal cost paths is enabled or disabled. Configured through the ip bgp maximum-paths command. |

output definitions (continued)

| | |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Graceful Restart | Indicates whether graceful restart is enabled or disabled. |
| Graceful Restart Status | Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP. |
| Configured Graceful Restart Interval | Indicates the timer for achieving a graceful restart. |
| IPv4 Unicast | Indicates whether IPv4 unicast is enabled or disabled. |
| IPv6 Unicast | Indicates whether IPv6 unicast is enabled or disabled. |
| BFD Status | Indicates whether BFD is enabled or disabled for the BGP protocol. Configured through the ip bgp bfd-state command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------|-----------------------------------------------------------------------|
| ip bgp unicast | Enables or disables unicast IPv4 updates for the BGP routing process. |
| ipv6 bgp unicast | Enables or disables unicast IPv6 updates for the BGP routing process |
| show ip bgp statistics | Displays BGP global statistics. |

show ip bgp statistics

Displays BGP global statistics.

show ip bgp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

Examples

```
-> show ip bgp statistics
# of Active Prefixes Known           = 0,
# of EBGP Neighbors in Established State = 0,
# of IBGP Neighbors in Established State = 0,
# of Feasible Paths                  = 0,
# of Dampened Paths                   = 0,
# of Unsynchronized Paths              = 0,
# of Policy unfeasible paths           = 0,
Total Number of Paths                 = 0
```

output definitions

| | |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| # of Active Prefixes Known | The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active. |
| # of EBGP Neighbors in Established State | The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to. |
| # of IBGP Neighbors in Established State | The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to. |
| # of Feasible Paths | The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol. |
| # of Dampened Paths | The number of route paths that are not active because they have violated dampening parameters. |
| # of Unsynchronized Paths | The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol. |

output definitions (continued)

| | |
|------------------------------|----------------------------------------------------------------------------------------------------------------|
| # of Unfeasible Paths | The number of route paths that are not active because they are not permitted based on a configured BGP policy. |
| Total Number of Paths | The total number of paths known to the speaker, active or not. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

show ip bgp dampening

Displays the BGP route dampening settings.

show ip bgp dampening

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

Examples

```
-> show ip bgp dampening
Admin Status           = disabled,
Half life value (seconds) = 300,
Reuse value            = 200
Suppress value         = 300,
Max suppress time (seconds) = 1800,
```

output definitions

| | |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin Status | Indicates whether route dampening is enabled or disabled. This value is configured through the ip bgp dampening command. |
| Half life value | The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the ip bgp dampening command. |
| Reuse value | The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the ip bgp dampening command. |
| Suppress value | The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the ip bgp dampening command. |
| Max Suppress time | The maximum time (in seconds) that a route will be suppressed. This value is configured through the ip bgp dampening command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp dampening](#)

Enables or disables BGP route dampening or the suppression of unstable routes.

MIB Objects

```

  alaBgpDampeningClear
```

show ip bgp dampening-stats

Displays BGP dampening statistics.

```
show ip bgp dampening-stats [ip_address ip_mask] [peer_address]
```

Syntax Definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | A 32-bit IP address. |
| <i>ip_mask</i> | A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number. |
| <i>peer_address</i> | A 32-bit IP address of peer (neighbor). |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

Examples

```
-> show ip bgp dampening-stats
```

| Network | Mask | From | Flaps | Duration | FOM |
|-------------------------------------|-----------------|--------------|-------|-------------|-----|
| -----+-----+-----+-----+-----+----- | | | | | |
| 155.132.44.73 | 255.255.255.255 | 192.40.4.121 | 8 | 00h:00m:35s | 175 |

output definitions

| | |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network | The IP address for the local BGP speaker that is responsible for route dampening in this router. |
| Mask | The mask for the local BGP speaker that is responsible for route dampening in this router. |
| From | The IP address for the route that is flapping. |
| Flaps | The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps. |
| Duration | The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period. |
| FOM | The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in ip bgp dampening), then this route will no longer be advertised. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp dampening](#) Enables and disables route dampening.

MIB Objects

N/A

show ip bgp path

Displays BGP paths.

show ip bgp path

[**ip-addr** *ip_address ip_mask*]
[**aspath-list** *aspathlist_name*]
[**community-list** *community_list_name*]

[**neighbor-rcv** *rcv_peer_address*]
[**neighbor-adv** *adv_peer_addr*]
[**regexp** “*regular_expression*”]
[**best**]
[**detail**]

Syntax Definitions

| | |
|----------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | A 32-bit IP address of the path. |
| <i>ip_mask</i> | A 32-bit subnet mask of the path. |
| <i>aspathlist_name</i> | AS path on which to filter. |
| <i>community_list_name</i> | Community name on which to filter. |
| <i>prefix_name</i> | Prefix on which to filter. |
| <i>routemap_name</i> | Route map on which to filter. |
| cidr-only | Filter out everything except CIDR routes. |
| <i>community_number</i> | Community number on which to filter. |
| <i>rcv_peer_address</i> | Filter all except paths received from this path. |
| <i>adv_peer_addr</i> | Filter all except paths sent to this path. |
| <i>regular_expression</i> | Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, “\$100”. |
| best | Show only the best path. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.
- ‘Detail’ option displays the AS Path details for a specific route.

Examples

```
-> show ip bgp path
Legends: Sta      = Path state
         >        = best, F = feasible
         P        = policy changing, U = un-synchronized

Path peer = 192.40.4.29
  Path nextHop = 192.40.4.29,
  Path origin = igp,
  Path local preference = -1,
  Path state = active,
  Path weight = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=2] : 3 2 ,
  Path MED = -1,
  Path atomic = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community = <none>,
  Path unknown attribute = <none>

```

output definitions

| | |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path address | The IP address for route path. |
| Path mask | The mask for this route path. |
| Path protocol | The protocol from which this route path was learned. Possible values for this field are as follows: local , static , directhost , rip , ospf , isis , ibgp , ebgp , and other . |
| Path peer | The IP address of the peer that is advertising this route path. |
| Path nextHop | The next hop along the route path. |
| Path origin | The BGP origin attribute. Possible values will be igp , egp , incomplete , and none . The origin attribute is considered during the route decision process. |
| Path local preference | The local preference value for this route as received in an UPDATE message. A negative value (for example, the -1 in the above display) indicates that the local preference value is missing for this route path. |
| Path state | Path state indicates the state of the path. The possible states are best , feasible , policy-wait , un-synchronized , dampened , or none . When path state is none , it indicates that there are no paths to this prefix and the route is being purged from the system. |
| Path weight | The path weight as assigned through inbound and outbound policies. |
| Path preference degree | The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the ip bgp default local-preference). |

output definitions (continued)

| | |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path autonomous systems | The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3. |
| Path MED | The multi-exit discriminator (MED) value for this route path. A negative value (for example, the -1 in the above display) indicates that the MED value is missing for this route path. |
| Path atomic | Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read yes), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate). |
| Path AS aggregator | Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <none> indicates this is not an aggregate route. |
| Path IPaddr aggregator | Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <none> indicates that this is not an aggregate route. |
| Path community | Indicates the community to which this route path belongs, if applicable. A value of <none> indicates that this route does not belong to a community. |
| Path unknown attribute | Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; 'detail' keyword added.

Related Commands

[show ip bgp routes](#) Displays BGP route details.

MIB Objects

alaBgpPathTable
 alaBgpPathEntry

show ip bgp routes

Displays BGP route details.

show ip bgp routes [*ip_address ip_mask*]

Syntax Definitions

ip_address A 32-bit IP address.

ip_mask A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all the routes in the routing table with details.

Examples

-> show ip bgp routes

Legends: ECL = EBGp change list, ICC = IBGP client change list
 ICL = IBGP change list, LCL = local change list
 AGG = Aggregation, AGC = Aggregation contribution
 AGL = Aggregation list, GDL = Deletion list
 AGW = Aggregation waiting, AGH = Aggregation hidden
 DMP = Dampening, ACT = Active route

| Address | Mask | ECL | ICC | ICL | LCL | AGG | AGC | AGL | AGW | AGH | GDL | DMP | ACT |
|--------------|-----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 192.40.4.0 | 255.255.255.0 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.0 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.8 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.72 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.80 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.104 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.112 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |
| 192.40.6.144 | 255.255.255.248 | No | No | No | No | No | No | No | No | No | No | No | Yes |

output definitions

| | |
|----------------|---------------------------------------------------------------------------------------------------------------------|
| Address | The route destination network address. |
| Mask | The route destination network mask. |
| ECL | External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires. |
| ICC | Internal BGP client change list. When Yes, this route will be advertised to internal non-clients. |

output definitions (continued)

| | |
|------------|---------------------------------------------------------------------------------------------------------------------------------------|
| ICL | Internal BGP change list. When Yes, this route has changes that need to be advertised. |
| LCL | Local change list. When Yes, this route is local. |
| AGG | Aggregation. When Yes, this route is an aggregate route. |
| AGC | Aggregation contribution. When Yes, this route is part of an aggregate route. |
| AGL | Aggregation list. When Yes, this route is placed on an aggregate list. |
| AGW | Aggregation waiting. When Yes, this route is waiting for an aggregate contributor. |
| AGH | Aggregation hidden. When Yes, this route is hidden as part of an aggregate route. |
| GDL | Deletion list. When Yes, this route will be deleted. |
| DMP | Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists. |
| ACT | Active route. When Yes, the route is active. |

show ip bgp aggregate-address

Displays aggregate route status.

show ip bgp aggregate-address [*ip_address ip mask*]

Syntax Definitions

ip_address A 32-bit IP address of the aggregate address.

ip_mask A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

Examples

```
-> show ip bgp aggregate-address
Network          Mask          Summarize As-Set  Admin state Oper state
-----+-----+-----+-----+-----+-----
155.132.44.73   255.255.255.255 disabled  disabled disabled  not_active
192.40.6.0      255.255.255.255 disabled  disabled disabled  not_active
```

```
-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address      = 192.40.6.0,
Aggregate mask         = 255.255.255.255,
Aggregate admin state  = disabled,
Aggregate oper state   = not_active,
Aggregate as-set       = disabled,
Aggregate summarize    = disabled,
Aggregate metric       = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

output definitions

| | |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network or Aggregate address | The IP address for this aggregate route. This value is configured through the ip bgp aggregate-address command. |
| Mask or Aggregate mask | The mask for this aggregate route. This value is configured through the ip bgp aggregate-address command. |
| Summarize or Aggregate summarize | Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the ip bgp aggregate-address summary-only command. |

output definitions (continued)

| | |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| As-Set or Aggregate as-set | Indicates whether AS path aggregate is enabled or disabled. This value is configured through the ip bgp aggregate-address as-set command. |
| Admin State or Aggregate admin state | Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the ip bgp aggregate-address admin-state command. |
| Oper State or Aggregate oper state | Indicates whether this aggregate route is operational and participating in BGP message exchanges. |
| Aggregate metric | The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the ip bgp aggregate-address metric command. |
| Aggregate local preference | The local preference value for this aggregate route. This value is configured through the ip bgp aggregate-address local-preference command. |
| Aggregate community string | The community string value for this aggregate route. This value is configured through the ip bgp aggregate-address community command. |

Release History

Release 7.1.1; command was introduced.

show ip bgp network

Displays currently defined network configurations.

show ip bgp network [*ip_address ip_mask*]

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | A 32-bit IP address. |
| <i>ip_mask</i> | A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all the configured networks, or a single network.

Examples

```
-> show ip bgp network
Network      Mask                Admin state Oper state
-----+-----+-----+-----
155.132.1.2  255.255.255.255 disabled    not_active
155.132.1.3  255.255.255.255 disabled    not_active
```

```
-> show ip bgp network 155.132.1.2 255.255.255.255
Network address      = 155.132.1.2,
Network mask         = 255.255.255.255,
Network admin state  = disabled,
Network oper state   = not_active,
Network metric       = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

output definitions

| | |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network or Network address | The IP address configured for this local BGP network. This value is configured through the ip bgp network command. |
| Mask or Network mask | The mask configured for this local BGP network. This value is configured through the ip bgp network command. |
| Admin state or Network admin state | Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the ip bgp network admin-state command. |

output definitions (continued)

| | |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oper state or Network oper state | Indicates whether this BGP local network is operationally active or inactive. |
| Network metric | The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the ip bgp network metric command. |
| Network local preference | The local preference value for this local BGP network. This value is configured through the ip bgp network local-preference command. |
| Network community string | The community string value for this local BGP network. This value is configured through the ip bgp network community command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp network Configures a local BGP network.

MIB Objects

alaBgpNetworkEntry

show ip bgp neighbors

Displays the configured IPv4 BGP peers.

show ip bgp neighbors [*ip_address*]

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

There are two output options for this command. If you specify `show ip bgp peer` without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

Examples

```
-> show ip bgp neighbors
Legends:Nbr = Neighbor
```

```
      As = Autonomous System
Nbr address  As      Admin state Oper state BGP Id      Up/Down      BFD Status
-----+-----+-----+-----+-----+-----+-----
192.40.4.29  3      enabled   estab     192.40.4.29 00h:14m:48s disabled
192.40.4.121 5      disabled  idle      0.0.0.0     00h:00m:00s enabled
```

output definitions

| | |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nbr address | The IP address for this BGP peer. Assign this address through the ip bgp neighbor command. |
| As | The autonomous system to which this peer belongs. A peer's AS number is assigned through the ip bgp neighbor remote-as command. |
| Admin state | Indicates whether this peer has been enabled or disabled through the ip bgp neighbor admin-state command. |
| Oper state | The current BGP state for this peer. Possible states are idle , connect , active , opensent , openconfirm , and established . |
| BgpId | The unique BGP identifier of the peer. This value is configured through the ip bgp neighbor update-source command. |

output definitions

| | |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Up/Down | The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN. |
| BFD Status | Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the ip ipv6 bgp neighbor bfd-state command. |

```
-> show ip bgp neighbors 0.0.0.1
Neighbor address                = 0.0.0.1,
Neighbor autonomous system      = 1,
Neighbor Admin state            = enabled,
Neighbor Oper state             = connect,
Neighbor passive status         = disabled,
Neighbor name                   = peer(0.0.0.1),
Neighbor local address          = vlan-215,
Neighbor EBGP multiHop          = enabled,
Neighbor next hop self          = disabled,
Neighbor TTL security           = 6,
Neighbor Route Refresh          = enabled,
Neighbor Ipv4 unicast           = enabled,
Neighbor Ipv4 multicast         = disabled,
Neighbor type                   = internal,
Neighbor auto-restart           = enabled,
Neighbor route-reflector-client = disabled,
Neighbor confederation status   = disabled,
Neighbor remove private AS      = disabled,
Neighbor default originate      = disabled,
Neighbor maximum prefixes       = 5000,
Neighbor max prefixes warning   = enabled,
# of prefixes received          = 0,
Neighbor MD5 key                = <none>,
Neighbor local port             = 0,
Neighbor TCP window size        = 32768
Graceful Restart State          = None,
Advertised Restart Interval     = 0s,
Forwarding State during restart = NotPreserved,
Activate IPv6 unicast           = enabled,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast           = advertised
BFD Status                      = Disabled,
Activate IPv4 unicast           = enabled,
BFD Status                      = disabled,
Activate IPv4 unicast           = enabled
```

output definitions

| | |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor address | The IP address for this BGP peer. Assign this address through the ip bgp neighbor command. |
| Neighbor autonomous system | The autonomous system to which this peer belongs. A peer's AS number is assigned through the ip bgp neighbor remote-as command. |
| Neighbor Admin state | Indicates whether this peer has been enabled or disabled through the ip bgp neighbor admin-state command. |

output definitions (continued)

| | |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor Oper state | The current BGP state for this peer. Possible states are idle , connect , active , opensent , openconfirm , and established . |
| Neighbor passive status | Indicates whether the local BGP speaker is “passive” (i.e., waiting for this peer to initiate a session). This value is configured through the ip bgp neighbor passive command. |
| Neighbor name | The name assigned to this peer through the ip bgp neighbor description command. |
| Neighbor local address | The interface assigned to this peer. This value is configured through the ip bgp neighbor update-source command. |
| Neighbor EBGMP multihop | Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the ip bgp neighbor ebgp-multihop command. |
| Neighbor next hop self | Indicates whether this peer is using next hop processing. This value is configured through the ip bgp neighbor next-hop-self command. |
| Neighbor TTL security | Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none. |
| Neighbor Route Refresh | Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability. |
| Neighbor Ipv4 unicast | Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability. |
| Neighbor Ipv4 multicast | Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability. |
| Neighbor type | Indicates whether this peer is internal or external to the router. |
| Neighbor auto-restart | Indicates whether peer auto-restart is enabled or disabled. This value is configured through the ip bgp neighbor auto-restart command. |
| Neighbor route-reflector-client | Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the ip bgp neighbor route-reflector-client command. |
| Neighbor confederation status | Indicates whether this peer is a member of a BGP confederation. This value is configured through the ip bgp confederation neighbor command. |
| Neighbor remove private AS | Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the ip bgp neighbor remove-private-as command. |
| Neighbor default originate | Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the ip bgp neighbor default-originate command. |

output definitions (continued)

| | |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor maximum prefixes | The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the ip bgp neighbor maximum-prefix command. |
| Neighbor max prefixes warning | Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the ip bgp neighbor update-source command. |
| # of prefixes received | Displays the total number of prefixes received by this neighbor. |
| Neighbor MD5 key [32- 47] | When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the ip bgp neighbor md5 key command. |
| Neighbor local port | The TCP port used for the session with this peer. |
| Neighbor TCP window size | The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message. |
| Graceful Restart State | Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP. |
| Advertised Restart Interval | Indicates the restart interval in seconds. |
| Forwarding State during restart | Indicates whether the peer has preserved the forwarding state during the graceful restart. |
| Activate IPv6 unicast | Indicates if the IPv6 unicast updates are enabled or not. Options include enabled or disabled . |
| Configured IPv6 NextHop Address | Specifies the IPv6 nexthop address. This is specified using the ipv6 bgp neighbor ipv6-nexthop command. |
| Neighbor Ipv6 unicast | Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers. |
| BFD Status | Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the ip ipv6 bgp neighbor bfd-state command. |
| Activate IPv4 unicast | Indicates if the IPv4 unicast updates are enabled or not for this peer. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; BFD Status and Activate IPv4 unicast output fields added.

Release 8.4.1; 'Neighbor TTL security' output field added.

show ip bgp neighbors policy

Displays BGP peer policy information.

```
show ip bgp neighbors policy [ip_address]
```

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific peer.

Examples

```
-> show ip bgp neighbors policy
Neighbor address = 0.0.0.0,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
Neighbor address = 0.0.0.1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,

  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

output definitions

| | |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor autonomous system | The AS to which the peer is assigned. This can be assigned by using the ip bgp neighbor remote-as command. |
| Neighbor output policy map name | The outbound route map policy for the peer. This can be assigned by using the ip bgp neighbor route-map command. |
| Neighbor input policy map name | The inbound route map policy for the peer. This can be assigned by using the ip bgp neighbor route-map command. |
| Neighbor output aspath-list name | The outbound AS path list policy for the peer. This can be assigned by using the ip bgp neighbor out-aspathlist command. |
| Neighbor input aspath-list name | The inbound AS path list policy for the peer. This can be assigned by using the ip bgp neighbor in-aspathlist command. |
| Neighbor output prefix-list name | The outbound prefix list policy for the peer. This can be assigned by using the ip bgp neighbor out-prefixlist command. |
| Neighbor input prefix-list name | The inbound prefix list policy for the peer. This can be assigned by using the ip bgp neighbor in-prefixlist command. |
| Neighbor output community-list name | The outbound community list policy for the peer. This can be assigned by using the ip bgp neighbor out-communitylist command. |
| Neighbor input community-list name | The inbound community list policy for the peer. This can be assigned by using the ip bgp neighbor in-communitylist command. |
| Neighbor soft reconfiguration | Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the ip bgp neighbor soft-reconfiguration command. |
| Neighbor output prefix6-list name | The outbound prefix6 list policy for the peer. This can be assigned by using the ip bgp neighbor out-prefix6list command. |
| Neighbor input prefix6-list name | The inbound prefix6 list policy for the peer. This can be assigned by using the ip bgp neighbor in-prefix6list command. |

show ip bgp neighbors timer

Displays BGP peer timer statistics.

show ip bgp neighbors timer [*ip_address*]

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

Examples

```
-> show ip bgp neighbors timer
```

```
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
```

| Nbr | address | As | Hold | Hold(C) | RtAdv | Retry | Kalive | Ka(C) |
|--------------|---------|----|------|---------|-------|-------|--------|-------|
| 192.40.4.29 | | 3 | 90 | 90 | 30 | 120 | 30 | 30 |
| 192.40.4.121 | | 5 | 0 | 90 | 30 | 120 | 0 | 30 |

output definitions

| | |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nbr address | The IP address for this BGP peer. Assign this address through the ip bgp neighbor command. |
| As | The autonomous system to which this peer belongs. A peer's AS number is assigned through the ip bgp neighbor remote-as command. |
| Hold | The current count for the holdtime value. |
| Hold(C) | The holdtime value configured through the ip bgp neighbor timers command. |
| RtAdv | The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the ip bgp neighbor advertisement-interval command. |
| Retry | The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured through the ip bgp neighbor timers command. |

output definitions (continued)

| | |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Kalive | The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable. |
| Ka(C) | The keepalive interval as configured through the ip bgp neighbor timers command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

N/A

show ip bgp neighbors statistics

Displays BGP peer message statistics.

show ip bgp neighbors statistics [*ip_address*]

Syntax Definitions

ip_address A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

Examples

```
-> show ip bgp neighbors statistics
```

```
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
          RUPDS = number of Update messages received,
          SUPDS = number of Update messages sent,
          RNOFY = number of Notify messages received,
          SNOFY = number of Notify messages sent
          RPFXS = number of prefixes received
          UPTNS = number of UP transitions
          DNTNS = number of DOWN transitions
```

| Nbr | address | As | RMSGS | SMSGS | RUPDS | SUPDS | RNOFY | SNOFY | RPFXS | UPTNS | DNTNS |
|--------------|---------|-----|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 192.40.4.29 | 3 | 110 | 123 | 5 | 0 | 0 | 1 | 8 | 2 | 2 | |
| 192.40.4.121 | 5 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |

output definitions

| | |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Nbr address | The IP address for this peer. This value is configured through the ip bgp neighbor command. |
| As | The autonomous system to which this peer belongs. This value is configured through the ip bgp neighbor remote-as command. |
| RMSGS | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer. |
| SMSGS | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer. |

output definitions (continued)

| | |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RUPDS | The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| SUPDS | The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| RNOFY | The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |
| SNOFY | The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |
| RPFXS | The number of unique route prefixes received by this peer. |
| UPTNS | The number of times this peer has come up, operationally. |
| DNTNS | Number of times this peer has gone down, operationally. |

```

-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address           = 0.0.0.1,
# of UP transitions        = 0,
Time of last UP transition = 00h:00m:00s,
# of DOWN transitions      = 0,
Time of last DOWN transition = 00h:00m:00s,
Last DOWN reason          = none,
# of msgs rcvd            = 0,
# of Update msgs rcvd     = 0,
# of prefixes rcvd        = 0,
# of Route Refresh msgs rcvd = 0,
# of Notification msgs rcvd = 0,
Last rcvd Notification reason = none [none]
Time last msg was rcvd     = 00h:00m:00s,
# of msgs sent             = 0,
# of Update msgs sent      = 0,
# of Route Refresh msgs sent = 0,
# of Notification msgs sent = 0,
Last sent Notification reason = none [none]
Time last msg was sent     = 00h:00m:00s,

```

output definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------------------|
| Neighbor address | The IP address for this peer. This value is configured through the ip bgp neighbor command. |
| # of UP transitions | The number of times this peer has come up, operationally. |
| Time of last UP transition | The duration that this peer has been up. |
| # of DOWN transitions | Number of times this peer has gone down, operationally. |
| Time of last DOWN transition | The duration since this peer last went down. |

output definitions (continued)

| | |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last DOWN reason | Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None |
| # of msgs rcvd | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer. |
| # of Update msgs rcvd | The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| # of prefixes rcvd | The number of unique route prefixes received by this peer. |
| # of Route Refresh msgs rcvd | The number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer. |
| # of Notification msgs rcvd | The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |

output definitions (continued)

| | |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last rcvd Notification reason | <p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none |
| Time last msg was rcvd | The duration since a message was received from this peer. |
| # of msgd sent | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer. |
| # of Update msgd sent | The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| # of Route Refresh msgd sent | The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer. |
| # of Notification msgd sent | The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |

output definitions (continued)

| | |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last sent Notification reason | NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the Peer last received notification reason field above. |
| Time last msg was sent | The duration since a message was sent to this peer. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp neighbor](#) Creates or deletes a BGP peer.

MIB Objects

N/A

show ip bgp policy aspath-list

Displays AS path list parameters.

```
show ip bgp policy aspath-list [name] ["regular_expression"]
```

Syntax Definitions

| | |
|---------------------------|-----------------------------------------------------------------------------------|
| <i>name</i> | An AS path name. |
| <i>regular_expression</i> | A regular expression. The regular expression must be enclosed by quotation marks. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the [ip bgp policy aspath-list](#) command on page 29-108.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

Examples

```
-> show ip bgp policy aspath-list
Aspath List Name      Aspath regular expression
-----+-----
aspl1                  (500 | 400) ? 300$
aspl2                  (500 | 400)
```

```
-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp    = (500 | 400) ? 300$
  Admin state    = disabled,
  Priority        = 1,
  Action         = deny,
  Primary index  = 0,
```

output definitions

| | |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Aspath List name | The name of the AS path list. This is defined using the ip bgp policy aspath-list command. |
| Aspath regular expression | The regular expression that defines the AS path list. This is defined using the ip bgp policy aspath-list command. |

output definitions (continued)

| | |
|----------------------|----------------------------------------------------------------------------------------------------------------------------|
| Admin state | The administration state of the AS path policy. It is either enable or disable. |
| Priority | The AS path list priority. This is defined using the ip bgp policy aspath-list priority command. |
| Action | The AS path list action, either permit or deny. This is defined using the ip bgp policy aspath-list action command. |
| Primary index | The instance identifier for the AS path list. This value is not configurable. |

Release History

Release 7.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list Creates or removes an AS path list.

show ip bgp policy community-list

Displays community list parameters.

show ip bgp policy community-list [*name*] [*string*]

Syntax Definitions

| | |
|---------------|-----------------------------------------------------------------------------------|
| <i>name</i> | Community name. |
| <i>string</i> | A regular expression. The regular expression must be enclosed by quotation marks. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

Examples

```
-> show ip bgp policy community-list
Community list name      Community string
-----+-----
adfasdf                  0:0
```

```
-> show ip bgp policy community-list com11
Community List name = com11
Community string    = 600:1
  Admin state       = disabled,
  Match type        = exact,
  Priority           = 1,
  Action            = deny,
  Primary index     = 0
```

output definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Community List name | The community list name. This is defined using the ip bgp policy community-list command. |
| Community string | The community list definition. This is defined using the ip bgp policy community-list command. |
| Admin state | The administration state of the community list policy, either enabled or disabled. |
| Match type | The match type of the community list. This is defined using the ip bgp policy community-list match-type command. |

output definitions (continued)

| | |
|----------------------|--------------------------------------------------------------------------------------------------------------|
| Priority | The community list priority. This is defined using the ip bgp policy community-list priority command. |
| Action | The community list action. This is defined using the ip bgp policy community-list action command. |
| Primary index | The instance identifier for the community list. This value is not configurable. |

Release History

Release 7.1.1; command was introduced.

show ip bgp policy prefix-list

Displays prefix list parameters.

```
show ip bgp policy prefix-list [name] [ip_address ip_mask]
```

Syntax Definitions

| | |
|-------------------|---------------------------|
| <i>name</i> | A prefix list name. |
| <i>ip_address</i> | A prefix list IP address. |
| <i>ip_mask</i> | An IP address mask. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

Examples

```
-> show ip bgp policy prefix-list
Prefix List name      Prefix address  Prefix mask
-----+-----+-----
pfxl1                 155.132.33.0   255.255.255.0
pfxl2                 155.148.32.0   255.255.255.0
```

```
-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask            = 255.255.255.0
Admin state     = disabled,
Match Mask >= (GE) = 0,
Match Mask <= (LE) = 0,
Action          = deny
```

output definitions

| | |
|-------------------------|-----------------------------------------------------------------------------------------------------------------|
| Prefix List name | The name of the prefix list. This is defined using the ip bgp policy prefix-list command. |
| Address | The IP address of the prefix list. This is defined using the ip bgp policy prefix-list command. |
| Mask | The mask of the prefix list. This is defined using the ip bgp policy prefix-list command. |
| Admin state | The administrative state of the prefix list, either enabled or disabled. |

output definitions (continued)

| | |
|------------------------------|--------------------------------------------------------------------------------------------------------------|
| Match Mask >= (GE) | The GE match mask of the prefix list. This is defined using the ip bgp policy prefix-list ge command. |
| Match Mask <= (LE) | The LE match mask of the prefix list. This is defined using the ip bgp policy prefix-list le command. |
| Action | The action of the prefix list. This is defined using the ip bgp policy prefix-list action command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

```

show ip bgp policy prefix6-list

Displays prefix6 list parameters.

show ip bgp policy prefix6-list [*name*] [*ipv6_address/prefixLength*]

Syntax Definitions

| | |
|---------------------|-------------------------------|
| <i>name</i> | A prefix6 list name. |
| <i>ip_address</i> | A prefix6 list IPv6 address. |
| <i>prefixLength</i> | A prefix6 list prefix length. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the list of prefix6-list policies configured for the speaker, or a specific list determined by the list name or IPv6 address.

Examples

```
-> show ip bgp policy prefix6-list
Prefix6 List name      Prefix6 address/Prefix length
-----+-----
p62                    ::/0
p63                    4001:1::/32
```

```
-> show ip bgp policy prefix6-list p63
Prefix6 List name = p63
Prefix            = 4001:1::
Prefix Length     = 32
Admin state       = enabled,
Match MaskLength >= (GE) = 32,
Match MaskLength <= (LE) = 0,
Action            = permit
```

output definitions

| | |
|--------------------------|----------------------------------------------------------------------------------------------------------------------|
| Prefix6 List name | The name of the prefix6 list. This is defined using the ip bgp policy prefix6-list command. |
| Prefix | The IPv6 address of the prefix6 list. This is defined using the ip bgp policy prefix6-list command. |
| Prefix Length | The prefix length of the prefix6 list. This is defined using the ip bgp policy prefix6-list command. |
| Admin state | The administrative state of the prefix6 list, either enabled or disabled. |

output definitions (continued)

| | |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Match MaskLength >= (GE) | The GE match masklength of the prefix6 list. This is defined using the ip bgp policy prefix6-list command. |
| Match MaskLength <= (LE) | The LE match masklength of the prefix6 list. This is defined using the ip bgp policy prefix6-list command |
| Action | The action of the prefix6 list. This is defined using the ip bgp policy prefix6-list command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a prefix6 match list.

```

show ip bgp policy route-map

Displays policy route map parameters.

show ip bgp policy route-map [*name*] [*sequence_number*]

Syntax Definitions

name Route map name.
sequence_number A sequence number. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

Examples

```
-> show ip bgp policy route-map
RouteMap name          Instance
-----+-----
rmap1                  1
rmap1                  2
rmap2                  1

-> show ip bgp policy route-map rmap1
RouteMap name          = rmap1
RouteMap instance     = 1
  Admin state          = disabled,
  Local pref (mode/value) = <none> / 0,
  Route map action     = permit,
  Origin               = <none>,
  MED (mode/value)    = <none> / 0,
  Weight              = 0,
  Aspath-List name     = aspl1,
  Aspath prepend       = <none>,
  Aspath match primitive = 500 .* 400$,
  Prefix-List name     = <none>,
  Prefix match primitive = 0.0.0.0 0.0.0.0,
  Prefix6-List name    = <none>,
  Prefix6 match primitive = ::/0,
  Prefix6-List name    = <none>,
  Prefix6 match primitive = ::/0,
  Community-List name  = coml2,
  Community match primitive = <none>,
  Community string [mode] = [Additive]
```

output definitions

| | |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RouteMap name | The name of the route map policy. This is determined using the ip bgp policy prefix6-list command. |
| RouteMap instance | The instance of the route map policy. This is determined using the ip bgp policy prefix6-list command. |
| Admin state | The administrative state of the route map policy, either enabled or disabled. |
| Local pref (mode/value) | The local preference of the route map policy. This is determined using the ip bgp policy route-map lpref command. |
| Route map action | The action of the route map policy. This is determined using the ip bgp policy route-map action command. |
| Origin | The origin of the route map policy. This is determined using the ip bgp policy route-map origin command. |
| MED (mode/value) | The MED of the route map policy. This is determined using the ip bgp policy route-map med command. |
| Weight | The weight of the route map policy. This is determined using the ip bgp policy route-map weight command. |
| Aspath-List name | The name of the AS path list attached to this route map. This is set using the show ip bgp policy aspath-list command. |
| Aspath prepend | The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done). |
| Aspath match primitive | The regular expression used to match AS Path for this route map. |
| Prefix-List name | The name of the prefix list attached to this route map. This is set using the show ip bgp policy prefix-list command. |
| Prefix match primitive | The prefix to match for this route map. |
| Prefix6-List name | The name of the prefix6 list attached to this route map. |
| Prefix6 match primitive | The prefix6 to match for this route map. |
| Community-List name | The name of the community list attached to this route map. This is set using the show ip bgp policy community-list command. |
| Community match primitive | The community string to match for this route map. |
| Community string [mode] | The name of the community mode attached to this route map. This is set using the ip bgp policy route-map community-mode command. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; Prefix6-List name and Prefix6 match primitive output fields added.

ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

ip bgp graceful-restart

no ip bgp graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful restart  
-> no ip bgp graceful restart
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip bgp Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart  
  alaBgpRestartInterval
```

ip bgp graceful-restart restart-interval

Configures the grace period for achieving a graceful BGP restart.

ip bgp graceful-restart restart-interval [*seconds*]

Syntax Definitions

seconds The hitless restart timeout interval, in seconds. The valid range is 1–3600.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 90 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful-restart restart-interval 600
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart  
  alaBgpRestartInterval
```

ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

ip bgp unicast

no ip bgp unicast

Syntax Definitions

N/A

Defaults

By default, BGP IPv4 advertisements are enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogeneous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

Examples

```
-> ip bgp unicast  
-> no ip bgp unicast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------------|-----------------------------------------------------------------------|
| ipv6 bgp unicast | Enables or disables unicast IPv6 updates for the BGP routing process. |
| show ip bgp | Displays the current global settings for the local BGP speaker. |
| ip router router-id | Configures the router ID for the router. |

MIB Objects

```
alaBgpGlobal  
  alaBgpMultiProtocolIpv4
```

ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

ipv6 bgp unicast

no ipv6 bgp unicast

Syntax Definitions

N/A

Defaults

By default, IPv6 BGP advertisements are disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

Examples

```
-> ipv6 bgp unicast  
-> no ipv6 bgp unicast
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|--------------------------------|-----------------------------------------------------------------------|
| ip bgp unicast | Enables or disables unicast IPv4 updates for the BGP routing process. |
| show ip bgp | Displays the current global settings for the local BGP speaker. |

MIB Objects

```
alaBgpGlobal  
  alaBgpMultiProtocolIpv6
```

ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **activate-ipv6**

no ip bgp neighbor *ip_address* **activate-ipv6**

Syntax Definitions

ip_address The 32-bit IPv4 address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip bgp neighbors](#) Displays BGP peer main status.

MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerIpv6Unicast
```

ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **ipv6-nexthop** *ipv6_address*

Syntax Definitions

| | |
|---------------------|----------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | The 32-bit IPv4 address of the neighbor. |
| <i>ipv6_address</i> | A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker. |

Defaults

By default, the IPv6 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1  
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerIpv6NextHop
```

show ipv6 bgp path

Displays the known IPv6 BGP paths for all the routes or a specific route.

show ipv6 bgp path [**ipv6-addr** *ipv6_address/prefix_length*] [**detail**]

Syntax Definitions

| | |
|-----------------------|------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address. |
| <i>/prefix_length</i> | The number of bits that are significant in the IPv6 address (mask) (3..128). |

Defaults

By default, IPv6 BGP paths for all the routes will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_address/prefix_length* parameter to display the IPv6 BGP paths for a specified route.
- ‘Detail’ option when used displays the AS Path details of each route.

Examples

```
-> show ipv6 bgp path
Legends: Sta      = Path state
          >       = best, F = feasible, S = stale
          U       = un-synchronized
          Nbr     = Neighbor
          (O)     = Path Origin (? = incomplete, i = igp, e = egp)
          degPref = degree of preference
```

| Sta | Prefix | Nbr Address | (O) | degPref |
|-----|---------------------|-----------------|-----|---------|
| > | 2020:100:200:1::/64 | 2001:100:3:4::1 | i | 100 |
| > | 2020:100:200:2::/64 | 2001:100:3:4::1 | i | 100 |
| > | 2020:100:200:3::/64 | 2001:100:3:4::1 | i | 100 |
| > | 2020:100:200:4::/64 | 2001:100:3:4::1 | i | 100 |
| > | 2020:100:200:5::/64 | 2001:100:3:4::1 | i | 100 |
| > | 2525:2525:1::/48 | 100.3.4.1 | i | 100 |
| > | 2525:2525:2::/48 | 100.3.4.1 | i | 100 |
| > | 2525:2525:3::/48 | 100.3.4.1 | i | 100 |
| > | 2525:2525:4::/48 | 100.3.4.1 | i | 100 |
| > | 2525:2525:5::/48 | 100.3.4.1 | i | 100 |

```
-> show ipv6 bgp path detail
Legends: Sta      = Path state
          >       = best, F = feasible, S = stale
          Nbr     = Neighbor
          (O)     = Path Origin (? = incomplete, i = igp, e = egp)
          degPref = degree of preference
```

| Sta | Prefix | Nbr address | degPref | AS Path, (O) |
|-----|-----------------|-------------|---------|----------------|
| > | 3001:1::/64 | 2001:1::2 | 100 | 65535 65530, i |
| > | 3001:1:0:1::/64 | 2001:1::2 | 100 | 65535 65530, i |
| > | 3001:1:0:2::/64 | 2001:1::2 | 100 | 65535 65530, i |
| > | 4001:1:0:1::/64 | 2101::51 | 140 | 65536, i |
| > | 4001:1:0:2::/64 | 2101::51 | 140 | 65536, i |
| > | 4001:1:0:3::/64 | 2101::51 | 140 | 65536, i |

output definitions

| | |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Sta | Status flag. A greater-than sign (>) indicates this is the best route to the destination. |
| Prefix | The destination address of the IPv6 route in the hexadecimal format. |
| Nbr Address | The IP or IPv6 address of the BGP peer that advertises this path. |
| (O) | The origin attribute of this route path. A question mark (?) indicates incomplete, and i indicates IGP, and an e indicates EGP. |
| degPref | The local preference value assigned to this route path. |

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
```

```
BGP Path parameters
```

```
Path address      = 2020:100:200:1::
Path Length      = 64
Path protocol     = ibgp
Path neighbor    = peer(2001:100:3:4::1)
  Path nextHop    = 2001:100:3:4::1,
  Path origin     = igp,
  Path local preference = 100,
  Path state      = active,
  Path weight     = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED        = <none>,
  Path atomic     = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community  = <none>,
  Path Originator Id = <none>,
  Path Cluster List = <none>,
  Path unknown attribute = <none>
```

output definitions

| | |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path address | The IPv6 address for route path. |
| Path Length | The prefix length of the IPv6 path. |
| Path protocol | The protocol from which this route path was learned. Possible values for this field are as follows: local , static , directhost , rip , ospf , isis , ibgp , ebgp , and other . |
| Path neighbor | The IPv6 address of the BGP peer. |
| Path nextHop | The next hop along the route path. |
| Path origin | The BGP origin attribute. Possible values will be igp , egp , incomplete , and none . The origin attribute is considered during the route decision process. |

output definitions (continued)

| | |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path local preference | The local preference value for this route as received in an UPDATE message. A negative value (for example, the -1 in the above display) indicates that the local preference value is missing for this route path. |
| Path state | Indicates the state of the path. The possible states are best , feasible , policy-wait , un-synchronized , dampened , or none . When path state is none , it indicates that there are no paths to this prefix and the route is being purged from the system. |
| Path weight | The path weight as assigned through inbound and outbound policies. |
| Path preference degree | The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the ip bgp default local-preference). |
| Path autonomous systems | The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3. |
| Path MED | The multi-exit discriminator (MED) value for this route path. A negative value (for example, the -1 in the above display) indicates that the MED value is missing for this route path. |
| Path atomic | Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read yes), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate). |
| Path AS aggregator | Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <none> indicates this is not an aggregate route. |
| Path IPaddr aggregator | Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <none> indicates that this is not an aggregate route. |
| Path community | Indicates the community to which this route path belongs, if applicable. A value of <none> indicates that this route does not belong to a community. |
| Path Originator Id | The Router Id of the BGP4 speaker that performed route reflection |
| Path Cluster List | Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS. |
| Path unknown attribute | Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; 'detail' keyword added.

| 2525:2525:5::/48 | No | No | No | No | No | No | No | No | No | No | No | Yes |

output definitions

| | |
|---------------|---------------------------------------------------------------------------------------------------------------------|
| Prefix | The destination address of the IPv6 route in the hexadecimal format. |
| ECL | External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires. |
| ICC | Internal BGP client change list. When Yes, this route will be advertised to internal non-clients. |

output definitions (continued)

| | |
|------------|---------------------------------------------------------------------------------------------------------------------------------------|
| ICL | Internal BGP change list. When Yes, this route has changes that need to be advertised. |
| LCL | Local change list. When Yes, this route is local. |
| AGG | Aggregation. When Yes, this route is an aggregate route. |
| AGC | Aggregation contribution. When Yes, this route is part of an aggregate route. |
| AGL | Aggregation list. When Yes, this route is placed on an aggregate list. |
| AGW | Aggregation waiting. When Yes, this route is waiting for an aggregate contributor. |
| AGH | Aggregation hidden. When Yes, this route is hidden as part of an aggregate route. |
| GDL | Deletion list. When Yes, this route will be deleted. |
| DMP | Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists. |
| ACT | Active route. When Yes, the route is active. |

Release History

Release 7.1.1; command was introduced.

ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

ipv6 bgp network *ipv6_address/prefix_length*

no ipv6 bgp network *ipv6_address/prefix_length*

Syntax Definitions

ipv6_address

The 128-bit IPv6 address.

/prefix_length

The number of bits that are significant in the IPv6 address (mask) (3..128).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network admin-state Enables or disables a BGP network.

show ipv6 bgp network Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

alaBgpNetwork6Table
 alaBgpNetwork6Addr
 alaBgpNetwork6MaskLen

ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

ipv6 bgp network *ipv6_address/prefix_length* [**community** {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num* | *num:num*}]

Syntax Definitions

| | |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address. |
| <i>/prefix_length</i> | The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128 |
| none | Removes a prefix from a community. |
| no-export | Routes in this community are advertised within the AS but not beyond the local AS. |
| no-advertise | Routes in this community are not advertised to any peer. |
| no-export-subconfed | Routes in this community are not advertised to any external BGP peer. |
| <i>num</i> | The community attribute number. |
| <i>num:num</i> | Community attribute in the AS:NN format. AS indicates the autonomous system and NN indicates the community number. |

Defaults

By default, a route is not assigned to a community.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.
- The value of AS:NN is num.num:num if using asdot or asdot+ notation and is num:num if using asplain format.

Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; syntax added to **community** string.

Related Commands

 alaBgpNetwork6MaskLen

 alaBgpNetwork6Community

ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ipv6 bgp network *ipv6_address/prefix_length* [**local-preference num**]

Syntax Definitions

| | |
|-----------------------|------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address. |
| <i>/prefix_length</i> | The number of bits that are significant in the IPv6 address (mask) (3..128). |
| <i>num</i> | The local preference attribute value. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------|---------------------------------------------------------------------------------------|

  alaBgpNetwork6LocalPref
```

ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

```
ipv6 bgp network ipv6_address/prefix_length [metric num]
```

Syntax Definitions

| | |
|-----------------------|------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address. |
| <i>/prefix_length</i> | The number of bits that are significant in the IPv6 address (mask) (3..128). |
| <i>num</i> | The MED attribute value. The valid range is 0–4294967295. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

ipv6 bgp network *ipv6_address/prefix_length* [**admin-state** {**enable** | **disable**}]

Syntax Definitions

| | |
|-----------------------|------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address. |
| <i>/prefix_length</i> | The number of bits that are significant in the IPv6 address (mask) (3..128). |
| enable | Enables the BGP network. |
| disable | Disables the BGP network. |

Defaults

By default, the BGP network is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ipv6 bgp network Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6RowStatus
```

show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

show ipv6 bgp network [*ipv6_address/prefix_length*]

Syntax Definitions

| | |
|-----------------------|------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address. |
| <i>/prefix_length</i> | The number of bits that are significant in the IPv6 address (mask) (3..128). |

Defaults

By default, all IPv6 BGP networks and their status will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address/prefix_length* parameter to display the status of a specific IPv6 BGP network.

Examples

```
show ipv6 bgp network
Network
-----+-----+-----
2525:500:600::/64          enabled    active
```

```
show ipv6 bgp network 2525:500:600::/64
Network address           = 2525:500:600::/64,
Network admin state      = enabled,
Network oper state       = active,
Network metric           = 0,
Network local preference = 0,
Network community string = <none>
```

output definitions

| | |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network or Network address | The IPv6 address configured for this local BGP network. This value is configured through the ipv6 bgp network command. |
| Admin state or Network admin state | Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the ipv6 bgp network admin-state command. |
| Oper state or Network oper state | Indicates whether this BGP local network is operationally active or inactive. |

output definitions (continued)

| | |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network metric | The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the ipv6 bgp network metric command. |
| Network local preference | The local preference value for this local BGP network. This value is configured through the ipv6 bgp network local-preference command. |
| Network community string | The community string value for this local BGP network. This value is configured through the ipv6 bgp network community command. |

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp network .Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

MIB Objects

  alaBgpNetwork6RowStatus
```

ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

ipv6 bgp neighbor *ipv6_address*

no ipv6 bgp neighbor *ipv6_address*

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the new BGP peer.

Defaults

By default, no BGP peers are configured in the BGP network.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor admin-state** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

Examples

```
-> ipv6 bgp neighbor 2001::1  
-> no ipv6 bgp neighbor 2001::1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor admin-state Enables or disables the BGP peer status.

ipv6 bgp neighbor remote-as Assigns an AS number to the BGP peer.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6Addr

ipv6 bgp neighbor ttl-security

Configures the Generalized TTL Security Mechanism (GTSM) for the BGP peer. GTSM allows to set the maximum number of hops for the IP packets between the switch and the peer. If the maximum number of hops exceeds, the packet is dropped at the NI.

ipv6 bgp neighbor *ipv6_address* ttl-security *num*

ipv6 bgp neighbor *ipv6_address* no ttl-security

Syntax Definitions

| | |
|---------------------|---------------------------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>num</i> | The maximum number of hops between the switch and the peer. The valid range for GTSM is 0 to 255. |

Defaults

By default GTSM is disabled for communication with the peer.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- GTSM must be manually enabled on both peers in a connection.
- When GTSM is enabled, eBGP multihop must be disabled or vice-versa.
- Use the **no** form of this command to disable GTSM.

Examples

```
-> ipv6 bgp neighbor 2001::1 ttl-security 6
-> ipv6 bgp neighbor 2001::1 no ttl-security
```

Release History

Release 8.4.1; command was introduced.

ipv6 bgp neighbor activate-ipv4

Enables the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

ipv6 bgp neighbor *ipv6_address* [**activate-ipv4**]

no ipv6 bgp neighbor *ipv6_address* [**activate-ipv4**]

Syntax Definitions

ipv6_address

The 128-bit IPv6 address of the new BGP peer.

activate-ipv4

Enable the advertisement of IPv4 unicast capability to the IPv6 BGP peer.

Defaults

By default, the command is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the advertisement of IPv4 unicast capability to IPv6 BGP peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 activate-ipv4
-> no ipv6 bgp neighbor 2001::1 activate-ipv4
```

Release History

Release 7.3.4; command was introduced.

Related Commands

 alaBgpPeer6Addr

 alaBgpPeer6ActivateIpv4

ipv6 bgp neighbor activate-ipv6

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* [**activate-ipv6**]

no ipv6 bgp neighbor *ipv6_address* [**activate-ipv6**]

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6ActivateIpv6
```

ipv6 bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv6-nexthop ipv6_address]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the next hop router.

Defaults

By default, the IPv6 next hop address is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24  
-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
```

Release History

Release 7.1.1; command was introduced.

Related Commands

alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeerIpv6NextHop
```

ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [admin-state {enable | disable}]
```

Syntax Definitions

| | |
|---------------------|-----------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the new BGP peer. |
| enable | Enables the BGP peer. |
| disable | Disables the BGP peer. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the [ipv6 bgp neighbor](#) command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ipv6 bgp neighbor 2001::1 admin-state enable
-> ipv6 bgp neighbor 2001::1 admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6RowStatus
```

ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer. The peer will be unavailable during this restart.

ipv6 bgp neighbor *ipv6_address* clear

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:
 - **ipv6 bgp neighbor remote-as**
 - **ipv6 bgp neighbor md5 key**
 - **ipv6 bgp neighbor passive**
 - **ipv6 bgp neighbor ebgp-multihop**
 - **ipv6 bgp neighbor maximum-prefix**
 - **ipv6 bgp neighbor update-source**
 - **ipv6 bgp neighbor next-hop-self**
 - **ipv6 bgp neighbor soft-reconfiguration**
 - **ipv6 bgp neighbor route-reflector-client**
 - **ip bgp confederation neighbor6**
 - **ipv6 bgp neighbor remove-private-as**
 - **ipv6 bgp neighbor update-source-address**
- You do not need to issue the **ipv6 bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ipv6 bgp neighbor 2001::1 clear
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor auto-restart Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

alaBgpPeer6Table
alaBgpPeer6Restart

ipv6 bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this IPv6 peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

ipv6 bgp neighbor *ipv6_address* auto-restart

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the neighbor.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

Examples

```
-> ipv6 bgp neighbor 2001::1 auto-restart  
-> no ipv6 bgp neighbor 2001::1 auto-restart
```

Release History

Release 7.3.4; command was introduced.

Related Commands

- ipv6 bgp neighbor** Creates or deletes a BGP peer relationship using IPv6 addresses.
- ipv6 bgp neighbor admin-state** Enables or disables the BGP peer status.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6AutoRestart

ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

```
ipv6 bgp neighbor ipv6_address [remote-as value]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

value Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; modified the command.

Related Commands

ip bgp autonomous-system Sets the AS for the local BGP speaker.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6AS
```

ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

```
ipv6 bgp neighbor ipv6_address [timers num num]
```

Syntax Definitions

| | |
|---------------------|--------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address for the BGP peer. |
| <i>num</i> | The KEEPALIVE message interval in seconds. |
| <i>num</i> | The hold time interval in seconds. |

Defaults

| parameter | default |
|------------------------|------------|
| <i>num</i> (keepalive) | 30 seconds |
| <i>num</i> (holdtime) | 90 seconds |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 bgp neighbor conn-retry-interval](#) The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6HoldTime
  alaBgpPeer6KeepAlive
```

ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

```
ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

```
no ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP peer.
num The number of prefixes. The valid range is 0–4294967295.

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 5000 |

By default, **warning-only** is enabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only  
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

Release History

Release 7.1.1; command was introduced.

ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

```
ipv6 bgp neighbor ipv6_address [next-hop-self]
```

```
no ipv6 bgp neighbor ipv6_address [next-hop-self]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP peer.

Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self  
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6NextHopSelf
```

ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

ipv6 bgp neighbor *ipv6_address* [**conn-retry-interval** *num*]

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address for the BGP neighbor. |
| <i>num</i> | The time interval (in seconds) between retries. The valid range is 0–65535. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 120 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

```
ipv6 bgp neighbor ipv6_address [default-originate]
```

```
no ipv6 bgp neighbor ipv6_address [default-originate]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the neighbor.

Defaults

This **default-originate** parameter is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate  
-> no ipv6 bgp neighbor 2001::1 default-originate
```

Release History

Release 7.1.1; command was introduced.

Related Commands

alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6DefaultOriginate
```

ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

ipv6 bgp neighbor *ipv6_address* [**update-source** *interface_name*]

no ipv6 bgp neighbor *ipv6_address* [**update-source** *interface_name*]

Syntax Definitions

ipv6_address

The 128-bit IPv6 address for the BGP peer.

interface_name

The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6  
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

Release History

Release 7.1.1; command was introduced.

ipv6 bgp neighbor ipv4-nextHop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv4-nextHop ip_address]
```

Syntax Definitions

| | |
|---------------------|--------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address for the BGP peer. |
| <i>ip_address</i> | The 32-bit IP address of the next hop. |

Defaults

By default, the IPv4 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nextHop 172.22.2.115  
-> ipv6 bgp neighbor 2004::1 ipv4-nextHop 0.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 bgp neighbor advertisement-interval

Configures the time interval for updates between external IPv6 BGP peers.

```
ipv6 bgp neighbor ipv6_address advertisement-interval value
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the neighbor.
value An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 30 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external IPv6 BGP peers.

Examples

```
-> ipv6 bgp neighbor 2001::1 advertisement-interval 60
```

Release History

Release 7.3.4; command was introduced.

Related Commands

```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the neighbor.
string Peer name (1 - 20 characters).

Defaults

| parameter | default |
|---------------|---------------------|
| <i>string</i> | peer (ipv6_address) |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format "peer(ipv6-address)" where ipv6-address is the IPv6 address of the BGP peer. For example, the default name of an IPv6 BGP peer at address 2001::1 would be "peer(2001::1)".
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ipv6 bgp neighbor 2001::1 description "peer6 for building 3"
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ipv6 bgp neighbor](#) Creates or deletes a BGP peer relationship using IPv6 addresses.

MIB Objects

alaBgpPeer6Table
 alaBgpPeer6Addr
 alaBgpPeer6Name

ipv6 bgp neighbor ebgp-multihop

Allows external IPv6 BGP peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the IPv6 BGP peers to speak to each other despite the non-BGP router that sits between them.

ipv6 bgp neighbor *ipv6_address* **ebgp-multihop** [*ttl*]

no ipv6 bgp neighbor *ipv6_address* **ebgp-multihop**

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>ttl</i> | The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255. |

Defaults

| parameter | default |
|------------|---------|
| <i>ttl</i> | 255 |

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external IPv6 BGP peer is on a directly connected subnet. This command allows you to configure an external IPv6 BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- The BGP peer is restarted after issuing this command.
- When eBGP multihop is enabled, GTSM must be disabled or vice-versa.

Examples

```
-> ipv6 bgp neighbor 2001::1 ebgp-multihop
-> ipv6 bgp neighbor 2001::1 ebg-multihop 50
-> no ipv6 bgp neighbor 2001::1 ebgp-multihop
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor Creates or deletes a BGP peer relationship using IPv6 addresses.

ipv6 bgp neighbor next-hop-self Configures router to advertise its peering address as the next hop address for the specified neighbor.

MIB Objects

ipv6 bgp neighbor update-source-address

Configures the local IPv6 address from which a BGP peer will be connected if the peer is configured with its link-local address. This local IPv6 address can be configured for internal and external BGP peers.

```
ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

```
no ipv6 bgp neighbor ipv6_address update-source-address ipv6_address
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

By default, the update-source-address value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The default is restored by using the **no** form of the command or by entering an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2001::1 update-source-address 2401::1  
-> no ipv6 bgp neighbor 2001::1 update-source-address
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ipv6 bgp neighbor update-source](#) Configures the local IPv6 interface from which a BGP peer will be connected.

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

MIB Objects

alaBgpPeer6Table
 alaBgPeer6LocalAddr

ipv6 bgp neighbor passive

Configures the local IPv6 BGP speaker to wait for this IPv6 BGP peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ipv6 bgp neighbor *ipv6_address* passive

no ipv6 bgp neighbor *ipv6_address* passive

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default, BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 passive
-> no ipv6 bgp neighbor 2001::1 passive
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ipv6 bgp neighbor *ipv6_address* **remove-private-as**

no ipv6 bgp neighbor *ipv6_address* **remove-private-as**

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default, all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they are intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remove-private-as
-> no ipv6 bgp neighbor 2001::1 remove-private-as
```

Release History

Release 7.3.4; command was introduced.

Related Commands

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6RemovePrivateAs
```

ipv6 bgp neighbor soft-reconfiguration

Enables or disables IPv6 BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ipv6 bgp neighbor *ipv6_address* soft-reconfiguration

no ipv6 bgp neighbor *ipv6_address* soft-reconfiguration

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- If a peer is not route-refresh capable, by default, BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the peer is not route-refresh capable and the inbound policy changes, the peer will have to be restarted using the **ipv6 bgp neighbor clear** command.
- If the peer is route-refresh capable and soft reconfiguration is disabled, inbound policy changes are still supported without re-starting the peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 soft-reconfiguration
-> no ipv6 bgp neighbor 2001::1 soft-reconfiguration
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor clear

Restarts the IPv6 BGP peer.

ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

MIB Objects

ipv6 bgp neighbor stats-clear

Clears the statistics for a peer.

ipv6 bgp neighbor *ipv6_address* stats-clear

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ipv6 bgp neighbors statistics](#).

Examples

```
-> ipv6 bgp neighbor 2001::2 stats-clear
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 bgp neighbors statistics](#) Displays the neighbor statistics of the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table

ip bgp confederation neighbor6

Configures this IPv6 BGP peer as a member of the same confederation as the local BGP speaker.

ip bgp confederation neighbor6 *ipv6_address*

no ip bgp confederation neighbor6 *ipv6_address*

Syntax Definitions

ipv6_address The 128-bit IPv6 address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.

Examples

```
-> ip bgp confederation neighbor6 2001::1
-> no ip bgp confederation neighbor6 2001::1
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip bgp confederation identifier Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

```

ipv6 bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-aspathlist {string / none}
```

Syntax Definitions

| | |
|---------------------|-------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>string</i> | Inbound AS path list (0 to 70 characters). This name is case sensitive. |
| none | Removes this AS path list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to an inbound policy.
- Use **none** to deassign an AS path filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-aspathlist InBoundASpath  
-> ipv6 bgp neighbor 2001::1 in-aspathlist none
```

Release History

Release 7.3.4; command introduced.

Related Commands

ipv6 bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-communitylist {string / none}
```

Syntax Definitions

| | |
|---------------------|-------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>string</i> | Input community list (0 to 70 characters). This name is case sensitive. |
| none | Removes this community list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input community filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-communitylist InboundCommlist  
-> ipv6 bgp neighbor 2001::1 in-communitylist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ipv6 bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefixlist {string / none}
```

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>string</i> | Input prefix filter list (0 to 70 characters). This name is case sensitive. |
| none | Removes the prefix list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound IPv4 routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- Use **none** to deassign an input prefix filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 in-prefixlist InboundPrefix  
-> ipv6 bgp neighbor 2001::1 in-prefixlist none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

```

ipv6 bgp neighbor in-prefix6list

Assigns an inbound prefix6 list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address in-prefix6list {string / none}
```

Syntax Definitions

| | |
|---------------------|------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>string</i> | Input prefix6 filter list (0 to 70 characters). This name is case sensitive. |
| none | Removes the prefix6 list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The prefix6 list name (**InboundPrefix6** in the example below) is created using the [ip bgp policy prefix6-list](#) command. Any inbound IPv6 routes from the BGP peer must match this prefix6 filter before being accepted or passed to inbound policy.
- To deassign an input prefix6 filter list, use this command to assign a value of “**none**.”

Examples

```
-> ipv6 bgp neighbor 2001::2 in-prefix6list InboundPrefix6  
-> ipv6 bgp neighbor 2001::2 in-prefix6list none
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

```
ipv6 bgp neighbor ipv6_address out-aspathlist {string / none}
```

Syntax Definitions

| | |
|---------------------|--------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the BGP peer. |
| <i>string</i> | Outbound AS path list (0 - 70 characters). |
| none | Removes the AS path list from the peer. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- Use **none** to deassign an output AS path filter list from this peer.

Examples

```
-> ipv6 bgp neighbor 2001::1 out-aspathlist OutboundASpath  
-> ipv6 bgp neighbor 2001::1 out-aspathlist none
```

Release History

Release 7.3.4; command was introduced.

ipv6 bgp neighbor route-map

Assigns a policy map to an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address route-map {string | none} {in | out}
```

```
no ipv6 bgp neighbor ipv6_address route-map {in | out}
```

Syntax Definitions

| | |
|---------------------|--------------------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address of the peer. |
| <i>string</i> | Policy map name (0 to 70 characters). This name is case sensitive. |
| none | Deletes the route map if entered rather than a text string. |
| in | Designates this route map policy as an inbound policy. |
| out | Designates this route map policy as an outbound policy. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to deassign a policy map.
- The policy route map name (**InboundRoute** and **OutboundRoute** in the example below) is created using the [ip bgp policy route-map](#) command. Any routes from the BGP peer must match this route map filter before being accepted or passed to a policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ipv6 bgp neighbor 2001::1 route-map InboundRoute in
-> ipv6 bgp neighbor 2001::1 route-map OutboundRoute out
-> ipv6 bgp neighbor 2001::1 route-map none in
-> no ipv6 bgp neighbor 2001::1 route-map in
```

Release History

Release 7.3.4; command introduced.

Related Commands

[ip bgp policy route-map](#) Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6RouteMapIn
  alaBgpPeer6RouteMapOut
```

ipv6 bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for an IPv6 BGP peer.

```
ipv6 bgp neighbor ipv6_address clear soft {in | out}
```

Syntax Definitions

| | |
|---------------------|---------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address for the BGP peer. |
| in | Applies reconfiguration to the inbound policies. |
| out | Applies reconfiguration to the outbound policies. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ipv6 bgp neighbor 2001::1 clear soft in  
-> ipv6 bgp neighbor 2001::1 clear soft out
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ipv6 bgp neighbor soft-reconfiguration](#) Enables or disables IPv6 BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6ReconfigureInBound  
  alaBgpPeer6ReconfigureOutBound
```

ipv6 bgp neighbor route-reflector-client

Configures this IPv6 BGP peer as one of the clients to the local route reflector.

```
ipv6 bgp neighbor ipv6_address route-reflector-client
```

```
no ipv6 bgp neighbor ipv6_address route-reflector-client
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP peer.

Defaults

By default, the command is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the no form of this command to disable IPv6 BGP peer as a client to the local route reflector.
- The IPv6 BGP peers configured using this command become part of the client group. The remaining peers become the members of the non-client group for the local route reflector.
- When IPv6 BGP Peer is configured as route reflector client, all internal BGP speakers in an autonomous system need not be fully meshed. Instead, this route reflector takes the responsibility for passing internal BGP-learned routes to its peers.

Examples

```
-> ipv6 bgp neighbor 2001::1 route-reflector-client  
-> no ipv6 bgp neighbor 2001::1 route-reflector-client
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show ipv6 bgp neighbors](#) .Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ClientStatus
```

ipv6 bgp neighbor md5 key

Configures an encrypted MD5 signature for TCP sessions with this IPv6 peer.

```
ipv6 bgp neighbor ipv6_address md5 key {string | none}
```

Syntax Definitions

| | |
|---------------------|---------------------------------------------------------|
| <i>ipv6_address</i> | The 128-bit IPv6 address for the BGP peer. |
| <i>string</i> | The MD5 public key. The maximum character length is 80. |
| none | Remove the password and disable authentication. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- The password you specified in this command is encrypted before it appears in a saved snapshot file. However, if you view this command in a snapshot file or **boot.cfg** file, the command is displayed in a different syntax as given below:

```
ipv6 bgp neighbor ipv6_address md5 key-encrypt encrypted_string
```

Note. This MD5 password will not work, if this syntax is used to set it.

Examples

```
-> ipv6 bgp neighbor 2001::1 md5 key openpeer2  
-> ipv6 bgp neighbor 2001::1 md5 key none
```

Release History

Release 7.3.4; command was introduced.

Related Commands

```

show ipv6 bgp neighbors

Displays the configured IPv6 BGP peers.

```
show ipv6 bgp neighbors [ipv6_address]
```

Syntax Definitions

ipv6_address The 128-bit IPv6 address for the BGP neighbor.

Defaults

By default, all the configured IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address* parameter to display the details of a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors
```

```
Legends: Nbr = Neighbor
```

```
        As = Autonomous System
```

| Nbr | address | As | Admin state | Oper state | BGP Id | Up/Down | BFD Status |
|--------------------------|---------|----|-------------|-------------|----------|-------------|------------|
| 2001:100:3:4::1 | | 30 | enabled | established | 11.4.0.1 | 01h:42m:08s | enabled |
| fe80::200:57ff:fe28:7e89 | | 10 | enabled | established | 11.5.0.1 | 01h:40m:58s | disabled |

```
-> show ipv6 bgp neighbors 2001:100:3:4::1
```

```
Neighbor address              = 2001:100:3:4::1,
Neighbor autonomous system    = 30,
Neighbor Admin state          = enabled,
Neighbor Oper state           = established,
Neighbor passive status       = disabled,
Neighbor name                  = peer(2101::51),
Neighbor local address        = 2001:100:3:4::10,
Neighbor EBGP multiHop        = disabled,
Neighbor next hop self        = disabled,
Neighbor TTL security         = 6,
Neighbor Route Refresh        = enabled,
Neighbor Ipv4 unicast         = enabled,
Neighbor Ipv4 multicast       = disabled,
Neighbor type                  = internal,
Neighbor auto-restart         = enabled,
Neighbor route-reflector-client = disabled,
Neighbor confederation status = disabled,
Neighbor remove private AS    = disabled,
Neighbor default originate    = disabled,
Neighbor maximum prefixes     = 5000,
Neighbor max prefixes warning = enabled,
```

```

# of prefixes received           = 10,
Neighbor MD5 key                 = <none>,
Neighbor local port             = 49154,
Neighbor TCP window size       = 32768,
Graceful Restart State         = NotRestarting,
Advertised Restart Interval     = 0s,
Forwarding State during restart = NotPreserved,
Activate IPv6 unicast          = enabled,
Configured IPv4 NextHop Address = 0.0.0.0,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast          = advertised,
BFD Status                      = enabled
Activate IPv4 unicast          = enabled

```

output definitions

| | |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nbr address or Neighbor address | The IPv6 address for this BGP peer. Assign this address through the ipv6 bgp neighbor command. |
| As or Neighbor autonomous system | The autonomous system to which this peer belongs. A peer's AS number is assigned through the ipv6 bgp neighbor remote-as command. |
| Admin state or Neighbor Admin state | Indicates whether this peer has been enabled or disabled through the ipv6 bgp neighbor admin-state command. |
| Oper state or Neighbor Oper state | The current BGP state for this peer. Possible states are idle , connect , active , opensent , openconfirm , and established . |
| BGP Id | The unique BGP identifier of the peer. |
| Up/Down | The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN. |
| Neighbor passive status | Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). |
| Neighbor name | The name assigned to this peer. |
| Neighbor local address | The interface assigned to this peer. This value is configured through the ipv6 bgp neighbor update-source command. |
| Neighbor EBGp multiHop | Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. |
| Neighbor next hop self | Indicates whether this peer is using next hop processing. This value is configured through the ipv6 bgp neighbor next-hop-self command. |
| Neighbor TTL security | Displays the number of hops between the switch and the peer. If the GTSM is disabled the value is displayed as none. |
| Neighbor Route Refresh | Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability. |
| Neighbor Ipv4 unicast | Indicates whether this peer is multiprotocol IPv4 unicast capable. |

output definitions (continued)

| | |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor Ipv4 multicast | Indicates whether this peer is multiprotocol IPv4 multicast capable. |
| Neighbor type | Indicates whether this peer is internal or external to the AS. |
| Neighbor auto-restart | Indicates whether peer auto-restart is enabled or disabled. |
| Neighbor route-reflector-client | Indicates whether this peer is a client to the local route reflector, if configured. |
| Neighbor confederation status | Indicates whether this peer is a member of a BGP confederation. |
| Neighbor remove private AS | Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. |
| Neighbor default originate | Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the ipv6 bgp neighbor default-originate command. |
| Neighbor maximum prefixes | The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the ipv6 bgp neighbor maximum-prefix command. |
| Neighbor max prefixes warning | Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the ipv6 bgp neighbor update-source command. |
| # of prefixes received | Displays the total number of prefixes received by this neighbor. |
| Neighbor MD5 key | When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. |
| Neighbor local port | The TCP port used for the session with this peer. |
| Neighbor TCP window size | The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message. |
| Graceful Restart State | Indicates the graceful restart state. This feature does not support IPv6 prefixes. |
| Advertised Restart Interval | Indicates the restart interval in seconds. |
| Forwarding State during restart | Indicates whether the peer has preserved the forwarding state during the graceful restart. |
| Activate IPv6 unicast | Indicates whether or not IPv6 unicast advertisements are enabled. Options include enabled or disabled . |
| Configured IPv4 NextHop Address | Specifies the IPv4 nexthop address. This is specified using the ipv6 bgp neighbor ipv4-nexthop command. |
| Configured IPv6 NextHop Address | Specifies the IPv6 nexthop address. This is specified using the ipv6 bgp neighbor ipv6-nexthop command. |
| Neighbor Ipv6 unicast | Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include enabled or disabled . |
| BFD Status | Indicates whether BFD is enabled or disabled for this peer. The BFD status is configured through the ip ipv6 bgp neighbor bfd-state command. |
| Activate IPv4 unicast | Indicates whether or not IPv4 unicast capability is advertised between the peers. Options include enabled or disabled . |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; 'Activate IPv4 unicast' output field added.

Release 8.4.1; 'Neighbor TTL security' output field added.

show ipv6 bgp neighbors statistics

Displays the neighbor statistics of the configured IPv6 BGP peers.

show ipv6 bgp neighbors statistics [*ipv6_address*]

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors statistics
```

```
Legends: Nbr    = Neighbor
```

```
      As        = Autonomous System
```

```
      RMSGs    = # of received messages
```

```
      SMSGS    = # of sent messages
```

```
      RUPDS    = # of Update messages received
```

```
      SUPDS    = # of Update messages sent
```

```
      RNOFY    = # of Notify messages received
```

```
      SNOFY    = # of Notify messages sent
```

```
      RPFXS    = # of prefixes received
```

```
      UPTNS    = # of UP transitions
```

```
      DNTNS    = # of DOWN transitions
```

```
Nbr address                      As        RMSGs SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1                    30       225    260    2       3       0       0       10       1       1
```

output definitions

| | |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Nbr address | The IPv6 address for this peer. This value is configured using the ipv6 bgp neighbor command. |
| As | The autonomous system to which this peer belongs. This value is configured using the ipv6 bgp neighbor remote-as command. |
| RMSGs | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer. |
| SMSGs | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer. |

output definitions (continued)

| | |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RUPDS | The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| SUPDS | The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| RNOFY | The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |
| SNOFY | The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |
| RPFXS | Number of unique route prefixes received by this peer. |
| UPTNS | Number of times this peer has come up, operationally. |
| DNTNS | Number of times this peer has gone down, operationally. |

```

-> show ipv6 bgp neighbors statistics 2001:100:3:4::1

Time last msg was sent     = 00h:00m:18s,

```

output definitions

| | |
|-------------------------------------|------------------------------------------------------------------------------------------------------|
| Neighbor address | The IPv6 address for this peer. This value is configured using the ipv6 bgp neighbor command. |
| # of UP transitions | Number of times this peer has come up, operationally. |
| Time of last UP transition | The duration that this peer has been up. |
| # of DOWN transitions | Number of times this peer has gone down, operationally. |
| Time of last DOWN transition | The duration since this peer last went down. |

output definitions (continued)

| | |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last DOWN reason | Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None |
| # of msgs rcvd | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer. |
| # of Update msgs rcvd | The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| # of prefixes rcvd | Number of unique route prefixes received by this peer. |
| # of Route Refresh msgs rcvd | Number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer. |
| # of Notification msgs rcvd | Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |

output definitions (continued)

| | |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last rcvd Notification reason | <p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none |
| Time last msg was rcvd | The duration since a message was received from this peer. |
| # of msgsd sent | Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer. |
| # of Update msgsd sent | Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information. |
| # of Route Refresh msgsd sent | Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer. |
| # of Notification msgsd sent | Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations. |

output definitions (continued)

| | |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last sent Notification reason | NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the Peer last received notification reason field above. |
| Time last msg was sent | The duration since a message was sent to this peer. |

show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

show ipv6 bgp neighbors policy *ipv6_address*

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv6 peer.

Examples

```
-> show ipv6 bgp neighbors policy
Neighbor address = 2001::1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

output definitions

| | |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Neighbor autonomous system | The AS to which the peer is assigned. This can be assigned by using the ipv6 bgp neighbor remote-as command. |
| Neighbor output policy map name | The outbound route map policy for the peer. This can be assigned by using the ipv6 bgp neighbor route-map command. |
| Neighbor input policy map name | The inbound route map policy for the peer. This can be assigned by using the ipv6 bgp neighbor route-map command. |
| Neighbor output aspath-list name | The outbound AS path list policy for the peer. This can be assigned by using the ipv6 bgp neighbor out-aspathlist command. |

output definitions (continued)

| | |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor input aspath-list name | The inbound AS path list policy for the peer. This can be assigned by using the ipv6 bgp neighbor in-aspathlist command. |
| Neighbor output prefix-list name | The outbound prefix list policy for the peer. This can be assigned by using the ipv6 bgp neighbor out-prefixlist command. |
| Neighbor input prefix-list name | The inbound prefix list policy for the peer. This can be assigned by using the ipv6 bgp neighbor in-prefixlist command. |
| Neighbor output community-list name | The outbound community list policy for the peer. This can be assigned by using the ipv6 bgp neighbor out-communitylist command. |
| Neighbor input community-list name | The inbound community list policy for the peer. This can be assigned by using the ipv6 bgp neighbor in-communitylist command. |
| Neighbor soft reconfiguration | Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the ipv6 bgp neighbor soft-reconfiguration command. |
| Neighbor output prefix6-list name | The outbound prefix6-list policy for the peer. This is configured using the ipv6 bgp neighbor out-prefix6list command. |
| Neighbor input prefix6-list name | The inbound prefix6-list policy for the peer. This is configured using the ipv6 bgp neighbor in-prefix6list command. |

show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

show ipv6 bgp neighbors timers [*ipv6_address*]

Syntax Definitions

ipv6_address The 128-bit IPv6 address.

Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the *ipv6_address* parameter to display the timer value for a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors timers
```

```
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
```

| Nbr | address | As | Hold | Hold(C) | RtAdv | Retry | Kalive | Ka(C) |
|-------|-----------------|-------|-------|---------|-------|-------|--------|-------|
| ----- | ----- | ----- | ----- | ----- | ----- | ----- | ----- | ----- |
| | 2001:100:3:4::1 | 30 | 90 | 90 | 30 | 120 | 30 | 30 |

output definitions

| | |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nbr address | The IPv6 address for this BGP peer. Assign this address using the ipv6 bgp neighbor command. |
| As | The autonomous system to which this peer belongs. A peer's AS number is assigned using the ipv6 bgp neighbor remote-as command. |
| Hold | The actual negotiated hold time value. |
| Hold (C) | The hold time value. This value is configured using the ipv6 bgp neighbor timers command. |
| RtAdv | The route advertisement interval, in seconds, for updates between external BGP peers. |
| Retry | The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured using the ipv6 bgp neighbor timers command. |

output definitions (continued)

| | |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Kalive | The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable. |
| Ka (C) | The KEEPALIVE interval as configured using the ipv6 bgp neighbor timers command. |

30 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

Filename ALCATEL-IND1-SLB-MIB.mib
Module: alcatelIND1SLBMIB

A summary of available commands is listed here:

| | |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global SLB Commands | <code>ip slb admin-state</code> <code>ip slb reset statistics</code> <code>show ip slb</code> |
| SLB Cluster Commands | <code>ip slb cluster</code> <code>ip slb cluster admin-state</code> <code>ip slb cluster ping period</code> <code>ip slb cluster ping timeout</code> <code>ip slb cluster ping retries</code> <code>ip slb cluster probe</code> <code>show ip slb clusters</code> <code>show ip slb cluster</code> |
| SLB Server Commands | <code>ip slb server ip cluster</code> <code>ip slb server ip cluster probe</code> <code>show ip slb cluster server</code> <code>show ip slb servers</code> |
| SLB Probe Commands | <code>ip slb probe</code> <code>ip slb probe timeout</code> <code>ip slb probe period</code> <code>ip slb probe port</code> <code>ip slb probe retries</code> <code>ip slb probe username</code> <code>ip slb probe password</code> <code>ip slb probe url</code> <code>ip slb probe status</code> <code>ip slb probe send</code> <code>ip slb probe expect</code> <code>show ip slb probes</code> |

ip slb admin-state

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

ip slb admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------------------------|
| enable | Enables the administrative status for Server Load Balancing on a switch. |
| disable | Disables the administrative status for Server Load Balancing on the switch. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

Examples

```
-> ip slb admin-state enable
-> ip slb admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|------------------------------------------|------------------------------------------------------------------------------------------------------|
| show ip slb | Displays the status of Server Load Balancing on a switch. |
| ip slb cluster | Configures a Server Load Balancing cluster on a switch. |
| ip slb server ip cluster | Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters. |

MIB Objects

```
slbFeatureGroup
  slbAdminStatus
```

ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

ip slb reset statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

Examples

```
-> ip slb reset statistics
```

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb clusters Displays the status and configuration of all Server Load Balancing clusters on a switch.

show ip slb cluster Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

MIB Objects

```
slbFeatureGroup  
  slbResetStatistics
```

ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

ip slb cluster *name* {**vip** *ip_address* / **condition** *string*} [**I3** | **I2**]

no ip slb cluster *name*

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”). |
| <i>ip_address</i> | The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format. |
| <i>string</i> | The name of an existing QoS policy condition that identifies the Server Load Balancing cluster. |
| I3 | Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server. |
| I2 | Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the condition parameter. |

Defaults

| parameter | default |
|-----------------------|-----------|
| I3 I2 | I3 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers. In addition, do not specify a VIP address that is already in use by an MCLAG VIP interface. The SLB VIP and MCLAG VIP both provide a common IP address but for different entities and should not share the same IP address.
- Specifying the **I3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin-state** command to enable this feature.

Note. It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

Examples

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond 12
-> ip slb cluster cluster_2 condition slb_cond 13
-> no ip slb cluster hr_servers
```

Release History

Release 7.1.1; command introduced.

  slbClusterType
```

ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

```
ip slb cluster cluster_name admin-state {enable | disable}
```

Syntax Definitions

| | |
|---------------------|------------------------------------------------------------------------|
| <i>cluster_name</i> | The name of an existing Server Load Balancing cluster. |
| enable | Administratively enables a Server Load Balancing cluster on a switch. |
| disable | Administratively disables a Server Load Balancing cluster on a switch. |

Defaults

By default, a cluster is administratively enabled when the cluster is created.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

Examples

```
-> ip slb cluster hr_servers admin-state enable
-> ip slb cluster "mail servers" admin-state disable
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |

| show ip slb clusters | Displays the status and configuration of all Server Load Balancing clusters on a switch. |
| show ip slb cluster | Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch. |
| ip slb cluster | Configures Server Load Balancing clusters. |
| ip slb server ip cluster | Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters. |

MIB Objects

```
slbClusterTable
    slbClusterAdminStatus
```

ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping period** *seconds*

Syntax Definitions

| | |
|---------------------|-----------------------------------------------------------------------------------|
| <i>cluster_name</i> | The name of the Server Load Balancing cluster. |
| <i>seconds</i> | The number of seconds for the ping period. Specifying 0 (zero) disables the ping. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the [ip slb cluster ping timeout](#) command to modify the ping timeout value.

Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

Release History

Release 7.1.1; command introduced.

Related Commands

| ip slb cluster ping retries | Modifies the number of ping retries. |

MIB Objects

```
slbClusterTable  
  slbClusterPingPeriod
```

ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

ip slb cluster *cluster_name* **ping timeout** *milliseconds*

Syntax Definitions

| | |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>cluster_name</i> | The name of the Server Load Balancing cluster. |
| <i>milliseconds</i> | The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>milliseconds</i> | 3000 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

Use the [ip slb cluster ping period](#) command to modify the ping period value.

Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

Release History

MIB Objects

slbClusterTable
 slbClusterPingTimeout

ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping retries** *count*

Syntax Definitions

cluster_name The name of the Server Load Balancing cluster.
count The number of ping retries.

Defaults

| parameter | default |
|--------------|---------|
| <i>count</i> | 3 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

Release History

 slbClusterPingRetries

ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name probe probe_name
```

Syntax Definitions

| | |
|---------------------|----------------------------------------------------|
| <i>cluster_name</i> | The name of the Server Load Balancing cluster. |
| <i>probe_name</i> | The name of the Server Load Balancing (SLB) probe. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

Release History

Release 7.1.1; command introduced.

Related Commands

| ip slb probe | Configures and deletes SLB probes. |
| show ip slb cluster | Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch. |
| ip slb server ip cluster | Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters. |

MIB Objects

```
slbClusterTable  
  slbClusterProbeName
```

ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

ip slb server ip *ip_address* **cluster** *cluster_name* [**admin-state** {**enable** | **disable**}] [**weight** *weight*]

no ip slb server ip *ip_address* **cluster** *cluster_name*

Syntax Definitions

| | |
|---------------------|--------------------------------------------------------|
| <i>ip_address</i> | The IP address for the physical server. |
| <i>cluster_name</i> | The name of an existing Server Load Balancing cluster. |
| enable | Enables a server. |
| disable | Disables a server. |
| <i>weight</i> | Specifies the weight of the server. |

Defaults

| parameter | default |
|-------------------------|---------------|
| enable disable | enable |
| weight | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **no** form of this command to remove a physical server from a Server Load Balancing cluster.
- Use the **weight** parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.
- A higher weight value indicates that the server can accept more network traffic.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable
weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers
```

Release History

Release 7.1.1; command introduced.

ip slb probe send

Configures an ASCII string that is sent to a server to invoke a server response and verify the health of the server.

```
ip slb probe probe_name {tcp | udp} send send_string
```

Syntax Definitions

| | |
|--------------------|-------------------------------------------------------------------|
| <i>probe_name</i> | Specifies the name of the Server Load Balancing probe. |
| tcp | Specifies a TCP probe. |
| udp | Specifies a UDP probe. |
| <i>send_string</i> | Specifies the ASCII string sent to a server to invoke a response. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

NA

Examples

```
-> ip slb probe web_server tcp send test
```

ip slb probe expect

Configures an ASCII string used to compare a response from a server to verify the health of the server.

```
ip slb probe probe_name {http | https | tcp | udp} expect expect_string
```

Syntax Definitions

| | |
|----------------------|----------------------------------------------------------------------|
| <i>probe_name</i> | Specifies the name of the Server Load Balancing probe. |
| http | Specifies an HTTP probe. |
| https | Specifies an HTTPS probe. |
| tcp | Specifies a TCP probe. |
| udp | Specifies a UDP probe. |
| <i>expect_string</i> | Specifies the ASCII string used to compare a response from a server. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http expect test
```

show ip slb

Displays the status of Server Load Balancing on a switch.

show ip slb

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

N/A

Examples

```
-> show ip slb
```

```
Admin status           : Enabled,  
Operational status    : In Service,  
Number of clusters    = 3
```

Output fields are described here:

output definitions

| | |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin status | The current administrative status of Server Load Balancing (SLB) on this switch (Enabled or Disabled). |
| Operational status | The current operational status of Server Load Balancing (SLB) on this switch, which is either In service (at least one SLB cluster is in service) or Out of service (all SLB clusters are out of service). |
| Number of clusters | The total number of Server Load Balancing (SLB) clusters on this switch. |

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| show ip slb servers | Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch. |
| show ip slb clusters | Displays the status and configuration of all Server Load Balancing clusters on a switch. |
| show ip slb cluster | Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch. |
| show ip slb cluster server | Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster. |

MIB Objects

```
slbFeature
  slbAdminStatus
  slbOperStatus
  slbClustersCount
```

show ip slb clusters

Displays the status and basic configuration for all Server Load Balancing (SLB) clusters on a switch. This command also displays traffic statistics for QoS policy condition clusters.

show ip slb clusters [statistics]

Syntax Definitions

statistics Displays SLB statistics for QoS policy condition clusters.

Defaults

By default, the status and basic configuration for all clusters is displayed; statistics are not shown.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to clusters because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below.

Examples

```
-> show ip slb clusters
```

| Cluster Name | VIP/COND | Admin Status | Operational Status | # Srv | % Avail |
|--------------|-----------------|--------------|--------------------|-------|---------|
| WorldWideWeb | 128.241.130.204 | Enabled | In Service | 3 | 95 |
| Intranet | 128.241.130.205 | Enabled | In Service | 2 | 100 |
| FileTransfer | 128.241.130.206 | Enabled | Out of Service | 2 | 50 |

Output fields are described here:

output definitions

| | |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cluster Name | The name of the SLB cluster. |
| VIP/COND | The virtual IP (VIP) address or the policy condition name for the SLB cluster. |
| Admin Status | The administrative status of the SLB cluster (Enabled or Disabled). |
| Operational Status | The operational status of the SLB cluster; In Service (at least one physical server is operational in the cluster) or Out of Service . |
| # Srv | The total number of physical servers that belong to the SLB cluster. |
| % Avail | The percentage of time that the physical server has been available for processing client requests. In other words, the actual ratio of up time (In Service plus Retrying) versus down time (No Answer plus Link Down). Please note that the Disabled and the initial Discovery states are not counted as down time. |

```
-> show ip slb clusters statistics
```

| Cluster Name | Admin Status | Operational Status | Count |
|--------------------------------------|--------------|--------------------|-----------|
| Cluster1 | Enabled | In Service | 4 Servers |
| Cluster2 | Enabled | In Service | 4 Servers |
| Dst IP 101.113.113.1/255.255.255.255 | | | 4503911 |
| Src IP 202.202.1.0/255.255.255.0 | | | 6527831 |
| Src Port 2/49 | | | |

output definitions

| | |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cluster Name | The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster. |
| Admin Status | The administrative state of this physical server (Enabled or Disabled). |
| Operational Status | The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> • Disabled (this server is administratively disabled). • No Answer (this server has not responded to ping requests). • Link Down (there is a bad connection to this server). • In Service (this server is used for SLB cluster client connections). • Discovery (the SLB cluster is pinging this physical server). • Retrying (the SLB cluster is making another attempt to bring up this server). |
| Count | The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster. |
| Dst | The destination Virtual IP address assigned to the cluster. |
| Src | Source IP address assigned to the cluster. |
| Src Port | Source slot and port number of the SLB cluster. |

Release History

Release 7.1.1; command introduced.

Related Commands

show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

show ip slb cluster *name* **server** *ip_address*

Syntax Definitions

name Specifies the name of the SLB cluster.
ip_address Specifies the IP address for the physical server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

Specifying a value for the *name* and *ip_address* parameters is required.

Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster c11
  VIP 128.220.40.205
  Server 128.220.40.4
    Admin status           : Enabled,
    Oper status           : In Service,
    Probe                  = phttp,
    Availability time (%)  = 95,
    Ping failures         = 0,
    Last ping round trip time (milliseconds) = 20,
    Probe status          = ,
```

Output fields are described here:

output definitions

| | |

show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

show ip slb probes [*probe_name*]

Syntax Definitions

probe_name Specifies the name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes are displayed.

Examples

No probe name is specified:

```
-> show ip slb probes
```

| Probe Name | Period | Retries | Timeout | Method |
|-------------|---------|---------|---------|--------|
| web_server | 60000 | 3 | 12000 | HTTP |
| mail_server | 60000 | 3 | 3000 | SMTP |
| mis_servers | 3600000 | 5 | 24000 | Ping |

Output fields are described here:

output definitions

| | |
|-------------------|------------------------------------------------------------------------------|
| Probe Name | The user-specified name of the probe. |
| Period | The period (in seconds) to check the health of servers. |
| Retries | The number of probe retries before deciding that a server is out of service. |
| Timeout | The timeout (in seconds) used to wait for probe answers. |
| Method | The type of probe. |

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server
```

```
Probe mail_server
  Type                = SMTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries              = 3,
  Port                = 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp
```

```
Probe phttp
  Type                = HTTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries              = 3,
  Port                = 0,
  Username            = ,
  Password            = ,
  Expect              = ,
  Status              = 200,
  URL                 = /,
```

Output fields are described here:

output definitions

| | |
|-----------------|----------------------------------------------------------------------------------------------------------|
| Probe | The user-specified name of the probe. |
| Type | The type of probe. |
| Period | The period (in seconds) to check the health of servers. |
| Timeout | The timeout (in seconds) used to wait for probe answers. |
| Retries | The number of probe retries before deciding that a server is out of service. |
| Port | The TCP/UDP port on which the probe is sent. |
| Username | The configured user name sent to a server as credentials for an HTTP GET operation for the probe. |
| Password | The configured password for the probe. |
| Expect | The configured ASCII string used to compare a response from a server to verify the health of the server. |
| Status | The expected status returned from an HTTP GET to verify the health of a server. |
| URL | The configured URL sent to a server for an HTTP GET to verify the health of the server. |

Release History

Release 7.1.1; command introduced.

Related Commands

31 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

The OmniSwitch IPMS software is compatible with the following RFCs:

- RFC 1112 — Host Extensions for IP Multicasting
- RFC 2236 — Internet Group Management Protocol, Version 2
- RFC 2933 — Internet Group Management Protocol MIB
- RFC 3376 — Internet Group Management Protocol, Version 3

The OmniSwitch IPv6MS software is compatible with the following RFCs:

- RFC 2710 — Multicast Listener Discovery for IPv6
- RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
- RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS and IPv6MS commands is as follows:

Filename: ALCATEL-IND1-IPMS-MIB.mib
Module: alcatelIND1IpmsMIB

The following table summarizes the available IP and IPv6 multicast commands:

| | |
|-------------------------------------------------------|---------------------------------------------------------|
| ip multicast admin-state | ipv6 multicast admin-state |
| ip multicast flood-unknown | ipv6 multicast flood-unknown |

ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **admin-state** [enable | disable]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **admin-state**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable IP Multicast Switching. |
| disable | Disable IP Multicast Switching. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configuration of an IP multicast routing protocol on an IP interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.
- If there is no IP Multicast routing protocol already running on the switch, then the **ip multicast admin-state** or the **ipv6 multicast admin-state** command alone controls IPMS operations.
- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If IPMS is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

Note. Globally enabling the IPMS status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPMS must be explicitly enabled or disabled for each SPB service. However, globally disabling IPMS for all SPB services is supported.

- Use the **no** form of this command to restore the IP Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> no ip multicast admin-state
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 3-5 admin-state disable
-> no ip multicast vlan 2 admin-state
-> no ip multicast vlan 3-5 admin-state
-> ip multicast service 10 admin-state enable
-> ip multicast service 11-15 admin-state disable
-> no ip multicast service 10 admin-state
-> no ip multicast service 11-15 admin-state
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

Related Commands

  alaIpmsConfigValue
  alaIpmsConfigStatus
```

ip multicast flood-unknown

Enables or disables the flooding unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **flood-unknown** [**enable** | **disable**]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **flood-unknown**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable flooding of unknown traffic until it is learned. |
| disable | Disable flooding of unknown traffic. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- If the flooding of unknown traffic is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- On an OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900:
 - The flood unknown behavior configured for any VLAN is enforced only on that VLAN. However, when the behavior is configured with the IPv6 multicast version of this command (**ipv6 multicast flood-unknown**) for any VLAN, the flood unknown behavior is enforced globally across all VLANs.
 - IPv4 multicast snooping for VLANs does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded IPv4 addresses.
 - When IPv4 multicast snooping is enabled for any service, the flooding of unknown multicast traffic

is unconditionally enforced for all snooping services; this is the only supported flood unknown behavior for services.

- IPv4 multicast snooping for services does not snoop MAC addresses that fall within the range of 01:00:5e:00:00:00/40 and 33:33:00:00:00:00/40 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded MAC addresses.
- On an OmniSwitch 9900, IPv4 multicast snooping for VLANs or services does not snoop 224.0.0.0/24 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to these excluded IPv4 addresses.
- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the **no** form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system or the specified VLAN.

Examples

```
-> ip multicast flood-unknown enable
-> ip multicast flood-unknown disable
-> no ip multicast flood-unknown
-> ip multicast vlan 100 flood-unknown enable
-> ip multicast vlan 101-105 flood-unknown enable
-> ip multicast vlan 100 flood-unknown disable
-> no ip multicast vlan 100 flood-unknown
-> no ip multicast vlan 101-105 flood-unknown
-> ip multicast service 10 flood-unknown enable
-> ip multicast service 11-15 flood-unknown enable
-> ip multicast service 10 flood-unknown disable
-> no ip multicast service 10 flood-unknown
-> no ip multicast service 11-15 flood-unknown
```

Release History

Release 8.3.1; command introduced.

Release 8.4.1.R02; **service** parameter added.

Related Commands

  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigFloodUnknown
```

ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **version** [*version*]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **version**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>version</i> | Default IGMP protocol version to run. Valid range is 1–3. |

Defaults

| parameter | default |
|----------------|---------|
| <i>version</i> | 2 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs or SPB services.
- If the default IGMP protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- Use the **no** form of this command to restore the IGMP multicast version back to the default value (version 2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip multicast version 0).

Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> no ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 3-5 version 3
-> ip multicast vlan 2 version 0
-> no ip multicast vlan 2 version
```

```
-> no ip multicast vlan 3-5 version
-> ip multicast service 2 version 3
-> ip multicast service 3-5 version 3
-> ip multicast service 2 version 0
-> no ip multicast service 2 version
-> no ip multicast service 3-5 version
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

```

ip multicast port max-group

Configures the maximum group limit learned per port or per Service Access Point (SAP) port. The group limit is applicable to all VLAN instances associated with the specified port or all Shortest Path Bridging (SPB) service instances associated with the specified SAP port.

ip multicast {port *chassis/slot/port* | **sap port** *sap_id*} **max-group** [*num*] [**action** {*none* | **drop** | **replace**}]

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number (3/1). |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>num</i> | The maximum IGMP group count. Valid range is 0–4294967295. |
| none | Disables the maximum group limit configuration. |
| drop | Drops the incoming membership request. |
| replace | Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group. |

Defaults

By default, the maximum group limit is set to zero.

| parameter | defaults |
|---------------|-------------|
| action | none |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
 - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
 - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast sap port 1/1/23:10 max-group 10 action drop**, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is set to drop.
- Configuring a maximum group limit is allowed even when the IP multicast status is disabled.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
 - Group limit configured for a port or an SPB SAP port.
 - Group limit configured for a specific VLAN or SPB service.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
 - Group limit configured for a VLAN or SPB service within a specific VRF context.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

Examples

```
-> ip multicast port 1/1/12 max-group 10 action drop
-> ip multicast port 1/1/14 max-group 20 action replace
-> ip multicast port 1/1/14 max-group

-> ip multicast sap port 1/1/23:10 max-group 10 action drop
-> ip multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ip multicast sap port 1/1/16:20.200 max-group
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

  alaIpmsIntfConfigType
  alaIpmsIntfAddressType
  alaIpmsIntfMaxGroupLimit
  alaIpmsIntfMaxGroupExceedAction
```

ip multicast max-group

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>num</i> | The maximum IGMP group count. Valid range is 0–4294967295. |
| none | Disables the maximum group limit configuration. |
| drop | Drops the incoming membership request. |
| replace | Replaces an existing membership with the incoming membership request. |

Defaults

By default, the maximum group limit is set to zero.

| parameter | defaults |
|---------------|-------------|
| action | none |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- If an SPB service is specified, this command configures the maximum group limit learned per SAP port on a service. The limit is applied to each SAP port that is a member of the given SPB service.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN or SAP port/SPB service instance
- If the *num* and **action** parameters are not specified, then the limit is removed.

- The maximum group configuration on a VLAN or SPB service will override the global configuration.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
 - Group limit configured for a port or an SPB SAP port.
 - Group limit configured for a specific VLAN or SPB service.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
 - Group limit configured for a VLAN or SPB service within a specific VRF context.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.
- IGMP zapping must be enabled when the maximum group limit is enabled and the action is to drop incoming membership requests.

Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 20 max-group action drop
-> ip multicast vlan 11-15 max-group 10 action replace
-> ip multicast vlan 10 max-group
-> ip multicast vlan 11-15 max-group
-> ip multicast service 5 max-group 10 action drop
-> ip multicast service 20 max-group action drop
-> ip multicast service 10-15 max-group 10 action replace
-> ip multicast service 5 max-group
-> ip multicast service 10-15 max-group
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

Related Commands

show ip multicast

  alaIpmsConfigType  
  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigMaxGroupLimit  
  alaIpmsConfigMaxGroupExceedAction
```

ip multicast static-neighbor

Creates a static IGMP neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ip multicast static-neighbor vlan *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

ip multicast static-neighbor service *service_id* **sap** {**port** | **linkagg**} {*sap_id*}

no ip multicast static-neighbor vlan *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

no ip multicast static-neighbor service *service_id* **sap** {**port** | **linkagg**} {*sap_id*}

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN to include as a static IGMP neighbor. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number to configure as a static IGMP neighbor. |
| <i>agg_id</i> | The link aggregate ID number to configure as a static IGMP neighbor. |
| <i>service_id</i> | SPB service ID to include as a static IGMP neighbor. The valid range is 1–32767. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic *and* IPv4 multicast traffic.
- To create an IGMP static neighbor entry on a link aggregate, use the **linkagg** parameter (for example, **ip multicast static-neighbor vlan 2 linkagg 7** or **ip multicast static-neighbor service 10 sap linkagg 10:100**).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast static-neighbor service 10 sap port 1/1/23:10**, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1/5
-> no ip multicast static-neighbor vlan 4 port 1/1/5
-> ip multicast static-neighbor vlan 4 linkagg 7
-> no ip multicast static-neighbor vlan 4 linkagg 7

-> ip multicast static-neighbor service 10 sap port 1/1/2:100
-> no ip multicast static-neighbor service 10 sap port 1/1/2:100
-> ip multicast static-neighbor service 10 sap linkagg 10:100
-> no ip multicast static-neighbor service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was introduced.
Release 8.4.1; **service** and **sap** parameters added.

```

ip multicast static-querier

Creates a static IGMP querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ip multicast static-querier vlan *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

ip multicast static-querier service *service_id* **sap** {**port** | **linkagg**} {*sap_id*}

no ip multicast static-querier vlan *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

no ip multicast static-querier service *service_id* **sap** {**port** | **linkagg**} {*sap_id*}

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN to include as a static IGMP querier. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number to configure as a static IGMP querier. |
| <i>agg_id</i> | The link aggregate ID number to configure as a static IGMP querier. |
| <i>service_id</i> | SPB service ID to include as a static IGMP querier. The valid range is 1–32767. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the IGMP traffic.
- To create an IGMP static querier entry on a link aggregate, use the **linkagg** parameter (for example, **ip multicast static-querier vlan 2 linkagg 7** or **ip multicast static-querier service 10 sap linkagg 10:100**).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, **ip multicast static-querier service 10 sap port 1/1/23:10**, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> ip multicast static-querier vlan 4 port 1/1/2
-> no ip multicast static-querier vlan 4 port 1/1/2
-> ip multicast static-querier vlan 4 linkagg 7
-> no ip multicast static-querier vlan 4 linkagg 7

-> ip multicast static-querier service 10 sap port 1/1/2:100
-> no ip multicast static-querier service 10 sap port 1/1/2:100
-> ip multicast static-querier service 10 sap linkagg 10:100
-> no ip multicast static-querier service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

show ip multicast querier Displays the IGMP querier table entries of IP Multicast Switching and Routing.

  alaIpmsStaticQuerierSubValue
  alaIpmsStaticQuerierRowStatus
```

ip multicast static-group

Creates a static IGMP group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ip multicast static-group *ip_address* **vlan** *vlan_id* **{port chassis/slot/port | linkagg agg_id}**

ip multicast static-group *ip_address* **service** *service_id* **sap {port | linkagg} {sap_id}**

no ip multicast static-group *ip_address* **vlan** *vlan_id* **{port chassis/slot/port | linkagg agg_id}**

no ip multicast static-group *ip_address* **service** *service_id* **sap {port | linkagg} {sap_id}**

Syntax Definitions

| | |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | The IP address of the multicast group. |
| <i>vlan_id</i> | VLAN to include as a static IGMP group. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number to configure as a static IGMP group. |
| <i>agg_id</i> | The link aggregate ID number to configure as a static IGMP group. |
| <i>service_id</i> | SPB service ID to include as a static IGMP group. The valid range is 1–32767. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an IGMP static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- To create an IGMP static group entry on a link aggregate, use the **linkagg** parameter (for example, `ip multicast static-group 225.0.0.1 vlan 2 linkagg 7` or `ip multicast static-group 225.0.0.1 service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ip multicast static-querier service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1/2
-> ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
-> no ip multicast static-group 225.11.11.11 vlan 4 linkagg 7

-> ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> no ip multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
-> no ip multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

show ip multicast group Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

MIB Objects

```
alaIgmStaticMemberTable
  alaIpmsStaticMemberConfigType
  alaIpmsStaticMemberAddressType
  alaIpmsStaticMemberValue
  alaIpmsStaticMemberIfIndex
  alaIpmsStaticMemberSubValue
  alaIpmsStaticMemberGroupAddress
  alaIpmsStaticMemberRowStatus
```

ip multicast query-interval

Sets the IGMP query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*] **query-interval** [*seconds*]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*] **query-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | IGMP query interval in seconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 125 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP query interval to use.
- Use the **no** form of this command to restore the IGMP query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast query-interval 0**).

Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> no ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
```

```
-> ip multicast vlan 3-5 query-interval 100
-> ip multicast vlan 2 query-interval 0
-> no ip multicast vlan 2 query-interval
-> no ip multicast vlan 3-5 query-interval
-> ip multicast service 2 query-interval 100
-> ip multicast service 3-5 query-interval 100
-> ip multicast service 2 query-interval 0
-> no ip multicast service 2 query-interval
-> no ip multicast service 3-5 query-interval
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

Related Commands

```

ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **last-member-query-interval** [*tenths_of_seconds*]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **last-member-query-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>tenths_of_seconds</i> | IGMP last member query interval in tenths of seconds. The valid range is 1–65535. |

Defaults

| parameter | default |
|--------------------------|---------|
| <i>tenths_of_seconds</i> | 10 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs or SPB services.
- If the IGMP last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- Use the **no** form of this command to restore the IGMP last member query interval back to the default value (10 tenth-of-seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast last-member-query-interval 0**).

Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> no ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
```

```
-> ip multicast vlan 3-5 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> no ip multicast vlan 2 last-member-query-interval
-> no ip multicast vlan 3-5 last-member-query-interval
-> ip multicast service 2 last-member-query-interval 22
-> ip multicast service 3-5 last-member-query-interval 22
-> ip multicast service 2 last-member-query-interval 0
-> no ip multicast service 2 last-member-query-interval
-> no ip multicast service 3-5 last-member-query-interval
```

Release History

ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*] **query-response-interval** [*tenths_of_seconds*]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*] **query-response-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>tenths_of_seconds</i> | IGMP query response interval in tenths of seconds. The valid range is 1–65535. |

Defaults

| parameter | default |
|--------------------------|---------|
| <i>tenths_of_seconds</i> | 100 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- Use the **no** form of this command to restore the IGMP query response interval back to the default value (100 tenths-of-seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast query-response-interval 0**).

Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> no ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 3-5 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
```

```
-> no ip multicast vlan 2 query-response-interval
-> no ip multicast vlan 3-5 query-response-interval
-> ip multicast service 2 query-response-interval 300
-> ip multicast service 3-5 query-response-interval 300
-> ip multicast service 2 query-response-interval 0
-> no ip multicast service 2 query-response-interval
-> no ip multicast service 3-5 query-response-interval
```

Release History

```

ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **unsolicited-report-interval** [*seconds*]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **unsolicited-report-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | IGMP unsolicited report interval in seconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 1 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs or SPB services.
- If the IGMP query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- Use the **no** form of this command to restore the IGMP unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast unsolicited-report-interval 0**).

Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> no ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
-> ip multicast vlan 3-5 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
```

```
-> no ip multicast vlan 2 unsolicited-report-interval
-> no ip multicast vlan 3-5 unsolicited-report-interval
-> ip multicast service 2 unsolicited-report-interval 300
-> ip multicast service 3-5 unsolicited-report-interval 300
-> ip multicast service 2 unsolicited-report-interval 0
-> no ip multicast service 2 unsolicited-report-interval
-> no ip multicast service 3-5 unsolicited-report-interval
```

Release History

ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **router-timeout** [*seconds*]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **router-timeout**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | IGMP router timeout in seconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 90 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the IGMP router timeout back to the default value (90 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast router-timeout 0**).

Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> no ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 3-5 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> no ip multicast vlan 2 router-timeout
-> no ip multicast vlan 3-5 router-timeout
-> ip multicast service 2 router-timeout 100
-> ip multicast service 3-5 router-timeout 100
```

```
-> ip multicast service 2 router-timeout 0
-> no ip multicast service 2 router-timeout
-> no ip multicast service 3-5 router-timeout
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

```

ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **source-timeout** [*seconds*]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **source-timeout**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | IGMP source timeout in seconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 30 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the IGMP source timeout back to the default value (30 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ip multicast source-timeout 0**).

Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> no ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 3-5 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> no ip multicast vlan 2 source-timeout
-> no ip multicast vlan 3-5 source-timeout 100
-> ip multicast service 2 source-timeout 100
-> ip multicast service 3-5 source-timeout 100
```

```
-> ip multicast service 2 source-timeout 0
-> no ip multicast service 2 source-timeout
-> no ip multicast service 3-5 source-timeout
```

Release History

Release 7.1.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

[show ip multicast](#)

```

ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*]] **querying** {**enable** | **disable**} [**static-source-ip** *ip_address*]

no ip multicast [vlan *vlan_id*[-*vlan_id2*]] **querying** [**static-source-ip**]

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| enable | Enable IGMP querying. |
| disable | Disable IGMP querying. |
| <i>ip_address</i> | A static source IPv4 address to use for IGMP querying. <i>This parameter is currently not supported.</i> |

Defaults

| parameter | default |
|------------------|---------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- Use the **no** form of this command to restore the IGMP querying status to the default value (disabled) on the system or the specified VLAN.

Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> no ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 3-5 querying disable
-> no ip multicast vlan 2 querying
-> no ip multicast vlan 3-5 querying
```

Release History

Release 7.1.1; command was introduced.

Release 8.3.1.R02; **static-source-ip** parameter added.

ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **robustness** [*robustness*]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **robustness**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>robustness</i> | IGMP robustness variable. Valid range is 1–7. |

Defaults

| parameter | default |
|-------------------|---------|
| <i>robustness</i> | 2 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs or SPB services.
- If the IGMP robustness variable is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP robustness variable to use.
- Use the **no** form of this command to restore the IGMP robustness variable back to the default value (2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ip multicast robustness 0).

Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> no ip multicast robustness
-> ip multicast vlan 2 robustness 3
```

```
-> ip multicast vlan 3-5 robustness 3
-> ip multicast vlan 2 robustness 0
-> no ip multicast vlan 2 robustness
-> no ip multicast vlan 3-5 robustness
-> ip multicast service 2 robustness 3
-> ip multicast service 3-5 robustness 3
-> ip multicast service 2 robustness 0
-> no ip multicast service 2 robustness
-> no ip multicast service 3-5 robustness
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **spoofing** {**enable** | **disable**}

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **spoofing**

Syntax Definitions

| | |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, OmniSwitch 6900-V72.</i> |
| enable | Enable IGMP spoofing. |
| disable | Disable IGMP spoofing. |

Defaults

| parameter | default |
|------------------|---------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing configuration and return the specified VLAN, SPB service, or system to the default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- By default, the source IP address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IP address using the **ip multicast spoofing static-source-ip** command to overcome the need for an IP interface. If configured, the static source IP is always used for spoofing, regardless of the IP interface address or administrative state.

Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> no ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
```

```
-> ip multicast vlan 3-5 spoofing disable
-> no ip multicast vlan 2 spoofing
-> no ip multicast vlan 3-5 spoofing
-> ip multicast service 2 spoofing enable
-> ip multicast service 3-5 spoofing disable
-> no ip multicast service 2 spoofing
-> no ip multicast service 3-5 spoofing
```

Release History

```

ip multicast spoofing static-source-ip

Configures an IGMP static spoofing address on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **spoofing static-source-ip** *ip_address*

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **spoofing static-source-ip**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>ip_address</i> | A static source IPv4 address to use for spoofing. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static source IP address.
- IGMP spoofing refers to replacing a client source MAC and IP address with the system's MAC and IP address when relaying or proxying aggregated IGMP group membership information to other devices.
- By default, a source IP address is not specified when spoofing is enabled. As a result, the switch will automatically use the address of the IP interface associated with the LAN. If there is no IP interface address to use, the switch will then use the Loopback0 interface address associated with the current VRF instance.
- Use this command to optionally configure a static source IP address to overcome the need for an IP interface. If configured, the static source IP is always used for spoofing, regardless of the IP interface address or administrative state.

Examples

```
-> ip multicast spoofing static-source-ip 10.2.2.1
-> no ip multicast spoofing static-source-ip
-> ip multicast vlan 2 spoofing static-source-ip 10.2.2.1
-> ip multicast vlan 3-5 spoofing static-source-ip 10.2.2.1
-> no ip multicast vlan 2 spoofing static-source-ip
-> no ip multicast vlan 3-5 spoofing static-source-ip
-> ip multicast service 2 spoofing static-source-ip 11.2.2.1
```

```
-> no ip multicast service 2 spoofing static-source-ip
-> ip multicast service 3-5 spoofing static-source-ip 11.2.2.1
-> no ip multicast service 3-5 spoofing static-source-ip
```

Release History

Release 8.3.1.R02; command was added.

Release 8.4.1.R02; **service** parameter added.

ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*] zapping [{enable | disable}]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] zapping

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable IGMP zapping. |
| disable | Disable IGMP zapping. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- Use the **no** form of this command to restore the IGMP zapping status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> no ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 3-5 zapping disable
-> no ip multicast vlan 2 zapping
-> no ip multicast vlan 3-5 zapping
-> ip multicast service 2 zapping enable
```

```
-> ip multicast service 3-5 zapping disable
-> no ip multicast service 2 zapping
-> no ip multicast service 3-5 zapping
```

ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **querier-forwarding** [enable | disable]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **querier-forwarding**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable IGMP querier forwarding. |
| disable | Disable IGMP querier forwarding. |

Defaults

| parameter | default |
|------------------|---------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the IGMP querier forwarding is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.
- Use the **no** form of this command to restore the IGMP querier forwarding status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> no ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 3-5 querier-forwarding disable
-> no ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 3-5 querier-forwarding
-> ip multicast service 2 querier-forwarding enable
```

```
-> ip multicast service 3-5 querier-forwarding disable
-> no ip multicast service 2 querier-forwarding
-> no ip multicast service 3-5 querier-forwarding
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **proxying** [enable | disable]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **proxying**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable IGMP proxying. |
| disable | Disable IGMP proxying. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- Proxy reported IGMP packets are sent using the source MAC address of the proxying switch. Unless the spoofing feature is used, proxy reported IGMP packets will be sent using 0.0.0.0 for the IPv4 source address.
- Use the **no** form of this command to restore the IGMP proxying status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> no ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 3-5 proxying disable
-> no ip multicast vlan 2 proxying
-> no ip multicast vlan 3-5 proxying
-> ip multicast service 2 proxying enable
-> ip multicast service 3-5 proxying disable
-> no ip multicast service 2 proxying
-> no ip multicast service 3-5 proxying
```

Release History

ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host Reports and Leave messages are sent.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*]] **helper-address** *ip_address*

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*]] **helper-address**

Syntax Definitions

vlan_id[-*vlan_id2*] VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs.

ip_address The IP address of the relay host.

Defaults

| parameter | default |
|-------------------|---------|
| <i>ip_address</i> | 0.0.0.0 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- An operational IPv4 interface is required for the receiving LAN before any IGMP Reports and Leave messages can be relayed.
- Configuring a destination IP helper address is supported only in the VLAN domain; the service domain is not supported.
- Use the **no** form of this command to restore the IPMS reporting feature back to the default value (IP address 0.0.0.0) on the system. When the IP address is set to 0.0.0.0, the IPMS reporting feature is disabled.

Examples

```
-> ip multicast helper-address 10.1.1.198
-> no ip multicast helper-address
-> ip multicast vlan 2 helper-address 10.1.1.198
-> ip multicast vlan 3-5 helper-address 10.1.1.198
-> no ip multicast vlan 2 helper-address
-> no ip multicast vlan 3-5 helper-address
```

Release History

ip multicast zero-based-query

Configures the use of an all-zero source IPv4 address for IGMP query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **zero-based-query** [**enable** | **disable**]

no ip multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **zero-based-query**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable IGMP zero-based querying. |
| disable | Disable IGMP zero-based querying. |

Defaults

| parameter | default |
|--------------------------------|---------------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The IGMP zero-based query status set for a specific VLAN or SPB service overrides the zero-based query status set for the system.
- Use the **no** form of this command to restore the IGMP zero-based query status back to the default value (enabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ip multicast zero-based-query enable
-> ip multicast zero-based-query disable
-> no ip multicast zero-based-query
-> ip multicast vlan 2 zero-based-query enable
-> ip multicast vlan 3-5 zero-based-query disable
-> no ip multicast vlan 2 zero-based-query
-> no ip multicast vlan 3-5 zero-based-query
-> ip multicast service 10 zero-based-query enable
-> ip multicast service 10-15 zero-based-query disable
-> no ip multicast service 10 zero-based-query
```

-> no ip multicast service 10-15 zero-based-query disable

Release History

Release 8.3.1; command introduced.

Release 8.4.1; **service** parameter added.

ip multicast forward-mode

Configures the Layer 2 forwarding mode for IPv4 Multicast Switching (does not apply to IPv4 Multicast Routing). The forwarding mode is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] forward-mode {asm | ssm | mac | auto}
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] forward-mode
```

Syntax Definitions

| | |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>vlan_id[-vlan_id2]</code> | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <code>service_id[-service_id2]</code> | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| asm | Sets the IPMS forwarding mode to ASM (the bridge lookup is based on the packet group destination IP address). <i>This parameter is supported only in the VLAN domain; service domain is not supported.</i> |
| ssm | Sets the IPMS forwarding mode to SSM (the bridge lookup is based on the packet source IP as well as the group destination IP). <i>This parameter is supported only in the VLAN domain; service domain is not supported.</i> |
| mac | Sets the IPMS forwarding mode to MAC address (the bridge lookup is based on the MAC destination address). |
| auto | Automatically determines the IPMS forwarding mode based on the current IGMP protocol version and the existing protocol state. |

Defaults

By default, the forwarding mode is set to automatic.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The forwarding mode set for a specific VLAN or SPB service overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
 - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
 - Multicast routing is not supported on the OmniSwitch 6560.

- On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.
- Use the **no** form of this command to restore the Layer 2 forwarding mode back to the default value (automatic) on the system or the specified VLAN or SPB service.

Examples

```
-> ip multicast forward-mode auto
-> ip multicast forward-mode asm
-> ip multicast forward-mode ssm
-> ip multicast forward-mode mac
-> no ip multicast forward-mode
-> ip multicast vlan 100 forward-mode auto
-> ip multicast vlan 101-104 forward-mode asm
-> ip multicast vlan 100 forward-mode ssm
-> ip multicast vlan 101-104 forward-mode mac
-> no ip multicast vlan 100 forward-mode
-> no ip multicast vlan 101-104 forward-mode
-> ip multicast service 10 forward-mode mac
-> ip multicast service 11-15 forward-mode mac
-> no ip multicast service 10 forward-mode
-> no ip multicast service 11-15 forward-mode
```

Release History

```

ip multicast update-delay-interval

Sets the amount of time to delay IPv4 multicast forwarding updates on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] update-delay-interval *milliseconds*

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] update-delay-interval

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>milliseconds</i> | The number of milliseconds to defer forwarding updates. Valid range is 0–10000. |

Defaults

By default, the forwarding update delay interval is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the forwarding update delay interval back to the default value (zero) on the system or the specified VLAN or SPB service.

Examples

```
-> ip multicast update-delay-interval 10
-> no ip multicast update-delay-interval
-> ip multicast vlan 100 update-delay-interval 20
-> ip multicast vlan 101-105 update-delay-interval 20
-> no ip multicast vlan 100 update-delay-interval
-> no ip multicast vlan 101-105 update-delay-interval
-> ip multicast service 20 update-delay-interval 20
-> ip multicast service 21-25 update-delay-interval 20
-> no ip multicast service 20 update-delay-interval
-> no ip multicast service 21-25 update-delay-interval
```

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

  alaIpmsConfigUpdateDelayInterval
```

ip multicast fast-join

Configures whether or not IP Multicast Switching will automatically create the forwarding entries in hardware as soon as the IGMP memberships are learned on the specified VLAN, Shortest Path Bridging (SPB) service or globally if no VLAN or SPB service is specified.

ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **fast-join** [enable | disable]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **fast-join**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. <i>This parameter is supported only on the OmniSwitch 9900.</i> |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable the IGMP fast join functionality. |
| disable | Disable the IGMP fast join functionality. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to IPv4 Multicast Switching. If IP Multicast Routing is enabled, then the routing configuration will override the fast join setting.
- When the IP Multicast Switching fast join functionality is enabled, convergence of multicast traffic may occur faster because the forwarding entries are already created before the actual multicast traffic is received.
- When the IP Multicast Switching fast join functionality is disabled (the default), forwarding entries are not created in the hardware until the multicast traffic reaches the switch.
- If the IP Multicast Switching fast join is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the IP Multicast Switching fast join setting back to the default value (disabled) on the system or the specified VLAN or SPB service.

Examples

```
-> ip multicast fast-join enable
-> ip multicast fast-join disable
-> no ip multicast fast-join
-> ip multicast service 10 fast-join enable
-> ip multicast service 11-15 fast-join disable
-> no ip multicast service 10 fast-join
-> no ip multicast service 11-15 fast-join
```

Release History

Release 8.3.1.R02; command introduced.

Release 8.4.1.R02; **vlan** and **service** parameters added.

ip multicast host-list

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

```
ip multicast host-list host_list_name ip_address [ip_address]
```

```
no ip multicast host-list host_list_name [ip_address]
```

Syntax Definitions

host_list_name

A name to assign to the host list (up to 20 characters).

ip_address

The IP address to add to the host list. Multiple IP addresses can be entered on the same command line.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the list or remove the entire list from the switch configuration.
- When the entire list is removed, any configuration associated with the list is also removed.

Examples

```
-> ip multicast host-list group-map1 10.1.1.198
-> ip multicast host-list ssm-map1 20.0.0.1
-> ip multicast host-list ssm-map2 30.0.0.1 30.0.0.2 30.0.0.3
-> no ip multicast host-list ssm-map2 30.0.0.2
-> no ip multicast host-list group-map1
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip multicast host-list Displays the IP multicast host address list configuration for the switch.

MIB Objects

 alaIpmsHostListAddress

ip multicast ssm-map

Configures the translation of Any Source Multicast (ASM) group memberships into Source Specific Multicast (SSM) group memberships on the specified VLAN or on the system if no VLAN is specified.

```
ip multicast [vlan vlan_id] ssm-map {group_address/prefixLen host_list_name | admin-state {enable | disable}}
```

```
no ip multicast [vlan vlan_id] ssm-map group_address/prefixLen
```

Syntax Definitions

| | |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN on which to apply the mapping configuration. |
| <i>group_address</i> [/ <i>prefixLen</i>] | The multicast group address/prefix length to map to the host list. If no prefix length is specified, then the a default length of 32 is used. |
| <i>host_list_name</i> | The name of a host list to use for SSM mapping. |
| enable | Enables the SSM mapping. |
| disable | Disables the SSM mapping. |

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove the SSM mapping configuration from the system or the specified VLAN.
- If an SSM mapping is already enabled on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ip multicast ssm-map 229.10.10.10 hostList1
-> ip multicast ssm-map admin-state enable
-> ip multicast vlan 200 ssm-map 225.11.11.11 hostList2
-> ip multicast vlan 200 ssm-map admin-state enable
-> no ip multicast ssm-map 229.10.10.10
```

Release History

Release 8.3.1.R02; command was introduced.

ip multicast initial-packet-buffer admin-state

Enables or disables initial packet buffering for IPv4 multicast flows on the specified VLAN or globally on the switch.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer admin-state** {**enable** | **disable**}

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| enable | Enable the initial packet buffering globally on the switch. |
| disable | Disable the initial packet buffering globally on the switch. |

Defaults

| parameter | default |
|--------------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- When enabled, the following configuration is used for initial packet buffering on new multicast flows:
 - The maximum number of initial packets buffered per IPv4 multicast flow. Use the **ip multicast initial-packet-buffer max-packet** command to set this value.
 - The maximum number of IPv4 multicast flows that can be buffered. Use the **ip multicast initial-packet-buffer max-flow** command to set this value.
 - The maximum amount of time buffered packets are held if they are not sent out. Use the **ip multicast initial-packet-buffer timeout** command to set this value.
 - The minimum amount of time packets are held before delivery begins. Use the **ip multicast initial-packet-buffer min-delay** command to set this value.
- Configuring the status for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer admin-state disable
-> ip multicast vlan 2 initial-packet-buffer admin-state enable
-> ip multicast vlan 3-5 initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

`show ip multicast`

```

ip multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv4 multicast flow on the specified VLAN or globally on the switch.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer max-packet** [*num*]

Syntax Definitions

| | |
|-------------------------------------|-----------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>num</i> | The maximum number of packets allowed to buffer per IPv4 multicast flow. Valid range is 1–10. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 4 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer max-packet 4
-> ip multicast vlan 2 initial-packet-buffer max-packet 10
-> ip multicast vlan 3-5 initial-packet-buffer max-packet 10
```

Release History

Release 8.2.1; command introduced.

ip multicast initial-packet-buffer max-flow

Configures the maximum number of IPv4 multicast flows that can be buffered on the specified VLAN or globally on the switch.

```
ip multicast [vlan vlan_id[-vlan_id2]] initial-packet-buffer max-flow [num]
```

Syntax Definitions

| | |
|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>num</i> | The maximum number of IPv4 multicast flows allowed for initial packet buffering. Valid range is 1–32. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 32 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer max-flow 32
-> ip multicast vlan 2 initial-packet-buffer max-flow 32
-> ip multicast vlan 3-5 initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv4 initial multicast packets on the specified VLAN or globally on the switch.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer timeout** [*seconds*]

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>seconds</i> | The timeout value for the initial buffered IPv4 multicast packets in seconds. Valid range is 1–10. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 10 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer timeout 2
-> ip multicast vlan 2 initial-packet-buffer timeout 5
-> ip multicast vlan 3-5 initial-packet-buffer timeout t
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer admin-state

ip multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet on the specified VLAN or globally on the switch.

ip multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer min-delay** [*milliseconds*]

Syntax Definitions

| | |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>milliseconds</i> | The minimum delay value to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Valid range is 0–1000. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>milliseconds</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ip multicast initial-packet-buffer min-delay 200
-> ip multicast vlan 2 initial-packet-buffer min-delay 200
-> ip multicast vlan 3-5 initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

ip multicast initial-packet-buffer admin-state

Enables or disables the initial packet buffering feature globally on the switch for IPv4 multicast flows.

show ip multicast

 alaIpmsConfigInitialPacketBufferMinDelay

ip multicast display-interface-names

Sets the display output of the **show** commands listed below. When enabled, the display outputs for these commands will show the IP interface name for each VLAN associated with the IP multicast table entry.

ip multicast display-interface-names

no ip multicast display-interface-names

Syntax Definitions

N/A

Defaults

By default, this function is disabled. The display format is set to include the VLANs that are associated with the IP multicast source and forward flows.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert back to displaying the VLAN name.
- If there are any VLANs that are not configured with an IP interface or the IP interface is disabled, the output display will still include the VLAN when this function is enabled.
- This command may be helpful when reviewing output from multicast snooping commands and comparing state in multicast routing, which only interacts with IP interfaces.
- Enabling the display interface names option applies to the following **show** commands:

show ip multicast forward

show ip multicast neighbor

show ip multicast querier

show ip multicast group

show ip multicast source

show ip multicast tunnel

- The command examples provided display the **show ip multicast source** output after the display interface name function is turned on (enabled) and off (disabled).

Examples

```
-> ip multicast display-interface-name
-> show ip multicast source
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ip multicast source

Displays the IP Multicast Switching and Routing source table entries.

show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries.

MIB Objects

alaIpmsGlobalConfigTable

 alaIpmsGlobalConfigAddressType

 alaIpmsGlobalConfigDisplayInterfaceNames

ip multicast inherit-default-vrf-config

Configures whether or not the global IPMS configuration defined in the default VRF instance is applied to all VRF instances.

ip multicast inherit-default-vrf-config

no ip multicast inherit-default-vrf-config

Syntax Definitions

N/A

Defaults

By default, the global IPMS configuration defined in the default VRF instance is applied to all VRF instances on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMS configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled (the default), additional VRF instances will inherit the global IPMS configuration defined in the default VRF instance.
- A global IPMS configuration defined for a specific non-default VRF instance takes precedence over the global IPMS configuration defined for the default VRF.
- Note that any per-VLAN IPMS configuration defined in a non-default VRF instance will show up as part of the default VRF instance in the configuration snapshot file. However, the functionality is still applied within the context of VRF instance in which the per-VLAN configuration was originally defined.

Examples

```
-> ip multicast inherit-default-vrf-config
-> no ip multicast inherit-default-vrf-config
```

Release History

Release 8.3.1; command introduced.

 alaIpmsGlobalConfigInheritDefaultVrfConfig

ip multicast profile

Defines an IPMS profile that is used to apply a pre-defined configuration to the global IPMS instance (all VLAN and service instances) or to a specific VLAN or service instance. Using a configuration profile to configure IPMS functionality avoids having to configure each IPMS parameter with a separate CLI command.

This section describes the base command (**ip multicast profile**) along with optional command keywords that are used to configure IPMS parameter values that are applied when the profile is assigned to an IPMS instance. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the profile.

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance. The default profile cannot be deleted, but the profile parameter values are configurable through this command.

ip multicast profile *profile_name*

[admin-state {enable | disable}]
[flood-unknown {enable | disable}]
[version version]
[robustness robustness]
[querying {enable | disable}]
[query-interval [seconds]]
[query-response-interval [tenths-of-seconds]]
[last-member-query-interval [tenths-of-seconds]]
[unsolicited-report-interval [seconds]]
[proxying {enable | disable}]
[spoofing {enable | disable}]
[spoofing static-source-ip ip_address]
[zapping {enable | disable}]
[querier-forwarding {enable | disable}]
[router-timeout [seconds]]
[source-timeout [seconds]]
[max-group [num] [action {none | drop | replace}]]
[helper-address [ip_address]]
[zero-based-query {enable | disable}]
[forward-mode {asm | ssm | mac | auto}]
[update-delay-interval milliseconds]
[fast-join {enable | disable}]
[initial-packet-buffer admin-state {enable | disable}]
[initial-packet-buffer max-flow [num]]
[initial-packet-buffer max-packet [num]]
[initial-packet-buffer timeout [seconds]]
[initial-packet-buffer min-delay [milliseconds]]

no ip multicast profile *profile_name* **[admin-state | flood-unknown | version | robustness | ...]**

Syntax Definitions

profile_name The name to associate with the IPMS profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IPMS profile from the switch configuration.
- To change the value of a specific profile parameter, specify the parameter keyword with this command. For example, **no ip multicast profile ipms-1 admin-state**, **ip multicast profile ipms-1 query-interval 100**, or **ip multicast profile ipms-1 querying enable**. The new parameter values are applied to all IPMS instances to which the profile is assigned.
- The profile name must already exist in the switch configuration before parameter values can be modified. Use this command to create the profile first, then configure the profile parameter values.
- For more information about specific profile parameter values, refer to the following explicit IPMS configuration commands for each profile parameter:

| Port Template Parameter | Explicit Port Configuration Command |
|-----------------------------------------------------------------------------|-------------------------------------------------|
| [admin-state {enable disable}] | ip multicast admin-state |
| [flood-unknown {enable disable}] | ip multicast flood-unknown |
| [version <i>version</i>] | ip multicast version |
| [robustness <i>robustness</i>] | ip multicast robustness |
| [querying {enable disable}] | ip multicast querying |
| [query-interval [<i>seconds</i>]] | ip multicast query-interval |
| [query-response-interval [<i>tenths-of-seconds</i>]] | ip multicast query-response-interval |
| [last-member-query-interval [<i>tenths-of-seconds</i>]] | ip multicast last-member-query-interval |
| [unsolicited-report-interval [<i>seconds</i>]] | ip multicast unsolicited-report-interval |
| [proxying {enable disable}] | ip multicast proxying |
| [spoofing {enable disable}] | ip multicast spoofing |
| [spoofing static-source-ip <i>ip_address</i>] | ip multicast spoofing static-source-ip |
| [zapping {enable disable}] | ip multicast zapping |
| [querier-forwarding {enable disable}] | ip multicast querier-forwarding |
| [router-timeout [<i>seconds</i>]] | ip multicast router-timeout |
| [source-timeout [<i>seconds</i>]] | ip multicast source-timeout |
| [max-group [<i>num</i>] [action {none drop replace}]] | ip multicast max-group |

| Port Template Parameter | Explicit Port Configuration Command |
|-------------------------------------------------------------------|-------------------------------------------------------|
| [helper-address [<i>ip_address</i>]] | ip multicast helper-address |
| [zero-based-query {enable disable}] | ip multicast zero-based-query |
| [forward-mode {asm ssm mac auto}] | ip multicast forward-mode |
| [update-delay-interval <i>milliseconds</i>] | ip multicast update-delay-interval |
| [fast-join {enable disable}] | ip multicast fast-join |
| [initial-packet-buffer admin-state {enable disable}] | ip multicast initial-packet-buffer admin-state |
| [initial-packet-buffer max-flow [<i>num</i>]] | ip multicast initial-packet-buffer max-flow |
| [initial-packet-buffer max-packet [<i>num</i>]] | ip multicast initial-packet-buffer max-packet |
| [initial-packet-buffer timeout [<i>seconds</i>]] | ip multicast initial-packet-buffer timeout |
| [initial-packet-buffer min-delay [<i>milliseconds</i>]] | ip multicast initial-packet-buffer min-delay |

Examples

```

-> ip multicast profile "IGMPv3 with Zapping"
-> ip multicast profile "IGMPv3 with Zapping" admin-state enable
-> ip multicast profile "IGMPv3 with Zapping" zapping enable version 3
-> ip multicast profile "IGMPv3 with Zapping" fast-join enable proxying enable
-> no ip multicast profile "IGMPv3 with Zapping" proxying
-> no ip multicast profile "IGMPv3 with Zapping"

```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

  alaIpmsProfileAddressType
  alaIpmsProfileName
  alaIpmsProfileIndex
  alaIpmsProfileRowStatus
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigProfileName

```

ip multicast apply-profile

Assigns the name of an existing IPMS configuration profile to the global IPMS instance (all VLANs and services) or to a specific VLAN or Shortest Path Bridging (SPB) service instance. An IPMS configuration profile defines parameter options that are applied to the IPMS instance to which the profile is assigned.

```
ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] apply-profile profile_name
```

```
no ip multicast [vlan vlan_id[-vlan_id2] | service service_id[-service_id2]] apply-profile
```

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>profile_name</i> | The name to associate with the IPMS profile. |

Defaults

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the profile assignment back to the “default” profile.
- Specify a range of VLANs (**vlan 20-25**) or a range of SPB services (**service 10-15**) to apply the specified profile to multiple VLANs or services with one CLI command.
- The specified profile name must already exist in the switch configuration.

Examples

```
-> ip multicast apply-profile "IGMPv3 with Zapping"  
-> ip multicast vlan 20 apply-profile "IGMPv3 with Zapping"  
-> ip multicast vlan 20-25 apply-profile "IGMPv3 with Zapping"  
-> ip multicast service 10 apply-profile "IGMPv3 with Zapping"  
-> ip multicast service 10-15 apply-profile "IGMPv3 with Zapping"  
-> no ip multicast apply-profile  
-> no ip multicast vlan 20 apply-profile  
-> no ip multicast vlan 20-15 apply-profile  
-> no ip multicast service 10 apply-profile  
-> no ip multicast service 10-15 apply-profile
```

Release History

Release 8.4.1.R02; command was introduced.

ipv6 multicast admin-state

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **admin-state** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **admin-state**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable IPv6 Multicast Switching and Routing. |
| disable | Disable IPv6 Multicast Switching and Routing. |

Defaults

| parameter | default |
|--------------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The configuration of an IPv6 multicast routing protocol on an IPv6 interface operationally triggers IP Multicast Switching and Routing functionality on any underlying VLAN or SPB service. This occurs regardless of any explicit IPMS configuration, such as attempting to specifically disable IPMS.
- If there is no IPv6 Multicast routing protocol already running on the switch, then the **ipv6 multicast admin-state** command alone controls IPMS operations.
- Enabling IPMS on individual VLANs or services, as needed, is recommended to conserve switch resources.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.

Note. Globally enabling the IPv6 Multicast Switching and Routing status for the switch only applies to the VLAN domain (does not apply to the service domain). As a result, IPv6 Multicast Switching and Routing must be explicitly enabled or disabled for each SPB service. However, globally disabling IPMS for all SPB services is supported.

- Use the **no** form of this command to restore the IPv6 Multicast Switching and Routing status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast admin-state enable
-> ipv6 multicast admin-state disable
-> no ipv6 multicast admin-state
-> ipv6 multicast vlan 2 admin-state enable
-> ipv6 multicast vlan 3-5 admin-state disable
-> no ipv6 multicast vlan 2 admin-state
-> no ipv6 multicast vlan 3-5 admin-state
-> ipv6 multicast service 10 admin-state enable
-> ipv6 multicast service 11-15 admin-state disable
-> no ipv6 multicast service 10 admin-state
-> no ipv6 multicast service 11-15 admin-state
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

```

ipv6 multicast flood-unknown

Enables or disables the flooding of initial unknown multicast traffic for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified. When a traffic flow is first seen on a port, there is a brief period of time where traffic may get dropped before the forwarding information is calculated. When flooding unknown multicast traffic is enabled, no packets are dropped before the forwarding information is available.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **flood-unknown** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **flood-unknown**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable flooding of unknown traffic until it is learned. |
| disable | Disable flooding of unknown traffic. |

Defaults

| parameter | default |
|--------------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If this command function is enabled after the system is up and running, the flooding of unknown multicast traffic only applies to new flows.
- On an OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900:
 - Configuring the flood unknown status for any VLAN enforces the flood unknown behavior globally across all VLANs. The IPv4 multicast version of this command (**ip multicast flood-unknown**), however, enforces the flood unknown behavior at the per-VLAN level.
 - IPv6 multicast snooping for VLANs does not snoop ff02::/64 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded IPv6 addresses.
 - When IPv6 multicast snooping is enabled for any service, the flooding of unknown multicast traffic is unconditionally enforced for all snooping services; this is the only supported flood unknown behavior for services.
 - IPv6 multicast snooping for services does not snoop MAC addresses that fall within the range of 01:00:5e:00:00:00/40 and 33:33:00:00:00:00/40 and the traffic is allowed to flood even if the

flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to the excluded MAC addresses.

- On an OmniSwitch 9900, IPv6 multicast snooping for VLANs or services does not snoop ff02::/120 and the traffic is allowed to flood even if the flooding of unknown multicast traffic is disabled. Avoid using any multicast groups that map to these excluded IPv6 addresses.
- Use this command to provide an "open failure" strategy for when hardware resource conflicts or software limits prevent the traffic from being registered in the fast path.
- Use the **no** form of this command to restore the flooding of unknown traffic back to the default value (disabled) on the system.

Examples

```
-> ipv6 multicast flood-unknown enable
-> ipv6 multicast flood-unknown disable
-> no ipv6 multicast flood-unknown
-> ipv6 multicast vlan 100 flood-unknown enable
-> ipv6 multicast vlan 101-105 flood-unknown enable
-> ipv6 multicast vlan 100 flood-unknown disable
-> no ipv6 multicast vlan 100 flood-unknown
-> no ipv6 multicast vlan 101-105 flood-unknown
-> ipv6 multicast service 10 flood-unknown enable
-> ipv6 multicast service 11-15 flood-unknown enable
-> ipv6 multicast service 10 flood-unknown disable
-> no ipv6 multicast service 10 flood-unknown
-> no ipv6 multicast service 11-15 flood-unknown
```

Release History

Release 8.3.1; command introduced.

Release 8.4.1.R02; **vlan** and **service** parameter added.

Related Commands

  alaIpmsConfigFloodUnknown
```

ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **version** [*version*]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **version**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>version</i> | Default MLD protocol version to run. Valid entries are 1 or 2. |

Defaults

| parameter | default |
|----------------|---------|
| <i>version</i> | 1 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs. or SPB services.
- If the default MLD protocol version is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- Use the **no** form of this command to restore the MLD multicast version back to the default value (version 1) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, ipv6 multicast version 0).

Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> no ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 3-5 version 2
-> ipv6 multicast vlan 2 version 0
-> no ipv6 multicast vlan 2 version
```

```
-> no ipv6 multicast vlan 3-5 version
-> ipv6 multicast service 2 version 3
-> ipv6 multicast service 3-5 version 3
-> ipv6 multicast service 2 version 0
-> no ipv6 multicast service 2 version
-> no ipv6 multicast service 3-5 version
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

Related Commands

[show ipv6 multicast](#)

Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

```

ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances or all SPB service instances of the port.

ipv6 multicast {port *chassis/slot/port* | **sap port** *sap_id*} **max-group** [*num*] [**action** {*none* | *drop* | *replace*}]

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number (3/1). |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>num</i> | The maximum MLD group count. Valid range is 0–4294967295. |
| none | Disables the maximum group limit configuration. |
| drop | Drops the incoming membership request. |
| replace | Replaces an existing membership with the incoming membership request. A leave is not sent to the router for the replaced group. |

Defaults

By default, the max-group limit is set to zero.

| parameter | defaults |
|-----------|----------|
| Action | none |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If group memberships are already registered on a port/VLAN or SAP port/SPB service instance and the group limit is set to a lower value for the instance, the current group memberships are not removed until they expire. The effect of the new lower group limit value is applied when one of the following occurs to help avoid any undetermined behavior:
 - IP multicast memberships are aged out on a port/VLAN or SAP port/SPB service instance.
 - IP multicast memberships are pruned by a leave or when IP multicast is disabled on the specific VLAN or SPB service or globally disabled for the switch.
- The configuration is allowed even when the IP multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast sap port 1/1/23:10 max-group 10 action drop, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.
- The maximum group configuration on a port will override the VLAN, SPB service, or global configuration.
- MLD zapping must be enabled when the maximum group limit is enabled and the action is dropped.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
 - Group limit configured for a port or an SPB SAP port.
 - Group limit configured for a specific VLAN or SPB service.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
 - Group limit configured for a VLAN or SPB service within a specific VRF context.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.

Examples

```
-> ipv6 multicast port 1/1/12 max-group 10 action drop
-> ipv6 multicast port 1/1/14 max-group action replace
-> ipv6 multicast port 1/1/14 max-group
-> ipv6 multicast sap port 1/1/23:10 max-group 10 action drop
-> ipv6 multicast sap port 1/1/26:20.200 max-group 20 action replace
-> ipv6 multicast sap port 1/1/16:20.200 max-group
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **sap port** parameter added.

Related Commands

show ipv6 multicast Displays the IPv6 Multicast Switching and Routing status and general configuration parameters.

show ipv6 multicast port Displays the maximum group configuration for VLAN ports or SPB service SAP ports.

MIB Objects

alaIpmsIntfTable
  alaIpmsIntfConfigType
  alaIpmsIntfAddressType
  alaIpmsIntfMaxGroupLimit
  alaIpmsIntfMaxGroupExceedAction
```

ipv6 multicast max-group

Configures the maximum group limit learned per port for the specified VLAN, Shortest Path Bridging (SPB) service, or per port on the system if no VLAN or SPB service is specified. The limit is applied to each port that is a member of the given VLAN or SPB service and the specified action is taken when the limit is exceeded.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>num</i> | The maximum MLD group count. Valid range is 0–4294967295. |
| none | Disables the maximum group limit configuration. |
| drop | Drops the incoming membership request. |
| replace | Replaces an existing membership with the incoming membership request. |

Defaults

By default, the max-group limit is set to zero.

| parameter | defaults |
|---------------|-------------|
| action | none |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If a VLAN or SPB service is not specified, this command configures the global maximum group limit applied to all VLAN ports and SPB Service Access Point (SAP) ports.
- If a VLAN is specified, this command configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.
- If an SPB service is specified, this command configures the maximum group limit learned per port on an SPB service. The limit is applied to each port that is a member of the given SPB service.
- Configuring a maximum group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN or port/SPB service instance
- The configuration of a maximum group limit is allowed even when the IP multicast status is disabled.

- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a VLAN or SPB service will override the global configuration.
- The maximum group configuration is applied in the following order of precedence (listed from highest to lowest precedence):
 - Group limit configured for a port or an SPB SAP port.
 - Group limit configured for a specific VLAN or SPB service.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service.
 - Group limit configured for a VLAN or SPB service within a specific VRF context.
 - Group limit configured for the IPMS profile assigned to a VLAN or SPB service within a specific VRF context.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 20 max-group action drop
-> ipv6 multicast vlan 11-15 max-group 10 action replace
-> ipv6 multicast service 5 max-group 10 action drop
-> ipv6 multicast service 20 max-group action drop
-> ipv6 multicast service 10-15 max-group 10 action replace
-> ipv6 multicast service 5 max-group
-> ipv6 multicast service 10-15 max-group
```

Release History

ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ipv6 multicast static-neighbor vlan *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

ipv6 multicast static-neighbor service *service_id* **sap** {**port** | **linkagg**} {*sap_id*}

no ipv6 multicast static-neighbor vlan *vlan_id* {**port** *chassis/slot/port* | **linkagg** *agg_id*}

no ipv6 multicast static-neighbor service *service_id* **sap** {**port** | **linkagg**} {*sap_id*}

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN to include as a static MLD neighbor. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number to configure as a static MLD neighbor. |
| <i>agg_id</i> | The link aggregate to configure as a static MLD neighbor. |
| <i>service_id</i> | SPB service ID to include as a static MLD neighbor. The valid range is 1–32767. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static neighbor entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the MLD traffic *and* IPv6 multicast traffic.
- To create an MLD static neighbor entry on a link aggregate, use the **linkagg** parameter (for example, `ipv6 multicast static-neighbor vlan 2 linkagg 7` or `ipv6 multicast static-neighbor service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ipv6 multicast static-neighbor service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1
-> ipv6 multicast static-neighbor vlan 4 port 7
-> no ipv6 multicast static-neighbor vlan 4 port 7

-> ipv6 multicast static-neighbor service 10 sap port 1/1/2:100
-> no ipv6 multicast static-neighbor service 10 sap port 1/1/2:100
-> ipv6 multicast static-neighbor service 10 sap linkagg 10:100
-> no ipv6 multicast static-neighbor service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

```

ipv6 multicast static-querier

Creates a static MLD querier entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ipv6 multicast static-querier vlan *vlan_id* **{port chassis/slot/port | linkagg agg_id}**

ipv6 multicast static-querier service *service_id* **sap {port | linkagg} {sap_id}**

no ipv6 multicast static-querier vlan *vlan_id* **{port chassis/slot/port | linkagg agg_id}**

no ipv6 multicast static-querier service *service_id* **sap {port | linkagg} {sap_id}**

Syntax Definitions

| | |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN to include as a static MLD querier. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number to configure as a static MLD querier. |
| <i>agg_id</i> | The link aggregate to configure as a static MLD querier. |
| <i>service_id</i> | SPB service ID to include as a static MLD querier. The valid range is 1–32767. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static querier entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive all of the MLD traffic.
- To create an MLD static querier entry on a link aggregate, use the **linkagg** parameter (for example, `ipv6 multicast static-querier vlan 2 linkagg 7` or `ipv6 multicast static-querier service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ipv6 multicast static-neighbor service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1
-> ipv6 multicast static-querier vlan 4 port 7
-> no ipv6 multicast static-querier vlan 4 port 7

-> ipv6 multicast static-querier service 10 sap port 1/1/2:100
-> no ipv6 multicast static-querier service 10 sap port 1/1/2:100
-> ipv6 multicast static-querier service 10 sap linkagg 10:100
-> no ipv6 multicast static-querier service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

  alaIpmsStaticQuerierRowStatus
```

ipv6 multicast static-group

Creates a static MLD group entry on the specified port for the specified VLAN or on the specified Service Access Point (SAP) port for the specified Shortest Path Bridging (SPB) service.

ipv6 multicast static-group *ipv6_address* **vlan** *vlan_id* **{port chassis/slot/port | linkagg agg_id}**

ipv6 multicast static-group *ipv6_address* **service** *service_id* **sap {port / linkagg} {sap_id}**

no ipv6 multicast static-group *ipv6_address* **vlan** *vlan_id* **{port chassis/slot/port | linkagg agg_id}**

no ipv6 multicast static-group *ipv6_address* **service** *service_id* **sap {port / linkagg} {sap_id}**

Syntax Definitions

| | |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6_address</i> | IPv6 multicast group address. |
| <i>vlan_id</i> | VLAN to include as a static MLD group. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number to configure as a static MLD group. |
| <i>agg_id</i> | The link aggregate to configure as a static MLD group. |
| <i>service_id</i> | SPB service ID to include as a static MLD group. The valid range is 1–32767. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on the specified port for the specified VLAN or on the specified SAP port for the specified SPB service.
- Creating an MLD static group entry on the specified port/VLAN or the specified SAP port/service, enables that network segment to receive MLD traffic addressed to the specified IP multicast group address.
- To create an MLD static group entry on a link aggregate, use the **linkagg** parameter (for example, `ipv6 multicast static-group 225.0.0.1 vlan 2 linkagg 7` or `ipv6 multicast static-group 225.0.0.1 service 10 sap linkagg 10:100`).
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, `ipv6 multicast static-querier service 10 sap port 1/1/23:10`, where 1/1/23:10 is the SAP ID).

- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 port 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 7

-> ipv6 multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> no ipv6 multicast static-group 229.10.10.10 service 10 sap port 1/1/2:100
-> ipv6 multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
-> no ipv6 multicast static-group 225.11.11.11 service 10 sap linkagg 10:100
```

Release History

Release 7.1.1; command was introduced.
Release 7.3.1; **linkagg** parameter was added.
Release 8.4.1; **service** and **sap** parameters added.

Related Commands

  alaIpmsStaticMemberRowStatus
```

ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN, Shortest Path Bridging (SPB), or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*] **query-interval** [*seconds*]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*] **query-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | MLD query interval in seconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 125 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs or SPB services.
- If the MLD query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD query interval to use.
- Use the **no** form of this command to restore the MLD query interval back to the default value (125 seconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast query-interval 0**).

Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> no ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
```

```
-> ipv6 multicast vlan 3-5 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
-> no ipv6 multicast vlan 2 query-interval
-> no ipv6 multicast vlan 3-5 query-interval
-> ipv6 multicast service 2 query-interval 100
-> ipv6 multicast service 3-5 query-interval 100
-> ipv6 multicast service 2 query-interval 0
-> no ipv6 multicast service 2 query-interval
-> no ipv6 multicast service 3-5 query-interval
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

Related Commands

ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **last-member-query-interval** [*milliseconds*]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **last-member-query-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>milliseconds</i> | MLD last member query interval in milliseconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>milliseconds</i> | 1000 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD last member query interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- Use the **no** form of this command to restore the MLD last member query interval back to the default value (1000 milliseconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast last-member-query-interval 0**).

Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> no ipv6 multicast last-member-query-interval
```

```
-> ipv6 multicast vlan 4 last-member-query-interval 2200
-> ipv6 multicast vlan 3-5 last-member-query-interval 2200
-> ipv6 multicast vlan 4 last-member-query-interval 0
-> no ipv6 multicast vlan 4 last-member-query-interval
-> no ipv6 multicast vlan 3-5 last-member-query-interval
-> ipv6 multicast service 2 last-member-query-interval 2200
-> ipv6 multicast service 3-5 last-member-query-interval 2200
-> ipv6 multicast service 2 last-member-query-interval 0
-> no ipv6 multicast service 2 last-member-query-interval
-> no ipv6 multicast service 3-5 last-member-query-interval
```

ipv6 multicast query-response-interval

Sets the MLD query response interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*] **query-response-interval** [*milliseconds*]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*] **query-response-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>milliseconds</i> | MLD query response interval in milliseconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>milliseconds</i> | 10000 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query response interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD query response interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The MLD query response interval refers to the time period to reply to an MLD query message.
- Use the **no** form of this command to restore the MLD query response interval back to the default value (10000 milliseconds) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast query-response-interval 0**).

Examples

```
-> ipv6 multicast query-response-interval 20000
-> ipv6 multicast query-response-interval 0
-> no ipv6 multicast query-response-interval
-> ipv6 multicast vlan 2 query-response-interval 20000
-> ipv6 multicast vlan 3-5 query-response-interval 20000
-> ipv6 multicast vlan 2 query-response-interval 0
-> no ipv6 multicast vlan 2 query-response-interval
```

```
-> no ipv6 multicast vlan 3-5 query-response-interval
-> ipv6 multicast service 2 query-response-interval 300
-> ipv6 multicast service 3-5 query-response-interval 300
-> ipv6 multicast service 2 query-response-interval 0
-> no ipv6 multicast service 2 query-response-interval
-> no ipv6 multicast service 3-5 query-response-interval
```

Release History

ipv6 multicast unsolicited-report-interval

Sets the value of the MLD unsolicited report interval on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **unsolicited-report-interval** [*seconds*]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **unsolicited-report-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | MLD unsolicited report interval in seconds. Valid range is 1–65535, where 0 represents the default setting. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 1 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs or SPB services.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- Use the **no** form of this command to restore the MLD unsolicited report interval back to the default value (1 second) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast unsolicited-report-interval 0**).

Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> no ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
```

```
-> ipv6 multicast vlan 3-5 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
-> no ipv6 multicast vlan 2 unsolicited-report-interval
-> no ipv6 multicast vlan 3-5 unsolicited-report-interval
-> ipv6 multicast service 2 unsolicited-report-interval 300
-> ipv6 multicast service 2 unsolicited-report-interval 0
-> no ipv6 multicast service 2 unsolicited-report-interval
-> no ipv6 multicast service 3-5 unsolicited-report-interval
```

ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **source-timeout** [*seconds*]

no ip multicast [vlan *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **source-timeout**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>seconds</i> | MLD source timeout in seconds. Valid range is 1–65535. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 30 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- Use the **no** form of this command to restore the MLD source timeout back to the default value (30 seconds) on the system or the specified VLAN. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast source-timeout 0**).

Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> no ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 3-5 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> no ipv6 multicast vlan 2 source-timeout
-> no ipv6 multicast vlan 3-5 source-timeout 100
-> ipv6 multicast service 2 source-timeout 100
-> ipv6 multicast service 3-5 source-timeout 100
-> ipv6 multicast service 2 source-timeout 0
```

```
-> no ipv6 multicast service 2 source-timeout  
-> no ipv6 multicast service 3-5 source-timeout
```

Release History

Release 7.1.1; command was introduced.

ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **querying** [{**enable** | **disable**}] [**static-source-ip** *ipv6_address*]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **querying** [**static-source-ip**]

Syntax Definitions

| | |
|-------------------------------------|---------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| enable | Enable MLD querying. |
| disable | Disable MLD querying. |
| <i>ipv6_address</i> | A static source IPv6 address to use for MLD querying. <i>This parameter is currently not supported.</i> |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- Use the **no** form of this command to restore the MLD querying status to the default value (disabled) on the system or the specified VLAN.

Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> no ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 3-5 querying disable
-> no ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 3-5 querying
```

Release History

Release 7.1.1; command was introduced.

Release 8.3.1.R02; **static-source-ip** parameter added.

```

ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN, Shortest Path Bridging (SPB) service or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **robustness** [*robustness*]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **robustness**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>robustness</i> | MLD robustness variable. Valid range is 1–7. |

Defaults

| parameter | default |
|-------------------|---------|
| <i>robustness</i> | 2 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs or SPB services.
- If the MLD robustness variable is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD robustness variable to use.
- Use the **no** form of this command to restore the MLD robustness variable back to the default value (2) on the system, the specified VLAN, or the specified SPB service. In addition, specifying a value of 0 with this command also restores the default value (for example, **ipv6 multicast robustness 0**).

Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> no ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
```

```
-> ipv6 multicast vlan 3-5 robustness 3
-> ipv6 multicast vlan 2 robustness 0
-> no ipv6 multicast vlan 2 robustness
-> no ipv6 multicast vlan 3-5 robustness
-> ipv6 multicast service 2 robustness 3
-> ipv6 multicast service 3-5 robustness 3
-> ipv6 multicast service 2 robustness 0
-> ipv6 multicast service 2 robustness
-> no ipv6 multicast service 3-5 robustness
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] spoofing {enable | disable}

no ipv6 multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*] spoofing

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable MLD spoofing. |
| disable | Disable MLD spoofing. |

Defaults

| parameter | defaults |
|------------------|----------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD spoofing is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IPv6 address with the system's MAC and IPv6 address when proxying aggregated MLD group membership information.
- By default, the source IPv6 address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IPv6 address to overcome the need for an IPv6 interface. If configured, the static source IPv6 is always used for spoofing, regardless of the IPv6 interface address or administrative state.
- Use the **no** form of this command to remove an MLD spoofing configuration and return the specified VLAN, SPB service, or system to the default behavior.

Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> no ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
```

```
-> ipv6 multicast vlan 3-5 spoofing disable
-> no ipv6 multicast vlan 2 spoofing
-> no ipv6 multicast vlan 3-5 spoofing
-> ipv6 multicast service 2 spoofing enable
-> ipv6 multicast service 3-5 spoofing disable
-> no ipv6 multicast service 2 spoofing
-> no ipv6 multicast service 3-5 spoofing
```

ipv6 multicast spoofing static-source-ip

Enables or disables MLD static spoofing on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **spoofing static-source-ip** *ipv6_address*

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **spoofing static-source-ip**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>ipv6_address</i> | A static source IPv6 address to use for spoofing. |

Defaults

| parameter | defaults |
|------------------|----------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static source IP address.
- MLD spoofing refers to replacing a client's MAC and IPv6 address with the system's MAC and IPv6 address when proxying aggregated MLD group membership information.
- By default, the source IPv6 address is not specified for spoofing; the system determines these addresses automatically. Optionally configure a static source IPv6 address to overcome the need for an IPv6 interface. If configured, the static source IPv6 is always used for spoofing, regardless of the IPv6 interface address or administrative state.

Examples

```
-> ipv6 multicast spoofing static-source-ip 3333::1
-> no ipv6 ip multicast spoofing static-source-ip
-> ipv6 multicast vlan 2 spoofing static-source-ip 3333::1
-> ipv6 multicast vlan 3-5 spoofing static-source-ip 3333::1
-> no ipv6 ip multicast vlan 2 spoofing static-source-ip
-> no ipv6 multicast vlan 3-5 spoofing static-source-ip
-> ipv6 multicast service 2 spoofing static-source-ip 3333::1
-> no ipv6 multicast service 2 spoofing static-source-ip
-> ipv6 multicast service 3-5 spoofing static-source-ip 3333::1
```

-> no ipv6 multicast service 3-5 spoofing static-source-ip

Release History

ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **zapping** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **zapping**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable MLD zapping. |
| disable | Disable MLD zapping. |

Defaults

| parameter | default |
|--------------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- Use the **no** form of this command to restore the MLD zapping status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> no ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 3-5 zapping disable
-> no ipv6 multicast vlan 2 zapping
-> no ipv6 multicast vlan 3-5 zapping
-> ipv6 multicast service 2 zapping enable
```

```
-> ipv6 multicast service 3-5 zapping disable
-> no ipv6 multicast service 2 zapping
-> no ip multicast service 3-5 zapping
```

Release History

ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **querier-forwarding** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **querier-forwarding**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable MLD querier forwarding. |
| disable | Disable MLD querier forwarding. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable / disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD querier forwarding is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.
- Use the **no** form of this command to restore the MLD querier forwarding status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> no ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 3-5 querier-forwarding disable
-> no ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 3-5 querier-forwarding
-> ipv6 multicast service 2 querier-forwarding enable
```

```
-> ipv6 multicast service 3-5 querier-forwarding disable
-> no ipv6 multicast service 2 querier-forwarding
-> no ip multicast service 3-5 querier-forwarding
```

Release History

Release 7.1.1; command was introduced.

Release 8.4.1; **service** parameter added.

```

ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **proxying** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **proxying**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable MLD proxying. |
| disable | Disable MLD proxying. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- Proxy reported MLD packets are sent using the source MAC address of the proxying switch. Unless the spoofing feature is used, proxy reported MLD packets will be sent using ":::" for the IPv6 source address.
- Use the **no** form of this command to restore the MLD proxying status back to the default value (disabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> no ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 3-5 proxying disable
-> no ipv6 multicast vlan 2 proxying
-> no ipv6 multicast vlan 3-5 proxying
-> ipv6 multicast service 2 proxying enable
-> ipv6 multicast service 3-5 proxying disable
-> no ipv6 multicast service 2 proxying
-> no ip multicast service 3-5 proxying
```

Release History

ipv6 multicast helper-address

Specifies the destination IPv6 address of a relay host where MLD host Reports and Leave messages are sent.

ipv6 multicast [*vlan* *vlan_id*[-*vlan_id2*]] **helper-address** [*ipv6_address*]

no ipv6 multicast [*vlan* *vlan_id*[-*vlan_id2*]] **helper-address**

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>ipv6_address</i> | The IPv6 address of the relay host. |

Defaults

By default, no destination IPv6 address is set.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- After the destination IPv6 address is specified, the IPMS reporting feature is enabled.
- An operational IPv6 interface is required for the receiving LAN before any MLD Reports and Leave messages can be relayed.
- Configuring a destination IPv6 helper address is supported only in the VLAN domain; the service domain is not supported.
- Use the **no** form of this command to restore the IPMS reporting feature back to the default value (no IPv6 helper address) on the system. When there is no IPv6 helper address set, the IPMS reporting feature is disabled.

Examples

```
-> ipv6 multicast helper-address 3333::2
-> no ipv6 multicast helper-address
-> ipv6 multicast vlan 2 helper-address 3333::2
-> ipv6 multicast vlan 3-5 helper-address 3333::2
-> no ipv6 multicast vlan 2 helper-address
-> no ipv6 multicast vlan 3-5 helper-address
```

Release History

```

ipv6 multicast zero-based-query

Configures the use of an all-zero source IPv6 address for MLD query packets when a non-querier is querying the membership of a port. This value is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **zero-based-query** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **zero-based-query**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable MLD zero-based querying. |
| disable | Disable MLD zero-based querying. |

Defaults

| parameter | default |
|--------------------------------|---------------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The MLD zero-based query status set for a specific VLAN or SPB service overrides the zero-based query status set for the system.
- Use the **no** form of this command to restore the MLD zero-based query status back to the default value (enabled) on the system, the specified VLAN, or the specified SPB service.

Examples

```
-> ipv6 multicast zero-based-query enable
-> ipv6 multicast zero-based-query disable
-> no ipv6 multicast zero-based-query
-> ipv6 multicast vlan 2 zero-based-query enable
-> ipv6 multicast vlan 3-5 zero-based-query disable
-> no ipv6 multicast vlan 2 zero-based-query
-> no ipv6 multicast vlan 3-5 zero-based-query
-> ipv6 multicast service 10 zero-based-query enable
-> ipv6 multicast service 11-15 zero-based-query disable
-> no ipv6 multicast service 10 zero-based-query
```

-> no ipv6 multicast service 11-15 zero-based-query disable

ipv6 multicast forward-mode

Configures the Layer 2 forwarding mode for IPv6 Multicast Switching (does not apply to IPv6 Multicast Routing). The forwarding mode is set for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **forward-mode** {**asm** | **ssm** | **mac** | **auto**}

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **forward-mode**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| asm | Sets the IPMSv6 forwarding mode to ASM (the bridge lookup is based on the packet group destination IPv6 address). <i>This parameter is supported only in the VLAN domain; service domain is not supported.</i> |
| ssm | Sets the IPMSv6 forwarding mode to SSM (the bridge lookup is based on the packet source IPv6 as well as the group destination IPv6). <i>This parameter is supported only in the VLAN domain; service domain is not supported.</i> |
| mac | Sets the IPMSv6 forwarding mode to MAC address (the bridge lookup is based on the MAC destination address). |
| auto | Automatically determines the IPMSv6 forwarding mode based on the current MLD protocol version and the existing protocol state. |

Defaults

By default, the forwarding mode is set to automatic.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The forwarding mode set for a specific VLAN or SPB service overrides the forwarding mode set for the system.
- If multicast routing is enabled on a VLAN, the following conditions apply:
 - On the OmniSwitch 9900, the bridging mode is independent of the routing mode. As a result, ASM bridging is allowed in a VLAN that has SSM routing configured or SSM bridging is allowed in a VLAN that has ASM routing configured.
 - Multicast routing is not supported on the OmniSwitch 6560.
 - On all other OmniSwitch platforms, the routing configuration overrides the forwarding mode setting

and determines the forwarding mode based on the group mappings. For example, BIDIR flows will use ASM while DVMRP flows and all other PIM modes will use SSM.

- Use the **no** form of this command to restore the Layer 2 forwarding mode back to the default value (automatic) on the system, the specified VLAN or SPB service.

Examples

```
-> ipv6 multicast forward-mode auto
-> ipv6 multicast forward-mode asm
-> ipv6 multicast forward-mode ssm
-> ipv6 multicast forward-mode mac
-> no ipv6 multicast forward-mode
-> ipv6 multicast vlan 100 forward-mode auto
-> ipv6 multicast vlan 101-104 forward-mode asm
-> ipv6 multicast vlan 100 forward-mode ssm
-> ipv6 multicast vlan 101-104 forward-mode mac
-> no ipv6 multicast vlan 100 forward-mode
-> no ipv6 multicast vlan 101-104 forward-mode
-> ipv6 multicast service 10 forward-mode mac
-> ipv6 multicast service 11-15 forward-mode mac
-> no ipv6 multicast service 10 forward-mode
-> no ipv6 multicast service 11-15 forward-mode
```

Release History

ipv6 multicast update-delay-interval

Sets the amount of time to delay IPv6 multicast forwarding updates on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **update-delay-interval** *milliseconds*

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **update-delay-interval**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>milliseconds</i> | The number of milliseconds to defer forwarding updates. Valid range is 0–10000. |

Defaults

By default, the forwarding update delay interval is set to zero.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When the forwarding update delay is set to zero, forwarding updates are processed immediately with minimal latency. Configuring a forwarding update delay value can limit the effects of persistent churn on the system.
- If the forwarding update delay interval is already configured on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the forwarding update delay interval back to the default value (zero) on the system or the specified VLAN or SPB service.

Examples

```
-> ipv6 multicast update-delay-interval 10
-> no ipv6 multicast update-delay-interval
-> ipv6 multicast vlan 100 update-delay-interval 20
-> ipv6 multicast vlan 101-105 update-delay-interval 20
-> no ipv6 multicast vlan 100 update-delay-interval 20
-> no ipv6 multicast vlan 101-105 update-delay-interval
-> ipv6 multicast service 20 update-delay-interval 20
-> ipv6 multicast service 21-25 update-delay-interval 20
-> no ipv6 multicast service 20 update-delay-interval
-> no ipv6 multicast service 21-25 update-delay-interval
```

Release History

Release 8.3.1; command was introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigUpdateDelayInterval
```

ipv6 multicast fast-join

Configures whether or not IPv6 Multicast Switching will automatically create the forwarding entries in hardware as soon as the MLD memberships are learned on the specified VLAN, Shortest Path Bridging (SPB) service or globally if no VLAN or SPB service is specified.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **fast-join** [**enable** | **disable**]

no ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*] | **service** *service_id*[-*service_id2*]] **fast-join**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. <i>This parameter is supported only on the OmniSwitch 9900.</i> |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| enable | Enable the MLD fast join functionality. |
| disable | Disable the MLD fast join functionality. |

Defaults

| parameter | default |
|--------------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command applies only to IPv6 Multicast Switching. If IPv6 Multicast Routing is enabled, then the routing configuration will override the fast join setting.
- When the IPv6 Multicast Switching fast join functionality is enabled, convergence of multicast traffic may occur faster because the forwarding entries are already created before the actual multicast traffic is received.
- When the IPv6 Multicast Switching fast join functionality is disabled (the default), forwarding entries are not created in the hardware until the multicast traffic reaches the switch.
- If the IPv6 Multicast Switching fast join is already enabled on the system, then the VLAN or SPB service configuration will override the system's configuration.
- Use the **no** form of this command to restore the IPv6 Multicast Switching fast join setting back to the default value (disabled) on the system or the specified VLAN or SPB service.

Examples

```
-> ipv6 multicast fast-join enable
-> ipv6 multicast fast-join disable
-> no ipv6 multicast fast-join
-> ip multicast service 10 fast-join enable
-> ip multicast service 11-15 fast-join disable
-> no ip multicast service 10 fast-join
-> no ip multicast service 11-15 fast-join
```

Release History

ipv6 multicast host-list

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

ipv6 multicast host-list *host_list_name* *ipv6_address* [*ipv6_address*]

no ipv6 multicast host-list *host_list_name* [*ipv6_address*]

Syntax Definitions

host_list_name

A name to assign to the host list (up to 20 characters).

ipv6_address

The IPv6 address to add to the host list. Multiple IPv6 addresses can be entered on the same command line.

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove an IPv6 address from the list or remove the entire list from the switch configuration.
- When the entire list is removed, any configuration associated with the list is also removed.

Examples

```
-> ipv6 multicast host-list group-map1 4444::2
-> ipv6 multicast host-list ssm-map1 4444::3
-> ipv6 multicast host-list ssm-map2 3333::2 3333::3 3333::4
-> no ipv6 multicast host-list ssm-map2 3333::3
-> no ipv6 multicast host-list group-map1
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 multicast host-list Displays the IPv6 multicast host address list configuration.

MIB Objects

 alaIpmsHostListAddress

ipv6 multicast ssm-map

Configures the translation of Any Source Multicast (ASM) group memberships into Source Specific Multicast (SSM) group memberships on the specified VLAN or on the system if no VLAN is specified.

```
ipv6 multicast [vlan vlan_id] ssm-map {group_address[/prefixLen] host_list_name | admin-state {enable | disable}}
```

```
no ipv6 multicast ssm-map group_address[/prefixLen]
```

Syntax Definitions

| | |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN on which to apply the mapping configuration. |
| <i>group_address[/prefixLen]</i> | The multicast group address/prefix length to map to the host list. If no prefix length is specified, then the a default length of 128 is used. |
| <i>host_list_name</i> | The name of a host list to use for SSM mapping. |
| enable | Enables the SSM mapping. |
| disable | Disables the SSM mapping. |

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- Use the **no** form of this command to remove the SSM mapping configuration.
- If an SSM mapping is already enabled on the system, then the VLAN configuration will override the system's configuration.

Examples

```
-> ipv6 multicast ssm-map ff05::5 hostList1
-> ipv6 multicast ssm-map admin-state enable
-> ipv6 multicast vlan 200 ssm-map ff05::6 hostList2
-> ipv6 multicast vlan 200 ssm-map admin-state enable
-> no ipv6 multicast ssm-map ff05::5
```

Release History

Release 8.3.1.R02; command was introduced.

ipv6 multicast initial-packet-buffer admin-state

Enables or disables initial packet buffering for IPv6 multicast flows on the specified VLAN or globally on the switch.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer admin-state** {**enable** | **disable**}

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| enable | Enable the initial packet buffering globally on the switch for IPv6 multicast flow. |
| disable | Disable the initial packet buffering globally on the switch for IPv6 multicast flow. |

Defaults

| parameter | default |
|--------------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- When enabled, the following configuration is used for initial packet buffering on new multicast flows:
 - The maximum number of initial packets buffered per IPv6 multicast flow. Use the **ipv6 multicast initial-packet-buffer max-packet** command to set this value.
 - The maximum number of IPv6 multicast flows that can be buffered. Use the **ipv6 multicast initial-packet-buffer max-flow** command to set this value.
 - The maximum amount of time buffered packets are held if they are not sent out. Use the **ipv6 multicast initial-packet-buffer timeout** command to set this value.
 - The minimum amount of time packets are held before delivery begins. Use the **ipv6 multicast initial-packet-buffer min-delay** command to set this value.
- Configuring the status for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer admin-state disable
-> ipv6 multicast initial-packet-buffer admin-state enable
-> ipv6 multicast vlan 2 initial-packet-buffer admin-state enable
-> ipv6 multicast vlan 3-5 initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.

Release 8.4.1.R02; **vlan** parameter added.

ipv6 multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv6 multicast flow on the specified VLAN or globally on the switch.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer max-packet** [*num*]

Syntax Definitions

| | |
|-------------------------------------|--------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>num</i> | The maximum number of packets allowed to buffer per IPv6 multicast flow. Valid range is 1 to 10. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 4 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer max-packet 4
-> ipv6 multicast vlan 2 initial-packet-buffer max-packet 10
-> ipv6 multicast vlan 3-5 initial-packet-buffer max-packet 10
```

Release History

```

ipv6 multicast initial-packet-buffer max-flow

Configures the maximum number of IPv6 multicast flows that can be buffered on the specified VLAN or globally on the switch.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer max-flow** [*num*]

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>num</i> | The maximum number of IPv6 multicast flows allowed for initial packet buffering. Valid range is 1 to 32. |

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 32 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer max-flow 32
-> ipv6 multicast vlan 2 initial-packet-buffer max-flow 32
-> ipv6 multicast vlan 3-5 initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

| | |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| ipv6 multicast initial-packet-buffer admin-state | Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows. |

```

ipv6 multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv6 initial multicast packets on the specified VLAN or globally on the switch.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer timeout** [*seconds*]

Syntax Definitions

| | |
|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>seconds</i> | The timeout value for the initial buffered IPv6 multicast packets in seconds. Valid range is 1 to 10. |

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 10 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.
- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer timeout 2
-> ipv6 multicast vlan 2 initial-packet-buffer timeout 5
-> ipv6 multicast vlan 3-5 initial-packet-buffer timeout t
```

Release History

Release 8.2.1; command introduced.
Release 8.4.1.R02; **vlan** parameter added.

Related Commands

| | |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| ipv6 multicast initial-packet-buffer admin-state | Enables or disables the initial packet buffering feature globally on the switch for IPv6 multicast flows. |

ipv6 multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet on the specified VLAN or globally on the switch.

ipv6 multicast [**vlan** *vlan_id*[-*vlan_id2*]] **initial-packet-buffer min-delay** [*milliseconds*]

Syntax Definitions

| | |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>milliseconds</i> | The minimum delay value to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Valid range is 0 to 1000. |

Defaults

| parameter | default |
|---------------------|---------|
| <i>milliseconds</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

- The configuration value set with this command is not applied unless initial packet buffering is administratively enabled for the switch.
- Configuring parameter values for initial packet buffering is supported only in the VLAN domain; the service domain is not supported.

Examples

```
-> ipv6 multicast initial-packet-buffer min-delay 200
-> ipv6 multicast vlan 2 initial-packet-buffer min-delay 200
-> ipv6 multicast vlan 3-5 initial-packet-buffer min-delay 200
```

Release History

  alaIpmsConfigAddressType  
  alaIpmsConfigValue  
  alaIpmsConfigInitialPacketBufferMinDelay
```

ipv6 multicast display-interface-names

Sets the display output of the **show** commands listed below. When enabled, the display outputs for these commands will show the IPv6 interface name for each VLAN associated with the IPv6 multicast table entry.

ipv6 multicast display-interface-names

no ipv6 multicast display-interface-names

Syntax Definitions

N/A

Defaults

By default, this function is disabled. The display format is set to include the VLANs that are associated with the IPv6 multicast source and forward flows.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert back to displaying the VLAN name.
- If there are any VLANs that are not configured with an IPv6 interface or the IPv6 interface is disabled, the output display will still include the VLAN when this function is enabled.
- This command may be helpful when reviewing output from multicast snooping commands and comparing state in multicast routing, which only interacts with IPv6 interfaces.
- Enabling the display interface names option applies to the following **show** commands:

show ipv6 multicast forward

show ipv6 multicast neighbor

show ipv6 multicast querier

show ipv6 multicast group

show ipv6 multicast source

show ipv6 multicast tunnel

- The command examples provided display the **show ipv6 multicast source** output after the display interface name function is turned on (enabled) and off (disabled).

Examples

```
-> ipv6 multicast display-interface-name
```

```
-> show ipv6 multicast source
```

Total 4 Sources

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|----------------|--------------|---------|
| | | Tunnel Address | VLAN/Service | |
| ff05::5 | 4444::2 | :: | VL-21 | |
| ff05::6 | 4444::2 | :: | VL-21 | |
| ff06::1 | :: | :: | VL-20 | |
| ff06::1 | :: | :: | VL-20 | |

```
-> no ip multicast display-interface-name
```

```
-> show ipv6 multicast source
```

Total 4 Sources

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|----------------|--------------|---------|
| | | Tunnel Address | VLAN/Service | |
| ff05::5 | 4444::2 | :: | vlan 21 | |
| ff05::6 | 4444::2 | :: | vlan 21 | |
| ff06::1 | :: | :: | vlan 20 | |
| ff06::1 | :: | :: | vlan 20 | |

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

- show ipv6 multicast source** Displays the IPv6 Multicast Switching and Routing source table entries.
- show ipv6 multicast forward** Displays the IPv6 Multicast Switching and Routing forwarding table entries.

MIB Objects

```
alaIpmsGlobalConfigTable
  alaIpmsGlobalConfigAddressType
  alaIpmsGlobalConfigDisplayInterfaceNames
```

ipv6 multicast inherit-default-vrf-config

Configures whether or not the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances.

ipv6 multicast inherit-default-vrf-config

no ipv6 multicast inherit-default-vrf-config

Syntax Definitions

N/A

Defaults

By default, the global IPMSv6 configuration defined in the default VRF instance is applied to all VRF instances on the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable this function. When disabled, the global IPMSv6 configuration defined in the default VRF instance is not applied to all other VRF instances on the switch.
- When enabled, additional VRF instances will inherit the global IPMSv6 configuration defined in the default VRF instance.
- A global IPMSv6 configuration defined for a specific non-default VRF instance takes precedence over the global IPMSv6 configuration defined for the default VRF.

Examples

```
-> ipv6 multicast inherit-default-vrf-config  
-> no ipv6 multicast inherit-default-vrf-config
```

Release History

Release 8.3.1; command introduced.

Related Commands

show ipv6 multicast

ipv6 multicast profile

Defines an IPMS profile that is used to apply a pre-defined configuration to the global IPMS instance (all VLAN and service instances) or to a specific VLAN or service instance. Using a configuration profile to configure IPMS functionality avoids having to configure each IPMS parameter with a separate CLI command.

This section describes the base command (**ipv6 multicast profile**) along with optional command keywords that are used to configure IPMS parameter values that are applied when the profile is assigned to an IPMS instance. Optional keywords are listed separately but can be entered in combination on the same command line. Use the **no** form for the keywords to change a specific parameter value for the profile.

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance. The default profile cannot be deleted, but the profile parameter values are configurable through this command.

```

ipv6 multicast profile profile_name
  [admin-state {enable | disable}]
  [flood-unknown {enable | disable}]
  [version version]
  [robustness robustness]
  [querying {enable | disable}]
  [query-interval [seconds]]
  [query-response-interval [milliseconds]]
  [last-member-query-interval [milliseconds]]
  [unsolicited-report-interval [seconds]]
  [proxying {enable | disable}]
  [spoofing {enable | disable}]
  [spoofing static-source-ip ipv6_address]
  [zapping {enable | disable}]
  [querier-forwarding {enable | disable}]
  [router-timeout [seconds]]
  [source-timeout [seconds]]
  [max-group [num] [action {none | drop | replace}]]
  [helper-address [ipv6_address]]
  [zero-based-query {enable | disable}]
  [forward-mode {asm | ssm | mac | auto}]
  [update-delay-interval milliseconds]
  [fast-join {enable | disable}]
  [initial-packet-buffer admin-state {enable | disable}]
  [initial-packet-buffer max-flow [num]]
  [initial-packet-buffer max-packet [num]]
  [initial-packet-buffer timeout [seconds]]
  [initial-packet-buffer min-delay [milliseconds]]

```

```

no ipv6 multicast profile profile_name [admin-state | flood-unknown | version | robustness | ...]

```

Syntax Definitions

profile_name The name to associate with the IPMS profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove an IPMS profile from the switch configuration.
- To change the value of a specific profile parameter, specify the parameter keyword with this command. For example, **no ipv6 multicast profile ipms-1 admin-state**, **ipv6 multicast profile ipms-1 query-interval 100**, or **ipv6 multicast profile ipms-1 querying enable**. The new parameter values are applied to all IPMS instances to which the profile is assigned.
- The profile name must already exist in the switch configuration before parameter values can be modified. Use this command to create the profile first, then configure the profile parameter values.
- For more information about specific profile parameter values, refer to the following explicit IPMS configuration commands for each profile parameter:

| Port Template Parameter | Explicit Port Configuration Command |
|-------------------------------------------------------------|------------------------------------------------------------|
| [admin-state {enable disable}] | ipv6 multicast admin-state |
| [flood-unknown {enable disable}] | ipv6 multicast flood-unknown |
| [version <i>version</i>] | ipv6 multicast version |
| [robustness <i>robustness</i>] | ipv6 multicast robustness |
| [querying {enable disable}] | ipv6 multicast querying |
| [query-interval [<i>seconds</i>]] | ipv6 multicast query-interval |
| [query-response-interval [<i>milliseconds</i>]] | ipv6 multicast query-response-interval |
| [last-member-query-interval [<i>milliseconds</i>]] | ipv6 multicast last-member-query-interval |
| [unsolicited-report-interval [<i>seconds</i>]] | ipv6 multicast unsolicited-report-interval |
| [proxying {enable disable}] | ipv6 multicast proxying |
| [spoofing {enable disable}] | ipv6 multicast spoofing |
| [spoofing static-source-ip <i>ipv6_address</i>] | ipv6 multicast spoofing static-source-ip |
| [zapping {enable disable}] | ipv6 multicast zapping |
| [querier-forwarding {enable disable}] | ipv6 multicast querier-forwarding |
| [router-timeout [<i>seconds</i>]] | ipv6 multicast router-timeout |
| [source-timeout [<i>seconds</i>]] | ipv6 multicast source-timeout |
| [max-group [<i>num</i>] [action {none drop replace}]] | ipv6 multicast max-group |

| Port Template Parameter | Explicit Port Configuration Command |
|-------------------------------------------------------------------|---------------------------------------------------------|
| [helper-address [<i>ipv6_address</i>]] | ipv6 multicast helper-address |
| [zero-based-query {enable disable}] | ipv6 multicast zero-based-query |
| [forward-mode {asm ssm mac auto}] | ipv6 multicast forward-mode |
| [update-delay-interval <i>milliseconds</i>] | ipv6 multicast update-delay-interval |
| [fast-join {enable disable}] | ipv6 multicast fast-join |
| [initial-packet-buffer admin-state {enable disable}] | ipv6 multicast initial-packet-buffer admin-state |
| [initial-packet-buffer max-flow [<i>num</i>]] | ipv6 multicast initial-packet-buffer max-flow |
| [initial-packet-buffer max-packet [<i>num</i>]] | ipv6 multicast initial-packet-buffer max-packet |
| [initial-packet-buffer timeout [<i>seconds</i>]] | ipv6 multicast initial-packet-buffer timeout |
| [initial-packet-buffer min-delay [<i>milliseconds</i>]] | ipv6 multicast initial-packet-buffer min-delay |

Examples

```

-> ipv6 multicast profile "MLDv2 with Zapping"
-> ipv6 multicast profile "MLDv2 with Zapping" admin-state enable
-> ipv6 multicast profile "MLDv2 with Zapping" zapping enable version 2
-> ipv6 multicast profile "MLDv2 with Zapping" fast-join enable proxying enable
-> no ipv6 multicast profile "MLDv2 with Zapping" proxying
-> no ipv6 multicast profile "MLDv2 with Zapping"

```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

| | |
|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| ipv6 multicast apply-profile | Assigns an IPMS configuration profile globally for the switch or to a specific VLAN or service instance. |
| show ipv6 multicast | Displays the profile assignment for the IPMS instance. |
| show ipv6 multicast profile | Displays the IPMS profile configuration. |

  alaIpmsProfileIndex
  alaIpmsProfileRowStatus
alaIpmsConfigTable
  alaIpmsConfigType
  alaIpmsConfigAddressType
  alaIpmsConfigValue
  alaIpmsConfigProfileName
```

ipv6 multicast apply-profile

Assigns the name of an existing IPMS configuration profile to the global IPMS instance (all VLANs and services) or to a specific VLAN or Shortest Path Bridging (SPB) service instance. An IPMS configuration profile defines parameter options that are applied to the IPMS instance to which the profile is assigned.

ipv6 multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **apply-profile** *profile_name*

no ipv6 multicast [vlan *vlan_id*[-*vlan_id2*] | service *service_id*[-*service_id2*]] **apply-profile**

Syntax Definitions

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> [- <i>vlan_id2</i>] | VLAN on which to apply the configuration. Use a hyphen to specify a range of VLAN IDs. |
| <i>service_id</i> [- <i>service_id2</i>] | SPB service ID on which to apply the configuration. The valid range is 1–32767. Use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>profile_name</i> | The name to associate with the IPMS profile. |

Defaults

There is a “default” profile that defines a default set of IPMS parameter values that is automatically assigned to an IPMS instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to revert the profile assignment back to the “default” profile.
- Specify a range of VLANs (**vlan 20-25**) or a range of SPB services (**service 10-15**) to apply the specified profile to multiple VLANs or services with one CLI command.
- The specified profile name must already exist in the switch configuration.

Examples

```
-> ipv6 multicast apply-profile "MLDv2 with Zapping"
-> ipv6 multicast vlan 20 apply-profile "MLDv2 with Zapping"
-> ipv6 multicast vlan 20-25 apply-profile "MLDv2 with Zapping"
-> ipv6 multicast service 10 apply-profile "MLDv2 with Zapping"
-> ipv6 multicast service 10-15 apply-profile "MLDv2 with Zapping"
-> no ipv6 multicast apply-profile
-> no ipv6 multicast vlan 20 apply-profile
-> no ipv6 multicast vlan 20-15 apply-profile
-> no ipv6 multicast service 10 apply-profile
-> no ipv6 multicast service 10-15 apply-profile
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

```

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters for the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

show ip multicast [vlan *vlan_id* | service *service_id*]

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN ID number (1–4094). |
| <i>service_id</i> | SPB service ID number (1–32767). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

By default the status and general configuration parameters for the system are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a VLAN ID to display the configuration information for a specific VLAN.
- Specify an SPB service ID to display the configuration information for a specific SPB service.

```

output definitions

| | |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Profile | The name of a predefined IPMS configuration profile that is assigned to this instance. Configured through the ip multicast profile command. |
| Status | Whether IP Multicast Switching and Routing is Enabled or Disabled (the default status). Configured through the ip multicast admin-state command. |
| Flood Unknown | Whether the flooding of initial unknown multicast traffic is Enabled or Disabled (the default status). Configured through the ip multicast flood-unknown command. |
| Version | Displays the default IGMP version, which can be 1 , 2 or 3 . Configured through the ip multicast version command. |
| Robustness | Displays the IGMP robustness value, ranging from 1 to 7 . (The default value is 2). Configured through the ip multicast robustness command. |
| Querying | Whether IGMP querying is Enabled or Disabled (the default status). Configured through the ip multicast querying command. |
| Query Interval (seconds) | Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). Configured through the ip multicast query-interval command. |
| Query Response Interval (tenths of seconds) | Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). Configured through the ip multicast query-response-interval command. |
| Last Member Query Interval (tenths of seconds) | Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the ip multicast last-member-query-interval command. |
| Unsolicited Report Interval (seconds) | Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). Configured through the ip multicast unsolicited-report-interval command. |

output definitions

| | |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxying | Whether IGMP proxying on the system is enabled or disabled (the default status). Configured through the ip multicast proxying command. |
| Spoofing | Whether IGMP spoofing on the system is enabled or disabled (the default status). Configured through the ip multicast spoofing command. |
| Zapping | Whether IGMP zapping on the system is enabled or disabled (the default status). Configured through the ip multicast zapping command. |
| Querier Forwarding | Whether IGMP querier forwarding on the system is enabled or disabled (the default status). Configured through the ip multicast querier-forwarding command. |
| Router Timeout (seconds) | Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) Configured through the ip multicast router-timeout command. |
| Source Timeout (seconds) | Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) Configured through the ip multicast source-timeout command. |
| Max-group | Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0, which means no limit is imposed). Configured through the ip multicast max-group command. |
| Max-group action | Displays the action taken when the maximum group limit has been exceeded (none , drop or replace). Configured through the ip multicast max-group command. |
| Helper-address | Displays the destination IP address of a relay host, where IGMP host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) Configured through the ip multicast helper-address command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |
| Static Querier Address | The Static Source IP Address to be used when querying. (The default value of 0.0.0.0 indicates that this is not configured.) <i>This function is currently not supported.</i> |
| Static Spoofing Address | The Static Source IP Address to be used when spoofing. (The default value of 0.0.0.0 indicates that this is not configured.) Configured through the ip multicast spoofing static-source-ip command. |
| Zero-based Query | Whether Zero-based Querying is disabled or enabled (the default status). Configured through the ip multicast zero-based-query command. |
| Forward Mode | Displays the current IPv4 Forwarding mode (asm , ssm , mac , or auto). Configured through the ip multicast forward-mode command. |
| Update Delay Interval (milliseconds) | Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the ip multicast update-delay-interval command. |

output definitions

| | |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSM Mapping | Whether Source Specific Multicast (SSM) mapping is enabled or disabled (the default). When enabled, Any Source Multicast (ASM) group memberships are translated into SSM group memberships. Configured through the ip multicast ssm-map command. <i>This function is currently not supported.</i> |
| Fast Join | Whether the IP Multicast Switching fast join functionality is enabled or disabled (the default). When enabled, forwarding entries are automatically created in hardware as soon as IGMP memberships are learned instead of waiting for the multicast traffic to reach the switch. Configured through the ip multicast fast-join command. |
| Initial Packet Buffering | The current state of Initial Packet Buffering, which can be enabled or disabled (the default status). Configured through the ip multicast initial-packet-buffer admin-state command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i> |
| Max Flows | The maximum number of IPv4 multicast flows buffered for initial packet. Configured through the ip multicast initial-packet-buffer max-flow command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i> |
| Max Packets Per Flow | The maximum number of initial packets buffered per IPv4 multicast flow. Configured through the ip multicast initial-packet-buffer max-packet command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i> |
| Buffer Timeout (seconds) | The timeout value for the initial buffered IPv4 multicast packets. Configured through the ip multicast initial-packet-buffer timeout command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i> |
| Min Delay (milliseconds) | The minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Configured through the ip multicast initial-packet-buffer min-delay command. <i>This function is supported only in the VLAN domain; service domain is not supported-</i> |

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; display fields added.

Release 8.4.1; **service** parameter added.

Related Commands

ip multicast admin-state Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

show ip multicast port

Displays the maximum group configuration applicable for the specified port or the specified Service Access Point (SAP) port. The current number of groups learned on a port, port/VLAN, SAP port, or SAP port/Shortest Path Bridging (SPB) service instance is also displayed.

show ip multicast {port [*chassis/slot/port*] | sap port [*sap_id*]}

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number (3/1). |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a port number to display the configuration information for a specific switch port.
- Specify a SAP ID to display the configuration information for a specific SAP port.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> show ip multicast port
```

```
Legends: Interface Max-group           = Max-group limit on the interface
          Interface Action              = Max-group action on the interface
          Interface-Instance Max-group = Active Max-group limit on the Lan Interface instance
          Interface-Instance Action    = Active Max-group action on the Lan Interface instance
```

Total 2 Lan Interface Instances

|----------------|--------------|----------------|---------------------|------------------|------------------------------|---------------------------|
| sap:1/1/23:200 | service 30 | 0 | 0 | none | 0 | none |

output definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The VLAN port or the SAP (chassis/slot/port:encapsulation) that serves as the virtual port for the SPB service. |
| Vlan/Service | The VLAN or SPB service ID associated with the IP multicast interface. |
| Current Groups | The current groups associated with the IP multicast interface. |
| Interface Max-group | The maximum group count allowed on the port or SAP port. This limit is applicable on the given port for all VLAN or service instances of the port. |
| Interface Action | The action to be taken when the group membership limit is exceeded (none , drop , or replace). |

output definitions

| | |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface-Instance Max-group | The maximum group limit learned per port for the given VLAN or per SAP port for the given SPB service. This limit is applied to each port that is a member of the given VLAN or each SAP port that is a member of the given service. |
| Interface-Instance Action | The action to be taken when the group membership limit is exceeded (none , drop , or replace). |

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

| | |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| ip multicast port max-group | Configures the maximum group limit learned per port. |
| ip multicast port max-group | Configures the maximum group limit learned per port for the specified VLAN, SPB service, or on the system if no VLAN or SPB service is specified. |

MIB Objects

```
alaIpmsIntfStatsConfigType
  alaIpmsIntfStatsAddressType
  alaIpmsIntfStatsValue
  alaIpmsIntfStatsCurrentGroupCount
  alaIpmsIntfStatsMaxGroupLimit
  alaIpmsIntfStatsMaxGroupExceedAction
```

show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

```
show ip multicast forward [ip_address] [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2]]  
[all-vrf]
```

Syntax Definitions

| | |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | IP multicast group address. |
| vlan [vlan_id[-vlan_id2] | Display forwarding table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [service_id[-service_id2] | Display forwarding table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Display forwarding table entries for all of the VRF instances. |

Defaults

By default, forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.
- Forwarding entries are derived by applying the state from the source table to the state in the group, neighbor, and querier tables.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” and “Egress Vlan/Service” fields instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast forward
```

Total 3 Forwards

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|------------|
| | | | Vlan/Service | Vlan/Service | |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | vlan 20 | vlan 20 | 1/1/2 |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | service 10 | service 10 | sdp:32776 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | vlan 20 | vlan 20 | 1/1/2 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | service 10 | service 10 | sdp:32776 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | vlan 20 | vlan 21 | 1/1/2 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | service 10 | service 10 | sap:1/5:10 |

```
-> show ip multicast forward service
```

Total 3 Forwards

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|------------|
| | | | Vlan/Service | Vlan/Service | |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | service 10 | service 10 | sdp:32776 |

```
-> show ip multicast forward vlan
```

Total 3 Forwards

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|-----------|
| | | | Vlan/Service | Vlan/Service | |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | vlan 20 | vlan 20 | 1/1/2 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | vlan 20 | vlan 20 | 1/1/2 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | vlan 20 | vlan 21 | 1/1/2 |

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
```

```
-> show ip multicast forward vlan
```

Total 3 Forwards

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|-----------|
| | | | Vlan/Service | Vlan/Service | |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | VlanToLab | VlanToLab | 1/1/2 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | VlanToLab | VlanToLab | 1/1/2 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | VlanToLab | VlanToCore | 1/1/2 |

output definitions

| | |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | IP group address of the IP multicast forward. |
| Host Address | IP host address of the IP multicast forward. |
| Tunnel Address | IP source tunnel address of the IP multicast forward. |
| Ingress Vlan/Service | The ingress VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast forward. If the global display interface names option is enabled, then the ingress interface name associated with the IP multicast forward is displayed. |

output definitions (continued)

| | |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Egress Vlan/Service | The egress VLAN or SPB service ID associated with the IP multicast forward. If the global display interface names option is enabled, then the egress interface name associated with the IP multicast forward is displayed. The egress interface (port) will also be included in the forward entry with both output formats. |
| Interface | The VLAN port or SPB virtual port of the IP multicast forward. |

Release History

Release 7.1.1; command was introduced.
 Release 8.3.1; **all-vrf** parameter added.
 Release 8.4.1; **domain** parameter added.
 Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

ip multicast static-group Creates a static IGMP group entry on a specified port on a specified VLAN.

show ip multicast neighbor

Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

show ip multicast neighbor [**vlan** [*vlan_id*[-*vlan_id2*]] | **service** [*service_id*[-*service_id2*]]] [**all-vrf**]

Syntax Definitions

- vlan** [*vlan_id*[-*vlan_id2*]] Display IGMP neighbor table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
- service** [*service_id*[-*service_id2*]] Display IGMP neighbor table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
- all-vrf** Display IGMP neighbor table entries for all of the VRF instances.

Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the neighbor table entries that exist in all of the VRF instances on the switch.
- Interfaces with neighbors receive all IPv4 multicast, including all IGMP traffic.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast neighbor
```

```
Total 12 Neighbors
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |

```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------|--------------|-----------|--------|-------|------|
| 170.0.63.47 | vlan 2063 | 0/13 | no | 553 | 66 |

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
```

```
-> show ip multicast neighbor vlan 2063
```

```
Total 1 Neighbors
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------|--------------|-----------|--------|-------|------|
| 170.0.63.47 | VlanToLab | 0/13 | no | 553 | 66 |

output definitions

| | |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Address | The IP address of the IP multicast neighbor. |
| Vlan/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast neighbor. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast neighbor is displayed. |
| Interface | The VLAN port or the SPB virtual port of the IP multicast neighbor. |

output definitions

| | |
|---------------|------------------------------------------------------|
| Static | Whether it is a static IP multicast neighbor or not. |
| Count | Displays the count of IP multicast neighbor. |
| Life | The life time of the IP multicast neighbor. |

Release History

show ip multicast querier

Displays the IGMP querier table entries of IP Multicast Switching and Routing.

show ip multicast querier [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2]]] [all-vrf]

Syntax Definitions

- vlan** [vlan_id[-vlan_id2]] Display IGMP querier table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
- service** [service_id[-service_id2]] Display IGMP querier table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
- all-vrf** Display IGMP querier table entries for all of the VRF instances.

Defaults

By default, only IGMP querier entries specific to the current VRF instance are displayed

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the IGMP querier table entries that exist in all of the VRF instances on the switch.
- Interfaces with queriers receive all IGMP traffic, and if querier forwarding is enabled, these interfaces will also receive all IPv4 multicast traffic.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast querier
```

```
Total 10 Queriers
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |

show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast group [*ip_address*] [**vlan** [*vlan_id*[-*vlan_id2*] | **service** [*service_id*[-*service_id2*]]] [**all-vrf**]

Syntax Definitions

| | |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | IP multicast group address. |
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>] | Display group membership entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>] | Display group membership entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Display group membership entries for all of the VRF instances. |

Defaults

By default, all IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IGMP group membership table entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast group
```

```
Total 8 Groups
```

| Group Address | Source Address | Vlan/Service | Interface | Mode | Static | Count | Life |

show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

```
show ip multicast source [ip_address] [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2] [all-vrf]
```

Syntax Definitions

| | |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | IP multicast group address. |
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>] | Displays source table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>] | Displays source table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Display source table entries for all of the VRF instances. |

Defaults

By default, all source table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display source entries for a specific multicast group.
- In the service domain, only the first flow that is used to learn the source is displayed. Use the **extended** parameter to display other possible multicast IP addresses matching the same multicast MAC address. In this case, an asterisk (*) in the “Host Address” field represents the other multicast IP addresses.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- On an OmniSwitch 9900, this command is available only when IP Multicast Switching *and* Routing is enabled for the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast source
```

```
Total 10 Sources
```

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|----------------|--|--------------|
| | | Tunnel Address | | Vlan/Service |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | | service 20 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | | service 20 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | | service 20 |
| 225.0.1.3 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.3 | 21.20.20.2 | 0.0.0.0 | | service 20 |
| 225.0.1.4 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.4 | 21.20.20.2 | 0.0.0.0 | | service 20 |

```
-> show ip multicast source 225.0.1.2
```

```
Total 2 Sources
```

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|----------------|--|--------------|
| | | Tunnel Address | | Vlan/Service |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | | service 20 |

```
-> show ip multicast source service
```

```
Total 5 Sources
```

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|----------------|--|--------------|
| | | Tunnel Address | | Vlan/Service |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | | 20 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | | 20 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | | 20 |
| 225.0.1.3 | 21.20.20.2 | 0.0.0.0 | | 20 |
| 225.0.1.4 | 21.20.20.2 | 0.0.0.0 | | 20 |

```
-> show ip multicast source vlan
```

```
Total 5 Sources
```

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|----------------|--|--------------|
| | | Tunnel Address | | Vlan/Service |
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.3 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |
| 225.0.1.4 | 21.20.20.2 | 0.0.0.0 | | vlan 21 |

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
-> show ip multicast source vlan
```

Total 5 Sources

| Group Address | Host Address | Source Tunnel Address | Ingress Vlan/Service |
|---------------|--------------|-----------------------|----------------------|
| 225.0.1.0 | 21.20.20.2 | 0.0.0.0 | VlanToLab |
| 225.0.1.1 | 21.20.20.2 | 0.0.0.0 | VlanToLab |
| 225.0.1.2 | 21.20.20.2 | 0.0.0.0 | VlanToLab |
| 225.0.1.3 | 21.20.20.2 | 0.0.0.0 | VlanToLab |
| 225.0.1.4 | 21.20.20.2 | 0.0.0.0 | VlanToLab |

output definitions

| | |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | IP group address of the IP multicast source. |
| Host Address | IP host address of the IP multicast source. |
| Source Tunnel Address | IP destination tunnel address of the IP multicast source. |
| Ingress Vlan/Service | The ingress VLAN or Shortest Path Bridging (SPB) service ID number associated with the IP multicast source. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast source is displayed. |

Release History

Release 7.1.1; command was introduced.
 Release 8.3.1; **all-vrf** parameter added.
 Release 8.4.1; **domain** parameter added.
 Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

show ip multicast tunnel Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

```

show ip multicast tunnel

Displays the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

show ip multicast tunnel [*ip_address*] [**vlan** [*vlan_id*[-*vlan_id2*]] | **service** [*service_id*[-*service_id2*]]] [**all-vrf**]

Syntax Definitions

| | |
|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | IP multicast group address. |
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>]] | Displays tunneling table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>]] | Displays tunneling table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Display the tunneling table entries for all of the VRF instances. |

Defaults

By default, all tunnel entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IP multicast tunnel entries that exist in all of the VRF instances on the switch.
- Use the **ip multicast display-interface-names** command to enable displaying the associated IP interface name in the “Ingress Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ip multicast tunnel
```

```
Total 3 Tunnels
```

| Group Address | Host Address | Destination Tunnel Address | Ingress Vlan/Service |
|-------------------------|--------------|-------------------------------|-------------------------|
| -----+-----+-----+----- | | | |
| 225.0.1.0 | 21.20.20.2 | 10.10.10.51 | vlan 20 |
| 225.0.1.1 | 21.20.20.2 | 10.10.10.51 | vlan 20 |
| 225.0.1.2 | 21.20.20.2 | 10.10.10.51 | vlan 20 |

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
-> show ip multicast tunnel
```

Total 3 Tunnels

| Group Address | Host Address | Destination Tunnel Address | Ingress Vlan/Service |
|---------------|--------------|----------------------------|----------------------|
| 225.0.1.0 | 21.20.20.2 | 10.10.10.51 | VlanToLab |
| 225.0.1.1 | 21.20.20.2 | 10.10.10.51 | VlanToLab |
| 225.0.1.2 | 21.20.20.2 | 10.10.10.51 | VlanToLab |

output definitions

| | |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | IP group address of the IP multicast tunnel. |
| Host Address | IP host address of the IP multicast tunnel. |
| Destination Tunnel Address | IP source tunnel address of the IP multicast tunnel. |
| Ingress Vlan/Service | VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast tunnel. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast tunnel is displayed. |

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

Release 8.4.1.R02: **vlan** and **service** parameters added.

show ip multicast host-list

Displays the IP multicast host address list configuration for the switch.

```
show ip multicast host-list [host_list_name]
```

Syntax Definitions

host_list_name The name of an existing IP multicast host list.

Defaults

By default, all host lists configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the *host_list_name* parameter to display information for a specific host list.

Examples

```
-> show ip multicast host-list
```

```
Total 2 Lists
```

| Host List Name | Addresses |
|----------------|----------------------------------------------|
| group-map1 | 10.2.2.1 10.2.2.3 10.2.2.4 10.2.2.5 |
| ssm-map1 | 20.2.2.1 20.2.2.2 20.2.2.3 |

```
-> show ip multicast host-list ssm-map1
```

| Host List Name | Addresses |
|----------------|----------------------------------|
| ssm-map1 | 20.2.2.1 20.2.2.2 20.2.2.3 |

Release History

Release 8.3.1.R02; command introduced.

Related Commands

[ip multicast host-list](#)

Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

MIB Objects

```

  alaIpmsHostListName  
  alaIpmsHostListAddressType  
  alaIpmsHostListAddress
```

show ip multicast ssm-map

Displays the Source Specific Multicast (SSM) mapping configuration for the switch.

show ip multicast ssm-map [**vlan** *vlan_id*]

Syntax Definitions

vlan_id VLAN for which to display the configuration.

Defaults

By default, all SSM mappings configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

Examples

```
-> show ip multicast ssm-map
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
global 0    225.20.1.1/32      h-list1
vlan   200  229.30.1.1/32      h-list2

-> show ip multicast ssm-map vlan 200
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
vlan   200  229.30.1.1/32      h-list2
```

Release History

Release 8.3.1.R02; command introduced.

Related Commands

[ip multicast ssm-map](#) Configures a list of host IP addresses.

  alaIpmsSsmMapConfigType
  alaIpmsSsmMapConfigAddressType
  alaIpmsSsmMapConfigValue
  alaIpmsSsmMapGroupAddress
  alaIpmsSsmMapGroupPrefixLength
  alaIpmsSsmMapSourceListName
```

show ip multicast bridge

Displays the IP multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ip multicast bridge [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2] | ip_address | mac_address] [all-vrf]
```

Syntax Definitions

| | |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan [vlan_id[-vlan_id2] | Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [service_id[-service_id2] | Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>ip_address</i> | IP multicast group address. |
| <i>mac_address</i> | Group MAC address. |
| all-vrf | Display bridge table entries for all of the VRF instances. |

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service_id*, *ip_address*, *mac_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
 - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

Examples

```
-> show ip multicast bridge
```

```
Total 2 Bridge Entries
```

| Vlan/Service | Type | Group Address | Host Address | Action | UpTime |
|--------------|------|-------------------|--------------|------------|-------------|
| vlan 1 | asm | 224.1.1.3 | | forwarding | 00d:00h:00m |
| vlan 10 | mac | 01-00-5e-09-08-07 | | forwarding | 00d:00h:00m |

```
-> show ip multicast bridge vlan 10
```

```
Total 1 Bridge Entries
```

| Vlan/Service | Type | Group Address | Host Address | Action | UpTime |
|--------------|------|-------------------|--------------|------------|-------------|
| vlan 10 | mac | 01-00-5e-09-08-07 | | forwarding | 00d:00h:00m |

output definitions

| | |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vlan/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry. |
| Type | The bridge entry type (asm , ssm , mac). Configured through the ip multicast forward-mode command. |
| Group Address | If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address. |
| Host Address | The source IP host address (only applies to SSM bridge entries, otherwise this field is blank). |
| Action | The current action taken for the bridge entry (forwarding or filtering). |
| UpTime | The amount of time that has elapsed since the bridge entry was created. |

Release History

Release 8.3.1; command introduced.
 Release 8.4.1.R02: **service** parameter added.

Related Commands

show ip multicast bridge-forward Displays the forwarding state of the IP multicast bridge table entries.

MIB Objects

```
alaIpmsBridgeTable  
  alaIpmsBridgeConfigType  
  alaIpmsBridgeAddressType

  alaIpmsBridgeUpTime  
  alaIpmsBridgeAction
```

show ip multicast bridge-forward

Displays the forwarding state of the IP multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IP multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ip multicast bridge-forward [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2] | ip_address | mac_address] [all-vrf]
```

Syntax Definitions

| | |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan [vlan_id[-vlan_id2] | Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [service_id[-service_id2] | Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <i>ip_address</i> | IP multicast group address. |
| <i>mac_address</i> | Group MAC address. |
| all-vrf | Display bridge table entries for all of the VRF instances. |

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service_id*, *ip_address*, *mac_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
 - The “Host Address” field will display zero (MAC) or the IP host address for the bridge entry (ASM or SSM).

Examples

```
-> show ip multicast bridge-forward
```

```
Total 2 Bridge Entries
```

| Vlan/Service | Type | Group Address | Host Address | Next Interface | UpTime |
|--------------|------|-------------------|--------------|----------------|-------------|
| vlan 1 | asm | 224.1.2.3 | | 1/4/12 | 00h:00m:01s |
| vlan 10 | mac | 01-00-5e-09-08-07 | | 1/4/12 | 00h:00m:05s |

```
-> show ip multicast bridge-forward vlan 10
```

```
Total 1 Bridge Entries
```

| Vlan/Service | Type | Group Address | Host Address | Next Interface | UpTime |
|--------------|------|-------------------|--------------|----------------|-------------|
| vlan 10 | mac | 01-00-5e-09-08-07 | | 1/4/12 | 00h:00m:05s |

output definitions

| | |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vlan/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry. |
| Type | The bridge entry type (asm , ssm , mac). Configured through the ip multicast forward-mode command. |
| Group Address | If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address. |
| Host Address | The source IP host address (only applies to SSM bridge entries, otherwise this field is blank). |
| Next Interface | The destination interface for the bridge forwarding entry. |
| UpTime | The amount of time that has elapsed since the bridge forward entry was created. |

Release History

Release 8.3.1; command introduced.

Release 8.4.1.R02: **service** parameter added.

show ip multicast bidir-forward

Displays the IP multicast Bidirectional Protocol Independent Multicast (BIDIR-PIM) forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

show ip multicast bidir-forward [*ip_address*] [**all-vrf**]

Syntax Definitions

ip_address IP multicast group address.

all-vrf Display forwarding table entries for all of the virtual routing and forwarding (VRF) instances.

Defaults

By default, BIDIR-PIM forwarding entries for all of the IP multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use the *ip_address* parameter to display BIDIR-PIM forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the BIDIR-PIM forwarding table entries that exist in all of the VRF instances on the switch.

Examples

```
-> vrf vrf-1 show ip multicast bidir-forward
```

```
VRF:vrf-1 Total 2 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| 225.0.1.0 | vlan 30 | 1/2/1 |
| | vlan 30 | 1/2/2 |

```
-> show ip multicast bidir-forward all-vrf
```

```
VRF:default Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| 225.0.1.0 | vlan 20 | 1/1/1 |
| | vlan 20 | 1/1/2 |
| 225.0.1.1 | vlan 21 | 1/1/2 |

VRF:vrf-1 Total 2 Forwards

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| 225.0.1.0 | vlan 30 | 1/2/1 |
| | vlan 30 | 1/2/2 |

output definitions

| | |
|----------------------------|-----------------------------------------------------------------------------------|
| VRF | The VRF instance for the BIDIR route. |
| Group Address | IP group address for the BIDIR route. |
| Egress VLAN/Service | The destination VLAN or Shortest Path Bridging (SPB) service for the BIDIR route. |
| Interface | Destination VLAN port or SPB virtual port for the BIDIR route. |

Release History

Release 8.3.1.R02; command was introduced.

show ip multicast profile

Displays a list of available IPMS configuration profiles or the parameter settings for a specific profile.

show ip multicast profile [*profile_name*]

Syntax Definitions

profile_name The name of an existing IPMS profile.

Defaults

By default, a list of available profiles is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The specified profile name must already exist in the switch configuration.

Examples

```
-> show ip multicast profile
```

```
Total 2 Profiles
```

```
Profile Name
```

```
-----
```

```
default
```

```
IGMPv3 with Zapping
```

```
-> show ip multicast profile "IGMPv3 with Zapping"
```

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN, Shortest Path Bridging (SPB) service, or on the system if no VLAN or SPB service is specified.

show ipv6 multicast [**vlan** *vlan_id* | **service** *service_id*]

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>vlan_id</i> | VLAN for which to display the configuration. |
| <i>service_id</i> | SPB service ID number (1–32767). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

By default, the status and general configuration parameters for the system are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a VLAN ID to display the configuration information for a specific VLAN.
- Specify an SPB service ID to display the configuration information for a specific SPB service.

Examples

```
-> show ipv6 multicast
```

```
Profile                = default,

output definitions

| | |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Profile | The name of a predefined IPMS configuration profile that is assigned to this instance. Configured through the ipv6 multicast profile command. |
| Status | Whether the IPv6 Multicast Switching and Routing is Enabled or Disabled (the default status). Configured through the ipv6 multicast admin-state command. |
| Flood Unknown | Whether the flooding of initial unknown multicast traffic is Enabled or Disabled (the default status). Configured through the ipv6 multicast flood-unknown command. |
| Version | Displays the default MLD version, which can be 1 or 2 . Configured through the ipv6 multicast version command. |
| Robustness | Displays the MLD robustness value, ranging from 1 to 7 . (The default value is 2). Configured through the ipv6 multicast robustness command. |
| Querying | Whether MLD querying is Enabled or Disabled (the default status). Configured through the ipv6 multicast querying command. |
| Query Interval (seconds) | Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). Configured through the ipv6 multicast query-interval command. |
| Query Response Interval (milliseconds) | Displays the time (in milliseconds) taken to reply to an MLD query message. (The default value is 100 tenths-of-seconds). Configured through the ipv6 multicast query-response-interval command. |
| Last Member Query Interval (milliseconds) | Displays the time (in milliseconds) taken to reply to an MLD query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) Configured through the ipv6 multicast last-member-query-interval command. |
| Unsolicited Report Interval (seconds) | Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). Configured through the ipv6 multicast unsolicited-report-interval command. |

output definitions

| | |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proxying | Whether MLD proxying on the system is Enabled or Disabled (the default status). Configured through the ipv6 multicast proxying command. |
| Spoofing | Whether MLD spoofing on the system is Enabled or Disabled (the default status). Configured through the ipv6 multicast spoofing command. |
| Zapping | Whether MLD zapping on the system is Enabled or Disabled (the default status). Configured through the ipv6 multicast zapping command. |
| Querier Forwarding | Whether MLD querier forwarding on the system is Enabled or Disabled (the default status). Configured through the ipv6 multicast querier-forwarding command. |
| Router Timeout (seconds) | Displays the MLD router timeout in seconds. (The default value is 90 seconds.) Configured through the ipv6 multicast router-timeout command. |
| Source Timeout (seconds) | Displays the MLD source timeout in seconds. (The default value is 30 seconds.) Configured through the ipv6 multicast source-timeout command. |
| Max-group | Displays the global maximum group limit that can be learned per VLAN instance. (The default value is 0 which means no limit is imposed). Configured through the ipv6 multicast max-group command. |
| Max-group action | Displays the action taken when the maximum group limit has been exceeded, which can be none , drop or replace . Configured through the ipv6 multicast max-group command. |
| Helper-address | Displays the destination IPv6 address of a relay host, where MLD host reports and Leave messages are to be sent. (By default, no Helper-address is configured.) <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |
| Static Querier Address | The Static Source IPv6 Address to be used when querying. (The default value of ":::" indicates that this is not configured.) <i>This function is currently not supported.</i> |
| Static Spoofing Address | The Static Source IPv6 Address to be used when spoofing. (The default value of ":::" indicates that this is not configured.) Configured through the ipv6 multicast spoofing static-source-ip command. |
| Zero-based Query | The current state of Zero-based Querying, which can be disabled or enabled (the default status). Configured through the ipv6 multicast zero-based-query command. |
| Forward Mode | Displays the current IPv6 Forwarding mode (asm , ssm , mac , or auto). Configured through the ipv6 multicast forward-mode command. |
| Update Delay Interval (milliseconds) | Displays the amount of time (in milliseconds) between propagating IPMS state changes. (The default value is 0 milliseconds). Configured through the ipv6 multicast update-delay-interval command. |

output definitions

| | |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSM Mapping | Whether Source Specific Multicast (SSM) mapping is enabled or disabled (the default). When enabled, Any Source Multicast (ASM) group memberships are translated into SSM group memberships. Configured through the ipv6 multicast ssm-map command. <i>This function is currently not supported.</i> |
| Fast Join | Whether the IP Multicast Switching fast join functionality is enabled or disabled (the default). When enabled, forwarding entries are automatically created in hardware as soon as group memberships are learned instead of waiting for the multicast traffic to reach the switch. Configured through the ipv6 multicast fast-join command. |
| Initial Packet Buffering | Whether Initial Packet Buffering is enabled or disabled (the default status). Configured through the ipv6 multicast initial-packet-buffer admin-state command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |
| Max Flows | The maximum number of IPv6 multicast flows buffered for initial packet. Configured through the ipv6 multicast initial-packet-buffer max-flow command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |
| Max Packets Per Flow | The maximum number of initial packets buffered per IPv6 multicast flow. Configured through the ipv6 multicast initial-packet-buffer max-packet command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |
| Buffer Timeout (seconds) | The timeout value for the initial buffered IPv6 multicast packets. Configured through the ipv6 multicast initial-packet-buffer timeout command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |
| Min Delay (milliseconds) | The minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Configured through the ipv6 multicast initial-packet-buffer min-delay command. <i>This function is supported only in the VLAN domain; service domain is not supported.</i> |

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; display fields added.

Release 8.4.1; **service** parameter added.

Related Commands

ipv6 multicast admin-state Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

show ipv6 multicast port

Displays the maximum group configuration applicable for the specified port or the specified Service Access Point (SAP) port. The current number of groups learned on a port, port/VLAN, SAP port, or SAP port/Shortest Path Bridging (SPB) service instance is also displayed.

```
show ipv6 multicast {port [chassis/slot/port] | sap port [sap_id]}
```

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> | The slot and port number (3/1). |
| <i>sap_id</i> | The SAP ID (chassis/slot/port:encapsulation). <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Specify a port number to display the configuration information for a specific port.
- Specify a SAP ID to display the configuration information for a specific SAP port.
- When using the **sap port** parameter with this command, specify a SAP ID by entering the access port number followed by the encapsulation value (for example, ip multicast static-querier service 10 sap port 1/1/23:10, where 1/1/23:10 is the SAP ID).
- A SAP ID is comprised of an access port and an encapsulation value. For example, the SAP ID for access port 1/1/23 with VLAN 10 encapsulation is 1/1/23:10. Any traffic received on port 1/1/23 that is tagged with VLAN 10 is mapped to the SPB service that is associated with the 1/1/23:10 SAP ID. Refer to [Chapter 10, “Service Manager Commands,”](#) for more information.

Examples

```
-> show ipv6 multicast port
Legends: Interface Max-group           = Max-group limit on the interface
          Interface Action              = Max-group action on the interface
          Interface-Instance Max-group = Active Max-group limit on the Lan Interface instance
          Interface-Instance Action    = Active Max-group action on the Lan Interface instance
```

Total 1 Lan Interface Instances

| Interface | Vlan/Service | Current Groups | Interface Max-group | Interface Action | Interface-Instance Max-group | Interface-Instance Action |

-> show ipv6 multicast sap port 1/1/23:200

Legends: Interface Max-group = Max-group limit on the interface
 Interface Action = Max-group action on the interface
 Interface-Instance Max-group = Active Max-group limit on the Lan Interface instance
 Interface-Instance Action = Active Max-group action on the Lan Interface instance

Total 1 Lan Interface Instances

| Interface | Vlan/Service | Current Groups | Interface Max-group | Interface Action | Interface-Instance Max-group | Interface-Instance Action |
|----------------|--------------|----------------|---------------------|------------------|------------------------------|---------------------------|
| sap:1/1/23:200 | service 30 | 0 | 0 | none | 0 | none |

output definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The VLAN port or the SAP (chassis/slot/port:encapsulation) that serves as the virtual port for the SPB service. |
| Vlan/Service | The VLAN or SPB service ID associated with the IPv6 multicast interface. |
| Current Groups | The current groups associated with the IPv6 multicast interface. |
| Interface Max-group | The maximum group count allowed on the port or SAP port. This limit is applicable on the given port for all VLAN or service instances of the port. |
| Interface Action | The action to be taken when the group membership limit is exceeded (none , drop , or replace). |

output definitions

| | |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface-Instance Max-group | The maximum group limit learned per port for the given VLAN or per SAP port for the given SPB service. This limit is applied to each port that is a member of the given VLAN or each SAP port that is a member of the given service. |
| Interface-Instance Action | The action to be taken when the group membership limit is exceeded (none , drop , or replace). |

Release History

Release 7.1.1; command was introduced.
Release 8.4.1; **sap port** parameter added.

Related Commands

- ipv6 multicast port max-group** Configures the maximum group limit learned per port.
- ipv6 multicast max-group** Configures the maximum group limit learned per port for the specified VLAN, SPB service, or on the system if no VLAN or SPB service is specified.

MIB Objects

```
alaIpmsIntfStatsConfigType  
  alaIpmsIntfStatsAddressType  
  alaIpmsIntfStatsValue  
  alaIpmsIntfStatsCurrentGroupCount  
  alaIpmsIntfStatsMaxGroupLimit  
  alaIpmsIntfStatsMaxGroupExceedAction
```

show ipv6 multicast forward

Display the IPv6 Multicast Switching and Routing forwarding table entries for the specified IPv6 multicast group address or all entries if no IPv6 multicast address is specified.

```
show ipv6 multicast forward [ipv6_address] [vlan [vlan_id[-vlan_id2]] | service [service_id[-service_id2]]  
[all-vrf]
```

Syntax Definitions

| | |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6_address</code> | IPv6 multicast group address. |
| <code>vlan [vlan_id[-vlan_id2]]</code> | Display forwarding table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| <code>service [service_id[-service_id2]]</code> | Display forwarding table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| <code>all-vrf</code> | Display forwarding table entries for all of the VRF instances. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the `ipv6_address` parameter to display forwarding entries for a specific multicast group.
- Use the `all-vrf` parameter option to display the forwarding table entries that exist in all of the VRF instances on the switch.
- Forwarding entries are derived by applying the state from the source table to the state in the group, neighbor, and querier tables.
- On an OmniSwitch 9900, this command is available only when IPv6 Multicast Switching and Routing is enabled for the switch.
- Use the [ipv6 multicast display-interface-names](#) command to enable displaying the associated IPv6 interface name in the “Ingress Vlan/Service” and “Egress Vlan/Service” fields instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast forward
```

```
Total 3 Forwards
```

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|-----------|
| | | | VLAN/Service | VLAN/Service | |
| ff05::6 | 4444::2 | :: | vlan 20 | vlan 20 | 1/1/2 |
| ff05::7 | 4444::2 | :: | vlan 20 | vlan 20 | 1/1/2 |
| ff06::1 | :: | :: | vlan 20 | vlan 21 | 1/1/2 |

```
-> show ipv6 multicast forward ff05::6
```

```
Total 1 Forwards
```

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|-----------|
| | | | VLAN/Service | VLAN/Service | |
| ff05::6 | 4444::2 | :: | vlan 20 | vlan 20 | 1/1/2 |

```
-> show ipv6 multicast forward service
```

```
Total 3 Forwards
```

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|------------|
| | | | VLAN/Service | VLAN/Service | |
| ff05::6 | 4444::2 | :: | service 10 | service 10 | sdp:32776 |
| ff05::7 | 4444::2 | :: | service 10 | service 10 | sdp:32776 |
| ff06::1 | :: | :: | service 10 | service 10 | sap:1/5:10 |

```
-> show ipv6 multicast forward vlan
```

```
Total 3 Forwards
```

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|-----------|
| | | | VLAN/Service | VLAN/Service | |
| ff05::6 | 4444::2 | :: | vlan 20 | vlan 20 | 1/1/2 |
| ff05::7 | 4444::2 | :: | vlan 20 | vlan 20 | 1/1/2 |
| ff06::1 | :: | :: | vlan 20 | vlan 21 | 1/1/2 |

Sample output when the global display interface names option is enabled:

```
-> ip multicast display-interface-names
```

```
-> show ip multicast forward vlan
```

```
Total 3 Forwards
```

| Group Address | Host Address | Tunnel Address | Ingress | Egress | Interface |
|---------------|--------------|----------------|--------------|--------------|-----------|
| | | | VLAN/Service | VLAN/Service | |
| ff05::6 | 4444::2 | :: | VlanToLab | VlanToLab | 1/1/2 |
| ff05::7 | 4444::2 | :: | VlanToLab | VlanToLab | 1/1/2 |
| ff06::1 | :: | :: | VlanToCore | VlanToDist | 1/1/2 |

output definitions

| | |
|-----------------------|-----------------------------------------------------------|
| Group Address | IPv6 group address of the IPv6 multicast forward. |
| Host Address | IPv6 host address of the IPv6 multicast forward. |
| Tunnel Address | IPv6 source tunnel address of the IPv6 multicast forward. |

output definitions (continued)

| | |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ingress VLAN/Service | The ingress VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast forward. If the global display interface names option is enabled, then the ingress interface name associated with the IPv6 multicast forward is displayed. |
| Egress VLAN/Service | The egress VLAN or SPB service ID associated with the IPv6 multicast forward. If the global display interface names option is enabled, then the egress interface name associated with the IPv6 multicast forward is displayed. The egress interface (port) will also be included in the forward entry with both output formats. |
| Interface | The VLAN port or SPB virtual port of the IPv6 multicast forward. |

Release History

Release 7.1.1; command was introduced.
 Release 8.3.1; **all-vrf** parameter added.
 Release 8.4.1; **domain** parameter added.
 Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

ipv6 multicast static-group Creates a static MLD group entry on a specified port on a specified VLAN.

show ipv6 multicast neighbor

Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

```
show ipv6 multicast neighbor [vlan [vlan_id[-vlan_id2] | service [service_id[-service_id2]]] [all-vrf]
```

Syntax Definitions

- vlan** [vlan_id[-vlan_id2]] Display MLD neighbor table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
- service** [service_id[-service_id2]] Display MLD neighbor table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
- all-vrf** Display MLD neighbor table entries for all of the VRF instances.

Defaults

By default, only the neighbor table entries specific to the current VRF instance are displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the IPv6 neighbor table entries that exist in all of the VRF instances on the switch.
- Interfaces with neighbors receive all IPv6 multicast, including all MLD traffic.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast neighbor
```

```
Total 4 Neighbors
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|------------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | vlan 20 | 1/1/2 | no | 1 | 6 |
| fe80::2a0:ccff:fed3:2853 | service 20 | SAP:1/5:10 | no | 5520 | 172 |
| :: | vlan 20 | 1/1/13 | yes | 0 | 0 |
| :: | service 20 | SAP:1/5:20 | no | 5520 | 172 |

```
-> show ipv6 multicast neighbor service
```

```
Total 2 Neighbors
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------|--------------|-----------|--------|-------|------|
|--------------|--------------|-----------|--------|-------|------|

```
fe80::2a0:ccff:fed3:2853  service 20      SAP:1/5:10      no      5520  172
::                       service 20      SAP:1/5:20      no      5520  172
```

```
-> show ipv6 multicast neighbor vlan
```

Total 2 Neighbors

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|-----------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | vlan 20 | 1/1/2 | no | 1 | 6 |
| :: | vlan 20 | 1/1/13 | yes | 0 | 0 |

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
```

```
-> show ipv6 multicast neighbor vlan
```

Total 2 Neighbors

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|-----------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | VlanToLab | 1/1/2 | no | 1 | 6 |
| :: | VlanToLab | 1/1/13 | yes | 0 | 0 |

output definitions

| | |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Address | The IPv6 address of the IPv6 multicast neighbor. |
| VLAN/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast neighbor. If the global display interface names option is enabled, then the interface name associated with the IP multicast neighbor is displayed. |
| Interface | The VLAN port or the SPB virtual port of the IPv6 multicast neighbor. |
| Static | Whether it is a static MLD neighbor or not. |
| Count | Displays the count of the IPv6 multicast neighbor. |
| Life | The life time of the IPv6 multicast neighbor. |

Release History

Release 7.1.1; command was introduced.
 Release 8.3.1; **all-vrf** parameter added.
 Release 8.4.1; **domain** parameter added.
 Release 8.4.1.R02; **domain** parameter deprecated.

Related Commands

ipv6 multicast static-neighbor Creates a static MLD neighbor entry on a specified port on a specified VLAN.

show ipv6 multicast querier

Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

```
show ipv6 multicast querier [vlan [vlan_id[-vlan_id2]] | service [service_id[-service_id2]]] [all-vrf]
```

Syntax Definitions

- vlan** [vlan_id[-vlan_id2]] Display MLD querier table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs.
- service** [service_id[-service_id2]] Display MLD querier table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. *This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.*
- all-vrf** Display querier table entries for all of the VRF instances.

Defaults

By default, only MLD querier entries specific to the current VRF instance are displayed

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **all-vrf** parameter option to display the MLD querier table entries that exist in all of the VRF instances on the switch.
- Interfaces with queriers receive all MLD traffic, and if querier forwarding is enabled, these interfaces will also receive all IPv6 multicast traffic.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast querier
```

```
Total 4 Queriers
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|------------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | vlan 20 | 1/1/2 | no | 1 | 6 |
| fe80::2a0:ccff:fed3:2853 | service 20 | SAP:1/5:10 | no | 5520 | 172 |
| :: | vlan 20 | 1/1/13 | yes | 0 | 0 |
| :: | service 20 | SAP:1/5:20 | no | 5520 | 172 |

```
-> show ipv6 multicast querier service
```

```
Total 2 Queriers
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|------------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | service 20 | SAP:1/5:10 | no | 5520 | 172 |
| :: | service 20 | SAP:1/5:20 | no | 5520 | 172 |

```
-> show ipv6 multicast querier vlan
```

```
Total 2 Queriers
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|-----------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | vlan 20 | 1/1/2 | no | 1 | 6 |
| :: | vlan 20 | 1/1/13 | yes | 0 | 0 |

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
```

```
-> show ipv6 multicast querier vlan
```

```
Total 2 Queriers
```

| Host Address | Vlan/Service | Interface | Static | Count | Life |
|--------------------------|--------------|-----------|--------|-------|------|
| fe80::2a0:ccff:fed3:2853 | VlanToLab | 1/1/2 | no | 1 | 6 |
| :: | VlanToLab | 1/1/13 | yes | 0 | 0 |

output definitions

| | |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Address | The IPv6 address of the IPv6 multicast querier. |
| VLAN/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast querier. If the global display interface names option is enabled, then the IPv6 interface name associated with the IPv6 multicast querier is displayed |
| Interface | The VLAN port or the SPB virtual port of the IPv6 multicast querier. |
| Static | Whether it is a static MLD neighbor or not. |
| Count | Displays the count of the IPv6 multicast querier. |
| Life | The life time of the IPv6 multicast querier. |

show ipv6 multicast group

Displays the MLD group membership table entries of IPv6 Multicast Switching and Routing for the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast group [*ipv6_ddress*] [**vlan** [*vlan_id*[-*vlan_id2*] | **service** [*service_id*[-*service_id2*]]] [**all-vrf**]

Syntax Definitions

| | |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6_ddress</i> | IPv6 multicast group address. |
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>] | Display MLD group membership entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>] | Display MLD group membership entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Display group membership entries for all of the VRF instances. |

Defaults

By default, all IPv6 multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_ddress* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD group membership table entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast group ff05::5
```

| Group Address | Source Address | Vlan/Service | Interface | Mode | Static | Count | Life |
|---------------|----------------|--------------|------------|---------|--------|-------|------|
| ff05::5 | :: | vlan 21 | 1/1/19 | exclude | no | 1 | 145 |
| ff05::5 | :: | service 20 | SAP:1/5:10 | exclude | no | 5520 | 172 |

```
-> show ipv6 multicast group service
```

```
Total 3 Groups
```

| Group Address | Source Address | Vlan/Service | Interface | Mode | Static | Count | Life |
|---------------|----------------|--------------|------------|---------|--------|-------|------|
| ff05::5 | :: | service 20 | SAP:1/5:10 | exclude | no | 5520 | 172 |
| ff05::6 | :: | service 20 | SAP:1/5:20 | exclude | no | 5520 | 172 |
| ff05::7 | :: | service 20 | sdp:32776 | exclude | no | 5520 | 172 |

```
-> show ipv6 multicast group vlan
```

```
Total 3 Groups
```

| Group Address | Source Address | Vlan/Service | Interface | Mode | Static | Count | Life |
|---------------|----------------|--------------|-----------|---------|--------|-------|------|
| ff05::5 | :: | vlan 21 | 1/1/19 | exclude | no | 100 | 145 |
| ff05::6 | :: | vlan 21 | 1/1/19 | exclude | no | 100 | 145 |
| ff05::7 | :: | vlan 21 | 1/1/19 | exclude | no | 101 | 145 |
| ff05::8 | :: | vlan 100 | 1/1/20 | exclude | yes | 0 | 0 |
| ff05::9 | :: | vlan 101 | 1/1/21 | exclude | yes | 0 | 0 |

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
```

```
-> show ipv6 multicast group vlan
```

```
Total 3 Groups
```

| Group Address | Source Address | Vlan/Service | Interface | Mode | Static | Count | Life |
|---------------|----------------|--------------|-----------|---------|--------|-------|------|
| ff05::5 | :: | VlanToLab | 1/1/19 | exclude | no | 100 | 145 |
| ff05::6 | :: | VlanToLab | 1/1/19 | exclude | no | 100 | 145 |
| ff05::7 | :: | VlanToLab | 1/1/19 | exclude | no | 101 | 145 |
| ff05::8 | :: | VlanToCore | 1/1/20 | exclude | yes | 0 | 0 |
| ff05::9 | :: | VlanToDist | 1/1/21 | exclude | yes | 0 | 0 |

output definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | IPv6 address of the IPv6 multicast group. |
| Source Address | IPv6 address of the IPv6 multicast source. |
| Vlan/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IPv6 multicast group. If the global display interface names option is enabled, then the IPv6 interface name associated with the IPv6 multicast group is displayed. |
| Interface | The VLAN port or the SPB virtual port on which the group membership was learned. |
| Mode | MLD source filter mode. |
| Static | Whether it is a static MLD group or not. |
| Count | Number of MLD membership requests made. |
| Life | Life time of the MLD group membership. |

show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

```
show ipv6 multicast source [ipv6_address] [vlan [vlan_id[-vlan_id2]] | service [service_id[-service_id2]]
[all-vrf]
```

Syntax Definitions

| | |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6_address</i> | IPv6 multicast group address. |
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>]] | Display source table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>]] | Display source table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Displays source table entries for all of the VRF instances. |

Defaults

By default, all source table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ipv6_address* parameter to display entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the MLD source table entries that exist in all of the VRF instances on the switch.
- Use the [ipv6 multicast display-interface-names](#) command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast source
```

```
Total 8 Sources
```

| Group Address | Host Address | Source | | Ingress |
|---------------|--------------|--------|---------|--------------|
| | | Tunnel | Address | VLAN/Service |
| ff05::6 | 4444::2 | :: | | vlan 21 |
| ff05::6 | 4444::2 | :: | | service 20 |
| ff05::7 | 4444::2 | :: | | vlan 21 |
| ff05::7 | 4444::2 | :: | | service 20 |
| ff06::1 | :: | :: | | vlan 20 |
| ff06::1 | :: | :: | | servuce 21 |
| ff06::2 | :: | :: | | vlan 20 |
| ff06::2 | :: | :: | | service 21 |

```
-> show ipv6 multicast source ff05::6
```

```
Total 2 Sources
```

| Group Address | Host Address | Source Tunnel Address | Ingress VLAN/Service |
|---------------|--------------|-----------------------|----------------------|
| ff05::6 | 4444::2 | :: | vlan 21 |
| ff05::6 | 4444::2 | :: | service 20 |

```
-> show ipv6 multicast source service
```

```
Total 4 Sources
```

| Group Address | Host Address | Source Tunnel Address | Ingress VLAN/Service |
|---------------|--------------|-----------------------|----------------------|
| ff05::6 | 4444::2 | :: | service 20 |
| ff05::7 | 4444::2 | :: | service 20 |
| ff06::1 | :: | :: | service 21 |
| ff06::2 | :: | :: | service 21 |

```
-> show ipv6 multicast source vlan
```

```
Total 4 Sources
```

| Group Address | Host Address | Source Tunnel Address | Ingress VLAN/Service |
|---------------|--------------|-----------------------|----------------------|
| ff05::6 | 4444::2 | :: | vlan 21 |
| ff05::7 | 4444::2 | :: | vlan 21 |
| ff06::1 | :: | :: | vlan 20 |
| ff06::2 | :: | :: | vlan 20 |

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
```

```
-> show ipv6 multicast source vlan
```

```
Total 4 Sources
```

| Group Address | Host Address | Source Tunnel Address | Ingress VLAN/Service |
|---------------|--------------|-----------------------|----------------------|
| ff05::6 | 4444::2 | :: | VlanToLab |
| ff05::7 | 4444::2 | :: | VlanToLab |
| ff06::1 | :: | :: | VlanToCore |
| ff06::2 | :: | :: | VlanToCore |

output definitions

| | |
|----------------------|--------------------------------------------------|
| Group Address | IPv6 group address of the IPv6 multicast source. |
| Host Address | IPv6 host address of the IPv6 multicast source. |

output definitions

| | |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Tunnel Address | IPv6 source tunnel address of the IPv6 multicast source. |
| Ingress VLAN/Service | The ingress VLAN or Shortest Path Bridging (SPB) service ID number associated with the IP multicast source. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast source is displayed. |

Release History

Release 7.1.1; command was introduced.

show ipv6 multicast tunnel

Displays the IPv6 Multicast Switching and Routing tunneling table entries matching the specified IPv6 multicast group address, or all entries if no IPv6 multicast address is specified.

show ipv6 multicast tunnel [*ipv6_address*] [**vlan** [*vlan_id*[-*vlan_id2*] | **service** [*service_id*[-*service_id2*]]] [**all-vrf**]

Syntax Definitions

| | |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6_address</i> | IPv6 multicast group address. |
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>] | Display tunneling table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>] | Display tunneling table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, or OmniSwitch 6900-V72.</i> |
| all-vrf | Display the IPv6 tunneling table entries for all of the VRF instances. |

Defaults

By default, all IPv6 tunnel entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *ip_address* parameter to display the tunnel entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the IPv6 multicast tunnel entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IP interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> show ipv6 multicast tunnel
```

```
Total 4 Tunnels
```

| Group Address | Host Address | Destination Tunnel Address | Ingress Vlan/Service |
|---------------|--------------|-------------------------------|-------------------------|
| ff05::6 | 4444::2 | 5555::3 | vlan 21 |
| ff05::6 | 4444::2 | :: | service 20 |
| ff05::7 | 4444::2 | 5555::3 | vlan 21 |
| ff05::7 | 4444::2 | :: | service 20 |

```
-> show ipv6 multicast tunnel service
```

```
Total 2 Tunnels
```

| Group Address | Host Address | Destination Tunnel Address | Ingress Vlan/Service |
|---------------|--------------|----------------------------|----------------------|
| ff05::6 | 4444::2 | :: | service 20 |
| ff05::7 | 4444::2 | :: | service 20 |

```
-> show ipv6 multicast tunnel vlan
```

```
Total 2 Tunnels
```

| Group Address | Host Address | Destination Tunnel Address | Ingress Vlan/Service |
|---------------|--------------|----------------------------|----------------------|
| ff05::6 | 4444::2 | 5555::3 | vlan 21 |
| ff05::7 | 4444::2 | 5555::3 | vlan 21 |

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
```

```
-> show ipv6 multicast tunnel vlan
```

```
Total 2 Tunnels
```

| Group Address | Host Address | Destination Tunnel Address | Ingress Vlan/Service |
|---------------|--------------|----------------------------|----------------------|
| ff05::6 | 4444::2 | 5555::3 | VlanToLab |
| ff05::7 | 4444::2 | 5555::3 | VlanToLab |

output definitions

| | |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | IPv6 group address of the IPv6 multicast tunnel. |
| Host Address | IPv6 host address of the IPv6 multicast tunnel. |
| Destination Tunnel Address | IPv6 source tunnel address of the IPv6 multicast tunnel. |
| Ingress Vlan/Service | VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast tunnel. If the global display interface names option is enabled, then the IP interface name associated with the IP multicast tunnel is displayed. |

Release History

Release 7.1.1; command was introduced.

Release 8.3.1; **all-vrf** parameter added.

Release 8.4.1.R02; **vlan** and **service** parameters added.

Related Commands

show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified

MIB Objects

```

  alaIpmsTunnelNextType
```

show ipv6 multicast host-list

Displays the IPv6 multicast host address list configuration for the switch.

```
show ipv6 multicast host-list [host_list_name]
```

Syntax Definitions

host_list_name The name of an existing IPv6 multicast host list.

Defaults

By default, all host lists configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Use the *host_list_name* parameter to display information for a specific host list.

Examples

```
-> show ipv6 multicast host-list
```

```
Total 2 Lists
```

| Host List Name | Addresses |
|----------------|-------------------------------|
| group-map1 | 3333::2 3333::3 3333::4 |
| ssm-map1 | 4444::2 4444::3 4444::4 |

```
-> show ipv6 multicast host-list ssm-map1
```

| Host List Name | Addresses |
|----------------|-------------------------------|
| ssm-map1 | 4444::2 4444::3 4444::4 |

Release History

Release 8.3.1.R02; command introduced.

Related Commands

[ipv6 multicast host-list](#)

Configures a list of host IPv6 addresses that is used for IPv6 multicast group maps and SSM maps.

MIB Objects

```
alaIpmsHostListTable  
  alaIpmsHostListName  
  alaIpmsHostListAddressType  
  alaIpmsHostListAddress
```

show ipv6 multicast ssm-map

Displays the IPv6 Source Specific Multicast (SSM) mapping configuration for the switch.

```
show ipv6 multicast ssm-map [vlan vlan_id]
```

Syntax Definitions

vlan_id VLAN for which to display the configuration.

Defaults

By default, all IPv6 multicast SSM mappings configured on the switch are displayed.

Platforms Supported

Not supported in this release.

Usage Guidelines

Specify a VLAN ID to display the configuration information for a specific VLAN.

Examples

```
-> show ipv6 multicast ssm-map
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
global 0    ff05::5/128        h-list1
vlan   200  ff05::6/128        h-list2

-> show ipv6 multicast ssm-map vlan 200
Type   Id   Group Address/Prefix  Source List Name
-----+-----+-----+-----+-----
vlan   200  ff05::6/128        h-list2
```

Release History

Release 8.3.1.R02; command introduced.

Related Commands

[ipv6 multicast ssm-map](#) Configures a list of host IP addresses that is used for IP multicast group maps and SSM maps.

MIB Objects

```
alaIpmsSsmMapTable  
  alaIpmsSsmMapConfigType  
  alaIpmsSsmMapConfigAddressType  
  alaIpmsSsmMapConfigValue  
  alaIpmsSsmMapGroupAddress  
  alaIpmsSsmMapGroupPrefixLength  
  alaIpmsSsmMapSourceListName
```

show ipv6 multicast bridge

Displays the IPv6 multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ipv6 multicast bridge [vlan vlan_id[-vlan_id2] | service [service_id[-service_id2] | ipv6_address | mac_address] [all-vrf]
```

Syntax Definitions

| | |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>] | Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>] | Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32., or OmniSwitch 6900-V72.</i> |
| <i>ipv6_address</i> | IPv6 multicast group address. |
| <i>mac_address</i> | Group MAC address. |
| all-vrf | Display bridge table entries for all of the VRF instances. |

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service-id*, *ipv6_address*, *mac_address*) to display bridge table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC).
 - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

Examples

```
-> show ipv6 multicast bridge vlan 130
```

```
Total 2 Bridge Entries
```

| Vlan/Service | Type | Group Address | Host Address | Action | UpTime |
|--------------|------|-------------------|--------------|------------|-------------|
| vlan 130 | asm | ff05::6 | | forwarding | 00h:00m:04s |
| service 10 | mac | 33-33-00-01-01-01 | | flooding | 00h:00m:05s |

output definitions

| | |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vlan/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry. |
| Type | The bridge type for the IPv6 multicast bridge entry (asm , ssm , mac). Configured through the ipv6 multicast forward-mode command. |
| Group Address | If the bridge entry type is ASM or SSM, this field displays the destination IP group address; if the bridge entry type is MAC, this field displays the destination MAC address. |
| Host Address | The source IPv6 host address (only applies to SSM bridge entries, otherwise this field is blank). |
| Action | The current action taken for the bridge entry (forwarding or filtering). |
| UpTime | The amount of time that has elapsed since the bridge entry was created. |

Release History

Release 8.3.1; command introduced.

Release 8.4.1.R02; **service** parameter added.

Related Commands

show ipv6 multicast bridge-forward Displays the forwarding state of the IPv6 multicast bridge table entries.

MIB Objects

```
alaIpmsBridgeTable
  alaIpmsBridgeConfigType
  alaIpmsBridgeAddressType
  alaIpmsBridgeValue
  alaIpmsBridgeType
  alaIpmsBridgeGroupAddress
  alaIpmsBridgeHostAddress
  alaIpmsBridgeUpTime
  alaIpmsBridgeAction
```

show ipv6 multicast bridge-forward

Displays the forwarding state of the IPv6 multicast bridge table entries that match the specified VLAN, Shortest Path Bridging (SPB) service, IPv6 multicast group address, MAC address, or all entries if no additional parameters are specified.

```
show ipv6 multicast bridge-forward [vlan vlan_id[-vlan_id2] | service [service_id[-service_id2] |  
ipv6_address | mac_address] [all-vrf]
```

Syntax Definitions

| | |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vlan [<i>vlan_id</i> [- <i>vlan_id2</i>] | Displays bridge table entries for the VLAN domain. Optionally enter a VLAN ID or use a hyphen to specify a range of VLAN IDs. |
| service [<i>service_id</i> [- <i>service_id2</i>] | Displays bridge table entries for the service domain. Optionally enter a service ID or use a hyphen to specify a range of service IDs. <i>This parameter is currently not supported on an OmniSwitch 6465, OmniSwitch 6560, OmniSwitch 6900-C32, OmniSwitch 6900-V72.</i> |
| <i>ipv6_address</i> | IPv6 multicast group address. |
| <i>mac_address</i> | Group MAC address. |
| all-vrf | Display bridge table entries for all of the VRF instances. |

Defaults

By default, all bridge table entries are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use one of the optional parameters (*vlan_id*, *service_id*, *ipv6_address*, *mac_address*) to display forwarding information for a specific multicast group.
- Use the **all-vrf** parameter option to display the source table entries that exist in all of the VRF instances on the switch.
- Based on the forwarding mode set for the switch (ASM, SSM, or MAC):
 - The “Group Address” field will display either a multicast group address (ASM or SSM) or the MAC address for the multicast group (MAC). In the examples for this command, the forwarding mode is changed to MAC to show how the “Group Address” field changes.
 - The “Host Address” field will display zero (MAC) or the IPv6 host address for the bridge entry (ASM or SSM).

Examples

```
-> show ipv6 multicast bridge-forward vlan 130
```

Total 2 Bridge Forwarding Entries

| Vlan/Service | Type | Group Address | Host Address | Next Interface | UpTime |
|--------------|-------------|-------------------|--------------|----------------|-------------|
| vlan 1 | asm-partial | ::1.1.2.3 | | 1/4/12 | 00h:00m:10s |
| vlan 130 | asm | 33-33-ff-ff-ff-ff | | 1/4/12 | 00h:00m:07s |

```
-> ipv6 multicast vlan 130 forward-mode mac
-> show ipv6 multicast bridge-forward vlan 130
```

Total 1 Bridge Forwarding Entries

| Vlan/Service | Type | Group Address | Host Address | Next Interface | UpTime |
|--------------|------|-------------------|--------------|----------------|-------------|
| vlan 130 | mac | 33-33-ff-ff-ff-ff | | 1/3/25 | 00h:00m:07s |

output definitions

| | |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vlan/Service | The VLAN or Shortest Path Bridging (SPB) service ID associated with the IP multicast bridge entry. |
| Type | The bridge entry type (asm , ssm , mac). Configured through the ipv6 multicast forward-mode command. |
| Group Address | If the bridge entry type is ASM or SSM, this field displays the destination IPv6 group address; if the bridge entry type is MAC, this field displays the destination MAC address. |
| Host Address | The source IPv6 host address (only applies to SSM bridge entries, otherwise this field is blank). |
| Next Interface | The destination interface for the bridge forwarding entry. |
| UpTime | The amount of time that has elapsed since the bridge forward entry was created. |

Release History

Release 8.3.1; command introduced.
Release 8.4.1.R02; **service** parameter added.

Related Commands

show ipv6 multicast bridge Displays the IPv6 multicast bridge table entries.

MIB Objects

```
alaIpmsBridgeForwardTable  
  alaIpmsBridgeForwardConfigType,  
  alaIpmsBridgeForwardAddressType,  
  alaIpmsBridgeForwardValue,  
  alaIpmsBridgeForwardType,  
  alaIpmsBridgeForwardGroupAddress,  
  alaIpmsBridgeForwardHostAddress,  
  alaIpmsBridgeForwardNextIfIndex,  
  alaIpmsBridgeForwardNextSubValue  
  alaIpmsBridgeForwardUpTime
```

show ipv6 multicast bidir-forward

Displays the IPv6 multicast Bidirectional Protocol Independent Multicast (BIDIR-PIM) forwarding table entries for the specified IPv6 multicast group address or all the entries if no IPv6 multicast group address is specified.

show ipv6 multicast bidir-forward [*ipv6_address*] [**all-vrf**]

Syntax Definitions

ipv6_address IPv6 multicast group address.
all-vrf Display forwarding table entries for all of the VRF instances.

Defaults

By default, BIDIR-PIM forwarding entries for all of the IPv6 multicast groups are displayed for the current VRF instance.

Platforms Supported

OmniSwitch 9900

Usage Guidelines

- Use the *ipv6_address* parameter to display BIDIR-PIM forwarding table entries for a specific multicast group.
- Use the **all-vrf** parameter option to display the BIDIR-PIM forwarding table entries that exist in all of the VRF instances on the switch.
- Use the **ipv6 multicast display-interface-names** command to enable displaying the associated IPv6 interface name in the “Vlan/Service” field instead of the VLAN ID or service ID.

Examples

```
-> vrf vrf-1 show ipv6 multicast bidir-forward
```

```
VRF:vrf-1 Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| ff05::6 | vlan 30 | 1/2/1 |
| | vlan 30 | 1/2/2 |
| ff05::8 | vlan 31 | 1/2/2 |

```
-> show ipv6 multicast bidir-forward all-vrf
```

```
VRF:default    Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| ff05::6 | vlan 20 | 1/1/1 |
| | vlan 20 | 1/1/2 |
| ff05::8 | vlan 21 | 1/1/2 |

```
VRF:vrf-1     Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| ff05::6 | vlan 30 | 1/2/1 |
| | vlan 30 | 1/2/2 |
| ff05::8 | vlan 31 | 1/2/2 |

Sample output when the global display interface names option is enabled:

```
-> ipv6 multicast display-interface-names
-> vrf vrf-1 show ipv6 multicast bidir-forward
```

```
VRF:vrf-1     Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| ff05::6 | IPv6ToCore2 | 1/2/1 |
| | IPv6ToCore2 | 1/2/2 |
| ff05::8 | IPv6ToLab2 | 1/2/2 |

```
-> show ipv6 multicast bidir-forward all-vrf
```

```
VRF:default    Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| ff05::6 | vlanToCore | 1/1/1 |
| | vlanToCore1 | 1/1/2 |
| ff05::8 | vlanToLab1 | 1/1/2 |

```
VRF:vrf-1     Total 3 Forwards
```

| Group Address | Egress | |
|---------------|--------------|-----------|
| | Vlan/Service | Interface |
| ff05::6 | IPv6ToCore2 | 1/2/1 |
| | IPv6ToCore2 | 1/2/2 |
| ff05::8 | IPv6ToLab2 | 1/2/2 |

output definitions

| | |
|----------------------|-----------------------------------------|
| VRF | The VRF instance for the BIDIR route. |
| Group Address | IPv6 group address for the BIDIR route. |

output definitions (continued)

| | |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Egress VLAN/Service | The destination VLAN or Shortest Path Bridging (SPB) service for the BIDIR route. If the global display interface names option is enabled, then the IPv6 interface name associated with the BIDIR route is displayed. |
| Interface | Destination VLAN port or SPB virtual port for the BIDIR route. |

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

show ipv6 multicast bridge-forward Displays the forwarding state of the IPv6 multicast bridge table entries.

  alaIpmsForwardNextType
```

show ipv6 multicast profile

Displays a list of available IPMS configuration profiles or the parameter settings for a specific profile.

show ipv6 multicast profile [*profile_name*]

Syntax Definitions

profile_name The name of an existing IPMS profile.

Defaults

By default, a list of available profiles is displayed.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The specified profile name must already exist in the switch configuration.

Examples

```
-> show ipv6 multicast profile
```

```
Total 2 Profiles
```

```
Profile Name
```

```
-----
```

```
default
```

```
IGMPv3 with Zapping
```

```
-> show ip multicast profile "IGMPv3 with Zapping"
```

32 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the DVMRP commands is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-DVMRP-MIB.mib
Module: alcatelIND1DVMRPMIB

Filename: DVMRP-STD-MIB.mib
Module: dvmrpStdMIB

A summary of the available commands is listed here:

ip load dvmrp
ip dvmrp admin-state
ip dvmrp flash-interval
ip dvmrp graft-timeout
ip dvmrp interface
ip dvmrp interface metric
ip dvmrp interface mbr-default-information
ip dvmrp neighbor-interval
ip dvmrp neighbor-timeout
ip dvmrp prune-lifetime
ip dvmrp prune-timeout
ip dvmrp report-interval
ip dvmrp route-holddown
ip dvmrp route-timeout
ip dvmrp subord-default
show ip dvmrp
show ip dvmrp interface
show ip dvmrp neighbor
show ip dvmrp nexthop
show ip dvmrp prune
show ip dvmrp route
show ip dvmrp tunnel

ip load dvmrp

Dynamically loads DVMRP to memory.

ip load dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the [ip dvmrp admin-state command on page 32-3](#).

Examples

```
-> ip load dvmrp
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp admin-state](#) Globally enables or disables DVMRP protocol on the switch.

MIB Objects

```
alaVrConfigTable  
  alaVrConfigDvmrpStatus
```

ip dvmrp admin-state

Globally enables or disables DVMRP protocol on the switch.

ip dvmrp admin-state {enable | disable}

Syntax Definitions

enable Administratively enables DVMRP on the switch.
disable Administratively disables DVMRP on the switch.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the [ip load dvmrp command on page 32-2](#).
- To enable or disable DVMRP for a particular interface, refer to the [ip dvmrp interface command on page 32-6](#).

Examples

```
-> ip dvmrp admin-state enable  
-> ip dvmrp admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.
[ip load dvmrp](#) Dynamically loads DVMRP to memory.
[show ip dvmrp](#) Displays global DVMRP parameters, including current status.

MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpAdminStatus
```

ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

ip dvmrp flash-interval *seconds*

Syntax Definitions

seconds Specifies the interval value, in seconds (5–86400).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 5 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

Examples

```
-> ip dvmrp flash-interval 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpFlashUpdateInterval
```

ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

ip dvmrp graft-timeout *seconds*

Syntax Definitions

seconds Specifies the graft message retransmission value, in seconds (5–86400).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 5 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp graft-timeout 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpGraftRetransmission

ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

ip dvmrp interface {*interface_name*}

no ip dvmrp interface {*interface_name*}

Syntax Definitions

interface_name The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

Use the **no** form of this command to delete an interface.

Examples

```
-> ip dvmrp interface vlan-10
-> no ip dvmrp interface vlan-10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------------------|-----------------------------------------------------------------------------------------------|
| ip dvmrp admin-state | Globally enables or disables the DVMRP protocol on the switch. |
| ip dvmrp interface metric | Configures the distance metric for an interface, which is used to calculate distance vectors. |
| show ip dvmrp interface | Displays information for all multicast-capable interfaces. |

MIB Objects

dvmrpInterfaceTable
 dvmrpInterfaceLocalAddress
 dvmrpInterfaceStatus

ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

ip dvmrp interface *interface_name* **metric value**

Syntax Definitions

interface_name The name of the interface.
value Specifies the metric value (1–31).

Defaults

| parameter | default |
|--------------|---------|
| <i>value</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.
[show ip dvmrp interface](#) Displays the DVMRP interface table.

MIB Objects

dvmrpInterfaceTable
 dvmrpInterfaceLocalAddress
 dvmrpInterfaceMetric

ip dvmrp interface mbr-default-information

Configures a DVMRP interface to advertise the default route for the interface. This command only applies when the local switch is operating in the Multicast Border Router (MBR) mode.

ip dvmrp interface *interface_name* **mbr-default-information** {**enable** | **disable**}

Syntax Definitions

| | |
|-----------------------|-------------------------------------------------------------------------|
| <i>interface_name</i> | The name of the interface. |
| enable | Enables advertisement of the default route on the specified interface. |
| disable | Disables advertisement of the default route on the specified interface. |

Defaults

By default, advertising the default route is disabled.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Advertising a default route on the DVMRP interface provides a method for ensuring that sources inside the PIM domain can reach all routers inside the DVMRP domain.
- Make sure that the default route is not advertised on the MBONE.

Examples

```
-> ip dvmrp interface mbr-default-information enable
-> ip dvmrp interface mbr-default-information disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

| | |
|-----------------------------------------|------------------------------------------------------------------|
| ip dvmrp interface | Enables or disables the DVMRP protocol on a specified interface. |
| show ip dvmrp interface | Displays the DVMRP interface table. |

MIB Objects

```
alaDvmrpIfAugTable
  alaDvmrpIfMbrDefaultInfoStatus
```

ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

ip dvmrp neighbor-interval *seconds*

Syntax Definitions

seconds Specifies the probe interval time, in seconds (5–30).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 10 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-interval 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip dvmrp neighbor-timeout](#) Configures the neighbor timeout.
- [show ip dvmrp neighbor](#) Displays the DVMRP neighbor table.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpNeighborProbeInterval

ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

ip dvmrp neighbor-timeout *seconds*

Syntax Definitions

seconds Specifies the neighbor timeout, in seconds (5–86400).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 35 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-timeout 35
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip dvmrp neighbor-interval](#) Configures the neighbor probe interval time.
- [show ip dvmrp neighbor](#) Displays the DVMRP neighbor table.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpNeighborTimeout

ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

ip dvmrp prune-lifetime *seconds*

Syntax Definitions

seconds Specifies the prune lifetime, in seconds (180–86400).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 7200 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-lifetime 7200
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- | | |
|----------------------------------------|----------------------------------------------------------------------------|
| ip dvmrp prune-timeout | Configures the prune packet retransmission value. |
| show ip dvmrp prune | Displays DVMRP prune entries, including the router's upstream prune state. |
| show ip dvmrp | Displays the global DVMRP parameters. |

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpPruneLifetime

ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

ip dvmrp prune-timeout *seconds*

Syntax Definitions

seconds Specifies retransmission time, in seconds (30–86400).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 30 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-timeout 30
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip dvmrp prune-lifetime](#) Indicates the length of time a prune will be in effect.
- [show ip dvmrp prune](#) Displays DVMRP prune entries, including the router's upstream prune state.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpPruneRetransmission

ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

ip dvmrp report-interval *seconds*

Syntax Definitions

seconds Specifies the report interval, in seconds (10–2000).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp report-interval 60
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip dvmrp route](#) Displays the DVMRP routes that are being advertised to other routers.

[show ip dvmrp](#) Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpRouteReportInterval

ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

ip dvmrp route-holddown *seconds*

Syntax Definitions

seconds Specifies the holddown time, in seconds (1–86400).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 120 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-holddown 120
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------------------|-----------------------------------------------------------------------|
| ip dvmrp route-timeout | Configures the route expiration timeout value. |
| show ip dvmrp | Displays the global DVMRP parameters. |
| show ip dvmrp route | Displays the DVMRP routes that are being advertised to other routers. |

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpRouteHoldDown

ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

ip dvmrp route-timeout *seconds*

Syntax Definitions

seconds Specifies the timeout value, in seconds (20–4000).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 140 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-timeout 140
```

Release History

Release 7.1.1; command was introduced.

Related Commands

- [ip dvmrp route-holddown](#) Configures the time during which DVMRP routes are kept in a hold down state.
- [show ip dvmrp](#) Displays the global DVMRP parameters.

MIB Objects

alaDvmrpGlobalConfig
alaDvmrpRouteExpirationTimeout

ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

ip dvmrp subord-default {true | false}

Syntax Definitions

| | |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| true | DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery. |
| false | DVMRP neighbors are <i>not</i> assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency. |

Defaults

| parameter | default |
|--------------|---------|
| true false | true |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a subordinate be changed to false.
- To view the current subordinate neighbor status, use the [show ip dvmrp](#) command.

Examples

```
-> ip dvmrp subord-default false
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

N/A

Examples

```
-> show ip dvmrp
DVMRP Admin Status          = enabled,
Flash Interval               = 5,
Graft Timeout                = 5,
Neighbor Interval           = 10,
Neighbor Timeout             = 35,
Prune Lifetime               = 7200,
Prune Timeout                = 30,
Report Interval              = 60,
Route Holddown               = 120,
Route Timeout                = 140,
Subord Default                = true,
BFD status                   = disabled,
MBR Operational Status      = enabled,

Number of Routes              = 3,
Number of Reachable Routes   = 3
```

output definitions

DVMRP Admin Status

The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, use the **ip dvmrp admin-state** command.

Flash Interval

The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

output definitions (continued)

| | |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Graft Timeout | The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Valid range from 5–86400. The default value is 5. |
| Neighbor Interval | The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Valid range from 5–30. The default value is 10. |
| Neighbor Timeout | The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Valid range from 5–86400. The default value is 35. |
| Prune Lifetime | The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Valid range from 180–86400. The default value is 7200. |
| Prune Timeout | The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Valid range from 30–86400. The default value is 30. |
| Report Interval | The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Valid range from 10–2000. The default value is 60. |
| Route Holddown | The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Valid range from 1–120. The default value is 120. |
| Route Timeout | The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Valid range from 20–4000. The default value is 140. |
| Subord Default | Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, use the ip dvmrp subord-default command. Options include true and false . The default value is true. |
| BFD Status | Not supported in the current release. |
| MBR Operational Status | Indicates whether or not DVMRP interaction with PIM is enabled or disabled on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface. |

output definitions (continued)

| | |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of Routes | The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes. |
| Number of Reachable Routes | The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR Operational Status** field added.

show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

show ip dvmrp interface [*ip_address* | *interface_name* | **enabled** | **disabled**]

Syntax Definitions

| | |
|-----------------------|-----------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | Specifies a particular interface IP address. |
| <i>interface_name</i> | The name of the interface. |
| enabled | Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>enabled</i> . |
| disabled | Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>disabled</i> . |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as **enabled** in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

Examples

```
-> show ip dvmrp interface
```

```
Total 4 Interfaces
```

| Interface Name | Vlan | Metric | Admin-Status | Oper-Status | BFD-Status | MBR-Default |
|----------------|------|--------|--------------|-------------|------------|-------------|
| vlan-4 | 4 | 1 | Disabled | Disabled | Disabled | Disabled |
| vlan-6 | 6 | 1 | Enabled | Enabled | Disabled | Enabled |

```
-> show ip dvmrp interface enabled
```

```
Total 1 Interfaces
```

| Interface Name | Vlan | Metric | Admin-Status | Oper-Status | BFD-Status | MBR-Default |
|----------------|------|--------|--------------|-------------|------------|-------------|
| vlan-6 | 6 | 1 | Enabled | Enabled | Disabled | Enabled |

output definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the interface. |
| Vlan | The associated VLAN ID. |
| Tunnel | Indicates whether there is a DVMRP tunnel currently configured on the interface. |
| Metric | The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost. |
| Admin-Status | The current administrative status of the corresponding interface. Options include Enabled or Disabled . An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the ip dvmrp interface command. |
| Oper-Status | The current operational status of the corresponding multicast-capable interface. Options include Enabled or Disabled . For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the ip dvmrp admin-state command. |
| BFD-Status | Not supported in the current release. |
| MBR-Default | Whether or not the DVMRP interface will advertise a default route when the interface is configured on a Multicast Border Router. Options include Enabled or Disabled . Configured through the ip dvmrp interface mbr-default-information command. |

Release History

Release 7.1.1; command was introduced.
Release 7.3.2; **MBR-Default** field added.

Related Commands

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.

show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

show ip dvmrp neighbor [*ip_address*]

Syntax Definitions

ip_address Specifies a particular IP address for a neighboring DVMRP router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

Examples

-> show ip dvmrp neighbor

| Neighbor Address | Intf Name | Uptime | Expires | GenID | Vers | State |
|------------------|-----------|-------------|-------------|-----------|-------|--------|
| 143.209.92.214 | vlan-2 | 00h:09m:12s | 00h:00m:06s | 546947509 | 3.255 | active |

output definitions

| | |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor Address | The 32-bit IP address of the DVMRP neighbor's router interface. |
| Intf Name | The interface name of the neighbor's router. |
| Uptime | The amount of time the neighbor has been running, displayed in hours, minutes, and seconds. |
| Expires | The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds. |
| GenID | The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent. |
| Version | The DVMRP version number for the neighbor. |
| State | The current state of the DVMRP neighbor. Options include active and down . |

Release History

Release 7.1.1; command was introduced.

Related Commands

- ip dvmrp neighbor-interval** Configures the neighbor probe interval time.
ip dvmrp neighbor-timeout Configures the neighbor timeout.

MIB Objects

  dvmrpNeighborMinorVersion  
  dvmrpNeighborState
```

show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

show ip dvmrp nexthop [*ip_address ip_mask*]

Syntax Definitions

| | |
|-------------------|-----------------------------------------------------------------------------------|
| <i>ip_address</i> | Specifies a source IP address for which DVMRP next hop entries will be displayed. |
| <i>ip_mask</i> | Specifies a source IP mask for which DVMRP next hop entries will be displayed. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0
```

| Src Address/Mask | Interface Name | Vlan | Hop Type |
|------------------|----------------|------|----------|
| 172.22.2.115/24 | vlan-2 | 2 | branch |

output definitions

| | |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Src Address/Mask | The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/). |
| Interface Name | The name of the interface. |
| Vlan | The associated VLAN ID. |
| Hop Type | The hop type of the associated entry. Options include leaf or branch . If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as branch . |

Release History

Release 7.1.1; command was introduced.

show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

show ip dvmrp prune [*group_address source_address source_mask*]

Syntax Definitions

| | |
|-----------------------|-----------------------------------|
| <i>group_address</i> | Specifies a pruned group address. |
| <i>source_address</i> | Specifies a source IP address. |
| <i>source_mask</i> | Specifies a source IP mask. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

Examples

```
-> show ip dvmrp prune
```

```
Group Address      Source Address/Mask  Expires
-----+-----+-----
225.0.0.4          143.209.92.14/24    00h:00m:30s
```

output definitions

| | |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Group Address | The 32-bit multicast group address. |
| Source Address/Mask | The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/). |
| Expires | The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds. |

Release History

Release 7.1.1; command was introduced.

show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

show ip dvmrp route [*ip_address ip_mask*]

Syntax Definitions

ip_address The 32-bit source IP address representing route(s).
ip_mask A 32-bit number that determines the subnet mask for the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

Examples

```
-> show ip dvmrp route
Legends:  Flags:  L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid
      Address/Mask      Gateway      Metric      Age      Expires      Flags
-----+-----+-----+-----+-----+-----
      11.0.0.0/8        55.0.0.5        2      00h:13m:14s  02m:07s      R
      22.0.0.0/8        44.0.0.4        2      00h:33m:14s  02m:15s      R
      44.0.0.0/8        -                1      05h:24m:59s  -            L
      55.0.0.0/8        -                1      05h:24m:59s  -            L
      66.0.0.0/8        44.0.0.4        2      00h:03m:11s  02m:15s      R
```

output definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Mask | The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24, etc. |
| Gateway | The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes. |
| Metric | The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost. |
| Age | The current age of the DVMRP route, displayed in hours, minutes, and seconds. |

output definitions (continued)

| | |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expires | The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes. |
| Flags | The flag type of a particular DVMRP route. Options include L (Local), R (Remote), F (Flash), H (Holddown), and I (Invalid). |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------------|------------------------------------------------------------------------------|
| ip dvmrp report-interval | Configures the route report interval. |

```

show ip dvmrp tunnel

Displays DVMRP tunnel entries.

show ip dvmrp tunnel [*local_address remote_address*]

Syntax Definitions

local_address

The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.

remote_mask

The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

Examples

-> show ip dvmrp tunnel

| Interface Name | Local Address | Remote Address | TTL | Status |
|----------------|----------------|----------------|-----|---------|
| vlan-2 | 143.209.92.203 | 12.0.0.1 | 255 | Enabled |

output definitions

| | |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The interface name. |
| Local Address | The 32-bit local IP address for the DVMRP tunnel. |
| Remote Address | The 32-bit remote IP address for the DVMRP tunnel. |
| TTL | The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Valid range from 0–255. |
| Status | The corresponding interface status. Options include Enabled or Disabled . If the interface specified by the local address has been configured and is operationally enabled, the status is Enabled . If the interface is down, the value displayed is Disabled . |

Release History

Release 7.1.1; command was introduced.

33 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only through specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs).

PIM-SM builds unidirectional shared trees that are rooted at a Rendezvous Point (RP) multicast router. Bidirectional PIM (BIDIR-PIM) is a variant of PIM-SM that builds bidirectional shared trees also rooted at an RP. However, BIDIR-PIM forwards packets from the source to the RP without the overhead of encapsulation or source-specific states.

PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

The OmniSwitch implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

Filename: ALCATEL-IND1-VIRTUALROUTER-MIB.mib
Module: alcatelIND1VirtualRouterMIB

Filename: ALCATEL-IND1-PIM-MIB.mib
Module: alcatelIND1PIMMIB

Filename: PIM-BSR-MIB.mib
Module: pimBsrMIB

Filename: PIM-STD-MIB.mib
Module: pimStdMIB

A summary of the available commands is listed here:

| | |
|------------------------------------------------------|------------------------------------------|
| ip load pim | show ip pim static-rp |

| show ip pim interface | |

ip load pim

Dynamically loads PIM to memory.

ip load pim

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip load pim
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------|------------------------------------------------------------------------------------|
| ip pim sparse admin-state | Globally enables or disables the PIM-SM protocol on the switch. |

| show ipv6 pim dense | Displays the status of the various global parameters for the IPv6 PIM dense mode. |

MIB Objects

```
alaVrConfigTable  
  alaVrConfigPimStatus
```

ip pim sparse admin-state

Globally enables or disables PIM-SM protocol on the switch.

ip pim sparse admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------|
| enable | Globally enables PIM-SM on the switch. |
| disable | Globally disables PIM-SM on the switch. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim sparse admin-state enable
-> ip pim sparse admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------|-------------------------------------------------------------------------------|
| ip pim interface | Enables or disables the PIM protocol on a specific interface. |

MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmAdminStatus
```

ip pim bidir admin-state

Globally enables or disables the BIDIR-PIM protocol on the switch.

```
ip pim bidir admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|--------------------------------------------|
| enable | Globally enables BIDIR-PIM on the switch. |
| disable | Globally disables BIDIR-PIM on the switch. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- BIDIR-PIM is a variant of PIM-SM, which means that PIM-SM must also be globally enabled on the switch.

Examples

```
-> ip pim bidir admin-state enable
-> ip pim bidir admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

alaPimsmGlobalConfig
  alaPimsmBidirStatus
```

ip pim dense admin-state

Globally enables or disables PIM-DM protocol on the switch.

ip pim dense admin-state {enable | disable}

Syntax Definitions

enable Globally enables PIM-DM on the switch.
disable Globally disables PIM-DM on the switch.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim dense admin-state enable
-> ip pim dense admin-state disable
```

Release History

Release 7.1.1; command was introduced.

alaPimdmGlobalConfig
alaPimdmAdminStatus
```

ip pim rp-hash admin-state

Configures the version of the hashing algorithm that the Rendezvous Point (RP) hashing function will use to select an RP.

ip pim rp-hash admin-state {enable | disable}

Syntax Definitions

enable Applies the newer version of the hashing algorithm.
disable Applies the legacy version of the hashing algorithm.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The RP hashing function is applied when selecting an RP from two or more equal group-range-to-RP mappings.
- To maintain interoperability between PIM routers, make sure all routers have the same setting for the RP hash function. For example, this function is enabled for all PIM routers or this function is disabled for all PIM routers.

Examples

```
-> ip pim rp-hash admin-state enable  
-> ip pim rp-hash admin-state disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmRPHashStatus
```

ip pim ssm group

Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ip pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ip pim ssm group group_address/prefix_length
```

Syntax Definitions

| | |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group_address</i> | Specifies a 32-bit group address. |
| <i>/prefix_length</i> | Specifies the prefix length of the multicast group. |
| override | Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s). |
| <i>priority</i> | Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128. |

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

Examples

```
-> ip pim ssm group 225.0.0.0/24 priority 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------|-----------------------------------------------------------------------------------------------------------------|
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ip pim ssm group | Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode. |
| show ip pim group-map | Displays the PIM group mapping table. |

MIB Objects

  pimStaticRPGrpAddress
  pimStaticRPGrpPrefixLength
  pimStaticRPPimMode
  pimStaticRPPrecedence
  pimStaticRPOverrideDynamic
  pimStaticRPRowStatus
```

ip pim dense group

Statically maps the specified IP multicast group(s) to the PIM Dense mode (DM).

ip pim dense group *group_address/prefix_length* [[**no**] **override**] [**priority** *priority*]

no ip pim dense group *group_address/prefix_length*

Syntax Definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group_address</i> | Specifies a 32-bit group address. |
| <i>/prefix_length</i> | Specifies the prefix length of the multicast group. |
| override | Specifies that this static Dense mode mapping configuration should override the dynamically learned group mapping information for the specified group(s). |
| <i>priority</i> | Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128. |

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ip pim dense group 225.0.0.0/24 priority 50
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ip pim cbsr *ip_address* [**priority** *priority*] [**mask-length** *bits*]

no ip pim cbsr *ip_address*

Syntax Definitions

| | |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip_address</i> | Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR. |
| <i>priority</i> | Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0–255. |
| <i>bits</i> | Specifies a 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1–32. |

Defaults

| parameter | default |
|-----------------|---------|
| <i>priority</i> | 64 |
| <i>bits</i> | 30 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ip pim cbsr`

Displays the Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

```
pimBsrCandidateBSRTable  
  pimBsrCandidateBSRAddress  
  pimBsrCandidateBSRPriority  
  pimBsrCandidateBSRHashMaskLength  
  pimBsrCandidateBSRRowStatus
```

ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

ip pim static-rp *group_address/prefix_length rp_address* [[no] **bidir**] [[no] **override**] [**priority** *priority*]

no ip pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

| | |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group_address</i> | Specifies a 32-bit group address. |
| <i>/prefix_length</i> | Specifies the prefix length of the multicast group. |
| <i>rp_address</i> | Specifies a 32-bit Rendezvous Point (RP) address. |
| bidir | Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. |
| override | Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s). |
| <i>priority</i> | Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128. |

Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to unset the priority

- To view current static RP configuration settings, use the **show ip pim static-rp** command.

Examples

```
-> ip pim static-rp 225.0.0.0/24 10.1.1.1 priority 10
-> ip pin static-rp 225.0.0.0/24 10.1.1.1 bidir override
-> no ip pin static-rp 225.0.0.0/24 10.1.1.1
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

| | |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ip pim static-rp | Displays the PIM static RP table for ASM mode, which includes the group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled). |
| show ip pim group-map | Displays the PIM group mapping table. |

MIB Objects

```
pimStaticRPTable
  pimStaticRPGrpAddress
  pimStaticRPGrpPrefixLength
  pimStaticRPRPAddress
  pimStaticRPPimMode
  pimStaticRPOverrideDynamic
  pimStaticRPPrecedence
  pimStaticRPRowStatus
```

ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

ip pim candidate-rp *rp_address group-address/prefix_length* [[**no**] **bidir**] [**priority** *priority*] [**interval** *seconds*]

no ip pim candidate-rp *rp_address group-address/prefix_length*

Syntax Definitions

| | |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>rp_address</i> | Specifies a 32-bit address that will be advertised as a Candidate-RP. |
| <i>group_address</i> | Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP. |
| <i>/prefix_length</i> | Specifies the prefix length of the multicast group. |
| bidir | Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. |
| <i>priority</i> | Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority. |
| <i>seconds</i> | Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300. |

Defaults

| parameter | default |
|----------------------------|-----------------|
| [no] bidir | no bidir |
| <i>priority</i> | 192 |
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple C-RP entries are defined, they must specify the same *rp-address*.
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the C-RP entries.

- This command is supported only in the sparse mode.

Examples

```
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 priority 100 interval 100
-> ip pim candidate-rp 50.1.1.1 225.0.0.0/24 bidir priority 100 interval 100
-> no ip pim candidate-rp 50.1.1.1 225.0.0.0/24
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

show ip pim candidate-rp Displays the IP multicast groups for which the local router will advertise itself as a Candidate-RP.

MIB Objects

```
pimBsrCandidateRPTable
  pimBsrCandidateRPAddress
  pimBsrCandidateRPGroupAddress
  pimBsrCandidateRPGroupPrefixLength
  pimBsrCandidateRPBidir
  pimBsrCandidateRPPriority

  pimBsrCandidateRPRowStatus
```

ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

ip pim rp-threshold *bps*

Syntax Definitions

bps The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

Defaults

| parameter | default |
|------------|---------|
| <i>bps</i> | 1 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the [show ip pim sparse](#) command.

Examples

```
-> ip pim rp-threshold 131072
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the global parameters for PIM sparse mode.

MIB Objects

alaPismGlobalConfig
alaPismRPThreshold

ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

ip pim keepalive-period *seconds*

Syntax Definitions

seconds Specifies the timeout value, in seconds (0-65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 210 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

Examples

```
-> ip pim keepalive-period 500
```

Release History

Release 7.1.1; command was introduced.

Related Commands

|-----------------------------|------------------------------------------------------------------------------------|
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ip pim dense | Displays the status of the various global parameters for the PIM dense mode. |
| show ipv6 pim sparse | Displays the status of the various global parameters for the IPv6 PIM sparse mode. |
| show ipv6 pim dense | Displays the status of the various global parameters for the IPv6 PIM dense mode. |

MIB Objects

pim
pimKeepalivePeriod

ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

ip pim max-rps *number*

Syntax Definitions

number The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

Defaults

| parameter | default |
|---------------|---------|
| <i>number</i> | 32 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the [ip pim sparse admin-state command on page 33-5](#).

Examples

```
-> ip pim max-rps 32
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|------------------------------------|------------------------------------------------------------------------------------|
| ip pim sparse admin-state | Globally enables or disables the PIM-SM protocol on the switch. |
| ipv6 pim sparse admin-state | Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6. |
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ipv6 pim sparse | Displays the status of the various global parameters for the IPv6 PIM sparse mode. |

MIB Objects

alaPimsmGlobalConfig
alaPimsmMaxRPs

ip pim probe-time

Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.

ip pim probe-time *seconds*

Syntax Definitions

seconds The probe time, in seconds (1–300).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 5 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is used with both IPv4 and IPv6 PIM-SM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim probe-time 5
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|--------------------------------------|------------------------------------------------------------------------------------|
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ipv6 pim sparse | Displays the status of the various global parameters for the IPv6 PIM sparse mode. |

MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmProbeTime
```

ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

ip pim register checksum {header | full}

Syntax Definitions

| | |
|---------------|---------------------------------------------------------------------------|
| header | Specifies that the checksum for registers is done only on the PIM header. |
| full | Specifies that the checksum is done over the entire PIM register message. |

Defaults

| parameter | default |
|---------------|---------|
| header full | header |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
alaPimsmOldRegisterMessageSupport
```

ip pim register-suppress-timeout

Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

ip pim register-suppress-timeout *seconds*

Syntax Definitions

seconds The timeout value, in seconds (0–65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register-suppress-timeout 10
```

Release History

Release 7.1.1; command was introduced.

Related Commands

|--------------------------------------|------------------------------------------------------------------------------------|
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ipv6 pim sparse | Displays the status of the various global parameters for the IPv6 PIM sparse mode. |

MIB Objects

```
pim  
  pimRegisterSuppressionTime
```

ip pim register-rate-limit

Configures the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry.

ip pim register-rate-limit *pps*

Syntax Definitions

pps The per (S,G) register rate limit in packets per second (0–65535).

Defaults

By default, the register rate limit is set to zero (no rate-limiting is applied to outgoing PIM Register messages).

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Setting the register rate limit to zero (the default) disables register rate limiting.
- Rate limiting is applied on a per (S,G) flow basis.
- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register-rate-limit 100
-> ip pim register-rate-limit 0
```

Release History

Release 8.4.1.R02; command was introduced.

Related Commands

alaPimsmGlobalConfigTable
  alaPimsmRegisterRateLimit
```

ip pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

ip pim spt admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|--------------------------------------------|
| enable | Enables last hop DR switching to the SPT. |
| disable | Disables last hop DR switching to the SPT. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the [show ip pim sparse](#) command.

Examples

```
-> ip pim spt admin-state enable
-> ip pim spt admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmAdminSPTConfig
```

ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

ip pim state-refresh-interval *seconds*

Syntax Definitions

seconds The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-interval 80
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| show ipv6 pim dense | Displays the status of the various global parameters for the IPv6 PIM dense mode. |

MIB Objects

pim
pimRefreshInterval

ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

ip pim state-refresh- limit *ticks*

Syntax Definitions

ticks The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

Defaults

| parameter | default |
|--------------|---------|
| <i>ticks</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

Examples

```
-> ip pim state-refresh-limit 2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

alaPimdmGlobalConfig  
  alaPimdmStateRefreshLimitInterval
```

ip pim state-refresh-ttl

Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

ip pim state-refresh-ttl *num*

Syntax Definitions

num The Time to Live to be used. Values may range from 0 to 255.

Defaults

| parameter | default |
|------------|---------|
| <i>num</i> | 16 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-ttl 122
```

Release History

Release 7.1.1; command was introduced.

Related Commands

MIB Objects

```
alaPimdmGlobalConfig  
  alaPimdmStateRefreshTimeToLive
```

ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

```
ip pim interface if_name
  [hello-interval seconds]
  [triggered-hello seconds]
  [joinprune-interval seconds]
  [hello-holdtime seconds]
  [joinprune-holdtime seconds]
  [prune-delay milliseconds]
  [override-interval milliseconds]
  [dr-priority priority]
  [prune-limit-interval seconds]
  [graft-retry-interval seconds]
  [df-election-robustness messages]
  [[no] stub]
```

```
no ip pim interface if_name
```

Syntax Definitions

| | |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The interface name on which PIM is being enabled or disabled. |
| hello-interval <i>seconds</i> | The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values may range from 0 to 18000. |
| triggered-hello <i>seconds</i> | Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values may range from 0 to 60. |
| joinprune-interval <i>seconds</i> | The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000. |
| hello-holdtime <i>seconds</i> | Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| joinprune-holdtime <i>seconds</i> | Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| prune-delay <i>milliseconds</i> | Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767. |
| override-interval <i>milliseconds</i> | Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in <i>milliseconds</i> . Values may range from 0 to 65535. |
| dr-priority <i>priority</i> | Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority. |

| | |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prune-limit-interval <i>seconds</i> | Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| graft-retry-interval <i>seconds</i> | Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| df-election-robustness <i>messages</i> | The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM |
| stub | Specifies the interface not to send any PIM packets through this interface, and to ignore received PIM packets. |

Defaults

| parameter | default |
|-----------------------------------------------|----------|
| hello-interval <i>seconds</i> | 30 |
| triggered-hello <i>seconds</i> | 5 |
| joinprune-interval <i>seconds</i> | 60 |
| hello-holdtime <i>seconds</i> | 105 |
| joinprune-holdtime <i>seconds</i> | 210 |
| prune-delay <i>milliseconds</i> | 500 |
| override-interval <i>milliseconds</i> | 2500 |
| dr-priority <i>priority</i> | 1 |
| prune-limit-interval <i>seconds</i> | 60 |
| graft-retry-interval <i>seconds</i> | 3 |
| df-election-robustness <i>messages</i> | 3 |
| stub | Disabled |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the [ip pim sparse admin-state command on page 33-5](#). To enable or disable PIM-DM on the switch, refer to the [ip pim dense admin-state command on page 33-7](#).
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/Prune messages are not sent.

- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinite time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/ Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets through that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.
- If the IP interface on which PIM is enabled is bound to an SPB service, then PIM can operate over an SPB L3 VPN in-line routing configuration (supported only on the OmniSwitch 9900).

Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-interval
100 hello-holdtime 350 joinprune-holdtime 400
-> no ip pim interface vlan-2
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **df-election-robustness** parameter added.

Related Commands

[show ip pim interface](#)

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

```

ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

ip pim neighbor-loss-notification-period *seconds*

Syntax Definitions

seconds Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim neighbor-loss-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimNeighborLossNotificationPeriod

ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

ip pim invalid-register-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 65535 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim invalid-register-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimInvalidRegisterNotificationPeriod

ip pim invalid-joinprune-notification-period

Specifies the minimum time that must elapse between the PIM invalid joinprune notifications originated by the router.

ip pim invalid-joinprune-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between invalid joinprune notifications, in seconds (10–65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 65535 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid joinprune notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the control plane to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim invalid-joinprune-notification-period 100
```

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimInvalidJoinPruneNotificationPeriod

ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

ip pim rp-mapping-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 65535 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim rp-mapping-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimRPMappingNotificationPeriod

ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

ip pim interface-election-notification-period *seconds*

Syntax Definitions

seconds Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 65535 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim interface-election-notification-period 100
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip pim notifications](#) Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

pim
pimInterfaceElectionNotificationPeriod

ip pim nonbidir-hello-notification-period

Specifies the minimum time that must elapse between notifications that a Bidirectional PIM (BIDIR-PIM) router transmits whenever the router receives a PIM Hello message that *does not* contain the Bidirectional Capable option.

ip pim nonbidir-hello-notification-period *seconds*

Syntax Definitions

seconds The minimum time value that must elapse between notifications, in seconds. The valid range is 10–65535.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 65535 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The default value of 65535 represents an infinite time. This type of notification is never sent when this value is set to infinite time.
- The default minimum time is set to a non-zero value to provide resilience against the propagation of denial-of-service (DoS) attacks from the control plane to the network management plane.
- The Bidirectional Capable option indicates that a router is capable of participating as a BIDIR-PIM neighbor.
- This value is used with both IPv4 and IPv6 PIM.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim nonbidir-hello-notification-period 1000
-> ip pin nonbidir-hello-notification-period 65535
```

Release History

Release 7.3.4; command was introduced.

Related Commands

[ip pim df-abort](#)

Configures whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

[show ip pim notifications](#)

Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

alaPimsmGlobalConfig

 alaPimsmNonBidirHelloPeriod

ip pim df-abort

Configures whether or not the Designated Forwarder (DF) election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option.

ip pim df-abort {enable | disable}

Syntax Definitions

| | |
|----------------|--------------------------------------------------------------------------------|
| enable | Administratively enables the DF abort operation (DF election is stopped). |
| disable | Administratively disables the DF abort operation (DF election is not stopped). |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- The DF election process occurs between PIM routers that support BIDIR-PIM. When the DF abort option is disabled, this election process continues between the BIDIR-PIM routers.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim df-abort enable  
-> ip pin df-abort disable
```

Release History

Release 7.3.4; command was introduced.

Related Commands

ip pim nonbidir-hello-notification-period

Specifies the minimum time between notifications that a BIDIR-PIM router transmits when the router receives a Hello message from a neighbor that does not contain the Bidirectional Capable option.

show ip pim sparse

Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

alaPimsmGlobalConfig

alaPimsmBidirDFAbort

ip pim mbr all-sources

Configures whether or not PIM notifies DVMRP about the routes to all multicast sources learned. This command applies only when the local switch is operating as a Multicast Border Router (MBR).

ip pim mbr all-sources

no ip pim mbr all-sources

Syntax Definitions

N/A

Defaults

By default, PIM only notifies DVMRP about the routes for subnets directly connected to PIM interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable notification of all route sources learned.
- This command applies to both PIM-SM and PIM-DM. Note that PIM-SSM does not support MBR functionality.
- DVMRP advertises the routes received from PIM within the DVMRP domain using standard DVMRP mechanisms.

Examples

```
-> ip pim mbr all-sources  
-> no ip pim mbr all-sources
```

Release History

Release 7.3.2; command was introduced.

Related Commands

| | |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| show ip pim sparse | Displays the status of the various global parameters for the PIM sparse mode. |
| show ip pim dense | Displays the status of the various global parameters for the PIM dense mode. |
| ip mroute mbr | Configures the switch to operate as a Multicast Border Router to provide interoperability between PIM and DVMRP. |
| ip dvmrp interface mbr-default-information | Configures whether or not the DVMRP interface on a Multicast Border Router advertises a default route. |

MIB Objects

```
alaPimGlobalConfig  
  alaPimMbrAllSourcesStatus
```

ip pim df-periodic-interval

Sets the interval at which the Designated Forwarder (DF) for each Rendezvous Point Address (RPA) periodically announces its status in a Winner message.

ip pim df-periodic-interval *seconds*

Syntax Definitions

seconds The time interval between successive Winner messages, in seconds. The valid range is 0–2000.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the value for this interval is set to zero, no messages are sent.
- This value is used with both IPv4 BIRDIR-PIM and IPv6 BIRDIR-PIM.
- Setting this interval value provides an additional degree of safety to ensure that two routers do not both consider themselves to be the DF for the same link.
- The periodic Winner messages will only occur for RPAs that have active groups, thus avoiding the periodic control traffic in areas of the network without senders or receivers for a particular RPA.

Examples

```
-> ip pim df-periodic-interval 80  
-> ip pin df-periodic-interval 0
```

Release History

Release 7.3.4; command was introduced.

Related Commands

show ip pim sparse

Displays the status of the various global parameters for the PIM sparse mode.

show ipv6 pim sparse

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

alaPimsmGlobalConfig

alaPimsmBidirPeriodicInterval

ip pim bfd-state

Enables or disables the registration of PIM with the BFD protocol.

```
ip pim bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------------|
| enable | Enables BFD for PIM. |
| disable | Disables BFD for PIM. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and PIM must be registered with BFD at the protocol level before PIM can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and PIM acts based upon the BFD message.
- Whenever a neighbor goes down, PIM will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of PIM with the BFD protocol:

```
-> ip pim bfd-state enable  
-> ip pim bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

alaPimBfdStatus

ip pim bfd-state all-interfaces

Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.

```
ip pim bfd-state all-interfaces {enable | disable}
```

Syntax Definitions

| | |
|----------------|------------------------------------------|
| enable | Enables BFD for all the PIM interfaces. |
| disable | Disables BFD for all the PIM interfaces. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for PIM must be enabled before PIM can interact with BFD.

Examples

```
-> ip pim bfd-state all-interfaces enable  
-> ip pim bfd-state all-interfaces disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|--------------------------------------------|--------------------------------------------------------------------|
| ip pim bfd-state | Enables or disables the registration of PIM with the BFD protocol. |
| ip pim interface bfd-state | Enables or disables BFD monitoring on a specific PIM interface. |
| show ip pim interface | Displays detailed PIM settings for a specific interface. |

MIB Objects

```
alaPimGlobalConfig  
  alaPimBfdAllInterfaceStatus
```

ip pim interface bfd-state

Enables or disables BFD monitoring for a specific PIM interface.

```
ip pim interface if_name bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------------------------------------|
| <i>if_name</i> | The name of an existing PIM interface. |
| enable | Enables BFD for the specified PIM interface. |
| disable | Disables BFD for the specified PIM interface. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Registering PIM with BFD is required at the protocol level before PIM can interact with BFD.
- When BFD is enabled on the specified PIM interface, BFD monitors the connectivity to all neighbors known through the specified interface.

Examples

```
-> ip pim interface pimInt1 bfd-state enable
-> ip pim interface pimInt1 bfd-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------------------------|----------------------------------------------------------------------------------------|
| ip pim bfd-state | Enables or disables the registration of PIM with the BFD protocol. |
| ip pim bfd-state all-interfaces | Enables or disables BFD monitoring for all PIM interfaces in the switch configuration. |
| show ip pim interface | Displays detailed PIM settings for a specific interface. |

MIB Objects

```
alaPimInterfaceAugTable
  alaPimBfdStatus
```

ip pim bidir ssm-compat

Configures the status of the Source-specific Multicast (SSM) compatibility mode. When enabled, a BIDIR-PIM router will support receiving IGMPv3 SSM joins and process them as a (*,G) join.

ip pim bidir ssm-compat {enable | disable}

Syntax Definitions

enable Administratively enables BIDIR/SSM compatibility mode.
disable Administratively disables BIDIR/SSM compatibility mode.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the SSM compatibility mode is disabled, SSM joins are ignored by the BIDIR-PIM router.
- This command is only applicable if BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ip pim bidir ssm-compat enable  
-> ip pim bidir ssm-compat disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmBidirSsmCompat
```

ip pim bidir fast-join

Configures whether or not a BIDIR-PIM router will automatically create (*,G) routes in the hardware as soon as BIDIR (*,G) routes are learned.

```
ip pim bidir fast-join {enable | disable}
```

Syntax Definitions

enable Administratively enables the BIDIR-PIM fast join functionality.
disable Administratively disables the BIDIR-PIM fast join functionality.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only applicable if BIDIR-PIM is globally enabled for the switch.
- When the BIDIR fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the BIDIR fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ip pim bidir fast-join enable  
-> ip pim bidir fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmBidirFastJoin
```

ip pim sparse asm-fast-join

Configures whether or not a PIM Sparse router will automatically create (*,G) routes in the hardware as soon as the (*,G) routes are learned.

ip pim sparse asm-fast-join {enable | disable}

Syntax Definitions

enable Administratively enables the PIM Sparse ASM fast join functionality.
disable Administratively disables the PIM Sparse ASM fast join functionality.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the PIM Sparse mode.
- When the PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.
- This option should be used with caution due to the complicated nature of PIM ASM, which involves forwarding on the shared tree, the sending and receiving of PIM register packets, and switching to the SPT. As a result, only enable the ASM fast join function when there are no other locally attached sources, the router is not the RP, and the SPT is disabled.

Examples

```
-> ip pim sparse asm-fast-join enable  
-> ip pim sparse asm-fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

alaPimsmAsmFastJoin

ip pim sparse ssm-fast-join

Configures whether or not a PIM Sparse router will automatically create both PIM Sparse and SSM (S,G) routes in the hardware as soon as the (S,G) routes are learned.

```
ip pim sparse ssm-fast-join {enable | disable}
```

Syntax Definitions

enable Administratively enables the PIM Sparse SSM fast join functionality.
disable Administratively disables the PIM Sparse SSM fast join functionality.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the PIM Sparse mode.
- When the PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (S,G) routes are already created before the actual multicast traffic is received.
- When the PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ip pim sparse ssm-fast-join enable  
-> ip pim sparse ssm-fast-join disable
```

```

output definitions

| | |
|-------------------------|---------------------------------------------------------------------------------------------------------------|
| Status | The current global (i.e., switch-wide) status of PIM-SM. Options include enabled and disabled . |
| Keepalive Period | The duration of the Keepalive timer. The default value is 210. |

output definitions (continued)

| | |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max RPs | The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32. |
| Probe Time | The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5. |
| Register Checksum | The current application of the checksum function on register messages in the domain. Options include header and full . The default setting is header . |
| Register Suppress Timeout | The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60. |
| RP Threshold | Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled. |
| SPT Status | The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include enabled (the default) and disabled . |
| BIDIR Status | The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include enabled and disabled (the default). |
| BIDIR Periodic Interval | The amount of time, in seconds, between Winner messages the Designated Forwarder (DF) sends out to announce its status. The valid range is 0–2000. The default is 60 seconds. |
| BIDIR DF Abort Status | Indicates whether or not the DF election process is stopped when a BIDIR-PIM router receives a Hello message that does not contain the Bidirectional Capable option. When enabled DF election is stopped; when disabled (the default) DF election continues. |
| BFD Status | Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled or disabled (the default) for the PIM router. |
| MoFRR Status MoFRR All Routes Status | Not supported in the current release. |
| MBR All Sources Status | Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include enabled (routes to all sources) or disabled (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode. |
| MBR Operational Status | Indicates whether or not PIM interaction with DVMRP is enabled or disabled on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface. |

output definitions (continued)

| | |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RP Hash Algorithm | The status of the RP hashing algorithm. When enabled , a newer version of the algorithm is in use; when disabled (the default), a legacy version of the algorithm is in use. |
| ASM Fast Join | <i>PIM Sparse fast join is currently not supported.</i> |
| SSM Fast Join | <i>PIM Sparse fast join is currently not supported.</i> |
| BIDIR Fast Join | <i>BIDIR-PIM fast join is currently not supported.</i> |
| BIDIR SSM Compatibility | The status of the SSM compatibility mode. When enabled , a BIDIR-PIM router will accept and process SSM joins as (*,G) joins; when disabled (the default), SSM joins are ignored. |
| Register Rate Limit | The per (S,G) register rate limit in packets per second. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.

Release 7.3.4; BIDIR fields added, **RP Hash Algorithm** field added.

Release 8.2.1.R02: **ASM Fast Join**, **SSM Fast Join**, **BIDIR Fast Join**, and **BIDIR SSM Compatibility** fields added.

Release 8.4.1.R02; **Register Rate Limit** field added.

Related Commands

| | |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip pim sparse admin-state | Globally enables or disables PIM-SM protocol on the switch. |
| ip pim interface | Enables or disables the PIM protocol on a specific interface. |
| ip pim keepalive-period | Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership. |
| ip pim max-rps | Configures the maximum number of C-RP routers allowed in the PIM-SM domain. |
| ip pim probe-time | Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. |
| ip pim register checksum | Configures the application of the checksum function on sent and received register messages in the domain. |
| ip pim register-suppress-timeout | Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message. |
| ip pim register-rate-limit | Specifies the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry. |
| ip pim rp-threshold | Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source. |

| | |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip pim spt admin-state | Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received. |
| ip pim bidir admin-state | Globally enables or disables BIDIR-PIM protocol on the switch. |
| ip pim df-periodic-interval | Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message |
| ip pim df-abort | Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option. |
| ip pim bfd-state | Enables or disables the registration of PIM with the BFD protocol. |
| ip pim mbr all-sources | Configures PIM to notify DVMRP of all learned routes to sources. This command only applies when the switch is operating in the Multicast Border Router mode. |
| ip pim rp-hash admin-state | Globally enables or disables the RP hashing algorithm version for the switch. |
| ip pim bidir ssm-compat | Configures the SSM compatibility mode for a BIDIR-PIM router. |

MoFRR Status = disabled,
MBR All Sources Status = disabled,
MBR Operational Status = enabled
```

output definitions

| | |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Status | The current global (i.e., switch-wide) status of PIM-DM. Options include enabled and disabled . |
| Source Lifetime | The duration of the Keepalive or Source Lifetime timer. The default value is 210. |
| State Refresh Interval | The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60. |
| State Refresh Limit Interval | Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. |
| State Refresh TTL | Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16. |
| BFD Status | Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled or disabled (the default) for the PIM router. |
| MoFRR Status | Not supported in the current release. |

output definitions (continued)

| | |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBR All Sources Status | Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include enabled (routes to all sources) or disabled (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode. |
| MBR Operational Status | Indicates whether or not PIM interaction with DVMRP is enabled or disabled on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.2; **MBR All Sources Status** and **MBR Operational Status** fields added.

show ip pim ssm group

Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

show ip pim ssm group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

Examples

```
-> show ip pim ssm group
Group Address/Prefix RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
225.0.0.0/24      0.0.0.0      ssm   false   none   enabled
```

output definitions

| | |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address/Prefix | The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). |
| RP Address | A 32-bit IP address that is the Rendezvous Point (RP) for groups within the group prefix. |
| Mode | The PIM mode to be used for groups in this prefix. The possible values include asm , ssm , or dm . |
| Override | Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s). |
| Precedence | Specifies the precedence value to be used for this static RP configuration. |
| Status | Displays whether this entry is currently enabled or disabled. Options include enabled and disabled . |

 alaPimdmDenseGroupRowStatus

show ip pim neighbor

Displays a list of active PIM neighbors.

show ip pim neighbor [*ip_address*]

Syntax Definitions

ip_address The 32-bit IP address for the PIM neighbor.

Defaults

If a neighbor's IP address is not specified, the entire PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IP address in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ip pim neighbor
Neighbor Address    Interface Name        Uptime            Expires            DR Priority
-----+-----+-----+-----+-----
212.61.20.250        vlan-2                01h:07m:07s    00h:01m:38s    100
212.61.60.200        vlan-6                01h:07m:07s    00h:01m:38s    100
214.28.4.254         vlan-26               01h:07m:07s    00h:01m:38s    100
```

If a specific neighbor IP address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ip pim neighbor 212.61.30.7
Neighbor IP Address        = 212.61.30.7,
Interface Name             = vlan-30,
Uptime                     = 00h:04m:14s,
Expires                    = 00h:01m:31s,
Lan Prune Delay Present    = true,
Propagation Delay          = 500,
Override Interval          = 2500,
TBit field                 = false,
Gen ID Present             = true,
Gen ID Value               = 0x79ca868e,
BiDir Capable             = false,
DR Priority Present         = true,
DR Priority                 = 1,
State Refresh Capable     = true
```

output definitions

| | |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor (IP) Address | The 32-bit IP address of the active PIM neighbor. |
| Interface Name | The name of the interface used to reach this PIM neighbor. |
| Uptime | The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds. |
| Expiry time | The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds. |
| Lan Prune Delay Present | Evaluates to TRUE if this neighbor is using the Lan Prune Delay option. |
| Propagation Delay | The expected propagation delay between PIM routers on this network. |
| DR Priority Present | Evaluates to TRUE if the neighbor is using the DR Priority option. |
| DR Priority | The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE. |
| TBit field | The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression. |
| Generation ID Present | Evaluates to TRUE if this neighbor is using the Generation ID option. |
| Generation ID Value | The value of the Generation ID from the last PIM Hello message received from the neighbor. |
| BiDir Capable | Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option. |
| State Refresh Capable | Displays whether the neighbor is capable of receiving State Refresh messages. Options include true or false . |
| Override Interval | The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500. |

Release History

Release 7.1.1; command was introduced.

show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

show ip pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip pim candidate-rp
RP Address      Group Address      Priority  Interval  Mode  Status
-----+-----+-----+-----+-----+-----
40.1.50.25     225.0.0.0/8       192      60       bidir enabled
```

output definitions

| | |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RP Address | A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP). |
| Group Address | The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash character (/). This is the group for which the local router advertises itself as a C-RP. |
| Priority | The C-RP router's priority. The lower the value, the higher the priority. |
| Interval | The time interval at which the C-RP advertisements are sent to the BSR. |
| Mode | Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group. |
| Status | The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **Mode** field added.

Related Commands

[ip pim candidate-rp](#)

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

MIB Objects

```
pimBsrCandidateRPTable
  pimBsrCandidateRPAddressType
  pimBsrCandidateRPAddress
  pimBsrCandidateRPGroupAddress
  pimBsrCandidateRPGroupPrefixLength

  pimBsrCandidateRPAdvTimer
  pimBsrCandidateRPPriority
  pimBsrCandidateRPAdvInterval
  pimBsrCandidateRPHoldtime
  pimBsrCandidateRPStatus
  pimBsrCandidateRPStorageType
```

show ip pim group-map

Displays the PIM group mapping table.

show ip pim group-map [**bsr** | **static-rp** | **ssm** | **dense**]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ip pim group-map
```

| Origin | Group Address/Pref Length | RP Address | Mode | Precedence |
|-----------|---------------------------|--------------|-------|------------|
| BSR | 225.0.0.0/24 | 172.21.63.11 | asm | 192 |
| BSR | 225.0.0.0/24 | 214.0.0.7 | asm | 192 |
| BSR | 225.0.0.0/8 | 40.1.50.25 | bidir | 192 |
| Static RP | 226.0.0.0/8 | 10.11.203.8 | bidir | none |
| Static RP | 232.0.0.0/8 | | ssm | |

```
-> show ip pim group-map bsr
```

| Origin | Group Address/Pref Length | RP Address | Mode | Precedence |
|--------|---------------------------|--------------|-------|------------|
| BSR | 225.0.0.0/24 | 172.21.63.11 | asm | 192 |
| BSR | 225.0.0.0/24 | 214.0.0.7 | asm | 192 |
| BSR | 225.0.0.0/8 | 40.1.50.25 | bidir | 192 |

```

-> show ip pim group-map static-rp
Origin      Group Address/Pref Length  RP Address  Mode  Precedence
-----+-----+-----+-----+-----
Static RP 226.0.0.0/8          10.11.203.8  bidir none
Static RP 232.0.0.0/8          ssm

```

output definitions

| | |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Origin | The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism. |
| Group Address/Prefix Length | The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). |
| RP Address | The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM. |
| Mode | The PIM mode to be used for groups in this prefix. |
| Mapping Precedence | The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence. |

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4; **bidir** mode support added.

Related Commands

| | |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ip pim ssm group | Creates and manages the static configuration of a Source Specific Multicast mode group mappings. |
| ip pim dense group | Creates and manages the static configuration of dense mode (DM) group mappings. |
| ip pim static-rp | Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters). |

MIB Objects

  pimGroupMappingPrecedence
```

show ip pim interface

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

show ip pim interface [*if_name*]

Syntax Definitions

if_name The interface name.

Defaults

By default, displays a summary list of IP PIM interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ip pim interface
```

```
Total 1 Interfaces
```

| Interface Name | IP Address | Designated Router | Hello Interval | J/P Interval | Oper Status | BFD Status |
|----------------|-------------|-------------------|----------------|--------------|-------------|------------|
| vlan-203 | 11.12.203.8 | 11.12.203.8 | 30 | 60 | disabled | disabled |

```
-> show ip pim interface vlan-203
```

```
Interface Name      = vlan-203,
IP Address          = 11.12.203.8,
Designated Router   = 11.12.203.8,
Hello Interval      = 30,
Triggered Hello Interval = 5,
Hello HoldTime      = 105,
Join/Prune Interval = 60,
Join/Prune HoldTime = 210,
Propagation (Prune) Delay = 500,
Override Interval   = 2500,
Generation ID       = 0x53291e4c,
DR Priority          = 1,
DR Priority Enabled  = true,
Lan Delay Enabled   = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled = true,
```

```

Stub Interface           = false,
Prune Limit Interval    = 60,
Graft Retry Interval    = 3,
State Refresh Enabled   = true,
BiDir Capable           = false,
DF Election Robustness  = 3,
Operational Status      = disabled,
BFD Status              = disabled

```

output definitions

| | |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the interface on which PIM is enabled. |
| IP address | Specifies the IP address of the specified interface. |
| Designated Router | The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR. |
| Hello Interval | The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30. |
| Triggered Hello Interval | The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 1 to 60. The default value is 5. |
| Hello Holdtime | The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105. |
| Join/Prune Interval | The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 1 to 18000. |
| Join/Prune Holdtime | The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210. |
| Propagation (Prune) Delay Override Interval | The expected propagation delay between PIM routers on this network. The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500. |
| Generation ID | The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface. |
| DR Priority | Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1. |
| DR Priority Enabled | Evaluates to TRUE if all routers on this interface are using the DR Priority option. |

output definitions (continued)

| | |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lan Delay Enabled | Options include true and false . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false. |
| Effective Propagation Delay | The Effective Propagation Delay on this interface. |
| Effective Override Interval | The Effective Override Interval on this interface. |
| Suppression Enabled | Specifies whether the Join suppression is enabled on this interface. |
| Stub Interface | Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored. |
| Prune Limit Interval | The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. |
| Graft Retry Interval | Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values may range from 1 to 65535. The default value is 3. |
| State Refresh Enabled | Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM. |
| BiDir Capable | Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM. |
| DF Election Robustness | The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM. |
| Operational Status | The current operational status of the corresponding interface. Options include enabled and disabled . This value indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. The default setting is disabled . To globally enable or disable PIM on the switch, use the ip pim sparse admin-state and ip pim dense admin-state commands. |
| BFD Status | Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled or disabled (the default) for the PIM interface. Configured through the ip pim interface bfd-state command. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.

Related Commands

ip pim interface Enables or disables the PIM protocol on a specific interface.

show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

show ip pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ip pim static-rp
Group Address/Pref Length  RP Address  Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
225.0.0.0/24              172.21.63.11  asm   false   none     enabled
226.0.0.0/8               10.11.203.8   bidir false   none     enabled
```

output definitions

| | |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address/Pref Length | The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the ip pim static-rp command on page 33-15 . |
| RP Address | A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the ip pim static-rp command on page 33-15 . |
| Mode | The PIM mode to be used for groups in this prefix. The possible values include asm , ssm , or bidir . |
| Override | Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s). |

output definitions

| | |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Precedence | Specifies the precedence value to be used for this static RP configuration. |
| Status | Displays whether static RP configuration is currently enabled or disabled. Options include enabled and disabled . To change the current status, refer to the ip pim static-rp command. |

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4: **bidir** mode support added.

Related Commands

ip pim static-rp Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

```

show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

```
show ip pim cbsr
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip pim cbsr
CBSR Address      = 214.0.0.7,
Status           = enabled,
CBSR Priority     = 0,
Hash Mask Length = 30,
Elected BSR     = False,
Timer            = 00h:00m:00s
```

output definitions

| | |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CBSR Address | The 32-bit address that the local router uses to advertise itself as a Candidate-BSR. |
| Status | The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled. |
| CBSR Priority | The value for the local router as a Candidate-BSR. The higher the value, the higher the priority. |
| Hash Mask Length | The 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group. |
| Elected BSR | Specifies whether the local router is the elected BSR. |
| Timer | The time value that is remaining before the local router originates the next bootstrap message. This value is zero if this router is not the elected BSR. |

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip pim groute

Displays (*,G) routing table entries for IPv4 PIM.

show ip pim groute [*group_address*]

Syntax Definitions

group_address A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Defaults

By default, the entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ip pim groute
```

```
Total 1 (*,G)
```

| Group Address | RP Address | RPF Interface | Upstream Neighbor | UpTime | Mode |
|---------------|-------------|---------------|-------------------|-------------|-------|
| 225.0.0.0 | 212.61.60.8 | vlan-30 | 212.61.30.7 | 00h:01m:43s | asm |

output definitions

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Group-address | The IPv4 Multicast Group Address. |
| RP Address | The address of the Rendezvous Point (RP) for the group. |
| RPF Interface | The RPF interface towards the RP. The ifIndex is converted to the if-name for the display. |
| Upstream Neighbor | The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to. |
| UpTime | The time since this entry was created. |
| Mode | Whether this entry represents an asm (Any Source Multicast) or bidir (Bidirectional PIM) group. |
| Pim Mode Origin | The mechanism by which the PIM mode and RP for the group were learned. |
| Upstream Join State | Whether the local router should join the RP tree for the group. |

output definitions (continued)

| | |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Upstream Join Timer | The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex. |
| RPF Next Hop | The address of the RPF next hop towards the RP. |
| RPF Route Protocol | The routing mechanism through which the route used to find the RPF interface towards the RP was learned. |
| RPF Route Address/Prefix Length | The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP. |
| Route Metric Pref | The metric preference of the route used to find the RPF interface towards the RP. |
| Route Metric | The routing metric of the route used to find the RPF interface towards the RP. |
| Interface Name | The interface name that corresponds to the ifIndex. |
| Local Membership | Whether the local router has (*,G) local membership on this interface. |
| Join Prune State | The state resulting from (*,G) Join/Prune messages received on this interface. |
| Prune Pending Timer | The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message. |
| Join Expiry Timer | The time remaining before (*,G) Join state for this interface expires. |
| Assert State | The (*,G) Assert state for this interface. The possible values are No Info, Winner, or Loser. |
| Assert Timer | If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires. |
| Assert Winner Address | If the Assert State is 'Loser', this is the address of the assert winner. |
| Assert Winner Metric Pref | If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero. |
| Assert Winner Metric | If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; Mode field added, **bidir** mode support added

show ip pim sgroute

Displays (S,G) routing table entries for IPv4 PIM.

show ip pim sgroute [*source_address* *group_address*]

Syntax Definitions

source_address The 32-bit IP address for a specific multicast source.
group_address A 32-bit multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ip pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,  
          L = Local, R = RPT, T = SPT, F = Register,  
          P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

| Source Address | Group Address | RPF Interface | Upstream Neighbor | UpTime | Flags |

output definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------|
| Source-address | The IPv4 Source address. |
| Group-address | The IPv4 Multicast Group Address. |
| RPF Interface | The RPF interface towards the RP. The ifIndex is converted to the if-name for the display. |

output definitions (continued)

| | |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Upstream Neighbor | The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to. |
| UpTime | The time since this entry was created. |
| Flags | Flags indicating SPTBit, Prune State, Join State, etc. |
| Pim Mode | Whether the Group Address is SSM, ASM or DM. |
| Upstream Join State | Whether the local router should join the SPT for the source and group represented by this entry. |
| Upstream Join Timer | The time remaining before the local router next sends a periodic (S,G) Join message. |
| RPF Next Hop | The address of the RPF next hop towards the source. |
| RPF Route Protocol | The routing mechanism through which the route used to find the RPF Interface towards the source was learned. |
| RPF Route Address/Prefix Length | The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source. |
| RPF Route Metric Pref | The metric preference of the route used to find the RPF interface towards the source. |
| RPF Route Metric | The metric preference of the route used to find the RPF interface towards the source. |
| DR Register State | Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune. |
| DR Register Stop Timer | The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP. |
| Upstream Prune State | Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned. |
| Upstream Prune Limit Timer | The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM. |
| Originator State | Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator. |
| Source Active Timer | If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM. |
| State Refresh Timer | If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM. |
| Interface Name | The interface name corresponding to the ifIndex that corresponds to this entry. |
| Uptime | The time since this entry was created. |
| Local Membership | Whether the local router has (S,G) local membership on this interface. |

output definitions (continued)

| | |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Join Prune State | The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending. |
| Prune Pending Timer | The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message. |
| Join Expiry Timer | The time remaining before (S,G) Join state for this interface expires. |
| Assert State | The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser. |
| Assert Timer | If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires. |
| Assert Winner | If the Assert State is Loser, this is the address of the assert winner. |
| Assert Winner Metric Pref | If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner. |
| Assert Winner Metric Metric | If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner. |

show ip pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

show ip pim df-election [*rp_address* | *if_name*]

Syntax Definitions

rp_address A 32-bit RP address.
if_name The interface name.

Defaults

By default, the DF election state for all RP interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *rp_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if_name* is specified in the command line, only information associated with the specified interface is displayed.

Examples

-> show ip pim df-election

| RP Address | Interface Name | DF State | Winner Address | Uptime | Metric Pref | Metric | Expires |
|-------------|----------------|----------|----------------|-------------|-------------|--------|-------------|
| 10.11.203.8 | vlan-13 | Win | 10.11.126.3 | 00h:06m:31s | 1 | 1 | 00h:00m:24s |
| | vlan-200 | Win | 10.11.200.1 | 00h:06m:31s | 1 | 1 | 00h:00m:24s |
| | vlan-204 | Win | 10.11.204.8 | 00h:06m:31s | 1 | 1 | 00h:00m:24s |
| | vlan-210 | Win | 10.5.5.8 | 00h:06m:31s | 1 | 1 | 00h:00m:24s |
| 40.1.50.25 | vlan-203 | Lose | 10.11.203.27 | 00h:00m:22s | 1 | 1 | 00h:00m:00s |
| | vlan-13 | Win | 10.11.126.3 | 00h:06m:31s | 110 | 2 | 00h:00m:32s |

```
-> show ip pim df-election vlan-200
```

| RP Address | Interface Name | DF State | Winner Address | Uptime | Metric Pref | Metric | Expires |
|-------------|----------------|----------|----------------|-------------|-------------|--------|-------------|
| 10.11.203.8 | vlan-200 | Win | 10.11.200.1 | 00h:06m:31s | 1 | 1 | 00h:00m:24s |
| 40.1.50.25 | vlan-200 | Win | 10.11.200.1 | 00h:06m:31s | 110 | 2 | 00h:00m:32s |

output definitions

| | |
|-----------------------|-------------------------------------------------------------------------------------------------------|
| RP Address | The IPv4 address of the Rendezvous Point (RP). |
| Interface Name | The name of the IPv4 interface. |
| DF State | The state of the DF election process (Offer , Lose , Win , or Backoff). |
| Winner Address | The primary IPv4 address of the winner of the DF election process. |
| UpTime | The amount of time since the current winner was last elected the DF for the RP. |
| Metric Pref | The metric preference advertised by the DF winner. This value is zero if there currently is no DF. |
| Metric | The metric value advertised by the DF winner. This value is zero if there currently is no DF. |
| Expires | The minimum time remaining before the local router expires the current DF state. |

ipv6 pim sparse admin-state

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

ipv6 pim sparse admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|------------------------------------|
| enable | Enables PIM-SM globally for IPv6. |
| disable | Disables PIM-SM globally for IPv6. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

Examples

```
-> ipv6 pim sparse admin-state enable
-> ipv6 pim sparse admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|--------------------------------------|------------------------------------------------------------------------------------|
| ipv6 pim interface | Enables or disables the PIM protocol on a specific interface. |
| ip load pim | Dynamically loads PIM to memory. |
| show ipv6 pim sparse | Displays the status of the various global parameters for the IPv6 PIM sparse mode. |

MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmV6AdminStatus
```

ipv6 pim bidir admin-state

Enables or disables IPv6 BIDIR-PIM (bidirectional) globally for IPv6.

```
ipv6 pim bidir admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|---------------------------------------|
| enable | Enables BIDIR-PIM globally for IPv6. |
| disable | Disables BIDIR-PIM globally for IPv6. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be set to **enable** before BIDIR-PIM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

Examples

```
-> ipv6 pim bidir admin-state enable
-> ipv6 pim bidir admin-state disable
```

Release History

Release 7.3.4; command was introduced.

| ip load pim | Dynamically loads PIM to memory. |
| show ipv6 pim sparse | Displays the status of the various global parameters for the IPv6 PIM sparse mode. |

MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmV6BidirStatus
```

ipv6 pim dense admin-state

Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.

ipv6 pim dense admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|------------------------------------|
| enable | Enables PIM-DM globally for IPv6. |
| disable | Disables PIM-DM globally for IPv6. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 33-3](#) for more information.

Examples

```
-> ipv6 pim dense admin-state enable
-> ipv6 pim dense admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------------|-----------------------------------------------------------------------------------|
| ipv6 pim interface | Enables or disables the PIM protocol on a specific interface. |
| ip load pim | Dynamically loads PIM to memory. |

```

ipv6 pim ssm group

Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ipv6 pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ipv6 pim ssm group group_address/prefix_length
```

Syntax Definitions

| | |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group_address</i> | Specifies the IPv6 multicast group address. |
| <i>/prefix_length</i> | Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128. |
| override | Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s). |
| <i>priority</i> | Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128. |

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

ipv6 pim dense group

Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

```
ipv6 pim dense group group_address/prefix_length [[no] override] [priority priority]
```

```
no ipv6 pim dense group group_address/prefix_length
```

Syntax Definitions

| | |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group_address</i> | Specifies the IPv6 multicast group address. |
| <i>/prefix_length</i> | Specifies the prefix length of the IPv6 multicast group. |
| override | Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s). |
| <i>priority</i> | Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128. |

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to unset the priority.

Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50  
-> no ipv6 pim dense group ff0e::1234/128
```

Release History

Release 7.1.1; command was introduced.

Related Commands

ipv6 pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ipv6 pim cbsr *ipv6_address* [**priority** *priority*] [**mask-length** *bits*]

no ipv6 pim cbsr *ipv6_address*

Syntax Definitions

| | |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ipv6_address</i> | The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR. The specified address must be a domain-wide reachable address. |
| <i>priority</i> | The priority value of the local router as a Candidate-BSR. Values may range from 0 to 255. |
| <i>bits</i> | The hash mask length that is advertised in the bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128. |

Defaults

| parameter | default |
|-----------------|---------|
| <i>priority</i> | 64 |
| <i>bits</i> | 126 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4
-> no ipv6 pim cbsr 2000::1
```

Release History

Release 7.1.1; command was introduced.

Related Commands

`show ipv6 pim cbsr`

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

ipv6 pim static-rp *group_address/prefix_length rp_address* [[no] **bidir**] [[no] **override**] [**priority** *priority*]

no ipv6 pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

| | |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>group_address</i> | Specifies the IPv6 multicast group address. |
| <i>/prefix_length</i> | Specifies the prefix length of the IPv6 multicast group. |
| <i>rp_address</i> | Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address. |
| bidir | Creates the static RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. |
| override | Specifies the static RP configuration to override the dynamically learned RP information for the specified group(s). |
| <i>priority</i> | Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128. |

Defaults

By default, the **priority** option is not set, the **override** option is set to false, and the **bidir** option is set to false.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- If the **bidir** parameter option is not specified with this command, the static RP entry is created for use in the ASM mode.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined a value of 65535 can be used to unset the priority

- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> ipv6 pin static-rp ff0e::1234/128 2000::1 bidir override
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

```

ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

ipv6 pim candidate-rp *rp_address group_address/prefix_length* [[no] **bidir**] [**priority** *priority*] [**interval** *seconds*]

no ipv6 pim candidate-rp *rp_address group_address/prefix_length*

Syntax Definitions

| | |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <i>rp_address</i> | Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address. |
| <i>group_address</i> | Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP. |
| <i>/prefix_length</i> | Specifies the prefix length of the specified IPv6 multicast group address. |
| bidir | Creates a C-RP entry for use in the Bidirectional PIM (BIDIR-PIM) mode. |
| <i>priority</i> | Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority. |
| <i>seconds</i> | Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300. |

Defaults

| parameter | default |
|-------------------|----------|
| [no] bidir | no bidir |
| <i>priority</i> | 192 |
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- If the **bidir** parameter option is not specified with this command, the C-RP entry is created for use in the ASM mode.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 bidir priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **bidir** parameter added.

Related Commands

  pimBsrCandidateRPAdvInterval
  pimBsrCandidateRPRowStatus
```

ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

ipv6 pim rp-switchover {enable | disable}

Syntax Definitions

enable Enables the RP to switch to native forwarding.
disable Disables the RP from switching to native forwarding.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim rp-switchover enable  
-> ipv6 pim rp-switchover disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```

ipv6 pim register-rate-limit

Configures the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry.

ipv6 pim register-rate-limit *pps*

Syntax Definitions

pps The per (S,G) register rate limit in packets per second (0–65535).

Defaults

By default, the register rate limit is set to zero.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Setting the register rate limit to zero (the default) disables register rate limiting.
- Rate limiting is applied on a per (S,G) flow basis.
- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim register-rate-limit 100
-> ipv6 pim register-rate-limit 0
```

Release History

Release 8.4.1.R02; command was introduced.

```

ipv6 pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

```
ipv6 pim spt admin-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|--------------------------------------------|
| enable | Enables last hop DR switching to the SPT. |
| disable | Disables last hop DR switching to the SPT. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

Examples

```
-> ipv6 pim spt admin-state enable  
-> ipv6 pim spt admin-state disable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```

ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

```

ipv6 pim interface if_name
  [hello-interval seconds]
  [triggered-hello seconds]
  [joinprune-interval seconds]
  [hello-holdtime seconds]
  [joinprune-holdtime seconds]
  [prune-delay milliseconds]
  [override-interval milliseconds]
  [dr-priority priority]
  [prune-limit-interval seconds]
  [graft-retry-interval seconds]
  [df-election-robustness messages]
  [[no] stub]

```

```

no ipv6 pim interface if_name

```

Syntax Definitions

| | |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The interface name on which the IPv6 PIM is being enabled or disabled. |
| hello-interval <i>seconds</i> | The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000. |
| triggered-hello <i>seconds</i> | Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60. |
| joinprune-interval <i>seconds</i> | The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000. |
| hello-holdtime <i>seconds</i> | Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| joinprune-holdtime <i>seconds</i> | Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| prune-delay <i>milliseconds</i> | Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767. |
| override-interval <i>milliseconds</i> | Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in <i>milliseconds</i> . Values may range from 0 to 65535. |

| | |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dr-priority <i>priority</i> | Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority. |
| prune-limit-interval <i>seconds</i> | Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| graft-retry-interval <i>seconds</i> | Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535. |
| df-election-robustness <i>messages</i> | The minimum number of DF-Election messages that must be lost in order for the DF Election to fail on the specified interface. Values may range from 1–65535. This value is used only by BIDIR-PIM. |
| stub | Specifies the interface not to send any IPv6 PIM packets through this interface, and to ignore received IPv6 PIM packets. |

Defaults

| parameter | default |
|-----------------------------------------------|----------|
| hello-interval <i>seconds</i> | 30 |
| triggered-hello <i>seconds</i> | 5 |
| joinprune-interval <i>seconds</i> | 60 |
| hello-holdtime <i>seconds</i> | 105 |
| joinprune-holdtime <i>seconds</i> | 210 |
| prune-delay <i>milliseconds</i> | 500 |
| override-interval <i>milliseconds</i> | 2500 |
| dr-priority <i>priority</i> | 1 |
| prune-limit-interval <i>seconds</i> | 60 |
| graft-retry-interval <i>seconds</i> | 3 |
| df-election-robustness <i>messages</i> | 3 |
| stub | Disabled |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.
- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the [ipv6 pim sparse admin-state command on page 33-100](#). To enable or disable IPv6 PIM-DM on the switch, refer to the [ipv6 pim dense admin-state command on page 33-102](#).
- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.

- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinite time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a joinprune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any IPv6 PIM packets through that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub.
- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.
- If the IPv6 interface on which PIM is enabled is bound to an SPB service, then PIM can operate over an SPB L3 VPN in-line routing configuration (supported only on the OmniSwitch 9900).

Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-
interval 100 hello-holdtime 350 joinprune-holdtime 400
-> no ipv6 pim interface vlan-2
```

Release History

Release 7.1.1; command was introduced.

Release 7.3.4: **df-election robustness** parameter added.

Related Command

show ipv6 pim interface Displays detailed IPv6 PIM settings for a specific interface.

  pimInterfaceGraftRetryInterval
```

ipv6 pim bfd-state

Enables or disables the registration of IPv6 PIM with the BFD protocol.

```
ipv6 pim bfd-state {enable | disable}
```

Syntax Definitions

| | |
|----------------|----------------------------|
| enable | Enables BFD for IPv6 PIM. |
| disable | Disables BFD for IPv6 PIM. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- BFD must be globally enabled for the switch and PIM must be registered with BFD at the protocol level before PIM can interact with BFD.
- All the status changes on the neighbors are received from the BFD level and PIM acts based upon the BFD message.
- Whenever a neighbor goes down, PIM will inform BFD to remove that neighbor from the BFD active list.

Examples

Globally enables the BFD protocol for the switch:

```
-> ip bfd admin-state enable
```

Enables and disables the registration of IPv6 PIM with the BFD protocol:

```
-> ipv6 pim bfd-state enable  
-> ipv6 pim bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

MIB Objects

alaPimGlobal
alaPimBfdStatus

ipv6 pim bfd-state all-interfaces

Enables or disables BFD monitoring for all PIM interfaces in the switch configuration.

```
ipv6 pim bfd-state all-interfaces {enable | disable}
```

Syntax Definitions

| | |
|----------------|-----------------------------------------------|
| enable | Enables BFD for all the IPv6 PIM interfaces. |
| disable | Disables BFD for all the IPv6 PIM interfaces. |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The BFD status for PIM must be enabled before PIM can interact with BFD.

Examples

```
-> ipv6 pim bfd-state all-interfaces enable  
-> ipv6 pim bfd-state all-interfaces disable
```

Release History

Release 8.4.1.R03; command was introduced.

Related Commands

| | |
|----------------------------------------------|--------------------------------------------------------------------|
| ipv6 pim bfd-state | Enables or disables the registration of PIM with the BFD protocol. |
| ipv6 pim interface bfd-state | Enables or disables BFD monitoring on a specific PIM interface. |
| show ipv6 pim interface | Displays detailed PIM settings for a specific interface. |

MIB Objects

```
alaPimGlobalConfig  
  alaPimBfdAllInterfaceStatus
```

ipv6 pim interface bfd-state

Enables or disables BFD monitoring for a specific PIM interface.

ipv6 pim interface *if_name* bfd-state {enable | disable}

Syntax Definitions

| | |
|----------------|-----------------------------------------------|
| <i>if_name</i> | The name of an existing IPv6 PIM interface. |
| enable | Enables BFD for the specified PIM interface. |
| disable | Disables BFD for the specified PIM interface. |

Defaults

| parameter | default |
|-------------------------|----------------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- Registering PIM with BFD is required at the protocol level before PIM can interact with BFD.
- When BFD is enabled on the specified PIM interface, BFD monitors the connectivity to all neighbors known through the specified interface.

Examples

```
-> ipv6 pim interface pimInt1 bfd-state enable
-> ipv6 pim interface pimInt1 bfd-state disable
```

Release History

Release 8.4.1.R03; command was introduced.

| ipv6 pim bfd-state | Enables or disables the registration of PIM with the BFD protocol. |
| ipv6 pim bfd-state all-interfaces | Enables or disables BFD monitoring for all PIM interfaces in the switch configuration. |
| show ipv6 pim interface | Displays detailed PIM settings for a specific interface. |

MIB Objects

```
alaPimInterfaceAugTable
  alaPimBfdStatus
```

ipv6 pim bidir ssm-compat

Configures the status of the Source-specific Multicast (SSM) compatibility mode. When enabled, an IPv6 BIDIR-PIM router will support receiving MLDv2 SSM joins and process them as a (*,G) join.

ipv6 pim bidir ssm-compat {enable | disable}

Syntax Definitions

enable Administratively enables the IPv6 BIDIR/SSM compatibility mode.
disable Administratively disables IPv6 BIDIR/SSM compatibility mode.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the SSM compatibility mode is disabled, MLDv2 SSM joins are ignored by the IPv6 BIDIR-PIM router.
- This command is only applicable if IPv6 BIDIR-PIM is globally enabled for the switch.

Examples

```
-> ipv6 pim bidir ssm-compat enable  
-> ipv6 pim bidir ssm-compat disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig

```

ipv6 pim bidir fast-join

Configures whether or not an IPv6 BIDIR-PIM router will automatically create (*,G) routes in the hardware as soon as IPv6 BIDIR (*,G) routes are learned.

ipv6 pim bidir fast-join {enable | disable}

Syntax Definitions

enable Administratively enables the IPv6 BIDIR-PIM fast join functionality.
disable Administratively disables the IPv6 BIDIR-PIM fast join functionality.

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only applicable if IPv6 BIDIR-PIM is globally enabled for the switch.
- When the IPv6 BIDIR fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 BIDIR fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.

Examples

```
-> ipv6 pim bidir fast-join enable  
-> ipv6 pim bidir fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```

ipv6 pim sparse asm-fast-join

Configures whether or not an IPv6 PIM Sparse router will automatically create (*,G) routes in the hardware as soon as the IPv6 (*,G) routes are learned.

ipv6 pim sparse asm-fast-join {enable | disable}

Syntax Definitions

| | |
|----------------|----------------------------------------------------------------------------|
| enable | Administratively enables the IPv6 PIM Sparse ASM fast join functionality. |
| disable | Administratively disables the IPv6 PIM Sparse ASM fast join functionality. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is only supported in the IPv6 PIM Sparse mode.
- When the IPv6 PIM Sparse fast join functionality is enabled, convergence of multicast traffic may occur faster because the (*,G) routes are already created before the actual multicast traffic is received.
- When the IPv6 PIM Sparse fast join functionality is disabled (the default), routes are not created in the hardware until the multicast traffic reaches the switch.
- This option should be used with caution due to the complicated nature of IPv6 PIM ASM, which involves forwarding on the shared tree, the sending and receiving of PIM register packets, and switching to the SPT. As a result, only enable the IPv6 ASM fast join function when there are no other locally attached sources, the router is not the RP, and the SPT is disabled.

Examples

```
-> ipv6 pim sparse asm-fast-join enable
-> ipv6 pim sparse asm-fast-join disable
```

Release History

Release 8.3.1.R02; command was introduced.

show ipv6 pim sparse

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim sparse
Status = disabled,
Keepalive Period = 210,
Max RPs = 32,
Probe Time = 5,
Register Suppress Timeout = 60,
RP Switchover = enabled,
SPT Status = enabled,
BIDIR Status = disabled,
BIDIR Periodic Interval = 60,
BIDIR DF Abort Status = disabled,
BFD Status = disabled,
ASM Fast Join = disabled,
SSM Fast Join = disabled,
BIDIR Fast Join = disabled,
BIDIR SSM Compatibility = disabled
Register Rate Limit = 100
```

output definitions

| | |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Status | The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include enabled and disabled . |
| Keepalive Period | The duration of the Keepalive timer. The default value is 210. |
| Max RPs | The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32. |

output definitions

| | |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Probe Time | The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the RP. This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5. |
| Register Suppress Timeout | The amount of time, in seconds, the DR will stop sending registers to the RP once a Register-Stop is received (1–300). The default value is 60. |
| RP switchover | The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include enabled and disabled . The default setting is enabled . |
| SPT Status | The current status of last hop DR switching to the SPT. Options include enabled and disabled . The default setting is enabled . |
| BIDIR Status | The current global status of Bidirectional PIM (BIDIR-PIM) for the switch. Options include enabled and disabled (the default). |
| BIDIR Periodic Interval | The amount of time, in seconds, between Winner messages the DF sends out to announce its status. The valid range is 0–2000. The default is 60 seconds. |
| BIDIR DF Abort Status | Indicates whether or not the Designated Forwarder (DF) election process is aborted when a PIM Hello message is received from a non-Bidirectional PIM (BIDIR-PIM) capable router. Options include enabled and disabled (the default). |
| BFD Status | Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled or disabled (the default) for the PIM router. |
| ASM Fast Join | The status of the PIM Sparse fast join operation for ASM routes. When enabled , PIM ASM (*,G) routes are automatically created in hardware when the routes are initially learned; when disabled (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch. |
| SSM Fast Join | The status of the PIM Sparse fast join operation for PIM Sparse and SSM routes. When enabled , PIM Sparse and SSM (S,G) routes are automatically created in hardware when the routes are initially learned; when disabled (the default), the (S,G) routes are not created in hardware until multicast traffic reaches the switch. |
| BIDIR Fast Join | The status of the BIDIR-PIM fast join operation. When enabled , BIDIR-PIM (*,G) routes are automatically created in hardware when the routes are initially learned; when disabled (the default), the (*,G) routes are not created in hardware until multicast traffic reaches the switch. |
| BIDIR SSM Compatibility | The status of the SSM compatibility mode. When enabled , a BIDIR-PIM router will accept and process SSM joins as (*,G) joins; when disabled (the default), SSM joins are ignored. |
| Register Rate Limit | The per (S,G) register rate limit in packets per second. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; BIDIR fields added.

Release 8.3.1.R02; **ASM Fast Join**, **SSM Fast Join**, **BIDIR Fast Join**, and **BIDIR SSM Compatibility** fields added.

Release 8.4.1.R02; **Register Rate Limit** field added.

Related Commands

| | |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 pim sparse admin-state | Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6. |
| ip pim keepalive-period | Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership. |
| ip pim max-rps | Configures the maximum number of C-RP routers allowed in the PIM-SM domain. |
| ip pim probe-time | Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. |
| ip pim register-suppress-timeout | Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message. |
| ipv6 pim rp-switchover | Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain. |
| ipv6 pim register-rate-limit | Specifies the maximum number of PIM Register Packets that the Designated Router (DR) will send per second for each (S,G) entry. |
| ipv6 pim spt admin-state | Enables or disables last hop DR switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received. |
| ipv6 pim bidir admin-state | Globally enables or disables BIDIR-PIM protocol on the switch. |
| ip pim df-periodic-interval | Configures the time interval at which the DF for each RP address periodically announces its status in a Winner message |
| ip pim df-abort | Configures whether or not the DF election process is stopped when a PIM Hello message received from a PIM neighbor does not contain the Bidirectional Capable option. |
| ipv6 pim interface | Enables IPv6 PIM and configures statistics on the interface. |
| ipv6 pim bfd-state | Enables or disables BFD for the PIM router. |
| ipv6 pim sparse asm-fast-join | Configures the status of the PIM Sparse fast join operation for ASM routes. |
| ipv6 pim sparse ssm-fast-join | Configures the status of the PIM Sparse fast join operation for both PIM Sparse and SSM routes. |
| ipv6 pim bidir fast-join | Configures the status of the BIDIR-PIM fast join operation. |

ipv6 pim bidir ssm-compat Configures the SSM compatibility mode for a BIDIR-PIM router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim dense
Status = enabled,
Source Lifetime = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL = 16
BFD Status = enabled
```

output definitions

| | |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status | The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include enabled and disabled . |
| Source Lifetime | The duration of the Keepalive or Source Lifetime timer. The default value is 210. |
| State Refresh Interval | The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60. |
| State Refresh Limit Interval | Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0. |
| State Refresh TTL | Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16. |
| BFD Status | Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled or disabled (the default) for PIM router. |

show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

```
show ipv6 pim ssm group
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim ssm group
```

| Group Address/Prefix | RP Address | Mode | Override | Precedence | Status |
|----------------------|------------|------|----------|------------|---------|
| ff00::/8 | :: | ssm | false | none | enabled |
| ff34::/32 | :: | ssm | false | none | enabled |

output definitions

| | |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Group Address/Prefix | The IPv6 multicast group address along with the prefix length. |
| RP Address | The IPv6 address of the Rendezvous Point (RP) for groups within this group prefix |
| Mode | The IPv6 PIM mode that is used for the groups in this prefix. |
| Override | Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s). |
| Precedence | The precedence value that can be used for this static RP configuration. |
| Status | Displays whether this entry is currently enabled or disabled. Options include enabled and disabled . |

Release History

```

show ipv6 pim interface

Displays detailed IPv6 PIM settings for a specific interface. In general, it displays IPv6 PIM settings for all the interfaces if no argument is specified.

show ipv6 pim interface [*if_name*]

Syntax Definitions

if_name The name of the interface.

Defaults

By default, a summary list of all IPv6 PIM interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ipv6 pim interface
```

```
Total 0 Interfaces
```

| Interface Name | Designated Router | Hello Interval | J/P Interval | Oper Status | BFD Status |
|----------------|--------------------------|----------------|--------------|-------------|------------|
| vlan-5 | fe80::2d0:95ff:feac:a537 | 30 | 60 | enabled | disabled |
| vlan-30 | fe80::2d0:95ff:feac:a537 | 30 | 60 | disabled | disabled |
| vlan-40 | fe80::2d0:95ff:fee2:6eec | 30 | 60 | enabled | disabled |

```
-> show ipv6 pim interface vlan-5
```

```
Interface Name      = vlan-5,
IP Address          = fe80::2d0:95ff:fee2:6eec,
Designated Router   = fe80::2d0:95ff:fee2:a537,
Hello Interval      = 30,
Triggered Hello Interval = 5,
Hello HoldTime      = 105,
Join/Prune Interval = 60,
Join/Prune HoldTime = 210,
Propagation (Prune) Delay = 500,
Override Interval   = 2500,
Generation ID       = 0x4717be4d,
DR Priority          = 1,
DR Priority Enabled  = true,
Lan Delay Enabled   = true,
Effective Propagation Delay = 500,
```

```

Effective Override Interval = 2500,
Suppression Enabled       = true,
Stub Interface            = false,
Prune Limit Interval      = 60,
Graft Retry Interval      = 3,
State Refresh Enabled     = true,
BiDir Capable             = false,
DF Election Robustness    = 3,
Operational Status        = enabled
BFD Status                = disabled

```

output definitions

| | |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name of the IPv6 PIM interface. |
| IPv6 address | Specifies the IPv6 address of the specified interface. |
| Designated Router | The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR. |
| Hello Interval | The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30. |
| Join/Prune Interval | The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60. |
| Triggered Hello Interval | The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5. |
| Hello Holdtime | The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105. |
| Join/Prune Holdtime | The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210. |
| Propagation Delay | The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500. |
| Override Interval | The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500. |
| Generation ID Option | The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface. |

output definitions (continued)

| | |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DR Priority | Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1. |
| Lan Delay Enabled | Options include true and false . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false. |
| Effective Propagation Delay | The Effective Propagation Delay on this interface. |
| Effective Override Interval | The Effective Override Interval on this interface. |
| Suppression Enabled | Specifies whether the Join suppression is enabled on this interface. |
| DR Priority Enabled | Evaluates to TRUE if all routers on this interface are using the DR Priority option. |
| Stub Interface | Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored. |
| Prune Limit Interval | The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60. |
| Graft Retry Interval | Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3. |
| SR Priority Enabled | Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM. |
| BiDir Capable | Evaluates to TRUE if all routers on this interface are using the Bidirectional Capable option. This is used only by BIDIR-PIM. |
| DF Election Robustness | The minimum number of PIM Designated Forwarder (DF) Election messages that must be lost to determine that the DF Election process has failed for this interface. This is used only by BIDIR-PIM. |
| Operational Status | The current operational status of the corresponding interface. Options include enabled and disabled . This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is disabled . To enable or disable PIM on an interface, refer to the ipv6 pim interface command on page 33-116 . To globally enable or disable PIM on the switch, refer to the ipv6 pim sparse admin-state command on page 33-100 and ipv6 pim dense admin-state command on page 33-102 . |
| BFD Status | Indicates whether the Bidirectional Forwarding Detection (BFD) protocol is enabled or disabled (the default) for the PIM interface. Configured through the ipv6 pim interface bfd-state command . |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **BiDir Capable** and **DF Election Robustness** fields added.

show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

show ipv6 pim neighbor [*ipv6_address*] [*if_name*]

Syntax Definitions

ipv6_address The IPv6 address for the PIM neighbor.
if_name The name of the interface.

Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ipv6 pim neighbor
Neighbor Address                      Interface Name                      Uptime                      Expires                      DR Pri
-----+-----+-----+-----+-----
fe80::2d0:95ff:feac:a537              vlan-30                              02h:56m:51s                  00h:01m:28s                  1
```

If a specific neighbor address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ipv6 pim neighbor fe80::2d0:95ff:feac:a537
vlan-30
Neighbor IPv6 Address                  = fe80::2d0:95ff:feac:a537,
Uptime                                    = 02h:57m:09s,
Expires                                  = 00h:01m:40s,
Lan Prune Delay Present                = True,
Propagation Delay                        = 500,
Override Interval                        = 2500,
TBit Field                                = True,
Gen ID Present                          = True,
Gen ID Value                             = 0x7720c123,
BiDir Capable                            = False,
DR Priority Present                       = True,
DR Priority                                = 1,
State Refresh Capable                   = True,
Secondary Addresses:
    3000::11
```

```

vlan-40
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 03h:57m:03s,
Expires                   = 00h:01m:20s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit Field                = True,
Gen ID Present            = True,
Gen ID Value               = 0x7720c123,
BiDir Capable             = False,
DR Priority Present       = True,
DR Priority                = 1,
State Refresh Capable    = True,
Secondary Addresses:
  4000::11

```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```

-> show IPv6 pim neighbor vlan-30
vlan-30
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 02h:57m:09s,
Expires                   = 00h:01m:40s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit Field                = True,
Gen ID Present            = True,
Gen ID Value               = 0x7720c123,
BiDir Capable             = False,
DR Priority Present       = True,
DR Priority                = 1,
State Refresh Capable    = True,
Secondary Addresses:
  3000::11

```

output definitions

| | |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor IPv6 Address | The IPv6 address of the active PIM neighbor. |
| Interface Name | The name of the IPv6 PIM interface that is used to reach the neighbor. |
| Uptime | The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds. |
| Expires | The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds. |
| LAN Prune Delay present | Specifies whether this neighbor is using the LAN Prune Delay option. Options include true or false . |
| Propagation Delay | The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor. |

output definitions (continued)

| | |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Override Interval | The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor. |
| TBit field | The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression. |
| Gen ID present | Specifies whether this neighbor is using Generation ID option. Options include true or false . |
| Gen ID Value | The value of the Generation ID in the last PIM Hello message received from this neighbor. |
| BiDir Capable | Specifies whether this neighbor is using the Bidirectional-PIM Capable option. |
| DR Priority Present | Displays whether the neighbor is using the Designated Router option. Options include true or false . |
| DR priority | The value of the Designated Router Priority in the last PIM Hello message received from this neighbor. |
| State Refresh Capable | Displays whether the neighbor is capable of receiving State Refresh messages. Options include true or false . |
| Secondary Addresses | The secondary IPv6 address of this PIM neighbor. |

show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

show ipv6 pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

-> show ipv6 pim static-rp

| Group Address/Pref Length | RP Address | Mode | Override | Precedence | Status |
|---------------------------|------------|-------|----------|------------|---------|
| ff00::/8 | 3000::11 | asm | false | none | enabled |
| ff08::/32 | 2100::8 | bidir | false | none | enabled |

output definitions

| | |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Address/Pref Length | The IPv6 multicast group address along with the prefix length. |
| RP Address | The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM. |
| Mode | The PIM mode to be used for groups in this prefix. The possible values include asm , ssm , dm , or bidir . |
| Override | Specifies that this static RP configuration can override the dynamically learned RP information for the specified group(s). |
| Precedence | The precedence value that is used for this static RP configuration. |
| Status | Displays whether the static RP configuration is currently enabled or disabled. Options include enabled and disabled . |

Release History

Release 7.1.1; command was introduced.
Release 7.3.4; **bidir** mode support added.

Related Commands

[ipv6 pim static-rp](#)

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

MIB Objects

```
pimStaticRPTable
  pimStaticRPAddressType
  pimStaticRPGrpAddress
  pimStaticRPGrpPrefixLength
  pimStaticRPRPAddress
  pimStaticRPPimMode
  pimStaticRPOverrideDynamic
  pimStaticRPPrecedence
  pimStaticRPRowStatus
  pimStaticRPStorageType
```

show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

show ipv6 pim group-map [**bsr** | **static-rp** | **ssm** | **dense**]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ipv6 pim group-map
```

| Origin | Group Address/Pref Length | RP Address | Mode | Precedence |
|--------|---------------------------|------------|-------|------------|
| BSR | ff00::/8 | 2000::8 | bidir | 192 |
| BSR | ff00::/8 | 3000::11 | asm | 192 |
| BSR | ff00::/8 | 4000::7 | asm | 192 |
| SSM | ff33::/32 | | ssm | |

```
-> show ipv6 pim group-map bsr
```

| Origin | Group Address/Pref Length | RP Address | Mode | Precedence |
|--------|---------------------------|------------|-------|------------|
| BSR | ff00::/8 | 2000::8 | bidir | 192 |
| BSR | ff00::/8 | 3000::11 | asm | 192 |
| BSR | ff00::/8 | 4000::7 | asm | 192 |

```
-> show ipv6 pim group-map ssm
```

| Origin | Group Address/Pref Length | RP Address | Mode | Precedence |
|--------|---------------------------|------------|------|------------|
| SSM | ff33::/32 | | ssm | |

output definitions

| | |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Origin | The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism. |
| Group Address/Prefix Length | The IPv6 multicast group address along with the prefix length. |
| RP Address | The IPv6 address of the Rendezvous Point to be used for groups within the group prefix. |
| Mode | The IPv6 PIM mode to be used for groups in this prefix. The possible values include asm , ssm , dm , or bidir . |
| Mapping Precedence | The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence. |

Release History

Release 7.1.1; command was introduced.
 Release 7.3.4; **bidir** mode support added.

Related Commands

| | |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ipv6 pim static-rp | Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters). |
| ipv6 pim ssm group | Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM). |
| ipv6 pim dense group | Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM). |

MIB Objects

```

show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

show ipv6 pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim candidate-rp
RP Address          Group Address      Priority  Interval  Mode  Status
-----+-----+-----+-----+-----+-----
2000::8             ff00::/8           192      60        bidir enabled
```

output definitions

| | |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| RP Address | An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP). |
| Group Address | The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP. |
| Priority | The C-RP router's priority. The lower the value, the higher the priority. |
| Interval | The time interval at which the C-RP advertisements are sent to the BSR. |
| Mode | Whether or not the Group Address is for a PIM-SM group or a Bidirectional PIM (BIDIR-PIM) group. |
| Status | The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; **Mode** field added.

Related Commands

show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

show ipv6 pim cbsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim cbsr
CBSR Address           = 3000::7,
Status                 = enabled,
CBSR Priority           = 0,
Hash Mask Length       = 126,
Elected BSR           = False,
Timer                  = 00h:00m:00s
```

output definitions

| | |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CBSR Address | An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR. |
| Status | The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled. |
| CBSR Priority | The value for the local router as a Candidate-BSR. The higher the value, the higher the priority. |
| Hash Mask Length | The hash mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group) |
| Elected BSR | Specifies whether the local router is the elected BSR. |
| Timer | The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR. |

Release History

show ipv6 pim groute

Displays (*,G) routing table entries for IPv6 PIM.

```
show ipv6 pim groute [group_address]
```

Syntax Definitions

group_address The IPv6 address of the Multicast Group.

Defaults

By default, entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ipv6 pim groute
Total 1 (*,G)
```

| Group Address | RP Address | RPF Interface | UpTime | Mode |
|---------------|------------|---------------|-------------|-------|
| ff08::2 | 2000::8 | vlan-200 | 00h:05m:42s | bidir |

```

output definitions

| | |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Group-address | The IPv6 Multicast Group Address. |
| RP Address | The address of the Rendezvous Point (RP) for the group. |
| RPF Interface | The RPF interface towards the RP. The ifIndex is converted to the if-name for the display. |
| UpTime | The time since this entry was created. |
| Mode | Whether this entry represents an asm , (Any Source Multicast) or bidir (Bidirectional PIM) group. |
| Pim Mode Origin | The mechanism by which the PIM mode and RP for the group were learned. |
| Upstream Join State | Whether the local router should join the RP tree for the group. |
| Upstream Join Timer | The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex. |
| Upstream Neighbor | The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to. |
| RPF Next Hop | The address of the RPF next hop towards the RP. |
| RPF Route Protocol | The routing mechanism through which the route used to find the RPF interface towards the RP was learned. |
| RPF Route Address/Prefix Length | The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP. |
| Route Metric Pref | The metric preference of the route used to find the RPF interface towards the RP. |
| Route Metric | The routing metric of the route used to find the RPF interface towards the RP. |
| Interface Name | The interface name that corresponds to the ifIndex. |

output definitions (continued)

| | |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Membership | Whether the local router has (*,G) local membership on this interface. |
| Join Prune State | The state resulting from (*,G) Join/Prune messages received on this interface. |
| Prune Pending Timer | The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message. |
| Join Expiry Timer | The time remaining before (*,G) Join state for this interface expires. |
| Assert State | The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser. |
| Assert Timer | If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires. |
| Assert Winner Address | If the Assert State is 'Loser', this is the address of the assert winner. |
| Assert Winner Metric Pref | If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero. |
| Assert Winner Metric | If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero. |

Release History

Release 7.1.1; command was introduced.

Release 7.3.4; Mode field added, **bidir** mode support added

show ipv6 pim sgroute

Displays (S,G) routing table entries for IPv6 PIM.

show ipv6 pim sgroute [*source_address* *group_address*]

Syntax Definitions

source_address The IPv6 address for a specific multicast source.
group_address A IPv6 multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ipv6 pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
           L = Local, R = RPT, T = SPT, F = Register,
           P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

| Source Address | Group Address | RPF Interface | UpTime | Flags |
|----------------|---------------|---------------|-------------|-------|
| 8ffe::3 | ff0e::7 | | 00h:01m:34s | SR |

```
-> show ipv6 pim sgroute 8ffe::3 ff0e::7
(8ffe::3,ff0e::7)
```

```

output definitions

| | |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Source-address | The IPv6 Source address. |
| Group-address | The IPv6 Multicast Group Address. |
| RPF Interface | The RPF interface towards the RP. The ifIndex is converted to the if-name for the display. |
| Upstream Neighbor | The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to. |
| UpTime | The time since this entry was created. |
| Flags | Flags indicating SPTBit, Prune State, Join State, etc. |
| Pim Mode | Whether the Group Address is SSM, ASM or DM. |
| Upstream Join State | Whether the local router should join the SPT for the source and group represented by this entry. |
| Upstream Join Timer | The time remaining before the local router next sends a periodic (S,G) Join message. |
| RPF Next Hop | The address of the RPF next hop towards the source. |
| RPF Route Protocol | The routing mechanism through which the route used to find the RPF Interface towards the source was learned. |
| RPF Route Address/Prefix Length | The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source. |
| RPF Route Metric Pref | The metric preference of the route used to find the RPF interface towards the source. |

output definitions (continued)

| | |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPF Route Metric | The metric preference of the route used to find the RPF interface towards the source. |
| DR Register State | Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune. |
| DR Register Stop Timer | The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP. |
| Upstream Prune State | Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned. |
| Upstream Prune Limit Timer | The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM. |
| Originator State | Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator. |
| Source Active Timer | If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM. |
| State Refresh Timer | If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM. |
| Interface Name | The interface name corresponding to the ifIndex that corresponds to this entry. |
| Uptime | The time since this entry was created. |
| Local Membership | Whether the local router has (S,G) local membership on this interface. |
| Join Prune State | The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending. |
| Prune Pending Timer | The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message. |
| Join Expiry Timer | The time remaining before (S,G) Join state for this interface expires. |
| Assert State | The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser. |
| Assert Timer | If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires. |
| Assert Winner | If the Assert State is Loser, this is the address of the assert winner. |
| Assert Winner Metric Pref | If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner. |
| Assert Winner Metric Metric | If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner. |

show ipv6 pim df-election

Displays the Designated Forwarder (DF) election state for Rendezvous Point (RP) interfaces. This command applies only to RPs operating in the Bidirectional PIM (BIDIR-PIM) mode.

show ipv6 pim df-election [*rp_address* / *if_name*]

Syntax Definitions

rp_address An IPv6 RP address.
if_name The interface name.

Defaults

By default, the DF election state for all RP interfaces.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- When the *rp_address* is specified in the command line, only those interfaces associated with the specified RP address are displayed.
- When the *if_name* is specified in the command line, only information associated with the specified interface is displayed.

Examples

```
-> show ipv6 pim df-election
RP Address Interface Name DF State Winner Address      Uptime      Metric Metric Expires
                                Pref
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2000::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:13s
          vlan-210      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:13s
2100::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:03s
          vlan-210      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:03s
```

```
-> show ipv6 pim df-election 2000::8
RP Address Interface Name DF State Winner Address      Uptime      Metric Metric Expires
                                Pref
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2000::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:13s
          vlan-210      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:13s
```

```
-> show ipv6 pim df-election vlan-13

                                Pref
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2000::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:13s
2100::8   vlan-13      Win    fe80::220:daff:fe11:2233 00h:10m:15s 1          1      00h:00m:03s
```

output definitions

| | |
|-----------------------|-------------------------------------------------------------------------------------------------------|
| RP Address | The IPv6 address of the Rendezvous Point (RP). |
| Interface Name | The name of the IPv6 interface. |
| DF State | The state of the DF election process (Offer , Lose , Win , or Backoff). |
| Winner Address | The primary IPv6 address of the winner of the DF election process. |
| UpTime | The amount of time since the current winner was last elected the DF for the RP. |
| Metric Pref | The metric preference advertised by the DF winner. This value is zero if there currently is no DF. |
| Metric | The metric value advertised by the DF winner. This value is zero if there currently is no DF. |
| Expires | The minimum time remaining before the local router expires the current DF state. |

34 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for multicast routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

Filename: ALCATEL-IND1-IPMRM-MIB.mib
Module: alcatelIND1IPMRMMIB

Filename: IPMCAST-MIB.mib
Module: ipMcastMIB

A summary of the available commands is listed here:

ip mroute-boundary
ip mroute-boundary extended
ip mroute interface ttl
ip mroute mbr
show ip mroute-boundary
show ip mroute
show ip mroute interface
show ip mroute-nexthop
show ip mroute mbr
ipv6 mroute interface ttl
show ipv6 mroute
show ipv6 mroute interface
show ipv6 mroute-nexthop

ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary *if_name scoped_address mask*

no ip mroute-boundary *if_name scoped_address mask*

Syntax Definitions

| | |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The interface name on which the boundary is being assigned. |
| <i>scoped_address</i> | A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255. |
| <i>mask</i> | A corresponding Class A, B, or C mask address (e.g., 255.0.0.0). |

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.

Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

show ip mroute-boundary Displays scoped multicast address boundaries for the switch’s router interfaces.

MIB Objects

```
ipMcastBoundaryTable  
  ipMcastBoundaryIfIndex  
  ipMcastBoundaryAddressType  
  ipMcastBoundaryAddress  
  ipMcastBoundaryAddressPrefixLength
```

ip mroute-boundary extended

Enables or disables the multicast route boundary expansion feature. On enabling the multicast route boundary is extended to all the multicast groups (that is, the non-scoped address, 224.0.0.0 to 239.255.255.255). All multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary extended {enable | disable}

Syntax Definitions

| | |
|----------------|---------------------------------------------------------------------------------------------------------------------------|
| enable | The multicast route boundary is extended to all the multicast cast address groups (224.0.0.0 through 239.255.255.255). |
| disable | The multicast route boundary is limited to administratively scoped multicast address (239.0.0.0 through 239.255.255.255). |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | disable |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip mroute-boundary extended enable
-> ip mroute-boundary extended disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip mroute-boundary Displays multicast address boundaries for the switch's router interfaces.

MIB Objects

alaIpirmGlobalConfig
alaIpirmExtendedBoundaryStatus

ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ip mroute interface *if_name* **ttl** *threshold*

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM). |
| <i>threshold</i> | The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface. |

Defaults

| parameter | default |
|------------------|---------|
| <i>threshold</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ip mroute interface vlan-1 ttl 255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip mroute interface](#) Displays IP multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

ip mroute mbr

Configures the switch to serve as a Multicast Border Router (MBR) that will provide interoperability between DVMRP and PIM domains.

ip mroute mbr admin-state {enable | disable}

Syntax Definitions

| | |
|----------------|-------------------------------------------|
| enable | Enables MBR functionality on the switch. |
| disable | Disables MBR functionality on the switch. |

Defaults

MBR functionality is disabled by default.

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

- To configure the switch to operate as an MBR, first configure the DVMRP and PIM protocols for the switch then enable MBR functionality.
- The MBR functionality is operationally enabled only when there is at least one PIM interface and one DVMRP interface enabled and both interfaces are operationally active on the switch.
- The MBR feature only supports interoperability between DVMRP and PIM (includes PIM-DM and PIM-SM) domains; no other routing protocols are supported.
- The following is *not* supported by the MBR feature in the current release:
 - PIM-SSM
 - Interoperability between multiple PIM domains
 - IPv6 (only IPv4)

Examples

```
-> ip mroute mbr admin-state enable
-> ip mroute mbr admin-state disable
```

Release History

Release 7.3.2; command was introduced.

Related Commands

show ip mroute mbr Displays MBR configuration information.

MIB Objects

alaIpmrmMbrStatus

ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ipv6 mroute interface *if_name* **ttl** *threshold*

Syntax Definitions

| | |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>if_name</i> | The name of the IPv6 interface. |
| <i>threshold</i> | The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface. |

Defaults

| parameter | default |
|------------------|---------|
| <i>threshold</i> | 0 |

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ipv6 mroute interface](#) Displays IPv6 multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

show ip mroute-boundary

Displays scoped multicast address boundaries for the switch's router interfaces.

show ip mroute-boundary

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ip mroute-boundary
Extended Boundary Address Range: enabled
```

| Interface Name | Interface Address | Boundary Address |
|----------------|-------------------|------------------|
| vlan-4 | 214.0.0.7 | 239.1.1.1/32 |
| vlan-2 | 170.2.0.1 | 224.2.2.2/24 |

output definitions

| | |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extended Boundary Address Range | Displays the status of extended multicast route boundary on the interface. |
| Interface Name | The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface. |
| Interface Address | The IP address of this interface where the boundary is assigned. |
| Boundary Address | The scoped multicast address that, when combined with the boundary mask, identifies the scoped boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24. |

Release History

Release 7.1.1; command was introduced.

Release 8.2.1; **Extended Boundary Address Range** output filed added.

Related Commands

| | |
|------------------------------------------|---------------------------------------------------------------------|
| ip mroute-boundary | Adds or deletes a router's scoped multicast address boundaries. |
| ip mroute interface ttl | Enables or disables the multicast route boundary expansion feature. |
| show ip mroute interface | Displays IP multicast interface information. |

MIB Objects

show ip mroute interface [*interface_name*]

Syntax Definitions

interface_name The name of the interface

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

Examples

-> show ip mroute interface

| Interface Name | IP Address | TTL | Multicast Protocol |
|----------------|-------------|-----|--------------------|
| vlan-4 | 214.0.0.7 | 0 | PIM |
| vlan-26 | 172.21.63.7 | 0 | PIM |
| vlan-11 | 212.61.11.7 | 0 | PIM |

output definitions

| | |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name configured for the interface. |
| IP Address | The IP address of this interface entry. |
| TTL | The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface. |
| Multicast Protocol | The multicast routing protocol currently running on this interface. Options include DVMRP and PIM. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[show ip mroute](#)

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

[show ip mroute-next-hop](#)

Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

show ipv6 mroute interface

Displays IPv6 multicast interface information.

show ipv6 mroute interface *{interface_name}*

Syntax Definitions

interface_name The name of the interface

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

Not specifying an interface name displays all known IPv6 multicast interfaces information.

Examples

-> show ipv6 mroute interface

| Interface Name | IP Address | TTL | Multicast Protocol |
|----------------|------------|-----|--------------------|
| vlan-4 | 2000::1 | 0 | PIM |
| vlan-26 | 2000::2 | 0 | PIM |
| vlan-11 | 2000::3 | 0 | PIM |

output definitions

| | |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name | The name configured for the IPv6 interface. |
| IP Address | The IPv6 address of this interface entry. |
| TTL | The datagram TTL threshold for the interface. Any IPv6 multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface. |
| Multicast Protocol | The multicast routing protocol currently running on this interface. Options include DVMRP and PIM. |

  alaIpMcastRouteNextHopProtocol
```

show ipv6 mroute-nexthop

Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

show ipv6 mroute-nexthop

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

N/A

Examples

```
-> show ipv6 mroute-nexthop
```

```
Total 2 Nexthops
```

| Group Address | Source Address | Interface | Next Hop Address | Protocol |
|---------------|----------------|-----------|------------------|----------|
| ff06:7777::1 | 2600::7 | vlan-40 | ff06:7777::1 | PIM-SM |
| ff06:7777::2 | 2600::7 | vlan-40 | ff06:7777::2 | PIM-SM |

output definitions

| | |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Group Address | The IPv6 multicast group address for this entry. |
| Src Address | The IPv6 multicast address, which identifies the source for this entry. |
| Interface Name | The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received. |
| Next Hop Address | The IPv6 address of the next-hop that is specific to this entry. |
| Protocol | The IPv6 multicast routing protocol by which this IPv6 multicast forwarding entry was learned. |

Release History

Release 7.1.1; command was introduced.

Related Commands

  alaIpMcastRouteNextHopProtocol
```

show ip mroute mbr

Displays the MBR status for the switch.

```
show ip mroute mbr
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, 9900

Usage Guidelines

The MBR feature only supports interoperability between DVMRP and PIM. Both of these multicast protocols must be configured and operationally active on the switch.

Examples

```
-> show ip mroute mbr
MBR Status                = enabled,
Protocols Registered      = DVMRP PIM
```

output definitions

| | |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------|
| MBR Status | The administrative status (enabled or disabled) of MBR functionality on the switch. |
| Protocols Registered | The operationally active multicast protocols (DVMRP , PIM) to which MBR functionality is applied. |

Release History

Release 7.3.2; command was introduced.

Related Commands

```
alaIpirmGlobalConfig
  alaIpirmMbrStatus
  alaIpirmMbrProtocolApps
```

35 QoS Commands

The OmniSwitch QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to [Chapter 44, “QoS Policy Commands,”](#) for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

Filename: ALCATEL-IND1-QOS-MIB.mib
Module: alaQoS MIB

Filename: ALCATEL-IND1-VIRTUAL-FLOW-CONTROL-MIB.mib
Module: alcatelIND1VfcMIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS commands are listed here:

| | |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of this option, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos {enable | disable}
    [trust-ports]
    [forward log]
    [log console]
    [log lines lines]
    [log level level]
    [stats interval seconds]
    [phones [priority priority_value | trusted]]
    [user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcpserver
    | dns-reply}]
```

Syntax Definitions

| | |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enable | Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The enable setting may be used alone or in conjunction with optional command keywords. |
| disable | Disables QoS. Flows coming into the switch are not matched to policies. The disable setting cannot be used with any other command keyword. |

Defaults

| parameter | default |
|------------------|---------|
| enable disable | enable |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

Examples

```
-> qos disable  
-> qos enable
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------------|--------------------------------------------------------------------------|
| qos apply | Applies configured QoS and policy settings to the current configuration. |
| policy rule | Configures a policy rule on the switch. |
| show policy rule | Displays information for policy rules configured on the switch. |

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigEnable  
  alaQoSConfigTrustedPorts  
  alaQoSConfigForwardLog  
  alaQoSConfigLogLines  
  alaQoSConfigLogLevel  
  alaQoSConfigLogConsolealaQoSConfigStatsInterval  
  alaQoSConfigAutoPhones  
  alaQoSConfigUserportFilter  
  alaQoSConfigAppliedUserportFilter  
  alaQoSConfigUserportShutdown  
  alaQoSConfigAppliedUserportShutdown
```

qos trust-ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See [page 35-36](#) for more information about this command.

qos trust-ports

qos no trust-ports

Syntax Definitions

N/A

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **qos ports trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

Examples

```
-> qos trust-ports  
-> qos no trust-ports
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------|----------------------------------------------------------------------|
| qos port | Configures a physical port for QoS. |
| qos port trusted | Configures whether or not a particular port is trusted or untrusted. |
| show qos port | Displays information about QoS ports. |

MIB Objects

alaQoSConfigTable
 alaQoSConfigTrustedPorts

qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

qos forward log

qos no forward log

Syntax Definitions

N/A

Defaults

By default, logged events are not sent to the policy server software in the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

Examples

```
-> qos forward log
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------|------------------------------------------------|
| qos log lines | Configures the number of lines in the QoS log. |
| show qos log | Displays the log of QoS events. |

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigForwardLog
```

qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

qos log console

qos no log console

Syntax Definitions

N/A

Defaults

QoS log messages are not sent to the switch logging utility by default.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

Examples

```
-> qos log console  
-> qos no log console
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------|--------------------------------------------------------------------------------------------------|
| qos log lines | Configures the number of lines in the QoS log. |
| swlog output | Enables or disables switch logging output to the console, file, or data socket (remote session). |
| show qos log | Displays the log of QoS events. |

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigLogConsole
```

qos log lines

Configures the number of lines in the QoS log.

qos log lines *lines*

Syntax Definitions

lines The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–10240.

Defaults

| parameter | default |
|--------------|---------|
| <i>lines</i> | 10240 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **boot.cfg** file. The log length will be changed at the next reboot.

Examples

```
-> qos log lines 5
-> qos log lines 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos log](#) Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
  alaQoSConfigLogLines
```

qos log level

Configures the level of log detail.

qos log level *level*

qos no log level

Syntax Definitions

level The level of log detail, ranging from 1 (least detail) to 8 (most detail).

Defaults

| parameter | default |
|--------------|---------|
| <i>level</i> | 5 |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **debug qos** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **debug qos** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- Note that a high log level value will impact the performance of the switch.

Examples

```
-> qos log level 4  
-> qos log level 0
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[qos log lines](#) Configures the number of lines in the QoS log.
[show qos log](#) Displays the log of QoS events.

MIB Objects

alaQoSConfigTable
 alaQoSConfigLogLevel

qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

qos stats interval *seconds*

Syntax Definitions

seconds The number of seconds before the switch polls network interfaces for statistics. The range is 1–3600.

Defaults

| parameter | default |
|----------------|---------|
| <i>seconds</i> | 60 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

Examples

```
-> qos stats interval 30
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R4; command deprecated.

Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

MIB Objects

alaQoSConfigTable
 alaQoSConfigStatsInterval

qos phones

Enables or disables the automatic prioritization of IP phone traffic.

qos phones [*priority priority_value* | **trusted**]

qos no phones

Syntax Definitions

priority_value The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

trusted Trusts IP phone traffic; priority value of the IP phone packet is used.

Defaults

| parameter | default |
|----------------------------------------|---------|
| <i>priority_value</i> trusted | trusted |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC:

| MAC Address Range | Description |
|-------------------------------------|--------------------------------|
| 00:80:9f:00:00:00—00:80:9f:ff:ff:ff | Enterprise IP Phones Range |
| 78:81:02:00:00:00—78:81:02:ff:ff:ff | Communications IP Phones Range |
| 00:13:fa:00:00:00—00:13:fa:ff:ff:ff | Lifesize IP Phones Range |
| 48:7a:55:00:00:00—48:7a:55:ff:ff:ff | ALE 8008 IP Phone MAC Range |

- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.
- On the OmniSwitch 6860, consider the following:
 - When automatic prioritization of QoS IP phone traffic is enabled, a rule is configured in the FFP (Fast Filtering Processor) with the source MAC address as 00:80:9F:00:00:00 and the mask FF:FF:FF:00:00:00 and 00-13-FA-xx-xx-xx and mask FF:FF:FF:00:00:00.
 - The QoS IP phone prioritization and SIP Snooping features are mutually exclusive. If one of these features is enabled when an attempt is made to enable the other feature, an error message is displayed. To enable QoS IP phone prioritization, first use the **sip-snooping admin-state disable**

command to disable SIP Snooping. To enable the SIP Snooping feature, first use the **qos no phones** command to disable QoS IP phone prioritization.

Note. QoS IP phone prioritization is configured, by default, on initialization

Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

Release History

Release 7.1.1; command was introduced.
Release 8.5R2; additional IP phone MAC ranges added.

Related Commands

[show qos config](#) Displays the QoS configuration for the switch.

MIB Objects

```
alaQoSConfigTable
  alaQoSConfigAutoPhones
```

qos quarantine mac-group

Configures the name of the Quarantine MAC address group. The OmniVista Quarantine Manager application identifies source MAC addresses to quarantine and adds these addresses to the Quarantine MAC group.

qos quarantine mac-group *mac_group*

qos no quarantine mac-group

Syntax Definitions

mac_group The name of the Quarantine MAC group (up to 31 alphanumeric characters).

Defaults

By default, the quarantine MAC group is not configured on the switch.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- Use the **no** form of the command to reset the default MAC group name back to “Quarantined”.
- The *mac_group* name specified with this command must match the group name specified with the OmniVista Quarantine Manager application.
- Each switch can have a different Quarantine MAC group name as long as each switch matches the OmniVista Quarantine Manager MAC group name for that switch. Note that there is only one such MAC group per switch.
- Do not use the Quarantine MAC group name in regular QoS policies.
- This group is also used by the switch Quarantine Manager and Remediation (QMR) application to restrict or restore network access to quarantined MACs.
- Note that QMR is not available if VLAN Stacking services or QoS VLAN Stacking inner VLAN and 802.1p policies are configured on the switch.
- QMR is considered active when there are MAC addresses in the Quarantine MAC address group. Use the **show quarantine mac group** command to display the contents of this group. In addition, the **show mac-learning** command output display identifies quarantined MAC addresses.

Examples

```
-> qos quarantine mac-group mac_group1
-> no quarantine mac-group
```

Release History

Release 8.1.1; command was introduced.

Related Commands

| | |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| qmr quarantine path | Specifies the URL for a remediation server. |
| qmr quarantine page | Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured. |
| show quarantine mac group | Displays information about the Quarantine MAC group. |
| show qmr | Displays the QMR configuration for the switch. |

MIB Objects

alaQoSConfigTable
 alaQoSConfigQuarantineMacGroupName

qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

qos user-port {**filter** | **shutdown**} {**spoof** | **bgp** | **bpdu** | **rip** | **ospf** | **vrrp** | **dvmrp** | **pim** | **isis** | **dhcp-server** | **dns-reply**}

qos no user-port {**filter** | **shutdown**}

Syntax Definitions

| | |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| filter | Filters the specified type of traffic when it is received on UserPort ports. |
| shutdown | Administratively disables UserPort ports that receive the specified type of traffic. |
| spoof | Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets. |
| bgp | Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured. |
| bpdu | Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets. |
| rip | Filters RIP protocol packets. |
| ospf | Filters OSPF protocol packets. |
| vrrp | Filters VRRP protocol packets. |
| dvmrp | Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options. |
| pim | Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options. |
| isis | Filters IS-IS protocol packets. |
| dhcp-server | Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67. |
| dns-reply | Filters all packets (both TCP and UDP) that originate from the known DNS port 53. |

Defaults

| parameter | default |
|-----------------|---------|
| filter | spoof |
| shutdown | none |

Platforms Supported

OmniSwitch 6560, 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spoof bgp ospf**).
- The **filter** option is applied only to ingress traffic on ports that are members of the UserPorts group. However, the switch will still process the filtered packets to determine if an egress update is sent on the same port. For example, if RIP traffic is filtered, the switch will still send RIP peer updates on that port.
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spoof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.
- To enforce anti-spoofing, a VLAN must have an IP address associated with it. If there is no IP address associated with the VLAN, no packets will be dropped.

Examples

```
-> qos user-port filter spoof bpdu
-> qos user-port shutdown spoof bgp ospf
-> qos no user-port shutdown
```

Release History

Release 7.1.1; command was introduced.

Release 8.5R4; OmniSwitch 6560 support for **BPDU shutdown** added.

Related Commands

policy port group

Configures a port group and its associated slot and port numbers.

show qos config

Displays QoS configuration information.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigUserportFilter  
  alaQoSConfigAppliedUserportFilter  
  alaQoSConfigUserportShutdown  
  alaQoSConfigAppliedUserportShutdown
```

qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) or other rate limiting mechanisms.

qos dei {ingress | egress}

qos no dei {ingress | egress}

Syntax Definitions

| | |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| ingress | Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic. <i>DEI mapping is not supported on the OmniSwitch 6465.</i> |
| egress | Marks the DEI/CFI bit for egress packets if the packets were marked yellow as a result of the rate limiting process. |

Defaults

By default, no DEI bit marking or mapping is done.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI bit set and ingress DEI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.
- DEI bit mapping is not supported on the OmniSwitch 6465. As a result, packets are processed as follows on that switch:
 - When packets are received on a trusted port, the DEI bit is retained only if the packets were not subject to a meter. If the port is untrusted, however, the DEI bit is always reset.
 - When a meter is set and DEI egress is configured on a trusted port, the DEI bit is reset to 0 for green packets. Yellow-red packets egress with the DEI bit set to 1.

Examples

```
-> qos dei ingress
-> qos dei egress
-> qos no dei ingress
```

-> qos no dei egress

Release History

Release 7.2.1; command was introduced.

Related Commands

| | |
|-----------------------------------|----------------------------------------------------------------------------------------------------------|
| qos port | Configures a physical port for QoS. |
| qos port dei | Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. |

MIB Objects

alaQoSConfigTable
 alaQoSConfigDEIMapping
 alaQoSConfigDEIMarking

qos dscp-table

Configures the internal priority and drop precedence for the specified Differentiated Services Code Point (DSCP) value. This value defines the six most significant bits of the DS byte in the IP header.

qos dscp-table *value*[-*value2*] **priority** *priority* **drop-precedence** {**low** | **medium** | **high**}

Syntax Definitions

| | |
|---------------------------------|-------------------------------------------------------------------------------|
| <i>value</i> [- <i>value2</i>] | The DSCP value. The range is 0–63. |
| <i>priority</i> | The internal priority value to map to the DSCP value. The valid range is 0–7, |
| low | Sets the drop precedence to low for the DSCP value. |
| medium | Sets the drop precedence to medium for the DSCP value. |
| high | Sets the drop precedence to high for the DSCP value. |

Defaults

By default, the drop precedence value is set to low precedence.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The priority and drop precedence settings configured with this command are global settings that are applied to all trusted ports.
- The values set in the DSCP table do not apply to untrusted ports.

Examples

```
-> qos dscp-table 63 priority 1 drop-precedence medium
```

Release History

Release 8.1.1; command was introduced.

Related Commands

[show qos dscp-table](#) Configures the priority and drop-precedence to be associated with the configured DSCP table.

MIB Objects

```
alaQoSdSCPEntryNumber  
alaQoSdSCPPriority  
alaQoSdSCPDropPrecedence
```

debug qos

Configures the type of QoS events that will be displayed in the QoS log.

```
debug qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3]
[classifier] [nat] [sem] [pm] [ingress] [egress]
```

```
debug no qos
```

```
debug no qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3]
[classifier] [nat] [sem] [pm] [ingress] [egress]
```

Syntax Definitions

| | |
|-------------------|---------------------------------------------------------------------------------------------------------------|
| info | Logs basic information about the switch. |
| config | Logs information about the global configuration. |
| rule | Logs events for rules configured on the switch. |
| main | Logs information about basic program interfaces. |
| port | Logs events related to QoS ports. |
| msg | Logs QoS messages. |
| sl | Logs information about source learning. |
| mem | Logs information about memory. |
| mapper | Logs information about mapping queues. |
| slot | Logs events related to slots. |
| l2 | Logs Layer 2 QoS events on the switch. |
| l3 | Logs Layer 3 QoS events on the switch. |
| classifier | Logs information whenever the switch classifies a flow; more details are provided if the log level is higher. |
| nat | Logs events for Network Address Translation policies. |
| sem | Logs information about semaphore, process locking. |
| pm | Logs events related to the Policy Manager. |
| ingress | Logs information about packets arriving on the switch. |
| egress | Logs information about packets leaving the switch. |

Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.

- Use this command to troubleshoot QoS events on the switch.

Examples

```
-> debug qos flows queue
-> qos debug no flows no queue
-> debug no qos
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|---------------------------------|-------------------------------------------------------------------------------|
| qos forward log | Enables the switch to send events to the PolicyView application in real time. |
| qos log lines | Configures the number of lines in the QoS log. |
| qos log level | Configures the level of log detail. |
| show qos log | Displays the log of QoS events. |

MIB Objects

```
alaQoSConfigTable
  alaQoSConfigDebug
```

debug qos internal

Displays debugging information for QoS internal to the switch.

debug qos internal [*slice slot/slice*] [**flow**] [**queue**] [**port**] [**l2tree**] [**l3tree**] [**vector**] [**pending**] [**verbose**] [**mapper**] [**pool**] [**log**] [**pingonly** | **nopingonly**]

Syntax Definitions

| | |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot/slice</i> | The slot number and slice to view debugging information. A <i>slice</i> is a logical section of hardware that corresponds to particular ports on a network interface module. |
| flow | Displays information about QoS flows. |
| queue | Displays information about QoS queues. |
| port | Displays information about QoS ports. |
| l2tree | Displays information about Layer 2 flows. |
| l3tree | Displays information about Layer 3 flows. |
| vector | Displays information about vectors. |
| pending | Displays information about pending QoS objects. |
| verbose | Sets the output to verbose mode for more detailed information. |
| mapper | Displays information about QoS mapping flows to queues. |
| pool | Displays information about the buffer pool. |
| log | Displays information about QoS information that is logged. |
| pingonly | Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies. |
| nopingonly | Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets. |

Defaults

Debugging is disabled by default.

| parameter | default |
|-------------------------------------|-------------------|
| pingonly nopingonly | nopingonly |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **debug qos** command to configure the type of QoS events that will be displayed in the QoS log.
- Use the **qos log level** command to set the level of log detail in the QoS log.

Examples

```
-> debug qos internal "verbose log"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[debug qos](#)

Configures the type of QoS events that will be displayed in the QoS log.

[qos log level](#)

Configures the level of log detail.

MIB Objects

N/A

clear qos log

Clears messages in the current QoS log.

```
clear qos log
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

Examples

```
-> clear qos log
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------------|------------------------------------------------|
| qos log lines | Configures the number of lines in the QoS log. |
| show qos log | Displays the log of QoS events. |

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigClearLog
```

qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

qos apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

Examples

```
-> qos apply
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| qos revert | Removes any policies configured through policy rule but not applied to the current configuration through the qos apply command. |
| qos reset | Resets the QoS configuration to its default values. |
| qos flush | Deletes all pending policy information. |

MIB Objects

alaQoSConfigTable
 alaQoSConfigApply

qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

qos revert

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

Examples

```
-> qos revert
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-----------------------------|---------------------------------------------------------------------------------------------------------------|
| policy rule | Configures a policy rule and saves it to the current configuration but does not make it active on the switch. |
| qos apply | Applies all QoS settings configured on the switch to the current configuration. |
| qos reset | Resets the QoS configuration to its defaults. |

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigRevert
```

qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

qos flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration*.

Note. Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

base commands

| | |
|-----------------------------|--------------------------|
| policy rule | policy mac group |
| policy network group | policy port group |
| policy service | policy condition |
| policy service group | policy action |

Examples

```
-> qos flush
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos revert**

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

policy server flush

Removes all cached LDAP policy data from the switch.

MIB Objects

alaQoSConfigTable
 alaQoSConfigFlush

qos reset

Resets the QoS configuration to its defaults.

```
qos reset
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

Examples

```
-> qos reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos apply

Applies all QoS settings configured on the switch to the current configuration.

qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

MIB Objects

alaQoSConfigTable

alaQoSConfigReset

qos stats reset

Resets QoS statistic counters to zero.

```
qos stats reset
```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.

Examples

```
-> qos stats reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigStatsReset
```

qos switch-group

Changes how the switch handles IP addresses configured on the switch to help reduce the number of hardware entries required for QoS policies that use an IP address configured on the switch.

qos switch-group {expanded | compact}

Syntax Definitions

| | |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expanded | Uses the expanded method for populating the hardware routing table. This method requires a hardware entry for each individual IP interface belonging to either the built-in 'Switch' or 'Switch6' network groups. |
| compact | Uses the compact method for populating the hardware routing table by programming a single next hop entry for all IP interfaces belonging to either the built-in 'Switch' or 'Switch6' network groups. |

Defaults

| parameter | default |
|--------------------|----------|
| expanded compact | expanded |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- The **expanded** method can be used to reduce the hardware entries required and allow for a single hardware entry to be programmed for all the IP interfaces belonging to either the built-in 'Switch' or 'Switch6' network groups instead of a hardware entry for each individual IP address.
- The built-in policy network group 'Switch' contains all the IPv4 interfaces configured on the switch.
- The built-in policy network group 'Switch6' contains all the IPv6 interfaces configured on the switch.
- It is required to reboot the switch for the switch group setting to take effect. The current setting will always be shown, with the modified setting in parentheses in the **show qos config** command.

Examples

```
-> qos switch-group compact
-> qos switch-group expanded
```

Release History

Release 8.4.1 R02; command introduced.

Related Commands**show qos config**

Displays global information about the QoS configuration.

MIB Objects

alaQoSConfig

alaQoSConfigSwitchGroup

qos port reset

Resets all QoS port configuration to the default values.

```
qos port chassis/slot/port[-port2] reset
```

Syntax Definitions

| | |
|--------------------------|-------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

The QoS port configuration parameters that are reset include:

| parameter | default |
|----------------|-------------|
| default queues | 8 |
| trusted | not trusted |

Examples

```
-> qos port 3/1 reset
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos port](#) Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortReset
```

qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos port chassis/slot/port[-port2]
  [trusted]
  [maximum egress-bandwidth bps]
  [maximum ingress-bandwidth bps]
  [maximum depth bps]
  [default 802.1p value]
  [default dscp value]
  [default classification {802.1p | tos | dscp}]
```

Syntax Definitions

| | |
|--------------------------|-------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |

Defaults

- All ports are untrusted.
- By default, QoS ports do not preempt queues of lower priority.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-------------------------|----------------------------------------------------------------------------|
| qos apply | Applies configured QoS and policy settings to the current configuration. |
| qos port trusted | Configures whether the default mode for QoS ports is trusted or untrusted. |
| show qos port | Displays information about QoS ports. |

MIB Objects

```
alaQoSPortTable
  alaQoSPortSlot
  alaQoSPortPort
  alaQoSPortTrusted
  alaQoSPortMaximumBandwidth
  alaQoSPortMaximumBandwidthStatus
  alaQoSPortMaximumIngBandwidth
  alaQoSPortMaximumIngBandwidthStatus
  alaQoSPortMaximumDefaultDepth
  alaQoSPortMaximumDefaultDepthStatus
  alaQoSPortDefault8021p
  alaQoSPortDefaultDSCPalaQoSPortDefaultClassification
```

qos port trusted

Configures whether an individual port is trusted or untrusted. Trusted ports can accept the 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

qos port chassis/slot/port[-port2] trusted

qos port chassis/slot/port no trusted

Syntax Definitions

| | |
|--------------------------|-------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the [qos trust-ports](#) command to set the default trust mode for all QoS ports. The **qos port trusted** command may be used to override the default.
- The setting applies only to ports with incoming traffic.
- Use the [qos port default 802.1p](#) or [qos port default dscp](#) commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different 802.1p or ToS/DSCP value for such packets.

Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos apply**

Applies configured QoS and policy settings to the current configuration.

qos port

Configures a physical port for QoS.

qos trust-ports

Configures the global trust mode for QoS ports.

show qos port

Displays information about QoS ports.

MIB Objects

alaQoSPortTable

 alaQoSPortTrusted

qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

qos port *chassis/slot/port[-port2]* **maximum egress-bandwidth** *bps[k | m | g | t]*

qos port *chassis/slot/port[-port2]* **no maximum egress-bandwidth**

Syntax Definitions

| | |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| <i>bps[k m g t]</i> | The maximum amount of bandwidth, in bits-per-second, for all traffic that egresses on the port. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g , 1t). |

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

| parameter | default |
|----------------------|----------|
| <i>k m g t</i> | k |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- If the maximum egress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum egress-bandwidth 1000
-> qos port 4/1-8 maximum egress-bandwidth 10m
-> qos port 3/1 no maximum egress-bandwidth
-> qos port 4/1-8 no maximum egress-bandwidth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------------------------------|--------------------------------------------------------------------------|
| qos port maximum ingress-bandwidth | Configures the rate at which traffic is received on a QoS port. |

```

qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

qos port *chassis/slot/port[-port2]* **maximum ingress-bandwidth** *bps[k | m | g | t]*

qos port *chassis/slot/port[-port2]* **no maximum ingress-bandwidth**

Syntax Definitions

| | |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| <i>bps[k m g t]</i> | The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g , 1t). |

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

| parameter | default |
|----------------------|----------|
| <i>k m g t</i> | k |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- If the maximum ingress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum ingress-bandwidth 1000
-> qos port 4/1-8 maximum ingress-bandwidth 10m
-> qos port 3/1 no maximum ingress-bandwidth
-> qos port 4/1-8 no maximum ingress-bandwidth
```

Release History

Release 7.1.1; command introduced.

Related Commands

| | |
|---------------------------------------------------|--------------------------------------------------------------------------|
| qos port maximum egress-bandwidth | Configures the rate at which traffic is sent on a QoS port. |
| qos apply | Applies configured QoS and policy settings to the current configuration. |
| qos port | Configures a physical port for QoS. |
| show qos port | Displays information about QoS ports. |

MIB Objects

alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortMaximumIngBandwidth  
  alaQoSPortMaximumIngBandwidthStatus
```

qos port maximum depth

Configures the maximum bucket size used for traffic metering. The bucket size determines how much the traffic can burst over the maximum bandwidth rate.

qos port *chassis/slot/port[-port2]* **maximum depth** *bps[k | m | g | t]*

qos port *chassis/slot/port[-port2]* **no maximum depth**

Syntax Definitions

| | |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| <i>bps[k m g t]</i> | The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, 10) or with abbreviated units (for example, 10k , 5m , 1g). |

Defaults

| parameter | default |
|----------------------|----------|
| <i>k m g t</i> | k |

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

- This QoS port parameter is configured in conjunction with the maximum bandwidth parameters. When the bucket size is reached, the switch starts to drop packets.
- Use the **no** form of the command to remove the maximum depth setting from a port.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- Modifying the maximum depth is most useful for low-bandwidth links.

Examples

```
-> qos port 3/1 maximum depth 100
-> qos port 4/1-8 maximum depth 10m
-> qos port 3/1 no maximum depth
-> qos port 4/1-8 no maximum depth
```

Release History

Release 7.1.1; command was introduced.

Related Commands

```

qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port[-port2]* **default 802.1p** *value*

Syntax Definitions

| | |
|--------------------------|----------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| <i>value</i> | The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority). |

Defaults

| parameter | default |
|------------------|----------------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.
- Note that the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

Examples

```
-> qos port 3/1 default 802.1p 5
-> qos port 4/1-8 default 802.1p 7
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos apply**

Applies configured QoS and policy settings to the current configuration.

qos port

Configures a physical port for QoS.

show qos port

Displays information about QoS ports.

MIB Objects

alaQoSPortTable

alaQoSPortDefault8021p

qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port[-port2]* **default dscp** *value*

Syntax Definitions

| | |
|--------------------------|-------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| <i>value</i> | The ToS/DSCP value. The range is 0–63. |

Defaults

| parameter | default |
|------------------|----------------|
| <i>value</i> | 0 |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

Examples

```
-> qos port 3/1 default dscp 63
-> qos port 4/1-8 default dscp 33
```

Release History

Release 7.1.1; command was introduced.

Related Commands**qos apply**

Applies configured QoS and policy settings to the current configuration.

show qos port

Displays information about QoS ports.

MIB Objects

alaQoSPortTable

alaQoSPortDefaultDSCP

qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

qos port *chassis/slot/port[-port2]* default classification {tos | 802.1p | dscp}

Syntax Definitions

| | |
|--------------------------|-----------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| tos | Specifies that the ToS value of the flow will be used to prioritize flows coming in on the port. |
| 802.1p | Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port. |
| dscp | Specifies that the DSCP value of the flow will be used to prioritize flows coming in on the port. |

Defaults

| parameter | default |
|---------------------|---------|
| tos 802.1p dscp | dscp |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified using this command.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

Examples

```
-> qos port 8/24 default classification dscp
-> qos port 4/1-8 default classification dscp
-> qos port 7/1 default classification 802.1p
-> qos port 5/1-8 default classification 802.1p
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |

qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) or other rate limiting mechanisms.

```
qos port chassis/slot/port dei {ingress | egress}
```

```
qos port chassis/slot/port no dei {ingress | egress}
```

Syntax Definitions

| | |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). |
| ingress | Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic. <i>DEI mapping is not supported on the OmniSwitch 6465.</i> |
| egress | Marks the DEI/CFI bit for egress packets if the packets were marked yellow as a result of the rate limiting process. |

Defaults

By default, no DEI/CFI bit mapping or marking is done.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI bit set and ingress DEI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.
- DEI bit mapping is not supported on the OmniSwitch 6465. As a result, packets are processed as follows on that switch:
 - When packets are received on a trusted port, the DEI bit is retained only if the packets were not subject to a meter. If the port is untrusted, however, the DEI bit is always reset.
 - When a meter is set and DEI egress is configured on a trusted port, the DEI bit is reset to 0 for green packets. Yellow–red packets egress with the DEI bit set to 1.

Examples

```
-> qos port 1/10 dei ingress
-> qos port 1/20 dei egress
-> qos port 1/10 no dei ingress
-> qos port 1/20 no dei egress
```

Release History

Release 7.2.1; command was introduced.

Related Commands

MIB Objects

```
alaQoSPortTable
  alaQoSPortDEIMapping
  alaQoSPortDEIMarking
```

qos qsp import

Imports a predefined QSet profile (QSP) to a new or previous custom profile.

```
qos qsp {qsp_id | qsp_name} import qsp {import_qsp_id | import_qsp_name}
```

```
no qos qsp {qsp_id | qsp_name}
```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------------------|
| <i>qsp_id</i> | A QSet custom profile ID. The valid custom profile ID range is 6–16. |
| <i>qsp_name</i> | The QSet profile name. |
| <i>import_qsp_id</i> | The ID of the QSet profile to import (1 or 5). |
| <i>import_dcp_name</i> | The name of the QSet profile to import (QSP-1 or QSP-5). |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- The new QSet profile must be unique and not contain the same name and ID of an existing QSet profile.
- Use the **no** form of the command to remove an existing custom QSet profile from the switch configuration.
- The predefined QSet profiles 1 and 5 cannot be removed from the switch configuration.
- A custom profile can be assigned to any port or link aggregate, but not to a VFL link.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.

Examples

```
-> qos qsp 12 import qsp 1  
-> qos qsp qsp-16 import qsp 5  
-> no qsp 12
```

Release History

Release 8.3.1.R02; command was introduced.

Related Commands

alaVfcQSPTemplateId

alaVfcQSPTemplateName

alaVfcQSPRowStatus

qos qsp qp

Modifies the Peak Information Rate (PIR), WFQ weight, and WFQ scheduler mode attributes for an individual queue profile (QP) associated with a custom QSet profile (QSP).

```
qos qsp {qsp_id | qsp_name} qp qp_id {pir % | weight weight | scheduler {sp | wrr | wrr2}}
```

Syntax Definitions

| | |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>qsp_id</i> | A QSet custom profile ID. The valid custom profile ID range is 6–16. |
| <i>qsp_name</i> | The QSet custom profile name. |
| <i>qp_id</i> | The queue profile number in the QSet custom profile. |
| <i>%</i> | The PIR rate limit to apply to queue traffic. |
| <i>weight</i> | The queue weight that is used to determine the amount of shared bandwidth allocated for queue traffic. The valid range is 0–127. |
| sp | Selects the Strict Priority scheduler. |
| wrr | Selects the Weighted Round Robin scheduler. |
| wrr2 | Selects a second Weighted Round Robin scheduler that is available on the OmniSwitch 9900. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 9900

Usage Guidelines

- The queue weight value is only used when WRR is the scheduler for the queue.
- The **pir**, **weight**, and **scheduler** attributes are only configurable for individual queues that are associated with a custom QSet profile.
- When a custom profile is modified, the changes are applied to all ports that are associated with that custom profile. To apply specific changes to a single port (QSet instance), import a custom or default profile into a new custom profile, make the necessary changes, then apply the new custom profile to the port.

Examples

```
-> qos qsp 6 qp 1 scheduler wrr weight 2 pir 100
-> qos qsp 6 qp 2 scheduler wrr weight 1 pir 100
-> qos qsp 6 qp 3 scheduler wrr weight 3 pir 100
-> qos qsp 6 qp 4 scheduler wrr weight 4 pir 100
-> qos qsp 6 qp 5 scheduler wrr weight 2 pir 100
-> qos qsp 6 qp 6 scheduler sp pir 50
-> qos qsp 6 qp 7 scheduler wrr2 weight 2 pir 100
-> qos qsp 6 qp 8 scheduler wrr2 weight 2 pir 100
```

qos qsi qsp

Configures the QSet profile (QSP) association for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port, link aggregate, and virtual fabric link (VFL).

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2] | vf-link vfl_id} qsp {qsp_id | qsp_name}
```

Syntax Definitions

| | |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> [- <i>port2</i>] | The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10). |
| <i>agg_id</i> [- <i>agg_id2</i>] | The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20). |
| <i>vfl_id</i> | The VFL link ID (1/0). <i>This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.</i> |
| <i>qsp_id</i> | An existing QSet profile (QSP) ID number to assign to this instance. <ul style="list-style-type: none"> OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900 support predefined QSP IDs 1 and 5; profiles 2, 3, and 4 are not supported. QSP IDs 6 through 16 refer to custom profiles that are also supported. OmniSwitch 6900-C32 and OmniSwitch 6900-V72 support predefined QSP ID 1; custom profiles are not supported. OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900 support predefined QSP IDs 1, 2, 3, and 4; custom profiles are not supported. |
| <i>qsp_name</i> | An existing QSet profile name (for example, qsp-1) to assign to this instance. |

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- There is only one QSI for each port, link aggregate, and VFL and only one QSP associated with each QSI.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.
- On an OmniSwitch 6860 or OmniSwitch 6865, changing the QSP assignment for one VFL instance automatically changes the QSP assignment for all other VFL instances to the same QSP. For example,

if QSP 2 is assigned to VFL 1/0, then the QSP assignment for VFL 2/0 is also changed to QSP 2. It is not necessary to configure the QSP assignment separately for each VFL on the switch.

Examples

```
-> qos qsi port 1/2 qsp 2
-> qos qsi port 2/1-10 qsp 3
-> qos qsi slot 3 qsp 4
-> qos qsi linkagg 10 qsp 2
```

The following command examples show that when the QSP assignment for VFL 1 is changed to QSP 2, the QSP for VFL 2 is automatically changed as well:

```
-> qos qsi vf-link 1/0 qsp 2
WARNING: configuration change applied to all VFLs in the system
```

```
-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.
```

| Port | Profile | | Mode | Parent |
|---------|---------|-------|------|---------|
| | # | Name | | |
| vfl-1/0 | 2 | qsp-2 | NDCB | vfl-1/0 |

```
-> show qos qsi vf-link 2/0 summary
Legends: * indicates port is misconfigured.
```

| Port | Profile | | Mode | Parent |
|---------|---------|-------|------|---------|
| | # | Name | | |
| vfl-2/0 | 2 | qsp-2 | NDCB | vfl-2/0 |

Release History

Release 7.2.1.R02; command introduced.

Release 8.3.1; **vf-link** parameter added.

Related Commands

| | |
|-----------------------|------------------------------------------------------------------------------|
| qos qsp import | Imports a predefined QSet profile (QSP) to a new or previous custom profile. |

| qos qsi stats | Configures statistics collection for the QSet instance. |
| show qos qsi | Displays the QSet instance configuration. |
| show qos qsp | Displays the QSet profile attributes. |

MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetInstanceTable
  alaVfcQsetId
  alaVfcQsetQSPId
  alaVfcQsetQSPName
```

qos qsp system-default

Changes the default QSet profile (QSP) that is assigned to each port, link aggregate ID, and virtual fabric link (VFL).

```
qos qsp system-default {qsp_id | qsp_name}
```

Syntax Definitions

| | |
|-----------------|---------------------------------------------------------------------------------------------|
| <i>qsp_id</i> | An existing QSet profile (QSP) ID number to use as the default QSP. The valid range is 1–4. |
| <i>qsp_name</i> | An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to use as the default QSP. |

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- When this command is used, the specified QSP is assigned to all ports, link aggregates, and VFLs on the switch.
- Changing the system default profile is only allowed when the switch is running in the non-Data Center Bridging (NDCB) mode. This mode is active by default when there is no OmniSwitch Data Center software license installed on the switch.
- A QSP assigned through the **qos qsi qsp** command overrides the system default QSP assignment. For example, if the system default QSP is set to 1 and the **qos qsi qsp** command is used to change the QSP to 2 on port 1/1/20, the QSP 2 settings are applied to port 1/1/20.

Examples

```
-> qos qsp system-default 2
-> qos qsp system-default qsp-4
```

Release History

Release 8.3.1; command introduced.

Related Commands

- qos qsi qsp** Configures the QSet profile association for the QSet instance.
- show qos qsp system-default** Displays the name and ID of the default QSP for the switch.

MIB Objects

```
alcatelIND1VfcMIB  
  alaVfcSystemDefaultQsetQSPName  
  alaVfcSystemDefaultQsetQSPID
```

qos qsi wred

Configures the WRED profile (WRP) administrative status for the QSet profile associated with the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port chassis/slot/port[-port2] | slot slot | linkagg agg_id[-agg_id2]} wred admin-state {enable | disable}
```

Syntax Definitions

| | |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (3/1-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-20). |
| enable | Enables the WRED profile for the instance. |
| disable | Disables the WRED profile for the instance. |

Defaults

By default, WRED is disabled for the QSet instance.

Platforms Supported

Not supported in this release.

Usage Guidelines

- There is only one QSI per port or LAG ID and only one profile (WRP 1) associated with the QSI.
- Changing the WRED profile status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.
- WRP 1 is the only profile supported. Configuring additional profiles is not supported at this time.
- When enabled, WRP 1 applies the following color threshold values only to TCP traffic. The threshold values indicated are a percentage of the maximum average queue length.

| Color | Min Threshold | Max Threshold | Drop Probability | Gain |
|--------|---------------|---------------|------------------|------|
| Red | 10 | 50 | 36 | 9 |
| Yellow | 50 | 90 | 30 | 9 |
| Green | 90 | 100 | 24 | 9 |

Examples

```
-> qos qsi port 1/2 wred admin-state enable
-> qos qsi port 2/1-10 wred admin-state disable
```

```
-> qos qsi slot 3 wred admin-state enable
-> qos qsi linkagg 10 wred admin-state enable
```

Release History

Release 7.2.1.R02; command introduced.

Related Commands

| | |
|-----------------------------------------|----------------------------------------------------------------|
| qos qsi qsp | Configures the QSet profile association for the QSet instance. |
| show qos wrp | Displays the WRED profile configuration. |
| show qos qsi wred-stats | Displays the QSet instance configuration. |

MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetInstanceTable
  alaVfcQsetQSPID
  alaVfcQsetQSPName
  alaVfcQsetWRPAdminState
  alaVfcQsetStatsAdmin
  alaVfcQsetStatsInterval
```

qos qsi stats

Configures the administrative status and interval for statistics collection for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats {admin-state {enable | disable} | interval interval_time}}
```

Syntax Definitions

| | |
|--------------------------|---------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20). |
| enable | Enables statistics collection for the instance. |
| disable | Disables statistics collection for the instance. |
| <i>interval_time</i> | The time interval for statistics gathering. The valid range is 10–300 seconds. |

Defaults

By default, statistics collection is disabled and the time interval is set to 10 seconds.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSet profile (QSP) or DCB profile (DCP) associated with the QSI.
- Changing the statistics collection status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.

Examples

```
-> qos qsi port 1/2 stats admin-state enable
-> qos qsi port 1/2 stats interval 30
-> qos qsi port 2/1-10 stats admin-state enable
-> qos qsi linkagg 10 stats admin-state enable interval 120
```

Release History

Release 7.2.1.R02; command introduced.

Related Commands

| | |
|---------------------------|------------------------------------------------------------------|
| qos qsi qsp | Configures the QSet profile association for the QSet instance. |
| qos qsi wred | Configures the WRED administrative status for the QSet instance. |

```

show qos port

Displays information about all QoS ports or a particular port.

show qos port [*chassis/slot/port*] [**statistics**]

Syntax Definitions

| | |
|--------------------------|-------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (3/1). |
| statistics | Displays statistics for high-density gigabit modules. |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

| character | definition |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| + | Indicates that the port is manually configured as trusted through the qos port trusted command; the port setting takes precedence over the global trust setting configured through the qos trust-ports command. |
| * | Indicates that the port is automatically trusted regardless of the global setting set through the qos trust-ports command. (Applies to mobile ports and ports configured for 802.1Q.) |

Examples

```
-> show qos port
```

| Slot/ Port | Active | Trust | Default P/DSCP | Default Classification | Bandwidth Physical | Ingress | Egress | DEI Map/Mark | Type |
|---------------|--------|-------|-------------------|---------------------------|-----------------------|---------|--------|-----------------|-------------|

```

output definitions

| | |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Slot/Port | The slot and physical port number. |
| Active | Whether or not the port is sending/receiving QoS traffic. |
| Trust | Whether the port is trusted or not trusted. Configured through the qos port trusted command. |
| Default P | The default 802.1p setting for the port. Configured through the qos port default 802.1p command. |
| Default DSCP | The default ToS/DSCP setting for the port. Configured through the qos port default dscp command. |
| Default Classification | The default classification setting for the port (802.1p , ToS , or DSCP). Configured through the qos port default classification command. |
| Physical Bandwidth | The amount of physical bandwidth available on the port. |
| Ingress Bandwidth | The amount of ingress bandwidth configured for the port. Configured through the qos port maximum ingress-bandwidth command. |
| Egress Bandwidth | The amount of egress bandwidth configured for the port. Configured through the qos port maximum egress-bandwidth command. |
| DEI Map/Mark | The Drop Eligible Indicator (DEI) bit mapping and marking setting for the port. Configured through the qos port dei command. |
| Type | The interface type, ethernet or wan . |

Release History

Release 7.1.1; command was introduced.

Related Commands

qos port Configures a physical port for QoS.

```

show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

show qos slice [*slot/slice*]

Syntax Definitions

slot/slice The slot number and slice for which you want to view information. The number of slices per module varies depending on the type of module.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6865, 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Information for all slots/slices is displayed unless a particular slot/slice is requested.
- This command is useful for monitoring switch resources required for policy rules.
- On the following switch platforms, use the [show tcam utilization](#) command instead of the **show qos slice** command:
 - OmniSwitch 6465
 - OmniSwitch 6560
 - OmniSwitch 6900-C32, 6900-V72
 - OmniSwitch 9900

Examples

```
-> show qos slice
Slot/          Ranges          Rules          Counters          Meters

| | | | 3 | 256/256 | 256/256 | 256/256 |

output definitions

| | |
|-----------------------|---------------------------------------------------------------------------------------------|
| Slot/Unit | The slot and slice number. |
| Type | The type of slice. |
| Ranges Total | The total number of TCP/UDP port ranges supported per slot/slice. |
| Ranges Free | The number of TCP/UDP port ranges that are still available for use. |
| CAM | The CAM number. |
| Rules Total | The total number of rules supported per CAM. |
| Rules Free | The number of rules that are still available for use. On startup, the switch uses 27 rules. |
| Counters Total | The total number of counters supported per CAM. |
| Counter Free | The number of counters that are still available for use. |
| Meters Total | The total number of meters supported per CAM. |
| Meters Free | The number of meters that are still available for use. |

Release History

Release 7.1.1; command was introduced.

Related Commands

[policy rule](#) Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

N/A

show qos log

Displays the log of QoS events.

show qos log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to display the current QoS log. To clear the log, use the **clear qos log** command.

Examples

```
-> show qos log
**QoS Log**
Insert rule 0
Rule index at 0
Insert rule 1
Rule index at 1
Insert rule 2
Rule index at 2
Enable rule r1 (1) 1,1
Enable rule r2 (0) 1,1
Enable rule yuba1 (2) 1,1
Verify rule r1(1)
Enable rule r1 (1) 1,1
Really enable r1
Update condition c1 for rule 1 (1)
Verify rule r2(1)
Enable rule r2 (0) 1,1
Really enable r2
Update condition c2 for rule 0 (1)
Verify rule yuba1(1)
Enable rule yuba1 (2) 1,1
Really enable yuba1
Update condition yubamac for rule 2 (1)
QoS Manager started TUE MAR 10 13:46:50 2002

Match rule 2 to 1
Match rule 2 to 2
Match rule 2 to 3
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[clear qos log](#)

Clears messages in the current QoS log.

[qos log lines](#)

Configures the number of lines in the QoS log.

MIB Objects

N/A

show qos config

Displays global information about the QoS configuration.

show qos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use this command to view the current global configuration for QoS. Use the **show qos statistics** command to view statistics about the QoS software in the switch.

Examples

```
-> show qos config
QoS Configuration
Admin                = enable,
Switch Group         = expanded,
Trust ports          = no,
Phones                = trusted,
Log lines             = 10240,
Log level             = 5,
Log console           = no,
Forward log           = no,
Stats interval        = 60,
User-port filter      = spoof,
User-port shutdown   = none,
Debug                 = info,
DEI Mapping           = Disabled,
DEI Marking           = Disabled,
Pending changes      = none
```

output definitions

| | |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin | Whether or not QoS is enabled or disabled. Configured through the qos command. |
| Switch Group | Whether the expanded or compact method is used to populate the hardware routing table. Configured through the qos switch-group command. |
| Trust Ports | The default trusted mode for switch ports. Configured through the qos trust-ports command. |

output definitions (continued)

| | |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phones | Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the qos phones command. |
| Log lines | The number of lines included in the QoS log. Configured through the qos log lines command. |
| Log level | The level of log detail. Configured through the qos log level command. |
| Log console | Whether or not log messages are sent to the console. Configured through the qos log console command. |
| Forward log | Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the qos forward log command. |
| Stats interval | How often the switch polls network interfaces for statistics about QoS events. Configured through the qos stats interval command. |
| User-port filter | The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the qos user-port command. |
| User-port shutdown | The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the qos user-port command. |
| Debug | The type of information that will be displayed in the QoS log. A value of info indicates the default debugging type. |
| DEI Mapping | The status (enabled or disabled) of Drop Eligible Indicator (DEI) bit mapping for ingress traffic. Configured through the qos dei command. |
| DEI Marking | The status (enabled or disabled) of DEI bit marking for egress traffic. Configured through the qos dei command. |
| Pending changes | QoS changes not yet applied to the configuration. |

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|----------------------------|----------------------------------------------------------------------------------------------------------------------|
| qos | Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch. |

output definitions

| | |
|-----------------------------|-------------------------------------------------------------------|
| Events | The number of Layer 2 or Layer 3 flows transmitted on the switch. |
| Matches | The number of Layer 2 or Layer 3 flows that match policies. |
| Drops | The number of Layer 2 or Layer 3 flows that were dropped. |
| L2 | The number of Layer 2 events, matches, and drops. |
| L3 Ingress | The number of Layer 3 ingress events, matches, and drops. |
| L3 Egress | The number of Layer 3 egress events, matches, and drops. |
| IGMP join | The number of multicast events, matches, and drops. |
| Fragments | The number of fragments dropped. |
| Bad Fragments | The number of fragments received with an offset of 1. |
| Unknown Fragments | The number of out-of-order fragments received. |
| Sent NI messages | The number of messages sent to network interfaces. |
| Received NI messages | The number of messages received by network interfaces. |
| Failed NI messages | The number of failed message attempts to network interfaces. |
| Load balanced flows | The number of Server Load Balance flow entries. |
| Reflexive flows | The number of reflexive flows. |
| Reflexive correction | The number of reflexive flow corrections. |
| Flow lookups | The number of flow table lookups. |
| Flow hits | The number of flow table lookup hits. |
| Max PTree nodes | The highest number of nodes in the classifier tree. |
| Max Ptree depth | The length of the longest path in the classifier tree. |
| Spoofed Events | The number of spoofed events. |
| Nonspoofed Events | The number of non-spoofed events. |
| DropServices | The number of TCP/UDP flows dropped. |

Release History

Release 7.1.1; command was introduced.

Related Commands

show qos dscp-table

Displays the QoS DSCP table. This table contains the internal priority mapping and drop precedence value for each of the DSCP values.

show qos dscp-table

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6860, 6865, 6900

Usage Guidelines

The DSCP table mapping is a global configuration that applies to all trusted ports; does not apply to untrusted ports.

Examples

```
-> show qos dscp-table
DSCP-Table   Priority      Drop-Precedence
-----+-----+-----
0             0             low
1             0             low
2             0             low
3             0             low
4             0             low
5             0             low
6             0             low
7             0             low
8             1             low
9             1             low
10            1             low
```

output definitions

| | |
|------------------------|-----------------------------------------------------|
| DSCP-Table | The DSCP number. |
| Priority | The priority number mapped to the DSCP value. |
| Drop-Precedence | The drop precedence value mapped to the DSCP value. |

Release History

Release 8.1.1; command was introduced.

Related Commands

qos dscp-table

Configures the priority and drop-precedence value associated with the DSCP number.

MIB Objects

alaQoSdSCPPriority
alaQoSdSCPDropPrecedence

show qos qsi summary

Displays a list of switch ports showing the QoS or DCB profile assigned to each port.

show qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} summary

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (3/1). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | A link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

This command displays the summary of the user ports in the switch.

Examples

```
-> show qos qsi port 1/1-5 summary
Legends: * indicates port is misconfigured.
```

| Port | Profile | | Mode | Parent |
|------|---------|-------|------|--------|
| | # | Name | | |
| 1/1 | 8 | dcp-8 | DCB | 1/1 |
| 1/2 | 8 | dcp-8 | DCB | 1/2 |
| 1/3 | 8 | dcp-8 | DCB | 1/3 |
| 1/4 | 1 | dcp-1 | DCB | 1/4 |
| 1/5 | 1 | dcp-1 | DCB | 1/5 |

output definitions

| | |
|---------------------|--------------------------------------------------|
| Port | Configured DCB ports. |
| Profile # | Identifies the DCB profile assigned to the port. |
| Profile Name | Name of the DCB profile assigned to the port. |
| Mode | Indicates if the port is DCB or NDCB. |
| Parent | Lists the parent of the port. |

Release History

Release 7.3.1; command was introduced.

Related Commands

show qos qsi dcb dcbx

Displays the configured ports in the system and the related DCBX information.

qos qsi qsp dcb

Assigns a DCB profile to a port or link aggregate.

show qos qsp

Displays the QSet profile (QSP) configuration for the switch.

```
show qos qsp [qsp_id | qsp_name] [detail [port chassis/slot/port[-port2]] | linkagg agg_id[-agg_id2]]
```

Syntax Definitions

| | |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>qsp_id</i> | A QSet profile (QSP) ID number. <ul style="list-style-type: none">• OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900 support predefined QSP IDs 1 and 5; profiles 2, 3, and 4 are not supported. QSP IDs 6 through 16 refer to custom profiles that are also supported.• OmniSwitch 6900-C32 and OmniSwitch 6900-V72 support predefined QSP ID 1; custom profiles are not supported.• OmniSwitch 6860, OmniSwitch 6865, and OmniSwitch 6900 support predefined QSP IDs 1, 2, 3, and 4; custom profiles are not supported. |
| <i>qsp_name</i> | A QSP profile name. |
| detail | Displays QSP configuration details for a specific profile, port, slot, or link aggregate. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |

Defaults

By default, displays the configuration for all four of the QSet profiles (QSP 1–4).

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the *qsp_id* or the *qsp_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information for all ports and link aggregates.
- Use the **port** *slot/port* and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.
- Configuring a QSP assignment for a virtual fabric link (VFL) is supported only on the OmniSwitch 6860 and OmniSwitch 6865.

Examples

```

-> show qos qsp 1

```

output definitions

| | |
|----------------|-------------------------------------------------------------------------------------------------|
| QSP | The QSet profile (QSP) ID number and name. |
| #Ports | The number of ports to which this profile is attached. |
| #Queues | The number of queues associated with this QSet. Currently there are eight queues for each QSet. |
| BW% | The bandwidth percentage for the QSet. The bandwidth is shared between all the queues. |

output definitions (continued)

| | |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRP | The WRED profile (WRP) ID number associated with the QSet. |
| Name | The WRP name. |
| Scheduler | The type of scheduler, such as queue specific priority (Qspec) or strict priority. |
| Type | Whether the QSP is static or dynamic. Currently there are predefined, static profiles on each switch. User-configured, dynamic profiles are only supported on the OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900. |
| QP 1...8 | The queue profile configuration for each QSet queue. The configuration for each of the individual queue profiles is defined by the QSP in use. For example, QSP 1 applies a different queue configuration than QSP 2, 3, or 4. |

```
-> show qos qsp detail

output definitions

| | |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QSAP Port | The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time. |
| QSAP Type | The type of QSAP port; Phy = physical (slot/port), Log = logical (linkagg ID or VFL ID). |
| dQSI | The default QSet instance (dQSI) ID number. This number is generated internally by the switch to identify the QSI that is automatically assigned to each port, link aggregate, and VFL. |
| ID | The QSet profile (QSP) ID number. |
| Name | The QSP name. |
| QSAP Parent | The QSAP parent ID number. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or a VFL. |
| BW (%) Admin | The administrative bandwidth percentage for the QSet. The administrative percentage is not configurable at this time. |
| BW (%) Oper | The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports. |
| Type | Whether the QSP is static or dynamic. Currently there are predefined, static profiles on each switch. User-configured, dynamic profiles are only supported on the OmniSwitch 6465, OmniSwitch 6560, and OmniSwitch 9900. |

Release History

Release 7.2.1; command was introduced.

Related Commands

| | |
|------------------------------|-----------------------------------------------------------|
| qos qsi qsp | Changes the QSet profile association for a QSet instance. |
| qos qsi wred | Configures the administrative status of the WRED profile. |
| show qos qsi | Displays the QSet instance configuration. |

MIB Objects

```

alcatelIND1VfcMIB

  alaVfcQSPBandwidthLimitValue
  alaVfcQSPQueueCount
  alaVfcQSPWRPId
  alaVfcQSPWRPAdminState
  alaVfcQSPSchedulingMethod
  alaVfcQSPStatsAdmin
  alaVfcQSPAttachmentCount

```

show qos wrp

Displays the Weighted Random Early Detection (WRED) profile (WRP) configuration for the switch.

```
show qos wrp [wrp_id | wrp_name] [detail [port chassis/slot/port[-port2]] | slot slot | linkagg agg_id[-agg_id2]]
```

Syntax Definitions

| | |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>wrp_id</i> | A WRED profile (WRP) ID number. The valid range is 1. |
| <i>wrp_name</i> | A WRED profile name. |
| detail | Displays WRED profile configuration details for a port, slot, or link aggregate. |
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10). |
| <i>slot</i> | A slot number. Displays information for all non-DCB ports on the slot. |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID for a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15). |

Defaults

N/A

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the *wrp_id* or the *wrp_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

Examples

```
-> show qos wrp
WRP 1 (wrp-1)
  #Ports: 480, MTU: 1540
  Red
    Min-Th: 10, Max-Th: 50, Max-Pb: 36, Gain: 9
  Yellow
    Min-Th: 50, Max-Th: 90, Max-Pb: 30, Gain: 9
  Green
```

Min-Th: 90, Max-Th: 100, Max-Pb: 24, Gain: 9

output definitions

| | |
|---------------|-----------------------------------------------------------------------------|
| WRP | The WRED profile (WRP) ID number and name. |
| #Ports | The number of ports to which this profile is attached. |
| MTU | The MTU size. |
| Min-Th | The minimum queue threshold percentage for red, green, and yellow packets. |
| Max-Th | The maximum queue threshold percentage for red, green, and yellow packets. |
| Max-Pb | The maximum drop probability percentage for red, green, and yellow packets. |
| Gain | The gain value to smooth out the queue (1–15). |

show qos qsi

Displays the QSet instance (QSI) configuration for the switch. A QSI is a logical set of eight egress queues associated with each port, link aggregate (LAG) ID, and virtual fabric link (VFL).

show qos qsi [**port** *chassis/slot/port*[-*port2*] | **linkagg** *agg_id*[-*agg_id2*] | **vf-link** *vfl_id*] [**detail** | **summary**]

Syntax Definitions

| | |
|------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> [- <i>port2</i>] | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id</i> [- <i>agg_id2</i>] | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| <i>vfl_id</i> | The VFL ID (1/0). <i>This parameter option is supported only on the OmniSwitch 6860 and OmniSwitch 6865.</i> |
| detail | Displays additional queue information for the instance. |
| summary | Displays summary information for the instance. |

Defaults

By default, displays the entire QSI configuration for the switch.

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

Use the **port** *slot/port*, **slot** *slot*, **linkagg** *agg_id*, and **vf-link** *vfl_id* parameters to display the QSI information associated with specific ports, link aggregates, or VFLs. These parameters can also be combined with the **detail** or **summary** parameters.

output definitions

| | |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QSAP | The port number, link aggregate ID, or virtual fabric link (VFL) ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port, link aggregate, and VFL. The QSAP is not configurable at this time. |
| Parent | The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL. |
| QSI | The QSet instance (QSI) ID number, internally generated by the switch. |
| QSP, Name | The QSet profile (QSP) ID number and name associated with the QSI. |
| WRP, Name, Admin, Oper | The WRED profile (WRP) ID number and name associated with the QSI. Also indicates the administrative and operational status of the WRP for the QSI. Only default WRP 1 is supported. |
| Stats, Admin, Oper, Interval | The QSI administrative status, operational status, and time interval for statistics collection. |
| BW Admin (%) | The administrative percentage of bandwidth (currently not user-configurable). |
| BW Oper (%) | The operational percentage of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidth percentages for the member ports. |
| QI 1-8 | The queue scheduling and bandwidth configuration for each QSI queue. These values are determined by which one of the QSet profiles (QSP 1-4) is associated with the QSI. |

```
-> show qos qsi port 1/1/20 summary
Legends: * indicates port is misconfigured.
```

| Port | Profile | | Mode | Parent |
|--------|---------|-------|------|--------|

| 1/1/20 | 1 | qsp-1 | NDCB | 1/1/20 |

```
-> show qos qsi vf-link 1/0 summary
Legends: * indicates port is misconfigured.
```

| Port | Profile | | Mode | Parent |
|---------|---------|-------|------|---------|
| | # | Name | | |
| vfl-1/0 | 2 | qsp-2 | NDCB | vfl-1/0 |

output definitions

| | |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port | The physical slot and port number (or link aggregate ID or VFL ID for a logical port). |
| Profile #, Name | The QSet profile (QSP) ID number and name associated with the QSI. |
| Mode | The QSI operating mode (NDCB or DCB). This mode determines whether Data Center Bridging (DCB) profiles or QSet profiles (non-DCB) are applied to the QSI instance. DCB and QSet profiles are mutually exclusive in that if the OmniSwitch Data Center software license is installed, only DCB profiles are applied. |
| Parent | The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate or VFL. |

Release History

Release 7.1.1; command was introduced.
 Release 7.2.1; output display modified for the OmniSwitch 6900.
 Release 7.2.1.R02; output display modified for the OmniSwitch 6900.
 Release 8.3.1; **vf-link** and **summary** parameters added.

Related Commands

```

Syntax Definitions

| | |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15). |
| bytes | Displays the total number of bytes (instead of packets) that flow through the QSI queues. This parameter is not supported on the |
| rate | Displays the number of packets-per-second that flow through the QSI queues. |

Defaults

| parameter | default |
|--------------|---------|
| bytes rate | bytes |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- The specified port or link aggregate must have statistics collection enabled.
- Use the **port** *slot/port* or **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- It is possible to combine the **bytes** parameter with the **rate** parameter to display the number of bytes-per-second that flow through the QSI queues. For example, **show qos qsi port 1/20 stats rate bytes**.
- Statistics are displayed on a per-queue basis for each port. There are eight queues associated with a single QSet instance. Each queue is identified with a queue ID (1–8). Each port and link aggregate is associated with one QSet instance.

Examples

```
-> show qos qsi port 1/20 stats
```

| Port | Q | Total | |
|------|---|-------|------|
| | | Tx | Drop |
| 1/20 | 1 | 0 | 0 |
| 1/20 | 2 | 0 | 0 |
| 1/20 | 3 | 0 | 0 |
| 1/20 | 4 | 0 | 0 |
| 1/20 | 5 | 0 | 0 |
| 1/20 | 6 | 0 | 0 |
| 1/20 | 7 | 0 | 0 |
| 1/20 | 8 | 9984 | 0 |

```
-> show qos qsi port 1/20 stats bytes
```

| Port | Q | Total | |
|------|---|--------|------|
| | | Tx | Drop |
| 1/20 | 1 | 0 | 0 |
| 1/20 | 2 | 0 | 0 |
| 1/20 | 3 | 0 | 0 |
| 1/20 | 4 | 0 | 0 |
| 1/20 | 5 | 0 | 0 |
| 1/20 | 6 | 0 | 0 |
| 1/20 | 7 | 0 | 0 |
| 1/20 | 8 | 987424 | 0 |

```
-> show qos qsi port 1/20 stats rate
```

| Port | Q | Average | |
|------|---|---------|--------|
| | | Tx/s | Drop/s |
| 1/20 | 1 | 0 | 0 |
| 1/20 | 2 | 0 | 0 |
| 1/20 | 3 | 0 | 0 |
| 1/20 | 4 | 0 | 0 |
| 1/20 | 5 | 0 | 0 |
| 1/20 | 6 | 0 | 0 |
| 1/20 | 7 | 0 | 0 |
| 1/20 | 8 | 7 | 0 |

```
-> show qos qsi port 1/20 stats rate bytes
```

| Port | Q | Average | |
|------|---|---------|--------|
| | | Tx/s | Drop/s |
| 1/20 | 1 | 0 | 0 |
| 1/20 | 2 | 0 | 0 |
| 1/20 | 3 | 0 | 0 |
| 1/20 | 4 | 0 | 0 |
| 1/20 | 5 | 0 | 0 |
| 1/20 | 6 | 0 | 0 |
| 1/20 | 7 | 0 | 0 |
| 1/20 | 8 | 694 | 0 |

output definitions

| | |
|-------------------|------------------------------------------------------------------------|
| Port | The slot and port number. |
| Q | The QSet queue ID number (1–8) associated with the QoS (non-DCB) port. |
| Total Tx | Total packets or bytes transmitted. |
| Total Drop | Total packets or bytes dropped. |

Release History

Release 7.3.1; command was introduced.

Related Commands

| | |
|-------------------------------------|----------------------------------------------------------------------|
| qos qsi stats | Enables or disables statistics collection for a DCB or non-DCB port. |
| clear qos qsi stats | Clears statistics collected for one or more QSet instances. |

MIB Objects

```
alaVfcQInstanceTable
  alaVfcQInstancePacketsEnqueued
  alaVfcQInstanceBytesEnqueued
  alaVfcQInstancePacketsDropped
  alaVfcQInstanceBytesDropped
```

show qos qsi wred-stats

Displays the Weighted Random Early Detection (WRED) statistics for the QSet instance.

```
show qos qsi {port chassis/slot/port[-port2] | slot slot | linkagg agg_id[-agg_id2]} wred-stats [rate | bytes]
```

Syntax Definitions

| | |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number of a non-DCB (Data Center Bridging) port. Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID number of a non-DCB aggregate. Use a hyphen to specify a range of IDs (10-15). |
| rate | Displays the number of packets per second. |
| bytes | Displays the total number of bytes. |

Defaults

By default, displays the total number of packets for all the QSI queues.

Platforms Supported

Not supported in this release.

Usage Guidelines

- This command is not supported on OmniSwitch 6900 DCB ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- This command displays the total number of packets or bytes.

Examples

```
-> show qos qsi port 1/2 wred-stats
* OS6900 WRED Per Q stats not supported, Tx stats not supported
      Green          Yellow          Red
Port   Q Drop      Drop      Drop
-----+-----+-----+-----
Port 1/2   - 0          0          0
```

```
-> show qos qsi port 1/1 wred-stats rate
* OS6900 WRED Per Q stats not supported, Tx stats not supported
      Green          Yellow          Red
Port   Q Drop/s     Drop/s     Drop/s
-----+-----+-----+-----
1/1     - 0          0          0
```

```

-> show qos qsi port 1/1 wred-stats bytes
* OS6900 WRED Per Q stats not supported, Tx stats not supported
          Green          Yellow          Red
Port      Q Drop          Drop          Drop
-----+-----+-----+-----
1/1      - 0              0              0

```

output definitions

| | |
|-------------------------------|----------------------------------------------------------------|
| Port | The switch port. |
| Q | The egress queue ID (1–8) associated with the port. |
| Green TX, Green Drop | The number of green packets or bytes transmitted and dropped. |
| Yellow TX, Yellow Drop | The number of yellow packets or bytes transmitted and dropped. |
| Red TX, Red Drop | The number of red packets or bytes transmitted and dropped. |

Release History

Release 7.2.1.R01; WRED per Q stats not supported; Tx stats not supported.

Related Commands

| | |
|-------------------------------------|---------------------------------------------------------------|
| qos qsi wred | Configures the administrative status of the WRED profile. |
| show qos wrp | Displays the WRED profile (WRP) configuration for the switch. |
| show qos qsi | Displays the QSet instance configuration. |
| clear qos qsi stats | Clears statistics collected for one or more QSet instances. |

```

show qos qsp system-default

Displays the name and ID of the QSet profile (QSP) that serves as the default system QSP. when the switch is running in the non-DCB (NDCB) mode.

show qos qsp system-default

Syntax Definitions

N/A

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6865

Usage Guidelines

- The switch is operating in the NDCB mode when the OmniSwitch Data Center software license is *not* installed on the switch.
- The switch is operating in the Data Center Bridging (DCB) mode when the OmniSwitch Data Center software license is installed on the switch. Configuring the system default profile is not supported in the DCB mode.

Examples

```
-> show qos qsp system-default
NDCB Default QSP profile      : 1   (qsp-1)
```

Release History

Release 8.3.1; command introduced.

Related Commands

[qos qsp system-default](#) Configures the default QSet profile for the switch.

MIB Objects

```
alcatelIND1VfcMIB
  alaVfcSystemDefaultQsetQSPName
  alaVfcSystemDefaultQsetQSPId
```

clear qos qsi stats

Clears QSet instance (QSI) statistics.

```
clear qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} stats
```

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1\5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |

Defaults

N/A

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **port** *slot/port* and **linkagg** *agg_id* parameters to clear QSI statistics associated with specific ports or link aggregates.
- QSI statistics can only be cleared on ports or link aggregates that have statistics collection enabled.

Examples

```
-> clear qos qsi port 1/1/2 stats
-> clear qos qsi port 1/1/10-15 stats
-> clear qos qsi linkagg 5 stats
-> clear qos qsi linkagg 10-15 stats
```

Release History

Release 7.1.1; command was introduced.

Related Commands

[show qos qsi stats](#) Displays QSet instance statistics.

MIB Objects

alaVfcQsapTable
  alaVfcQsapClearStats
  alaVfcQsapQpId
```

qos qsp dcb import

Imports a Data Center Bridging profile (DCB) to a new or previous custom profile.

```
qos qsp dcb {dcp_id | dcp_name} import qsp dcb {import_dcp_id | import_dcp_name} [802.3x-pause]
no qos qsp dcb {dcp_id | dcp_name}
```

Syntax Definitions

| | |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>dcp_id</i> | A DCB custom profile ID. The valid custom profile ID range is 12 through 128. |
| <i>dcp_name</i> | The DCB profile name. |
| <i>import_dcp_id</i> | The ID of the DCB profile to import. The valid profile ID range is 1–11 to specify a predefined profile and 12–128 to specify a custom profile. |
| <i>import_dcp_name</i> | The name of the DCB profile to import. |
| 802.3x-pause | Makes the profile pause-ready. When enabled, the Priority based Flow Control (PFC) is lossy for all traffic classes in the profile and they cannot be changed to lossless. |

Defaults

By default the **802.3x-pause** flag is disabled.

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- The new DCB profile must be unique and not contain the same name and ID of an existing DCB profile.
- On an OmniSwitch 6900-Q32, only import DCB profile 8 to create a custom profile. Do not use any of the other pre-defined profiles to create a custom profile.
- Use the **no** form of the command to remove an existing custom DCB profile from the switch configuration.
- The pre-defined DCB profiles from 1 to 11 cannot be removed from the switch configuration.
- A custom profile attached to a port cannot be removed from the switch configuration. In this case, the profile must be disassociated from the port before being removed.
- Use the **802.3x-pause** tag to enable pause-ready on the profile. When enabled, the PFC is lossy for all traffic classes in the profile and they cannot be changed to lossless. This type of custom profile is created to support legacy PAUSE frames on ports to which the profile is applied. However, before applying the custom profile to a port, disable PFC TLV and PFC willing on the port.

Examples

```
-> qos qsp dcb 33 import qsp dcb 8
-> qos qsp dcb lossyETS import qsp 10
```

```
-> qos qsp dcb 34 import qsp dcb 7 802.3x-pause  
-> no qsp dcb 33
```

Release History

Release 7.3.1; command was introduced.

Related Commands

  alaDcbxDCPRowStatus
```

qos qsp dcb tc

Modifies the Data Center Bridging (DCB) traffic class attributes of a DCB profile.

```
qos qsp dcb {dcp_id | dcp_name} tc tc_num {pfc flow-type { ll | nll} | pfc link-delay allowance | min-bw % | max-bw % | recommended bw %}
```

Syntax Definitions

| | |
|-------------------------|----------------------------------------------------------------------------------------------------|
| <i>dcp_id</i> | A DCB custom profile ID. The valid custom profile ID range is 12 through 128. |
| <i>dcp_name</i> | The DCB custom profile name. |
| <i>tc_num</i> | The traffic class number in the DCB profile. |
| ll | Designates traffic class as lossless. |
| nll | Designates traffic class as non-lossless (lossy). |
| <i>allowance</i> | Link delay allowance value for PFC. |
| min-bw % | Sets the minimum bandwidth guaranteed for the Enhanced Transmission Selection (ETS) traffic class. |
| max-bw % | Sets the maximum bandwidth guaranteed for the Strict Priority (SP) traffic class. |
| recommended bw % | Sets the recommended minimum bandwidth for the traffic class. |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- The **pfc flow-type** option is used to change a traffic class from lossless (ll) to lossy (nll) or from lossy (nll) to lossless (ll).
- The **pfc link-delay** option sets the actual headroom for the traffic class. An incorrect setting can result in traffic loss.
- The **min-bw** option sets the minimum bandwidth guaranteed for the ETS traffic class.
- The **max-bw** option sets the maximum bandwidth guaranteed for the SP traffic class.
- The **recommended bw** option sets the recommended minimum bandwidth for the traffic class.

Examples

```
-> qos qsp dcb 11 tc 0 min-bw 3
-> qos qsp dcb lossyETS tc 1 min-bw 12
-> qos qsp dcb lossyETS tc 2 pfc flow-type ll
-> qos qsp dcb 11 tc 0 recommended bw 3
```

Release History

Release 7.3.1; command was introduced.

Related Commands

`show qos qsp dcb`

Displays the configured DCB profiles and the traffic classes associated to the DCB profile.

MIB Objects

```
alaDcbxDCPTrafficClassTable

```

qos qsp dcb tc-numbering

Modifies the traffic class (TC) numbering for custom profiles.

```
qos qsp dcb {dcp_id | dcp_name} tc-numbering tc_num
```

Syntax Definitions

| | |
|-----------------|-------------------------------------------------------------------------------|
| <i>dcp_id</i> | A DCB custom profile ID. The valid custom profile ID range is 12 through 128. |
| <i>dcp_name</i> | The DCB custom profile name. |
| <i>tc_num</i> | Enter the traffic class numbering sequence for the DCB profile. |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- The command can be used to modify the traffic class numbering for the custom profiles.
- The numbering must be assigned in ascending order. For example, a profile with TCs numbered 0, 1, 2, can be changed to 1, 5, 7.
- The number of TCs specified must match the number of TCs in the profile.

Examples

```
-> qos qsp dcb 11 tc-numbering 1 5 7 9
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show qos qsp dcb](#) Displays the configured DCB profiles and the traffic classes associated to the DCB profile.

MIB Objects

```
alaDcbxDCProfileTable  
  alaDcbxDCPTDCPName  
  alaDcbxDCPTCsPresent
```

qos qsi qsp dcb

Assigns a DCB profile to a port or link aggregate.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} qsp dcb {dcp_id | dcb_name}
```

Syntax Definitions

| | |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| <i>dcp_id</i> | DCB profile ID. DCB profile ID 11 through 128 refers to the custom profiles. DCB profile ID 1 through 10 refers to the predefined profiles. |
| <i>dcp_name</i> | DCB profile name. |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- When a DCB profile is assigned to a link aggregate, the profile is applied to all the ports associated with the linkagg.
- Avoid configuring different profiles for each port of the link aggregate.
- The command will not work if the link aggregate is associated with 1Gig port. Different combination of ports (10G and 40G) are allowed in a link aggregate.

Examples

```
-> qos qsi port 1/11 qsp dcb lossyETS  
-> qos qsi port 1/11 qsp dcb 7
```

Release History

Release 7.3.1; command was introduced.

Related Commands

`show qos qsp dcb`

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

MIB Objects

```
alaDcbxPortInstanceEntry  
  alaDcbxPIAdminDCPId  
  alaDcbxPIAdminDCPName
```

qos qsi dcb dcbx version

Selects the version of the DCB Exchange protocol (DCBX) to apply to the specified DCB port.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx version {ieee | cee | auto}
```

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| ieee | Selects IEEE 802.1Qaz DCBX. |
| cee | Selects Converged Enhanced Ethernet DCBX 1.01. |
| auto | Automatically detects the DCBX version used by the peer switch. |

Defaults

By default, the DCB port is configured to automatically use the DCBX version detected from the peer.

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

Initially, the IEEE version of DCBX is run on the port until the switch detects the peer is running the CEE version. At that point, the switch will stop IEEE DCBX and start to run the CEE version.

Examples

```
-> qos qsi port 1/10 dcb dcbx version ieee
-> qos qsi port 1/10 dcb dcbx version cee
-> qos qsi port 1/11 dcb dcbx version auto
```

Release History

Release 7.3.3; command was introduced.

Enables or disables DCB exchange protocol (DCBX) functionality on a per port basis.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx admin-state {enable | disable}
```

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| enable | Enables the DCBX functionality on the port. |
| disable | Disables the DCBX functionality on the port. |

Defaults

| parameter | default |
|-------------------------|---------|
| dcbx admin-state | enable |

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

The DCBX admin-state, enables or disables DCBX TLVs and negotiation on a port.

Examples

```
-> qos qsi port 1/10 dcb dcbx admin-state enable
-> qos qsi port 1/10 dcb dcbx admin-state disable
```

Release History

Release 7.3.1; command was introduced.

Related Commands

```

qos qsi dcb dcbx ets

Enables or disables config-TLV, recommended-TLV, and the willing bit for ETS on a per-port basis.

qos qsi {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **dcb dcbx ets** [config-tlv {enable | disable} | recommend-tlv {enable | disable} | willing {yes | no}]

Syntax Definitions

| | |
|------------------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> [- <i>port2</i>] | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id</i> [- <i>agg_id2</i>] | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| config-tlv enable | Enables the transmission of ETS configuration TLVs. |
| config-tlv disable | Disables the transmission of ETS configuration TLVs. |
| recommend-tlv enable | Enables the transmission of ETS recommended TLVs. |
| recommend-tlv disable | Disables the transmission of ETS recommended TLVs. |
| yes | Sets the willing bit to on in the TLVs. |
| no | Sets the willing bit to off in the TLVs. |

Defaults

| parameter | default |
|--------------------------------------|---------|
| config-tlv {enable disable} | enable |
| ets recommend-tlv {enable disable} | enable |
| willing {yes no} | yes |

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the option **ets config-tlv** to enable or disable the transmission of ETS configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets recommended-tlv** to enable or disable the transmission of ETS recommended TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to set the willing bit on the TLVs. This option is used when the DCBX is enabled on the port and the ETS configuration TLV is sent on the port.

Examples

```
-> qos qsi port 1/1-10 dcb dcbx ets config-tlv disable
-> qos qsi port 1/11 dcb dcbx ets recommended-tlv disable
-> qos qsi linkagg 5 dcb dcbx ets willing no
```

Release History

Release 7.3.1; command was introduced.

```

qos qsi dcb dcbx pfc

Enables or disables config-TLV, defense mode, and willing for PFC on a per port basis.

```
qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb dcbx pfc [config-tlv {enable |
disable} | defense {enable | disable} | willing {yes | no}]
```

Syntax Definitions

| | |
|---------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | The link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| config-tlv enable | Enables the transmission of PFC configuration TLVs. |
| config-tlv disable | Disables the transmission of PFC configuration TLVs. |
| defense enable | Enables the defense mode for the PFC. |
| defense disable | Disables the defense mode for the PFC. |
| willing yes | Allows the PFC to negotiate with the network. |
| willing no | Stops the PFC from negotiating with the network. |

Defaults

| parameter | default |
|-----------------------|---------|
| pfc config-tlv | enable |
| pfc defense | enable |
| pfc willing | yes |

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the option **pfc config-tlv** to enable or disable the transmission of PFC configuration TLVs. To use this option, DCBX must be enabled on the port.
- Use the option **ets willing** to allow the PFC to negotiate with the network.

Examples

```
-> qos qsi port 1/1-10 dcb dcbx pfc config-tlv disable
-> qos qsi port 1/11 dcb dcbx pfc defense disable
-> qos qsi linkagg 5 dcb dcbx pfc willing no
```

Release History

Release 7.3.1; command was introduced.

Related Commands

- show qos qsi dcbx pfc** Displays the configured ports in the system and the related DCBX PFC information.
- show qos pfc-lossless-usage** Displays the usage of the PFC lossless traffic class on the switch.
- show qos qsi dcb pfc stats** Displays the traffic statistics per port and per traffic class.

  alaDcbxPIPFCDefense  
  lldpXdot1dcbxLocPFCWilling
```

show qos qsp dcb

Displays the configured DCB profiles and the traffic classes associated with the DCB profile.

```
show qos qsp dcb [dcp_id | dcp_name] [tc tc_num]
```

Syntax Definitions

| | |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>dcp_id</i> | DCB profile ID. DCB profile ID 11–128 refers to the custom profiles. DCB profile ID 1–0 refers to the predefined profiles. |
| <i>dcp_name</i> | DCB profile name. |
| <i>tc_num</i> | The traffic class associated to the DCB profile. The valid range is 0–7. |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- This command displays the details of the configured DCB profile.
- Use the **tc** option to display the traffic classes associated to the DCB profile.

Examples

```
-> show qos qsp dcb
```

Legends: Prio TC Map:

Represents the priority to traffic class mapping;
begins with priority 0 on the left and displays the
traffic class it belongs to.

| # | Name | Priority TC Map | PFC Cap | Max TC | ETS | | 802.3x Pause-Ready |
|----|--------|--------------------|------------|-----------|-------------------|--------|-----------------------|

show qos qsi dcb dcbx

Displays the DCBX port configuration and status.

```
show qos qsi [port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]] dcb dcbx [status]
```

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | A link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| status | Displays the DCBX operational status for the port. |

Defaults

By default, the DCBX configuration is displayed for all ports.

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

- Use the **port** *slot/port* or **linkagg** *agg_id*, parameters to display information for a specific port or link aggregate.
- Use the **status** option to display the status information of the DCBX related to the port.

Examples

```
-> show qos qsi port 1/1-5 dcb dcbx
```

| Port | DCP Name | DCBX Ver | DCBX Admin | Stats Admin | PFC Defense | ETS | | | | |
|------|----------|----------|------------|-------------|-------------|---------|----------|---------|----------|----------|
| | | | | | | PFC TLV | PFC Will | Cfg TLV | Reco TLV | ETS Will |
| 1/1 | 8 dcp-8 | AUTO | Ena | Dis | Ena | Ena | Yes | Ena | Ena | Yes |
| 1/2 | 8 dcp-8 | AUTO | Ena | Dis | Ena | Ena | Yes | Ena | Ena | Yes |
| 1/3 | 8 dcp-8 | AUTO | Ena | Dis | Ena | Ena | Yes | Ena | Ena | Yes |
| 1/4 | 8 dcp-8 | AUTO | Ena | Dis | Ena | Ena | Yes | Ena | Ena | Yes |
| 1/5 | 8 dcp-8 | AUTO | Ena | Dis | Ena | Ena | Yes | Ena | Ena | Yes |

output definitions

| | |
|--------------------|----------------------------------------------------------------------------------------|
| Port | The DCB slot and port number or link aggregate ID. |
| DCP Name | The DCB profile ID assigned to the port. |
| Name | The name of the DCB profile assigned to the port. |
| DCBX Ver | The version of DCBX running on the port (CEE , IEEE , or AUTO). |
| DCBX Admin | Indicates the administrative status of DCBX on the port. |
| Stats Admin | Indicates if statistics collection is enabled or disabled on the port. |

output definitions (continued)

| | |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PFC Defense | Indicates the status of PFC defense (Ena or Dis). Applies when PFC negotiation fails. If enabled then PFC becomes disabled but traffic still flows. If disabled then the PFC local configuration remains on the port. |
| PFC TLV | Indicates whether the IEEE 802.1 organizationally defined PFC TLV transmission is allowed on a given LLDP transmission capable port. |
| PFC Will | Indicates whether or not the port is willing to accept the PFC configuration from a remote peer. |
| Cfg TLV | Indicates whether or not ETS configuration TLV transmission is allowed on a port. |
| Reco TLV | Indicates whether or not ETS configuration TLV transmission is allowed on a port. |
| ETS Will | Indicates whether or not the port is willing to accept the recommended ETS configuration from a remote peer. |

```
-> show qos qsi port 1/1-5 dcb dcbx status
```

1/5     Dis  No    AUTO  -    No             -

```

output definitions

| | |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Port | The DCB slot and port number or link aggregate ID. |
| DCBX Oper | Indicates the operational status of DCBX on the port. |
| Local Oper Changed | Identifies if the local configuration is different from the configuration imported from the DCB profile applied to the port. |
| Error | Indicates if there is an error condition. |
| Local Oper Ver | The version of DCBX running on the local port (CEE , IEEE , or AUTO). |
| Remote Oper Ver | The version of DCBX running on the remote port (CEE , IEEE , or AUTO). |
| Action | Indicates the action taken as a result of the status. |

Release History

Release 7.3.1; command was introduced.

Release 7.3.3; fields added to display the version of DCBX (IEEE or CEE).

Related Commands

show qos qsi dcb ets

Displays the configured ports in the system and the related DCBX ETS and ETS traffic class information.

show qos qsi {port *chassis/slot/port*[-*port2*] | linkagg *agg_id*[-*agg_id2*]} **dcb ets** [*tc* [*tc_num*]]

Syntax Definitions

| | |
|------------------------------------|--------------------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port</i> [- <i>port2</i>] | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id</i> [- <i>agg_id2</i>] | A link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |
| <i>tc_num</i> | Enter the traffic class for which the information needs to be displayed. The valid range is 0-7. |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

Use the *tc_num* option to display the DCBX ETS information for a specific traffic class.

Examples

```
-> show qos qsi port 1/1 dcb ets
```

Legends: Prio TC Map:

Represents the priority to traffic class mapping;
begins with priority 0 on the left and displays the
traffic class it belongs to.

show qos qsi dcbx pfc

Displays the configured ports in the system and the related DCBX PFC information.

show qos qsi {port chassis/slot/port[-port2] | linkagg agg_id[-agg_id2]} dcb pfc

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |
| <i>agg_id[-agg_id2]</i> | A link aggregate ID. Use a hyphen to specify a range of IDs (10-15). |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

If there is no PFC TLV received from the remote end, then the remote information will be blank.

Examples

```
-> show qos qsi port 4/1-2 dcb pfc
```

Legends: * indicates port oper status is different than the configured status

| Port | Priorities | Loc-Adm | | | Loc-Oper | | | Rem-Oper | | | | |
|------|------------|---------|------|-----|------------|-----|------|----------|------------|-----|------|-----|

```

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

This command displays the PFC lossless traffic class usage on the switch.

Examples

```
-> show qos pfc-lossless-usage
Lossless Priorities in use      : 55,
Lossless Priorities reserved   : 60,
Lossless Priorities available  : 73
```

output definitions

| | |
|--------------------------------------|--------------------------------------------------------------------------------|
| Lossless Priorities in use | Indicates the number of PFC lossless priorities in use in the system. |
| Lossless Priorities reserved | Indicates the number of PFC lossless priorities in reserve in the system. |
| Lossless Priorities available | Indicates the number of priorities available to be configured as PFC lossless. |

Release History

Release 7.3.1; command was introduced.

Related Commands

qos qsi dcb dcbx pfc Enables or disables config-tlv, defense mode, and willing for PFC on a per port basis.

MIB Objects

```
alaDcbxConfig
  alaDcbxPfcLLPrioritiesUsed
  alaDcbxPfcLLPrioritiesReserved
  alaDcbxPfcLLPrioritiesAvailable
```

show qos qsi dcb pfc stats

Displays the Priority Flow Control (PFC) statistics for the specified DCB port.

show qos qsi [port chassis/slot/port[-port2] dcb pfc stats

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

Statistics are displayed on a per-traffic class (TC) basis.

Examples

```
-> show qos qsi port 1/11 dcb pfc stats
```

Legends: displays packet count

| Port | Q | PFC | | PFC |
|------|---|-----|----------|-----|
| | | TC | TX (req) | |
| 1/11 | 0 | 0 | 0 | 0 |
| 1/11 | 1 | 0 | 0 | 0 |
| 1/11 | 2 | 0 | 0 | 0 |
| 1/11 | 3 | 0 | 0 | 0 |
| 1/11 | 4 | 1 | 0 | 0 |
| 1/11 | 5 | 1 | 0 | 0 |
| 1/11 | 6 | 2 | 0 | 0 |
| 1/11 | 7 | 2 | 0 | 0 |

output definitions

| | |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Port | The DCB port number. |
| Q | The 802.1p priority number (0–7). This number is mapped to a traffic class (TC) based on the DCB profile assigned to the port. |
| TC | Indicates the traffic class to which the priority belongs. |
| Priority | Indicates the priority of the DCB port. |
| PFC TX (req) | Total count of PFC packets transmitted. |
| PFC RX (ind) | Total count of PFC packets received. |

Release History

Release 7.3.1; command was introduced.

Related Commands

- qos qsi dcb dcbx pfc** Enables or disables config-tlv, defense mode, and willing for PFC on a per port basis.
- clear qos qsi dcb pfc stats** Clears the port statistics.

MIB Objects

  alaDcbxPIPrioPFCPacketsReceived
```

clear qos qsi dcb pfc stats

Clears the DCB PFC queue statistics.

```
clear qos qsi {port chassis/slot/port[-port2]} dcb pfc stats
```

Syntax Definitions

| | |
|--------------------------|------------------------------------------------------------------------------------|
| <i>chassis</i> | The chassis identifier. |
| <i>slot/port[-port2]</i> | The slot and port number (1/5). Use a hyphen to specify a range of ports (1/5-10). |

Defaults

N/A

Platforms Supported

OmniSwitch 6900, except 6900-C32, 6900-V72

Usage Guidelines

Use the *slot/port* parameter to clear queue statistics associated with specific ports.

Examples

```
-> clear qos qsi port 2/1 dcb pfc stats
```

Release History

Release 7.3.1; command was introduced.

Related Commands

[show qos qsi stats](#) Displays the queue statistics for DCB and NDCB ports.

36 QoS Policy Commands

This chapter describes the CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

Note. Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

Refer to [Chapter 35, “QoS Commands,”](#) for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

Filename: ALCATEL-IND1-QOS-MIB.mib
Module alaQoS MIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS Policy commands are listed here:

|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

```
policy rule rule_name [enable | disable] [precedence precedence] [condition condition] [action action]  
[validity-period name] [save] [log [log-interval seconds]] [count {packets | bytes}] [trap] [default-list]
```

```
policy rule rule_name no {validity-period | save | log | trap | default-list}
```

```
no policy rule rule_name
```

Syntax Definitions

| | |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>rule_name</i> | The name of the policy rule, any alphanumeric string. |
| enable | Enables the policy rule. |
| disable | Disables the policy rule. |
| <i>precedence</i> | The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView. |
| <i>condition</i> | The condition name that is associated with this rule. Conditions are configured through the policy condition command. |
| <i>action</i> | The name of the action that is associated with this rule. Actions are configured through the policy action command. |
| <i>name</i> | The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the policy validity period command. |
| save | Marks the policy rule so that it may be captured as part of the switch configuration. |
| log | Configures the switch to log messages about specific flows coming into the switch that match this policy rule. <i>This parameter is not supported on the OmniSwitch 6465 or OmniSwitch 6560.</i> |
| <i>seconds</i> | Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible. |
| packets | Counts the number of packets that match the rule. |
| bytes | Counts the number of bytes that match the rule. |
| trap | Enables or disables traps for the rule. |
| default-list | Adds the rule to the QoS default policy list. |

Defaults

| parameter | default |
|-------------------------|-------------------------------|
| enable disable | enable |
| <i>precedence</i> | 0 |
| log | no |
| <i>seconds</i> | 60 |
| packets bytes | packets |
| trap | enable |
| default-list | adds rule to the default list |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration or to remove parameters from a particular rule. The change will not take effect, however, until the **qos apply** command is issued.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **copy running-config working** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- If the rule is going to belong to a QoS policy list for a Universal Network Profile (UNP), use the **no default-list** option when creating the rule. Doing so will give the rule precedence over default list rules when the policy list is applied to UNP device traffic.

- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.
- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

from {cli | ldap | blt}

This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.

- The **log** option is useful for determining the source of attacks on the switch firewall.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.

Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule3 condition c3 action a3 no default-list
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity-period vp01
-> policy rule rule2 no precedence
-> policy rule rule2 no validity-period
-> policy rule rule3 no default-list
-> no policy rule rule2
```

Release History

Release 7.1.1; command was introduced.

Related Commands

| | |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| policy validity-period | Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect. |
| policy condition | Configures condition parameters. |
| policy action | Configures action parameters. |
| qos apply | Applies configured QoS and policy settings to the current configuration. |
| show policy rule | Displays information for policy rules configured on the switch. |
| show active policy rule | Displays only those policy rules that are currently being enforced on the switch. |

policy validity-period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

policy validity-period *name* [**days** *days*] [**months** *months*] [**hours** *hh:mm to hh:mm*] [**interval** *mm:dd:yy hh:mm to mm:dd:yy hh:mm*]

policy validity-period *name* **no** {**hours** / **interval**}

no policy validity-period *name*

Syntax Definitions

| | |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i> | The name of the validity period (up to 31 alphanumeric characters). |
| <i>days</i> | The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., monday , tuesday , wednesday , etc.). |
| <i>months</i> | The month(s) in which the validity period is active. Enter the actual month (e.g., january , february , march , etc.). |
| <i>hh:mm</i> | The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30). |
| <i>mm:dd:yy hh:mm</i> | An interval of time during which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:17 12:01 to 11:02:17 12:01). |

Defaults

By default, no validity period is in effect for a policy rule.

| parameter | default |
|-------------------------|------------------|
| <i>days</i> | no restriction |
| <i>months</i> | no restriction |
| <i>hh:mm</i> | no specific time |
| <i>mm:dd:yyyy hh:mm</i> | no interval |

Platforms Supported

OmniSwitch 6465, 6560, 6860, 6865, 6900, 9900

Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.

- Use the **policy rule** command to associate a validity period with a rule.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **configuration snapshot** command is entered after the **policy validity-period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity-period** command:

from {cli | ldap | blt}

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy validity-period vp01 days tuesday thursday months january february
-> policy validity-period vp01 hours 13:00 to 19:00
-> policy validity-period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity-period vp01 no days thursday
-> no policy-validity period vp02
```

Release History

Release 7.1.1; command was introduced.

Related Commands

policy list

Configures a QoS policy list. There are four types of lists available: a Universal Network Profile (UNP) policy list, an egress policy list, an Application Fingerprinting policy list, and a default policy list.

policy list *list_name* **type** {**unp** | **egress** | **appfp** | **empacl**} [**enable** | **disable**]

no policy list *list_name*

Syntax Definitions

| | |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>list_name</i> | The name to assign to the policy list. Note that the list name is case sensitive. |
| unp | Applies the list of policy rules to traffic classified into the User Network Profile to which the list is assigned |
| egress | Applies the list of policy rules to traffic egressing on switch ports. <i>This parameter is not supported on the OmniSwitch 6465, OmniSwitch 6560, or OmniSwitch 9900.</i> |
| appfp | Applies the list of policy rules to an Application Fingerprinting interface. <i>This parameter is supported only on the OmniSwitch 6900.</i> |
